Springer International Handbooks of Education

The *Springer International Handbooks of Education* series aims to provide easily accessible, practical, yet scholarly, sources of information about a broad range of topics and issues in education. Each *Handbook* follows the same pattern of examining in depth a field of educational theory, practice and applied scholarship, its scale and scope for its substantive contribution to our understanding of education and, in so doing, indicating the direction of future developments.

The volumes in this series form a coherent whole due to an insistence on the synthesis of theory and good practice. The accessible style and the consistent illumination of theory by practice make the series very valuable to a broad spectrum of users. The volume editors represent the world's leading educationalists. Their task has been to identify the key areas in their field that are internationally generalizable and, in times of rapid change, of permanent interest to the scholar and practitioner.

Welcome to the Country

Yanbalehla Ngulung Karulbo on Bugeram Jagun – Walking Ahead Altogether on Sacred Land

I would first like to thank the Handbook Editors for this opportunity to create a Welcome to Country for this book on childhoodnature.

A Welcome to Country is generally conducted in the physical presence by traditional custodians of the land by which you are gathered. It is an honor reserved specifically to traditional custodians of that land due to the physical and emotional connection to place. To acknowledge country is an honor that anyone can deliver to pay respects to the traditional custodians.

As an Aboriginal person with connection to the Mununjali people of Beaudesert through Bilin Bilin and Nellie, I regard myself a representative of the Yugambeh language region of South East Queensland, Australia. My totem is Mibun, the eagle, which I consider sacred and connect through story and spirit. It provides guidance and strength to my journey. I acknowledge the country and land that you may be gathered upon as the reader and send my respects to the traditional custodians of that physical place.

Elders are important to me and are the ones that hold the knowledge, teach, and guide us through life's journeys. They were also the ones who had to fight to keep our cultural practices alive and ensure that our culture was not decimated. Often paying the ultimate price, they are our guiding lights. I humbly acknowledge the elders that have touched my life and continue to provide a lifetime of guidance.

As jarjums (children) we do not automatically get taught a lesson like at school. We must earn the right to receive that information and then ensure that we utilize that information or practice in the way that it was received. At no time does any one person hold all the knowledge. Each person is provided with the right information, at the right time, for the right reasons.

To receive these lessons requires trust and relationship. Our connection with others is like connection to country. It is assured but limited by the level of trust and relationship you have together. Our lore or law is taught through a number of ways and the responsibility of our lore men and women. This is passed down through stories, songlines, art, totems, and from the land. Our creation stories come from our country and link to neighboring countries through story and song lines.

All people should understand our connection and share the pride in our "mother," this country. To connect and understand the environment provides guidance and strength that is immeasurable and should come naturally to all people.

Year 12

Childhoodnature Preamble

"You did not act in time"

Greta Thunberg's speech to MPs at the Houses of Parliament, United Kingdom (UK), 23 April, 2019

My name is Greta Thunberg. I am 16 years old. I come from Sweden. And I speak on behalf of future generations.

I know many of you don't want to listen to us – you say we are just children. But we're only repeating the message of the united climate science.

Many of you appear concerned that we are wasting valuable lesson time, but I assure you we will go back to school the moment you start listening to science and give us a future. Is that really too much to ask?

In the year 2030 I will be 26 years old. My little sister Beata will be 23. Just like many of your own children or grandchildren. That is a great age, we have been told. When you have all of your life ahead of you. But I am not so sure it will be that great for us.

I was fortunate to be born in a time and place where everyone told us to dream big; I could become whatever I wanted to. I could live wherever I wanted to. People like me had everything we needed and more. Things our grandparents could not even dream of. We had everything we could ever wish for and yet now we may have nothing.

Now we probably don't even have a future any more.

Because that future was sold so that a small number of people could make unimaginable amounts of money. It was stolen from us every time you said that the sky was the limit, and that you only live once.

You lied to us. You gave us false hope. You told us that the future was something to look forward to. And the saddest thing is that most children are not even aware of the fate that awaits us. We will not understand it until it's too late. And yet we are the lucky ones. Those who will be affected the hardest are already suffering the consequences. But their voices are not heard.

Is my microphone on? Can you hear me?

Around the year 2030, 10 years 252 days and 10 hours away from now, we will be in a position where we set off an irreversible chain reaction beyond human control, that will most likely lead to the end of our civilisation as we know it. That is unless in

that time, permanent and unprecedented changes in all aspects of society have taken place, including a reduction of CO_2 emissions by at least 50%.

And please note that these calculations are depending on inventions that have not yet been invented at scale, inventions that are supposed to clear the atmosphere of astronomical amounts of carbon dioxide.

Furthermore, these calculations do not include unforeseen tipping points and feedback loops like the extremely powerful methane gas escaping from rapidly thawing arctic permafrost.

Nor do these scientific calculations include already locked-in warming hidden by toxic air pollution. Nor the aspect of equity – or climate justice – clearly stated throughout the Paris agreement, which is absolutely necessary to make it work on a global scale.

We must also bear in mind that these are just calculations. Estimations. That means that these "points of no return" may occur a bit sooner or later than 2030. No one can know for sure. We can, however, be certain that they will occur approximately in these timeframes, because these calculations are not opinions or wild guesses.

These projections are backed up by scientific facts, concluded by all nations through the IPCC. Nearly every single major national scientific body around the world unreservedly supports the work and findings of the IPCC.

Did you hear what I just said? Is my English OK? Is the microphone on? Because I'm beginning to wonder.

During the last six months I have travelled around Europe for hundreds of hours in trains, electric cars and buses, repeating these life-changing words over and over again. But no one seems to be talking about it, and nothing has changed. In fact, the emissions are still rising.

When I have been travelling around to speak in different countries, I am always offered help to write about the specific climate policies in specific countries. But that is not really necessary. Because the basic problem is the same everywhere. And the basic problem is that basically nothing is being done to halt – or even slow – climate and ecological breakdown, despite all the beautiful words and promises.

The UK is, however, very special. Not only for its mind-blowing historical carbon debt, but also for its current, very creative, carbon accounting.

Since 1990 the UK has achieved a 37% reduction of its territorial CO_2 emissions, according to the Global Carbon Project. And that does sound very impressive. But these numbers do not include emissions from aviation, shipping and those associated with imports and exports. If these numbers are included the reduction is around 10% since 1990 – or an average of 0.4% a year, according to Tyndall Manchester.

And the main reason for this reduction is not a consequence of climate policies, but rather a 2001 EU directive on air quality that essentially forced the UK to close down its very old and extremely dirty coal power plants and replace them with less dirty gas power stations. And switching from one disastrous energy source to a slightly less disastrous one will of course result in a lowering of emissions.

But perhaps the most dangerous misconception about the climate crisis is that we have to "lower" our emissions. Because that is far from enough. Our emissions have

to stop if we are to stay below 1.5–2°C of warming. The "lowering of emissions" is of course necessary but it is only the beginning of a fast process that must lead to a stop within a couple of decades, or less. And by "stop" I mean net zero – and then quickly on to negative figures. That rules out most of today's politics.

The fact that we are speaking of "lowering" instead of "stopping" emissions is perhaps the greatest force behind the continuing business as usual. The UK's active current support of new exploitation of fossil fuels – for example, the UK shale gas fracking industry, the expansion of its North Sea oil and gas fields, the expansion of airports as well as the planning permission for a brand new coal mine – is beyond absurd.

This ongoing irresponsible behaviour will no doubt be remembered in history as one of the greatest failures of humankind.

People always tell me and the other millions of school strikers that we should be proud of ourselves for what we have accomplished. But the only thing that we need to look at is the emission curve. And I'm sorry, but it's still rising. That curve is the only thing we should look at.

Every time we make a decision we should ask ourselves; how will this decision affect that curve? We should no longer measure our wealth and success in the graph that shows economic growth, but in the curve that shows the emissions of greenhouse gases. We should no longer only ask: "Have we got enough money to go through with this?" but also: "Have we got enough of the carbon budget to spare to go through with this?" That should and must become the centre of our new currency.

Many people say that we don't have any solutions to the climate crisis. And they are right. Because how could we? How do you "solve" the greatest crisis that humanity has ever faced? How do you "solve" a war? How do you "solve" going to the moon for the first time? How do you "solve" inventing new inventions?

The climate crisis is both the easiest and the hardest issue we have ever faced. The easiest because we know what we must do. We must stop the emissions of greenhouse gases. The hardest because our current economics are still totally dependent on burning fossil fuels, and thereby destroying ecosystems in order to create everlasting economic growth.

"So, exactly how do we solve that?" you ask us – the schoolchildren striking for the climate.

And we say: "No one knows for sure. But we have to stop burning fossil fuels and restore nature and many other things that we may not have quite figured out yet."

Then you say: "That's not an answer!"

So we say: "We have to start treating the crisis like a crisis – and act even if we don't have all the solutions."

"That's still not an answer," you say.

Then we start talking about circular economy and rewilding nature and the need for a just transition. Then you don't understand what we are talking about.

We say that all those solutions needed are not known to anyone and therefore we must unite behind the science and find them together along the way. But you do not listen to that. Because those answers are for solving a crisis that most of you don't even fully understand. Or don't want to understand.

You don't listen to the science because you are only interested in solutions that will enable you to carry on like before. Like now. And those answers don't exist any more. Because you did not act in time.

Avoiding climate breakdown will require cathedral thinking. We must lay the foundation while we may not know exactly how to build the ceiling.

Sometimes we just simply have to find a way. The moment we decide to fulfil something, we can do anything. And I'm sure that the moment we start behaving as if we were in an emergency, we can avoid climate and ecological catastrophe. Humans are very adaptable: we can still fix this. But the opportunity to do so will not last for long. We must start today. We have no more excuses.

We children are not sacrificing our education and our childhood for you to tell us what you consider is politically possible in the society that you have created. We have not taken to the streets for you to take selfies with us, and tell us that you really admire what we do.

We children are doing this to wake the adults up. We children are doing this for you to put your differences aside and start acting as you would in a crisis. We children are doing this because we want our hopes and dreams back.

I hope my microphone was on. I hope you could all hear me.

Childhood and Nature: *A Natural Meeting Place*

Every book comes to be through the flourishing of an initial spark or idea released into the universe and let to follow its own line of thought while being guided by a host of many. Assembled in a forest in the hinterlands of the Gold Coast, Australia, in 2015, 20 scholars gathered for an international colloquium on childhoodnature. The intent of the colloquium was to act as a meeting place for researchers working in the fields of childhood and nature, to consider a cartography of the field as an ever-evolving movement, and to contemplate the central tenets of the field in order to support imaginaries for potential. The concept of childhoodnature and the *Research Handbook on Childhoodnature* was imagined and began to be realized.

Figure 1 represents places as circles, the coming together of entities and bodies, and lines as the journey of these bodies and entities through and within places. The Gold Coast campus of Southern Cross University, the site of the handbook's emergence, is a

[1]Nabi means to "begin" in Bundjalung-Yugambeh. See http://bundjalung.dalang.com.au/language/dictionary.

Fig. 2 Childhoodnature Collective, 2015. The concept of the collective is symbolic of Latour's (2004) concept of common worlds recognizing that all objects and subjects are in perpetual relation

historical Aboriginal meeting place. We were attuned to the sensitivity of the land, nature, humans, and non-humans as entangled in places through past, present, and future tracings. In this sense, the intent of the colloquium was to act as a "moving" meeting place for researchers working in the field (see Fig. 2, Childhoodnature Collective) through a program that followed a unique and untraditional structure, a dialogic journey through time and space from the rainforest, a school, to the coast where a public dialogue on childhood and nature was then performed.[2]

The colloquium opened with a keynote address by Professor Karen Malone at Binna Burra National Park entitled "Reconsidering children's encounters with nature and place using posthuman theoretical approaches." Malone's keynote troubled the

[2]The moving and dialogic format of the program was inspired by Professor Sean Blenkinsop of Simon Fraser University and the colloquium that he convened in Vancouver, Canada (September 2014).

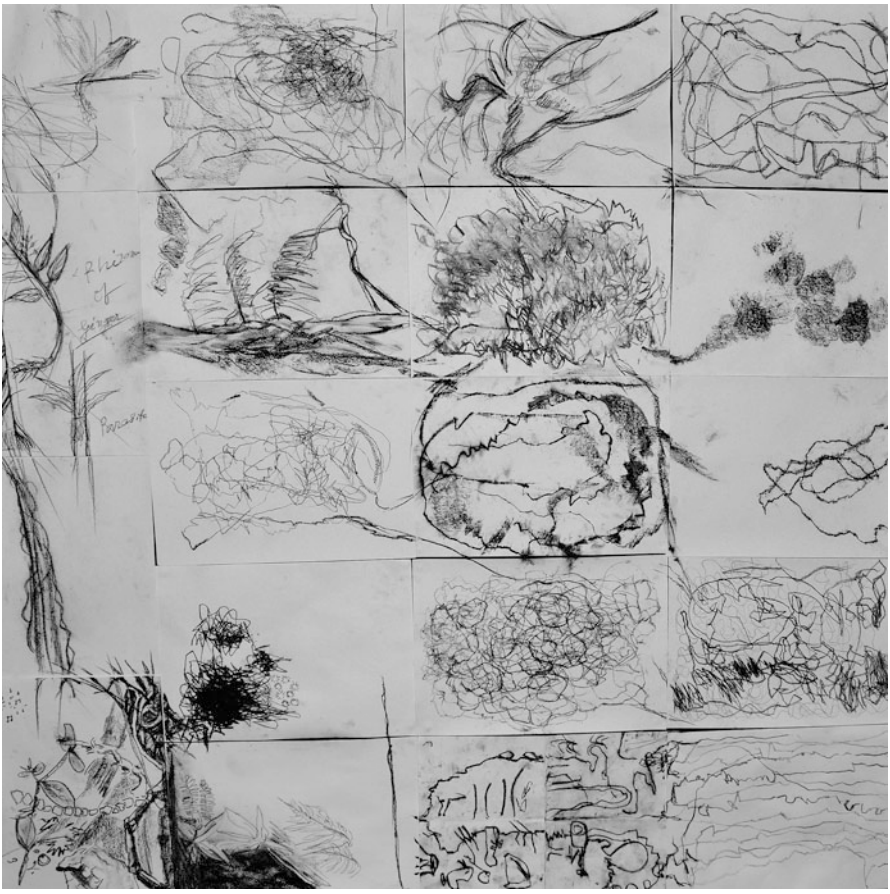

Fig. 3 Psychogeographic methods of walking and mapping (Photographer Dr David Rousell, Childhoodnature Collective Researcher)

"centrality of the human and to reconsider the way we relate, set ourselves outside of and seek to dominate the more than human world." From that vantage point, the collective represented their research on childhood and nature. In particular, Cutter-Mackenzie and Barratt Hacking reflected on their personal and research journeys toward childhoodnature; they discussed the way in which the development of child-framed research methodologies had supported child and adult researchers in understanding and representing children and young people's ontologies on childhood and nature (Barratt Hacking, Cutter-Mackenzie, & Barrratt, 2013). Such thinking led the group to consider the proposition of "Childhood after Nature: Walking and mapping new pathways for the posthuman child in the Anthropocene" facilitated by David Rousell. Rousell provoked "If the earth has become something other than 'nature', and humanity has become something other than 'human', what are the implications for our understanding of 'childhood'?" The session responded to two recent turns that have

Fig. 4 The *Handbook of Childhoodnature* editors – Amy Cutter-Mackenzie-Knowles, Karen Malone, and Elisabeth Barratt Hacking

far-reaching implications for understandings of childhood: firstly, the turn toward the Anthropocene as an era in which natural and cultural phenomena have become fundamentally entangled (Crutzen & Brauch, 2016) and, secondly, the turn toward posthuman theory that rejects anthropocentrism, humanism, and individualism to make way for new forms of collective subjectivity and expression (Braidotti, 2013). These turns have brought the romantic concepts of "childhood" and "nature" under productive scrutiny, and paved the way for new imaginings of childhood.

Applying psychogeographic methods of walking and mapping (O'Rourke, 2013), the participants explored Binna Burra national park as and with "ecology without nature" (Morton, 2008). Approaching the national park as *always already inhabited by multiple others*, and *always already mediated by multiple technologies*, walking, dialogue, reflection, writing and drawing, were sought to uncover new and alternative pathways for considering possibilities for a childhood in the posthuman age of the Anthropocene (see Fig. 3). Our walking and mapping led to intensive dialogue about the concepts of childhood and nature.

Evolving from our being together, the concept of "childhoodnature" was cocreated by Cutter-Mackenzie-Knowles, Malone, and Barratt Hacking during an intensive conversation on the intent of the Handbook (see Fig. 4). The concept reflects Cutter-Mackenzie, Malone, and Barratt Hacking's underpinning belief, and the latest innovative concepts in the field, that as children *are* nature, this should be redefined in this integrating concept. It was envisaged that the Handbook would critique and decenter

Fig. 5 Contemplating Childhoodnature at Silkwood School through 8 Ways of Aboriginal Learning

dominant anthropocentric views of nature. These disruptions would interrupt existing ways of considering children and nature by making visible the limits of a view of human exceptional, that humans are positioned as superior to nature. These ideas have been nurtured and flourish in the handbook as it now comes into being.

In considering the porousness of childhoodnature, the dialogue continued at Silkwood School with educators, children, and young people (Fig. 5). Educators conceptualized childhoodnature as a kindred concept with traditional ways of knowing. At Silkwood Independent School, traditional ways of knowing are central to the School's philosophy, curriculum, teaching, and learning. Silkwood School is part of Kombumerri country and the wider Yugambeh language region. Jaelyn Biumaiwai, an indigenous student at Silkwood, welcomed our collective to the School. Fittingly, Jaelyn has commenced the Handbook by giving a Welcome to Country – *opening this Handbook*.

Dialogue was further continued at Southern Cross University, the final meeting place, for a public dialogue on childhoodnature. As we ended our journey, the childhoodnature collective opened its doors to welcome children, young people, educators, parents, academics, and interested community members into a public dialogue on childhoodnature. We now welcome you to the childhoodnature collective in search of common ground, a common world where children and nature are enmeshed as they *are*.

About the Editors

Professor Amy Cutter-Mackenzie-Knowles
School of Education, Sustainability Environment and the Arts in Education (SEAE) Research Cluster
Southern Cross University, Gold Coast Campus
Coolangatta, QLD, Australia

Dr. Amy Cutter-Mackenzie-Knowles (formerly Cutter-Mackenzie) is a Professor at Southern Cross University, School of Education, in Sustainability, Environment and Education. She is the Dean and Head of School for the School of Education, as well as the Research Leader of the "Sustainability, Environment, the Arts in Education" (SEAE) Research Cluster.

Amy commenced her career as a school teacher in Queensland, Australia, and later moved into academia after completing her Ph.D. Amy's research is deeply engaged with children's ontologies with/as nature through socioecological and posthumanist theoretical framings. Amy's most current book is *Touchstones for Deterritorializing Socioecological Learning: The Anthropocene, Posthumanism and Common Worlds as Creative Milieux* (with Lasczik, Wilks, Logan, Turner, and Boyd). Amy is the Editor-in-Chief of the *Australian Journal of Environmental Education* with Professor Karen Malone (Cambridge, Q2) and a Consulting Editor for the *Journal of Environmental Education* (Q1) and the *International Journal of Early Childhood Environmental Education* (NAAEE).

In the past 5 years Amy has generated substantial external research income (including two Australian Research Council Discovery grants), having completed over 40 research projects in the areas of environmental education, climate change education, and nature play.

She is the research leader of an international research program in climate change education called Climate Change + Me (http://climatechangeandme.com.au).

In 2014 Amy was awarded the Australian Association for Environmental Education Fellowship (Life Achievement Award) for her outstanding contribution to environmental education research. Further, in 2010 Amy was awarded a prestigious Australian Learning and Teaching Council (OLT) National Teaching Excellence Award. In 2009 she was awarded Monash University's Vice-Chancellor's Teaching Excellence Award (September 2009) and a prestigious OLT Citation for Outstanding Contributions to Student Learning (August 2008). These respective teaching awards were specifically for "leading school-community teaching and learning practices and partnerships to influence, motivate and inspire pre-service education students and schools to engage in environmental education and sustainability."

Professor Karen Malone
Department of Education
Faculty of Health, Arts and Design
Swinburne University of Technology
Melbourne, Victoria, Australia

Professor Malone researches in science and environmental education, urban and animal ecologies, and childhood studies with a specific focus on children's environmental encounters with the more than human world of damaged urban landscapes. Her current research program is located under the overarching theme of **Children in the Anthropocene**. Within this program she has five enmeshed research themes that entwine a series of research interests and activities: **children sensing ecologically**, **children's bodies on damaged landscapes**, **children's multispecies companions**, **children's watery lives,** and **children's natural play**. The research program is the culmination of over 20 years of research working in urban environments with children and families in a variety of community, school, and public spaces in cities and towns around the world. She has successfully attracted over two million dollars in grants on this research work with the majority of her grants having been funded by the United Nations (UNESCO and UNICEF) and other

government, industry, and community partners. In all these funded projects she has documented the everyday lives of children aged 2–15 years while growing up in challenging environments. Her research activities are conducted using participatory place-based research workshops, using visual, mobile, and verbal methods. Thousands of children have participated in research workshops in Australia, Albania, Bolivia, Cook Islands, Indonesia, Japan, Kazakhstan, Papua New Guinea, and South Africa, with this data set now providing a solid foundation for ongoing longitudinal comparisons. Her most recently funded research project "Children sensing ecologically" explores for the first time very young children's (1–3 year olds) walking encounters of urban landscapes in public, home, and childcare settings. Sensing ecologically is a conceptual tool that she is using in order to imagine how children can engage/communicate with the more than human world prior to language acquisition. In early 2018 she published a sole-authored book *Children in the Anthropocene* that provided her most current thinking theoretically, methodologically, and conceptually and setting the foundation for future research activities. During her career Professor Malone has authored 7 books and over 100 other publications. She is coauthor of the *International Research Handbook on Childhoodnature* and first named editor of the Springer education book series Children: Global Posthumanist Perspectives and Materialist Theories. She is also first named author of an edited collection titled *Reimaginging Sustainability in Precarious Times*.

Elisabeth Barratt Hacking
Department of Education
University of Bath
Bath, UK

Elisabeth is the Deputy Head of the Department of Education at the University of Bath and Director of Studies for the MA Education. Elisabeth is a founding member of the University's Childhood, Wellbeing and Education Special Interest Group.

Elisabeth's research is in the overlapping areas of environmental education, childhood and the natural environment, and global citizenship. For more than 20 years Elisabeth has led numerous educational

research, evaluation, and development projects with children, educators, educational and environmental organizations, and national and international policymakers. Much of this research has been undertaken in partnership with children and young people using participatory, child-framed research methodologies. Initially commenced through an Economic and Social Research Council (UK) research grant, "Listening to children: Environmental perspectives and the school curriculum" (with Scott and Barratt), Elisabeth has made an important contribution to the advancement of theory, policy, and practice in the area of childhood and the natural environment. In 2007 Elisabeth guest edited a special issue of the journal *Environmental Education Research,* "Childhood and Environment" (with Barratt); this was the first special issue to focus on childhood and was ground-breaking in the environmental education field. In 2010 Elisabeth authored a government report synthesizing latest research evidence on the impact of attending schools in England that focus on education for sustainability (with Scott and Lee). This has since contributed to the policy and practice debate about Education for Sustainability in England and further afield. Most recently Elisabeth's global citizenship research has been advanced by a funded research study exploring how "International Mindedness" is conceptualized and practiced in International Baccalaureate (IB) World Schools (2017). These research findings are being used to inform IB policy and practice and, more widely, contribute to research and policy debates in global education.

Elisabeth serves as a Consulting Editor and International Editorial Board Member across multiple journals, including the *Australian Journal of Environmental Education*.

Abstract

What follows in this International handbook are nine distinct sections, together with a companion authored by children and young people. It is the first handbook on childhoodnature research, theory, and practice – a new field of research and inquiry. In the handbook introduction, we initially invite readers to join us for a grandtour of the handbook and companion, followed by a rich discussion on the new concept "childhoodnature" co-created by the handbook editors.

Keywords

Childhoodnature · Assemblage · Posthuman · Anthropocene · Childhood

Embarking on a New Childhoodnature Adventure

"The adventures first" as Lewis Caroll would say. This handbook is an adventure. A new adventure of thought; indeed a thought experiment. It experiments through the compilation of new and old ideas enmeshed into one collection.

We are sitting together at a set of table and chairs constructed for small children. I feel uncomfortable, unstable, my knees are bent. I am slightly hunched over so I can attentively watch at the actions of the small child next to me, without getting too close. Sara has the packet of developed photographs from the disposable camera she handed to me a week ago. She had run up to me with an air of excitement when I had arrived in the Kindergarten room. She wouldn't be disappointed. I had the photographs. She opens the packet and starts to methodically pull each one out. She pauses at each, looks at it for a while, then places it on the table in front of her.

She stops at one photograph and holds it in her hands. Putting aside the packet with the unviewed photographs still contained inside, she holds the photograph in both hands. For where I am sitting I can see the photograph she is holding has the trunk of two trees and the perspective is as if it was taken looking up into the tree from the ground. I pause and allow her to guide the process.

'I took this in the park' she says quietly, almost like she is speaking to herself. I nod my head. 'I am a leaf fallen from the tree'. She turns her head to see my reaction. I nod again. She pauses, still looking at me, 'from that tree', she says and points to the tree on the right of the photograph. She then gets off the chair on the floor beside me and lays down on her back.

She is once again becoming a leaf. I sit still, quietly watching. She is still, quietly being a leaf. (Extract from Malone (2018), *Children in the Anthropocene* (used with permission of the author))

Grandtour of Childhoodnature Handbook

Through its 81 chapters, including the companion, the Research Handbook on Childhood is an assemblage of research in the field of childhoodnature. Likened to an assemblage as espoused by Deleuze and Guattari (1987) in their book "a thousand plateaus" the handbook can be entered and exited at any point. It has content and form, ways of being and becoming with many ideas and concepts, some new, many in between old and new and other speculative around how the field could be and the contribution it could make in future thinking. At present no such handbook or major work of this breadth and depth of theoretical and applied thinking and research in the field exists, but beyond this is for the first time it invites children and young people to walk alongside adult researchers and provide their own perspectives through a range of multimodal philosophies and methodologies.

With the advent of a re-turning of the "children in nature" movement, the "new nature movement" has seen an increase in producing the practice and nature of outdoor and nature education that has led to a resurgence in public visibility of the field (see Fletcher, 2017; Gill, 2011; Kahn, 1999; Kahn & Kellert, 2002; Kellert, 2002; Louv, 2011, 2016; Malone, 2016; Malone, Birrell, Boyle, & Gray, 2015; Sobel, 1996, 2008; Taylor, 2013). At the public interface, this resurgence has primarily been orchestrated on a small collection of well-known books (for example Louv, 2005, 2011, 2016). These books, although focused on the ways and means of educating children in nature and effective in engaging the (minority Western) public in such matters (Alam, 2008), have tended not to problematize the implications for this field or be instrumental in supporting new theoretical perspectives and associated research methodologies. Further, we argue that this work maintains the Cartesian nature-culture binary, which

we find problematic, by suggesting a separation between children and nature. As a response the new concept of childhoodnature aligns with a posthuman turn in educational and childhoodnature research and, associated with this, the recognition that humans are having an unprecedented planetary impact on Earth in this time of the Anthropocene. To this extent, posthumanist ontologies reject "that humans are the only species capable of producing knowledge and instead creates openings for other forms/things/objects/beings/phenomenon to know" (Ulmer, 2017, p. 834). Such ontological thinking troubles traditional and scientific ways of knowing between species, opening up "a wealth of research possibilities. . . when humans are decentered as the only possible knowers" (Ulmer, 2017, p. 834).

The intent of this handbook was therefore to bring together children and researchers interested in the new concept of childhoodnature, whose research work reflected our commitment to problematizing views around childhood and nature and progressing "childhoodnature" work. Here, we offered an opportunity for researchers to gather into a new research collective and, as such, build the momentum. To these ends, this handbook's endeavor is to consolidate the field of childhoodnature research, providing an avenue for considering the terrain that lies ahead to continue to build the influence and impact of the field.

Uniquely, this handbook assembles existing research themes and seminal authors in the childhoodnature field alongside new cutting-edge research and researchers drawing on cross-cultural and international research data. From the onset, the underlying objectives of the handbook were twofold:

- Opening up spaces for childhoodnature researchers in what we have termed a childhoodnature collective; and
- Assembling Childhoodnature Research into one Collection that informs education and the social sciences

The handbook's nine sections were edited by 22 Section Editors who took oversight of those particular sections. The sections and editors include:

1. Childhoodnature Theoretical Perspectives (*Section Editors: Professor Karen Malone, A/Professor Iris Duhn and A/Professor Mark Tesar*)
2. Childhoodnature Research Methodologies (*Section Editor: Professor Paul Hart*)
3. Cultural, Political and Wild Perspectives of Childhoodnature (*Section Editors: Professor Sean Blenkinsop and Professor Peter Kahn*)
4. Childhoodnature and the Anthropocene: An Epoch of "Cenes" (*Section Editors: Professor Amy Cutter-Mackenzie-Knowles, Professor Karen Malone, A/Professor Hilary Whitehouse and Professor Marianne Krasny*)
5. Childhoodnature Significant Life Experience (*Section Editors: Elisabeth Barratt Hacking, Dr Debra Cushing and Professor Robert Barratt*)
6. Childhoodnature Ecological Systems (*Section Editors: Dr Marianne Logan and Dr Helen Widdop Quinton*)

7. Childhoodnature Animal Relations (*Section Editors: Professor Pauliina Rautio and Dr Tracy Young*)
8. Childhoodnature Pedagogies and Place (*Section Editors: Professor Bob Stevenson, Dr Greg Mannion and Dr Snowy Evans*)
9. Childhoodnature Ecological Aesthetics and the Learning Environment (*Section Editors: Dr David Rousell and Professor Dilafruz Williams*)

The handbook also includes a **childhoodnature Companion** authored by children and young people, edited/curated by distinguished early career researchers (Dr Helen Widdop Quinton, Dr. Laura Piersol, Dr. David Rousell and Dr. Joshua Russell) supported by a panel of youth reviewers. The companion is located in the middle of the handbook signifying its centrality. It operates as a milieu akin to Deleuze and Guattari's (1987) conception of milieu that is vibratory, chaotic yet relational. The companion vibrates through/in/as the handbook where children are nature.

Section 1: Childhoodnature Theoretical Perspectives (*Section Editors: Professor Karen Malone, A/Professor Iris Duhn and A/Professor Mark Tesar*)

In setting out on an uncertain and tenuous adventure into the future, theories are needed which can help humans effectively respond to the rapidly changing conditions of everyday life on earth. This is particularly the case in the emerging field of childhoodnature studies, as children themselves will be forced to grapple with existential threats associated with the onset of the Anthropocene era, including climate change, social instability, and water crises, among many others. This section assembles a theoretical toolkit which can enable childhoodnature encounters to flourish into the Anthropocene and indeed post-Anthropocene. In this undertaking, this section does not put diverse theoretical perspectives into competition but rather assembles theories as tools which can produce sparks when knocked together. These are theories that you can pack up and take for a walk, theories that can help get you out of sticky situations, and theories which children themselves can use to address the crises which they will inevitably inherit. As such, this section puts multiple philosophical perspectives into consequential relation such that they can become productive in their differences. This endeavor asks us to take stock of theories which have been productive in the field to this point and also to seek new theories which are emerging in direct response to the contemporary moment.

Section 2: Childhoodnature Research Methodologies (*Section Editor: Professor Paul Hart*)

This section focuses on the framing of childhoodnature research and its interpretations and applications, as well as trends and issues. Methodological inquiry in the social sciences normally rests upon certain epistemological interests, ontological

assumptions, and axiological commitments. This basic frame of research is complicated further in environmental education research when the formative context of childhoodnature is included. Additional demands are placed on the conceptualization, contextualization, representation, and legitimation of the research problem, purposes, processes, values, and inevitably, usefulness. Methodological deliberations and debates in environmental education research have a four decade long history (strictly in a Western minority sense) but are now subject to "new" theoretical perspectives introduced in Section 1 while also drawing inspiration from the rise of the environmental arts, humanities, sciences, and related genres of emergent inquiry. Paradigmatic change for childhoodnature is a potential – exacerbated practically by the local-global consequences of the Anthropocene now being felt intergenerationally and lived cross culturally. Children and childhood are particularly vulnerable. How, and in what ways, does methodological inquiry about the researcher-researched (childhoodnatures) relationship *access* children's lived experiences; historicized selves/subjectivities and identity formations including family and schooling ecologies; actions and interactions with (and against) nature; and "worldviews"? Methodological inquiries into the framings, interpretations/applications, and trends/issues supported by, where possible, distinctive empirical insights are invited. Exemplary contributions to this section demonstrate how the methodological reflexivity of childhoodnature studies advances the qualities, values, status, and efficacy of environmental education research and the social sciences more broadly.

Section 3: Cultural, Political, and Wild Perspectives of Childhoodnature (*Section Editors: Professor Sean Blenkinsop and Professor Peter Kahn*)

This small yet significant section speaks to the transformative power of children interacting with nature, and more wild nature, in diverse settings, including schools. It considers investigations of nature and wildness, nature as teacher, and educational, political, social, and cultural transformation. Consideration is given to ways in which current and near future (often digital) technologies are impacting children's learning and experience of nature and authenticity of relation. Chapters also include innovative educational work that is currently happening that imagines beyond the boundaries of conventional affluent minority educational norms. Linkages are established between theory, practice, ethics, diversity, and contested ideas of childhoodnature.

Section 4: Childhoodnature and the Anthropocene: An Epoch of "Cenes" (*Section Editors: Professor Amy Cutter-Mackenzie-Knowles, Professor Karen Malone, A/Professor Hilary Whitehouse and Professor Marianne Krasny*)

Section Four troubles childhoodnature and the Anthropocene, a scientific and popular term used to described the present human-nature conditions on planet Earth. The section does this through eight contributions which broadly speak to four 'cenes',

namely: children in the Anthropocene – child-cene; woman in the Anthropocene – gyno-cene; Cities as sites of the Anthropocene – city-cene; and relations with the morethanhuman – kin-cene. The lines though between/within/ through these identified cenes are porous and enmeshed as the nonliving, the human, and nonhuman transition between two epochs – the Anthropocene and the Postanthropocene.

Childhoodnature Companion (*Companion Editors/Curators: Dr Helen Widdop Quinton, Dr Laura Piersol, Dr David Rousell and Dr Joshua Russell*)

This "Companion" to the Childhoodnature Handbook is a co-creation between children, young people, and adults, curated by four academics and five graduate students to bring children and young people's voices to the foreground. What does it mean to create a Companion? How might the voices of children and young people become "companions" with the other chapters that make up this Handbook? The Companion editors began the process of compiling and curating the Companion with these open questions in mind. They wanted to explore how a notion of companionship could grow and develop organically and perhaps become something more than what we had expected. In early 2017, the Companion Editors extended an international call for contributions from children and young people all over the world. The call asked for children and young people (from early childhood to 25) to submit essays, photographs, poetry, drawings, creative writing, or personal narratives that expressed their experiences and understandings of childhoodnature. They asked for *"anything and everything that you, as children, teenagers, and young people (ages 0–25), might contribute that draws on your ideas about nature, your experiences with animals, or your thoughts about environmental issues."*

The companion editors' editorial approach to constructing the Companion has attempted to preserve the quality and diversity of the submissions that they received. They also worked with youth reviewers who helped to shape their approach and understanding of the material.

The Companion is something new in academic publishing – there were no models or templates to guide either the Handbook Editors or Companion Editors. Rather than attempting to represent, interpret, or categorize the experiences of children and young people, the Companion Editors created four distinct *compositions* of interwoven feelings, places, sensations, and ideas:

Composition 1: stories of human and nonhuman relation
Composition 2: practices of sense and sensation
Composition 3: eco-poetics of childhoodnature encounter
Composition 4: the childhoodnature imaginary

In putting these compositions together, the Companion Editors endeavored to give each submission space to breathe, inhabit, and saturate the page, while also weaving together different voices and geographical locations to produce a range of feelings and sensations for the reader.

Section 5: Childhoodnature Significant Life Experience (*Section Editors: Elisabeth Barratt Hacking, Dr Debra Cushing and Professor Robert Barratt*)

Being in nature as a child has long been reported as an important contributor to being an advocate for the environment later in life. This section investigates the multiple-complexities about what people attribute their significant lived experiences to and how it has shaped their environmental choices. Significant Life Experiences (SLE) was coined in 1980 by Tom Tanner (Chawla, 1998) who inspired an avid interest in this area of research. Tanner's ground-breaking study identified affective experiences in nature that had an impact upon people's respect and appreciation for the environment. Following on from Tanner's work, further research has also endorsed and confirmed the power of SLE in nature. But what is it about these SLEs that have such an impact upon people's lives? The quality of SLE has been shown to influence learning, not just in early childhood but throughout life. Chawla has noted that natural areas, family influences, organization, negative experiences, and/or education have been attributed to creating these SLE. While children are often not able to recall these experiences, they do shape lifelong learning, which clearly develops into personal adult characteristics, as is demonstrated by adults' reflections upon their experiences. This section provides a snapshot of current research and associated understandings of SLE in childhoodnature. Authors draw on SLE reported from around the world contextualizing the influence of society, people, and culture on childhoodnature relationships and theorize on the meaning of both social disadvantages and negative environmental experiences. By developing deeper understanding of these experiences, authentic achievements in environmental education are afforded.

Section 6: Childhoodnature Ecological Systems (*Section Editors: Dr Marianne Logan and Dr Helen Widdop Quinton*)

Section 6 focuses on childhoodnature within the complexity of the entanglement of the biological environment with the physical environment. It incorporates childhoodnature in the light of the magnitude of environmental change as a result of human activity, indeed the Anthropocence. Ecological literacy, ecological thinking, ecological identity, and whole systems thinking are central to the eight chapters which comprise this Section. The section (re)explores systems thinking, ecological systems and the interaction of humans within those systems. The chapters reveal a posthuman turn for reconceptualizing ecological systems thinking in childhoodnature.

Section 7: Childhoodnature Animal Relations (*Section Editors: Professor Pauliina Rautio and Dr Tracy Young*)

Until recent times human-animal relationships have received minimal attention from educational and social science research or have rarely focused on children's inter-species relations. We know that animals matter in the lives of children and the

Handbook and Section Editors have chosen to privilege these human-animal relationships through this section. The complex relationships with children, animals, and environment provide a space for ethical considerations that critique the social positioning of animals in education and society. The ten chapters provoke a diversity of (re)thinking of child/animal relationships in communities, families, and education with a range of suggested ways that animals can be elevated as crucial components of pedagogical theory and practice. The authors grapple with taken-for-granted interspecies relationships in their messy, complex, and multiple forms, looking beyond the hidden, the marginalized, the unexplained, and the ill-considered. This questioning of multiple relatings has the potential to (re)imagine new models, theories, and ways of crossing boundaries that blur the illusion of separation between children and animals.

Section 8: Childhoodnature Pedagogies and Place (*Section Editors: Professor Bob Stevenson, Dr Greg Mannion and Dr Snowy Evans*)

This section explores a range of pedagogies enacted in diverse contexts with a childhoodnature focus. Place is an integral element of childhoodnature experience and education; this section represents writing that engages with a depth of pedagogical understandings and a breadth of pedagogical repertoires. The way that childhoodnature centric approaches promote critical thinking, problem solving, resilience, adaptability, and preparedness in the current and future global uncertainties is considered and discussed in this section. The seven chapters in this section document current research and thinking about place and pedagogy supported with illustrative vignettes and case studies from a range of educational contexts.

Section 9: Childhoodnature Ecological Aesthetics and the Learning Environment (*Section Editors: Dr David Rousell and Professor Dilafruz Williams*)

This section explores the ecological and aesthetic dimensions of learning environments in which childhoodnature encounters take place. While environmental education has traditionally placed children in contact with a relational and interconnected world, too often the aesthetic dimensions of these encounters have been overlooked. As revealed across the ten chapters in this section, eco-aesthetics provides fertile grounds for interdisciplinary research and practice which attends to richly textured compositions of childhoodnature through a diverse range of material, social, and conceptual practices. Such approaches have become increasingly relevant following the onset of the Anthropocene epoch, which has provoked new modes of thinking and practice transgressing established barriers between the arts, humanities, sciences, and technology. In attending to the sensuous and affective qualities of childhoodnature encounters, multiple sites are opened up as vital spaces for children to respond to the changing material conditions of everyday life. These

spaces are not limited to national parks, remote wilderness areas, nature schools, or community gardens but also include art galleries, online environments, museums, urban landscapes, everyday domestic spaces, among many other settings. Each of these sites of engagement can be considered inherently ecological *and* aesthetic spaces which afford and constrain the very possibilities for movement, learning, and thought. This perspective supports methodological turns towards arts-based, creative, and sensory practices in educational research with children.

A Childhoodnature Emergence

In recent years, there has been a significant return to the enduring sentiment that providing opportunities for children to be immersed in "nature" particularly in the places close to where they live is an essential way to support children's opportunities to reconnect with the planet. Premised on the argument that a nature-child connection is essential for their health, well-being, and their potentiality to be environmental stewards and that unless children are re-natured then all these attributes would be compromised. This is a significant challenge, engaging children to be the potential "masters" (using this term is to signify how humans, particularly male Eurocentric humans, have come to view themselves in relation to nature) of the Earth's destiny on behalf of the human/nonhuman species. Educators in sustainable development, environmental, and nature education as fields of educational study have sought to idealize and argue that the central challenge of education is to encourage and entice the human moral desire to "conserve nature," to "protect animals," and for children to grow up and be politically active agents for change (see Cutter-Mackenzie & Rousell, 2018; Cutter-Mackenzie, Edwards, Moore, & Boyd, 2014; Rousell, Cutter-Mackenzie, & Foster, 2017). Big-ticket environmental issues such as limits to production, climate change, and animal conservation are the backbone of sustainability, environmental, and nature education; to be able to "overcome" these significant global issues, a well-educated and natured child willing to have the moral certitude to take up the challenges has been viewed as essential. Cutter-Mackenzie et al. (2014, p. 26) caution such "child" positionings:

> An anthropocentric perspective emphasises the use of the environment *for human gain*, and so sustainability is associated for some scholars with responding to this use so that children become 'agents of change', working to protect the earth's resources from being depleted. Whilst this approach undoubtedly has value... critics argue that an ecocentric [relational] perspective is more appropriate.

Taylor (2017, p. 1462) further problematizes stewardship in environmental education and traces this belief in the potential environmental immersion to produce agents of change back to the writings of Wilson (1993), Chawla (2009) and the historical traditions of Rousseau: "... the close association of young children with nature can be traced back to Rousseau's figurative 'Nature's Child' legacy and the subsequent Romantic western cultural traditions that perpetuate the view that young

children have a special and close affinity with the natural world (see Taylor, 2013, pp. 3–57). From this legacy, the assumption is that, if nurtured, children's 'biophilia' (or innate love of nature) will predispose them to become environmental stewards" (p. 5). Taylor (2017) then goes on to argue that these beliefs are a divergence between good romantic nature and bad evil culture with children positioned as "bad culture" in need of a return/reconnect back to their pure natured bodies. She argues that these beliefs are supported by a set of two keenly held assumptions: "Firstly, they assume that nature exists 'out there' in a pure space that is somehow separate to the corrupting cultural/technological/urban domain in which most children grow up" (p. 1452); and "Secondly, and concomitantly, they assume that young children's 'natural' place is in nature, and that the increasing paucity of children's first hand nature experiences in their overly urban lives constitutes a threat to their wellbeing" (p. 1452).

These beliefs have been supported also through much of the recent studies by agencies such as the US-based child and nature network (https://www.childrenandnature.org) where the focus is on creating opportunities to enhance children's experiences and capacity to encounter "real" nature. In their fervor to improve what may have been viewed as degraded environments or deprived children, what they have not done is look closely at the relations of those entities and things that surround and embrace children in the urban places where they live. Questions about what the meanings of those child-nature encounters are or even to acknowledge that children, no matter where they are (in slums or in a conservation park), are engaging with a range of different types of "nature" relations have been missing from the literature, something explored and unpacked deeply in this childhoodnature handbook.

Dickinson, for instance, has argued in the past that (2013, p. 7) "Fall-recovery narratives can be problematic in how they reify the human-nature split, obscure environmental justice, influence irresponsible behavior, and normalize contemporary conditions and relationships." What she means by fall-recovery narratives is a form of reminiscing about the past that has been sanitized/romanticized in order to present a specific view of childhood and nature. That is, for example, the view that "the past was always 'good' and 'virtuousness' particularly in terms of the child-nature relationship and the focus should be on returning children to this desired natured state" (Malone, 2018). The past generation is sentimentalized as having grown up in an utopian dream in which all children had a childhood where they were safer, had more freedom to be "children," and were left to explore nature (particularly wild nature). This return to a "better" nature relation is contrived on an assumption that past generations had a closer and more intimate relation with the planet and "de-emphasizes" according to Dickinson (2013, p. 7) "a long history of environmental degradation and disconnectedness."

Past studies on children's perceptions of nature in a range of urban and peri-urban environments reveal that unlike the simplified and commodified definitions of "childhoodnature relations," child/nature relations are complex and these encounters of children with and through their natured selves, as nature, with nature, being entangled with natural entities can often be uncomfortable, difficult, and tricky. We do not need to go far back into the literature to find this work. Teenagers in

Wals's (1994) early study on perceptions of nature (one of the first ever in the field), for example, defined their view of "nature" as a threatening place and validated an anthropocentric desire by the young people to control, tame and manage the wilds. In his study, the students' perception of nature was based upon "..a combination of their own fantasies and the unspeakable acts that occur in local parks, which are often well documented by the media" (p. 132). In their home neighborhood, the students feared the forest and trees. One student remarked that they would prefer forests with "just enough trees to give you shade, but not enough for murderers and rapists to be able to hide behind them" (p. 135). Wals's (1994) results are consistent with other research studies where "nature" (including animals) can be viewed as both threatening and fascinating (Evans, 2013; Evans et al., 2007; Phenice & Griffore, 2003).

Participatory research with 10–12 year old children in a disadvantaged urban area of the UK (Barratt Hacking et al., 2007) found that children held a realist rather than romanticized view of childhoodnature relations. While this research predates the new concept of childhoodnature, looking back it is clear that childhoodnature experience was important to the children. Specifically, they demonstrated concern for the (local) environment for themselves, other children, and adults and more than human nature. The children conveyed a real sense of emotional attachment to, and physical engagement with, the local environment (Barratt & Barratt Hacking, 2008). Despite living in a disadvantaged environment, the children viewed more than human nature as integral and important to their lives and their locality. The research found that children had intricate local environment knowledge which "is generated through exploration and play, passed to the children from their peers and families through stories, and is renewed through contact with each other, with older children, with adults" (Barratt Hacking et al., 2007, p. 131). Green spaces in the form of parks and school grounds, though limited in this urban area, were significant in children's lives, not least as places beyond the adult gaze to play, socialize, and enjoy. Nevertheless, there were concerns about how older youths and adults posed a threat to the children's safety and enjoyment in the park and to the wildlife contained in it. The child researchers' analysis of data they gathered about their own and their peers' local environment perspectives led them to conclude that:

> Many of us move around without adults now. . . we have detailed knowledge that is different to adults and we use our knowledge differently to them. The environment is important to us, we want more wildlife, we want a cleaner and safer environment, we want to care for the environment. (Barratt Hacking & Barratt, 2009, p. 379)

While attaching great importance to local environment quality the children reported that they and their peers have "difficulty taking action to achieve what they want for their local environment; (and) do not know how to go about it" (Barratt Hacking et al., 2013, p. 447). The evidence from this research showed how the children viewed their natural worlds as intertwined with their socio-cultural worlds and that children have "a strong desire to be involved in local improvement; for example, they are concerned about environmental quality and would like to see more habitats" (Barratt Hacking et al., 2007, p. 132).

Then taking into account the diversity of children and childhoods now existing in multiple ways of knowing and being in the world, childhoodnature has the opportunity to open up a range of different possibilities. Hordyk, Dulde, and Shem (2014), for example, reporting on their study of immigrant and refugee children in Canada revealed that for children coming from majority world nations: "Nature was not a utopian ideal waiting to be experienced by children" and "human and animal predators made walks in a forest dangerous pass-times" (p. 6). Malone (2018, p. 124) also revealed this less than romantic view of childhoodnature relations from her studies in Bolivia which are further expanded in the handbook:

> The majority of children growing up in the slums of La Paz although in a built and very altered environment were deeply embedded in the potential of intra-acting with the natural environment. This was not an imagined pure nature, a wooded forest with birds and butterflies; it is the difficult dirty gritty world of living in poverty with nature through shared material matter.

The world outside of the Western minority gaze also reveals a view of the natural world as entangled in cosmological philosophies dating back for thousands of years in many indigenous nations. The diversity of possibilities and potential for childhoodnature as a means for relational ways of being as nature, child, and earth allows something new and old to happen differently:

> Children in La Paz are deeply entangled in a relation with their natural world. This is not just a worldly present relation but a deeply entrenched history of reverence and respect for nature and the earth that has evolved through their indigenous spiritual beliefs of the Pachamama. (Pachma meaning 'cosmos' and mama meaning 'mother'). In the indigenous philosophy of the Andean people, the Pachamama is a goddess. She is Mother Earth. She sustains life on earth. Water, Earth, Sun, and Moon are Mother Earth's four Quechuan cosmological entities. (Malone, 2018, p. 103)

Conclusion

By shifting away from the child in nature as the only agential body and focusing on the materiality of child bodies and the bodies of other nonhuman entities as relational assemblages allows this new ethical imagining for children and their encounters with place and nature. In this handbook, we are seeking to reframe the importance of childhoodnature relational encounters as central to children's collective agency with and through being with others. This allows us to realize the messy, entangled natures of living in a less than romantic world. In this time of the Anthropocene, children are living natured lives with a host of others. A focus on the human subject to the detriment of 'other' possible agentic subjects has narrowed the view of child-nature relations and supported the Cartesian divides human/nature, adult/child, and self/other. Taylor (2013, p. 66) describing the recent conversations in the field states:

> . . . such conversations have constellated around the challenge of thinking differently about nature, as well as what it means to be human. Those involved have undertaken to reconceptualize what counts as nature outside the bounds of the nature/culture divide, to build connections rather than rehearse separations.

The research conversations with the emergent compositions of the companion have sought to disrupt beliefs and assumptions around children and nature by engaging with the majority of the world's children's real (rather than imagined) childhoodnatures. Essentially, what this makes clear is that childhood encounters with the "environment" are not always as restorative, healthy, or spiritually uplifting as some nostalgic stories have seduced many to believe. A child-nature reconnect as purported by many in the fields of childhood and nature are in danger of reinforcing the human-nature divide by continuing to position humans as "exceptional" and outside of nature, a sentiment that some may say has set humanity on its current destructive path. This handbook holds the space for something new to happen outside these past histories, bringing emerging new relational potentials through childhoodnature.

Abstract

The purpose of this chapter is to assemble a theoretical toolkit, a greedy bag of possibilities, that can enable childhoodnature encounters to flourish in the Anthropocene and beyond. In this undertaking, our aim is not to put diverse theoretical perspectives into competition with each other but rather to assemble theories as tools which can produce sparks when knocked together. These are theories that can be packed up and taken for a walk. Theories that can help us to get out of sticky situations. And theories which children themselves can use to

address the crises which they will inevitably inherit (and already are). As such, this theory-infused section seeks to put multiple philosophical perspectives into consequential relations such that they can become productive in their directions and differences. In this chapter we take stock of theories that have been productive in the field childhood-nature up to this point, while at the same time seeking new theories, which are emerging in direct response to the contemporary planetary turn.

> It matters what matters we use to think other matters with;
> It matters what stories we tell to tell other stories with;
> It matters what knots knot knots, what thoughts think thoughts, what ties tie ties.
> It matters what stories make worlds, what worlds make stories. (Donna Haraway, 2011, p. 4)

While setting out on an uncertain and tenuous adventure into the future, theories should be available to us and are very much needed to help us respond effectively to what is regarded as rapidly changing conditions of life on earth for all species and things. This is particularly the case in the emerging field of childhoodnature, as children themselves are being forced to grapple with existential threats associated with the onset of the Anthropocene era, including climate change, social instability and water crises, among many others. The purpose of this section is to assemble a theoretical toolkit a greedy bag of possibilities that can enable childhoodnature encounters to flourish in the Anthropocene and beyond. In this undertaking, our aim is not to put diverse theoretical perspectives into competition with each other but rather to assemble theories as tools which can produce sparks when knocked together. These are theories that can be packed up and taken for a walk, theories that can help us to get out of sticky situations, and theories which children themselves can use to address the crises which they will inevitably inherit (and already are). As such, this theory-infused section seeks to put multiple philosophical perspectives into consequential relations such that they can become productive in their directions and differences. This section, and pondering with theory, asks us to take stock of theories that have been productive in the field childhoodnature up to this point however at the same time to seek new theories which are emerging in direct response to the contemporary planetary turn.

The questions that authors are asking refer to the natures of the theories of childhoodnature and to the complexities of childhoods in the Anthropocene. We need theories to respond to and challenge the changing conditions of human and nonhuman subjects and of all, mundane, everyday, organic, and inorganic planetary life. Children in the Anthropocene – as Malone (2017) argues – are grappling with this era, as the crisis is real. Children are in the center of the greedy theoretical bag that is required for us to both problematize and establish the field of childhoodnature. The questions we have asked of the authors, and which the authors in return have

asked of themselves, are how childhoodnature theories are becoming the catalyst to move childhoodnature and how they can capitalize on difference.

Contemporary posthumanist and new relational materialist theories, which figure prominently throughout this section, critique the value of human/nature binaries and the limits they place on how we come to understand what it means to be human, not as outside of the world but deeply entangled with all that makes up the human and more than human world. In this world of new materialist/posthumanist theories, creativity and agency will still exist, but they will no longer be positioned as the property of humans alone (Chandler 2013). Rather agency, and in this case children's agency when responding to the ecological crisis, will be recognized as assemblages, associations, and relationships through which they are wordly with a host of other species and entities. By moving away from an explanation of children's environmental encounters from a humanist perspective where we "...understand and act in the world on the basis of our separation from it – articulated in the constraining, alienating and resentment-filled modernist divides of human/nature, subject/object, culture, environment," a posthumanist approach allows a consideration of how we "should develop our understandings around our attachment to the world" (Chandler 2013, p. 516). That means shifting away from the child in nature as the only agential body and focusing on the materiality of child bodies and the bodies of other nonhuman entities as relational assemblages to allow a new ethical and theoretical imagining for children and their encounters with place and nature.

This focus on shifting away from a romanticized or humanistic view of the human/nature relationship has been a feature of scholarship in a range of disciplines evolving over many years/centuries (Head 2016; Duhn, Malone, & Tesar, 2017). So even though they feel fresh, their ontology can be traced back to a range of theoretical approaches – philosophical thoughts – of philosophers such as Spinoza, Derrida (2005), Deleuze and Guattari (1987/2014), and many more (see Murris in this section for a mapping of this cartography of human/nature theorizing). Unfortunately, over this time, many of the disciplines – where these ideas have had the least currency and still remain in many ways uncontested – are disciplines that have been very influential in the children's environments, childhood studies, child/nature, and children/cities research fields. Disciplines, such as environmental education, childhood sociology, urban planning and urban studies, landscape architecture, and environmental psychology, have been slow on the uptake of working with contesting human/culture binaries and contest human exceptionalism in particular. Thus, the outcome has been a strong human-centric and deterministic paradigm that has been influential in the conception of the childhood – nature field. While there has been some leverage through theories such as biophilia (reference) and affordance theory (ref), the theoretical work has mostly been narrowly focused on sociocultural frameworks solely attentive to human-centric agendas. The main exception to this has been in geography, with many urban, human, and cultural geographers who have been interested in children and environments applying these theoretical approaches in their research. The journal *Children's Geographies*, for example, has encouraged and has, over a long period of time, been publishing articles in which authors have engaged in a range of theoretical approaches including posthumanist and new

relational materialist theories, and many other cutting-edge theoretical thinking, in their research. The theory section of this handbook therefore becomes a significant moment for attending to and noticing how and what theorizing in childhoodnature is influencing the field and, to paraphrase Haraway (2011), what stories are making worlds and what worlds are making stories.

This section tells some of these theories and philosophies of childhoodnature stories. However, theories are not captured or sealed in a tight container of science. There is always some spillage. So theories and philosophies of childhoodnature do spill over, and they are both a liberation and a shift; and they are perceived as a possibility to engage with others. Such philosophies of childhoodnature primordially attest to that notion and thus speak back to Haraway's statement above. Furthermore, in such a way, childhoodnature is the world of children's lived experience, a physical world not so much indifferent since they are personally bound to it with their love, hatred, relations, contempt, respect, narratives, tradition, nature, and culture. In this tradition, conceptions of "nature" and "culture" are conceived as theories with children. There are these realms of childhoodnature as inimitable, inalienable, and nontransferable notions of children's relations. At the basis of this planetary experience and childhoodnature relations are values which are simply there, perennially, before children ever speak of them and before they reflect upon them and inquire about them. Childhoodnature theories function in this section as if there is a rational understanding at our grasp but at the same time of the hidden source of all the rules, customs, commandments, prohibitions, and norms that hold within it. The natural world, by virtue of its very being, bears within it the presupposition of the absolute which grounds, delimits, animates, and directs it, without which it would be unthinkable, absurd, and superfluous and which we can only quietly respect. Any attempt to spurn it, master it, or replace it with something else appears, within the framework of the natural world, as an expression of hubris for which humans must pay a heavy price.

Based upon this thinking, by initiating this section, the editors invited authors to engage in a variety of theoretical responses which would open up the potential theoretical landscapes of childhoodnature as samenesses and differences. There was no sense of what those theories had to be other than that they should be disruptive of set ways of knowing and thinking that set up dichotomous relations between human subjects and nature. We advised that potential guiding theoretical papers could include but were not limited to sociocultural theory, poststructuralism, posthumanism, systems thinking, postcolonial theory, ecoexistentialism, and eco-psychology. From this call, we received a number of chapters that are part of this section. These have been grouped under the key conceptual headings (loose containers) of diffractive and speculative theorizing, posthuman and new materialist theories of learning, and theorizing through place.

Diffractive and Speculative Theorizing

Murris engages with diffractive theorizing to provide a cartography of western thought and engages with the key concepts of culture/nature. She acknowledges the role of feminist scholarship in order to understand that the dominant concept of

knowledge in education is grounded in both the nature/culture dichotomy and in patriarchy. The knowing subject, man, is assumed to be of a particular (adult) age. Modern schooling positions children as knowledge *consumers*, not *producers*, because it is assumed that they are (still) developing, (still) innocent, (still) fragile, (still) immature, (still) irrational, and so forth. In her chapter, she shows how six overlapping configurations of child presuppose the metaphysical nature/culture binary which have shaped schooling as a process of *becoming adult* (man): the "developing child," the "ignorant child," the "evil child," the "innocent child," the "egocentric child," and the "fragile child." The figuration of the "normal" knowing subject informs institutionalized discriminatory and colonizing child-adult relationships and has brought into existence specific roles of the educator: guide, instructor, trainer, discipliner, facilitator, socializer, protector, diagnozer, or medicator. Drawing on the philosophies of Barad, Braidotti, Haraway, and Deleuze, the chapter by Murris unhinges child and childhoods from their metaphysical frame of reference. For "justice to come" (Barad, 2012, p. 81), she argues schooling needs to contribute to a postcolonial future that disrupts human exceptionalism and age-discrimination. Moving beyond the anthropocentric focus on children's abilities or capacities as *individuals*, such posthuman schooling would regard knowledge production as part of an ontological *relationality* (including nature *and* culture) through which the human and more than human render each other able (Haraway, 2016). Drawing on posthuman notions of space and time, she offers tentative imaginaries of a diffractive posthuman educator.

Weaving her personal narrative and a cartography of the theoretical field of childhoodnature, Malone's chapter is a biographical account of being and becoming an environmental educator and researcher in the field of childhoodnature over and through 25 years. Also borrowing from Barad (2014), she uses the notion of a "diffractive turn": ". . .by re-turning – not by returning as in reflecting on or going back to a past that was, but re-turning as in turning it over and over again – iteratively intra-acting, re-diffracting, diffracting anew, in the making of new temporalities (spacetimematterings), new diffraction patterns" (Barad, 2014, p. 168). Barad (2014) attributes the notion of diffraction as evolving from feminist theorizing and the science discipline of physics, both seeking to deepen understandings about difference differently. Diffraction is a useful and troubling process, and unlike the idea of reflecting on stories, she views her research as entangled in many worlds. Over and over, spanning a series of theoretical returns from ecophilosophy, environmental activitism, feminist theory, critical theory, human geography, social cultural theory, and more recently posthumanist and new materialist approaches her accounts are embedded in the interdisciplinary fields of childhood studies, children's geographies, children's environments, and environmental/nature education. The stories by children in this chapter illustrate their everyday experiences of growing up in relation with the places they inhabit: the weather, the landscape, the earth, the mountains, the dogs, and the dirt. Childhoodnature is theorized as lively, messy everyday lives, a living well with a host of others. The chapter traces the past, present, and future of environmental education and childhood studies of nature as omnipresent in complex webs. It's littered with the intersection of stories of children growing up in a variety of "places" across the globe as the account seeks to

acknowledge and trouble the view that childhoodnature does not exist without a philosophical past by tracing its theoretical ghosts.

Taking a narrative approach that also follows Haraway's (2016) call for making kin with growing awareness of a looming sixth mass extinction of species, the chapter by ▶ Chap. 5, "Eye-to-Eye with Otherness: A Childhoodnature Figuration" focuses on multispecies encounters to consider what childhoodnature as a concept can do for research. The intention is neither to focus on what can be learned from multispecies child-animal encounters nor is it an attempt to document such encounters in "real life." Rather, the chapter experiments with the porosity and liveliness of materialized thought (the text) as it gives form to an event (the multispecies encounter) across time and in place. The intention is to speculatively imagine a childhoodnature figuration of a hen and a child as a lively encounter that ripples through time/place and that generates unexpected lines of inquiry. The chapter experiments with a speculative approach to explore new ways of thinking and doing multispecies relationships as "earthly encounters" that matter to politics and ethics of sharing worlds. This, they argue, is an essential task in the midst of loss of diversity as it opens spaces for new imaginings about sharing worlds through kin making in childhoodnature research.

Posthuman and New Materialist Theories of Learning

Provoked by curiosity about the rise of posthuman theorizing in early years learning research and practice, the chapter by ▶ Chap. 7, "Outlining an Education Without Nature and Object-Oriented Learning" is set in the context of the Anthropocene as the age of human entanglement in the fate of the planet; it takes the view that the primary task of this time is to develop new understandings of the human and new concepts of thought (Colebrook, 2010). Early childhood has led the field of education in the development and application of posthuman theorizing in response to this imperative, prompting the explorations of the chapter. A review of the literature in this field resulted in the identification of three distinct areas of posthuman theoretical activity: *new materialism*, *child-animal relations,* and *indigenous nonindigenous intersections*. The third category *indigenous nonindigenous intersections,* which draws primarily on indigenous theorizing, was so divergent from the others, and so complex, as to be considered outside the scope of this chapter. In gathering the various papers together to make sense of the literature in each of *new materialism* and *child-animal relations*, different modes of analysis were called for. *New materialism* in early childhood education and practice is considered using a genealogical generational analysis following the work of Van der Tuin (2014), while *child-animal relations* prompted an analytical approach involving Haraway's bag lady method following Taylor, Blaise, and Giugni (2013). A particularly interesting and curious finding was that "life" emerged as a major theme from *new materialism* and "death" from *child-animal relations* in keeping with the paradoxical nature of the Anthropocene.

The chapter by ▶ Chap. 6, "Posthuman Theory and Practice in Early Years Learning" aims to outline a theory of object-oriented learning. In this effort, it breaks with tracing nature in environmental education and education (cf. Morton 2007) in

order to approach learning as relating to radical, dark ecological thought (Morton 2010, 2016). It engages in the groundbreaking work of translating the emerging ontological outlook of object-oriented ontology (Harman, 2011, 2013; Morton, 2013) into a theory of learning. This theory of learning will transgress a number of core axioms, such as the anthropocentric notions of knowledge and learning. Instead, the chapter aims to offer an outlook on learning that includes humans but does not confine learning and engagement with other objects only to humans. Accordingly, the outlined theory develops radically new perspectives on education that break with the human-world centrism of post-Kantian philosophy and offers the opportunity to a conceptualization of a widened process of learning to include also objects and inter-object relations. Learning in this object-oriented perspective becomes limited or bounded with regard to the withdrawnness of objects (Harman 2002), where we as objects have a partial sense of other objects that form a mesh in their relation to us and to other objects (Morton 2016). In this object-object relation, some qualities of objects (the sensual object) are sensible, but some remain hidden (the real object). The outline of object-oriented learning will initially embed itself within a critical analysis of philosophical underpinnings of contemporary trends within environmental education and broader education research.

Theorizing Through Spaces and Place

Amidst a growing social movement to connect children to nature, little is understood about how children actually attach to place or the role of children as nature in the shaping and theorizing of spaces and places. While place attachment is often viewed as an undertheorized concept, human attachment is well understood in traditional contemporary theories. In the chapter by ▶ Chap. 8, "The Influence of Nature on a Child's Development: Connecting the Outcomes of Human Attachment and Place Attachment", an exploration of human attachment provides clarity of the potential outcomes of place attachment. Human attachment and place attachment may be related concepts. Both focus on the strength of the attachment of an individual to an external entity, a caregiver, or a place in the physical environment. The secure base function of secure human attachment mirrors the home range function of place attachment. In both concepts, children venture away from the object of attachment only to return in times of stress. Yet while human attachment is well documented, the outcomes from place attachment are still being identified. Secure human attachments foster the development of an internal working model in which a child mentally organizes behavior to solicit a desired response. The strength of the model predicts the quality of future relationships. Currently no research links the development of an internal working model to place attachment. Secure human attachments also foster resilience in that children are better able to respond to and cope with stress. According to Little and Derr, secure place attachments are linked to the presence of nature, social bonding, and emotional and cognitive processes. This is consistent with emergent resilience research with children, which suggests that nature can play an important role in fostering resilience. Nature thus may be a defining feature of place attachments that help build resilience.

Waite and Quay continue in this line of thinking around children's place attachment and its relation to nature when in their chapter they present the question, (How) do places affect us? They explore how place is experienced by children with reference to empirical studies that reflect several forms of outdoor learning, both curricular and outside the classroom. Outdoor learning is undergoing a renaissance of interest and is widely seen as an effective means of connecting children to the natural world (Louv, 2005). This common conceptualization is challenged by recognizing the child within nature. In examining the question of the effect of places on young people (and vice versa), the paper employs theories of cultural density (Waite, 2013, 2015) and cultureplace (Quay, 2017) in relation to how culture informs place and pedagogies within them. It argues that the more-than-human world shapes possibilities for interaction but that these are mediated by structural and cultural influences, acknowledged and tacit, in the enactment of outdoor learning within and across countries (Malone & Waite, 2016). Interweaving sociological and psychological perspectives, the chapter considers the implications for practice and suggests that feelings and affect may act as intrapersonal organizers of this complex interplay of cultural and material influences. The authors argue that by rejecting human dominion over nature, place as "personal" is nonetheless a key contributor to the power of outdoor learning to transform lives.

With the introduction of the "co-research playspace" as a methodological figure for working with children as co-researchers and co-artists in the Anthropocene, the final chapter of this section assembles objects, place, and theoretical reconfigurations to present powerful multimedia engagements with climate change. Cutter-Mackenzie and Rousell focus on collaborative research and artistic co-production with 135 children who participated in the *Climate Change and Me* project (2014–2017) in Northern New South Wales, Australia. Drawing on Winnicott's concepts of "transitional space" and "transitional objects" in relation to children's art and environmental play, they focus on the ways that iPads functioned as transitional objects within the *Climate Change and Me* project. This leads to further analysis which highlighted that children used digital video as a "transitional medium" to experiment with new forms of co-production and creative resistance. Through analysis of films produced by children in the project, a series of three political esthetic modes of response to climate change is outlined to break with the predominant moralistic discourse surrounding the issue: I. critical interventions in public space; II. wild, absurd, and improvisational disruptions; and III. the creation of thought experiments and alternative worlds. The chapter concludes with the consideration of "children as para-academic researchers," a concept that emphasizes children's abilities to invent their own modes of co-creation and critical inquiry that disrupt normative research protocols and associated adult expectations.

Final Comments

Sections in this chapter significantly offer and contribute to ideas both of "naming" of the field and persistence with analyzing not only subjects and space/places but also "time." Recently, Koro-Ljungberg (2015) developed a concept of

"methodologies with no name," or methodologies without methodologies. The methodology of naming is equally important as the act of naming. In the methodology of naming, we utilize the same methods: There have been attempts to colonize both children and nature through the act of naming. Through the act of naming, there is a strong seductive calling for new recipes, new ideologies, new control systems, new institutions, and new instruments, to eliminate the dreadful consequences of our prior errors of children and nature/culture binaries. Failing to name a theory or methodology can be a productive exercise which could continue the grappling with existential threats associated with the childhoodnature challenge and with the objective way out of the crisis of objectivism and the arrogant belief that all issues can be solved with new technologies and with the push of a button. Indeed, the naming of new theories is filled with complexities and potential pitfalls.

The notion of urgency – and time – illustrates the paradox of the measure and the measured: time may be said to measure motion, or motion may be said to measure time, in our understanding of childhoodnature. This paradox is inherent in speculations, being and listening and deep hanging out with children, and fiction alike: the walking and the travels are measured by time, and time itself is measured by walking and being with the other. The concepts of mobility and time become pertinent in human subjects' memory-infused narratives – in the freedom to move and explore or the freedom to work with time. Time runs slowly in the mornings and in school and disappears quickly in the afternoons. Time runs quickly with the Anthropocene and slowly with us doing something about it. Time is a continuity divided paradoxically into three parts: the past, which is a continuity but no longer exists, the future, which is a continuity but does not yet exist, and the present, the now, then moment, which exists but is discrete. And theories of childhoodnature, named or unnamed, in this section allow children in the Anthropocene to be equipped with theories.

Haraway (2015) insists that if we are to imagine and nurture rich multi/species/material assemblages and new ways of being with the planet, then "we need stories (and theories) that are just big enough to gather up the complexities and keep the edges open and greedy for surprising new and old connections" (Haraway, 2015, p. 160). In this childhoodnature theoretical section, we were set the task of mapping out the possibilities for richer, more complex, yet open and greedy, theoretical frameworks for posthuman assemblages of childhoodnature. Readers are invited to consider this section as a loosely woven bag or basket, unfinished, with raw edges that invite additional weavings and threads. The function of the bag is not to carry loads from here to there as efficiently as possible. Rather, the bag poses a challenge to the ways in which we have come to think of functionality, normality, and efficiency. Many children know this: things are not what they seem to be. Theories as things, as thought objects, and as tools may benefit from a shake-up or closing or from being threaded to the raw edges of the bag in unexpected ways. This section invites readers to enter into a space where playing with theories makes childhoodnature come alive – a childhoodnature playspace.

Abstract

This chapter gives an overview of how the *substance ontology* of Western philosophy thrives on the power producing Nature/Culture dichotomy, has caused asymmetrical violence, infiltrated everyday language, created academic divisions, produced hierarchical categories and classifications, and underpins colonialism and colonizing notions of relationships – not only between humans and sub-humans (e.g., child) but also between humans and more-than-humans (e.g., animals, matter). This chapter shows how critical posthumanism as a navigational tool offers a different *relational ontology* – more akin to African Indigenous scholarship and ways of living – that reconfigures subjectivity and brings into

Introduction

Drawing on posthuman notions of space and time, the chapter starts with a vignette: a tentative imaginary of a diffractive posthuman educator: a heron. In the writing that follows, I explain how the relational ontology of the diffractive teacher as *sympoietic* system disrupts the Nature/Culture binary and patriarchal notions of the self on which modern schooling has been built. The knowing subject, Man, is assumed to be of a particular (adult) age. Modern schooling positions children as knowledge *consumers*, not *producers*, because it is assumed that they are (still) developing, (still) innocent, (still) fragile, (still) immature, (still) irrational, and so forth. In this chapter, I show how six overlapping configurations of child presuppose the metaphysical Nature/Culture binary which has shaped schooling as a process of *becoming-adult* (Man), also in Africa: the "developing child," the "ignorant child," the "evil child," the "innocent child," the "egocentric child," the "fragile child." The figuration of the "normal" knowing subject informs institutionalized discriminatory and colonizing child/adult relationships, and has brought into existence specific roles of the educator: guide, instructor, trainer, discipliner, facilitator, socializer, protector, diagnoser, or medicator.

Drawing on the philosophies of Barad, Braidotti, Haraway, and Deleuze, this chapter unhinges child and childhood(s) from their metaphysical frame of reference. For "justice-to-come" (Barad, 2012, p. 81), schooling needs to contribute to a postcolonial future that disrupts in particular misogeny, racism, human exceptionalism, and age-discrimination (misopedy). Moving beyond the anthropocentric focus on children's abilities or capacities as *individuals*, such posthuman schooling would regard knowledge production as part of an ontological *relationality* (including Nature *and* Culture) through which the human and more-than-human render each other able (Haraway, 2016).

Vignette: A Diffractive Teacher

Posthuman education is a shift from "seeing, observing, and knowing from afar to entanglements and relationalities, focusing instead on making and marking differences from within as part of an entangled state" (Ivinson & Renold, 2016 p. 171).

Fig. 1 The diffractive teacher

What it means to teach is what the heron is doing – standing in the Rhine in Basel (Fig. 1) creating a diffraction pattern in the water.

This is not a metaphor, or an analogy, which would assume the Nature/Culture binary, but a *homology*. Teacher and heron are basically *doing the same thing*. In the case of an analogy or metaphor, we might for example propose that the heron is *like* a teacher, but of course not *really* believing that herons can be teachers, because they have little intelligence after all (a "bird brain") and no self-reflective consciousness which one needs for being a (reflexive) teacher. With metaphorical thinking, teacher (read: culture, therefore human) and heron (read: nature, therefore nonhuman) are assumed to be at an ontological distance from one another. The human who thinks this connection between teacher and heron *re-presents* the heron *as* the teacher through language or other symbolic sign systems, *without attributing teacher (human) qualities to the heron himself or herself*.

In the case of a homology, the comparison between the human teacher and the bird teacher means that both bodies make and mark "differences from within as part of an entangled state" (quote above). Both bodies – human and nonhuman (heron) – cause diffraction patterns. It literally *matters* that both bodies are "there," whether in the river or in the classroom. Moving away from *human*-centered (e.g., *child*-centered) education (Murris, 2017), the diffractive teacher is part of the process of producing new thoughts and ideas diffractively sedimented materially as part of the world. The notion of diffraction disrupts the Nature/Culture dichotomy that presupposes individualized existence of subjects and objects.

When I took the photo from a bench along the river, the heron moved gracefully through the river, all the time keeping a watchful eye on me. We were entangled when we were in each other's vicinity. However, Karen Barad's notions of diffraction and quantum entanglement go even further than that. Drawing on Quantum Field Theory (QFT), she argues that the "intra-action" *is always there* (and at the same time *not* there), even when bodies are not close physically. Moreover, according to QFT, bodies are waves or particles depending on the apparatus that

measures (also at macro-level). So, as a matter of *fact*, QFT queers the individual existence of human and nonhuman bodies as bounded by a skin, whether human skin, bird feathers, the surface of the water or the banks of the river. Boundaries are discursive and human-made after all. Space, time, and matter are not threaded like beads on a string, but threaded through one another sympoietically. Human and nonhuman bodies do not move between *points* in space and time but *are always "*on the move." Sympoiesis, Haraway (2016, p. 58) explains "is a simple word; it means 'making-with'." As I was observing the heron in the river, and now, diffracting "my" memories of the event of our encounter, I am also part of the phenomenon and an entangled "observer": a "being-with," a "making-with," a "thinking-with" as a "sympoietic system" (Haraway, 2016).

The work of feminist philosophers Karen Barad and Donna Haraway is about the implosion of nature and culture – a plea to rethink relationality together *without* the Nature/Culture binary. The posthuman ontology of a sympoietic system (e.g., that of a diffractive teacher) disrupts the Nature/Culture binary on which modern schooling has been built and has profound implications for (child) subjectivity (Murris, 2016). The figuration of the diffractive teacher provokes a tracing of the complex philosophical ideas entangled in posthumanism before re-turning to the diffractive teacher at the end of the chapter where learning is conceptualized as a relational material-discursive process between human and nonhuman bodies. Such a "body" can be human, an animal, a child, or even a stone in the river Rhine. Posthumanism reconfigures subjectivity and with it radically changes what it means to teach and what it means to learn and the Nature/Culture binary is central in what we have come to understand as real knowledge: asocial, apolitical, and rational (in a disembodied manner).

The Philosophical Origin of the Nature/Culture Dichotomy

The Nature/Culture dichotomy and its entanglement with modern schooling and figurations of child and childhood can be traced to – as Alfred North Whitehead famously characterizes the European philosophical tradition – as "a series of footnotes to Plato" (Whitehead, 1979, p. 39). To understand why embodied experiences and the body (Nature) have been rendered inferior to the mind (Culture) in schooling, we need to turn to the binary logic that was put in place by Western metaphysics (and reinforced by capitalism and Christian theology).

The dualism between mind and body has had an incredibly strong foothold on Western thought, with the writings of Ancient Greek philosopher Plato as a major influence. A deeply influential articulation of Platonic dualism can be found in the philosophies of René Descartes. He proposed the idea that the mind is a *substance* whose whole essence or nature consists in thinking and can exist without the body. Of the two substances, the mind is privileged over the body, or put differently, contemplative life is superior to active life. Also, not the body, but the mind guarantees existence, as expressed in his well-known dictum: "I think therefore I

am" (cogito ergo sum). In Descartes, we find the most extreme expression of the dichotomous mind/body split that characterizes modernity. Universal, timeless knowledge of the "outside" world is obtained from the "inside" of the knowing subject (as conscious, self-aware, self-contained, independent, rational, mature, universal). This *substance ontology* has infiltrated everyday language (e.g., what counts as "common sense") and has given rise to the sciences with strong disciplinary divisions, hierarchical categories, and classifications (Deleuze & Guattari, 1987/1994). It also in-forms academic discourses in the Global North as well as the Global South. Moreover, substance ontology underpins colonialism and colonizing notions of relationships between humans, and between humans and more-than-humans. A radically different ontological framework for relationality is possible using posthumanism as a "navigational tool" (Braidotti, 2013). It is important to stress that this is "radical" only for the Western tradition of thought that was globalized through colonial practices, including education. Juanita Sundberg (2014, pp. 36–37) argues that posthumanists are unaware of their own location when making universalizing claims about "the" human and are silent about past and present non-Western or Indigenous scholarship and ways of living. She points out that "other" knowledge systems based in non-dualist thinking tend to be "forgotten" in the posthuman literature, thereby perpetuating a colonial stance when advancing posthuman scholarship that only engages with "Anglo-European scholarship" (Sundberg, 2014, p. 38). Bearing this critique in mind, I turn to some key ideas in posthumanism and assess her claim that posthumanists are not aware that "knowledge comes from somewhere and is, therefore, bound up in power relations" (Sundberg, 2014, p. 36). I pick it up again at the end of this chapter when re-turning to the figuration of a diffractive teacher.

Man and Asymmetrical Violence

Fields as diverse as, for example, environmental humanities, the performative arts, cultural theory, education, organizational studies, critical geography, architecture, anthropology, political theory, childhood studies, and literary and literacy studies are now questioning human-centered figurations of the subject and see it as the main reason for all present struggles with respect to race, gender, class, and the environmental problems in the controversially termed geological period of the Anthropocene. For example, Donna Haraway (2016, pp. 49–57) offers eight reasons why she prefers to distance herself from the word "Anthropocene" and explains why she prefers "Chthulucene" – a tentacular thinking that disrupts the human exceptionalism of the Anthropocene discourse in which we now live. Donna Haraway (2016, p. 35) explains our predicament passionately:

> These times called the Anthropocene are times of multispecies, including human, urgency: of great mass death and extinction; of onrushing disasters, whose unpredictable specificities are foolishly taken as unknowability itself; of refusing to know and to cultivate the capacity

> of response-ability; of refusing to be present in and to onrushing catastrophe in time; of unprecedented looking away.

A plethory of terms have emerged that describe this "new" philosophical orientation with implications for ethics: "posthumanism," "new materialism," "vital materialism," "relational materialism," "socio-materialism," "object-orientated ontology" and so forth. There are more or less subtle differences between these philosophies, and my own inspiration for doing education differently is inspired mainly by the complex critical posthumanism developed by Karen Barad and Rosi Braidotti (who in turns draws heavily on Gilles Deleuze and Felix Guattari, who in turn have developed their ideas in dialogue with the writings of Plato, Leibniz, Kant, Nietzsche, and especially Spinoza).

Reinforced by Cartesian dualisms and underpinning capitalism, ontoepistemologies that assume that knowledge and intelligence are located only in the human, and *one* human bounded by a skin for that matter, have become so naturalized as "common sense" and engrained in everyday language (Deleuze & Guattari, 1987/2014) globally that it is not easy to identify the "I" as the root cause of structural exploitation, dehumanization (of women, sexualized, racialized, and naturalized "others") and asymmetrical violence (Snaza & Weaver, 2015). For poststructuralists and critical posthumanists, the "human" is clearly a political category – white, male, heterosexual, able-bodied (Braidotti, 2013), although interestingly and of concern, age is not included (yet) (Murris, 2016). Sylvia Wynter's powerful writing makes the receptive reader feel and think differently about the "I" that has made modernity and colonialism possible. She writes that the Western bourgeois "conception of the human, Man, which over-represents itself as if it were the human itself, and that of securing the well-being, and therefore the full cognitive and behavioral autonomy of the human species itself/ourselves" (Wynter, 2003, p. 260). The Western "I" – Man – as universal, essentializing signifier has created identity through difference, that is, the human/subhuman dichotomy. This metaphysics, reinforced by religious humanist mythology, has spawned an ontology and epistemology that move on binary logic, power relations of inequality, and "otherizing" notions of identity. Not a posthumanist as such, Wynter's decolonizing project is that of "practicing epistemic disobedience," that is, "a delinking of oneself from the knowledge systems we take for granted (and can profit from)" (Mignolo, 2015, p. 107). But Man is not just a product of a particular *epistemology*, a matter of how and what we know – epistemology and ontology are always entangled as what it means to know and depends on assumptions about what exists ("onto"). Shifts in ontology have implications for what it means to have agency, a voice, or an identity, and particularly relevant for this chapter, what it means to be a teacher. I agree with Sundberg (2014, p. 34) that "decolonization" means "exposing the ontological violence authorized by Eurocentric epistemologies both in scholarship and everyday life." I am interested in how decolonizing education involves an examination of the various philosophical ways in which coloniality manifests itself in the production and communication of knowledge and meaning-making (Patel, 2016), and how humanist ontology has produced certain constructions of childhood with the

Nature/Culture dichotomy as its structuring mechanism (Murris, 2016, Chap. 5). Colonialism has instilled a non-relational ontology and competitive individualized subjectivity in education that continues to regard people, land, and knowledge as property, and this *also* includes colonizing relationships between adult and child (the subhuman).

Critical posthumanists not only raise awareness of the Western Man/human dichotomy, but they also queer how we see the more-than-human as not merely inert, passive things *in* space and time (Barad, 2007). The queering of the binaries such as the social/physical, nature/culture, individual/society is especially relevant here. To queer is not a fixed, determinate term with a stable meaning and referential context (Barad, 2012, p. 81), but it is the ethico-political practice of radically questioning identity and binaries (Barad, 2012, p. 81). Such a shift to a relational ontology, akin to some Indigenous knowledge systems, requires an un/learning of agency "outside the acting, human body" (Rotas, 2015, p. 94). This unsettling of agency, voice, and identity as not something subjects "have," invites us to reconfigure who and what the "I" is, as well as its relationship to "the" world.

Earthlings are Never Alone: Queering the Nature/Culture Dichotomy

The Nature/Culture dichotomy presupposes individualized existence of subjects and objects. The kind of individualism and deep dualism this dichotomy has created has become the trademark of Western thought, a philosophical substratum that has made colonialism and capitalism possible, and an imperialism that has permeated the globe (Cannella & Viruru, 2004; Castaneda, 2002). By understanding the Subject (Culture, self, "I," me, adult) at an *ontological* distance from the Object (Nature, you, animal, matter, child) particular kinds of power relationships have been made possible: imperial and colonial exploitation of land, resources, animals, certain categories of humans (e.g., young, black, labourer, peasant, nomad, rural dweller, ghetto dweller, township inhabitant, infant, child, homosexual, homeless, female, elderly, disabled, disturbed, addict) – complex global networks of political and economic domination. Nature is otherized, and placed at a distance. The Western humanist ideal notion of the human has been restricted to very few human animals, ironically thereby *dehumanizing* the sexualized "other" (women), racialized "other" and naturalized "other" (e.g., child, matter).

The Nature/Culture dichotomy has inserted itself into Western knowledge systems and beliefs and, through colonization and global capitalism, extends its reach to push aside and override different knowledge systems (Kayira, 2015), including those of young children (e.g., animism; Kennedy, 2006).

"Immaturity" has become synonymous with childhood and maturity with adult masculinity (Jones, 2009, p. 40). Immaturity has become an umbrella term for a period in a human's life that is *lacking*: lacking cognitive ability, moral responsibility, emotional independency and rationality. Child is seen as vulnerable, fragile and in need of adult surveillance and controlled opportunities and experiences,

"given" by teachers whose teacher-directed pedagogies rob children of opportunities to show what they know and can do. Interestingly, there is the same ontoepistemic distancing move from child by adult when childhood is conflated with idealized "pure" Nature (Taylor, 2013), for example child as "little angel." Influenced by Rousseau, positioning child as innocent, means that she/he needs to be protected from the corrupting influence of adult society, and is therefore separated off from the rest of humanity (Taylor, 2013, p. 62). Critically, the way the concept childhood is used in teaching, research, policy-making and curriculum design presupposes the Nature/Culture dichotomy, with child associated with Nature and adult with Culture. Anthropologist Maria Kromidas, (2014, p. 429; my italics) argues that children have been neglected, "taken for granted as appendages to adult society, or cocooned from the world and thrown out of society, children can only be of *nature*, which is to say, *outside the human*. . .." She points at the lone position child takes up, the "last savage," since people of color and women have found their legitimate place in society (by law, although not necessarily in practice). She puts it beautifully:

> Humanism, with its discourse of progress and perfectibility theorized as a movement out of nature, no longer holds the racial Other or prehistoric man as the representative of ground zero – that position is now solely the child's. (Kromidas, 2014, p. 429)

So child is either positioned as good or as bad (e.g., immature) by Nature, and therefore, adults needs to protect child, or adults need to be protected *from* child. In both cases, it prevents children to be seen as *part* of the world they share with other earth dwellers, and prevents them from building "real common world relationships" (Taylor, 2013). This, Affrica Taylor (2013, p. 62) points out, is the "biggest cost of all." Diffracting with Haraway's ideas, she argues that the real world gets lost. "Common worlds" (a term from Bruno Latour), she explains, are "down-to-earth". . . "worlds full of entangled and uneven historical and geographical relations, political tensions, ethical dilemmas and unending possibilities" where crucially nature and culture come back together again (Taylor, 2013, p. 62). So, as a result of the ontoepistemological nature/culture divide, our complex, "messy" real worlds have been kept away from our sanitized classrooms.

The figuration of the "normal" knowing subject as the mature (Western) adult has informed institutionalized discriminatory child/adult relationships and materializes specific roles of the educator: guide, instructor, trainer, discipliner, facilitator, socializer, protector, diagnoser and medicator. These are the result of at least six overlapping configurations of child that are still dominant globally in educational theories and practices (Murris, 2016, pp. 104–122) (Table 1): the "developing child" who lacks maturity by nature and needs culture's guidance; the "ignorant child" who lacks rationality and experience from birth and needs instruction and training; the "evil child" who lacks natural goodness and requires cultural intervention of control and discipline; the "innocent child" who lacks responsibility, therefore needs culture to provide protection and to facilitate learning; the "egocentric child" who lacks social norms and cultural

Table 1 A map of figurations of child that presuppose the Nature/Culture dichotomy, and position child that is deficit

Figurations of child	Theoretical influences	What child lacks by Nature	What Culture needs to provide child
Developing child	Aristotle, Darwin, Piaget, Vygotsky	Maturity	Maturation; guidance
Ignorant child	Plato, Aristotle, Locke	Rationality; experience	Instruction; training
Evil child	Christianity esp. Protestantism	Trustworthiness; natural goodness	Control, discipline inculcation; Drawing in
Innocent child	Romantics (Rousseau)	Responsibility	Protection facilitation
Egocentric child	Piaget	Empathy; social norms and values	Socialization by elders inculcation
Fragile child	Psycho-medical scientific model	Resilience	Protection medication diagnoses; remediation

values and requires socialization by elders; the "fragile child" who is assumed to lack resilience by nature and needs culture to diagnose, protect and possibly medicate.

All these deficit figurations of child assume childhood as an inferior stage in human development with the mature, developed, rational, autonomous adult self as the normative ideal. Moreover, this self is also gendered (male). Nature, traditionally coded as passive and feminine, awaits the active, male imprint of Culture (Barad, 2011, pp. 435, 439). Knowing how the gendered, ageist, ableist and racist Nature/Culture binary works and for whom is salient in this chapter. Some posthumanists offer powerful imageries and experimentally play with new concepts in their academic writing to provoke readers to think differently about relationships. One such powerful notion is Haraway's *sympoiesis.*

Sympoiesis and Intra-action

Haraway (2016, p. 176, fn 13) writes about the difference between seeing human animals as *autopoietic* systems and *sympoietic* systems. In the former, humans have "self-produced binaries," they are "organizationally closed," "autonomous units," centrally controlled (e.g., through a human will or intellect), orientated around growth and development with "evolution between systems," and are "predictable." In contrast, *sympoietic* systems lack boundaries, are "complex amorphous entities," have "distributed control" with an "evolution within systems" and are "unpredictable." Haraway (2016, p. 58) explains:

> Sympoiesis is a simple word; it means "making-with." Nothing makes itself; nothing is really autopoietic or self-organizing. In the words of the Inupiat computer "world game," earthlings are *never alone*. That is the radical implication of sympoiesis. *Sympoiesis* is a

> word proper to complex, dynamic, responsive, situated, historical systems. It is a word for worlding-with, in company.

Earthlings are never alone. In other words, the human is not an individual with distinct boundaries, but is "spread out," like "a flow of energies, constituted in a total inter-dependence with other humans and the matter and physical intensities and forces around us" (Palmer, 2011, p. 7). The subject comes into existence through the encounter with other material-discursive agencies (Petersen, 2014, p. 41). Subjectivity as an existential event is a paradigmatic shift from the discursive to the material-discursive and describes a relational posthuman ontology. The ontological fact that earthlings are never alone means that teachers are always part of, and situated in (as Haraway points out), complex, dynamic, historical, and responsive systems that are both material and discursive at the very same time. Teaching and learning are "worlding-with" practices that disrupt the Nature/Culture binary – explored further below.

The significance of critical posthumanism for decolonizing education, is this key idea that categories that involve binaries, such as "subjects, objects, kinds, races, species, genres, and genders" are all products of *relationships "between" significant others* (Haraway, 2003, pp. 6–7). An ethics of respect for these "significant others," as Donna Haraway calls them, means "to hold in regard, to respond, to look back reciprocally, to notice, to pay attention, to have courteous regard for, to esteem" (Haraway cited in Lund, 2014, p. 103). Despite not regarding herself as a post-humanist (Haraway, 2016), Haraway's influence on posthuman scholars has been, and still is, significant. Her inspiration is also notable in the work of her friend Karen Barad, whose notion of *intra-action* at the heart of her *agential realism* also emphasizes an ontological shift in how humans and more-than-humans relate and influence each other (Barad, 2007, 2013) as we have seen in the notion of the diffractive teacher.

Barad's neologism *intra-action* ruptures the familiar concept of "interaction." Intra-action is different from "interaction" in that "nature" and "culture" are never "pure," are never unaffected by each other, but are always in relation – a sympoietic system, Haraway would say ("entanglement" for Barad). It is a radical shift from substance ontology to an *intra-active relational ontology*. It moves discussions about relationality from the *sociological* to the *ontological* – sometimes referred to as "the ontological turn" in the history of ideas. This "ontological turn" sits uncomfortably with pedagogies informed by scientific realism, social constructivism or post-structuralism that all assume the necessity for linguistic or other semiotic systems to mediate between Nature and Culture (Murris, 2016). The power of these systems has not only been substantial, but also "substantializing," allowing linguistic structure to determine our understanding of the world (Barad, 2007, p. 133). Take, for example, the standardized educational practice of giving definitions of concepts to capture the essence or meaning of concepts, including attempts to define what child is by nature.

Posthumanism breaks with the assumption that there is no direct "access" to child in reality, that child is not *present*, and can only be *re-presented* through human

semiotic constructions or scientific language. Key to this rupture is the notion of intra-action.

Intra-action is ontologically different from "interaction." Intra-action should not be confused with notions such as "inter-subjectivity" or "inter-activity" (as in child-centered pedagogies), which assume pre-social, independently existing *human* subjects (in relation with one another). This ontological shift is so difficult to make because it requires thinking differently about space and time – not as containers filled with bodies (as in Newtonian space), or as a succession of atomic moments. Movement does not depend on time; it is the other way around ontologically: time measures or re-presents motion (Deleuze, 1968/1994). Or, as Barad (2007) puts it: past, present, and future are always intra-actively threaded through one another (Barad, 2007) – the reason why at the same time, posthumanism is not *post*, as it would assume that humanism can be left *behind*.

The neologism "intra-action" creates fresh decolonizing opportunities for a *doing* of subjectivity differently. Ethics is not only a human affair – human actions are just one element of the apparatus of entangled intra-actions with the more-than-human. The quantum entanglement of all human and nonhuman phenomena intra-acting with one another means as we have seen in the case of the diffractive teacher, that it is impossible to say where the boundaries *are* of each entity, including people. This "lack" of bodily boundaries is not just *epistemological*, but *ontological*. Put differently, it is the way the world *is*, not just a matter of how we get to *know* this world. Ontological relationality is not a matter of how we *experience* the world, or a matter of (psychological) *awareness*. Neither is it a doing away with, or a denial, that there are individual humans who exist, but what is at stake here is a rethinking and revaluation of human's anthropocentric philosophical claims to *exceptionalism*: the normative idea that what sets human animals apart from other earth dwellers (including matter) is reason and rationality, the source of all knowledge and located in a mind that is contained by a body which exists alongside other bodies moving through space and time (as autopeiotic systems). For critical posthumanists, words or concepts do not capture or mirror things "out there" in the world, but are part of a constantly changing reality.

This means pushing aside colonizing knowledge systems that assume an inner/outer (or mind/body) and nature/social binaries. Meaning making is not purely a *social* process involving *human* agency only. Barad (2007, p. 152) writes: "Neither discursive practices nor material phenomena are ontologically prior or epistemologically prior. . .matter and meaning are mutually articulated." For a posthumanist (and many other knowledge systems other than Western, including young children's), human and nonhuman matter always exist in entangled intra-active relations.

African Indigenous Ontoepistemology

As new materialists Jackson and Mazzei (2012, p. 114) explain: the artificial divisions between the biological and the cultural, the material and the semiotic, the natural and the human, genes and the environment blind us from the knowledge "at

the intersection between things and people, between feats of engineering and social structures, between experiences and bodies." Such "blindness" is particularly devastating for Africa. According to the Geo-2000 report, some 500 million hectares of land have been affected by soil degradation since 1950, it has lost 39 million hectares of tropical forest and water is scarce in 14 countries and the number is only growing, not getting less (Le Grange, 2012, p. 60). Apartheid capitalism is partly to blame, not only for the "material suffering," but also the "mental suffering" as apartheid legacy continues to impact on the everyday in terms of race, gender and class inequalities (Le Grange, 2012, p. 61). Conservation and the environment are often seen as a luxury and of concern only of the white elite who are not struggling for basic survival.

With "Indigenous" I mean the groups of people in sub-Saharan Africa who have ancestral ties and claims to the land prior to colonization by European nations, and who have a particular ontoepistemic relationship to that land (as well as to each other and ancestors). African scholars claim that unlike Western humanism, African humanism does not reduce nature to a mere object of human knowledge and thereby also disrupts the Nature/Culture dichotomy. Nature is not seen as something that exists "out there," passively, to be discovered by humans' thinking about or experimenting on "it."

Le Grange (2012, p. 61) urges for a decolonization of the mind through a re-appropriation of *Ubuntu* (humanness) and in particular *ukama*, which means "relatedness to the entire cosmos." What these terms mean exactly and their current relevance for educational theory and practice are the topic of heated academic debate especially in the context of decolonization (see, for example, Enslin & Horsthemke, 2004; Le Roux, 2000; Murove, 2009; Ramose, 2002). One of the main difficulties is the use of Western languages to explain African philosophies. How to interpret, for example, the following quote?

> We belong in a bundle of life. We say, "a person is a person through other people" (in Xhosa *Ubuntu ungamntu nganabye abantu* and in Zulu *Umuntu ngumuntu ngabanye*). I am human because I belong, I participate, and I share. A person with *Ubuntu* is open and available to others, affirming of others, does not feel threathened that others are able and good; for he or she has a proper self-assurance that comes from knowing that he or she belongs in a greater whole and is diminished when others are humiliated or diminished, when others are tortured or oppressed, or treated as if they were less than who they are. (Tutu, 1999, cited in Kahiri, 2015, p. 110)

At first glance the ontology described seems very anthropocentric, but Kayira (2015, p. 111) claims that *Ubuntu*'s interdependence and community involves the natural world as well as human networks: "Nature and persons are one, woven by creation into one texture or fabric of life" (Sindima, 1995 cited by Kayira, 2015, p. 111). South African scholar, Le Grange (2012, p. 58) draws on Guattari's "ecosophy," which recognizes the entanglement of the social, the environment, and human subjectivity – nature and culture cannot be separated. He suggests that there is a close similarity between ecosophy, *ubuntu,* and the broader concept of *ukama* (Le Grange, 2012, p. 61), hence his proposal to use African philosophies as an

ethical response to the environmental degradation and "erosion of human solidarities" characteristic of contemporary Africa (Le Grange, 2012, p. 61).

Now to what extend does *Ukama* put the *human* in the center of the ontoepistemic universe and to what extent does that presuppose the possibility of a justification for the human (Culture) to be at a distance from Nature, with the latter to be used as a resource and commodity for exploitation? Zimbabwean philosopher of education Amasa Ndofirepi explains that "*Ukama*, in its etymological roots, is a Shona adjective from the stem *hama,* meaning "relative." While *U* is the adjectival prefix, *kama* is the adjectival stem and *kama* on its own means "to milk' an animal." The idea of milking an animal suggests "closeness and affection" and Ndofirepi (2015) adds that *ukama* points at a relational ethic – relationships that come first and form us. Quoting De Quincey, Ndoferipi argues that "we emerge as subjects from intricate networks of interrelatedness, from webs of inter-subjectivity."

The implications for education are that moral education with *ukama* as guiding principle starts with the family and then outwards. The core of the ethic is non-individualistic and focuses on shared interdependence. *Ukama* expresses a relationality between people that also extends beyond death. The relations with ancestors are critical for the passing on of the values that are immortal and need to be treasured and preserved. What it means to be ethical for an individual in this context is to re-establish the presence of one's ancestors (Le Grange, 2012, p. 61). Le Grange (2012, p. 63) insists that *ukuma* is not speciecist, and constitutes the right ethical response to the environmental crisis – a crisis that includes the erosion of human solidarities (Le Grange, 2012, p. 61). He also claims that his proposal is in line with Guattari's ecosophy. However, there seems to be a profound tension between the Natureculture relationality claimed by African philosophers and the scholarship on child and childhood in Africa.

Child in Africa, Childhood, and Ontoepistemic Injustice

In all societies, the figurations in Table 1 are entangled phenomena and are materialized differently in teaching, educational research, curriculum construction and educational policies. In African societies, the extended family is a microcosm of the wider society, characterized by communal interdependence (Letseka, 2013). Hierarchies are written into the nature of the universe, with child low in the hierarchy – subservient (obedient and respectful) to adults and ancestors. Child's place is to serve this extended family, with obedience as a prerequisite and reinforced through physical punishment (Penn, 2005, p. 110). Girls have even less status and authority than boys, and are expected to be more domesticated and more compliant, also sexually (Penn, 2005, p. 110). There is an important difference though from (deficit) Western notions of childhood. Children are capable of important responsibilities, and like adults, need to contribute to the subsistence of their extended families and wider communities. Depending on gender, even young children are supposed to, for example, look after infants or herd cattle. Childhood is not seen as *a phase* in a human life, but is instead associated with certain *capabilities*, that is, *the*

physical activity to perform adult tasks, economic independence and getting married (Twum-Danso, 2005). The hierarchy is less related to age, and more to children's obligations to support the family in times of need and old age, so in that sense, children always remain children (of their parents). It is not something they grow out of. The basic assumption in the (dominantly Western) literature is that (Western) children – "indoor children" – grow up in a benign environment where the family will look after their development, whereas child-headed households are not uncommon in Africa (Penn, 2005, p. 111). Especially in a continent plagued with HIV/AIDS, there is a distorted picture of what childhood is like for many children, obscuring their capacities and the contributions they make in caring for siblings and other family members (Kesby, Gwanzura-Ottemoller and Chizororo, 2006, p. 186). As Penn (2005, p. 111) puts it "[c]hildren's resilience, solidarity, capacity for sharing, their stamina, their sense of time, place and the future, are rarely conceptualized or investigated." In a significant sense, child in Africa is only visible in Table 1, because child has been normalized into a Western metaphysics that assumes the Nature/Culture dichotomy. The latter has infiltrated and colonized Indigenous peoples, also through a Western normative education system that regarded African culture and their ways of being and knowing as inferior and worthless – something to be ashamed of (Kayira, 2015, p. 108). The queering of the Nature/Culture dichotomy in Table 1 is therefore both a decolonizing *and* a posthuman move towards regarding young earthlings on a more egalitarian footing: a "being-with," "making-with," and "thinking-with" as part of the world as sympoiesis. This should be included in the larger creative ethico-political project of transforming how humans relate to each other and to nonhuman "others" and the material environment. Although the decolonization of speciest discourses is on the agenda of an increasing number of scholars, child is still rarely mentioned as a category of exclusion, even in the feminist, postcolonial and posthuman literature (Burman & Stacey, 2010). And this despite the fact that it could even be argued that the logic of childhood is the internal structure of the logic of colonialism (see below). Crucially, a reconfiguration of child and childhood is not just a matter of *including* another category of humans previously excluded epistemologically and ontologically. What is involved is a radical reconfiguration of identity and the human subject.

Salient for education is that the Nature/Culture dichotomy separates the *thinking* subject with agency from a sensing body (object) that is temporal, spatial, without agency and not involved in knowledge production. Affect and other transcorporeal knowledges are thereby excluded from the domain of "real" knowledge. But as Barad (2014, p. 168) argues "the quantum understanding of diffraction troubles the very notion of *dicho-tomy* – cutting into two – as a singular act of absolute differentiation, fracturing this from that, now from then."

The Western dichotomy has also cut child (Nature) apart from adult (Culture) thereby essentializing and discriminating the young "other." But surprisingly, child as subhuman tends to be forgotten and childhood remains unproblematizied in much posthumanist, postcolonial writing, as well as African philosophy of education. For example, Kayira (2015, p. 109) states that "traditionally most Africans believe that that one gains wisdom and knowledge with age in relation to traditional and

community-based practices." Many Western philosophers and educationalists still assume that child is associated with Nature and that his or her development to mature adult will either unfold (Rousseau), or needs to be developed (Locke), or interacted with (Kant) through Culture in order to become "fully-human" (Murris, 2016).

The Nature/Culture binary works in contradictory ways in Western education – an education that has now become the universal norm. Since the Enlightenment, human intentionality and agency and the capacity to reason have positioned school-based education as the conduit through which to bring the pre-rational child into the world of the rational (white, male) adult through cognitive development, thereby rendering Nature as passive and inert (Taylor, 2017, p. 62). On the other hand, the Romantics (e.g., Rousseau) have inspired educational approaches that regard Nature as innocent, good, pure and true. Nature is aligned with "children, animals, 'native' people, and pristine wilderness areas," whilst Culture is aligned with "greed, immorality, political exploitation, technological perversions, and urban and industrial pollution" (Taylor, 2017, p. 63). In short, Western education assumes that either Culture is "the teacher," or Nature, and has led to two very different approaches to (environmental) education: play-based back-to-nature approaches (e.g., Forest schools) or cognitive-orientated classroom activities that involve representations of and knowledge *about* Nature. The problem of both Western approaches is that they assume the Nature/Culture dichotomy, but there is no "pure" nature, only environmentally damaged places (Taylor, 2017, p. 65). Since the unenlightened Enlightenment, educators have been unhealthily (for the planet) preoccupied with the holistic development of the individual child in social-cultural contexts at the expense of the nonhuman and more-than-human "others," such as plants, animals, things, planet, water. For example, the production of economic profit relies on the exploitation of animal bodies, their labor and their reproductive capacities (Pedersen, 2015, p. 59). Although postcolonial, poststructuralist and postmodernist theorizing has brought many gains in terms of foregrounding categories of discrimination and exploitation, these scholars tend to focus on the human (race, gender, class), rather than the young human, or as Helena Pedersen (2016, p. 6) argues, on animal/human relationships (speciesism) and are therefore also anthropocentric.

The Nature/Culture Dichotomy and Ontoepistemic Injustice

Thanks to twentieth century feminist scholarship, we have come to understand that the hegemonic conception of knowledge is grounded in *patriarchy*. The normal Subject, the standard by which other earth dwellers (including more-than-humans) are measured, is of a particular gender (male), race (white), able-bodied, and with a particular sexual orientation (heterosexual); the humanist ideal of Leonardo da Vinci's Vitruvian Man as the yardstick by which the worth of the "other" is measured (Braidotti, 2013). But we have to turn to scholarship in childhood studies and early childhood education to find that this normal Subject is also assumed to be of a particular (adult) age (Burman, 1994; Cannella & Viruru, 2004; Dahlberg, Moss, & Pence, 1999/2013; Fendler, 1998; Jenks, 1996; Walkerdine, 1984). This injustice is

not just social, but also *ontoepistemic* (Murris, 2016). Children are not listened to because of their very *being* (onto) a child and are therefore unable to make claims to knowledge, because it is assumed that they are (still) developing, (still) innocent, (still) fragile, (still) immature, (still) irrational, and so forth. As a result, child is denied ethically, epistemically and ontologically.

Ontoepistemic injustice is a kind of injustice that is woven into the fabric of social injustice. The Nature/Culture binary affirms the child (Nature)/adult (Culture) binary. For decolonization this is important, because much injustice is inflicted on children on the basis of adult claims of what counts as reason, rationality or true knowledge, and therefore what is, for example, educationally worthwhile. For Miranda Fricker (2007), who coined the term, epistemic injustice is done when people are wronged specifically in their capacity as a *knower*. Knowledge is offered by the child, but not heard by the adult, because of identity prejudice (ageism) (Miranda Fricker does not refer to children as a marginalized social group. She only refers to class, gender, and race.). This kind of prejudice is in turn related to conceptions of child and childhood and the stereotyping involved (Murris, 2013). Stereotyping involves empirical generalizations about a given social group (here, children), sometimes even resulting in universal claims, such as, "All children are immature." Fricker points out two necessary conditions for the identity prejudice in such a claim to be prejudicial. First, the attribute (intellectual disability) needs to be a reliable generalization, and secondly, it should not be a "*pre-judgment,*" that is, a judgment made without proper evidence (Fricker, 2007, pp. 32–33). Importantly, the misjudgment of the speaker's credibility should be non-intentional, that is, clouded by prejudice and not a case of deliberate manipulation (Fricker, 2017, p. 54). She continues that many attributes assigned to historically powerless groups are often associated with a lack of "competence or sincerity or both" (Fricker, 2007, p. 32), and the attributes she mentions also apply to child historically: "over-emotionality, illogicality, inferior intelligence, evolutionary inferiority, incontinence, lack of "breeding," lack of moral fiber, being on the make, etc." (Fricker, 2007, p. 32). These prejudices of deficit are often held "unchecked" in the collective social imagination, and do their damage, especially, when child is not only young, but *also* female, black and lives in poverty (Murris, 2016). Prejudice runs deep. It operates "beneath the radar of our ordinary doxastic self-scrutiny" (Fricker, 2007, p. 40) and is particularly damaging, but hard to detect, when power relations and structural prejudice undermine child's faith in its own ability to make sense of the world (a case of "hermeneutic injustice" – see Fricker, 2007, 2017). Ageist prejudices are directly related to the Nature/Culture binary, which separates child from adult epistemically and positions child as an ontological, colonized "other."

Misopedy and Colonialism

Deficit figurations of child (child as not fully-human-yet) and colonialism are entangled phenomena. Toby Rollo (2016, p. 2) argues that the ancient conception of the degraded, "not fully-human," child "misopedy" is the *internal logic* that has

made colonial superiority (the colonial denial of full humanity) and the notion of the ontological "other" possible (Rollo, 2016, p. 2). Rollo (2016, p. 2) explains:

> The idea of a *telos* of progress from animal child to human adult is both a historical and conceptual antecedent of the idea of European civilization, prefiguring its stories about maturation and progress from cultural ignorance to enlightenment.

Developmental theories prepare children for a capitalist economic workforce (Burman, 1994), have an evolutionary bias, and are colonial (Burman, 2008, 2016). It has been pointed out that the assumption in developmental theories is that the goal of the process is maturity – each stage is followed by one that is "better," more "mature." This is what philosopher of childhood Gareth Matthews (1994, p. 17) calls "evolutionary bias." Developmentalism is a *recapitulation theory*: child's intellectual development is compared with ("recapitulates") the development of the species (with the child as nature, as the origin of the species) from "savage" to "civilized." This process of "racial differentation" underlies our modern understanding of the child and is influenced by the natural sciences, and in particular physiology and medicine (Oswell, 2013, p. 24). It is significant that colonialism and cognitive theories of child development emerged at the same time in Europe (Nieuwenhuys, 2013, p. 5). There is an intricate connection between imperialism and the institutionalization of childhood (Burman, 2008; Cannella & Viruru, 2004; Nandy, 1987).

One view is that enlightenment notions of progress and reason have colonized children as positioning them in need of recapitulating the development of the species. Like Indigenous peoples, children are seen as simple, non-abstract, immature thinkers who need age-appropriated interventions in order to mature into autonomous fully-human rational beings, and therefore cannot be granted political agency. Child as not fully-formed-human and developing is evident in biomedical and bio-psychosocial approaches to early childhood education (e.g., their focus on age, weight charts, language, gross and fine motor skills) (Cregan & Cuthbert, 2014, p. 10). Children's development is seen as dependent on adult Man – the standard by which their development is measured, evaluated and found wanting.

Rollo takes this a step further and argues that the concept of childhood has made it possible to conceptualize *all* subhumans as ignorant, immature, uncivilized animals by Nature and therefore they need faith (premodernity) and reason (modernity) in order to progress and develop into fully-human beings (Rollo, 2016, p. 4). This means that age is not just another category of exclusion, like race, gender or class, but "*the degraded figure of the child provides the internal structure and logic of the colonial conception*" (Rollo, 2016: 4; my italics) of the deficient "other." The comparison between the colonizing of ("developing") nations, women, people of color, and people living in poverty is, therefore, not just a paternalistic *analogy* (as e.g., with Burman, 2008), but a *homology* – a sharing of essential structures: these subhumans *are* children (Rollo, 2016, p. 4). Misopedy is not only about children, that is, young people of a particular age, but includes "*all* feral children of civilization, including white European ancestors" (Rollo, 2016, p. 2). Key to this internal structure of the childhood of society as inferior is a linear notion of time.

The logic of linear progression has positioned school at the heart of a civilization process (Culture) in aid of developing the wild and ignorant (Nature) to become "fully-human," whether as individuals or as species.

Since the Enlightenment, so-called inferiority in reasoned speech (*logos*), through which the intellect is evaluated and assessed, is not seen as innate and inherent in the subhuman, but understood as *temporary* and *should* be "fixed" through schooling (Rollo, 2016, p. 11). The associated *moral* superiority of the adult colonizer explains the resilience of misopedy and its intricately related use of time (*linear* progress) in school. Whether inspired by religion (progress through faith), or non-secular ethics (progress through reason), the adult as savior is seen as in a hierarchical and authoritative position to cultivate the inferior non-civilized "other" – even as a means to justify the use of violence (Rollo, 2016, p. 4). It is this moral superiority that is disturbing as misopedy is sedimented in school as chronological institution. Elsewhere (Murris & Haynes, 2018), a decolonizing way forward is proposed through the verb "to child" – something *all of us* can do.

Posthuman Child and Justice-to-Come

We have seen how dominant discourses and material practices, especially since modernity, position child as a lesser human being, marginalized and excluded, despite sustained academic critique from many disciplinary quarters in higher education. If these dominant discourses are not contested, the professional preparation of, for example, teachers, architects, lawyers, anthropologists, medical practitioners, art educators and social workers, will continue to be ageist. African children experience the most fundamental intersecting forms of discrimination on the basis of race, gender, living in poverty and lack of representation in political decision-making fora. As Achille Mbembe (2015, p. 2) comments: Western philosophical traditions regard "the body and the flesh" of the non-Western, and especially the African as the "stranger." Like many others in the postcolonial literature (see, e.g., Mignolo, 2011; Maldonado-Torres, 2007), Mbembe argues that an African self has been negated as a result of the Western "I" as universal, essentializing signifier, creating identity through difference.

In the case of black African child, an even lesser degree of humanity has been attributed by virtue of not only being black, but also being child – a double blow. As elsewhere, conversations about decolonization in South Africa as well as the literature tend to focus on the individual adult human. In contrast, we have seen that for posthumanists all earth dwellers are mutually entangled and always becoming, always intra-acting with everything else (sympoiesis). The notion of intra-action implies that there is no prior existence of individuals with properties, competencies, a voice, agency, etc. Hence, the reconfiguration of the posthuman child is not *a* child at all, in the sense of a fleshy unit bounded in space and time (Murris, 2016). Individuals human and nonhuman bodies (of whatever age) materialize and come into being *through* relationships; and so does meaning. "Age" as a human made apparatus can cause ontoepistemic injustice when it excludes young human bodies

through unjustified stereotyping on the basis of the deficit figurations of child (Table 1). The figuration of the "normal" knowing subject informs institutionalized discriminatory child/adult relationships and materializes specific roles of the educator (Table 1). The Western dichotomy cuts child (Nature) apart from adult (Culture) thereby essentializing and discriminating the younger "other." Drawing in particular on the philosophies of Barad and Haraway, this chapter has unhinged child and childhood(s) from their metaphysical frame of reference. For "justice-to-come" (Barad, 2012, p. 81), schooling needs to contribute to a postcolonial future that disrupts not only human exceptionalism, but also misopedy. Justice, for Barad, is about "proceeding responsibly," which involves the impossible task of allowing the response of the "between" she says she is trying to gesture toward. Barad (2012, p. 81) explains:

> (Doing justice is a profound yearning, a crucially important if inevitably unachievable activity, an always already inadequate attempt to respond to the ethical cry of the world.) Or, rather, perhaps I can put it this way: It is the very question of justice-to-come, not the search for a final answer or final solution to that question, that motivates me. The point is to live the questions and to help them flourish.

This decolonizing move is therefore not about *truths about a just future* as perceived by the educator to be taught (transmitted, facilitated, mediated etc.) to the learner, but to continue to ask the awkward questions (including what it means to decolonize). Importantly, it also means to allow children to ask the questions that *matter* in class (including what it means for *them* to decolonize education). This decolonizing pedagogical move reconfigures children as knowledge co-creators and as such includes them in the becoming of their own futures (both immediate and long term). We can now pick up some of these and other threads and re-turn to the figuration of a posthuman teacher. If the teacher is neither a guide, nor an instructor, nor a trainer, nor a discipliner, nor a facilitator, nor a socializer, nor a protector, nor a diagnoser, nor a medicator, then what kind of teacher is s/he/it? How will learning be assessed? Which pedagogies will be used? What kind of teaching resources will s/he/it use and how? What is becoming evident is that they are simply the wrong questions to ask as they already assume the existence of bounded (by their skin) individuals who exist prior to their interactions with the human and more-than-human. A posthuman reconfiguration of both child and teacher assumes that there is ontological, as well as epistemological equality between species and between different members of each species.

Re-turning: The Diffractive Teacher

Posthuman education moves beyond the anthropocentric focus on children's abilities or capabilities as *individuals* and regards knowledge production as part of an ontological *intra-active relationality* (including nature *and* culture) through which

the human and more-than-human render each other able as part of a sympoietic system (Haraway, 2016).

Several teacher educators have interrogated the logic and ethics of anthropocentrism in education and have given examples of decentering the human by resisting "following the child" only (Blaise, Hamm & Iorio, 2017; Lenz Taguchi, 2010; Murris, 2016; Nxumalo, 2016; Olsson, 2009; Taylor, 2013). Drawing on the philosophies of Deleuze and Guattari, Haraway and Barad, they have given concrete examples of how pedagogies and research methodologies, such as multispecies ethnography, rhizomatics, modest witnessing, or diffraction can work in the university classroom, outdoor outings and on field trips. This is important work, as they show how a posthuman inclusion of the more-than-human can work in the context of schooling – rendering children "capable by and with both things and living beings" (Haraway, 2016, p. 16). The details of these material-discursive entanglements matter, and tracing them "link actual beings to actual response-abilities" (Haraway, 2016, p. 29). When child is reconfigured as part of a sympoietic system, more equitable relationships between humans (of, e.g., different ages) and between the human and more-than-human are brought into existence. Sometimes these pedagogical examples focus explicitly on more-than-human entanglements in everyday encounters with colonized and environmentally damaged places (Nxumalo, 2016, p. 2). Like many Indigenous ontologies, posthumanism posits the inseparability of humans from their material environment and more-than-human relations and response-abilities (Nxumalo, 2016, p. 2). There is an important ethico-political point about building a different relational ontology in the Anthropocene, a geological period of permanent change to the planet's biosphere caused by large-scale industry, natural-resource exploitation and intensive agriculture. Unlike ecologists who assume that natural systems are universal and "outside, or separate, from human communities," posthumanism offers a transdisciplinary approach that disrupts the Nature/Culture binary and attends to land, the temporality of place and offers a way of "experiencing ecology as an intensive quality of experience," for example, attending "to the smell and texture of grass, soil and plants (Rotas, 2015, pp. 91, 97). A different kind of education is required for "an affirmative ethico-political economy" that addresses the "problematic of a dying species such as ours who is on the trajectory to extinction" through a shift that includes "trans-subjective and transhuman forces" (jagodzinski, 2015, p. 128).

It is only when we separate the human "I" from other human and nonhuman bodies that teaching and learning become activities that (human) individuals *do* (to each other or themselves as in "reflection"). This happens when we use language and other semiotic sign systems and *mediate* knowledge *about* the world through these conceptual systems and thereby bring into existence the Nature/Culture binary. Knowledge, so construed, is about the languages we use *about* the world and not regarding ourselves as *part of* the world.

It should become clear now that Sundberg's critique discussed earlier that posthumanists are not aware that "knowledge comes from somewhere and is, therefore, bound up in power relations" (Sundberg, 2014, p. 36) is unfounded. Ontology and epistemology are always entangled with the ethical because the knowing subject is

not at a distance from the world. S/he is always located, but not in a "fixed position," that is, "with the specification of one's social location along a set of axes referencing one's *identity*" (Barad, 2007, p. 470, Fn 45; my italics). Therefore, "location" does not mean the same as "local" or "perspective." For example, my email address is specific *in* the internet, but this net itself is always fluid and becoming, and so are identities (Barad, 2007, p. 470, Fn 45), but never politically neutral.

In contrast to the transcendal signifier "I" of humanism, the posthuman subject (including child subjectivity) is an entanglement that is constituted by concepts *and* material forces, where the social, political, the biological, and its observing, measuring, and controlling machines are interwoven and entwined. All elements of the entanglement intra-act without clear bodily boundaries, including between what is natural or cultural. For a justice-to-come this is salient, because binary thinking misses important knowledges – it cuts nature away from culture, child from adult, mind from body, boy from girl. So what could or should the role of the teacher be in posthuman schooling? What does it mean to teach and to work and think together in a posthuman classroom? Let us re-turn to the vignette at the start of this chapter.

Diffraction helps materialize important new insights for posthuman schooling. It disrupts the idea of humanist schooling that knowledge acquisition is *mediated* by the more expert and knowledgeable other; schooling as a linear journey from child to the more "fully-human" adult. Importantly, *the diffractive teacher can be human, nonhuman or more-than-human*, contributing to a reconfiguration of the world in all its materiality – a process of "worlding." Importantly, this process is always *relational,* not *individual*. The heron's standing in the water is made possible by the water, the river, the people who maintain it, the mountains, the people who pay taxes, the heron's mother who gave birth to him/her, environmental laws and rules of the city, animal protection agencies, other species, global politics of climate change and sustainability and so forth. All are intra-acting with one another and with me who took the photo. Like the diffraction pattern caused by the heron's body, the relationship between the human and more-than-human is dynamic and has agency. The point is not so much that knowledge practices have material consequences, but that "practices we enact *matter* – in both senses of the word," and that these practices of knowing are "part of the world's differential becoming" (Barad, 2007, p. 91; my emphasis). And this includes when as educators we re-turn to experiences diffractively: experiencing the experience (again). Making knowledge is not about the production of facts, but about "making worlds" ("worlding"), "in the sense of materially engaging as part of the world in giving it specific material form" (Barad, 2007, p. 91). Knowledge is constructed through "direct material engagement with" and not by "standing at a distance and representing" the world (Barad, 2007, p. 49). In that sense, teaching and learning are a "performance." (Barad has been influenced by Judith Butler's theory of performativity, but she is also critical of her reinscribing matter "as a passive product of discursive practices rather than as an active agent participating in the very process of materialization" (Barad, 2007, p.151).)

When learning is not positioned "within" a subject, but is conceptualized and enacted as a dynamic, relational process of intra-action, what it means to "think-with" in education is a material-discursive intra-action between human and

nonhuman bodies (a "flattened," non-hierarchical ontology). A body is to be understood as in physics, as any kind of body, whether a human body, an organ, a heron or a stone. Jane Bennett (2010, p. 2) describes how, for Spinoza, human *and* nonhuman bodies have "a peculiar vitality" or "conatus" – "a power present in every body [*conatur*] in order to persevere in its own being" (Bennett, 2010, p. 2). In that sense, all things (including the human body) are equal, and therefore form an ontological *continuum*, not a difference of *kind*. Although for Spinoza (like Descartes a rationalist), human beings strive to live by the guidance of reason, *all* things have vitality and are able to persist in existing "with the same force whereby it began to exist." For Spinoza, even a falling stone strives to continue its motion (Bennett, 2010, p. 2). Spinoza's monism and the relational ontologies of Barad, Deleuze and Guattari make us think differently about teaching and what it means to think together. Not only human bodies, but also their minds are *part* of nature, not in control of it, or in command of it. It has been wrongly assumed that education is only for, and about, humans. Decentering the human is one step (in the river) towards decolonizing education and the figuration of posthuman child is part of our response-ability for a justice-to-come.

Abstract

Weaving my personal narrative with a cartography of the theoretical field of childhoodnature, this chapter is the account of being a scholar working in the field of environmental education and more recently childhoodnature for close to two decades. To do this disruptive work, I am exploring the use of Barad's (Parallax 20(3): 168–187, 2014), this notion of a "re-turn" in her diffractive theorizing. Spanning a series of theoretical turns from critical theory, ecophilosophy, human geography, social cultural theory, feminist theory, and more recently

This chapter draws on text from the recently published book: Malone, K. (2018). *Children in the Anthropocene: Rethinking Sustainability and Child Friendliness of Cities*, London, UK: PalgraveMacmillan.

posthumanist and new materialist theory, this account is embedded in the interdisciplinary fields of childhood studies, children's geographies, children's environments, and environmental/nature education. Littered with the intersection of stories of children growing up in a variety of "places" across the globe, the account seeks to acknowledge and trouble the view that childhoodnature does not exist without a philosophical past by tracing its theoretical ghosts.

Introduction

> . . .by re-turning – not by returning as in reflecting on or going back to a past that was, but re-turning as in turning it over and over again – iteratively intra-acting, re-diffracting, diffracting anew, in the making of new temporalities (spacetimematterings), new diffraction patterns. (Barad, 2014, p. 168)

Re-turning through the theoretical field of childhoodnature, this chapter is a diffractive account of a researcher who has been wondering in the field of childhoodnature for a quarter of a century. I am borrowing from Barad (2014) this notion of a "re-turn." Spanning a series of theoretical turns from critical theory, human geography, social cultural theory, feminist theory, and more recently posthumanist, new materialist theoretical approaches, this engagement is enmeshed in the interdisciplinary fields of children's geographies, children's environments, childhood studies, and environmental, outdoor, and nature education. These stories of children growing up in a variety of "places" across the globe come from slum communities in Bolivia, inner city towns and prefectures in Japan, communities in polluting industry zones in the western suburbs of major cities in Australia, palm industries in rural villages and urban fringes of Papua New Guinea, small island communities in the Pacific, and a number of cities and regional towns in Kazakhstan. Life, according to Deleuze and Guattari (2004), is developed along thread lines (Ingold, 2010). A "line of becoming," Deleuze and Guattari write:

> . . . is not defined by the points it connects, or by the points that compose it; on the contrary, it passes between points, it comes up through the middle . . . A becoming is neither one nor two, nor the relation of the two; it is the in-between, the . . . line of flight . . . running perpendicular to both. (2004, p. 323)

Ingold (2010) building on a similar view of becoming explains his concept of "lines of light and flow" as linked to his notions of network and meshwork. The network of lines, the flow of materiality of child-city-nature-bodies in the stories of my own past tracings of environmental education research, provide the possibilities for real and imagined journeys where the human and nonhuman have always been

connected and always been implicated but often been mere adornment or context for the lives of those that were seen to matter the most, the humans. The defining attribute of a network of flow lines is their potential for connectivity. Using diffractive tools with Ingold's (2010) lines of light and flow with notions of enmeshment and creative entanglement, movement and freedom are embodied, performed, and inscribed in becoming simultaneously both as conforming and transgressive. It is through walking with children in past tracings of research that I have come to know the complicated negotiation of performing research with posthumanist approaches. The chapter explores three re-turning moments in my theoretical meanderings.

Diffractive Stance 1: Socially Critical Environmental Activist Re-turn

I start with my re-turning by exploring a "critical" environmental activist turn. It was 20 years ago during my doctorate research that I came to be first collaborating with a disenfranchised community in the western suburbs of Melbourne. It is here that I first came to understand the vulnerability of children in cities where pollution, toxic contamination, and disconnect of being with and through the environment were having significant impacts on children's lives. The UNICEF Convention on the rights of the child had just been endorsed by a number of countries around the world, and there was a sense that a "rights agenda" was becoming a dominant theoretical approach for understanding oppressed childhoods. The term Anthropocene hadn't been introduced into the nomenclature of the environmental crisis, but the sense of foreboding and its implications for the planet were already being revealed to me.

Diffractive Stance 2: Critical Cultural, Sociological, Geographical Re-turn

The second theoretical re-turn follows a critical "cultural, sociological, geographical turn." This began with the start of a postdoctoral fellowship with the United Nations on a project *Growing Up In Cities* where I was once again studying a community in the western suburbs of Melbourne, Australia. As part of an eight-country study replicating the work of eminent urban planner Kevin Lynch from the 1970s and directed by Louise Chawla, this project was my first entry into exploring a multidisciplinary, multi-theoretical approach to research that focused on working directly with children as co-collaborators and co-researchers while studying their relationship with a place. All sites in the study were communities where children were living in the most disadvantaged neighborhoods of the cities. The international team of academic researchers were urban planners, environmental psychologists, architects, anthropologists, geographers, and myself, the only education/social science researcher (and the youngest academic) on the team. One aim of the study was to develop results representing the diversity of children's experiences, including possible longitudinal comparisons. The project developed into a book of case studies on children's lives where the first ever set of qualitative indicators of environmental

quality devised by children was produced. The new sociology of childhood was impacting on the field of childhood studies; children as social/cultural beings with agentic properties adopted a central role in the stories of child rights.

Diffractive Stance 3: Critical Posthumanist and New Materialist Re-turn

I then re-turn to my emerging, lively "posthumanist and new materialist turn." Enmeshed in a human and more-than-human world, an onto-epistemological shift finds my researcher body implicated in a "messy entanglement" as an assemblage of and with all beings and entities acting on each other. Being in ecological community, I have employed the potential of posthumanist approaches while seeking to critique classic humanism, an approach that emphasizes only the value and agency of humans to the detriment of the agentic potential of the more-than-human world. Through the import of de-centering the human by using new materialist approaches, I am being enticed to question the centrality of the human and to reconsider the way humans relate to, set ourselves outside of, and seek to dominate the more-than-human world (Malone, 2018). Beyond the global crisis, these new ways of considering material relations with the planet have become important through lines for exposing children's encounters and relations with a nonhuman world, by their enticing of a shared agency among others. By reimagining this materialist manner, I was seeking to acknowledge the intricate web of interrelations that marked the contemporary child subjects' relationship to their multiple ecologies, the natural, the social, the physic, and the material possibilities of being child-kin-other on a damaged planet with a host of others. A posthuman child disrupts Cartesian divides: subject/object; human/nature; a new way of considering family, community, rights, ethics and injustices. To speak of ecological communities, beings in common, is to shift away from sentimentality, a distinct disruption of romantic views of child with/in nature; it is to know that all things are mutually implicated; the child is nature. Theorizing as childhoodnature the child as nature comes into being; reconfigured, co-present, enmeshed in diffractive becomings (Malone, 2018).

Diffractive Theorizing

Only the green twinkle of streetlights below me, endlessly floating in the open space, is there to greet me. The white light impacted by the altitude, higher levels of nitrogen, and less oxygen, diffracts and shines green. In years passed this prompted many to name La Paz the emerald city. Ironically, drawing on descriptions by the author Baum of the emerald city in book The Wizard of Oz*, it is claimed that he thinly disguised Oz as a socialist utopian. There were no poor people in the fantasyland of Oz, because there was no such thing as money; everyone worked halftime and played half the time. In 2005 Evo Morales became the current indigenous President of Bolivia on a platform of people living in community, with values*

such as solidarity and reciprocity. His party the "Movement to Socialism" *(MAS) established Bolivia as a plurinational state based on the autonomies of the indigenous peoples to liberate Bolivia from its colonial past. MAS represents a new indigenous nationalism combining elements of indigenismo, nationalism, and* "miners" *Marxism. As I descend I can hear the familiar sounds of gunshots or fireworks; likely it is protesters on the streets in the valley below. I remember a local telling me once* "you have not experienced Bolivia unless you have smelt tear gas in your nostrils or rubber bullets in your bum." *Socialism came at a great cost in Bolivia. The streets still echo the sounds of civil war, and the buildings in Central Square bear the scars of the bullets shot. From the taxi I can see posters in the streets* "Evo hasta 2020" (Evo until 2020) *alerting me to a coming election; people are always anxious during these times*; *it is probably neighboring factions fighting in the streets. I may have only dropped 500 m, but by the time I reach my hotel, I can feel my body calming. My heart is returning to a familiar regular beat; my breathing has slowed down. Now to climb the stairs and find the room that will be my home and office for the next 4 weeks. I silently creep quietly into bed and fall into a deep sleep.*

Barad (2014) attributes the notion of diffraction as evolving from feminist theorizing and the science discipline of physics, both seeking to deepen understandings about difference differently. Diffraction is a useful and troubling process, and unlike the idea of reflecting on my stories (as I would have done in the past), I am seeing who I am as entangled in my world of research, seeking to be with my data in different ways and using these new theoretical tools as the means for doing that. "Diffraction is not a set pattern, but rather an iterative (re)configuring of patterns of differentiating-entangling. As such, there is no moving beyond, no leaving the 'old' behind. There is no absolute boundary between here-now and there-then" (Barad, 2014, p. 168).

By attending to Haraway's (2016) notion of relational natures of difference, I use a diffractive lens to be responsive to patterns that map not where differences appear but rather to map where the *effects of differences appear*. Barad (2007) states that while diffraction apparatuses help us:

> . . . measure the effects of difference, even more profoundly they highlight, exhibit and make evident the entangled structure of the changing and contingent ontology of the world, including the ontology of knowing. In fact diffraction not only brings the reality of entanglements to light, it is itself an entangled phenomenon. (Barad, 2007, p. 73)

By not elevating all things or matter to the status of exceptional human or de-elevating human to the status of object or things but by exploring the biopolitical, bioethical, and ontological in order to pay attention to the subtleties of an ecological community that takes into account new relational materialist ontologies. Ontologies where "vital" and "lively" materialism is relational and emergent, it is an enduring structure of assemblages that is the product of their internal inertia. Vital new materiality acknowledges the aliveness of matter; it is always more than mere matter it is "active, self-creative, productive, unpredictable" (Coole & Frost, 2010, p. 9). I am using this diffractive approach to explore the many theoretical approaches I have adopted over

time. I am acknowledging that these approaches don't operate in isolation – the traces of past ways of thinking frame and reframe my analysis and the choices I make when encountering data is never in isolation, matter and meaning intra-act, and differences are exposed, and as I follow the path of these differences as they are becoming and are mattering, I am marking and noticing what matters falls away.

Therefore, to grapple with, in order to retheorize the research studies in this chapter, I have employed mechanisms that will help the reader to disrupt idealized ways of understanding children's relations with the more-than-human world. To do this I have sometimes employed the theoretical device of "intra-action" as used in new relational materialism approaches to support documenting messy, heterogeneous relations between children and their environment (in this case the cities) (Barad, 2007; Rautio, 2013a, b). The world, as used with this approach, is viewed as dynamic and in a constant process of "being" and "becoming" material matter. Intra-action constitutes a reconfiguring of "things" and "objects" that are not structured with a specific space or time but are enacted as agential entities flowing in a space-time continuum (Barad, 2007). The focus of reality in this approach is not on the phenomena of the things (their specific properties) but how the things are "in phenomena" – being produced through a series of entangled relational possibilities with other objects and things. Barad (2007, p. 185) uses the term "onto-epistemology" to describe "the study of practices of knowing in being" – an understanding that is central to intra-action. Onto-epistemology assumes that epistemology and ontology are mutually implicated "because we are of the world," not standing outside of it. The separation of epistemology from ontology, according to Barad (2008, p. 829), "is a reverberation of a metaphysics that assumes an inherent difference between human and nonhuman, subject and object, mind and body, matter and discourse." Therefore, when adopting a posthumanism approach, diffraction through intra-action can fulfil the aim of disrupting the Cartesian divide between humans and objects or things in our environment by challenging the simplistic dichotomies of animal/human, nature/culture, and object/subject (Barad, 2007).

As I fall asleep, I conjure up images of the children I met the last time I was in La Paz. I smile when I think of Luis, who was 14 years old when I was here on the mountain, before. I am coming back with the hope of speaking to him again. Now at 16 I want to ask him if his life has changed since we last spoke. Two years ago I had given Luis a camera so he could take photographs of his life up in the valley. A week later I had visited him and his friends at the local sports field to give him his photographs back. I also interviewed him. After he had a chance to look at his photographs, Luis had summoned me to come over, and then he showed me this photograph (Fig. 1).

> "I want you to have this one." he had said. ".. it is my favourite. The Illimani mountain is in this photo and a view over the city of La Paz from the El Alto. I can see Illimani from my house when sunshine hits the snow it fills me with joy." He then paused for a moment and closed his eyes, "My dream though is to live far, far, away from the city and my mountain, to be in the country where there are trees and fresh air where it is clean and safe."

Fig. 1 Illimani mountain. (Source: Photograph taken by Luis age 14, Cotahuma La Paz)

Fig. 2 My imagined dream place. (Source: Drawing by Luis aged 14, Cotahuma, La Paz)

He then drew a picture of his dream place for me and explained:

My favourite place is the country because it is peaceful and open, the places are beautiful there. This is the house where I can live in the country. The view from the hills, you can see everything. I like it because there are many rivers and fish (Fig. 2).

When Luis dreams of moving back to the countryside of Bolivia where many of his family still live, his life is representative of a rural-to-urban movement that is well established in our rapidly urbanizing world. Sixty million people in the developing world are leaving the countryside every year. For the first time in human history, more people live in urban than rural areas, and city populations are growing by more than 200,000 new inhabitants each day. As people continue to migrate the numbers of people living in slums, shantytowns and informal settlements rises steeply. Over one billion people currently live in slums that amount to one in seven people on the planet. Most come to the city holding onto a dream of a better life – more schools for their children, healthcare, jobs – to move out of their poverty. City life in cities like La Paz comes as a mixed blessing for children like Luis. The sense of deprivation and disappointment can be multiplied as children like Luis are so close to the opulence of modern society yet so far from enjoying it. Luis and his friends are exposed to a range of risks in their precarious environment: polluted air, dirty water, traffic accidents, flooding, potential landslides, forest degradation, the lack of sanitation, and the stench of garbage surrounding their homes. For these children, surviving to 5 years old is a major milestone, and the dream of a better life is often a privilege. The research activities conducted with the children by my team of newly graduated students from the social worker department of the University of San Andres in La Paz have been documenting the lives of children growing up in La Paz. Through their everyday encounters of being with others, our intention was to be influential with city council officials so they could create, for the first time, a children's plan for the city (Malone, 2018).

There has also been something more personal than the research study that connected me to Luis and other children who I have worked with in these challenging places. Like Luis as a child, I also had dreams for a different world. There was a place in my neighborhood, a place where I sought refuge. This was a place where I could quietly be *with* the world. The birds, lizards, and plants were my kin. My "humanness" was invisible; I existed merely as a "being," an entity among others who shared these spaces with me. These times exist as past tracings that I carry around within me. These moments captured in my body as a small child have influenced my thinking and drove me to understand the importance of children "sensing ecologically" through bodies, with bodies' affective relations with the leaves, the sky, the breeze, and the birds. I wrote this poem at a diffractive moment, leaving place, leaving kin, and leaving childhoodnature. The poem adorned the first page of my doctoral thesis 18 years later.

> Sitting on the rock
> I can hear the breeze
> playing on the leaves in the trees
> The sound of water trickles through my thoughts and dreams
> Is that a blue Wren in the distance I can hear?
> Wren will you be singing here again tomorrow?
> or is your life so filled with sorrow
> since they choked the sky with smoke and took away your home?
> The silence is so easy

Hiding in the shadows of history
time stands still when I am here
It is my special place
Nobody knows I am here
Nobody knows where I go
But special place will you always be here?
Do you quietly fear .....
as I do?
That in years to come the shadows will be gone
and only memories will stand in this place.
Karen Malone, March 1978, age 15

Luis calls her Pachamama *Earth mother*; as a child I called her Mother Nature. Mother Nature held me tight in those times when I felt that all humans had abandoned me. So how did I, a girl growing up in public housing in the outer suburbs of Melbourne, Australia, come to be here in this place with Luis and his friends discussing dreams and aspirations and learning to live with difference differently? Being connected, enmeshed, and entangled with their life and with my ghostly tracings remind me that we live in a time of rupture, a world haunted by the *Anthropos*.

Diffractive Stance 1: Socially Critical Environmental Activist Re-turn

When I first considered working with posthumanist approaches, I imagined that I was embarking on a new theoretical journey, a new way of seeing the world. But the more I have become entangled in my posthumanist new materialist thinking, the more the traces of its past iterations are being revealed to me. As a child in that poem who knew how it felt to be in an ecological community and to know plants and animals as kin, and professionally it and as a researcher in early 1993 when I arrived at the housing estate in Laverton Park to do my doctoral research, I came to realize seeking ecological kin was not a desire of mine alone.

It is now over 20 years ago since I first came to be collaborating with children who were experiencing the impacts of a mounting environmental crisis. The implication of an advancing anthropocentric world where nature was viewed as vast and bountiful as an unlimited resource for humans is that economic and technological progress was left to advance unchecked because technology could provide a solution for any ecological problem. I remember feeling at a loss as to how I could support the children as I looked across the highly degraded urban environment. The social and ecological degradation going hand in hand seemed to sap the energy, the desires, and the dreams from its inhabitants. I had young children at the time who played in well-manicured "natured" playgrounds, in safe suburban streets some distance away, and it seemed such an injustice that children in the same city were exposed to unsafe, polluted, toxic play spaces. The term Anthropocene hadn't been introduced into the nomenclature of the environmental crisis, but the sense of foreboding and its

Fig. 3 Offensive industries creeping up to the housing estate buffer zones, Laverton Park Housing Estate, Melbourne Australia. (Source: Photograph taken by author)

implications for the planet were already being revealed to me through the everyday lives of those most vulnerable to it, the children and the environment.

Although there were large expanses of vacant land owned by the government or industry, in Laverton they had lain idle for years and had, through neglect and lack of regulation, become dumping grounds for toxic waste and household rubbish. There were few parks or playgrounds with the only substantial area of public open space being McCormack Park. Local residents and educators describe the issues like this:

> "It is a bit late; we are surrounded by industry polluting all the area so bad that children occasionally come home from school with hands on their mouths to try to breathe", "Living close to industry can become very depressing, especially on windless nights when the stench of industrial fumes permeate the air." "The EPA say the industry doesn't put out emissions but when I wake up in the morning and my washing on the line is covered with smelly thick soot – I question that" "Children at this school suffer at a much higher rate than normal asthma, learning problems and constant general sickness" (Fig. 3).

A teacher in the local public school describing it to me stated:

> The general impression is that Laverton Park is the slums. People have deep sympathy for you if you say you work at Laverton Park. It's very hard, it's just an attitude people have. I just wonder if the kids don't take on that identity too, certainly the parents feel guilty that the children get so sick from the industry but many of them have no choice they cant afford to live anywhere else.

After my first days of visiting the school, I went home and wrote in my researcher's journal the following reflection. It revealed the very personal impact of being in the community:

> When I was a child I spent my first years living in a housing commission estate built at around the same time as Laverton Park. The school I attended was built from the same grey mortar bricks and the houses built in the same prosaic design. When I wandered around the school grounds today at Laverton Park I was constantly reminded of my past. I tried to recall how being in the school and living on a housing estate felt as a child.

The focus of the community environmental program being supported through the local primary school was to alter the power relationship that existed between the community and city authorities – to provide the space for the communities silenced voices to be heard. It meant supporting the community to perceive themselves not as mere objects of their social conditions but as active creators and narrators of their own lives. This had just started when I entered the community. I could tell from my first community meeting that the community, the children, and the adults felt powerless and silenced. This they told me was a consequence of them being "poor," having no political clout, no social status, and easy to ignore. They had come to accept that this was the way life was. It was their destiny, their lot in life, and their cross to bear. When I saw the principal of the school during my first visits, I asked him to describe the community program. This is what he had said:

> It was about developing a system of values for life – that you have the right and ability to change your world, change your society, that you can influence it. A lot of children and adults from this community don't believe they have the ability or right to do that. We're trying to set up something where the community would in every real sense own it and make it, would drive it and lead it to wherever it goes – empowering people to change society.

In my thesis I wrote the following to support how I was defining my own ideologies around the environmental movement and the theories informing my activist research position with an open invite to environmental education researchers to consider themselves as research activists. Oppositional or counter-hegemonic ideologies challenge dominant ideologies by disrupting the dominant discourse and providing alternative ways of viewing the world. Ideology becomes the tangible outcome of our consciousness; it helps to determine how we will "act" in our world. The environmental movement was committed to an abandonment of the commonly accepted and reigning paradigm of modern society or, as Goldsmith (1992, p. 337) aptly stated:

> So long as we argue within the accepted 'conceptual framework' of the reigning paradigm, or the canonical knowledge of the day, we can never persuade people either to accept a new idea or to abandon an old one ... it is the paradigm of science itself that must be abandoned, and hence the world-view of modernism which it faithfully reflects; and they must be replaced by the world-view of ecology.

The *cosmological dimension*, according to Eyerman and Jamison (1991), was the world view from which a social movement constructs its historical meaning and its utopia. It is the ideology or common belief held by its members. In environmentalism this was evident in the establishment of a new environmental worldview, an alternative way of viewing nature and society relationships. Cosmology served as a translation process and popularized systems ecology to the extent that the process of studying ecology became a discourse in the public arena and was used as a process for social and political action (Eyerman & Jamison, 1991). It was from the work of Carson (1962), Commoner (1972), Bookchin (1971), and Goldsmith (1972) that ecology was transformed into a kind of social philosophy (Eyerman & Jamison 1991, p. 71):

> As a break from the old conservationism which separated nature from society and acted on a continued separation – that is what wilderness preservation is all about- the environmental movement presupposed an ecological society, and by presupposing it, by conceptualising it, acted to achieve it.

It was the environmental movement that provided the space for the science "ecology" to move beyond the realm of scientific theory and become a way of life: "the movement provided the social context for a new kind of knowledge to be practiced" (Eyerman & Jamison, 1991, p. 73). The new ecological world view, the utopia, became the glue which bound the members of the movement together; it was an identity to which all who participated in the movement subscribed, of which I also subscribed as a member of the local conservation society and wilderness group.

Environmentalism and the environmental movement at this time gave rise to my early research by evolving as a philosophic discipline devoted to the interrelations between people and nature (Fairweather, 1993). This new philosophy "ecophilosophy" was concerned with thinking about nature and our relationship to it. The Norwegian philosopher Arne Naess began in 1973 to promote ecosophy or deep ecology as a comprehensive, integrative academic inquiry. Naess (1973, p. 99) stated:

> ... in so far as ecology movements deserve our attention, they are *ecophilosophical* rather than ecological. Ecology is a *limited* science which makes use of scientific methods. Philosophy is the most general forum of debate on fundamentals, descriptive as well as prescriptive, and political philosophy is one of its subsections. By an ecosophy I mean a philosophy of ecological harmony or equilibrium.

When I first started researching at Laverton Park, the children and the community seemed extremely apathetic to me about the degraded environment. Rubbish lay on the streets, there were no trees in the park, and the creek lay dead and dormant winding through the housing estate like a snake ready at any time to reveal some torrid poison. When I left 3 years later, the children with teachers and the community had planted over 10,000 trees in the park, cleaned up the rubbish, placed oxygenation ponds in the river, and had devised enough water quality data to convince the Environmental Protection Authority (EPA) to fine a number of the offensive

Fig. 4 Thousands of trees later. . . Laverton Park Housing Estate, Melbourne, Australia, 1996, Laverton Park Housing Estate, Melbourne, Australia, 2016. (Source: Photograph taken by author)

industries who then placed filters on their discharge pipes. With the community I had watched the world around the neighborhood change. They had made changes, through new imaginings, where they reconstructed themselves as a scientist, arborist, activist, anthropologist, and mostly as educators; they began to see themselves as connected, part of, and embedded in the liveness of the ecology of their urban landscape. The two photographs below are taken at the same location 20 years apart. The impact of the planting trees, cleaning up and diversifying the degraded ecosystem, and bringing attention to the "polluters" had been significant, and 20 years on the small seedlings have grown to become a eucalypt forest, a home for an array of others (Fig. 4).

I remember telling the children that by putting in oxygenation ponds, we were bringing life back to the river allowing animals to breathe to exist in the toxic water. In particular we had discussed how frogs were sensitive to the contamination because of

their porous skin. Frogs, as I remembered from my own biology classes in year 7, were an indicator species. On the final day of leaving the school, a child came running into the classroom, out of breath, agitated, and seemingly distressed. This normally would have set off alarm bells that something terrible may have happened at home during the night. But when I calmed her down enough so she could speak, she said: "I found a frog, I found a frog in my pond I found a frog, our river is alive ...."

In my doctoral thesis, I wrote that the dominant world view has entrenched a structure of hegemonic values and processes based on "human exceptionalism." Drawing on Merchant (1992, p. 63), I wrote, "Environmental ethics are a link between theory and practice. They translate thought into action, world views into movements." I supported this position using the work of Catton and Dunlap (1980, pp. 17–18) who had identified four assumptions held by contemporary industrial societies that reinforced the separation between ethics and morality and natural law in science: (1) People are fundamentally different from all other creatures and have dominion over them; (2) people have control of their own destiny. They can choose their own goals and learn to do whatever is necessary to achieve them; (3) nature is vast and bountiful and provides unlimited resources for people to satisfy their needs, wants, and aspirations; and (4) human history is the story of economic and technological progress. Progress need never cease because technology can provide a solution for every problem.

In Australia at that time, a number of environmental educators were contesting these assumptions (Fien, 1993; Gough, 1992), and by drawing again from the writings of Catton and Dunlap (1980) and Merchant (1992) in my research, I proposed four new or alternative assumptions to underpin a new environmental (ecological) paradigm and oppose the natural law of science: (1) humans may be exceptional species in some respects; however, they still depend upon other life forms for their survival; (2) human affairs are influenced by social processes; however, they are also influenced by the biophysical environment which often reacts to human activities; (3) the biophysical environment imposes constraints upon human affairs (e.g., human health and survival are possible only under certain environmental conditions); and (4) no matter how inventive humans may be, their science and technology cannot repeal ecological principles; there are limits to the economic growth of human societies Malone (1996).

In my writing I identified the basic tenet of this emerging shift as the expansion of human sympathies to include the nonhuman. Environmental ethics at this time as expressed by deep ecologists was viewed as a shift to a valuing of, and compassion for, all forms of nature – nature had valid rights that needed to be considered alongside human rights. Devall and Sessions (1985) at the time had summarized these two positions as an ecological consciousness that was in sharp contrast with the dominant world view. I had included the following tables as a summary of where my ecological theoretical approach was located. I argued that my theoretical framing was in opposition to the dominant world view and cohesive with ecocentric ideologies (Table 1).

The central thread weaving through the program at Laverton Park was the notion of collective action – providing opportunities for all members of the Laverton Park

Table 1 Contrasting world views and informing ecological ideologies from my 1996 doctoral thesis. (Source: Malone (1996) adapted from Devall and Sessions (1985) and Merchant (1992))

Devall and Sessions (1985) **Dominant world view**	**New environmental (ecological)** **World view**
Dominance over nature	Harmony with nature
Natural environment as resource for humans	All nature has intrinsic worth/biospecies equality
Material/economic growth growing human population	Elegantly simple material needs
Belief in ample resource reserves	Earth "supplies" are limited
High technological progress and solutions	Appropriate technology; non-dominating science
Consumerism	Doing with enough/recycling
National/centralized community	Minority tradition/bioregion

Merchant (1992) **Egocentric**	**Homocentric (anthropocentric)**	**Ecocentric**
Based on mechanistic science	Based on dialectic science	Based on holistic science
Matter is composed of atomic parts	The whole is a relation among parts, rather than a sum of elements	Everything is connected to everything else
Whole is equal to the sum of the parts (law of identity)	Emphasizes change, historicity, and social construction	Whole is greater than sum of parts
Knowledge is context-independent	Knowledge in any given period changes over time; it is socially constructed	Knowledge is context-dependent
Change occurs by the rearrangement of parts	Greatest good for the greatest number of people	Primacy of process over parts
Dualism mind and body, matter and spirit	The environment and society are the living contexts of life	Unity humans and nonhuman nature
Maximization of individual self-interest: what is good for each individual will benefit society as a whole	Look beyond the individual to the social and environmental whole for values by which to restructure the world	Faith all living and nonliving things have value
Mutual coercion mutually agreed		Duty to whole environment
		Human and cosmic survival

community to be involved in actions that would benefit the environment. As a researcher and co-participant in the community, my role as an environmental activist meant that I used the knowledge and practical skills I had to support these environmental actions. In practical terms this meant I not only observed and documented the actions of others but also became involved in community consultations to develop the plan of action, in helping to negotiate for funds to support the revegetation programs, and by planting trees with the community. It was a process of sharing and learning the importance of dialogue and the dialogic processes as a means of

providing a context for a shared activist stance. Even though I did not notice or give attention to the nonhuman entities travelling in that research journey with us, I look back now and realize that they were there at the level of ideology; the theoretical frame informing the research was always one of husbandry or "caring" for the environment. And just like in my childhood special place, and Luis with his Mt. Illimani, these children at Laverton sensed and knew it was "right" to care and to be with others and to be in a common world with other nonhuman entities.

In this study at Laverton, I used socially critical theory, drawing on theories of false consciousness, hegemony, governmentality, and false illusions. I explored the impact of social stratification and the relationship between structure, power, and agency. My intention was to support the community to reclaim their identity and voice and to identify how and where the power of their oppression was specifically located and to look for ways to live in a more harmonious relationship with their environment. While I was adopting an ethnographic stance, I also shared a role with the community in their activist processes, where they took up the role of "organic intellectuals." I was also introduced to participatory research as a way to work collaboratively with community and to help support them to be active in transforming their situation through research. Participatory research acted both as a methodological and a theoretical framework with oppressed others taking on the role as researchers in pursuit of answers to the questions of their daily struggles and to give a voice to the silenced, including the environment. Theoretically the research sought to find the means for exposing the myth of neutrality and objectivity and emphasized the principles of subjectivity. It brought into light the human/nature and subject/object binaries, but other than developing an awareness of the need for a paradigm shift where these binaries no longer had supremacy, they were exposed and yet under-theorized. The everyday lived experience of "forgotten classes" being in the world negotiating power with the most dominant while all the time seeking to construct counter-hegemonic discourses that reveal the false illusions that sought to maintain oppression, silence, and ecological degradation was exposed. The theoretical framing was based on the belief that ordinary people, including children, were capable of understanding unpacking, noticing the imbalance of power between themselves and nature and the dominant class.

The desire to rewrite the masters' story of human was evident in the work of Val Plumwood who at the time was a very influential in my thinking. Plumwood as a forewarning of time ahead wrote over two decades ago:

> The reason/nature story has been the master story of western culture. It is a story which has spoken mainly of conquest and control, of capture and use, of destruction and incorporation. This story is now a disabling story. Unless we can change it, some of those now young may know what it is to live amid the ruins of a civilisation on a ruined planet. (Plumwood, 1993, p. 196)

The work of ecofeminists such as Plumwood supported the final thesis of my study, a call to environmental educator researchers to take up the role as environmental activist in the same way feminist research scholars had taken up the role as

feminist activists. These theoretical outcomes of the research were explored in a paper *Environmental Education Researchers as Activists* published in 1999 in EER. I wrote in the article:

> The view of researcher as environmental activist I put forward is not restricted to an argument for a specific social research methodology but because I believe as intellectuals we carry a responsibility to engage in struggles of democracy and justice. As an environmental education researcher and an environmental activist I have a personal and professional commitment and responsibility to support and empower community members to be active in social and environmental change. I am engaging in a highly politicised act. How these multiple roles were constructed and synthesised is the essence of my research story." (Malone, 1999, p. 166)

The paper was one of the most cited papers at the time and was selected for the 10-year anniversary of the journal to be part of a special issue and book. The reprinted article included a commentary by Kim Walker. Walker summarizing the focus of the published paper wrote:

> Malone argues for an activist approach to environmental education research drawing on parallels that exist between feminist educational research and environmental education research. She argues that as a researcher in environmental education the researcher is engaged in a political act and that researchers are generating knowledge to advance a social movement. Malone calls for researchers to move out of the 'academy', develop partnerships with communities and become involved in political activism. (Walker, 2006, p. 394)

She then went on to explore the relationship between the particular theory, socially critical theory, that I had selected and the predictability of a set of conclusions from the research. In particular she questioned whether the theory has been central in the selection of a community (one suffering environmental problems, unemployment, and ethnic issues) that would meet the conditions of matching my theory:

> Malone's preferred theory in fact gave her the opportunity to understand that the participants of her study had adopted an activist approach to solving community problems in a manner that she did not expect. More importantly, she was able to develop a theory of the researcher as environmental activist based on her own experiences in the research process. (Walker, 2006, p. 399)

Diffractive Stance 2: Critical Cultural, Sociological, and Geographical Re-turn

Next came the "cultural, geographical and sociological turn." It was now 1996, and my thesis was submitted. In the role as a postdoctoral fellow with the UNESCO, I took on the role as the Australia director of a large international project *Growing Up In Cities*. As an eight-country study replicating the work of urban planner Kevin Lynch from the 1970s and coordinated by Professor Louise Chawla, this project

allowed for a transdisciplinary, trans-theoretical approach to research with a focus on positioning children as co-researchers. Children who participated were living in some of the most disadvantaged city neighborhoods in South Africa, Argentina, Poland, India, Australia, the USA, the UK, and Norway. The international team included urban planners, environmental psychologists, architects, anthropologists, geographers, and myself, the only education/social science researcher. One aim of the study was to represent the diversity of childhoods and, where possible, longitudinal comparisons. The project was published as a book of cases with the first ever set of qualitative indicators of environmental quality devised by children and was produced (Chawla, 2002). The methodological aim of the project was to devise a model of children's participatory research that would be generative and culturally sensitive. The audience of the research was UNESCO and UNICEF, in particular, but also other UN agencies, could use it to collect qualitative data with children in order to represent the fine-grained differences and experiences of children's everyday lives across a variety of neighborhoods in cities (Driskell, 2002).

After the *Growing up in Cities* project was completed, I continued to work with UNICEF on their *Child-Friendly Cities* international project. Building on my previous child-focused studies, I continued to refine with others the development of a place-based participatory research approach for researching with children. At the time I was also conceptualizing new ways of exploring the data with emerging theories from human and cultural geography, globalization, postcolonial theory, and the new sociology of childhood. These research studies were located with disadvantaged communities in city and rural villages in Papua New Guinea, a number of Pacific Islander communities, HIV-AIDS orphaned children in South Africa, and city, suburban, and small-town sites in Japan, Australia, and most recently Kazakhstan, Albania, and Bolivia. I called this my cultural, geographical, and sociological turn because it was during this time that sociocultural theory and geographical theories (inclusion/exclusion, affordance theory) meet with critical place-based studies to take on a central role in my reading of children's lives. Like another participant in the children's stories, it (place, geography, culture) wrote itself into my storylines with such vengeance that it was often hard to see outside of the thickness of the rich descriptions by children of childhoods as cultural, social, and geographical beings. I was very influenced by the compelling call by Qvortrup to childhood researchers:

> . . .children have been present all the time and they have influenced both their significant and insignificant others as well as the environment they were a part of. As other minority groups in history they cannot help having had an influence by means of their mere presence either as workers, helpers or as a nuisance. The research which is now being done in order to reveal their actual role in history and society is very important and must be continued with vigour and hard work. (1999, p. 5)

During this period I was employed by UNESCO to do conduct research on childhoods in the Cook Islands; the following is text taken from my writings around this time (Malone, 2011).

The image of childhoods on the Pacific Islands is often one of utopian paradise – clear blue oceans, palm trees, white sand, and other tourist brochure clichés. But for island communities behind this holiday facade, they face serious and unique challenges comparable often to the world's poorest nations. There have been long-term impacts of capitalism and free market on these fragile island ecologies: climate change, resource exploitation, pollution, and loss of culture to name a few. Islands are often strong metaphors in anthropology and other disciplines (such as biology) as isolated, unique, and bounded frequently portrayed as the archetypical metaphor of a closed, self-sustaining social, and spatial system. But it is important to debunk this view, even that somehow only modernist versions of globalization and a greedy capitalism have changed this isolation. That is, globalization is not a postmodern phenomenon; island cultures have always been involved in extensive networks and flows across hilltops, across islands, and across oceans. They are not exempt from the ecologies and degraded environmental conditions of a twenty-first century world consumed with consumption, including the consumption of child bodies, island resources, and cultural capital as they sip cocktails by swimming pools in gated hotels. My role was to bring the child-nature-island perspective to the world stage; small island states were being identified as central to debates on climate change and global warming. The research was to be an art of global call by children at the UN meetings on the sustainability and future of small island states (Malone, 2011). The following is a typical sociocultural storyline from children we researched with.

My drawing is of the beach because it is my favorite place. I love to look under the water at all the sea creatures and make sure they are OK. We have to take care of the beach because the animals will die if we don't. In my picture you can see a coconut palm, beach, and the sea, and in the sea are rocks, fish, coral, seaweed and jellyfish. And at the front, that's me. I am dancing at the beach. There are not many places I don't like to go, but I don't like the graves. They scare me. And the jail is bad especially when someone has to stay there I get scared for them. I think it is good that people come to our island. They need to learn our culture. But it is bad if they don't be nice or steal and stuff. We need to tell them not to pollute or leave rubbish. I think we should teach them about our beautiful island. The good thing about tourists is that they bring money and make jobs. The bad thing is that they leave rubbish and fight and get drunk. They should respect our culture and our language. When I grow up I would like to go to New Zealand, but I would come back (Fig. 5).

Children on the island were strongly committed to being active agents of change in their community, especially through the use of technology. We heard stories from both children and elders of villages, explaining how the children had become keepers of much of the traditional knowledge as they recorded songs, language, and other cultural artifacts from island elders on computers and uploaded them for others to see on the Internet. There was also a strong conservation movement fuelled by a number of active NGOs in the Pacific which have been working to develop environmental and sustainable practices for small island nations. Children have often been identified as the key actors in these environmental projects (Malone, 2011). From large-scale cleanup days, to campaigns to create *Raui* (marine protected areas) on fragile island reefs, children have been central. Teokotai aged 13, from Mitiaro,

Fig. 5 Drawing of my special place. (Source: Elizabeth, age 10 years, Rarotonga, Cook islands)

tells me: "We don't know enough of what is going on outside in the world, we need to be connected in order to be active in the future so we can protect and contribute to the global environmental issues." In a published article, some years later I described my encounters of Cook Island childhoods this way:

> Their experience of childhood, while personally unique, can be understood as a collective as well as an individualised journey in the process of being a child and growing up. Their stories weave threads of a collective concern about the need to have a voice, to move out from the periphery and into the centre of their island life. And while I have attempted to provide a construction of island childhood one which demonstrates the cultural autonomy of childhood and children's distinct identity from adult island society. I am also aware that to universalise their life would be to overlook that their culture of childhood is situated within and alongside, rather than outside, the world of adults Identities are neither fixed nor given; they are not ascribed or belonging to a particular culture or dependent on living in a particular space, but are the outcome of the negotiation of multiple spaces and multiple cultures. (Malone, 2011, p. 475)

This research, as with others projects I was working on during this time, was very political; children's rights in newly formed democratic countries like the Cook Islands are often tenuous and superficial. A human rights submission to save the Motu Koitaba city village in Port Moresby, for instance, put me in opposition to the government, who decided they could not ensure my safety when moving around the city. In response my research colleague and I elected to sleep in the village on the wooden floor of an elder's hut. The toilet was a hole in the pier, mosquitos buzzed inside netting, and the young rascals who were in opposition to the government took over as our security patrol. More recently, I have been again challenged with my own middle-class white privileged life when in the eastern cities of Kazakhstan my throat stung so much

from acrid toxins in the air I could hardly breathe. And again while in the western city of Aktau, Kazakhstan, I was reminded by the children that the nuclear reactor on the outskirts of town was so old it had been condemned. "Did you know?" they asked me. Did others know? Did the rest of the world understand what was hidden in these cities off the grid, far from prying eyes? I was sitting on a mountain pouring over 2000 photographs from children in La Paz feeling inadequate that I could only include brief descriptive data in the city report. Mostly in the report I wrote only of the role of children as social agents but all the time knowing there was so more being revealed. So many other actors were invisible.

Throughout this "cultural, geographical and sociological turn," I continued to explore the lived experience of my own subjectivity, always disrupting the subject-object binary. I was guided by the sentiments of writers like Michael Jackson at the time when he wrote: "Lived experience accommodates our shifting sense of ourselves as subjects and as objects, as acting upon and being acted upon by the world, of living with and without certainty of belonging and being estranged" (1989, p. 2). When reconfiguring my researcher role, I found myself seeking to find a close, empathetic position as an insider yet constantly aware of my power as an outsider. I questioned the impact of these multiple roles in countries where I did not speak the language and was positioned as an "expert" whose roles were to bring attention to "children's rights" through their participation, to have a voice. I had a great sense of responsibility to the children and their families to make sure their views were listened to, taken seriously, and acted on. I was drawing on an "epistemology of insiderness" that saw life and work entangled, where my life and the life of the communities, especially the children, became entwined in complex relations. The audience of government and especially policy-makers put pressure on me to "represent" data as discreet and clean, with which would be digestible to their needs, rather than providing me with opportunities to delve into and explore the complexities, to know these lives more deeply. It was from this yearning, a sense that these stories weren't allowing the deeply entangled lives of children to be present, that I embraced the theoretical musings first of Rosi Braidotti and then Karen Barad and considered if I could revisit this data through these new lenses.

Diffractive Stance 3: Critical Posthumanist and New Materialist Re-turn

The most recent theoretical and methodological "re-turn" is an emerging "posthumanism and new materialist turn." This turn supported a shift in focus, from culture as outside of nature, to a reorienting of relations where the human and more-than-human world were recognized as existing in an ecologically collective of "messy entanglements." By employing the potential of posthumanist approaches, my theorizing was seeking to critique classic humanism, an approach that emphasizes only the value and agency of humans to the detriment of the agentic potential of the more-than-human world. Through the import of de-centering the human by using new materialist approaches, I am being enticed to question the centrality of the

human and to reconsider the way humans relate to, set ourselves outside of, and seek to dominate the more-than-human world. Beyond the global crisis, these new ways of considering relations with the planet had important consequences for understanding current debates around children's encounters and relations with the more-than-human world. By reimagining in a vital new materialist manner, I was acknowledging "the intricate web of interrelations that mark the contemporary subjects' relationship to their multiple ecologies, the natural, the social, the physic" (Braidotti, 2013, p. 98). I was noticing and attending to the subtle ways "other objects" (animals, plants, buildings, earth, air) were often disregarded as nothing but aesthetics, the background context of children lives. A feature of this new ontological perspective was that "it shifts from conceptions of objects and bodies as occupying distinct and delimited spaces, and instead sees human bodies and all other material, social and abstract entities as relational" and that these "...assemblages of relations develop in un-predicable ways" (Fox & Alldred, 2014, p. 401). I explored these new theories by returning to research data from my studies with children in a 4-year period between 2012 and 2016. During that time I was researching again for UNICEF and had worked with four regional and inner city communities of Kazakhstan and the three communities in the higher reaches of the valley of La Paz, Bolivia.

The posthumanist/materialist reading of nonhuman encounters in urban environments helped me to unpack the political, ethical, and ontological questions about human-nonhuman relations through a deepening sense of intraspecies interdependence. The materialist reading, in particular, exposed the physicality of the relationships, an embodied reality of knowing others and what it meant to live in oneness with the nonhuman. While reflective or critical analysis had provided opportunities for me in the past to see similarities and cohesion in my data across place and time (reflecting sameness), working with diffractive lenses allowed for an opening up of data, "to diffract it, and to imagine what newness might be incited from it" (Hultman & Lenz Taguchi, 2010, p. 6). Rather than a fine-tuned analysis of the theoretical field of childhoodnature, I sought to share with the reader my grappling when applying these approaches. I moved away from generalizations and assumptions that have often universalized children's environmental experiences, and I sought to find a glimpse of the complexity of urban environments. I was using a diffractive analysis technique.

Diffractive theorizing encouraged me to view differently a shared ecosystem of bodies. Hultman and Lenz Taguchi (2010) term a "diffractive way of seeing" (p. 535) as involving reading with, not against data, allowing the data to work through you. Often I will insert scientific information juxtaposed with personal stories and children's images. These threads weave a complex and deep understanding of the different ways for representing what knowing and being in the Anthropocene could mean.

By adopting a posthumanistic approach and considering the value of theoretical tools like diffraction, I have sought to deconstruct children's relations with other "entities" or objects by expressing their encounters with all objects and entities as being shaped through noticing and being attentive to ". . .. space in between children

and their environments" (Rautio, 2013a, p. 4). I analyze data that does not fit into neat categories of certainty with closure; rather I research where the "complexity and open-endedness of phenomena" are not sacrificed. Drawing from Bruno Latour's concept of "learning to be affected" – which requires the researcher to develop more than cognitive modes of attention – I want to become attuned to the multifarious ways human and nonhuman bodies and entities move and affect each other.

Intra-action therefore supports the capacity for human-nonhuman encounters to co-merge (to take up an intersubjective position) where all things are "agentic" – that is, agency is not something a body (human or nonhuman) or an entity has but that it is a relationship brought about by intra-action. Rautio, for example, explains the distinction between more common ways of thinking about interaction and her use of Barad's offering of intra-action in the following way: "In interaction independent entities are viewed as taking turns in affecting each other, which implies that these entities are taken to each have an a priori independent existence. In intra-action, on the contrary, interdependent entities are taken to co-emerge through simultaneous activity to come into being as a certain kind because of their encounter."

My "posthumanism and new materialist turn" is evolving. Throughout my recent writing, I have endeavored to reveal my own struggles to reconcile my desire be to honest and respectful in the reporting of the children's lives and, in particular, incorporating child rights with rights for the more than human world while engaging in analysis that disrupts anthropocentrism and continue to expose the implications for a long history where humans have considered themselves as exempt from nature and as exceptional beings. In revisiting my earlier research in the early nineties, I felt rather than letting go and starting anew that this re-turning was enmeshed with past tracings of theoretical engagement with deep ecology, in particular, the work of ecofeminists such as Val Plumwood and Carolyn Merchant. When posthumanism contests the human/nature dualism, a dualism that installs this mastery and strips humans of their own "natural" dimensions, it challenges the myth that we are no longer animal nor part of nature and that nonhuman entities are not comparable to humans because they don't have emotions and attachments, comparable to humans.

Smith argues that the posthumanist perspective takes seriously this urgency for critique to stop "the anthropological machine, the constant production of absolute dividing lines between humans and the rest of the natural world" (2013, p. 24). And Wolfe argues that to question "humanism" in the posthuman is to be attentive to its limitations:

> . . .posthumanism isn't posthuman at all – in the sense of being 'after' our embodiment has been transcended – but is only posthumanist, in the sense that it opposes the fantasies of disembodiment and autonomy, inherited from humanism itself. (Wolfe, 2009, p. xv)

Children are closely affected by dogs. It is an ancient alliance of dogs supporting human survival by their capacity to be alerted to, and have sensitivity for, the precarious landscape. The child-dog intra-action and cohabitation provide a space for this mutual reciprocity, care, and protection to be thrown together and to be living well together. The child-dog accounts of intraspecies companionship and survival in

urban spaces in La Paz challenge the sanitized boundaries and binaries maintained by Western middle-class sensibilities. The "unromantic" child-dog relations experienced by impoverished urban dwelling child-dog bodies of La Paz contradicts Western centric views of humanized, romantic urban environments where nonhuman "animals" are wild, unwelcome, savage, and marginalized and children are "adult becomings," safe, secure, and contained by adult lives.

Diego takes photographs of stray street dogs, the ones who often accompany him as he walks the streets. He hands me one where I can see a dog high up on a roof alone, looking down. He explains, "this photograph is of a dog that I take care of because it doesn't eat. The dogs are badly treated and the people beat them for no reason [pause] a bit like the children [he giggles as he looks at his photograph] sometimes we hide on the rooftops to be off the streets with the dogs." The other photograph? "That is the dog that sometimes gets beaten, the streets are dangerous" (Figs. 6 and 7).

Many children feed street animals; they told me they felt distressed when animals were treated badly by others, normally the adults or strangers in the neighborhood. Dog-child entities are "co-present" in the streets, the children and the dogs yielding a shared "worldly collective" of the street-home-being present, dwelling in this shared place. Street dogs are urban scavengers, not Western-style, house-dwelling, middle-class "family pets." Child-dog assemblages are expressed through their intra-action in the streets.

Coco is his companion. Juan co-inhabits this environment with Coco. On the way up the valley Juan photographs a large dumping area for household rubbish; Coco is rummaging around amongst the rubbish looking to find food. It is a harsh life they share. Survival is dependent on the possibilities of what can found at this degraded

sites. In the final photograph we come to where Juan-Coco (child-dog) play freely in wild nature. Together they have evaded the confines of the built environment and found refuge. Both photographs Juan show me illustrate something other than an 'idealized' and 'romantic' play place where child-dog encounters of diverse majority world child-nature reconnections are possibly located. 'Coco was my best friend', says Juan, 'He was near me, always he was near me. He heared me, he was always with me. He understands the things I want. He always comed with me into the forest to play. He was my play mate. He was the same as a human friend, it was no difference between us as friends. He is gone now and I miss him. He was part of me and my life. My heart aches now. Death is all around me now' (Fig. 8).

The land is steep and due to the regularity of landslides and floods, it is dangerous. Rubbish is often dumped here, and dogs scavenge, while children climb trees and build huts. Juan's photographs portray child-dog as they journey and move through the in-between from streets to "wild degraded nature" on the upper reaches of the valley. We sense the intimacy and companionship of child-dog as they explore and roam together from prying adult eyes. This is not a human contrived nature forest play activity or a family dog on a lead being taken into nature with a child, such as we might find in one of Richard Louv's (2005) accounts of his or his children's childhood in middle-class suburbia (see Malone 2016 for further explication of this argument).

Unlike a Western centric theorizing of human-dog relations which often sees the dog presented as a substitute-dependent child – humans findings solace in the seemingly unconditional love from their dogs, the child-dog relations as expressed

Fig. 8 Dog and dumped rubbish. (Source: Photographs taken by Juan age 13, Cotahuma)

by Diego as "beings together" in La Paz are more likened to Donna Haraway's (2015) notion of "making kin." The purpose of or to make "kin" according to Haraway (2008) is to recognize the coming together of different entities who may not be tied purely by ancestry or genealogy. She argues the stretch and recomposition of kin and represents the understanding that earthlings are all kin in the deepest sense – kin becomes the purest of entities in assemblages of the human, more-than-human, other-than-human, and inhuman: "all earthlings are kin in the deepest sense, and it is past time to practice better care of kin-as-assemblages" (2015, p. 162). Kin relationships emerge in this study as a deep sensitivity by the children when describing the similarities of the child-dog experiences (Malone 2016, 2017).

Rather than understanding data as articulated from the modernist divides of human-culture, subject-object, and child-nature, I have in these instances sought to disrupt these familiar patterns and distance my analysis from the dominance of the human subject in order to notice new imaginings for a child-nature assemblage of intraspecies relations. Children's accounts of moving with dogs through dangerous public spaces and exercising mutual care, companionship, and protection in these spaces speak to the way where "dog and child bodies are shared bodies," together they are "learning how to be with" a damaged landscape. They are something outside of the image of the "adult human" in the landscape – the exceptional human and the unified, adult master human who is concerned with dominating and controlling the nonhuman other who is lesser animal, lesser being. Child-dog-bodies of La Paz illuminate children's encounters of dogs in La Paz that as an "ecological collective encounter," it could be possible to further extend Taylor's (2013) adaption of

Latour's "common worlds" notion and advance an indivisible human and nonhuman real-world posthuman ecological collective (Malone, 2017). That is, rather than a child engaging with nature (out there), it could be helpful to adopt the view childhoodnature collectives are integral to and deeply enmeshed in children's lives (Taylor, 2013).

Conclusion: Re-turning as Reconfiguring of Past Tracings

Through the introduction of new theories, namely, posthumanist and new materialist approaches, I have been grappling with the complexities of considering what happened when I viewed my research data differently. Did I even *do* data differently? Part of this was to consider what happened when humans as the "subject" did not occupy central stage in the stories and narratives of my data. What happened when that which was designated as peripheral, those phenomena (nonhuman entities, earthlings, others) that had existed in the background, moved to the center?

By using Barad's work, I am supporting the idea of a "flatter ontology," a flatter ontology that emerges from an understanding that all entities (humans, dogs, rocks, mountains, trees) have ontological significance and are always in relation to one another in nonhierarchical ways. Barad, for instances, writes:

> Neither discursive practices nor material phenomena are ontologically or epistemologically prior. Neither can be explained in terms of the other. Neither is reducible to the other. Neither has privileged status in determining the other. Neither is articulated or articulable in the absence of the other; matter and meaning are mutually articulated'. (Barad, 2007, p. 152)

Diffractive analysis therefore makes us aware of our embodied involvement in the materiality of the event of analyzing data.

As a researcher, in my re-turning to a posthumanist and new materialist perspective, I am implicated in the ethical choices I am making and how that positions me politically. In these current stories where I have retrospectively retraced past theories with current imaginings, I am acknowledging that I was and still am entangled in relations with the nonhuman world in a way that a mere unpacking of an ecological, cultural, or social self didn't fully reveal. I am moving and revealing my shifting as an ontological being, from identifying bodies (human and nonhuman) as separate entities with distinct borders, to think instead of assemblages and interdependences, my onto-epistemological self; I am knowing and being with my past, present, and future. I am inspired by the possibility of an embodied engagement with the materiality of my research: a *becoming with the data* as new and past researcher. I am considering new ways of making meaning from my research that will invite uneasiness, messiness, and complexity rather than reassurance and comfort. I am not separating the past from the present, I am iteratively intra-acting, re-diffracting, and diffracting anew in the making of new temporalities and new ways of knowing and being with the world through my data that includes the tracings of past theoretical landscapes.

Engaging with posthumanist and diffractive theorizing has allowed me to introduce the concept of "posthumanist ecological communities" into my environmental education research. This is different than the "environmental collective action" I supported in earlier theorizing, yet in my re-turn, I can see tracings of an activist stance embedded in desires to unhitch the primacy of the exceptional human in mine and others' writings. Environmental education drawing on environmental collective action assumed a deep ecological perspective that humans should be acting on behalf of the environment; this was essentially motivated by a central anthropocentric ethic; destroying the planet was jeopardizing the longevity of human life on earth. This diffractive theorizing through posthumanist ecological community contests human exceptionalism as I had done before but in turn acknowledges also that we are connected to the more-than-human in more diverse and complex means than I had envisaged before. Taylor (2017, p. 4) responding to one of my current research articles stated:

> She is one of the few environmental education scholars who is calling for 'a new imagining of a 'collective ecology' of human and nonhuman for future sustainability and environmental education'. (Malone, 2015, p. 50) in the Anthropocene

> Motivated by an engagement with posthumanist theory, Malone's notion of 'collective ecology' is not the same as calls for 'environmental collective action' emanating from political ecology and some of the more activist branches of sustainability education. While the former moves from an understanding of the 'collective' as already constituted by humans and nonhumans alike, the latter assumes that humans need to band together to take collective action on behalf of the environment. (Taylor, 2017, p. 4)

In the era of Anthropocene where the human has been positioned outside of the nonhuman, I desire to disrupt dominant master discourses. Discourses that have in the past embedded me deeply in my human dreaming of a Cartesian modernist divide, where children as the decolonized other stood with the nonhuman, separated and outside of the contemporary unified adult human. Through diffractive theorizing I have in this chapter re-turned to the potential of a child-body-nonhuman, childhoodnature within an ecological collective and traced its ghostly presence in over 20 years of research in the field of environmental education and a range of other related disciplines. I have found through diffractive theorizing that my posthumanist approaches are entangled in the ghosts of Devall and Sessions' (1985) new ecological worldview and Merchants' (1992) ecocentric ideologies.

> Ghosts point to our forgetting, showing us how living landscapes are imbued with earlier tracks and traces. (Gans, Tsing, Swanson, & Bubandt, 2017, p. G6)

These new temporalities (spacetimematterings) and emerging diffractive patterns have allowed me to reconfigure my research landscapes and find those past tracks and traces as they now become enmeshed in my newly configured potentialities.

Abstract

Taking a narrative approach that follows Haraway's (Staying with the trouble. Making kin in the Chthulucene. Duke University Press, Durham/London, 2016) call for making kin with growing awareness of a looming 6th mass extinction of species, the chapter focuses on multispecies encounters to consider what

The story is a hen and child story. They are the main actors and we thank them for their ability to call us to attention. Chickens and child are members of Gloria's kin and we hope that we have captured their encounters in ways that agree with them. And Ena, thank you for sharing worlds for a time.

childhoodnature as a concept can do for research. The intention is neither to focus on what can be learned from multispecies child-animal encounters, nor is it an attempt to document such encounters in "real life." Rather, the chapter experiments with the porosity and liveliness of materialized thought (the text) as it gives form to an event (the multispecies encounter) across time and in place. The intention is to speculatively imagine a childhoodnature figuration of a hen and a child as a lively encounter that ripples through time/place and that generates unexpected lines of inquiry. The chapter experiments with a speculative approach to explore new ways of thinking and doing multispecies relationships as "earthly encounters" that matter to politics and ethics of sharing worlds. This, we argue, is an essential task in the midst of loss of diversity as it opens spaces for new imaginings about sharing worlds through kin-making in childhoodnature research.

Introduction to the Experiment

The intention of this chapter is to be experimental. In order to move beyond well-rehearsed habits of thinking, doing, and perceiving the self with the world, the chapter encourages playful imaginings and speculating with a toolkit of concepts, perceptions, and figurations. In the search for new tools that give rise to new stories, the focus are encounters with ideas, affects, and experiences which breathe life into the exhausted forms and habits of thinking and being with the world that we inhabit most of the time in our everyday life.

We tell a story of EnaSilva, or rather, we create the figuration of EnaSilva as a possible childhoodnature figuration. EnaSilva, as figuration, is more than the child and the hen that appear in the narrative. EnaSilva is an attempt to generate alternative imaginings as it aims to express aspects of the complex, "internally contradictory multifaceted subjects we have become" (Braidotti, 2011, p. 26). As a figuration, perhaps it is also less, and more, than what appears in the narrative that follows, in the sense that EnaSilva intends to undo some of the assumptions about child-animal relationships. Speculation is the method we use to rekindle imaginations about what may or may not happen in the encounters between hen and child, but we also make use of interpretation of what we think we notice and observe. This interplay of interpretation and speculation with a childhoodnature figuration creates spaces for us as writers to go beyond what we think we know, and we hope it does something similar for readers.

It seems that new times, and we argue that we find ourselves in dangerous new times where nothing can be taken for granted, need new ideas, new imaginings, and new figurations to cultivate spaces for diversity in a seemingly narrowing world (Bauman, 2015; Morton, 2010). Childhoodnature is a new imagining, and the idea of EnaSilva is an attempt to see what such an imagining can do for research. EnaSilva as a childhoodnature figuration seeks to steer clear of interpretation as representation of "what really happened," of individualization, and of romanticization (Taylor, 2013). EnaSilva, like

Fig. 1 EnaSilva in the making

childhoodnature, is not a representation of animal and child play or of nature learning with animal-others. It is, perhaps, an attempt to bring into being a transformative possibility for becoming-other without becoming familiar. It is an attempt to keep distance from the known and the assumed in order to create space for further becoming and for inviting the unfamiliar into the conversation (Kristeva, 1991). EnaSilva is not so much an entity of sorts but a vibrant figuring of place, time, and life itself that remains open to ongoing imagination and speculation. Every encounter with this figuration is another figuring which then creates more possibilities for further becoming (Braidotti, 2011). EnaSilva is a figuration that, if successful, sprouts multiple others. Childhoodnature itself is such a figuration and EnaSilva is one of its sproutlings (Fig. 1).

To be upfront about experimentation: this is not the fruit of individual labor nor is it devoid of power relations. There are many threads that make this text, and so the text is a collective endeavor where some ideas take hold whereas others fly by. Threads of this contingent assemblage include places, things, other texts, animals, coffee and food, computers, people, air, talk, atmospheres, movements, and mobilities. This contingent assemblage is a map of power relations in itself. It left traces, such as this chapter. The assemblage contributed CO_2 emissions through the use of computing power. According to this blog, (https://www.custommade.com/blog/carbon-footprint-of-internet/), global Internet usage produces more CO_2 emissions than air travel. Writing this chapter in April 2017 coincides with a terrifying milestone in earth history when:

> the Mauna Loa Observatory recorded its first-ever carbon dioxide reading in excess of 410 parts per million. Carbon dioxide hasn't reached that height in millions of years. It's a new atmosphere that humanity will have to contend with, one that's trapping more heat and causing the climate to change at a quickening rate. (Kahn, 2017, p. 1)

The point of paying attention to the assemblage is to heed Foucault's (1977, 1991, 1994) reminder: there is no innocence or purity. Every action causes something; and every human action is political because human action is always embedded in power relations. Crossing a historical carbon dioxide threshold at the time of writing this chapter belongs

now to the assemblage of this childhoodnature chapter. The other point is that childhoodnature research may have entered the age of speculation altogether as no one knows what crossing a line like the one crossed in April 2017 means for life on earth.

It might help to consider this chapter as a specific materialization of complex ecologies that overlap at times and in places with such force that our human presence and perception were called, temporarily, to attention (Haraway, 2016). The text is a capture of these fleeting moments of an emerging ecological sensibility that begins to perceive experiences across the human self, other embodied matter, and materialities. This is a horizontal experiencing of self with the world rather than a vertical one; the vertical experience of self is one where the human cognitive mind dictates what counts as individualized perception and experience, whereas horizontal perception is less focused on the individual cognitive mind as the fount of all knowledge-making (Bennett, 2010, p. 10). This text is a framed expression of an emerging vertical ecological sense-ability.

The notion of ecological sense-ability draws on Bennett's (2010) suggestion to change perception from a vertical to a horizontal perspective. Vertical perception, it seems, comes naturally to humans. To some degree it is an evolutionary outcome of walking upright, and historically it has intensified in postindustrial cultures which now give preference to the sense of seeing over all other senses (Rose, 2007). Perceiving the world through the eyes which then shapes social interactions is commonly understood as being at the core of social cognition (Itier & Batty, 2009). According to neuroscience, human and monkey brains, in contrast to other species, may be "hard wired" for a social gaze which enables selective responses to other faces and bodies, including following others' gaze (Emery, 2000). This hypothesis underscores the belief in human exceptionalism based on evolutionary biology which, following Darwin, "has become more and more essential to our ability to think, feel, and act" (Haraway, 2016, p. 62). Human exceptionalism is highly problematic, especially if it is tied up with a sense of entitlement and a reductionist understanding of Darwin (Grosz, 2011).

Moving away from an understanding of humans as somehow superior to other species is a wicked problem because humans have been so successful in marking their presence on earth through domination and decimation of nonhuman others (Kolbert, 2014; Latour, 2014; Yusoff, 2013). This makes Bennett's (2010) suggestion for a change in perspective from vertical to horizontal truly revolutionary. It is almost unimaginable to forego interpretation of social interactions of all kinds based on seeing-as-perception. From a vertical and upright position, the human gaze is the direct entry to cognition in most encounters in everyday life. What happens if the mighty human brain is no longer the seat of meaning-making? What happens if human perception of the other and meaning-making of the encounter happens through the soles of the feet, the palms of the hand, and the knees in the dirt?

The Place, Time, and Life/Death Itself

The story begins with a description to generate a sense of place (Dovey, 2010; Duhn, 2012) for the EnaSilva figuration (Fig. 2). Place: a house under ongoing renovation in a semirural community in Victoria, Australia. The house has a fenced

Fig. 2 Horizontal ecological sense-ability in the making

backyard and is surrounded by trees and birds, by natureculture, including the wind, foxes, cars, chain saws, and other heavy farm machineries. Ena was a hatchling in a clutch of seven from a nearby farm. The entire clutch, all female, were bought by Silva's family who wanted to establish a small chicken run to support their daughter's sense of living with animals and to benefit from the hens' egg laying ability. They also liked chickens and wanted to live with them and see them thrive under their care. Despite best intentions, the hens have experienced violent deaths in their backyard chicken community, both through foxes who found their way into the chicken hutch and also through Tina, the rescue dog, who joined the family about 3 years ago. Tina was gentle with Silva but ferocious with chickens and bit two of them to death. At the time of writing, Tina has given up on her chicken killing, and the foxes are kept out of the backyard with improved fencing.

As adult observers who are also part of the childhoodnature storying, we are time travelers and place shifters. Memories of the encounters shape the story (Gloria was there at the time), while imaginings of the encounter then overlay the story (Iris was not there at the time but imagines the event, based on her own memories of other places and other child-animal encounters). The materialization of EnaSilva as a figuring/story/text/trace is an earth story of cantankerous human-animal kinship over time and place. Earth stories matter because of the asymmetry and the incommensurability of kin-making with other earth beings. Feminist speculative fabulation is political as Haraway (2016, p. 12) explains because "it matters what matters we use to think other matters with; it matters what stories we tell to tell other stories with; it matters what knots knot knots, what thoughts think thoughts what descriptions describe descriptions, what ties tie ties. It matters what stories make worlds, what worlds make stories." Our story has many enfoldings for us, as writers, as readers, as thinkers, as doers, as sacs of flesh (Plumwood, 2008), as hosts to myriads of microbiological communities (Tsing, 2012), as organic/inorganic vibrant mattered assemblages (Bennett, 2010), and as tiny specs in an unimaginably vast cosmos (Tito & Reinfeld, 2007).

Fig. 3 EnaSilva in a "moment of encounter. . .affective encounter." (Bear, 2011, p. 302)

The encounter in Fig. 3 seems to be close to what Bennett (2010, p. 122) calls "one matter-energy," chicken and child, and child and chicken coming eye to eye horizontally as fellow lively creatures. Silva is young enough to not be "too human" in the sense that she does not seem to care about demonstrations of human exceptionalism and superior cognitive function. The hens probably consider themselves as advantaged in this encounter, as they know how to quickly flutter away if the situation requires it. Silva can only watch and learn. It takes her a long time to move, compared to the swift hens.

As we speculate on possible stories of these matter-energies, we begin to see and unsee how this affective encounter unfolds. It is important to the EnaSilva figuration to point out that this is not about a flattening of difference. The figuring that EnaSilva enables is a mapping of power relations as much as it is a mapping of strangeness and incommensurability. Chicken and child and child and chicken share the vitality of matter-energies and of being in the world right now. But their worlds are incomprehensible to each other and to any observer, as perception of "reality" differs across species. Yet there appear to be momentary affective encounters where tiny sparks or molecules or breaths are exchanged across matter-energies and where worlds are shared (Irigaray, 2008). EnaSilva are more than a child and a hen caught on camera (Rose, 2007). These fleeting exchanges between them, caught in the image as a frozen moment in time and place, generate excess that flows outward as generative impulses to imagine what else is possible to think, to feel, and to do. Speculation feeds on facts, too, as factual knowledge supports meaning-making as a political and ethical task.

Some facts are about being kin in shared worlds. EnaSilva are earth beings in this place, and they get to know one another over time (Latour, 2010). They even share nourishment as both like oats. Their bodies share physiological similarities, such as blood, inner organs, a face, and a physical and social need to be with others and to have kin close by. Their bodies have chemistry together as half of their genes are shared even though their bodies look very different (Potts, 2012). Yet one body can

be made killable (Haraway, 2016) to nourish the other. It is kinship and yet it is more dangerous for one to be close to the other. Time works differently on the two bodies. A year for Silva is a decade for Ena. Silva has a life expectancy of 90 years. Ena's life expectancy as a well-cared for hen is possibly 10 years. As a mature being, Ena is a much more experienced earthling in their early encounters than Silva. While Silva will experience aging, Ena does not age in a human sense (Potts, 2012).

Cutting Together-Apart

> Kin is a wild category that all sorts of people do their best to domesticate. Making kin as oddkin rather than, or at least in addition to, godkin and genealogical and biogenetic family troubles important matters, like to whom one is actually responsible. Who lives and who dies, and how, in this kinship rather than that one? What shape is this kinship, where and whom do its lines connect and disconnect, and so what? What must be cut and what must be tied if multispecies flourishing on earth, including human and other-than-human beings in kinship, are to have a chance (Haraway, 2016, p. 2)?

Gloria's Narrative #1 EnaSilva shape their kinship and both multispecies flourish on earth, they do have a chance, they had a chance, they connected, and there were moments were the lines connected and disconnected. It is when we begin to see how the child-human – nonhuman – lines tie together, because for Silva, Ena might not be a chicken, Ena is kin and is a family, and what matters is that she learns to act responsible. In acting responsibly, in Ena being domesticated, Silva's emerging eco-sensibility is shown by being on Ena and May's level. She is keeping a distance but seeking kinship, a shared gaze, and a response that ties them together. As Bennett (2010, p. 103) *explains nonhuman bodies participate in "conjoint action." Nonhuman and human bodies are vibrant material that relates in affective events. As Silva leans to get closer to Ena and May, as Ena and May keep their distance, they respond, and they affect each other. These are "intelligent improvisations"* (Bennett, 2010, p. 96)*, Ena and May make decisions in the vibrant matter that surrounds them and that make them. They are responding to unprecedented situations "in real time and without predetermined outcome, to each other and to the collective force of the shifting configurations"* (Bennett, 2010, p. 97). *In this event they are seeking closeness, seeking kinship, and making ties as they collectively respond to Silva calling them to come close to eat oats as once they came close to the window.*

Making kin? Making it up? The intensities that create this text were so forceful that they cut through everyday habits of thinking and shifted attention to make details matter which may otherwise have gone unnoticed. For instance, both of us have had many previous encounters with children and animals, yet as we began to tell a story that would help us to create this text, the animal/child events that are familiar to us in principle started to become blurry to the extent that they lost their initial form. When we studied images and short video clips of child and hen, hen and child, it was no longer obvious what we thought we saw. Once perception began to

blur, new shapes emerged, and imaginations began to whisper possibilities that were not there before. Did the hen just encourage the child to come to closer when she turned her head? Or was that an illusion? Did the child's fingers mimic the hen's beak when the child tried to pick up oats from the ground? Was the hen teaching the child how to do this? Are the child's and the hen's body mimicking each other's posture? Was this a shared moment of emerging horizontal ecological sense-ability for hen/child/adult hand-on-video camera? And then the desire to explain "new insights" and to speculate to give them permanence and solidity arises. How does sharing worlds look when hen-child kinship awakens ecological sense-ability? How to balance porosity and impermanence *and* solid knowledge to create ethics and politics for shared worlds?

Facts: Who Is "a Chicken?" How Is a Chicken?

First of all, Ena did not see Silva as the Silva that humans see. Chickens' vision accentuates contrast and brightness, and they sense motion through their vision in much more detail than humans. Their color vision is also very different to human color perception as they have the ability to see ultraviolet light in addition to red, blue, and green. The extra spectrum means that chickens see everything completely differently to humans. Chickens, like other birds, can look at the sky and detect gradients of ultraviolet which assist orientation. This and other well-researched information about chickens can be found on a blog by a veterinarian who cares deeply for the welfare of chicken, both in industrialized poultry farming and in backyard farming. His blog (mikethechickenvet, 2014), is an example of what Haraway (2008) refers to as staying with the trouble of companion species living and dying. Going back to what the video and the images (see Fig. 2) seem to show: hen and child bodies are engaged in postures that appear as a delicate dance where movements are similar yet different for each partner. Yet this is an entirely human story. The world looks different for chickens.

Gloria's memory of the encounter: Silva wants to fed the "gallinas" (chickens) oats, she calls to them, "Gallinas come," and she almost cries at not having their attention this time. They are not very keen to come closer; her mother, Gloria, says maybe they are afraid. Silva persists and walks closer to fed them oats; she leans in for closeness. Maria and Ena feel at ease and they come closer for a couple of minutes.

More Cutting Together-Apart

What we saw in the photo (Fig. 2): *Ena was turning her head toward Silva, and she was coming closer.* Yet what Ena would have sensed and seen is so essentially different from what Silva would have seen and sensed that it becomes increasingly difficult to speculate on what exactly happened (Fig. 4). In addition to perceiving each other in very different ways, Ena's ability for facial recognition only becomes

Fig. 4 Cutting together-apart: speculating on how the shared world looks through Ena's eyes. (See also Fig. 2)

possible at a close distance of about 20–30 cm. When Silva said, "Gallinas come!," she was inviting the hens to get to know her face and to lock eyes in kinship across genealogical and biogenetic categories (Haraway, 2016). We know each other through our faces, and turning toward each other is one aspect of being hospitable with the other (Irigaray, 2008; Levinas, 2004). This is also true across species, even though humans have a hard time recognizing faces of other species. For many humans, faces are most recognizable if they look similar to what is most familiar. The less familiar, the more strange and challenging the other becomes (Kristeva, 1991). Critical race theory tells us as much (Sleeter, 2017). Chicken faces look all the same to humans. To chickens, all chook faces are distinctly different from each other.

Chickens know the faces of fellow birds, as chickens are able to memorize over 100 chicken faces even after months of separation. Chickens also recognize the faces of other non-chicken, including human faces. Chickens have turned away from people they dislike (Potts, 2012). When Ena turned her head toward Silva, she was most likely recognizing Silva's face. She then moved closer which means that in this instance she sought being close to Silva, even though she was not keen initially (see Fig. 2, Gloria's memory of the encounter). To make matters even more complicated, Ena has the, for humans, disorienting ability to use each eye independently, with a focus on different distances for each eye. This is important, should there be hawks or other birds of prey overhead. Speculating again, this might mean that Ena's kinship making with Silva was much more complex than we thought. It is likely that Ena was less focused on locking eyes with Silva than we speculated as Ena was literally keeping one eye on the sky above.

Silva got to know Ena from her very first weeks on earth. When Silva was born, Ena was already an experienced hen, while Silva only just began to make sense of the world around her. Here is another little known fact about chickens. "Three day old chicks are capable of identifying a whole object when part of it is obscured – a feat not accomplished by human babies until four to five months of age" (Potts, 2012, p. 39). In case this matters to any kind of speculation of hen-child kinship, it is

intriguing to note that when Silva and Ena first met, Ena was way ahead of Silva in terms of cognitive abilities. Perhaps it matters, because chickens are stigmatized as particularly stupid, as lacking courage and in general as unworthy of attention as intelligent, capable fellow living beings. This of course makes it more palatable to keep chickens in abhorrent conditions and to treat them as nothing but dead meat, even while alive (Potts & Haraway, 2010). The stories we tell matter.

Most of the stories we continue to tell without questioning them, particularly stories of conquest and domination, are stories that create a specific capitalist-globalized human-centric world rather than shared worlds where differences are valued. Indigenous people know this, and many people from minorities also know it (Adamson, 2012; hooks & Mesa-Bains, 2006; Sykes, 2008). These anthropocentric stories continue to perpetuate global material cultures of suffering. Chicken and humans have been tied together in an unholy alliance ever since a housewife in the US Midwest discovered the basics of industrial poultry farming in the 1950s (Potts, 2012). Chicken and human stories are a type of horror story that came into existence through a tide of postwar intensified industrialization. These stories are told as stories of affluence and general progress when in fact they are materializations of greed, cruelty, and suffering on a massive scale (Silbergeld, 2016). Only a few gain financially and millions upon millions of others pay with their lives. This includes humans who die of the consequences of pollution of soil, air, and water as a by-product of industrialized farming. It includes entire species that are wiped out by intensification of farming practices. It includes small holdings that cannot compete with mass produced meat, grain, and produce in general (Foote, Joy, & Death, 2015).

The story of EnaSilva perhaps also matters because "when it comes to friendships, chickens like humans, are all different" (Potts, 2012, p. 49). In a human-centric world, chickens' individuality is dismissed as anthropomorphic at best and as misplaced attachment to a purely material resource at worst (Bear, 2011). Research tells us that animals are sentient beings who, just like humans, have personalities, communities, problems to solve, and things to celebrate. In short, they have their own lives. Animals, and plants for that matter, communicate, make decisions, and care for each other (Halberstam, 2010; Marder, 2013; Ogden, Hall, & Tanita, 2013; Pedersen, 2010; Power, 2008). Just like humans some do it better than others. Ena likes to be in close proximity with Blanquita and Maria. They tend to hang out together, and they look out for each other, sharing their world (Irigaray, 2004). Chickens have clear preferences and dislikes for fellow birds which make it all the more heartbreaking to consider the conditions of factory-farmed hens. But chickens' ability to be kin with others, including humans, is best described by the story of Mr. Joy (Tomlinson, 2009), a rooster who over the course of his life cheered up people in nursing homes with his charismatic presence. Mr. Joy and his female human did highly effective educational work by demonstrating that chickens are intelligent, empathetic, and funny beings. Their work together changed the way in which people regarded chickens by undoing the story of chickens as nothing but buffalo wings or chicken nuggets (Potts, 2012).

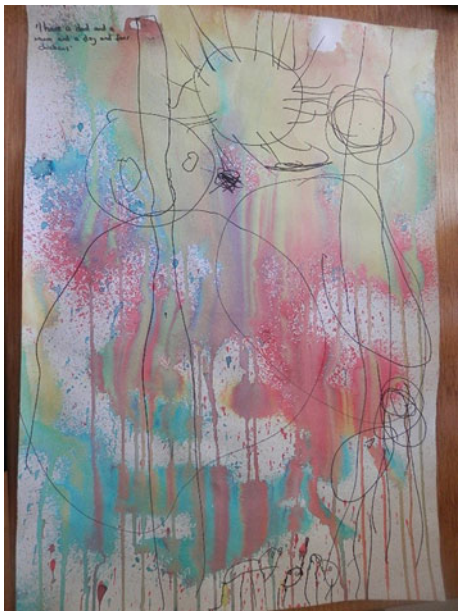

Fig. 5 Kin-making: "I have a dad and a mum and a dog and four chickens"

Gloria's Narrative #2 Silva changed her body movements as she learned from Ena's wisdom, Ena's agency, and Ena's intentions and her negotiation of space. Is this what kin-making involves too? Potts (2012) *explains how chickens are able to demonstrate forms of agency and self-determination. Extending the idea of agency,* Jackson and Mazzei (2012) *explain how in a posthumanist perspective agency and intentionality are not only attributed to humans but to nonhumans, and as* Barad (2007, p. 23) *explains agency is a "complex network of human and non-human agents… specific sets of material conditions that exceeds traditional notion of the individual." Making kin, being family between multiple species, involves understanding a complex network of differences and EnaSilva's own display of agency. This can be seen in Silva's drawing of her family where her chickens are like relatives* (Fig. 5).

Late Hen: Child Time

Gloria's Narrative #3 Ena for the past days comes to the window; Silva's father says, "Ena is going to die soon, I can feel it." Ena comes to the new living area (to say goodbye? We speculate – to search for food/sustanance/ease of pain?); the adults wonder when death will happen. Ena looks as if life is leaving her body. Ena is not in close proximity to her hen family; instead, she stays close to the window. Silva feels: "Ena looks sad." Ena and her sisters lived very different lives to Silva;

her four sisters Blanquita, Tomasa, Rosa, and Clara were eaten by the fox. May was a mother hen twice and now has six daughter hens. Early in the morning Silva's father tell Silva's mother – Ena has died, "I have put her in the drum" (for a latter burning of her body. What to do with a dead hen who is kin?). Silva is listening to the conversation.

Silva: "What happened to Ena?"

Silva and her mother sit in her bedroom as her mother says: "Daddy has told me just now that Ena died."

Silva cries, "I am going to miss her, I am sad, I don't want her to die."

Mother: "Ena came and said goodbye, we are sad too."

Silva cries and she doesn't ask about Ena's body. Ena's body is burned. Silva, weeks later, asks: "Ena, where is Ena." Mother says, "where do you think Ena is?" Silva says: "She is in the moon, in the stars." Mother: "Her body is back to earth, back to the moon and the stars." Ena's body is gone; Ena is remembered. Ena is remembered; her last sister May is the last living hen of all the six sisters. They are all remembered. Ena dies when Silva is 4 years old; Ena dies when she is 5 years old.

Speculation: What Does a Hen Know About Death? What Does a Child Know?

It is easy to criticize our use of language when we refer to Ena and her sisters. The idea of sisterhood is a human idea, based on genetic kinship which then releases a plethora of social and cultural associations, emotions, and meanings. Referring to Ena's sisters, for instance, generates echoes of Woody Allen's (1986) movie, *Hannah and Her Sisters*, or of memories of family events, books, or it may even generate a sense of melancholy for missing a sister in one's life. Would this be different for Ena? What happens when Ena's relationship to other chickens are described in human kinship terms? Common knowledge about chickens is that they have a hierarchical pecking order which can be brutal and even lead to the pecking to death of flock members. Again, it seems, this is more of a reflection of cultural bias against chickens than fact, or perhaps it is true for situations when chickens are stressed to their very bones, as happens in factory farming conditions. Potts (2012) argues that chicken have caring relationships with others, to the extent that in one example when a hen died the other hen stopped eating and died within a week of losing her companion. What do we really know about the lives and deaths of those others who share time and spaces with us? What worlds do we share?

This chapter does not dwell on the event of death that seemed to have put an end to EnaSilva as a figuration. Instead the death of Ena exists as another cutting together-apart of story and matter (Yusoff, 2012). EnaSilva lingers in Silva's ongoing becoming with the world. Is it possible to intensify EnaSilva's presence by creating a space for ongoing EnaSilva becoming in Silva's life? What happens when Silva experiences humans around her who continue to remember Ena as a lively being whose presence added joy, sorrow, care, community, and existential fear to this world? What stories become possible to tell and to live if EnaSilva is more than a fleeting multispecies'

encounter? What if EnaSilva is an ongoing lively figuration that forges a path for sharing worlds even though Ena and Silva's shared physical presence has ceased to exist? What becomes possible once EnaSilva has its own presence in the story? How to magnify the invitation to share worlds, to invite multispecies becoming, and to create ongoing conditions for flourishing? This chapter does not answer questions. It invites readers to consider possibilities and to imagine shared worlds with less suffering and more joy. What stories are worthy of telling and living?

The chapter is an experiment in writing and living. How to create a text that still breathes and keeps its own life force? Our experiment desires to produce a text that is porous and invites further storying, more speculation, and a spreading of lines or waves that may do, as well as undo, with a cutting-together-apart disposition to knowledge-making (Barad, 2014; Ellsworth, 2005; Ingold, 2016). Politically, we see this as a contribution to the ethics of flourishing (Cuomo, 1998) and to the Spinozean ethics of living a life in the pursuit of an expression of our innermost essence – this essence is the joyful affirmation of our freedom, our desire to persevere, to endure, and to become capable to express adequately what it is that we are doing to flourish by sharing the world (Braidotti, 2011; Irigaray, 2008). As Braidotti points out, it is no longer possible to reduce ethical life to bios as the human/nature, now molten, binary of Enlightenment philosophy and modernity's politics. What is required now on a planet where perceptions of time and space seem to spin and twist, noticeable to human senses as climate chaos – floods violently reshaping landscapes where there were no floods in human memory, unseasonable heat or cold or droughts that kill the last nomadic tribes, wild animals and plants who rely on seasonal change that is predictable to some extent? How do we protect biodiversity when time is running out? Latest research paints a dire picture of our futures, with mass extinction well under way and climate change already out of control (Kolbert, 2014). Unless we learn quickly and radically to share worlds and to create worlds together with humans, nonhumans, and more-than-humans in all their forms, there might be no world, shared or otherwise, to come. And yet there is great hope in taking up the challenge for new stories, new imaginings, and new thinking and doing. If not now, then when?

The world invited us to become and we, for once, were open to the invitation. The shared worlds that appear in human stories can go unnoticed, and this chapter attempted to pay attention to the ways in which other worlds become visible in kin-making, for moments in time. Authorship is the privilege of being able to attend to specific threads, waves, or lines and to care for the intersections that tell a particular story. An emphasis on narratives seems important to kin-making as stories hold the self and others in the world. Stories enable the knotting together of mind and body, self, and others and open up possibilities for new perceptions, new imaginings, and new alliances.

A Few Final Words

The attempt to think through kin-making as an experiment in horizontal encounters with difference has opened a space for us as thinkers and writers to push our own imagination and speculation. Another outcome is that our perception has changed. It

is getting more challenging to ignore the sense of horror when faced with images of battery-farmed hens, now that we know chickens a little more intimately. EnaSilva makes it impossible to not at least sometimes shift the deeply entrenched anthropocentric gaze and imagine how multispecies encounter might look/feel/be sensed from the other's way of being. The notion of kin-making across species is troublesome. There is the "danger" of anthropomorphism – but how convenient to ignore animals' individuality and their ability for expression, for perception, for learning, for being, and for becoming at a time when animals are exploited for profit at a never-before scale. One of the risks to take now surely is to have the courage to engage with "nature" on new terms and to experiment with kin-making as new forms of multispecies' alliances for sharing the world. As Haraway (2016, p. 4) reminds us, "we require each other in unexpected collaborations and combinations, in hot compost piles. We become-with each other or not at all." There is more at stake than teaching children to be kind to animals. EnaSilva is not about kindness. We suspect that EnaSilva is fierce and curious and only beginning to feel her own power. Hot compost piles recomposite matter in a furnace of becoming. EnaSilva is only beginning to heat up, and we are curious to see what else is possible in this kind of naturechildhood thinking and doing.

Abstract

This childhood/nature chapter was provoked by curiosity about the rise of posthuman theorizing in early years learning research and practice. Set in the context of the Anthropocene as the age of human entanglement in the fate of the planet, it takes the view that the primary task of this time is to develop new understandings of the human and new concepts of thought (Colebrook, Extinction: framing the end of the species. Open Humanities Press, 2010). Early childhood has led the field of education in the development and application of posthuman theorizing in response to this imperative, prompting the explorations of the chapter. A review of the literature in this field resulted in the identification of three distinct areas of posthuman theoretical activity: *new materialism*, *child-animal relations*, and *Indigenous-nonindigenous intersections*. The third

category *Indigenous-nonindigenous intersections* which draws primarily on Indigenous theorizing was so divergent from the others, and so complex, as to be considered outside the scope of this chapter. In gathering the various papers together to make sense of the literature in each of *new materialism* and *child-animal relations*, different modes of analysis were called for. *New materialism* in early childhood education and practice is considered using a genealogical generational analysis following the work of Van der Tuin (Generational feminism: new materialist introduction to a generative approach. Lexington Books, London, 2014), while *child-animal relations* prompted an analytical approach involving Haraway's bag lady method following Taylor, Blaise, and Giugni (Discourse Stud Cult Polit Educ 34(1):48–62, 2013). A particularly interesting and curious finding was that "life" emerged as a major theme from *new materialism* and "death" from *child-animal relations* in keeping with the paradoxical nature of the Anthropocene.

Keywords
Posthuman · New materialism · Child-animal relations · Early childhood · Anthropocene

Introduction

The separation of nature and culture in Western language, thought, and practice has long been identified as the reason for the destructive exploitation of the natural world (e.g., Plumwood, 2002; Rose and Robin, 2004). More recently there has been an increasing recognition that this has resulted in massive changes to the capacity of the Earth to sustain life with the proposal of the new geological era of the Anthropocene, the time of human entanglement in the fate of the planet (Zalasiewicz, Williams, Steffen, & Crutzen, 2010). Despite debates about the timeframe and meaning of the Anthropocene – its emphasis on human power or the reverse – the concept has generated a remarkable flourishing of scholarship across all disciplines with a focus on how to theorize new understandings of the human and new concepts of thought (Colebrook, 2010). This scholarship has a special relevance to education. Young children born into the increasing awareness of the catastrophic impacts of climate change will grow up into a very different sense of the world than the adults of today and can be understood as children of the Anthropocene (Somerville & Green, 2015), leading to the need to learn and research with them. The question to address with these children in their more-than-human worlds is how to move beyond the nature/culture binary in educational research and what does this mean for the practice of education?

Early childhood has long been a leader in the field of posthuman theorizing in its application to educational thought and practice (Somerville & Williams, 2015). My curiosity in contemplating this chapter was provoked by this phenomenon: why early childhood; who are the researchers, what theoretical work are they drawing on; how do they frame their approaches and findings; and how can we apply these new approaches in everyday practice? In reviewing this extensive body of work, three

categories emerged to better answer these questions: *new materialism*, *child-animal relations*, and *Indigenous-nonindigenous intersections*. In further engaging in an in-depth analysis of each of these categories, it became clear that the third category of *Indigenous-nonindigenous intersections* was of a fundamentally different order than the others and would require its own, independent chapter.

In reviewing the many papers in the *new materialism* and *child-animal relations* categories, it became clear that different modes of analysis were called for. The trajectory of *new materialism* was best understood using a genealogical and generational approach (Van der Tuin, 2014), while *child-animal relations* prompted an analytical approach involving Haraway's bag lady method (Taylor, Blaise, & Giugni, 2013).

The approach taken to writing the chapter overall employs Springgay's method of "anarchiving." This method was developed from creative arts and is used to refer to visual artist's renditions of new artworks based on the archived work of others (Springgay, 2014). It does not attempt to offer a complete and exhaustive coverage but instead produces new and creative productions from these past works. In naming the approach of anarchiving the writing acknowledges that many of the words and sentences in this chapter are composed of the words of others, gathered together from the range of papers in each of the categories. All of the sources are acknowledged, but for ease of reading, direct quotes are sometimes paraphrased where they occur within the text. Key quotes are indented and remain in their original form. It is hoped that the contribution of this chapter emerges from the unique combination of words and ideas generated from within this amazing body of work.

New Materialism: Genealogy and Generation

> Starting from the etymological register, the established methodology related to generation is genealogy. . . *genea*-logy enfolds generation. . . the continental philosophy method of writing genealogies, of engrossing oneself in cartographies of conceptual shifting, allows for 'a transformation of history into a totally different form of time' (Foucault, [1971] 1977, p. 160). . . .the genealogical method helps to understand conceptual shifting along timelines that capture the often erratic, utterly nonlinear generation (of thought, practices, and artifacts) itself. Genealogies. . . focus is on the very moment of creating innovative concepts . . . among the most generative of feminism. (Van der Tuin, 2014, p. 59)

This chapter is animated by the question of how posthumanism came to be so prominent in early childhood education as opposed to other sectors of educational thought and practice. My thinking in relation to *new materialism* began by exploring Hillevi Lenz Taguchi's landmark text, *Going beyond the theory/practice divide in early childhood education* (Lenz Taguchi, 2010). I was immediately struck with its beginning in the intense materiality of an official meeting. Hillevi writes: "It felt so hard to breathe in here and smelled like an old museum. . . The wooden chair that creaked quietly as I sat down at the large oval shiny table. The wide leather seat was quickly heated by my jean-clothed buttocks" (p. 1). Hillevi later connects the recognition of the power of the materiality of this room to the book's exposition of

the problem of an ontological divide between theory and practice and between academic knowledge and our sensing bodies, matter, rooms, and material environments and places (p. 3).

But it was not only this that so shaped and disrupted my imaginings of the beginnings of new materialism in early childhood research and practice but a chance remark of an early childhood practitioner when I explained that Hillevi traces her own thought to the Reggio Emilia movement as it was taken up in Sweden:

> Reggio was a grassroots movement in Italy started by women immediately after WW2 as Italy was rebuilding. Very little materials and poor, so 'the environment' was what they had. They were opposed to the dictatorship experienced in the war and this in part determined the politics of the movement. Started by women, first book written by a male, taken up first in Scandinavia (Sweden) and then USA but differently in Sweden. (K. Power, personal communication, 2017)

The search for these women became a process of archaeology rather than genealogy as I sifted through the traces in the only book I could locate that would reveal anything of the origins of the Reggio movement, *The hundred languages of children: The Reggio Emilia approach – advanced reflections* (Malaguzzi, 1998). Chap. 3, "History, ideas and basic philosophy," is an interview with Loris Malaguzzi, universally credited with the founding of the Reggio Emilia preschools in that region of Italy. At first I mistakenly thought Chap. 3 was an interview with Lella Gandini, expecting to find women's presence, but it is an interview by Lella with Loris Malaguzzi and features only Malaguzzi's words facilitated by Gandini. The chapter is framed with a photo of Loris Malaguzzi in the top right-hand corner of the first page. It is labeled "Loris Malaguzzi, founder of the program in Reggio Emilia" (p. 49). Soon after its unpromising beginning, however, I am excited to see the first appearance of the women:

> I hear that in a small village called Villa Cella, a few miles from the town of Reggio Emilia, people decided to build and run a school for young children. . . .I rush on my bike and discover that it is all quite true. I find women intent upon salvaging and washing pieces of brick. (p. 49)

Unfortunately at this point the women disappear into the generic "people" making it impossible to tell whether it is these women's actions in the rest of the chapter (as one might assume) or in fact a group of "people": "We will build the school on our own, working at night and on Sundays, the land has been donated by a farmer, the bricks and beams will be salvaged from bombed houses, the sand will come from the river; the work will be volunteered by all of us" (p. 49). I want to find out who these women were who cleaned bricks and salvaged timber from war-torn homes to make a preschool for the children. I want to know more but the story continues to use the plural generic term "people." I comb through the words, like sifting through the rubble, to find traces of the women. They are few. I learn at the end of the chapter that all the teachers were female: "Until a few years ago Italian law forbade males to teach pre-primary children" (p. 71), which makes the words, "they were ample and

greedy (p. 50)" in the description of the teachers, even more meaningful. Even though that is all there is, it is the image of these "ample and greedy" women cleaning bricks in war-torn Italy, maintaining "enough rage and strength to survive for almost 20 years" (p. 50) that captures my imagination and flows forward into reading Hillevi Lenz Taguchi's book with new insight.

Beyond the theory/practice divide (Lenz Taguchi, 2010) addresses the problem of an ontological divide between theory and practice, drawing "sensing bodies, matter and material environments – spaces and places" into academic knowledge from the pedagogical context of the practices in Sweden that have taken their inspiration from the municipal preschools in the Italian city of Reggio Emilia (p. 3). While many theorists are cited in the context of critical and feminist pedagogies emerging in Western universities in the 1980s, Deleuze and Guattari, and Karen Barad, form the main theoretical underpinnings of this "jumping gene" leap of conceptual thought (Van der Tuin, 2014).

For Lenz Taguchi, Deleuze and Guattari (1994) contribute an ontology of immanence, in which "everything around us affects everything else, which makes everything change and be in a continuous process of becoming" through processes with "a central element of unpredictability, creative and inventive change in the interconnections between different matter and organisms with different potentialities" (p. 15). In this understanding, there is "no hierarchical relationship between different organisms (human and non-human)" (p. 15), drawing a parallel for Lenz Taguchi with Karen Barad's onto-epistemology of intra-activity (Barad, 2007). Intra-activity is described as all matter having agency emerging through relationship in which different bodies of matter mutually change and alter in their ongoing intra-actions. Importantly, for a book based on the Reggio Emilia tradition of teachers learning from children through pedagogical documentation, learning is understood in terms of different matter – human and nonhuman – making themselves intelligible to each other (p. 4), an idea further elaborated in Lenz Taguchi's influential paper with Karin Hultman (Hultman & Lenz Taguchi, 2010).

In *Challenging anthropocentric analysis of visual data*, a "relational materialist methodological approach" is applied to the analysis of two photographs of children's activities in an early learning setting (Hultman & Lenz Taguchi, 2010). This influential paper is significant for its application of complex posthuman theory to a real-world education setting. It analyzes two photographs in detail: one of a young girl playing in a sandbox and another of a girl on a climbing frame. In the following, I focus on the analysis of the girl+sand photograph as being the most mind-opening application of Barad's intra-activity and Deleuzean becoming:

> . . .the sand and the girl, as bodies and matter of forces of different intensities and speed, fold around each other and overlap, in the event of sand falling, hand opening, body adjusting and balancing, eyes measuring height and distance and observing the falling movement of the glittering sand into the red bucket. Thus, in a relational materialist understanding, the sand can be understood as 'active' and 'playing with the girl' just as much as the girl plays with the sand. They come into play. The girl is in a state of becoming with the sand, and the sand is in a state of becoming with the girl (Deleuze, 1990). To be able to see this, we need to think of a relational field of immanence, where there is no absolute or inherent border between the sand and the girl in this event. (Hultman & Lenz Taguchi, 2010, p. 530)

In the intertwining of theory and practice in this paper, Hultman and Lenz Taguchi (Hultman & Lenz Taguchi, 2010) expand on both Deleuze's "becoming" and Barad's "intra-action" through their analysis of the sand+girl dyad. In the above quote, influenced by Deleuzean "becoming," both girl and sand are in a continual state of becoming with and through each other. Barad's "intra-activity" is extended in this article to include the discursive as well as material phenomenon for "neither discursive practices nor material phenomena are ontologically or epistemologically prior. . . .Neither is articulated or articulable in the absence of the other; matter and meaning are mutually articulated" (pp. 529–530). In this sense "the girl and the sand simultaneously "pose questions" to each other in the process of trying to make themselves intelligible to each other as different kinds of matter involved in an active and ongoing relation" (p. 530). The article destabilizes the fixed identity of the researcher as standing outside of the event of analyzing their data. In a move closely akin to the concept of the "sensing body" and the Reggio women, a "diffractive reading" is offered in which the researcher needs to activate all of her "bodily affective perceptions" when intra-acting with data as an entirely new event (p. 537).

Finally, ethics and politics are never far from the surface in this work, influenced by the enraged women of postwar Italy, because what we do as researchers "creates new possibilities and evokes new responsibilities." Hultman and Lenz Taguchi articulate the ultimate aim of doing research and analysis in this new way as making it possible "for others (humans and nonhumans) to live differently in realities yet to come" (p. 540).

Miriam Giugni is the direct genealogical daughter of Lenz Taguchi's sensing body in its material mattering. In *Becoming worldly with: An encounter with the Early Years Learning Framework*, Giugni (2011) positions herself as practitioner-activist, deeply resonant with the activism of the Reggio women of Villa Cella. While Giugni's theorizing references Haraway's "becoming worldly," her method, as with the Reggio Emilia women, is of pedagogical documentation. For Giugni, becoming worldly "encapsulates assemblages of political, historical and geographical entanglements of relationality between the human and the non-human or more-than-human actants" (p. 11). In her narrative telling of two encounters with young children in a multicultural preschool in urban Sydney, becoming worldly offers Giugni a way to include the more-than-human such as animals, technologies, organisms, objects, landscapes, the weather, and so forth (p. 11).

Of the two vignettes in this paper, it is the retelling of the Easter story encounter with young children that emerges as the most powerful example of becoming worldly through pedagogical documentation. When Giugni invites a group of four multi-faith children to express how they might want to investigate Easter, one of them responds, "Easy – just Google for Jesus" (p. 21). From their Google search, they chose an image of Michelangelo's Pietà and print it. After a brief discussion about the beautiful sculpture, together they decide that sculpting with clay would be the most practical starting point. As they fashion their brown clay figures, the children observe the similarity of Giugni's white skin to the marble sculpture, and they explore the topic of skin color, ethnicity, brown color of the clay, and the brown

color of the skin of those children who also come from the Middle East with skin color just like Mary and Jesus.

Giugni theorizes at length about the printed image; the brown, gritty clay; the color of her skin; sculpted draping bodies; and the politics of all these elements, as an assemblage of the more-than-human actants that produce their "becomings with" (p. 23). By including the clay, the Internet, the computer, and their diverse views, beliefs, and cultural practices (p. 23), Giugni demonstrates how meaning and matter are inseparable. In a move more typical of Haraway's theorizing, Giugni "stays with the trouble" (Haraway, 2008), adding a strong activist political dimension as the children and clay become-with in the tensions of their intra-subjective time together (p. 16). This paper extends the possibilities of Hultman and Lenz Taguchi's analysis of girl+sand and girl+climbing frame in its location in examples from practice and its inclusion of the multiple materialities of clay, the Internet, computer, and diverse cultural practices. At the same time, it acknowledges its generational indebtedness to Hultman and Lenz Taguchi's work.

Pauliina Rautio is similarly influenced by Lenz Taguchi, adding another dimension from her "ongoing empirical journey into the materiality of children's everyday life environments" (Rautio, 2013). Rautio's interest is particularly situated in what she refers to as "autotelic material practices" – things children do for no purpose other than the activity itself. *Children who carry stones in their pockets*, the first and most distinctive paper of Rautio's early work, consider "whether bridging the nature-culture divide can be attempted by exploring practices through which children themselves seem to do this" (Rautio, 2013, p. 403). The cited theoretical antecedents of this paper include similar aspects of Deleuze and Guattari, and Barad, as inspired Lenz Taguchi, but the paper demonstrates a more in-depth engagement with Bennett's (2010) vibrant matter: "Material is vibrant insomuch as it has the capacity to not just impede the courses and wills of other material entities, such as humans, but also to act as a "quasi-agent" with tendencies of its own" (Rautio, 2013, p. 397). The "human" becomes differently with stones. Stones, she says, "have intra-agency: stones do things to us and with us. They have us pick them up, feel them, close them in our fist (if particularly smooth and rounded) or hold them between our thumb and forefinger (if small and edgy)" (p. 404):

> We exist as a consequence of stones: the event of carrying stones makes us in the moment. We become stone-carrying with carrying stones. We literally weigh a bit more, balance our walk a bit differently, think certain thoughts and become certain kind of bodies and individuals in relation to what kind of stone-bodies we encounter and interact with. (Rautio, 2013, p. 404)

For Rautio, then, carrying stones with no particular purpose other than the attraction of stones is a political act, differentiated from the economics of extractive mining. In carrying stones, as children do, we come to know ourselves as part of the world, not separate from it (p. 405): "Bodies (human and non-human, organic and inorganic entities) exist as a consequence of the world" (p. 397). The unique contribution of this paper is to think playfully with stones, drawing on Deleuze's encouragement to

experiment with new modes of thinking and being that keep generating novel and endless possibilities (p. 396).

Two further papers by Rautio are based on a study in which 12 Finnish children, aged 4 to 7, gathered once a week for a total of 11 times to assist an adult researcher in studying things, objects, and beings (Rautio, 2014; Rautio & Winston, 2015). Each of these papers makes a distinctive contribution to understanding young children's play from a posthuman perspective. In *Mingling and imitating in producing space for knowing and being*, Rautio explores the relationship between children and things, producing insights into the ways that things constitute children:

> We need to assign agency and relevance to the things that children move, order, clean up, don't clean up, combine, attach, stack, throw, dismantle, feel with and talk to. In a materialist vein of thinking, a chaos of things could serve in keeping the children conversant and open to be played with by the things around them. This is how things are able to invite children to play. (Rautio, 2014, p. 8)

Through processes described as "mimicry," previously regarded only in relation to human to human social learning, Rautio finds that children "engaged in repeating the same bodily or sensory events they witnessed around them – in other humans or nonhumans – so as to try them out" (p. 9). She describes how one child imitated his box by lying flat on his stomach beside the box lid in front of him, on the floor, and then moving the lid with his finger (p. 9).

The categories of mingling and imitating that arise from the analysis of the children's play with things offer new ways of thinking about the agency of things and understanding children and their play differently. The paper also offers a different understanding of the adult human researcher in its connection with the Reggio Emilia women and Hillevi Lenz Taguchi's work. In a way that has become characteristic of Rautio's work, it is the "sensing body" that registers and responds to her full participation in the encounter, continually disrupting the certainty or possibility of any external observing position. Through this she understands the human (child) differently, "children in our meetings were like amebous creatures that overlapped with each other as well as with their surrounding materials, producing assemblages of movement, sweat, cheering and panting" (p. 10).

In *Things and children in play* (Rautio & Winston, 2015), the question of language enters the picture of the posthuman in early childhood where language is understood in its materiality. Drawing on other researchers of language and play, language is rethought "as material, as form rather than function," such as in nursery rhymes which are common to all cultures with sounds and rhythms dependent on patterns, and where meanings emerge from their material form rather than shape it (p. 4). Bennett's (2010) concept of "congregational agency," of beings and things, both material and immaterial (p. 21), is newly applied to language's play with children. In congregational agency, it is the collective, or the combined assemblage of beings and things, that produces the play in its intrinsic value and desire.

The idea of "congregational agency" of languages and play with children is extended in my own research in *Emergent literacies in "The land of do anything*

you want" (Somerville & Green, 2015). In this small informal research project, the emergence of language with and from the world became a significant new insight. Influenced by Hultman and Lenz Taguchi (2010), I became vitally interested in the proposition that the individual subject emerges only through the mutual entanglements of different bodies of matter, each with their own force or agency (Barad, 2007). Two young girls were invited to take part in an "experiment" in which they chose spaces and places to play, recorded in tiny video segments, still photos, and notes on an iPhone. The detailed analysis of these small video segments was surprisingly challenging, and it was in the process of persevering with turning the movements and sounds into Word on the computer that new insights into the congregational agency of language emerged:

(Water gurgling, birds twittering
child singing high bird-like sounds
walks into water with fine stick balancing on stones
flicking stick at water and at stones
wobbles back to stones on island, humming)
that's a daddy (low sing song voice, lifting a rock),
that's a daddy, that's a daddy, that's a bigger daddy (patting a rock each time)
that's a little baby (picking up a small pebble), that's a little baby
got babies cousins dadda (arms wide open in expansive gesture
walks away lifts hands to sky, loud sound to sky
comes back to rock pile singing)
a-gugu a-gugu a-gugu (sing-song to birds trilling)
you're a baby (to me), and I'm a mama kangaroo
I'm a mama kangaroo, you're a baby kangaroo
that's my fire (loudly, pointing to rocks)
that's my fire, baby kangaroo, that's my fire, baby kangaroo
that's my fire, baby kangaroo.
(Charmaine, 3 years, at river)
(Somerville & Green, 2015, p. 119)

Initially in transcribing the small video, the human ear hears only meaningful human words, but when forced to listen minutely to all of the sounds, it becomes apparent that there is no separation of the sounds of birds and water from the soundings of the child. The place is singing to the child and the child is singing to the place. She is also simultaneously playing with stones, telling a story about stones, talking to the sky, opening out her arms and hands, and calling out loudly to the sky, just to call to the world. When the child sings "a-gugu a-gugu a-gugu" with a bird trilling in unison, two songs come together. Both are small incidental songs to the world, with no meaning other than sounding the place, a meaning that suddenly appeared transformative. This emergence of language within new materialism enacts Barad's proposition of the mutual entanglement of discursive practices and material phenomena as mutually implicated in the dynamics of intra-activity (Barad, 2007, p. 152).

In amongst the glitter and the squashed blueberries (Hackett, Pahl, & Pool, 2017) similarly addresses questions of language and materiality in a study located in a community setting with open-ended exploration of children's emergent play. It also

references Barad (2007) and Lenz Taguchi (2010) but adds some significant new dimensions and theorizing. Based on their collaborative arts-based practice of exploring children's play with cardboard den constructions, they include concepts of place (Somerville, 2015) and nonrepresentational theories of language (MacLure, 2013). In what they describe as "a methodology of blueberries, glitter, cardboard and chaotic, embodied meaning making" (p. 66), they venture unexpectedly to the "cusp of chaos":

> The scene begins with a shot of the castle and a path made of two narrow parallel sheets of cardboard … Giggling, a little girl climbs into a wooden trolley (intended for wooden bricks), while her slightly older brother takes up position to push her in the trolley down the cardboard path. The trolley is too wide to fit down the path, so as the boy pushes his delighted sister faster and faster down the path, the paths falls apart, the cardboard becomes caught in the wheels, the whole structure collapses. At the end of the path, the trolley falls over, spilling the little girl onto the floor where she lies laughing. (p. 66)

In the many examples of children's meaning-making with arts materials, they note both the role of intra-action with materials in moment-by-moment meaning-making and the embodied sensations and notions of emplacement in how the children collaboratively create and share meaning through their play with the materials. These insights are connected to a pedagogy of unknowing, the agency of materials within processes, and an understanding that the processes of making were themselves forms of thought. They conclude that this pushes the field of literacy and language away from strongly representational forms and toward knowing from the inside and acknowledging the ways in which we might come to know through place, body, and materials (p. 70).

Language also features, but somewhat differently, in Iris Duhn's, 2015 paper, *Making agency matter*, which works to counteract the significance of language as a marker of agency in very young children: "It is argued that agency, when conceptualised with emphasis on individuality and the autonomous self, poses a conceptual "dead end" for those who are not-yet-in-language, such as babies and toddlers" (Duhn, 2015, p. 920). Drawing inspiration from Thrift's notion of "wild ideas" that "invite the world to speak back and take part in the production of different futures" (p. 920), the subject/object divide is unsettled by viewing toddler's through the lens of vibrant matter (Bennett, 2010):

> The wooden floorboards quiver in rhythm with stamping feet. The phone rings behind the closed office door. A mouse moves through the paper clippings in her little cage on the floor beside the shelf. Mia wriggles in her father's arms. Carl drops a cup, which he was going to put on the table. The cup rolls under a chair and continues to move in time with the stamping. Jay, Adam and Mia along with the other bodies in this space are affecting, and are being affected, by the forces and forms all around. (Duhn, 2015, p. 927)

For Duhn, viewing the world in this way is "a pull towards life and vibrant matter, a bodily awareness of the world" (p. 928), because infants and toddlers are less caught up in the illusion of a self that controls and governs than older humans who have learned to see, feel, and think the self and the world in other ways. Such "wild

thinking" forces thought out of its patterns and opens up possible new futures that are less human-centric and allow for reimaginings of how we might think differently in a world of vibrant matter (Duhn, 2015, pp. 927–928).

Inspired by this paper and its focus on Bennett's vibrant matter, Marek Tesar and Sonia Arndt (2016) investigated the *Vibrancy of childhood things* in relation to yet another different approach to language in new materialism. The substantive material for analytical attention in this paper is provided by literature, "the well-loved stories of Pinocchio and Little Otik" (p. 193). These stories are animated by considering "these dead-alive, wooden-thing-materialities as vibrant thing-hoods with agency and power" in a philosophical genealogy of thought embracing both Foucault and new materialist philosophies (p. 193). In an interesting move that resonates with the framing of genealogy and generation, Tesar and Arndt begin the paper with a quote from Barad (2015) on transmaterialities:

> Lightning mucks with origins. Lightning is a lively play of in/determinacy, troubling matters of self and other, past and future, life and death. It electrifies our imaginations and our bodies. If lightning enlivens the boundary between life and death, if it exists on the razor's edge between animate and inanimate does it not seem to dip sometimes here and sometimes there on either side of the divide. (Barad, 2015, p. 390 in Tesar & Arndt, 2016, p. 193)

In this sense, the paper is as much about the process of generation and genealogical thinking as it is about new materialism. The authors' method is described as "a theoretical re-reading, in a sense a deterritorialization, of Foucauldian thought through new materialist philosophies" (p. 193). Through the genealogical approach, they enable subjugated discourses to resurface as resistance and create possibilities for the emergence of the impossible/possible in assemblages of matter, energies, forces, or things beyond the discursive and beyond the human (Tesar & Arndt, 2016, p. 195). While they draw on Barad's materialism of all bodies, both human and nonhuman, they rely more strongly on Bennett's vibrant matter:

> For Bennett (2010), a political act does not need to have been consciously planned or conceived as such. In other words, non-human actants – such as worms – might be equally as political in their acts as humans (and perhaps contribute in a greater sense to certain interdependencies and ecologies). Furthermore, matter or things, such as piles of rubbish on the street, also possess agency. Matter, objects, things, and humans become something different as a result. (Tesar & Arndt, 2016, p. 196)

In returning to Foucault, they note the entanglement of past and present, new and old, in genealogies of thought: "Foucault's thinking about bio-politics . . . establishes and enacts the boundaries between socially relevant and politically recognized existence and "pure matter," something that does not possess legal-moral protection and is "reduced" to 'things'" (p. 7) (Tesar & Arndt, 2016, p. 199). For Tesar and Arndt, materialist philosophies are seen as "approaches, tentacles, and versions that have in common their urge to move beyond simplified, absolute, and objective definitions and classifications of matter as unitary, passive, inactive, and dead" (p. 197).

Summary: Life as a Theme in New Materialism

The overwhelming sense of new materialism as it is theorized and applied in early years learning is about its emphasis on "lifefulness." New materialism derives its understanding from the processes of life itself, from the cellular level, and from the philosophies of physics to the vibrancy of matter and all material things. Beginning with the women of Reggio Emilia who were "ample and greedy" in their desiring a new life for their children after the ravages of the war, to Lenz Taguchi's sensing body, the urge of new materialism is toward life. The way is opened for the materiality of sand, stones, things, and children in play, the river's songs, quivering of wooden floor boards, and wooden images of Pinocchio and Little Otik to generate new ways of thinking and being where the world becomes present in all of its vibrant vitality rather than reduced to the dull and abstract forms of universal generalizations more typical of Western knowledge theorizing.

Animal-Child Relations (Multispecies Ethnographies)

This section largely owes its very substantial contribution to the *Common Worlds Collective* initiated by Affrica Taylor and Veronica Pacini-Ketchabaw. I am indebted to their website for its compilation of this work. Although the "common worlds" website includes both new materialism and Indigenous/Western intersections in its collection of publications, its distinctive and major contribution lies in its theorizing of human-animal relations and methodologies of multispecies ethnography. My first question of this collective work, after my experience with the Reggio Emilia women, was to ask from where did it emerge and what was *the before* of this movement of thought? I found in *Queering home corner* the beginnings of an interest in child-animal relations in early childhood education in the account of Lily and Margie taking turns performing themselves as horse:

> Their embodiment of horse demands a physical performance that appears to be both satisfying and liberating. Margie's performance is impressive and compelling and the result of her conviction that she is, in fact, a horse. Determinedly equine, she performs horse consistently, only changing to princess when playing in the home corner. However, as Margie's home corner is a queer heterotopia, it does not require her to commit to one identity category. Rather, it enables her transformation from horse to princess and then back to horse again. (Taylor & Richardson, 2005, p. 170)

It is in this paper that the thread of influences on the emergence of child animal relations is linked to Elspeth Probyn's (1996) Deleuze-informed musings upon girls and girls and horses (Taylor & Richardson, 2005). Taylor herself, however, locates the beginning of the common worlds research and collective movement to a paper published with Miriam Giugni that first outlines common worlds theorizing. *Common worlds: Reconceptualising inclusion in early childhood communities* is a landmark paper for the common worlds movement that brings together Latour's (2005) generative and entangled common worlds, Haraway's (2008) queer kin, and Massey's (2005) "thrown togetherness of place," "to deepen the pedagogical

opportunities afforded by place-conscious early years researching, teaching and learning" (Taylor & Giugni, 2012, p. 114). It is important to note the interventionist pedagogical intention of the common worlds framework, largely informed by "the central ethical and political question" of "how do we live together with human and non-human others?" (p. 111).

There are two crucial elements of common worlds theorizing that draw together the work from the past and forecast new work to come. The first, connected to *Queering home corner*, is Donna Haraway's "reconfiguration of kinship beyond the conventions of the biological heterosexual human family and into the species (as well as gender) border-crossing terrain of 'queer kin'" (Taylor & Giugni, 2012, p. 112). Queer kin "encapsulates the possibility of sustaining relations with unlikely and very different but nevertheless significant others through a process of continual questioning" (p. 113). Because "queer kin relations, with all their unlikely intimacies, predictable asymmetries, and radical differences pose significant challenges for living together," Haraway's "staying with the trouble" (p. 113) is evoked as a central and repeated feature of the research papers developed subsequently within this framework. "Staying with the trouble" implies going where it is too difficult to go; entering a realm of struggle, difficulty, and conflict; and reflecting there without generating solutions.

Another key feature of Haraway's contribution to common worlds thinking is the idea of "worlding." Throughout her prolific writings about human/more-than-human relations, Haraway (2003, 2004, 2008) interchangeably names her generative relational ontology a process of "becoming with," "becoming worldly," and "worlding" (Taylor & Giugni, 2012, p. 112). Bringing together "worlding" and common, Taylor and Giugni (2012) draw on Gibson-Graham's (2006) notion of commons because an "ethical practice of commons management . . .creates and reproduces 'common substance' of the community while at the same time making a space for raising and answering the perennial question of who belongs." "The commons are the political grounds of belonging" (pp. 109–110). While Taylor and Giugni themselves explicate a very elaborate and rhizomatic web of theoretical connections in relation to "worlding" and "commons," it is to Latour (2005) that they credit the combination term "common worlds," which owes its origins to Plato's philosophy of the commons within the significantly extended notion of "common worlds" (p. 110). Revealing Haraway's indebtedness to Latour, Taylor and Giugni quote Latour's assertion "that a common worlds ethics requires us to remain radically open to the composition of these worlds. For it is only when we exercise curiosity to find out more about where we are, and who and what is there with us, that we find hitherto unknown dimensions" (p. 110). This question of who and what is there with us in this place is a perennial question that informs research within the framework of child-animal relations.

Haraway's Bag Lady Stories as Method

It was at this point in reviewing *child-animal relations* that any form of generational or genealogical tracing failed as the collective proliferation of common worlds papers functioned as a network, creating myriads of rhizomatic connections and

disjunctures. Haraway's *bag lady storytelling* (Taylor et al., 2013) offered another analytical possibility:

> . . .the practice of 'putting unexpected partners and irreducible details into a frayed, porous carrier bag'. . . .Haraway's bag lady stories are collections of ordinary everyday encounters between these 'unexpected partners' – human and non-human. They are stories that trace the 'living histories' of. . . relations 'in the contact zone' of entangled human/non-human lives. (Taylor et al., 2013, p. 49)

The papers were gathered together into bag lady story bags loosely categorized according to the focus animals with the categories enlivened by the frayed, porous nature of Haraway's carrier bags. As I read and thought with the papers, the idea that birds, bears, dogs, raccoons, and kangaroos are different groupings to ants, worms, wasps, bees, and stick insects (Taylor & Pacini-Ketchabaw, 2015, p. 508) became the basis of the bag lady categories. The bags emerged in the following forms: a *bird bag*, a *large animal bag*, and a *small animal bag*. These seemingly childlike categories enabled new questions to emerge about what different theoretical responses are called forth by different animal-child relations and through what events and processes does this occur?

Bird Bag Stories

Miriam Giugni's bag lady story is the only one in this paper that focuses on early childhood (Taylor et al., 2013). Giugni's story "attends to the everyday grapplings of a group of early childhood teachers, as they searched for new ways to include chooks' in search of a companion species curriculum" (p. 56). The theoretical underpinnings are similar to those elaborated in the earlier paper with Taylor, with Haraway's "worlding" described as "a practice that explicitly recognises that the worlds of animals, plants, places, waterways, skies, technologies and so on, as not synonymous with human worlds, or human imaginaries of the world" (p. 56). In this paper, it is Giugni's acute observations of the human-animal encounters in practice that offers extraordinary insights from the world of chooks in an early childcare setting. It was the tension between Giugni's chooks and Rautio's raven and crow that made these unlikely bird bag-fellows productive.

Giugni's chooks story is told in the context of the common practice of renting chooks in early childhood settings. Both the teacher and Giugni were keen for the chooks to roam free because "they wanted them to be part of the centre community and something more than an object of study." They felt that the "children could benefit from co-habiting with chooks, and chooks could benefit from living with the children" (p. 57). However, certain events relating to the rights of the chooks to roam free turned this seemingly straightforward concern into a conundrum of contested rights:

> . . . The children' s belongings were kept in an open shelf with individual cubed spaces, so the chooks could hop and flap their way into any of them when they were out of their cage. By nesting in the children' s belongings, the chooks caused two main dilemmas: first, the chooks had laid eggs in the children's bags . . . and, second, the chooks had pooed in the children' s bags and all over the lockers. (Taylor et al., 2013, pp. 57–58)

The story goes on to examine how the teachers "engaged with the ethical dilemmas thrown up by this conundrum of chook" (p. 58), adding that both the children's and the chook's relatings needed to be considered, including how chooks also grappled with and responded to this new relationship, to living with unfamiliar plants, people, furniture, light and shade, and new routines of roosting, laying, nesting, and scratching (p. 58). As well as thinking with chooks in this way, however, Giugni's interest is intentionally pedagogical, desiring a "companion species curriculum" that takes account of an ethics and politics of animal rights. In concluding that a companion species curriculum requires that we "become worldly with," the response-ability that we share with our nonhuman companions is recognized, reinforcing the collective framing of common worlds pedagogies in their intimate and detailed attention to the ethics and politics of child-animal relations.

Thinking about life and species lines with Pietari and Otto (Rautio, 2017) relates to a personal practice with birds as companion species. While not directly related to early childhood, it is part of the common worlds collective and an important story about human/bird relations. Pietari, a pigeon, and Otto, a crow, "write with" Rautio about life and death. In her moving accounts of growing attachments to the injured and motherless baby birds whose death she experiences as a loss of self, Rautio questions the very idea of species as determining the limits of the way "a life" is categorized and understood:

> What if you defined who counts as your family by including all who eat from the same fridge? What if you defined your kin by thinking about who share and get by with the particular environmental conditions in your neighbourhood (in my case the harsh winters and darkness)? What if you bonded with all who have garlic breath? (Rautio, 2017, p. 97)

In thinking with pigeons and crows, "attuning" and "attending" are proposed as methods of understanding how something *not-self* is *similar to your self* and attending that not-self *as part of your self* (p. 97). In following this line of thought and practice, the category "human" is destabilized as Rautio's relation with animal is formed through their similarity to human: "like her, they suffer, rejoice, feel hunger, face difficult situations and overcome them, sleep, have sex, communicate with others, can be hurt, are vulnerable, can and will eventually die" (p. 100).

By combining these different stories of chooks, ravens, and crows in this bird bag category, the category "bird" itself is fundamentally destabilized, as it becomes evident that in each case, the bird animal becomes other in their human encounters. In this way, species constructs, which differentiate human from animal, break down at the edges like Haraway's frayed and porous bags. The questions "what is *a* life" and "what is *a* death" are fundamental in this category.

Large Animal Bag Stories: Bears, Raccoons, Kangaroos, and Dogs

Large animal stories include bears, raccoons, kangaroos, and dogs as affective presences in early years learning. As a reader, it is the closely detailed accounts of the intimate and intertwined responses of children and animals that animate this work. In bringing the different theorizing from these papers together, it again becomes apparent that animal-human-becoming is part of human-animal mutual meaning-making.

Bear-child stories begins with some charming stories of young children's encounters with bears in an early childhood community where they go for walks to the forest:

> When we encounter holes, both tree hollows and holes in the soil where trees once stood, the children imagine them as 'bear holes': 'This is where the bears would take a bath,' they chant. (p. 26)

In indoor bear play, the children transform the classroom into an "indoor forest" using sand, tree stumps, rocks, indoor plants, and several sticks and branches, making dinner for bears, feeding them pancakes, and making a dark cave for a bear to sleep in (pp. 26–27).

The paper engages with a number of very different public stories of bears, including news stories, children's story books, Indigenous stories, scientific stories, and eco-tourist promotions, which are analyzed according to Povinelli's account of late liberal colonialism, Haraway's (2008) species interdependence and worlding, and Tsing's (2005) frictional encounters. The aim of considering these public discourses of bears is to grapple with "the complexities and tensions that emerge in these late liberal colonized and colonialist spaces where bears and human children meet and contradictory images and figures of child and bear abound" (p. 34). These wide ranging stories are then analyzed in terms of how they shape children's entangled relations with bears in British Columbian early childhood, evoking Haraway's "response-ability" as a way to disrupt taken-for-granted notions about bear-child relations:

> Our stories are entangled, not neatly packaged together, without following a linear trajectory. The stories aggregate; they add up to create other stories and to disrupt taken for granted stories. They are stories that grapple with troubles, with connections that trouble us, but have no generalized moral teachings nor are they finished stories of grandiose research findings. They do, however, have 'consequences for response-ability.' (Haraway, 2012, p. 312)

The paper is typically inconclusive as Haraway's "staying with the trouble" does not attempt to offer solutions but considers how thinking with animals might require paying attention to the ways in which nonhumans are typically left out of children's histories and futures (p. 49).

Raccoons and roos offer different opportunities for theorizing in *Kids, raccoons, and roos: Awkward encounters and mixed affects* (Taylor & Pacini-Ketchabaw, 2017) provoking a tracing of "the imbroglio of child–animal curiosities, warinesses,

risks, inconveniences, revulsions, attachments, and confrontations" (Taylor & Pacini-Ketchabaw, 2017, p. 131). A family of raccoons actually moves into the early learning center in British Columbia, confounding interspecies separability, in common with Rautio's animal-becoming-human destabilization of species separations:

> One particular encounter on a rainy afternoon especially moved the children to ponder about their relations with the raccoons. Looking from the classroom window into the playground, the children watched the mother raccoon carefully pick up a bucket of water that the children had left that morning and place it in front of her cubs. The cubs set about to splash their paws in the water (as the children often do) and wash the sandbox toys. All the while the mother raccoon attentively watched her cubs, intermittently turning her head to also watch the curious children. (Taylor & Pacini-Ketchabaw, 2017, p. 135)

Not only are the raccoons constituted as their own family group who mimic the children in their actions, but they also communicate directly with the children. When one of the children places his hand on the window to say hello to the raccoons, the mother comes to the window and raises her paw to meet the child's hand through the glass (p. 134). The children are described as beguiled, entertained, amused, perplexed, and confronted by what they had witnessed, suspended between their interspecies experiences and "the ubiquitous public discourses that provoke anxiety and panic about the threats that wild animals pose to human safety" (p. 136).

The kangaroos in this paper occupy a common ground that the children enter, and different opportunities for animal-child relations emerge. The emphasis moves more toward the children than the kangaroos as the children repeatedly engage in mimicking what it would be like to live in a kangaroo' s body:

> They find or make big tails, attach them and hop around. They put their hands on their heads to listen carefully with protruding swivelling ears. They pay new attention to the feel of furry fabrics. This comes into play as they scratch their (imagined) furry chests, tuck themselves up and simulate what it would be like to be securely ensconced in a warm furry pouch. (p. 149)

The agency of the kangaroo comes powerfully to the fore in an account of children's response to a dead kangaroo that has been killed by a car:

> The tension of this grisly and awkward encounter was broken when a couple of the children ran away from the kangaroo corpse and suddenly dropped to the ground. Others ran to try and rouse these dying child-kangaroos. . . performatively enacting what it is like to die in a kangaroo's body. It was intense and chaotic. With much shrieking, laughter, and release, the child-kangaroos started rushing around, listening for and fleeing from imaginary cars, being knocked over, lying dead or dying on the grass, and going to the assistance of fatally injured kangaroo kin. (p. 141)

The theories evoked by these raccoon and kangaroo encounters are framed within the context of the Anthropocene and the need for a new ethics and politics of

encounter. Mimicry or mimesis is a new addition to this theorizing. In this paper, both raccoons and children can be understood as engaged in processes of mimesis, each trying out what it might be like to be other, animal-becoming-human, and human-becoming-animal. In each case, the other is required, neither animal nor human can be seen as initiating the interspecies mimicry, and there is no particular purpose except the experience of sameness. Especially poignant is the resonance of the children's response to the dead body of the kangaroo with Rautio's encounter with the death of Pietari and Otto. Both examples beg the question what is "*a* death," asking whether the concept of a life or a death can be limited to an individual or is it much more than that?

Finally, in *Reconsidering children's encounters with nature and place using posthumanism*, Malone (2016) considers child-dog encounters in the slums of La Paz, Bolivia. The dogs in La Paz are street dogs who "are neither pets, strays, or wild; they are left to scavenge for themselves, loosely connected to families, coming and going, sometimes wandering into yards, but mainly hanging around on the streets" (p. 51). Dogs associate with children (or children associate with dogs) in different ways and for different reasons, captured by the children's own photographs and stories: The street dogs are urban scavengers, not Western-style, house-dwelling, middle-class "family pets"; and children spend long periods of unsupervised time on the streets with the dogs, where the dogs live; they coexist as dog-child, as a unique body, and as a street collective entity (p. 47).

In this paper it is as if these intimate, material, and entwined relations between dog and child themselves call forth Barad's concept of "intra-action" "to help to understand relations in which object and subject are mutually constituted. . . they do not exist as separate individual elements" (p. 51). The bodies of children and dogs are fully present in "the fleshy detail of the physicality of the relationships" (p. 46). It is as if they merge in these mutual encounters in the streets of La Paz with much in common with animal-child encounters in the more regulated environments of early childhood education.

By pulling the threads of these large animal bag lady stories together, it is possible to weave other insights emerging from the frayed edges. The idea of mimicry is interestingly resonant with *Things and children in play* (Rautio & Winston, 2015). If mimicry is not a conscious choice for human or animal but an involuntary bodily response evoked by unconscious desires, then this links to the destabilization of species itself (Rautio, 2017). The raccoon family clearly experience themselves as human in many respects and the children as kangaroos. Similarly bears and children are deeply intertwined. Dog and child bodies become as one in La Paz. It is possible to reread bears, raccoons, and kangaroos as all like the street dogs of La Paz, habituated to living with humans, animal-becoming-human simultaneously with human-becoming-animal. The meaning-making that emerges from this theorizing with large animals disrupts the boundary between animal and human child, bringing into question the categorization of species itself, particularly the hyper separation of the human species.

Small Animal Bag Stories: Wasps, Worms, Ants, Bees, and Stick Insects

The last of the frayed and porous bags that make up this section on human-animal relations is the small animal category, probably the most significant and certainly the most numerous form of animal life on the planet (Taylor & Pacini-Ketchabaw, 2015). More than any other, the small animal bag raises questions about how different animals call forth different theoretical responses. Whatever we think of the concept of species, it is clear that ants, bees, wasps, stick insects, and worms are of a different order than birds, bears, dogs, raccoons, and kangaroos. While the papers engage the same theoretical framings around ethics and politics, mainly referencing Haraway, an additional layer of complexity is added when considering animals that are "less appealing, very small, and invisible and that may bite or sting" (Taylor & Pacini-Ketchabaw, 2015). In the following, seven papers generated by small animals are discussed, first in terms of the separate contributions and finally in relation to the theme of death, which is common to all of these small animal papers.

Learning with children, ants and worms (Taylor & Pacini-Ketchabaw, 2015) is generated by worms in the wet forests of British Columbia and ants in the dry forests of Canberra, Australia. In both cases the small animals are agentic: The earthworms "attract the children who are fascinated by the movements of these red wigglers" (p. 517), and the ants get faster and feistier as the weather warms up, sometimes running up the children's legs or into their clothing and biting them (p. 523). The worms and ants evoke the theoretical framing of Myra Hird's of "multispecies vulnerabilities," an extension of Haraway's entangled species ontologies into microbial worlds (p. 512). For Taylor and Pacini-Ketchabaw, "agency is completely reversed when we become beholden to the myriad of micro life forms we rarely see, let alone acknowledge, and yet which sustain the lives of all large animal species, including our own" (p. 512). This in turn gives rise to "inventive and experimental co-implicated research practices" that necessitate "paying attention to the movements and actions of the worms, ants, water, rain boots, fingers, sticks, rocks, mud, pebbles and dust" (p. 515). The experience of embodied intimacy with these small animals raises awareness of "the precarity of life through (literally) holding the responsibility for another life, at the same time as making themselves vulnerable to another species" (p. 525).

In *Wasps-bees-mushrooms-children* (Atkinson, 2015), the children walk in a park where they find dark shady places with piles of rocks, prickly mounds of garden debris, discarded pipes, tiles, and chunks of concrete. A slug attaches itself to a child's princess dress and is rescued by another who places it carefully on a flower that she carries for the duration of the walk. Wasps fly crazily in all directions when the children move a large slab of concrete to expose a wasps' nest and a bee lands on a boy's leg when he is observing its movements through the grass. These small animal encounters evoke another new theoretical framing to add to common worlds theorizing: Ginn, Beisel, and Barua's (2014) "unloved others." This entails "an ethic of flourishing that requires us to look at the knotty relationships between human and

non-humans, to notice who prospers and who does not, who lives and who dies, and the vulnerabilities that emerge in multispecies encounters" (p. 71). The strategy of "deep listening" generates "small conversations" and a sense of mutual vulnerability through which worms, slugs, and wasps are acknowledged as having a role to play in the pedagogies of early learning and in mutual survival (p. 78).

In *"Staying with the trouble" in child-insect-educator common worlds*, Nxumalo and Pacini-Ketchabaw (2017) trouble human relations with small animals in the very different situation of imported stick insects in a child care center. The stick insects breed so prolifically in captivity that it forces educators to deal with death through the need to reduce the large populations of the prolific breeding insects. For the educators:

> acts of culling required them to juggle regret, resentment, guilt. They questioned who these acts of caring benefited – the children? the stick insects? themselves? . . .They questioned what living and dying well meant for the stick insects. . . They grappled with how 'best' to kill the insects to relieve their crowded living conditions: Should they boil the stick insects or freeze their eggs to death or perhaps withdraw food and water? What practices of 'mindful killing' and 'ethical detachment' might they enact in relation to the stick insects? One educator asked, 'Do we keep killing them little by little forever?' (Nxumalo & Pacini-Ketchabaw, 2017, p. 10)

In order to address the knotty problem that the stick insects pose, another new theoretical framing, "a practice of becoming witness to others," is introduced. This involves an "openness to others in the material reality of their own lives [as] noisy, fleshy, exuberant creatures with their multitude of interdependencies and precarities, their great range of calls, their care and their abundance along with their suffering and grief" (Rose & van Dooren, 2017, p. 124, as cited in Nxumalo & Pacini-Ketchabaw, 2017, p. 6).

The concepts of "wildness" (Collard, Dempsey, & Sundberg, 2015) and "wildlife" (Lorimer, 2015) are also evoked by these tiny commodified animals in order to interrogate what it might mean to live and die in captivity in this way. Wildness encompasses the degree to which the animal can come and go, express itself, work for itself, and form social networks. These are conditions of possibility, of potential, not forced states of being (Collard et al., 2015, p. 328). "Wildlife" is evoked by the concept of wild as "a vernacular political concept that counters the idea of wilderness" (Nxumalo & Pacini-Ketchabaw, 2017, p. 6). Wildlife describes "ecologies of becoming that provokes curiosity, disconcertion, and care, and demand political processes for deliberating discord among multiple affected publics" (p. 11). Ultimately, the intention of this paper, in common with common worlds theorizing, is to "stay with the trouble" of these imported stick insect pets and the challenges they pose of contemplating the ending of a life.

Finally, *Stories for living on a damaged planet* (Nxumalo, 2017) considers the endangered Western bumble bee's engaging presence in an early learning center. This paper introduces new concepts and modes of thought as it "brings attention to the particularities of the emergent assemblage of children and bumble bees as well as its multiple and contingent material-discursive relations" (p. 1). Concepts such as

"assemblage" (derived from Deleuze) and material-discursive relations (new materialism) are evoked as the plight of dying bees and failure of pollination are contemplated:

> As bees, children and educators responded to their mutual presences, children began to make offerings to the bees they encountered crawling on the ground outside. Some children built 'homes to try and make the bees feel better', while others kept their distance and watched. Some children picked up some of the still-moving bees and placed them on flowers in the classroom or outside, or tried to find the bees' nesting grounds. Some children also prepared, with educators' help, a sugary water to feed the bees – occasionally a bee would respond to the offering and then fly away, to the children's delight. Some responded by covering the dead bees with article 'to stop them blowing away' and by building a wood 'bridge' so that the bees could 'walk' to the flowers. (Nxumalo, 2017, p. 8)

This paper reworks Haraway's "worlding" with related concepts, drawing on Stewart's (2010) *Atmospheric attunements*, considering "in any worlding we can ask how things come to matter and through what qualities, rhythms, forces, relations and movements" (Nxumalo, 2017, p. 3). Worlding, then, becomes a methodology introduced by these dying and endangered bumble bees, a methodology that focuses on "particular affects, bodily (dis)orientations and sensory modes of attention in relation to children's and educators' situated encounters with bee-life and bee-death" (p. 3). It can be read as a "bee methodology" that focuses on "what potential modes of knowing, relating, and attending to things are already somehow present in them as a potential or resonance" (p. 3).

Death is the predominant concept in this paper in which "children's modes of bearing witness to bee death and caring for bees" is "inseparable from their knowledge-making about what was harming the bees" (p. 8). Children learn by "touching death" as they interact with the growing pile of dead bees they collect from their grounds. The death of these endangered bumble bees is connected to the question of mass extinctions in the age of the Anthropocene, "because the death, and subsequent absence of a whole species, unmakes these relationships on which life depends, often amplifying suffering and death for a whole host of others" (Van Dooren, 2010, p. 273, cited in Nxumalo, 2017, p. 8).

While these small animals present experiences of death to the human child, they gesture toward the presence of death as an overriding theme across the papers that represent animal-child relations in early years learning.

Summary: Death as a Theme in Animal-Child Relations

Commonly set among the mass extinctions of the Anthropocene, the researchers in the small animal bag stories recognize the smallness of these encounters as necessary minor and incremental steps in young children's learning. The one commonality across all the different theories these small animal bag stories evoke is the idea of touching and being touched in the double sense of being affected by, or *touched* by, death and *touching* death with the hands, the sensing body. The same can be said of

the ravens and crows, the dead kangaroo, the risk-taking raccoons, and the dogs in La Paz who get beaten to death and die in the streets. In these encounters, animal and human body become intercorporeal where each is affected by the other. In this affecting and being affected by the intertwined materiality of bodies, each becomes different, and new ways of being and knowing are born for both. Through becoming-with both living and dying/dead animals in these ways, life and death are comprehended differently; the life and death of the individual and of a species are newly understood through death giving ultimate meaning to life and both life and death questioning the singularity of species.

Concluding Thoughts

The dominance of the posthuman in early years learning is traced to two major movements, or categories of theorizing, *new materialism* and *animal-child relations*, each requiring different analytical strategies. A genealogical/generational model adapted from Iris van der Tuin (2014) identified the origins of new materialism in the "ample and greedy" women at the beginning of the Reggio Emilia movement in war-torn Italy. This movement informed the materiality of the sensing body in Lenz Taguchi's influential text, *Beyond the Theory Practice Divide*, which added Deleuze's theory of immanence and Barad's intra-action to open new possibilities of emergent materiality in early years learning. Many researchers have applied these philosophical influences in practice, with a particular interest in language and materiality emerging as a major focus. While additional theoretical influences are noted in the papers, it is the extensive iterations of Barad's theories of materiality derived from quantum physics that open up a new paradigm of thought. This new paradigm emphasizes the vibrancy of all life and matter where human life comes into being only within the materiality of the world and young children's play arises from this mutual emergence.

Animal-child relations with its network of common worlds collective theorizing evoked a horizontal rather than a genealogical approach. Donna Haraway is the major theoretical and philosophical influence, and the adoption of Haraway's "bag lady story" strategy as a rhizomatic analytical tool produced a "bird bag," a "large animal bag," and a "small animal bag." This categorizing animated the papers to make evident the ways that different categories of animals evoke different theoretical understandings. Small animals, for example, call forth Myra Hird's "interspecies vulnerability," an extension of Haraway's entangled species ontologies into microbial worlds. The small animal bag is uniquely powerful in generating the dominant theme of animal-child relations, that of being affected by, or *touched* by, death and *touching* death with the hands, the sensing body. The question of what is a (singular) life and what is a (singular) death disrupts the certainty of species categories where animal-becoming-human is as present as child-animal becomings. The animal bags offer a way of reading these papers to make evident their contribution to new ways of thinking and knowing emerging from early childhood research and practice as a major contribution to Anthropocene scholarship.

Abstract

This chapter interrogates the concept of nature as central to the understanding of education, learning, and the position of the child in education. Based on a problematization of the concept of nature, a philosophy of education without nature is outlined. This philosophy is substantiated by a conception of object-oriented learning, where learning is reconceived as a primarily aesthetic process of unappropriation. In sum, this chapter aims to develop an alternate ecological outlook on education that wants to open up processes of learning as to foster nearness and compassion with other objects.

Introduction

This chapter aims to reapproach the question of the relationship between learner and nature by first problematizing the conception of nature in education. Second, we will engage with what this reapproaching will mean for the understanding of childhood and the mesh of childhoodnature. In the first section of the chapter, I will engage in an interrogation of the concept of nature in foundational thought about education, learning, as well as maturing through education. As will be shown, the concept of nature is fundamentally linked to the concept of subject and an integrative part of the dialectics of enlightenment as they still shape the very core of contemporary thinking about education and learning. According to this thought, learning can be understood as appropriation of nature by the human subject. This process of maturing by appropriation, that is, a rational and human project, leads, in a paradoxical move, to the emancipation of the human subject from nature, where that human subject is simultaneously seen as still emerging from nature and essentially different from nature. Problematizing the very form of reasoning inherent in this thinking of nature in education, I argue for a radicalization of the conception of education through a tentative outline of a philosophy of education without an appeal to the concept of nature. Drawing on emergent thought in object-oriented ontology (OOO) and especially the work of Timothy Morton, I engage in an experiment of rethinking education once we abandon nature as a guiding reference point for learning. The proposed notion of object-oriented learning is to counter the enlightenment ideal of learning as appropriation. What I offer is a reconception of learning as unappropriation that recenters learning on the primacy of aesthetics and fosters processes that sensitize the learner to the interdependence of objects and the emotional reaction this nearness to objects might provoke. Thus, what the, in this chapter, outlined philosophy of education without nature and the related theory of object-oriented learning offer is a dismantling of the humanist learning subject and a vision for how learning and consequently education can again become a broadened communitarian political project that seeks to distribute and multiply enjoyment. This political project feeds upon a rehabilitated notion of an immature learner or the childish learner that is to be overcome in the enlightenment notion of the learner by her very nature.

Education, Nature, and Childhood

In this section, I aim to unpack a number of core assumptions that shape how the relation between education, nature, and childhood is conceived in education. While human/nature relationships have been discussed in other fields (e.g., Horkheimer & Adorno, 2002; Plumwood, 1993), I will explore how the conception of the relation between the learning human and nature in education can be seen to share parallels with the seminal work on human/nature relation by Kahn (1999). In particular, I am going to highlight the ontological outlook that is at play in the conception of this relation and how correlationist accounts (Meillassoux, 2009) of a nature for us

humans gives expression to a double notion of nature. The focus of this section is then preempted by the two sections that are to come, that is, this section is to highlight how the conception of nature restrains our potential engagement with objects in ecologically oriented education.

I will throughout this and the following sections argue that the relation between education and nature in Western educational thought is historically framed by particular ontological outlook that can be rooted in the Enlightenment's dialectics of rationality and social reality (Horkheimer & Adorno, 2002) and the subsequent Kantian (1781) hard separation of things into inaccessible noumena (thing-in-itself) and apparent phenomena (things as they appear to the transcendental human subject). It is primarily through the Hegelian notion of a historical and communitarian subject that educational thought became focused on phenomena (Hegel, 1807), thereby following the Kantian precluding gesture. Yet noumena, while barred from human access, remained a crucial role as the world of things in themselves, that is, nature, provided a horizon for the world of humans. Such a nature as *horizon* for the play of human emancipation can be seen to surface in the naturalism that is appealed to by educational thinkers such as Rousseau (Babbit, 2009) or Dewey (Santayana, 1925). Thus, a crucial point of departure for educational thought is the distinction between a cultural, social, and technological world of humans and one that is separate and which is called nature or natural world (e.g., Dewey, 1928; Durkheim, 1922). For example, in the Marxist/Hegelian tradition, education and learning is consequently positioned on the side of production and reproduction of a human social, cultural, and technological world, where nature as a lump of immediate things is translated or appropriated according to different historically determinate social and cultural paradigms, discourses, or ideologies (e.g., Apple, 2013; Bourdieu & Passeron, 1970; Giroux, 1981).

While the conception of this separation differs according to the specific underlying theoretical outlook that is appealed to, a shared feature is the by the Enlightenment and Kant established separation between the world of humans (culture, technology, language) and a distinct realm of nature. It is the emergence of environmental awareness in the later half of the past century that can be seen to have called for a return to the world of nature as part of efforts to address an alienated and malignant relation to nature. Kahn (1999, p. 226) calls here, for example, for a *fostering* of the human relationship with nature.

What this return to nature in educational thought is taking for granted and at the same time highlighting and problematizing is that these two realms stand in a relationship – a human/nature relationship (e.g., Bowers, 2001). Further, this distinction informs a dualism of immaturity/maturity that is crucial for understanding childhoodnature relations, as childhood and nature are essentially associated with *immaturity*. The educational prerogative is, hence, to assure maturity and a departure from nature. I argue that education, which is addressing environmental issues and human/nature relations, remains committed to the dialectics of enlightenment and the notion of fostering as a guided movement toward maturity. Without addressing this outlook, I argue, a reengagement with the world of things is caught up in the loop of thinking and writing double nature, thereby preemptively closing down

alternative possibilities of thought and engagement. In the following, I will explore how this ontological outlook, as a loop of thinking nature, might have led to a conception of environmentally oriented education that is doubling down on a concept of nature that, as I will argue, should have been abandoned. Consequently, this abandonment can open up for new understandings of the childhoodnature assemblage.

As stated, historically, direct access to the world of things, or nature, has been barred, and this prohibition has been dealt with in different ways. In Kahn (1999), I see the Hegelian approach of appealing to mediation to resurface. Mediation refers here to the observation that nothing is immediately present but that everything is mediated in relation to and through something else (Hegel, 1816). For education, this meant that nature is always already mediated, that is, a nature for us humans. Hegel and German idealism pursued this correlationist reasoning of things as they appear to us to its maximum, erasing the traces of noumena in their accounts of education fully. For Hegelian- and absolute idealist-inspired educational thought, this means that things of concern only emerge as artifacts, as already mediated by a history of use and human engagement with the world. Thus, in order to have any educational value, things have to be relative to or mediated by a human standard that is historical and social.

This standard is also *maturing*, that is, it is relative to a process of historical unfolding of an absolute spirit (*Geist*), which is progressing (Hegel, 1807). To put this into an educational context, to learn is to attune to the historical process of maturing, where there can be seen to be two standards of maturity. First, the current adults who express a current spirit or state of progress and then the future state of absolute knowing toward which human history is moving. The former can in education be seen to stand in for the later as guarantee for progress.

With the emergence of environmentally oriented education during the late 1960s, the process of reducing nature to processes of human production became an issue of problematization. Environmental awareness in education became related to the problem of reduction of nature as means for human activity (cf. Bonnett, 2004; Bowers, 2001). Thus, what was problematized was a reduction of nature to processes of appropriation of nature as part of economic and social processes of production. This figure of reasoning can be seen to reconfigure an earlier concern in educational thought, one already articulated by Rousseau (1762), that is, education as a historical process that is to denature man. Rousseau can here be seen to articulate a proto-form of Hegelian dialectics (Szkudlarek, 2016). Education is, for Rousseau, to transform over time the nature of man. Thus, what I find in this figure of reasoning is a notion of education that should alter the nature of man, that is, to overcome a corrupted and egoistic nature and to foster a nonnatural general will that is based on reason (Riley & Welchman, 2003). What this figure of reasoning expresses is a paradox (cf. Baker, 2001; Szkudlarek, 2016). While education is to denature, this denaturing, as a process of realizing true nature of man, is accomplished through experience of our surroundings and things, or, I might say, experience of nature. The paradox emerges in the appeal to man as both having a false nature and a true nature. Hence, there is an underlying tension between experiencing nature and of deviating from it, that is, a true nature that is to be fostered.

Rousseau and peers of his generation of enlightenment thinkers turned here to reason, where Kant (1784, p. 51) appealed to the Enlightenment as the process of "man's release from self-incurred immaturity" given the "ability to use one's understanding without the guidance of another." Maturity is in this sense the true nature of "man," and this progression from immaturity to maturity can paradoxically be seen as given by nature. Thus, nature can be framed in two paradox configurations in the context of the discussion of child/nature relations. First, there is the false child/nature relation that is irrational and unfree. Second, there is the true adult/nature relation, as defined by a reason and freedom.

However, the paradox of Rousseau can be seen to resurface in terms of the grounding of reason. If man's release is dependent on his ability to understand without guidance, we might ask us: What is the reason for this release? Thus, if immaturity is self-imposed, and release is self-incurred, both release and immaturity can be seen as grounded in a reason to do so. What can be seen to be at stake is the potential collapse of the hard distinction between maturity/adulthood and immaturity/childhood once we take a closer look at the status of nature in the conception of the dialectics of enlightenment and, I argue, the underlying notion of the learner in education.

I argue, this Kantian paradox is still informing education as curricular objectives can be seen to be grounded in the idea of maturity, that is, what an adult is necessary to know and do in contemporary society. However, the Kantian paradox and the dialectics of enlightenment can be seen to haunt educative narratives of progress, development, and attunement to societal demands with regard to the underlying double notion of nature that is at play in these narratives. That is to say, if the development of the capacity of reason in learning turns to nature for determining maturity and immaturity, there is the danger of subversive learning. What I mean by this subversive potential of learning is the inherent necessity of learning to contribute to a teleological general progress of humanity's ability to reason. Thus, there needs in the process of learning that is turning toward nature a potentiality of release from immaturity that undermines the childhood/adulthood distinction. Learning, irrespective of the status of the learner, must have the potential of approaching absolute knowing by reflecting on nature. If this would not be a condition, then there would be no condition for progress. Thus, in the dialectics of enlightenment, nature has a paradoxical double didactical function.

Leaving this paradox briefly aside, I argue the human/nature relationship is framed through the dialectics of the enlightenment by the idea of the demystification and disenchantment of the world. This disenchantment has, as I stated, an essential didactical dimension to it; man is to learn from nature in order dominate it: "What human beings seek to learn from nature is how to use it to dominate wholly both it and human beings" (Horkheimer & Adorno, 2002, p. 2). What Horkheimer and Adorno are interpreted to underline is that the concept of nature plays a crucial role not only when it comes to substantiating rationalism but also to uphold particular forms of social production. The double character of nature orders according to the dialectic distinctions that substantiate and praise Western white, male patriarchy, by categorizing according to dichotomies such as civilized/uncivilized, man/women, or adult/child according to the true/false logic of true and false nature of man.

I argue, environmentally oriented education tried and tries to reconfigure the Enlightenment's outlook on education. However, I argue that for the most part, it aims to reconfigure the latter part of Horkheimer and Adorno's characterization of the dialectics of enlightenment, that is, human beings still seek to learn from nature but this time in order to live in accordance with it. Thus, I argue environmentally oriented education is still committed to the principle of demystification and disenchantment, arguing that we are finally starting to figure out nature. As a result, a continued appeal to the concept of nature in the diversity of its forms and expressions can be seen to reinforce a dualistic standard that reinforces notions of immaturity and maturity.

For example, in Kahn (1999), reason is to shed light on the human/nature relationship, showing through the development of reason over time that our true nature is to affiliate with nature. Hence, I argue Kahn is rearticulating the dialectics of enlightenment, reinstalling the paradox role of nature in learning, and giving expression to an understanding of learning that is essentially teleological. There is a notion of progress and maturing at play. The Kantian paradox can also be seen to reemerge in Kahn's (1999, p. 226) double notion of nature, that is, nature and human nature, where human nature is characterized by our intellectual ability to construct increasingly sophisticated ideas. Thus, repeating our interrogation of Kant, why would these human constructs be *increasingly* sophisticated if they are essentially and a priori grounded in nature?

I argue, it is the same notion of nature in the Enlightenment, which is to teach us humans something, that common to conceptions of environmentally oriented education as well as other notions of education draw on. The notion of nature feeds on the idea of nature's inherent didactical character. As I will show below in the exploration of this didactical character, it is problematic not only with regard to the logics by which learning is conceived but also the moral and political consequences of such an understanding of learning.

I argue that nature plays a crucial role in three processes of education: *ecomimesis*, *ecodidacticism*, and *ecorhapsody*. I derive these terms from Morton (2007) and will in the following elaborate how they reemerge in conceptions of the relation of learning and nature in education.

Ecomimesis can be translated into "nature writing," or, to put it in the terminology introduced above, a presentation of nature in the writing of nature. Ecomimesis can be seen to be at play in the act of "rooting" learning about nature in experience. In line with Rousseau's thought, the writing of nature is a process guided by nature, not by the corrupting learner or writer. This requirement relates to the possibility of children to learn, who can be seen to be too close to nature and further away from the true nature of man. The learner or writer tunes into nature, or as Morton (2007, p. 55) puts it, "the mind lets go while the body takes over." Ecomimesis is in the writing of nature, as a process of learning, an attunement to nature. Thus, what ecomimesis does is, first, to point to an "over-there nature" about which the learner is *here* writing and learning about. Thus, ecomimesis as an eco-didactical move *points out* nature as a background or the horizon for learning. It is here that I see the paradox of the dialectics of enlightenment to resurface, as I question *where* the source of inspiration

for reason is located. In a weird twist, learning cannot be grounded in reason itself but requires an external/background inspiration for learning that is taking place in the foreground (thinking about nature): "I choose to not reason forth my experiences of nature as a basis for learning something about it." This experience of the background is to teach me something; it is to allow for a change of my reasoning without determining that very process of reasoning. Nature is in this function of the background terrifying, in a double sense, as it undermines the possibility of continuity of progress in learning as well as can be seen to bring into play the potentiality of the intervention of future nature of man. To clarify this potential of subversion, the playful engagement of a child with nature may be closer to nature than the reasonable and mature position of an adult. Hence, here the paradox notion of nature in Rousseau emerges again; the child might be closer to nature than the mature and rational adult.

To summarize the process of ecomimesis, I argue it consists of two related processes. First, there is the act of pointing out nature that ascribes significance to "over-there nature" for learning. This is the dimension of *ecodidacticism* (cf. Morton, 2007, p. 62) that I already observed in Rousseau. Nature is to teach us, humans, something but we have to look beyond corrupted and egoistic nature to encounter true nature. The "here" where learning is taking place, or in the environmental education commonly appealed to place, attains its significance from nature . The child can here be seen as to remain in a mystical relation to nature that is judged as both adorable naive in its engagement with nature and frightening attuned to something that corrupted adults cannot be seen to have access to. Similarly, the here is also a place for "we" in the thought of Rousseau, where that "we" emerges as the distance to nature over there. Hence, ecodidacticism points out the significance of the background as the basis for writing it as a foreground in the process of learning (ecomimesis). Children in their play can be seen to be too close to a here, both spatially and intellectually, and a common didactic intervention is to call for perspective and distance. A mature position to be gained through learning is calling for a detachment from the "here," where the learner is to attain a distanced and detached position toward that "here." The child is to "see" things fully for what they truly are given its intellectual capacities as a maturing human subject. The things encountered here are or should be in a particular or natural way according to the naturalness provided by nature over there. However, ecodidacticism can be seen to haunt the mature "we," as the immature and childish proximity can be seen to have access to a surplus, which we are no longer able to see from over here. There can be seen to be a mixture of despise and envy of the childish perspective in ecomimesis.

What I argue surfaces in this eco-didactical move is a paradoxical ecomimesis, writing of and learning about nature, where the background is written in the foreground. Thus, ecodidacticism points out the significance of nature over there in the here, which is to teach us something. Ecodidacticism points out a position to be attained by the child, that of the adult "here," distanced from the over there. The writing of nature over there (background) in the foreground (here) is articulated as a form of *ecorhapsody*. Ecorhapsody is the resonance of the background in the foreground (Morton, 2007, p. 57). We might here think of Plato's allegory of the

cave with a twist, as there seems to be something more natural in the reflections on the wall than the objects reflected. Thus, there is not only a reflection but also an appropriation of that reflection by a reasoning subject. In line with the enlightenment dialectic, there is a human subject appropriating the reflection or resonance of over-there nature. Yet, there seems to be a double distance at play. While the child can be seen as caught up too much with the objects over here, the mature adult can be seen to not yet distanced enough. There can be seen to be a distance between we and "here," as the wall needs to be looked at. I argue that the mature position of "we" still needs to mature, to attain absolute knowledge, as the writing requires a poetic act and not literal translation. The play at work in this poetic act can be seen to entail a potential relapse into the childish proximity, which is a fascination with the surplus of things over here. The danger is that we do not know if the rhapsody went too far or remained too close.

It is in this conception of ecorhapsody, as a process of learning, that I see Kant's rationalism to concur with his transcendental humanism. It is the human subject's cognitive special status, as on the one hand part of nature, subject to its laws, but who also as an actor and knower transcends nature and actually becomes the authors of the laws of nature (Allison, 1971). Thus, here we are thinking nature in a loop. In this thinking-nature-loop, nature is not only writing itself through us but also wants to make a point about an "ought," which is implicit in ecodidacticism's imperative "Look over there, Nature"! Nature is, in this appeal to an "ought" related to Rousseau's nature that is still to come, while at the same time making itself already present to the human mind. There is in the thinking-nature-loop an appeal to a transcendental principle (principle of sufficient reason) that establishes, through the thinking of nature, that which is natural or how it ought to be (purpose). Yet, in an almost ironic gesture, the transcendental subject thinking the nature loop seems to have to erase itself from thinking this loop in order to conceal the loop-like form of thought and to present thinking nature as linear.

Consider for a moment the following form of thinking nature that could be seen as appealed to in Kahn (1999): Me thinking and reflecting about nature in order to unveil my true nature as human being is coming to the conclusion that I should affiliate with nature. Nature has a funny way of sneaking up on you – don't you think? For the childhoodnature relation, this transcendental principle means that there is an inherent pregiven imperative for the child to grow up through means of learning. Environmental education can in a number of instances then make the addition that the child should learn from nature in order to become aware that where I was is where I should have stayed.

I argue similarly to Morton (2016) that nature is, as we already saw in Rousseau, a project and a product of human ambitions that precedes the Enlightenment. Thus, the naturalness of nature is a by-product of particular forms of reasoning, that is, reasoning in loops that wants to present itself as linear. This is a presentation of the loop, where the presenter erases herself from the presentation, given her self-declared transcendental status. As argued above, nature plays a crucial role in thinking that wants to appropriate a political and moral outlook that seeks to fully dominate and to open itself up in order to consolidate itself from within. In line with

critical and reflexive traditions in environmental education, I aim to problematize the consequences of such an underlying outlook. Especially against the background of the processes of becoming aware of the effects of such an outlook, that has been labeled the Anthropocene, I would like to engage in elaborating what might happen if we start thinking learning and education without nature. I am to explore an alternate loop of thinking, ecological thought, that, as a strange loop, might allow us to leave behind attempts to appropriate and dominate and instead open us up to compassion and coexistence with other objects. In parallel, I will also explore what this might mean for a rethinking of childhoodnature relations.

A Philosophy of Education Without Nature

When arguing for learning and education without nature, I am not arguing for a form of ontological or epistemological idealism, claiming that everything is or can be known as human mind. On the contrary, I am rather pursuing a form of German realism that, as Harman (2013) puts it, could have been a feasible alternative to German idealism. Following Kant, I do reinstall the thing-in-itself (noumena) as unknowable. However, instead of installing the barrier between the knowable between the world-for-us-humans and the world-in-itself (Nature), I argue in line with object-oriented ontology (OOO) (Harman, 2011), for a barrier between sensible object and real object. As a result, I end up with an ontological outlook that is different than the notion learning as appropriation as it is defined by a human/nature distinction. OOO has only initially been translated into the context of education (Oral, 2014, 2015), where I in this chapter aim to outline some consequence of OOO for rethinking childhoodnature relations in an educational setting.

In this section, I am exploring how OOO and Morton's ecological thought might allow for an alternate entry point for understanding childhood in education and learning. Thus, in this section, I will begin a translation process from ontology (OOO) into a philosophy of education. In the next section, I will translate this philosophy of education into a conception of learning as *unappropriation*.

In the philosophy of education to be developed here, there is no lump of real things called nature, fully transparent to itself. Instead, I argue, in line with OOO, for the existence of real objects that are withdrawn from other objects, where humans are not special in the sense that they are withheld access to real objects. What I end up with is an ontological outlook that holds that humans, as well as other objects, have access to other sensible objects, without the possibility of access to the related real objects (Harman, 2011). Thus, there is no mature access to real object or nature given that neither reason nor experience has any full access to real objects. Consequently, objects remain in some sense mystical or magical, exerting, like in an immature position, a power of attraction in their sheer infinity of apprehensible qualities (cf. Morton, 2013b).

As it might become obvious, what I am starting to withhold is the humanist attitude's special position of humans and in particular a mature position toward nature. Hence, I do neither essentialize human access to the world nor claim a view

from nowhere (Nagel, 1986). I do no longer want to erase myself from the loop of thinking other objects. What OOO can be seen to bedding for is the attempt to replace the hierarchal conception of nature, where everything is judged according to a human standard of maturity, with a democratic playing field of objects. Thus, what OOO is by me seen to offer to the study of childhoodnature relations is a reengagement with the seeming infinite surplus of objects in learning and education, where we fully engage with that surplus without the danger of an immature position toward the objects of study looming over our heads. Thus, what OOO offers to this outlook is a position where the "childish" absorption with its surroundings is elevated to a general position for what it means to be an object among others, including humankind.

Thus, OOO claim of the uniqueness and withdrawnness of objects is tied into a political engagement with current forms of interaction with the world in the widest possible meaning of the word, even looking beyond the world. What OOO offers here to childhoodnature relations is a theoretical basis for political engagement that embraces the nearness in our relations to the world as well as the magic capacities of aesthetics of learning. It refocuses on how we are mesmerized by appearance, and where this aesthetic encounters does things to us. The learner's path is according to this outlook not a teleological process of development, from immaturity to maturity, but rather OOO opens up an understanding of learning as being essentially concerned with openness and how that openness appears to us in inter-objective encounters. OOO engages thereby not only in theory for theory's sake but wants to open up alternative modes of being with the other in the world.

In my engagement with OOO, I turn particularly to Morton's work as he offers an ecological political outlook in line with OOO. In the following, I will be considering what Morton offers in a possible reconception of the relation between childhood and nature in an educational context. I argue that Morton (2010a) conception of ecological thought opens up new ways of thinking of ecological learning as a form of education without nature.

Fundamental to ecological thought is the notion that every object is interconnected to other objects in the form of a mesh. This mesh has no center and no edge, and objects in this mesh have no clear within and outside to them (Morton, 2010a). It is as if objects are sticking to another and that all other objects are reflected in a particular object. Thus, what the notion of mesh withholds is both the possibility of knowing other objects fully and the notion of distance and holism that I discovered in the notion of nature are discussed in the previous section. What this means for childhoodnature relations is that a critique of childish proximity to environment and objects becomes a lame critique as the notion of mesh withholds the possibility of a distanced, mature, and objective perspective. Thus, we are not able to attain a mature position in which we separate or distance us from other objects as held apart by and in relation to the horizon in a distance (in relation nature). The capacity of reason is in this outlook not capable to provide a third, objective perspective that is distanced. What I instead acknowledge is that if we remain committed to proximity, we remain open for the mesmerizing seeming infinity of qualities that any object emits. Once we allow for the proximity of objects to get hold of us, we experience how we are

entangled in a mesh of objects. The mesh should not be understood as a form of holism, where the whole is something more than its parts, for example, the whole is determining the functioning of its parts. On the contrary, with Morton (2013a, 2017), I argue that the whole is strangely less than its parts.

To illustrate this mesh, where the principle holds that an object as a whole is less than its parts, we might think of our hand (Morton, 2017). We encounter this mesh once we start to count what characterizes our hand. My hand consists of five fingers, a ring, a couple of finger nails, some reminders scribbled on my forehand, etc. By counting these features, we see that the whole of my hand is less than the things that we just mentioned about it. The "etc." in my efforts to account for my hand highlights something of ontological significance. I cannot account fully for the excess of my hand, or to put it differently, objects like my hand are bigger on their inside (infinite real object) than they are on their outside (finite sensible object) (Morton, 2013a, p. 113).

A classical ecorhapsodic approach is to counter this experience of seemingly infinite qualities by referring to a necessary *rational reduction* of this surplus in experience. The child is encouraged to look beyond the seeming excess it apprehends; it is to look for nature, using its faculty to reason and to learn to focus its gaze according to particular disciplinary perspective on the object of study. The mesh reminds us of the impossibility to attain such a look from beyond, as the whole is indistinguishable from its parts as it is inseparable and dependent on all of its parts (Morton, 2010b). What an ecorhapsodic move does is to organize the look according to what can be separated according to a particular and disciplinary way of looking. What the thinking of the mesh resensitizes us to is that excess and the way that the whole, that, for example, an object represents, is less than its parts. A disciplinary perspective on my hand, for example, a biological perspective, might reduce it to certain anatomic features. However, I ask: Is my hand only a set of anatomic features and not the ring or the scribbling on it? What I see here at stake is what counts as being of significance, as well as an ontological assumption of what is more real than something else.

Thinking the mesh is to counter this stance that claims that some things are of greater significance, and we have to look beyond their infinity of qualities. Thinking the mesh holds instead that the mesh is infinite and beyond concept, it is unthinkable as such (Morton, 2010b). Why is it unthinkable? Because its conception and the ability to capture, the mesh would require our separability from it, a distinct, distanced, autonomous top-level position or view (a view from nowhere), where its parts would become separate and displaceable from the whole (Morton, 2010a, p. 49). This is again to erase oneself from the thinking loop, to attain a transcendental look from nowhere. It is here that I would like to argue that the mature approach of distanced, reasonable, claim of access to a view from nowhere is ecologically problematic as that sort of strong holism, which sees the whole as larger than its parts, assumes not only the redundancy of the parts but also their disposability of these parts. Thus, my hand would still remain my hand even if I would cut of a finger or lose my wedding ring. An ecosystem will remain still that ecosystem even if that polar bear or that species will become extinct, once we look at the "bigger picture."

There is no worry or to grieve for the ring or the species if they should be lost, they are fully replaceable by something else as the whole is always more than its parts.

Thinking the mesh is thinking the childish closeness to things, to remain absorbed in and with things close to us that touch us and that make us what we are. Thinking the mesh is thinking and feeling the inseparability, interdependence, and interconnectedness of objects.

Thinking this inseparability, interdependence, and interconnectedness leads to a thinking that is getting lost in the mesh of objects; it leads to the experience of non-locality. We are too close to orient ourselves. Non-locality and the collapse of the immature/mature differentiation are due to the absence of nature as a horizon and reference point for us to orient ourselves. Thinking childhoodnature relations without thinking nature is frightening in the same sense that an experience of non-locality is. Those who have gotten lost in a forest know how that feeling of non-locality relates to an absence of reference points. The thinking of childhoodnature relations without thinking of nature requires this uncanny feeling that we can experience when getting lost. What it relates to is a transformation of something we have learned to encounter in a particular way; let's say that forest, with new eyes, where that what we take as familiar becomes something strange, unfamiliar, and, potentially, even frightening.

I argue, it is exactly this rendering of the familiar into the unfamiliar that is needed in the context of current environmental crisis. What has led us to this crisis is a thinking that relies on a notion of nature, a nature that we know, appropriate, and control. Hence, we might think of the Anthropocene in the context of climate change. Thinking nature surfaces in the very conception of "climate change." The idea of a change in climate feeds on the idea that we know what the climate is and that we given that knowledge can state that it has now changed. Hence, in contrast to conceptions of the Anthropocene as a becoming aware of planetary boundaries and systemic functions, I argue that the Anthropocene relates to the encounter of the limits of our ability to know and to appropriate. I might say that what we become aware of is the absence of nature. Instead, we might think of the Anthropocene as a becoming aware of hyperobjects.

Hyperobjects are like all other objects and made up of smaller objects without top or bottom (Morton, 2013a, p. 116), that is, there is no background like nature that would provide a top or bottom view. Hyperobjects are also part of the mesh. However, hyperobjects differ from other objects only in the sense that they are so massively distributed in time and space that humans cannot apprehend them. However, what we, humans, are becoming aware of in the Anthropocene is that these hyperobjects are real and that we are caught up with them. We cannot perceive, for example, the climate, what we humans have access to are experiences of weather. However, given modeling techniques that try to account for patterns of weather distributed in geological space and time, we become aware of the climate as a hyperobject. We are part of that hyperobject and it is real; yet we can neither fully know nor control it (Morton, 2017). I argue, this emergence of the Anthropocene is a process of attunement to the fact that what we labeled nature was instead our enmeshment with other objects. Some of these objects are so massive that is

paradoxically in the rational pursuit to know them that we become aware of their existence as well as our inability to fully know them.

To put if differently, the emergence of the Anthropocene can be seen to highlight to us that we have not been sufficiently immature in our engagement with other objects. Our educative and enlightening efforts to achieve maturity and a distance to the world can be seen to have created something like a reality distortion field, a field that has had real and devastating effects on other beings and the biosphere. We can be seen to have engaged in a dream the maturing self of the Enlightenment, where that dream has real effects, which we are now becoming aware of in the terms of global warming. This explication of the Anthropocene is to illuminate two aspects of what OOO means for childhoodnature relations.

First, it highlights that nothing exists all by itself, and so nothing is fully "itself" (Morton, 2010a, p. 15). Hence, it undermines the "/" in childhood/nature relations, where there can be seen as something as a co-contamination of objects. The learner in this sense becomes *distributed*. The learning self is, according to this ecological thought, both myself (a distinct object) and not myself (other objects) at the same time. Second, this relates to possibility of change that the Anthropocene as an event can be seen to signal, as I am both myself and not myself, that what I am is *open*. What this means is, what I am is not fully present to me, and given this presence of an absent self, change can happen. It is only due to that I am co-defined by other objects and not fully present to myself that things in general can happen. Consequently, there is no determined pathway from immaturity to maturity, from childhood to adulthood, or from proto-me to a me that is more real or that was already given in advance, as such a notion of learning subject can be seen to figure in appeals to talent or natural ability. The learner is no longer approaching freedom or emancipation but rather open.

So what does OOO offer for education? I argue the here outlined thought of education without nature leaves behind the assumption that learning is *naturally* confined to humans. What is fundamental to OOO is the assumption that humans do not hold a special place or position, either having or are being withhold access, to nonhuman objects. What this means for education and childhoodnature relations is that there is no hard separation or transcendental limit that human learners or children either can transgress or to which they are confined. To recall, I stated, drawing on Morton, that nothing exists by itself. This means that there is a self, yet this self is interconnected with other objects. For education this means that this also applies to nonhuman objects. The interconnection is an ontological feature, yet other objects might apprehend that connection differently.

What the mesh can be seen to highlight is that learning is always relative to an asymmetric relation between objects, that is, an object sensing another object. How one child might sense another object might be different from another child but also to another object. For childhoodnature relations in an educational context, this means that childhood becomes *subscended* by, for example, individual learners (Morton, 2017). Subscendence refers to how wholes are less or subscended by their parts; thus objects as wholes render them partial and implosive in a sense that they are subscended in turn by other objects (Morton, 2017, p. 104). While I might speak

of species, humans, which are made up what I might call children and adults, these hyperobjects are subscended by individuals. I might be human and I might be a child, but I am at a same time myself, different from other selves and not reducible to humankind or childhood.

For apprehension in learning, this means that there is a form of intimacy that works in all directions, upward, downward, and sideways. I might feel a form of intimacy with or allure radiating from all three objects: humankind (upward), my hand (downward), but also a squirrel sitting outside my window (sideways). What this remark on the directionality of intimacy and allure is highlight in an educational context is that we cannot draw boundaries around what category of object to feel intimacy for or what allure might have educative value for learning. To feel intimacy or attraction for society, my wife or the sprinkler in the garden is equally valid from this perspective. These objects have significance for me in their own right and without differences in degree. Thus there is nothing "natural" about certain objects that might give them more or significant educational value, as the notion of educational substance or *Bildungsgehalt* (Klafki, 1995) might be seen to argue for. The educative essence seems to be strangely open, as nothing is fully itself. I argue, with Morton (2017), the educative essence is subscended in a form of holism, where the whole is less than its parts.

In this lesser form of holism, that can be seen to inform my education without nature, learning is focused on the aesthetics of subscendence. What this means is that the learner is caught up in the allure of the seemingly infinite excess of an object of consideration. For example, I might be fascinated by how global warming seems to expressed in a myriad of different forms of weather as well as floodings, power cuts, etc. I am caught up in this subscendence of climate change, too close to extract myself emotionally and intellectually.

In this lesser holistic outlook on education, learning is taking place in the aesthetic realm, as it is the aesthetics of the objects encountered that I feel myself caught up in; they are doing something to me, or they are able to influence me over spatial distance. This influence is not a misguided position that is too close to nature and that I have to overcome by extracting or distancing myself as part of a process of maturing. Rather, it is in the aesthetics of learning that we should move closer toward the objects, acknowledging that we cannot fully know them but that we are still fascinated by them. Moving closer is in this sense rather emotional than spatial, to *feel* closeness. To remain "childishly" fascinated allows us to be surprised. This in turn allows for a breaking down of the projected image of the object to be deliberately reconstituted as part of staged educative encounters, where the teacher is to create an environment in which particular learning situations become possible (Szkudlarek, 2016).

Thus, an ecological learning can be seen as involving a twofold *infinite* recursive response pattern. It involves a movement back and forth between an arbitrary delineation of appearances of a content and acknowledgment of that these appearances are disturbed or subvert by subscendence of the content initially focused upon. This means for education without nature that the educative potential of a content cannot be judged in relation to a present. An education without nature, or

ecorhapsody as learning, does therefore not only concern that what is sensible or present to the learner but also involves thinking and reflection about potential objects and qualities of objects that might not yet be present to our senses. It remains committed to the allure of objects not present yet to us but the shadowy appearance of which we are becoming aware of when we engage with the subscendence of objects by other objects. Hence, I argue an education without nature entails a "childish" or "naive" engagement with things that are not fully present, yet exert a force of attraction upon us. To be naive is to be emotionally close, to not let reason distance you or extract yourself entirely.

Thus, education without nature is engaging in the process of opening up the learning "self" toward a nearness of objects, one in which we have to learn to lose ourselves where learning entails a form of getting lost. I argue that "childish" proximity and a lack of perspective are exactly the right educative responses to the Anthropocene, responses that requires us to loosen up our distanced positions and gaze upon the world and to move closer. This stance allows us to be touched again by objects too near to attain emotional and cognitive distance from.

Object-Oriented Learning in a Nutshell

This section is going to explore further what a philosophy of education without nature will imply for learning. It needs to be pointed out that the ambition is to provide a notion of learning that is conceptually different to the contemporary focus on learning as contrasted by an earlier focus on teaching and schooling. As I will argue, such a contemporary focus on learning seeks to abandon underlying notions of appropriation and the entailing notion of progression as a form of increasing maturity.

This shift toward a focus on learning is conceived to be connected to the emergence of new public management in the education sector. As Simons and Masschelein (2008, p. 699) highlight, this focus on learning is connected to a notion of environment, that is "to experience oneself as being part of an environment implies that the appropriation of one's finitude (through learning) [. . .]." Learning is in this common understanding an appropriation of environment, where in that appropriation, an innovative or productive reconfiguration of the environment takes place (cf. Simons & Masschelein, 2008, p. 698). Object-oriented learning is an inversion of this notion of learning. To put it differently, the experience of being in the presence of an ecology of objects implies the appropriation of one's *infinitude* (through learning). What object-oriented learning dissolves is a sense of growth, progression, or expansion of self through learning in environment, that is, to say, learning as the capacity of appropriation of something by a subject in order to reproduce itself and to gain greater maturity.

As already highlighted, this conception of appropriation is still very much inspired by a sense of maturity, where the productivity or innovativeness of learning is to be judged in relation to a human escape from nature. What I am breaking with is the earlier discussed notion of learner of the Enlightenment who "[. . .] wants both

to learn and to legislate for all time, to open up itself to the other and to consolidate itself from within, to expand indefinitely whilst reproducing itself as the same. Its ultimate dream is to grow whilst remaining identical to what it was, to touch the other without vulnerability" (Land, 2011, p. 64). I argue here that this notion of learning is directly feeding issues leading to the emergence of the Anthropocene. The Enlightenment educator's fantasy imagines human learning to allow for a control based on the capacity to reason. In the Anthropocene, we are becoming aware that this fantasy of the Enlightenment intertwines with the fantasies of other entities, for example, that of the biosphere. The fantasy or dream of progression turns out to be someone else's nightmare, which in its shivers starts to render that human dream of invulnerability into the uncanny insight of feeding through engaging with that fantasy humanity's own annihilation.

In contrast to this outlook of the Enlightenment, in thinking the ecological mesh, the act of appropriation becomes de-centered or reflected by the mesh, as we are no longer are able to separate that which appropriates and that which is appropriated. Thus, object-oriented learning undermines the traditional notion of agency in learning, as learning is aesthetic and related to a between objects. The sensible object is here influencing (causality) the learning of the object apprehending. The apprehending object is caught up in the aesthetics of objects, even those not yet apprehended. These objects arrest us in their zone of influence and disturb our sense of apprehension and ultimately sense of ourselves. An example of such an object that is holding us in its gaze is the climate. If we are to engage in object-oriented learning in the context of the Anthropocene, we increasingly find us caught up in the aesthetic sphere of influence of the hyperobject of the climate and will have to actively work with the apprehension of the climate. We have to acknowledge that we never "see" it as a whole, using either our own eyes or technological prosthesis; instead, we encounter a sheer infinity of qualities of climate as expressed in, for example, weird instances of weather that are measured or sensed. Object-oriented learning acknowledges on the one hand that climate is not knowable yet engages in how the climate can be seen to influence our understanding of ourselves as humans. We are starting to learn that what we thought we had learned to control and to appropriate was never controlled or appropriated and seemingly had a life of its own. The turning of a key did never only start the engine of the car, allowing us to move around in a more unrestricted manner, it turns out we created at the same time and as individuals acting as "species" another hyperobject, that of global warming (cf. Morton, 2016).

Object-oriented learning aims to dismantle the defense systems build around subjectivity that the notion of learner of the Enlightenment provided and that frame our understanding of learning as a form of appropriation. The first insight and step of dismantling the notion of an autonomous learning subject that the Anthropocene challenges us with is acknowledging how learning as appropriation is not an act of making one's own, but to understand and feel how this self/own is already dependent on and connected to something else. To think and feel this mesh in learning dismantles the notion of a learning subject by undermining the autonomy and sovereignty of that learning subject. No object is an island, meaning autonomous and sovereign. According to object-oriented learning, learning and education as a

whole cannot lead to a Brexit of the learner, that is, it does not lead to or aim for freedom and emancipation but instead strives for a declaration of interdependence which calls for a sensitization of relations to the enmeshment of the learner with other objects. Learning that is to be built on this declaration of interdependence engages with instead of turning away from the emotions that might arise when we become aware that there is no nature, no homey place of dwelling that is to be protected. Object-oriented learning engages with the uncanny feeling that what I am as a learner is also distributed to other objects. It calls for a form of intimacy with other objects in learning.

This notion of learning as a self encountering its dependence and deference to something else is interpreted as compatible with Levinas' *Autrui*, as that from which I cannot distinguish myself and that is arresting and paralyzing (Hofmeyr, 2009). Learning in this sense draws on Levinas' conception of radical passivity, where learning is not the active appropriation of the other, but, instead, the learner becomes subjected to alterity, as a necessity imposed from an outside or rather other objects (Hofmeyr, 2009, p. 18). In object-oriented learning, ecodidacticism points toward an inner experience of a partial absence of self, that is to say that my self is not fully present to me. As with, for example, Hegel's distinction between nothingness and being (Hegel, 1816), that absence of a self can be seen to be crucial for understanding the limit of myself. For example, when engaging with introspection in learning, the learner might encounter this absence of self. I might become aware that what I thought I am isn't so straightforward to answer. I get a feeling that I might be wrong and that what I am is not possible to be captured in a simple yes/no dualism. In contrast to a sense of nothingness, as in there being no self at all, I might encounter instead the emptiness of myself. By emptiness, I refer to a potential infinity of qualities of myself that are not present to me, or as Nishitani (1990, p. 180) puts it, "everything is possible in a person in whom the nature of emptiness arises."

The encounter of emptiness and object-oriented learning as a consequence defies a traditional rational approach to learning, at least one that is committed to the classical laws of identity. In order to engage with that intimacy of the learner with other objects, I need to abandon the law of noncontradiction. In order to rethink learning and to move away from a notion of learning as appropriation, it is necessary to undermine the idea of an autonomous unity of the learner. This can be done by engaging with the feeling that what I am is not fully present to myself refers to an absence that I cannot define in dualist terms. This absence is due to the mesh that connects the learner to other objects, some of which might not be present to the learner. Hence, in object-oriented learning, ecorhapsody engages with this thinking and feeling of the loss of self in the arresting and paralyzing presence of other objects. What ecorhapsody envisions to accomplish is the second step of the dismantling of the autonomy of the learner as subject. What ecorhapsody aims to accomplish is to burrow the distance between subject and object. This can be done by letting go of the feeling of a self as a subject that is distanced and distinct from objects. Thus what learning is contributing to is a feeling of something else already being me, something that I cannot cut out from me and view from a distance.

Hence, ecorhapsody is aiming for dislocated passion, or to be precise a *compassion* without object, which consequently renders object-oriented learning into a process of *unappropriation*. Object-oriented learning aims to allow for a feminine dislocated passion that I contrast to masculine appropriative passion that wants to own, command, and subdue from a distance. Irigaray (1977, p. 31) allows us to conceive of this feminine passion in terms of nearness, a "[n]earness so pronounced that it makes all discrimination of identity, and thus all forms of property, impossible." Thus, object-oriented learning as unappropriation is fostering nearness, a nearness that is too close to distinguish between subject and object. It is not a nearness to something that is or will become familiar, but a nearness that is too close and hence ruining the subject. Think, for example, of Carbon-14, a radioactive isotope, whose prevalence in the atmosphere radically increased given human testing of nuclear explosive devices. It is a hyperobject that we cannot think as distinct from a learning subject, it is in us as we breathe and eat it constantly. It subscends the learning subject; it does things to it, for example, altering our DNA, and as other radionuclides, it might as a consequence of being in me produce cancer.

I argue, the reversal of ecodidacticism's pointing gesture is closely related to ecorhapsody's call for the abandonment of the principle of sufficient reason as well a break with the law of noncontradiction. To put it differently, as the self pointed toward in the ecodidactic pointing gesture is partially absent and distributed, the nearness discussed above undermines the distinction between learning subject and object to be appropriated in learning. This is not to assume that we can flip into the other perspective of nature or the right perspective that we have abandoned, as environmental education often can be seen to argue. Rather, what ecodidacticism points to and ecorhapsody aims to articulate is a sheer infinity of strange worlds that are "here." Object-oriented learning as fostering unappropriation is undermining any notion of what is natural. Nature or that what is natural has, as I earlier stated, a particular pedagogical function. Nature is to provide the authoritative horizon of staged educative encounters, where the teacher is to create an environment in which particular learning situations become possible (Szkudlarek, 2016). Nature is here closely associated with the imperative to "grow up," to abandon one's childish proximity, and to maturely appreciate the view from a distance. Nature as authoritative horizon is in this sense authoritarian in the double meaning of the word, as referring to the enforcement of obedience and showing a lack of concern for the wishes or opinions of others. Thus, the pedagogical move to erase nature is envisioned to open up learning. It is to open up learning as to "childishly" explore what learning can become possible and what situations and environments can be created in respect of others opinions and wishes.

Hence, object-oriented learning that aims to open up the unity and to undermine the autonomy of the learner in the Enlightenment prepares for the third step and final assault on the learning subject, that of moving the essence of that learner toward an open future. This third step is an attack on the teleological notion of a learning that surfaces in the ideal of maturity. For object-oriented learning, learning is not linear progression. The learner is not a proto-version of the real deal to come. Instead, what learning is producing as part of unappropriation is contingent and open. Object-

oriented learning is feeling and thinking from the future that the learner is realizing in the present. For example, once I think this thought of being myself and not being oneself, I open up my feeling to not-my feeling. Object-oriented learning operates against the defense mechanisms of the subject that might kick in again when thinking and feeling this not myself that I am. Feeling and engaging with the feeling of nearness is an opening up that cannot be fully encapsulated by thinking that is shaped by the laws of identity. For example, I might feel guilty or disgusted by what I might encounter when engaging with the self. Yet, guilt and disgust are not close enough; they can be seen hinge on a distance between what I am and that what I not am. In the case of guilt, it would be in relation to something or an object in relation to which I should feel that guilt. Yet, moving closer I cannot feel guilt for myself. Object-oriented learning questions the pedagogical potential of feelings that feed on distance, for example, how productive an engagement with guilt or shame might be as a didactical emotive tool. Once, we have moved beyond the third step of deconstructing the learner of the Enlightenment, we might arrive at a learning that is attuning to other objects. The learner has lost a sense of self and attunes to an emotive resonance of objects too close. The learner encounters at this point an opening in the defense system called the subjective self and at the same time opens up toward a sensitization of nearness.

The feeling of sadness and anxiety might, hence, no longer remain *my* feeling but an attunement to the vibrations of other objects; it is a feeling of being in a community of loss. Hence, a proper emotive response to the Anthropocene might be that of sadness (cf. Morton, 2016), a sadness that is not relative to an object or subject done harm or in distress but an emotive response that reverberates. Feeling this sadness or anxiety is also a precondition for the possibility to engage with it. Yet, as I have deconstructed the idea of unity or autonomy of the learning subject, there is no longer a determinate imperative for how to move on. Engaging with sadness and anxiety is open; there is no longer a nature to guide us, to dictate how things ought to be. It becomes, literally, possible for things to happen again. Object-oriented learning that is taking place when things happen is no longer appropriating; it does not want to own the excessive surplus of experiences of things happening but wants to multiply it. A proper childish response would be to repeat and to share the enjoyment of repetition of that exciting thing happening with others. Hence, object-oriented learning sees itself as to contribute to a political project that aims to alter the economics of enjoyment (cf. Morton, 2017). This alternate economy of enjoyment is no longer based on the principle of a unified and autonomous subject appropriating that enjoyment but a learning that is com-passionate. It is fostering an economy that multiplies enjoyment without a loss.

Conclusion

In this chapter, I aimed to outline education without nature and object-oriented learning. I need here to acknowledge that the thoughts presented are a philosophy of education in the making, and hence I do emit certain answers and extensive

elaboration of consequences of certain presumptions. What I hope to have accomplished was to outline what an ecologically oriented educative perspective without an appeal to nature could look like. As I argue, the concept of nature in its variety of connotations and disguises might impede efforts to address ecological issues such as pollution or global warming in education. In particular, I wanted to show how the notion of nature as it emerges in the thought of the Enlightenment has framed and constricted educational thinking about the child as learner. Playing immaturity against maturity, education came to foster generations of learners encouraging to distance themselves from other objects and other peoples. The vision of education as a means for emancipation and freedom is rearticulated in diverse forms, even critical education. In contrast, my effort to contribute to this handbook aimed to explore how the childhoodnature relation could be reapproached by breaking with central tenets of educational thought with its traces in the Enlightenment.

In particular, I wanted to highlight what political educational outlook might become possible once we put some of these tenets on their head, embracing childish naiveté, female nearness, and compassion. OOO played a significant source of inspiration, and as I mentioned earlier, it is a source that is only in its early stages of influencing educational thought. I see OOO here to offer childhoodnature research alternative ontological perspectives, which as I tried to show might open up alternative vistas than, for example, Deleuzian-inspired assemblage theory or post-humanist theory. While these ontological positions can be seen to share a number of congruencies, I see them to also share a number of differences. I did actively not engage in criticizing or positioning a conception of education without nature or object-oriented learning against positions arguing for assemblage theoretical entrance points or post-humanist feminist thinking, rather I aimed to position this chapter against broader mainstream thinking. I acknowledge fully the viability of these alternate positions; yet, some theoretical as well as political tensions might become aware to the reader.

Yet, I did not want to engage in a war of position in this chapter; what I hoped to accomplish instead in this chapter to outline is an alternate outlook on learning that moves beyond rationalist and correlationist accounts of education. What might learning, education, and children's engagement with object look like, once they no longer the human transcendental subject, is the center of learning. I see here OOO to allow for education and learning to become magical again, to highlight that surplus active in childish fascination with the world full of things that we openly acknowledge we do not and cannot know everything about. To put a limit back into rationalism, I think, is crucial for both rehabilitating a child perspective in contemporary political debate on how to engage with global problems as well as trying to become a humble educator and researcher. What I see as crucial for further research, mine included, is to continue an effort to lower the status of educators and research as well as to raise the status of child and object in learning and education. This chapter aimed to do so by providing a philosophy of education without nature and a theory of object-oriented learning.

attachment is well understood. In the chapter, an exploration of human attachment provides clarity of the potential outcomes of place attachment.

Both forms of attachment focus on the strength of the attachment of an individual to an external entity, a caregiver, or a place in the physical environment. The secure base function of secure human attachment mirrors the home range function of place attachment. In both concepts, children venture away from the object of attachment only to return in times of stress. Secure human attachments also foster the development of an internal working model in which a child mentally organizes behavior to solicit a desired response. The strength of the model predicts the quality of future relationships. Currently no research links the development of an internal working model to place attachment. Secure human attachments also foster resilience in that children are better able to respond to and cope with stress. Secure place attachments are linked to the presence of nature, social bonding, and emotional and cognitive processes. This is consistent with emergent resilience research with children which suggests that nature can play an important role in fostering resilience. Nature thus may be a defining feature of place attachments that help build resilience.

Introduction

With his writing of *The Last Child in the Woods*, Richard Louv spawned a children and nature movement that has galvanized families, practitioners, and researchers across the United States (Jordan, Charles, & Cleary, 2017; Louv, 2008). The movement capitalized on existing place-based education (Smith & Sobel, 2014), as well as research in the role of nature in health promotion (Chawla, 2014, 2015; Faber Taylor & Kuo, 2006; McCormick, 2017; Wells, 2014) and cooperative play (Chawla, Keena, Pevec, & Stanley, 2014). This collective momentum positioned nature as a central player in shaping children's environmental attitudes and behaviors (Adams & Savahl, 2017; Chawla & Derr, 2012) and thus also has increased momentum for integration of nature into schoolyards and parks and as a focus for place-based learning (Anderson, 2017; Danks, 2010).

However, the movement to connect children to nature draws very little from our understanding of how children actually attach to place or the role of nature in shaping place attachments. Place attachment in children has been defined as phenomenon where "children are attached to a place when they show happiness at being in it and regret or distress at leaving it, and when they value it not only for the satisfaction of physical needs but for its own intrinsic qualities" (Chawla, 1992, p. 64). The phenomenon has been asserted to play an important role in childhood development in fostering places for security, social affiliation, and creative expression and exploration (Chawla, 1992). Place attachment has also been associated with

connections to nature (Chawla, 2015), with pro-environmental behaviors (Benson, 2009; Kudryavtsev, Krasny, & Stedman, 2012), and with resilience to disaster and climate change (Chawla, 2014; Scannell, Cox, Fletcher, & Heykoop, 2016). Yet despite the potential importance of this concept, it remains relatively undertheorized, particularly in relation to children's relationships to the natural world.

Most research focuses on the importance of nature for health and well-being benefits. In these studies, researchers have adopted the Kaplan and Kaplan (1989) definition of nature to include any outdoor space where natural elements are present. Far less research examines how or why meaningful childhood attachments to nature and place occur. Adams, Savahl, and Casas (2016) suggested that more research is needed to understand the true effects of nature on well-being across cultural and social contexts. While some research examines children's direct relationship with nature (see reviews by Adams & Savahl, 2017; Chawla, 2015), this research typically does not draw from or contribute to our understanding of place attachments. Recent research has begun to explore place attachments and the social context directly, with one study exploring how place attachments can foster civic engagement, social connections, and trust (Stefaniak, Bilewicz, & Lewicka, 2017). While some studies exist which investigate place attachment, research has only begun to scratch the surface of understanding the concept. A greater theorizing of place attachment is needed (Hernández, Hidalgo, & Ruiz, 2014; Lewicka, 2011).

In this chapter, we draw from existing research specifically focused on childhood place attachments to develop a working model for how children and nature relate through emerging place attachments. Drawing from human attachment theory, we build a model of place attachment outcomes and explore the role of nature, culture, and social relationships in exploring existing research about how the relationship between children and nature develops. We examine the processes for attachment, for without this understanding, we lose an important dimension in understanding children's relationships with nature, as places for exploration, connection, and care for the natural world. If attachments to places matter for children's development and for the development of caring relationships with nature (Benson, 2009; Chawla & Derr, 2012), we also need a greater articulation of the contexts in which these relationships develop and occur (Adams & Savahl, 2017).

Place Attachment

Place attachment theories emerged from phenomenological scholars writing in the 1950s and 1960s (e.g., Bachelard, 1964) and were later developed by humanistic geographers and environmental design scholars (e.g., Relph, 1976; Seamon, 1982; Tuan, 1990). The seminal volume *Place Attachment*, edited by Irwin Altman and Setha M. Low (1992), brought together scholars of varied disciplines to explore and advance the theory of place attachment. Place attachment has been defined as an "integrating" and "multidimensional" concept comprised of complex individual, group, and cultural phenomena and associations in which bonding between a person and a specific, meaningful place occurs (Hernández et al., 2014; Scannell & Gifford,

2010). At the individual level, place attachment reflects personal connections to a place, including memories and a sense of self-connection to place. Individual attachments may also develop from milestones and experiences of growth (Scannell & Gifford, 2010).

The most distinct feature of place attachment is the bonding or "attachment" aspect (Low & Altman, 1992), which suggests that feelings and emotions are integral to the concept. Bonds can be expressed through specific feelings associated with a place, place preferences, feelings of security or belonging, a sense of identity, or a sense of well-being (Low & Altman, 1992). However, in addition to affective dimensions, most constructions of place attachment also include cognition – knowledge, beliefs, and behaviors. For example, place attachments can motivate action for rituals, social gatherings in public spaces, place creation or change, and place protection (Low & Altman, 1992). In his framing of place attachment, Riley (1992) identified an "affective relationship between people and place *that goes beyond* cognition, preference, or judgement" (p. 13).

Attachments to places may be experienced and understood by individuals as well as cultural or affinity groups, and these attachments also may affect social relationships. Some scholars suggest that "the social relations a place signifies may be equally or more important to the attachment process than the place qua place" (Low & Altman, 1992, p. 7). Collective place attachments may be represented and reinforced through symbolic meanings of a place, through cultural practices associated with a place and through religious practices and pilgrimage (Hay, 1998; Low, 1992). Places for attachment may be small scale and intimate, such as a child's fort or a family home, to large scale, such as a neighborhood, city, sacred site, or national park. Finally, temporal aspects of place, as shaped by past, present, and future time, influence how people think about and experience place.

This complex mixing of time and place as experienced through individual, social, and cultural realms influences not only how and to what extent place attachments form but also the role place attachments play in people's lives and actions. Low and Altman (1992) reflected that "all of this makes for a rather complex concept, perhaps so complex that place attachment may not be a single phenomenon . . . but a variety of types of place attachments that differ in their aspects, origins, and purposes" (p. 12). More recent reviews have further unpacked varying types of place attachments by social, physical, and symbolic types, yet do little to advance place attachment theory to the next stage (Hernández et al., 2014; Lewicka, 2011).

These reviews identify both a proliferation of concepts and a lack of clarity as essential problems in articulating theory and empirical research in place attachment (Hernández et al., 2014; Lewicka, 2011). For example, Hernández and colleagues (2014) reviewed research in which place attachment is a multidimensional, superordinate construct, with two, three, or five factors and as a subordinate construct with other variables such as place identity and place dependence. Raymond and colleagues (2010) described place attachment as a multidimensional concept that influences place identity, place dependence, and bonding with nature, family, and friends. As a subordinate concept, place attachment is viewed as a dimension of sense of place or of place identification (Hernández et al., 2014). Scannell and

Gifford (2010) developed a tripartite model for place attachment that integrates various definitions and frameworks. This model includes the person who is attached; the psychological processes – affect, cognition, and behaviors – through which attachment is manifest; and the place itself, the object of attachment.

Childhood Place Attachment

Childhood place attachment has emerged as a potential type of place attachment, worthy of its own distinction and framing. Childhood is a unique period of time, with distinct stages of development and subsequent place relationships. Place attachments are thought to be a product of childhood experience with particular landscapes and places (Chawla, 1992; Riley, 1992). In particular, middle childhood (ages 6–11) has been identified as an important stage of childhood bonding with place (Chawla, 1992; Derr, 2001, 2006; Hart, 1979; Moore, 1986; Sobel, 1993). It is in this period that children's range expands from the familiar home and extends outward, though the extent of this range can vary widely based on environment and perceived and real safety constraints (Derr, 2006; Hart, 1979; Moore, 1986). In his review, Morgan (2010, p. 12) characterized "children's attitude towards place" as one in which children value physical environments for what you can do in them rather than for their social meanings; however, others have emphasized the importance of social relationships in facilitating place experiences and identity formation with place (Chawla, 1992; Derr, 2001, 2006; Gauci, 2016; Little, 2016). These latter discussions of childhood place attachments suggest that the social dimension is an integral part of early place experiences and activities. In fact, Chawla (1992) questioned whether place attachments should be seen as "merely secondary effects of social attachments, or whether they have an independent existence" (p. 63). Place may be important for inward and outward experiences, as well as those that support social affiliations and the development of self-identity (Chawla, 1992). Derr (2001) suggested that "place and nature seem to be significant to children when adults play a central role in shaping or encouraging experience. When parents, uncles, cousins, and especially grandparents were involved, it was much more likely that a cultural place was passed on" (p. 222).

Adult memories of childhood places have been the primary means of understanding childhood place attachments and the role of nature in shaping these bonds (Chawla, 1992; Cooper Marcus, 1992; Morgan, 2010). Cooper Marcus (1992) suggested that:

> We hold onto childhood memories of certain places as a kind of psychic anchor, reminding us of where we came from, of what we once were, or of how the environment nurtured us when family dynamics were strained . . . It is as though childhood is a temporal extension of the self. (p. 89)

In her research with design students' "fondly remembered" childhood places, Cooper Marcus identifies childhood places as "powerful images" that adults carry forward in their memories, dreams, and creative work. Across many nationalities and socioeconomic backgrounds, the majority of fond memories were of playing outside

and creating or finding special places for hiding. Cooper Marcus (1992) asserted that these places remained significant because "they were the settings of significant emotional experiences critical to the process of growing up" associated with human development in the middle years (ages 6–11) (p. 92).

Chawla (1992) asserted the importance of adult memories of childhood places because they "attest that lasting attachments have been formed" (p. 73). Through her study of environmental autobiographies, Chawla (1986) found that loved ones and family members were the most frequent sources of attachment to a childhood home. Chawla's (1992) childhood place attachment model describes place attachments as developing in memory in adolescence, between the ages of 12 and 17 years. She referenced Kevin Lynch's work with adolescents which found that "their attachment to their community, measured through pride in identification and a desire to continue to live there after growing up," was associated with adult views of youth as important members of the community (Chawla, 1992, p. 69). Dallago and colleagues (2009) provided further support that social capital played a significant role in place attachment for youth (age 15) across 13 countries with cultural and geographic differences. Social capital provided youth with a sense of safety and cohesion among neighbors (Dallago et al., 2009). They surmised that while future research is needed, place attachment across nations and cultures appears to develop through social ties which begin in childhood and which foster a sense of safety that allow place attachments to deepen as neighbors and friends develop in relation to place.

At this writing, few studies directly examine childhood place experiences and attachments together (Benson, 2009; Derr, 2001, 2002, 2006; Gauci, 2016). Geographic studies explore place experiences during middle childhood, but have provided less direct assessment of attachment. Both environmental memory research and children's environments research identify place as an important source of inward-focused emotional regulation as well as outward-focused exploration (Lim & Barton, 2010). These inward- and outward-focused experiences have been suggested as the means by which children develop attachments to place (see Fig. 1) (Chawla, 1992; Derr, 2006).

Special places, forts, and casitas represent a hybrid of natural and built environments and are linked to the development of place attachments (e.g., Derr, 2006). Special places may be important in providing spaces for emotional regulation, privacy, self-expression (Benson, 2009; Cooper Marcus, 1992; Derr, 2006; Korpela, Ylén, Tyrväinen, & Silvennoinen, 2008; Sobel, 1993), or a "fund of calm" (Chawla, 2014, p. 112). They are active sites for place-making and construction, as places for imagination and fantasy play, and as settings for social activities with other friends (Benson, 2009; Derr, 2001, 2006; Linzmayer & Halpenny, 2014; Moore, 1986; Sobel, 1993). The social and cultural context of special places can be particularly important for some (e.g., Derr, 2002). In contrast to special places, outward exploration is frequently spontaneous in which places are sought and found, and play is often transactional with the specific elements present in a place (Derr, 2001; Hart, 1979; Min & Lee, 2006; Moore, 1986).

Taken as a whole, children's place experiences – through place-making and exploration – facilitate attachments to place via the development of social

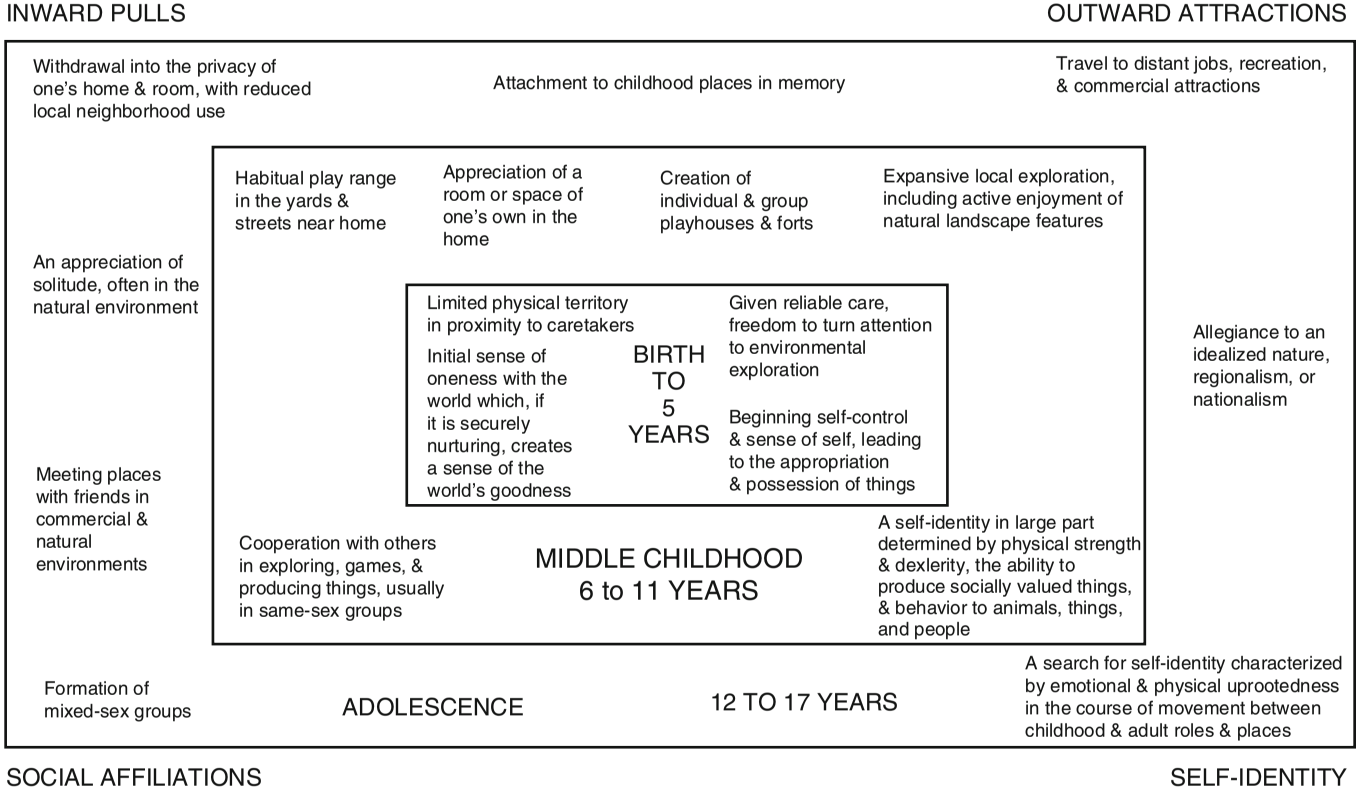

Fig. 1 "Sources of developing place attachments in early and middle childhood and adolescence" (Chawla, 1992, p. 67)

relationships, creative expression and self-identity, imagination, and the development of self-confidence through increased mastery and independence. Children seek out and potentially attach to places because of the specific qualities that a place provides (Benson, 2009; Derr, 2002, 2006; Hart, 1979; Lim & Barton, 2010; Min & Lee, 2006). Childhood place attachments may be a unique time of place bonding in that so many types of social interaction, imaginative play, emotional needs, and individual development appear to be associated with place.

The Influence of Nature on Place Attachment

Nature may be of particular importance in shaping childhood place attachments. Riley (1992) identified nature as a potentially "special" landscape type that for some, there is no substitute. Nature preferences have been documented in environmental psychology (Kaplan & Kaplan, 1989; Ulrich, 1979), and the health and social benefits of nature for children are increasingly documented (Chawla, 2014; Wells, 2014). When examining recollections of place, outdoor places "claimed attention in memory out of all proportion to the actual amount of time spent there" (Chawla, 1992, p. 76). The majority of these places were natural places or features, including fields, woods, but also city streets. These places were valued for the freedom, exploration, and physical manipulation of space they afforded. Korpela, Hartig, Kaiser, and Fuhrer (2001) interviewed university students about their favorite places in an effort to understand place attachment. Natural places represented the majority of responses for favorite places (48 responses of 101); only five responses of 98 mentioned natural places as unpleasant (Korpela et al., 2001).

Derr (2001) found that among 89 children across three communities in northern New Mexico, natural places ranked first as children's "favorite places" and "exploring places." The specific types of nature valued – a tree, a creek, or a specific mountain range – varied by gender and community, but nature was consistently favored across communities, from urban to rural.

When Sebba (1991) evaluated children's environmental preferences and adults' remembered experiences, she found that 96.5% of adults identified natural places as most important in their childhood, while 46% of children name an outdoor or natural place as most important. Derr (2001) similarly found a mix of places, both indoors and outdoors, that children identified as important for their emotional well-being and play preferences. In her research with Hawaiian preschool children, Gauci (2016) found that nature played a more significant role in children's place attachments when they experienced it often than for children who are not exposed to nature very often.

Morgan (2010) described the soothing, restorative qualities attributable to the natural environment (e.g., Kaplan & Kaplan, 1989) as analogous to the human caregiver. Evidence that nature serves this function in place attachments is given through Morgan's own research (2010, in which "Bluey was very clear that he used his time wandering the farm each weekend to recover from his negative experience of school and create a sense of calm self-belief" (p. 19).

Benson (2009) found that while special places in nature were most preferred among northern California children, they used a mix of places for emotional regulation. Children's rooms, special places, and nature each played a role in emotional regulation (Benson, 2009; Derr, 2001). Gauci (2016) found that while nature was important for some children in her research with Hawaiian preschoolers, in some contexts, children's interactions were shaped more by social interactions than by elements of nature: "family, social relations, and personal meaning are more important than physical features for children who are exposed to nature less than those who are around nature a lot" (p. 130). However, children's outdoor special places facilitated both place attachments and a sense of stewardship for nature.

It may be that place attachments become more salient in adulthood, and therefore so too does the role of nature in childhood. However, without additional research directly with children, particularly of children over time through longitudinal research, the importance of nature in place attachment could be overstated. This remains an empirical question yet to be addressed in childhood place attachment literature. This research is emerging, and Chawla (2014) provided growing evidence for the importance of nature in childhood experiences across many countries, cultures, and socioeconomic backgrounds. Research with children in a wide range of contexts similarly suggests that nature is an important quality of many place relations and the potential development of attachments (Benson, 2009; Chawla, 2014; Derr, 2001; Gauci, 2016; Hart, 1979; Hordyk, Dulude, & Shem, 2015; Sobel, 1993).

Human Attachment

One potential source of clarity in understanding the significance of place attachment in child development may come from attachment theory, referred to as human attachment in this chapter. Human attachment relationships refer to the proximity between caregiver and a child during times of stress to protect the child's welfare (Bowlby, 1982). Human attachment theory originated with John Bowlby's three seminal articles: "The Nature of the Child's Tie to His Mother" (1958), "Separation Anxiety" (1959), and "Grief and Mourning in Infancy and Early Childhood" (1960), which discussed attachment in terms of the bond between mother and child (Bretherton, 1995; Holmes, 1995). Bowlby theorized about the significant outcomes children experienced from a strong attachment to the mother: an internal working model which predicts the quality of future relationships based on that initial bond and resilience in the face of stress (Bretherton, 1995). Subsequent research expanded the scope of an attachment figure beyond the role of the mother to include caregivers, such as fathers, grandparents, and teachers (Holmes, 1995).

Strong attachment occurs when the caregiver is responsive to a child in distress in a way that the child perceives as consoling; thus, the child will seek out the caregiver during times of stress (Bowlby, 1982). Typical human attachment behaviors involve a child:

- Displaying positive behavior, e.g., vocalizing and smiling, to elicit a caregiver's attention
- Displaying negative behavior, e.g., crying, to elicit a caregiver's attention
- Actively locomoting, e.g., crawling or walking, toward the caregiver (Howe, Brandon, Hinings, & Schofield, 1999)

If the child believes that the caregiver reliably provides care and protection, then the child begins to understand their own self-worth through these interactions. The child develops an internal working model in which they model and organize these human attachment interactions in order to develop behavioral strategies for future interactions to ensure that their needs are continuing to be met (Howe et al., 1999). Through the internal working model, the quality of that initial bond predicts the quality of future relationships. Human attachment relationships also influence resilience. Children who are securely attached to a caregiver display resilience in the face of stress. The model of interpersonal relationships inherent in human attachment may provide a protective factor of resilience to stressful situations (Rutter, 1999).

Integrating Human Attachment and Place Attachment

Few works have attempted to integrate human attachment and place attachment. Chawla (2007) identified attachment figures within human attachment relationships as influencing the formation of pro-environmental behaviors in children. Zentella (2009) utilized human and place attachment models in understanding the loss of land in a Hispano community of New Mexico. Jack (2010) proposed that attachment to a special place may substitute for the lack of secure human attachment relationships in children living in foster care.

Giuliani (2003) and Morgan (2010) proposed a method to integrate human and place attachment through emotion. Giuliani (2003) identified behaviors within place attachment that mirror aspects of the affective bond of human attachment relationships. Giuliani approaches the task of integrating human and place attachment through emotion but spends little effort in examining the influence of the characteristics of the physical environment on place attachment which Morgan (2010) addresses.

Emotion is integral in human attachment in that an emotional response to the environment drives a child back to the caregiver to whom they are securely attached. "'There is no action and no thought that is not affectively motivated... Motivation underpins agency and motivation is always emotional' (Basch, 1988, pp. 68–69)" (Morgan, 2010, p. 14). Motivation may provide the link to combine human and place attachment since the place must inspire or motivate a child to venture from the caregiver. Morgan (2010) utilized Lichtenberg's theory of five motivational systems which influence human behavior and include physiological regulation, attachment/affiliation, exploratory/assertive, aversive, and sensual/sexual (Lichtenberg, Lachmann, & Fosshage, 2011). Morgan (2010) utilized the attachment/affiliation and exploration/assertion systems to link human and place

attachment. The attachment/affiliation system motivates children to seek out the attachment figure; the exploration/assertion system motivates a child to explore their surroundings which positively affects a child's sense of efficacy. However, characteristics of the place could inspire exploration/assertion. Motivation may not be internal only; external forces, such as place characteristics, may also motivate the child to explore. Morgan (2010) identified fascination, the involuntary attention paid to environments which are engaging as explained by Kaplan (1995), as an environmental quality which may motivate children to explore. A child motivated by the exploration/assertion system ventures from the attachment figure into the physical environment; the sense of efficacy motivates the child to engage with the physical environment instead of engaging only with the attachment figure (Morgan, 2010). In times of distress, the attachment/affiliation system is activated motivating the child to return to the attachment figure. In a secure attachment relationship, the attachment figure soothes the child, and the child is once again motivated by the exploration/assertion system to explore the physical environment (Morgan, 2010).

Home Range Mirrors the Secure Base

The motion that Morgan (2010) described in terms of the attachment/affiliation and exploration/assertion systems is also known as the secure base function of human attachment relationships. Caregivers to whom a child is securely attached become a secure base from which the child explores and returns to find physical and emotional support (Bowlby, 1988). The secure base function of place attachment is illuminated within the concept of home range. Home range refers to the range or distance from home in which children can travel autonomously. Home range is experienced as the secure base function of attachment relationships where parents determine boundaries of exploration which typically increase as children age. In three seminal studies of children and their environments, home range is referred to as parentally defined range (Hart, 1979), territorial range (Moore, 1986), and field of promoted action (Chawla, 2006).

Little (2016) documents the home range of a group of boys ($n = 5$; 3 children and 2 mothers) who played in a creek in Raleigh, NC, from 2002 to 2006. Most days after school, the boys played in the creek located between their elementary school and homes. With the autonomy granted and lack of extracurricular activities, the boys spent approximately 2 h every afternoon playing in the creek. Play activities included the formation of a tribal society, the creation of a currency system to barter and buy found objects collected along the creek, and the celebration of Creek Christmas where the boys dragged discarded Christmas trees from the curbs to decorate the creek (Little, 2016). As the boys aged, their home range expanded (see Fig. 2). At first, the boys' range from home was small; the initial area of their range, zone 1 on Fig. 2, included their homes, their school, and the creek. As the boys aged and were granted more autonomy, their home range expanded to a local cemetery in zone 2. Eventually, the boys roamed into zone 3 as they were lured by

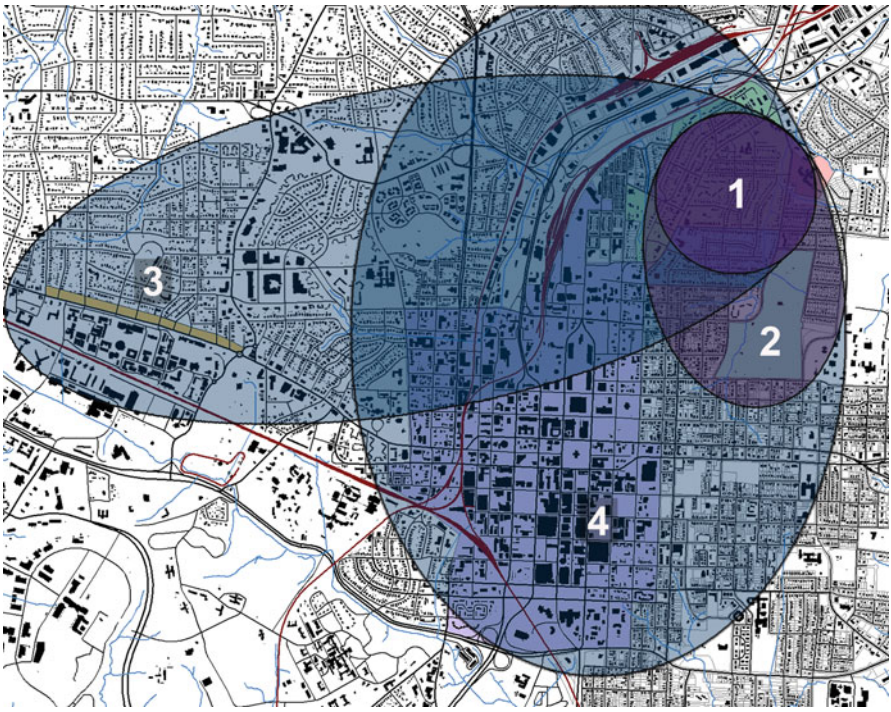

Fig. 2 Zone 1 is the initial area of the boys' home range which contains their homes, their school, and the creek. As they matured, their home range expanded. No matter how far they roamed, they returned to the creek. The orbit around the creek mirrors the secure base function of human attachment relationships where children orbit around their attachment figure (Little, 2016)

the cheap restaurants lining Hillsborough Street adjacent to the campus of North Carolina State University. As the boys became teenagers, they ventured into the bustling streets of Downtown Raleigh of zone 4. No matter how far they ventured from zone 1, the boys always returned to the creek.

Of interest to integrating human and place attachment is the boys' merging of the secure base function of human attachment with home range. First, the boys appear to be securely attached to their caregivers. From interview accounts, caregivers acted as the secure base for the boys in that caregivers were aware of the managed risks the boys encountered in nature in the urban environment which implied that the boys sought comfort from caregivers during times of stress (Little, 2016). However, the boys seemed to view the creek as a secure base as well. Mirroring the secure base function of human attachment relationships, the creek seemed to act as an attachment figure from which the boys drew comfort and returned during times of stress. Matt described the creek as, "It was just like a sanctuary we could go" (Little, 2016, p. 127). As the boys' home range expanded, the creek remained at the center of the home range. They continued to visit the creek after graduating from elementary school. No matter where their home range

expanded, they continued to visit the creek seeking comfort and remembering old times. David recalled:

> A lot of times it was kind of like trying to show [high school friends] our lifestyle to get them to understand, and it is funny bringing people to the creek and showing them around Raleigh and like 'That is what we used to do.' (Little, 2016, p. 127)

Nature may influence the extent and direction of the home range. The studies investigating home range (e.g., Chawla, 2006; Hart, 1979; Moore, 1986) acknowledge the importance of nature for children, but do not link the presence of nature to home range. However, Little (2016) documented that the progression of the boys' home range occurred along a spectrum of mostly natural places to mostly urban places. For example, the boys began their social and cooperative play at Cemetery Branch across from Conn ES. Although evidence of urban elements existed, e.g., Frank St. culvert, a sewer manhole, and homes, the creek was mostly natural. As the boys aged, home range expanded and the balance between natural and urban environments shifted. From the creek, the boys ventured to a cemetery where urban elements were more obvious with the presence of pathways and tombstones; however, the cemetery was still natural, only less than the creek. Eventually, the boys frequented Hillsborough Street. Although street trees occurred along both sides of Hillsborough Street, urban elements were starting to overpower nature. Finally, the boys discovered the joys of climbing the abandoned warehouses in Downtown Raleigh where, for the most part, nature was not present and urban elements were more dominant than nature.

While the boys moved away from nature, nature was still a very meaningful environment to them. Nature, e.g., the creek, continued to be a magnet for the boys. No matter how far their home range expanded, they always returned to nature, the creek.

The Influence of Autonomy

The influence of autonomy may provide further insight into integrating human and place attachment. In secure human attachment relationships, caregivers act as a secure base from which children venture to explore (Bowlby, 1988). Inherent in the secure base function is the provision of scaffolding opportunities which foster autonomy. For example, caregivers set a home range within which children are allowed to explore autonomously. As children age, home range increases. The scaffolding of home range distance supports greater autonomy. In secure human attachment relationships, caregivers encourage children to become more autonomous with age (Howe et al., 1999) thus leading to larger home ranges. To relate back to Morgan (2010), the distance from the caregiver created by the exploration/assertion system depends upon the level of autonomy granted.

While autonomy is encouraged in human attachment, it may be critical in the development of place attachment. The level of autonomy granted to the boys in the Little (2016) study greatly impacted their relationship to the creek. One

mother recalled, “There really wasn’t much close supervision at all, and we found that they usually did better if there wasn’t because they were much more creative” (Little, 2016, p. 82). Away from caregivers’ watchful eyes, the boys created a magical experience at the creek, a society completely separate from adults. Within “store fronts” created by tunneling into an overgrown *Elaeagnus* shrub, the boys displayed found objects that could be bartered or bought with the “creek currency” one of the boys created on his computer. After Christmas, the boys would drag discarded Christmas trees to the creek and celebrate Creek Christmas. Matt explains, “I think a lot of it was wanting to be unsupervised and have the freedom to like do whatever you want really and kind of go wild” (Little, 2016, p. 67).

Derr (2001) observed the influence of autonomy on place attachments among New Mexico children. While there was great variation in the extent of home range across communities, gender, and specific contexts of home, children with strong attachments to place generally were afforded a high degree of autonomy (Derr, 2001). As an example, two Dixon children lived just a few houses apart, and both had long, narrow properties. While both families valued a way of life tied to the land, Crystal was allowed freedom to explore and create places on her own, whereas Beverly was not allowed to leave the immediate yard outside the house without supervision. While both children participated in cultural activities associated with place, only Crystal illustrated strong place connections. These connections were created when she explored the overgrown ditch, the semi-managed orchards, and her own favorite willow tree. It was these places, which Crystal independently created on her own or with a cousin that repeatedly brought her out onto the land, where she bonded with her home. Cultural associations were important to both children, but it was the repeated and changing experiences Crystal described that came alive, and these experiences resulted from autonomous time outside.

Outcomes of Human Attachment and Connections to Place Attachment

Outcomes of human attachment can possibly lend clarity to potential outcomes of place attachment. Significant outcomes children experience from a secure attachment relationship to a caregiver are an internal working model that predicts the quality of future relationships based on that initial bond and resilience in the face of stress (Bretherton, 1995). These outcomes influence adult life as well. If human attachment and place attachment are related concepts, then an internal working model and resilience to stress may also be outcomes of place attachment.

Internal Working Model

In secure human attachment relationships, children develop an internal working model or mental representation of themselves, other people within their social

environment, and the relationship between themselves and others (Howe et al., 1999). The internal working model is based on the initial bond with the attachment figure and their ability to meet the child's needs and provide comfort and security (Siegler, DeLoache, & Eisenberg, 2011). The function of the internal working model is to mentally model different behavioral scenarios with the desired goal of having their needs satisfied (Howe et al., 1999). Eventually, these models facilitate the organization of behaviors and predict the quality of future relationships beyond the attachment figure.

Place attachment literature does not mention an internal working model as an outcome. Place may function in a similar capacity as the attachment figure in the development of an internal working model; however, the ultimate target of the model is unclear. In other words, does an internal working model from place attachment predict future relationships to other people or to other places? Studies of adults reflecting on their childhoods suggest that it may be both (Chawla, 1992; Cooper Marcus, 1992). Over many years of study with landscape architecture students, childhood special places played an important role in the types of places design students created (Cooper Marcus, 1992). Autobiographies similarly suggest that place plays a role in predicting future relationships, to other places and people (Chawla, 1992). Human geographers have long documented the ways immigrants migrate to new places that reflect some aspect of their previous homes. Derr's (2001) intergenerational research in New Mexico suggests that an internal working model influences both relationships to place as well as to people.

Place Attachment and Future Relationships with Other People

The internal working model within human attachment helps the child develop and organize interactions within human attachment in order to develop behavioral strategies for future interactions to ensure that their needs are continuing to be met (Howe et al., 1999). Through these initial interactions with the attachment figure, a child gains an understanding of their own self-worth (Howe et al., 1999). The belief of one's worth and the expectation of positive future interactions are key concepts of the internal working model's ability to model future relationships. Much like with human attachment, children gain a sense of their self-worth and self-identity from attachment to place (Proshansky & Fabian, 1987; Wilson, 1997). Does it follow that the feelings of self-worth from secure place attachment could indicate an internal working model which would predict the quality of future relationships with others?

Little (2016) found that secure place attachment resulted in the longevity of friendships in the study of the boys who played in the creek. Initially, the creek play was very physical, e.g., running around and climbing trees. Eventually, as the boys became more familiar with each other, the play became more imaginative. Playing with a consistent group of friends changed the nature of the creek play; the play evolved from physical to imaginative. The boys maintained their friendship while attending different middle and high schools and universities. While the "future relationships" in the Little (2016) study were the future iterations of relationships created at an early age, the place attachment of the boys to the creek cemented the continuation of these friendships.

Place Attachment and Future Relationships with Place

The internal working model within human attachment predicts future relationships with others; perhaps the internal working model within place attachment predicts future relationships with place. Little (2016) concluded that a possible outcome of the boys who autonomously explored a creek in Raleigh, NC was self-efficacy in judgment and decision-making. From the risks they managed autonomously as children exploring the creek, the boys began to develop confidence in their ability to judge a situation and decide upon the best course. David recalled an encounter with a rabid raccoon while walking along the creek:

> Like one time, a raccoon that obviously had rabies was like, you know trying to get us, kind of. I always remember, running just so far away, but like yeah I mean, that sort of thing, I guess makes your courage go up. (Little, 2016, p. 86)

Encountering the rabid raccoon presented the boy with an opportunity to judge the situation and decide how to proceed. The courage he mentioned in the quote represents the attainment of self-efficacy in judgment and decision-making.

The boys' potential internal working model of themselves within the creek environment predicted their future relationships with other places in emerging adulthood. During the summer of the interviews, the boys while on summer break from college had just returned from Peru. They traveled without the safety of a tour group unlike their college peers. David explained:

> I think that not that many people do that. Where they go with a group of their friends just to like explore. A lot of my friends are like peers at [college] for instance are going out of country but everyone that was going out of country was going through like a program or something. (Little, 2016, p. 143)

The safety of a tour group was not required because the boys had explored autonomously as children and knew that they could manage risks. While in Peru, the boys experienced difficult situations; however, their self-efficacy in judgment and decision-making facilitated successful navigation of these situations. David elaborated:

> We get in funny situations maybe but like we were always able just to like 'Haha, we'll get through it' and so, and I mean we always did too. But I feel like that upbringing made us more comfortable in that situation. (Little, 2016, p. 144)

Based on the strength of their initial relationship with the creek environment and their resulting self-efficacy, they knew that they could navigate successfully through unknown situations in other places.

In addition to other places, the internal working model may predict continued interactions with place over generations. Belief of one's worth was a central factor *as tied to land and community* expressed by many parents and grandparents in Derr's (2001) intergenerational research in New Mexico. In other words, their ownership of land and connectedness within a community potentially supported the development of an internal working model in which they derived a sense of self-worth. Tommy's

parents and grandparents developed an internal working model through their social and cultural engagement with place. Tommy's grandmother, Lupe, reflected on the tradition of community events that afforded the continuation of her attachment to place. Lupe spoke about the annual fiesta, where they visited a mountain cabin, built fires, and sang songs, and of more frequent barbeques under the trees beside their pasture.

While the community began to change, the internal working model predicted how Tommy's family continued to interact with place. Tommy's parents in the rural community of Mora reflected upon changes in their community, how new people were coming in, "and the old people are dying off." Tommy's mother reflected, "but I still hear the birds the way I remember when I was growing up" and Tommy's father added that they are still teaching "the 'old ways' of self-sufficiency":

> I take Tommy to go for wood because I want him to learn things. So he can feel the difference of heat [from wood], the peacefulness of a crackling fire. It's a heat that relaxes instead of making you tired. I do gardening with them so that they'll learn. I don't want him to be a bum. I want them to learn for themselves, to do things for themselves. I want them to know how to change the carburetor – that you don't have to depend on anyone for anything. (Derr, 2001, p. 91)

Lupe explained that they gave Tommy's parents a piece of their own property saying, "If we give you this property, will you stay?" (Derr, 2001, p. 92). Parents and grandparents with strong place attachments maintained these attachments through their ongoing relationships with place, community, and ritual and through the ways that they raised their children and passed on place-based values. The internal working model in these cases resulted in ongoing place relations passed on through generations.

Resilience to Stress

No other relationship is more significant than attachment relationships in regard to coping with stress (Grusec & Davidov, 2010; Mikulincer & Florian, 1998; Repetti, Taylor, & Seeman, 2002). "For the infant and young child, attachment relationships are the major environmental factors that shape brain development during its period of maximal growth" (Siegel, 2012, p. 113). Strong attachment in childhood creates an "inner resource" which is utilized by adults to cope with stress (Mikulincer & Florian, 1998, p. 144).

Masten (2001) described resilience processes as "ordinary magic" that is a common result of basic human adaptation: "If those systems are protected and in good working order, development is robust even in the face of severe adversity" (p. 227); however, if these systems are impaired and experience prolonged "environmental hazards," then the risk for developmental problems is much greater. Development psychologists define resilience as "good outcomes in spite of serious threats to adaptation or development" (Masten, 2001, p. 228). Fifty years of resilience research has found that protective factors are relatively consistent across populations and include a variety of individual traits, such as problem-solving skills,

self-control, and motivation to success, influences of family, and influences of the broader social environment (Masten, 2014; Wells, 2014). Most of these traits develop as an outcome of human attachments, including effective caregiving and supportive relationships with adults and effective schools and neighborhoods (Masten, 2014). Derr, Chawla, and Van Vliet (2017, p. 25) suggested that "resilience reflects an interactive process that occurs when children exhibit personal strengths by reaching out to find care and support, and people and places around them provide the resources that they need."

With a changing climate and increased natural disasters, urban planning and policy literatures have also explored resilience among communities. In this realm, resilience is facilitated by community agency and capacity, opportunities for self-organization, diverse forms of knowledge, and opportunities to learn about and steward natural systems (Derr et al., 2017; Magis, 2010). These frameworks recognize human agency as central to resilience: resilient cities are places where "everyone has a role, an idea, an insight and the ability to participate" (Pearson & Pearson, 2014, p. 247). Evidence also suggests that active stewardship and community gardening activities may also foster resilience (Chawla, 2014; Derr et al., 2017; Derr, Corona, & Gülgönen, 2017; Wells, 2014).

Resilience has been framed in many cities as an ability to withstand both acute shocks, such as natural disasters, and chronic stressors, such as poverty (Derr et al., 2017). In the context of chronic stressors, nature and social supports emerge as two consistent factors across cultures and environmental contexts (Chawla, 2014; Derr et al., 2017; Derr et al., 2017; Wells, 2014). In Derr's (2002) research with children in New Mexico, nature, cultural place, and strong social supports were all factors in coping with hardship. As Low (1992) suggested, these place attachments were strongly expressed when places were threatened in some way. Threats could come from a fear of losing a place, by growing up and moving away (Derr, 2002). However, threats could also come from the effects of poverty and adversity, where social relations break apart or family ties are strained, as in the cases of Marcos and Terésa (Derr, 2002), or for a child in northern California, from expansion of logging trails (Benson, 2009). These relationships raise the question as to whether strong place attachments foster resilience or if children turn to places for resilience when experiences chronic or acute stressors.

Billig, Kreitler, Zadernovsky, and Alkalay (2016) provided some insight into these questions through their examination of the relationship between place attachment, coping, and quality of life among 5392 Israeli children across 2 ethnicities, gender, and age (from elementary through secondary school). Place attachment and coping were each independently associated with quality of life. Coping mechanisms, such as specific activities and optimism, had a greater impact on quality of life than place attachments. However, their structural model also shows that "though place attachment and coping affect quality of life directly and independently, they are interrelated, which indicates that they may interact with and affect the other" (p. 27). In their research, girls were significantly different from boys in the association between coping and quality of life and in the behavioral and cognitive factors associated with place attachments. Boys scored higher than girls in quality of life

overall, but lower than girls in place attachment and coping factors. The relationship between place attachment and coping appeared to be highest among elementary school children.

Scannell and colleagues (2016) reviewed existing literature and theories to suggest that place attachment may play an important role in children and youth's response to disaster. Children and youth who have strong place attachments are better "prepared" for disasters because the place bonds provide a form of resilience. However, they assert that during a disaster and any resulting displacement, these same children and youth experience heightened emotional distress, at the loss or damage to places of attachment. Over time, these same young people are able to draw on their pre-existing and new place attachments in order to increase their recovery.

Nature and Its Relationship to Resilience

The natural quality of the "place" in place attachment may influence resilience. Chawla (2014) and Wells (2014) reviewed a range of literatures that suggest that natural environments, in particular, provide protective factors for strength and resilience in the face of extreme poverty, war, and natural disasters. Across these studies, "evidence indicates that nature can be a vital protective factor in children's lives, and a feasible dimension of programs for reconstruction and risk reduction" (Chawla, 2014, p. 121). The association between nature and resilience may be found in recent research that identifies nature as a significant source of mental and physical health (Chawla, 2015). Informal play in nature contributes to mental restoration (Wells, 2014), positive and creative social play (Chawla et al., 2014), satisfaction of intellectual curiosities, and development of individual capabilities (Chawla, 2014). Wells (2014) identified two prominent features in the children's psychological resilience literature that are particularly present in nature: experiences that foster positive social relationships and those that facilitate optimal intellectual function. In her review, Wells (2014) suggested that green spaces serve to facilitate increased positive social relationships, both between children and across generations:

> Green settings serve as a social magnet, drawing people together and fostering social interaction, the development of friendships, and the formation of neighborhood social ties. This literature provides a clearer understanding of one plausible mechanism that might link nature access to childhood resilience. (p. 101)

Exposure to nature may enhance executive functioning in the brain, including greater concentration and ability to withstand delayed gratification. Nature exposure has also led to improved cognitive functioning among children with attention-deficit hyperactivity disorder (Wells, 2014). Wells (2014) suggested that the growing body of evidence that nature supports cognitive functions in children may also provide support that natural environments contribute to children's resilience. As additional support, Chawla and colleagues (2014) found that nature was a source of restoration, a source of motivation and focused learning, and a place for positive social relationships across ages and types of experiences in green school grounds. They describe

children's experiences with nature as "deep engagement" in both the types of action facilitated and cooperative relationships formed. Environmental features that foster resilience may vary, but include special places in nature, natural surroundings, nature play, care for animals, and involvement in gardening (Benson, 2009; Chawla, 2014; Chawla et al., 2014; Derr et al., 2017).

Research with immigrant children links nature back to attachment theory by suggesting that nature served as a "holding" space in children's transition to a new city and nation (Hordyk et al., 2015). In this context, "holding" describes the role of a primary caregiver in holding an infant for an extended period of time. This holding promotes growth and fosters attachment. Hordyk and colleagues (2015) described the "sensory-embodied" experiences of children as a way of understanding their place meanings: "children appeared to relax emotionally and physically in both social and solitary activities in nature with nature appearing to serve as a buffer" (p. 577). They described children's relaxation in nature in which:

> Children sprawled themselves on the ground spending lengthy periods of time observing minute insects. They quieted themselves in response to slight movements in the weeds or branches. They took time planting their gardens, enjoying the sensation of soft, moist dirt. (p. 578)

In this context, Hordyk and colleagues observed relaxation among the children, with movements and muscles stilled. They also described nature as a "transitional object" (per Winnicott, 1953) in which children used nature to maintain caregiver attachments even when the caregiver was not present: "aspects of the natural environment appeared to function as transitional objects that maintained connectedness between children and the absent caregiver or country of origin, linking participants to places and people they hoped or expected to see again" (Hordyk et al., 2015, p. 580).

In resilience research among Bedouin children growing up in illegal villages of Israel, children drew elements of nature, especially flowers, sheep, and camels as supportive, along with social supports. The flowers were not present in the village, but were still "profusely drawn" by children as they described their villages (Huss & Alhaiga-Taz, 2013). Similarly, children in Mexico City, Mexico drew and described a vision of their "ideal city" as profusely natural. In contrast to the street, which children viewed as a hostile and dangerous place, Mexico City children's ideal place was consistently natural, with children composing a model city made of trees, grass, animals, flowers, shrubs, and many water features (Gülgönen & Corona, 2015). Such research suggests that children in challenging environments view nature as restorative, whether or not it is present in their physical surroundings. Chawla (2014) similarly describes children's desires for nature – trees for shade, food for gardens, and green refuges – to be woven into new places during participatory projects with children in forced resettlements in Johannesburg, South Africa, and Delhi, India.

While nature may be important in facilitating resilience among all children (Chawla, 2014; Wells, 2014), it appears to be particularly significant for children living in temporary or long-term hardship, such as those who experience chronic poverty, war, disaster, or resettlement (Chawla, 2014). In these contexts, positive

place relations associated with nature may facilitate attachments, especially when other attachment objects are disrupted (Hordyk et al., 2015).

A Working Model

This chapter proposes a model which links human attachment processes and outcomes with place attachment (see Fig. 3). This model is nascent. From current research, the secure base and home range suggest a connection between human attachment and place attachment. In human attachment, the attachment figure acts as a secure base from which the child ventures and returns for comfort (Bowlby, 1988). Within secure attachment relationships, the attachment figure encourages children to become more autonomous with age (Howe et al., 1999) which reinforces the attachment figure as the secure base. Morgan (2010) recognized the influence of nature in the form of fascination on the secure base function; in other words, an environment must inspire a child to leave the secure base. Morgan (2010) suggested that fascination, involuntary attention typically solicited by natural environments (Kaplan, 1995), could motivate the child. In place attachment, the secure base becomes a significant place from which

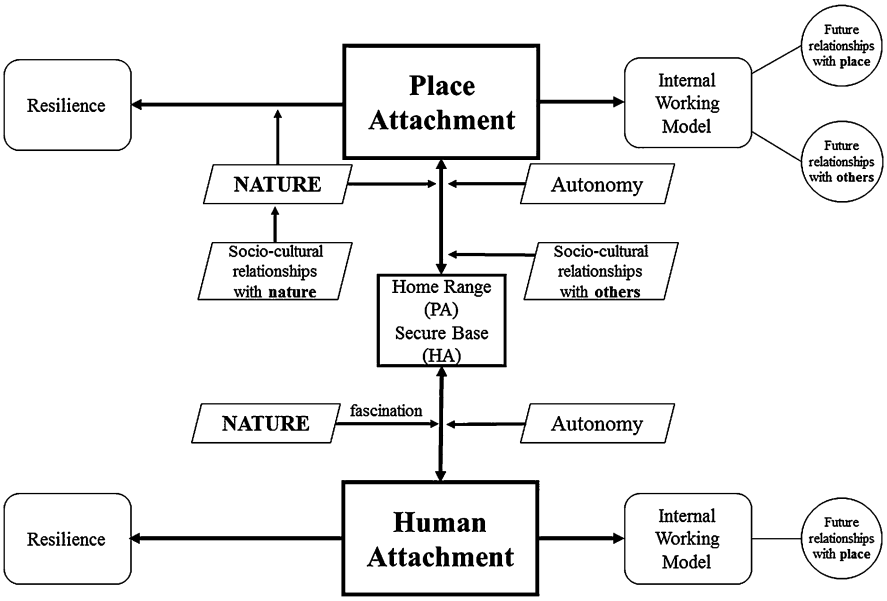

Fig. 3 A working model linking outcomes from human attachment and place attachment with similar outcomes of resilience and an internal working model. The secure base function of human attachment and the home range within place attachment are mirroring concepts. Nature motivates the child to venture from the attachment figure, and nature seems key in the formation of place attachment. The ways nature is understood and experienced is influenced by sociocultural relationships

the child ventures but returns: the home range. Like human attachment, the level of autonomy granted to children and the presence of nature influences home range and the formation of place attachment. Sociocultural relationships influence not only how individuals experience and interact with place but also the ways nature is understood and experienced (Linzmayer & Halpenny, 2014).

If human attachment and place attachment are related concepts, then outcomes of human attachment may be experienced through place attachment. In human attachment, children who are securely attached to a caregiver are resilient to stress and develop an effective internal working model which predicts the nature of future relationships. In place attachment, existing literature identifies resilience as a possible outcome of place attachment which is influenced by nature. Emerging research in resilience provides some suggestions that nature as a component of place, and social relationships within and with a place, may be significant factors in place attachments and resilience. If this is the case, then place attachments are potentially significant not only as an empirical realm of study but for influencing well-being of children into adulthood.

Currently, no research has explored the internal working model in regard to place attachment. If secure place attachment creates the potential of the development of an internal working model, then whether the prediction relates to future relationships to people, to place, or to both is unknown.

Discussion

While there are compelling linkages between human and place attachment, many questions remain: Is place attachment a separate construct or a part of human attachment? What factors cause children to attach to places? Which of these factors provide lasting effects? Are these effects in the form of an internal working model and resilience?

Morgan (2010), like Chawla (1992), suggested that place attachment, unlike human attachment, may not be a universal construct. In human attachment, the bonding figure is often consistent. In place attachment, the bonding figure may be place itself, which geographers have consistently described as a complex mixing of social, cultural, and physical attributes. Thus, exactly *what* children attach to can vary significantly: "the sophisticated intersubjective attunement underpinning human attachment has no obvious parallel in place attachment" (Morgan 2010, p. 11). Research with children suggests that place does play a significant role in shaping place relations and potential attachments, through the formation of a secure base/home range and through the development of an internal working model (Little, 2016). More research directly with children, over time, and different life stages would help to better understand these relations in place attachment. Similarly, more research with adults reflecting back on their childhood places, also with an eye toward understanding secure base and internal working models, would serve to further develop this model.

The relationship between place attachment and resilience in children is emerging. Empirical research found that place attachment may play a role in quality of life and be associated with coping (Billig et al., 2016). Reviews of place attachment literature suggest that place attachment may contribute to resilience in times of displacement and natural disaster (Chawla, 2014; Scannell et al., 2016). Resilience research with children has found nature and social supports as central factors to resilience (Derr et al., 2017; Derr et al., 2017). Positive place relations associated with nature may facilitate attachments, especially when other attachment objects are disrupted (Hordyk et al., 2015). Billig and colleagues' (2016) finding that place attachment varies by age and gender may also suggest potential variations in the role of place in fostering resilience. Further research to examine these factors and their association with place attachments would help us understand resilience as a potential outcome from place attachments.

This analysis, however, is not fully able to explain the social and cultural realms of place in shaping place attachments. If resilience is an outcome of place attachments, then research with children suggests that physical, social, and cultural aspects of place experience serve to develop these outcomes. More place attachment studies with children in a variety of social, cultural, and physical environments will develop a greater understanding of these relationships.

Conclusion

We began this chapter by identifying the importance of childhoodnature connections in a variety of domains, from those associated with health to those associated with the fostering of pro-environmental behaviors (e.g., Chawla 2014, 2015; Faber Taylor & Kuo, 2006; McCormick, 2017; Wells, 2014). We also identify that despite the abundance of place-based education, there still exists a relatively small body of research that directly seeks to understand childhood place attachments in relation to nature. To develop the theoretical underpinnings of this relationship further, we explored the idea that human attachment may provide some clarity to place attachment theory, particularly as it relates to the outcomes of place attachment and children's relationships with nature. In human attachments, the quality of the initial bond with a caregiver predicts the quality of future relationships, and children with secure attachments are more resilient in the face of stress. In childhood place attachments, bonds between children and place may form as a result of one or more of the following: the unique qualities of a place, the transactional relations with that place, and the social or cultural associations with a place (Derr, 2001; Hart, 1979; Min & Lee, 2006; Moore, 1986). Childhood place attachments may be a unique form of place bonding that includes social interaction, imaginative play, and attainment of emotional and developmental needs (Benson, 2009; Derr, 2001, 2006; Linzmayer & Halpenny, 2014; Moore, 1986; Sobel, 1993). Both human attachment and place attachment theory describe a process of moving outward from a secure base, and in so doing, gaining confidence and a sense of self. Nature appears to be an important attractor in that the qualities of a natural environment draw children

outward for exploration (Lim & Barton, 2010). At times, nature is also a place for comfort, security, and emotional regulation and thus may function as a secure base and provide support for resilience (e.g., Derr, 2002; Little, 2016). While our review identifies many questions for future research, the human attachment model provides a point of entry to deepen our understanding of the role of place attachments in psychological well-being and the role of nature in bringing about and supporting these attachments.

Abstract

(How) do places affect us? This chapter will explore how place is experienced by children, referencing empirical studies that reflect several forms of outdoor learning, both curricular and outside the classroom. Outdoor learning is undergoing a renaissance of interest and is widely seen as an effective means of connecting children *to* the natural world (Louv. Last child in the woods. Algonquin Books of Chapel Hill, New York, 2010). This common conceptualization will be challenged by recognizing the child *within* nature. In examining the

question of the effect of places on young people (and vice versa), the paper will employ theories of cultural density (Waite. Cam J Edu 43(4):413–433, 2013; Waite. Culture clash and concord: supporting early learning outdoors in the UK. In: Prince H, Henderson K, Humberstone B (eds) International handbook of outdoor studies. Routledge, London, 2015) and cultureplace (Quay. Stud Philos Edu 36:463–476, 2017) in relation to how culture informs place and pedagogies within them. It will argue that the more-than-human world shapes possibilities for interaction but that these are mediated by individual, structural, and cultural influences, both acknowledged and tacit, in the enactment of outdoor learning within and across countries (Malone, Waite. Student outcomes and natural schooling: pathways from evidence to impact report. Plymouth University, Plymouth, 2016).

Interweaving multidisciplinary perspectives, the chapter considers implications for practice and suggests that feelings and affect may act as intrapersonal organizers of this complex interplay of cultural and material influences. It will argue that in rejecting human dominion over nature, place as "personal" is nonetheless a key contributor to the power of outdoor learning to transform lives.

Introduction

We suggest that all our experiences occur *in* place as emplaced and *in* culture as enculturated. To construct this argument, we will consider the concept of place and illustrate ways in which place is experienced by children and young people using examples from empirical studies that reflect several forms of outdoor learning, both curricular and informal. Drawing upon diverse theoretical frames as well as examples of children in particular places, we will discuss whether theories of cultural density (Waite, 2013) and cultureplace (Quay, 2017) may help to improve understanding of the affect of places. In conclusion, we will suggest some ways that careful thinking about cultureplaces and cultural density might help to shape responsive and responsible pedagogies which fully embrace the fact that living and learning is always in place.

In Place: Self and Social Space

A rich seam of thinking can be found which troubles the idea of place as defined by physical boundaries; clearly this chapter cannot cover it all. Tuan's thesis of place (see e.g., Tuan, 1977, 2001) stems from an understanding of ourselves as "being-in-the-world" and includes personal and social striving toward "a good life." His relational view of geography sees humanity as inside

the world, both physically and emotionally, famously defining place as space with meaning that is both affective and moral. Thus, place is constructed. Places become known through reflection and the attention paid to the way we live our lives (Tuan, 2001).

However, some commentators have argued that place significance is increasingly attenuated by globalization and technology, obscuring geographical and material differences. For example, in response to neoliberal threats to the environment, Escobar (1998:61) suggests that:

> Unlike modern constructions, with their strict separation between biophysical, human, and supernatural worlds, local models in many non-Western contexts are often predicated on links of continuity between the three spheres and embedded in social relations that cannot be reduced to modern, capitalist terms.

The suggestion is that critical and local social movements offer opportunities to resist homogenization of "nature" and cultures. Neoliberal redefinitions of space are also the target of Lefebvre's (2003) argument that geographical space is at heart social and therefore has several potential cultural meanings: *perceived space* as unremarked everyday surroundings, *conceived space* as intended and managed by those in positions of power, and *lived space* as transformed through personal and social meaning. This third space, he suggests, allows new ways of being through imagined alternatives. In a sense, self and space become merged in place through dwelling, and this meaningful grounding of space can offer resistance to the habitual or managed.

Moving beyond social construction, Thrift (1997) highlights the intended and unintended in places and emphasizes *embodied* knowledge, where feeling, being, and doing offer insight into place significance. Critical to how action unfolds, attention to place and its affordances are deemed essential to its understanding. Thrift (2004) draws attention to "a microbiopolitics of the subliminal, much of which operates in the half-second delay between action and cognition, a microbiopolitics which understands the kind of biological-cum-cultural gymnastics that takes place in this realm" (p. 71).

This view gives place a partnership role and material importance in shaping action. Nevertheless, Lewicka's (2011) review of place attachment literature over the last 40 years concludes that, of the three elements in Scannell and Gifford's (2010) model of place attachment, "person" has attracted disproportionately more attention than "place" and "process." In a similar vein, McKenzie (2008) considers places of pedagogy in intersubjective experience but emphasizes that the source of affect can often be mistakenly attributed. She writes:

> Williams (1977) suggests that a structure of feeling is "a social experience which is still in process, often indeed not yet recognised as social but taken to be private, idiosyncratic, and even isolating" (p. 132). Symptomatic of westernised cultural norms of individualisation and isolation, this also suggests the ways in which much grappling with cultural formation is experienced and attempted at the level of the "who of the subject." (Biesta 1999)

However, if place itself was conceived as a melding of person and world, then the dominance of discourses of individual difference and anthropocentrism might be disrupted. What if place is conceived as partner and agentic? In the following vignette from case study research reported in more detail by Goodenough, Waite, and Wright (submitted), we glimpse how affect and materiality together create attachment to a specific place.

> *Amy had been visiting Fort Apache for about a year. She visited the wooded adventure playground on the site of an old municipal tip primarily to "escape from being near my sisters" who woke her up at night. Amy enjoyed being with her friends, making dens, and getting warm by the fire. She made dens, "places you won't see or think of," in locations along boundaries that are heavily walked and played in by young people. Fort Apache's long woodland edge at the top of its slopes ends abruptly against a wire fence separating it from a grassed playing field. The fence supports bramble and ivy to spill over some shrubby hawthorn, field maple, and elder, forming natural cubby holes that were frequently occupied as ready-made dens; the ground underneath worn and plant-free through constant occupation. Amy, though acknowledging that she shared such spaces with others, was clear that she used them to remove herself and "privately" experience her emotional mood.*
>
> *That tree was there and you could sit down on it. And then you sit like if you were a bit upset and you went to Fort Apache you could just go sit in there quietly.... there's like loads of little trails that go along there, along the top. . .you know where that big bush is there?... There's like this little hole in there. . .You can fit in there and if you actually get across you can see right over. . .there's a little cubby hole and you can see the tree house. . .Up there, that little bush is part of my den as well; so that I can sit in there and have more quietness and if it rains it won't get me wet that much.*
>
> (Extract from Goodenough et al., submitted)

This extract may be interpreted to illustrate how the personal meanings for Amy are stimulated *in* place, are inseparable *from* place, and are *emplaced*. She is in discourse with place such that place seems to reach out to her while being simultaneously shaped by the uses and passage of many young bodies in and through its material presence. This physicality of sensations in place incorporates affective aspects that may be understood to transcend the sociocultural, highlighting the need for further theories which can accommodate this understanding.

In Place: Place-Based Education

Place is more commonly regarded as a partner when considered in the context of play (Fjørtoft, 2001; Gandini 2012; Maxwell, Mitchell and Evans, 2008). Yet play is but one way in which we learn, albeit the predominant mode in the early years. What then is the role of place in later forms of education? There is considerable debate about the extent to which contemporary schooling offers suitable preparation for the wider world. Much current Western formal education happens within institutions between the four walls of the classroom (Malone and Waite, 2016; Quay, 2015), thereby discounting place as a significant contributor to the content of learning and presenting the classroom as the privileged physical locus for schooling. In a similar vein, there is also commentary about how much outdoor education is individualist,

universal, and generalist, in effect place-blind (Brookes, 2004). As both Park (2006) and Stewart (2004) illustrate, a focus on a specific place may help to break down artificial boundaries between nature and culture in place-based education. They advocate active engagement with the landscape to support this focus.

For Tuan, the material world appears to be a necessary but subordinate part of experience in which the human is at the center. Tuan's experiential perspective on *place* sees place sensitivity as one route to self-knowledge, positioning "every person . . . at the center of his world" (1977:41). Kolb (1984: 31) similarly understood experiential *learning* as "describing the central process of human adaptation to the social and physical environment."

The term "experience" perhaps helps us to incorporate active relationship between human and nonhuman and materialize the idea of culture to help appreciate ways that place may suffuse learning. Elkjaer (2009: 80) argues that far from experience being something of the past, it is also continuously in the present and for the future, "Subjects are not passive spectators who look at the world from the outside but powerful and future-oriented participants in natural and social worlds." She also suggests that experience happens when "habitual action and thinking are disturbed and call for inquiry" (ibid.:86). This disturbance of the status quo foreshadows some creative possibilities of place.

Smith and Sobel (2010: viii) contend that place- and community-based education offers an antidote for children "caught in an interior and electronically mediated world, [who are] losing touch with both the society of flesh and blood humans and the delicate natural world that supports our species." The idea that the natural world supports our species, however, suggests an instrumental view of place as existing *for* human benefit (Davis, Rea and Waite, 2006), putting humankind in a position of dominance and privilege. This person-centered focus is particularly evident in literature associated with place attachment (Lewicka, 2011) such that place is often understood as "my place." Such centering around the individual may tend to privilege the human and personal over the nonhuman and social.

On the other hand, a sense of belonging and ownership can foster community and support social justice (Gruenewald, 2008), but "if place-based educators seek to connect place with self and community, they must identify and confront the ways that power works through places to limit the possibilities for human *and non-human others*" (ibid: 315, *emphasis added*). In order to develop pro-environmental attitudes, Kudryavtsev, Stedman, and Krasny (2012) suggest that a "sense of place – including place meaning and place attachment – is shaped mainly through direct experiences in places and indirect learning about places." In the following case study excerpt, this combined approach is taken.

> *The "Exmoor Curriculum," based in Dulverton Middle and Community School with support from the Exmoor National Park Authority and the Exmoor Society, builds upon the idea of situation-specific and place-sensitive pedagogy. Children from years 5 to 8 at Dulverton school engage in weekly 2-hour activities planned to offer progression in various educational themes connected to the local environment (Exmoor), including studies of habitats, map work, and water skills. The place-based program is deliberately set within the*

children's local environment, and the design of the curriculum is intended to provide repeated experiences over 4 years, building on developing knowledge and skills.

One group of four boys, including one with autism, shows very good cooperation. The Learning Support Assistant is very hands off, facilitating and letting them work out a way of working together. She explains: "They know what to do because they are farmer's sons." They eschew using scissors and unpick the thickly bound and knotted twine with nimble fingers. They cooperate with different jobs, except for one in school uniform who isn't allowed to the muddy area. There is always someone dismantling and others ferrying and sorting. Conversations are prompted by the task – different hay bales and the shapes and the function that these perform (the round ones in plastic are not watertight but can be unrolled like a toilet roll to get as much or as little as you need) (extract from field notes, shelter dismantling, DMS Y5).

Binder twine is both a real and symbolic tie to some students' home lives as children of farmers. Their knowledge about this was respected and valued by the adults supporting the observed activity of shelter dismantling. While carrying out the task, the students talked knowledgeably about aspects of their surroundings, prompted by the materials they were handling and at times the teacher/learner power relationship was more mutual.

(From Waite (2010))

In this vignette, we see how the current learning environment is connected to other significant places for the children and that this is expressed materially as well as through accumulated cultural practices. The study showed affective aspects such as enjoyment of physically active learning and pride in having a unique curriculum, as well as cognitive and emotionally enhanced awareness of their locality and its particular biotic and abiotic features. However, the study also showed that this sort of activity did not awaken sustainability attitudes to other places, which were deemed "exotic" by the children nor did it provide a strong base for their subsequent schooling in a larger community, where they were perceived by some as misfits and "inbreds" (Waite, 2010: 30 and 37). The dominant culture there differed.

In Place: Situated Learning

Communities of practice are evidently highly situated. Elkjaer (2009), in her review of Dewey's contribution to theory of learning and the role of space and place, draws attention to how practice is a key element and how this resonates in the work of Jean Lave and Etienne Wenger on situated learning (Lave and Wenger, 1991). Here learning is seen as induction into a community of practice. Learning is thus socially constructed in the spaces between those experienced participants occupying the center of the community and those with less experience at the periphery. This is a very different positioning to that discussed by Tuan where the person was at the center of their world, with attendant risks of individualist and anthropocentric thinking. However, as Elkjaer (2009) points out, this process of movement toward the expert seems reproductive of the norm and may not sit so easily with creativity and innovation. Nor, perhaps, does it adequately account for and interweave the material within places for learning; indeed, situated learning theory is widely used to describe online communities (Waite and Pratt, 2015).

Although Lave (1988:1) points out that "cognition observed in everyday practice is distributed – stretched over, not divided among – mind, body, activity and culturally organized settings (which include other actors)," materiality of body and place is often ignored. In contrast to this emphasis on the social situatedness of learning, Hinds and Sparks (2008, 2011) find distinct patterns of affective response concomitant with the kind of places encountered: woodland or park, mountain, or garden. These patterns indicate that place matters, supporting the idea that biophilic tendencies are reinforced by childhood experiences. Waite and Pratt (2017) discuss the usefulness of different lenses to think about learning, considering how the concept of "situated learning" describes learning that happens across a community of practice, a social perspective in which it is the nature of relationships between actors that matter and not where this activity occurs, and an emphasis on the social critiqued by Brown, Collins, and Duguid (1989) among others. But the roots of situated learning theory within particular communities have also spawned other theorizations such as activity theory or CHAT (cultural-historical activity theory) (Engeström, 1987; Seaman, 2007), as well as thinking that privileges place such as the notion of learning in situ or place-based education. The latter enable accounts for nonhuman participation and things as agentic but do not necessarily shift the focus from the individual in the way that "alternative" theoretical frameworks such as CHAT can help to illustrate how learning occurs as an indivisible part of continually changing physical and social conditions rather than as a phenomenon located "in the privacy of one's own head" (Horwood, 1989: 6). Such an individualist view of learning still predominates in mainstream schooling and is reflected in the assessment and performance measures that structure and regulate many educational systems worldwide (Waite, Rutter, Fowle and Edwards-Jones, 2017).

This focus on attainment was taken into account in the design of some recent research in the UK. The Natural Connections Demonstration Project worked with 125 schools to embed outdoor learning across the curriculum between 2012 and 2016 and was structured recognizing that most schools' top priority is to support children's nationally assessed educational achievement, meaning that teachers were supported in their work to address curriculum subjects but in local natural environments (Gilchrist, Passy, Waite and Cook, 2016). Ninety percent of responding schools found outdoor learning useful for curriculum delivery, and the opportunities they developed for learning in natural environments were particularly prevalent in science, math, and English teaching, so-called high-stakes subjects measured for school standards (Waite, Passy, Gilchrist, Hunt and Blackwell, 2016). According to participating school teachers, subjects were supported through enhanced experience and wonder, "I think it is hard to bring in the wonderment of science stuck in a science lab for the whole year, whereas if you get outside you can give some people a real 'Oh my gosh!'"; creativity, "I will do a lot of stories based in the woodland, using artefacts and natural objects. . .I've seen a real improvement in children's writing"; embodied learning of conceptual knowledge, "I know a lot of children would have really struggled with grasping the concept of perimeters, but being able to walk it out. . . made a lot more sense to them"; and making subjects authentic

through place-based enactments, "There is no way you could get the same sense of belonging to the past doing it in the classroom or the hall. . . it's just been amazing." This evidence clearly indicates the influence of affect and materiality of place on learning, even when the focus and content of that learning is concentrated predominately on attainment of curriculum objectives.

However, place does not necessarily map well to curriculum objectives or pedagogies of the classroom. In the following case study, taken from an Economic and Social Research Council (ESRC) study of the role of outdoor learning in the transition between early years and primary education, cultural belonging and material features of place appear to complicate pedagogical understanding of place. The study was funded by the ESRC over a period of 29 months. Its aim was to consider the opportunities afforded by outdoor spaces to smoothing the transition to the national curriculum.

> *Laura feels some trepidation in taking this Year 1 class outside. As a supply (i.e., substitute/cover) teacher, she does not know the children very well although certain characters have already been pointed out to her. The children gather around her on the carpet as she sets out the plans for the lesson on Forces, looking for examples of pulls and pushes in the play park. Nearly all the talking is done by the teacher. In fact, there are over 18 behavioral injunctions, principally about how they should* ***not*** *behave, and several of these remarks are targeted at the characters directly; seven teacher comments are about practical arrangements such as who will hold the clipboard and pencil; a mere six relate to the substantive topic of the activity, why they are going out to the play park and that they will need to put on their "science hats." The children are very excited about their trip.*
>
> *In the play park, the children are in their assigned groups with a leader (chosen by the teacher and indicated by possession of a clipboard), but they are pulled by the attractions of play in this context that they associate so much with freedom. They debate if play is allowed. One child says "we must be doing work, because I have a pencil." Others are not so sure and lark about, making the most of their surroundings. The leader adopts the teacher role while trying to get them to cooperate in compiling a group list of pushes and pulls in the environment. She herself has to be pushy to try to achieve this, but the interaction is very unidirectional, as it was in the classroom beforehand. "If I see any silly behavior!" she admonishes the boys throwing grass. Eventually, she calls on the teacher to reinforce behavioral control in this ambiguous area. "Right," says the teacher, "we're coming away from this* ***play*** *area because you're all* ***playing****." The child replies, "I'm not* ***playing****. I'm just looking." But the leader of the group rejoins, "You was* ***playing****."*
>
> (Extract from Waite and Pratt (2017:14))

The question arises about *whose place* this is? What was intended for this conceived space, and how do the place and people within it reconstitute its potential and meanings as lived space (Lefebvre, 2003)? The cultural import of the local play park for the teacher was very different to that for the children, and its features had affordances that were not shared; therefore intended learning was obstructed (Waite, 2015). Place exists not just as special landscapes like national parks but also in the scrubby Fort Apache woodland and a play park commandeered for schooling; children and place comingle in less romantic settings too (Wattchow and Brown, 2011).

In Place: Childhood

In the light of widespread current concerns about children's disconnection from nature (Louv, 2010) and the growing popularity of ways to bring children back into nature, it almost seems that babies are believed to be born outside of the wider ecological system (although clearly population growth is a significant factor in the balance of nature). Kellert's (2002) suggested nine values toward nature, which he argues emerge during children's development, attest to this belief that the beginning of a life is characterized by a separation from nature.

1. Between age 3 and 6 years:
   (a) *Dominionistic* – related to mastery of nature and physical control of it
   (b) *Negativistic* – experienced as fear and alienation from nature
   (c) *Utilitarian* – involving practical and material exploitation of nature
2. Between 7 and 12 years:
   (a) *Humanistic* – exhibiting a strong emotional attachment to nature
   (b) *Aesthetic* – appreciating the beauty of nature
   (c) *Symbolic* – using nature for language development
   (d) *Scientific* – systematic study of structure and functions of nature
3. Between 13 and 17 years:
   (a) *Moralistic* – inspiring spiritual reverence and ethical concern for nature
   (b) *Naturalistic* – direct experience and exploration of nature

Nevertheless, Davis et al. (2006) take issue with this framework, questioning the notion that children's engagement with nature only begins after the age of 3 and problematizing the kinds and sequence of values identified. Mouthing of objects in the material world is one of infants' very first actions in their sensory approach to make sense of the world. For example, eating soil is a very common pastime until repeated "Yuck! Dirty!" adult exclamations train children away from this form of "taking in" their world. Responses between 3 and 6 years are typified by a sense of wonder and the young child's attachment to familiar places and people. The values claimed by Kellert (2002) as framing children's initial engagement with nature rather than being an original response to the nonhuman world seem influenced by significant adults modelling attitudes toward nature as they grow (Taylor and Blaise, 2014). Contemporary Western society continues to exploit natural resources, and this attitude is more likely enculturated in children by our own example, rather than being an early response to the nonhuman world.

The developmental frame may tend to set humankind outside of the ecological world and deny our part in Earth's wider ecosystems. Studies of very young children point to an original sense of unity with the nonhuman world where boundaries of self and other are initially absent (Rochat, 2003). A similar experience is recaptured in moments of flow (Csikszentmihalyi, 1990) and the lived simple unity that Quay (2017) draws upon in his concept of cultureplace; but perhaps some aspects of this first simple unity are lost through subsequent learnt behaviors (Phenice and Griffore, 2003). Nonetheless, Rochat (2003) also argues that context causes us to oscillate

between different overall developmental stages of self/other awareness. In this way, particular place contexts are again influential in mediating our relationship with human and nonhuman other.

In Place: The Anthropocene

In the previous sections, we have looked at some of the ways in which place and learning in situ have been conceptualized. We have tried to draw attention to and critique some taken-for-granted assumptions that appear to underpin the theories discussed, including the continuing dominance of individualist, person-centered, and anthropocentric attitudes toward how human and nonhuman relate within the common world. From both psychological and sociological perspectives, the personal and social are dominant discourses, but Prout (2011), MacNaghton and Urry (1998), and Taylor and Giugni (2012), among others, have made considerable contributions to disrupting these hegemonies.

Prout (2011) calls for more interdisciplinary work to avoid oversimplification and bifurcation in thinking about what childhood is; for example, anthropology, philosophy, and accounts of children's geographies have all helped broaden psychological developmental understandings. As Prout argues, "different combinations of human and nonhuman elements can be treated as different partial, more or less stable, orderings of childhood that can both overlap with and sustain each other – or, indeed, that can come into conflict" (ibid.:10).

We mentioned earlier some disquiet about the idea of "my place"; this "my" has become a common marketing tool for the environment as well as retail sector in the UK in recognition of pervasive self-reference in contemporary society. Plumwood (2008:147) expresses a similar concern that personalization encourages privileging certain places at the potential expense of others, commenting "In the same way, in the place case, I think we may have to start the process of recognising denied places by owning multiplicity, envisioning a less monogamous ideal and more multiple relationship to place." This resonates with findings from the Exmoor Curriculum and ESRC studies in this chapter.

Mutual construction by human and nonhuman is part of the process of engagement with place, but Massey (2006: 46) notes that shifting the emphasis to the landscape or place and reflecting that elements that we see as constant are also in flux can help to redress uneven people-centered readings: "The reorientation stimulated by the conceptualization of the rocks as on the move leads even more clearly to an understanding of both place and landscape as events, as happenings, as moments that will be again dispersed." For Massey, the diminution of the human through temporal stretching to geological time helps to put humans in place as a small part of the whole.

However, despite our being only a small part of the whole, human impact on the world has been and continues to be disproportionate, and Earth is now considered to have entered a new geological epoch, referred to as the Anthropocene (Crutzen, 2002) to acknowledge humankind's effects on the planet, enacted over a much

shorter time than previous geological periods. Not only is twenty-first century society more rapidly changing and unpredictable, "nature" itself appears to have been accelerated by human action. Blundell (2017: 10), in discussing the effects of the Anthropocene on concepts of childhood, argues that:

> Through this coming together of Earth or natural time and human time the Anthropocene proposes that rigid and dualistically separated notions of nature and human culture are increasingly difficult, if not impossible, to sustain. Instead it invites a re-imagination of the relationship between them as one of complex entanglement; so that, following Latour (2004), it now makes sense to speak of the Earth system as comprising a diversity of nature-culture hybrids rather than a non-negotiable 'Nature' with all its implied fixity.

Taylor and colleagues (Taylor and Giugni, 2012; Taylor and Blaise, 2014; Taylor, Blaise and Giugni, 2013) further argue that it should prompt us to rethink relationships between childhood and nature, pointing to a diversity of childhoods globally combined with reified conceptualizations of nature. Homogenization of diversity is a risk that the concept of childhoodnature potentially runs. At the same time, this work has also highlighted intimate personal lived connections of children with the non-human world, other than through the romantic historical lenses widely promoted in popular Western literature. Their examples resonate with tacit and often visceral ways that people/nature/place merge as documented from other disciplinary vantage points, including notions of "being-in-place" (Tuan, 2001) and "becoming-speckled warbler" (Stewart, 2011). In this interpretation, the particularity of place(s) becomes more critical and entangled.

In Place: Cultureplace and Cultureplaces

It is clear that there have been many attempts to theorize how the more-than-human world shapes possibilities for interaction in places and that these possibilities are mediated by structural and cultural influences, whether recognized or hidden. Across these attempts there seems to be a move toward what Macnaghten and Urry (1998:167) describe as efforts to overcome "conventional distinctions between humans and nature and between mind and matter." Following Ingold (1993), they refer to such tacit embodiment as "dwelling." Dwelling also suggests a slowing of pace, giving pause to think about how these are entangled and mutually influencing. Dwelling, as Ingold (1993) acknowledges, is a phenomenological concept developed by Heidegger, whose philosophy is central to Quay's (2013, 2015) ontological perspective on education. In further work emanating from these phenomenological roots, Quay (2017) argues that it is the various ways in which the notion of *relation* is understood that confuses and therefore impedes the many attempts to theorize relations between humans and nature adequately and thus between culture and place.

Quay draws on Peirce's (1902) three forms of unity – synthetical, individual, and simple – to highlight three forms of relation. These need to be described and thought through carefully. *Synthetical unity* brings a myriad of things together as one in the

form of a totality or a universe, characterized relationally by interaction/transaction between these things. An *individual* unity is different to a synthesis in that it suggests a unity which is perceived as indivisible (the etymology of the word individual); hence there are no parts constituting this individual which may be considered as one individual among other individuals. A *simple* unity goes a step further in its sense of oneness and is phenomenological in character. Here there is no sense of synthesis or individuality, as there are no parts perceived at all, and thus relation is not relevant as it is assumed. A simple unity is a sense of wholeness that moves beyond the notion of one as there are no divisions: all is "one" without any awareness that there is any whole beyond this whole.

These three forms of unity and their corresponding forms of relation help with understanding human-nature relationships, which are a focus of theorizing in outdoor education (Martin, 2004; Martin and Thomas, 2000). Human-nature relationships embrace a synthetical unity: a totality of things held together in interaction/transaction, like an ecosystem. However, this formulation of the issue – as human in relation with nature and vice versa – is a specific type of synthesis as it approaches the issue from a high vantage point, a bird's eye view, in the sense that human and nature are very general concepts, in which are understood differently by scientific disciplines such as ecology and biology. Martin and Thomas attempt to overcome this distance by referring to human-nature relationships as a form of interpersonal relation. However, perhaps a better way to situate these relations – to socialize them and materialize them locally – is to refer to them as cultureplace relations. Cultureplace is also a synthetical unity but of a different type than human-nature because it is more situated.

But what of the other two understandings of unity: individual unity and simple unity? This requires taking a leap beyond a synthetical unity of things classified as human and/or nature. To express this, Quay (2017) uses the term "cultureplace" with no hyphen. We live, here and now, in cultureplace, as simple unity. In this simple unity, everything already makes sense: it is everydayness, ordinariness, and mundaneness – of the flavor, of the aesthetic, and of the particular cultureplace. However, we can also be aware, thinking reflectively about it, that this simple unity is an individual unity: it is one simple unity among others; it is one indivisible cultureplace among other indivisible cultureplaces. We can name such cultureplaces as *places*: classroom, train station, and park, but when we do so, we must also acknowledge that they are also *cultures* – student or teacher (classroom), commuter or conductor (train station), player or ranger (park), and swimmer or sunbaker (beach) – as examples. These cultures and places are together as cultureplaces. Student culture in a classroom place = studentclassroom = cultureplace. Thus, the truth of a cultureplace is experiential as lived simple unity. This is the phenomenological concept of dwelling.

Continuing with this example, these three forms of unity are accessible in thought: as *synthetical* unity (human-nature) from a high vantage point using reflective/abstract thinking and general concepts – such as classroom, student, and teacher – all meant in a general sense; as synthetical unity (cultureplace) at a more situated level using reflective/concrete thinking and more particular concepts, such

as classroom, student, and teacher, all meant in a specific sense as *this* school or *that* school, etc.; as an *individual* unity (cultureplace) such as the cultureplace of studentclassroom or teacherclassroom, such that we are aware studentclassroom is one among other versions of cultureplace and different to teacherclassroom; and also as a *simple* unity (cultureplace), in a phenomenological or affective way of thinking, which is the everydayness of the ongoing, present, but unnamed, living moment. This last form of unity is perhaps the most important to be aware of, as all the other forms depend on it. This is the living experience which we call on to experientially understand the other concepts. It is very difficult to fully capture in language, highlighting how terms such as studentclassroom are very much approximations as labels when applied to an individual indivisible cultureplace – while pointing to something much richer that requires more poetic language to convey.

It is the subtle distinction between cultureplace as an individual unity and cultureplace as a simple unity which contributes the most to understanding and analysis here. As an individual unity, different cultureplaces may be seen to inhabit the one space, coming into contact in various ways – such as conflicts between different users of a park. As we saw in the ESRC example, the park is a place, but the notion of cultureplace highlights how this place holds diverse possibilities for action amidst multiple, sometimes conflicting, meanings. It is actually a collection of different cultureplaces such as playerpark or teacherpark or birdwatcherpark or footballerpark. Alternatively, cultureplaces may be transportable from one particular spatial location to another. Playerpark might occur as an experience in a range of locations, which we would generally describe in place terms as parks.

In Place: Cultural Density

Waite (2013) accounts for this complexity of different cultureplaces and the power struggles that may occur between them in her theory of cultural density, based on Bourdieu's ideas about habitus (Bourdieu, 2002). Casey (2001:686) observes that a "given habitus is always enacted in a particular place and incorporates the features inherent in previous such places, all of which are linked by a habitudinal bond"; this is akin to Quay's simple unity. For Waite, "cultural density refers to the strength and composition of dispositions to practice and norms of behaviour embedded within places that mediate the possibilities for action of individuals within them" (Waite, 2013:414). Quay's multiple cultureplaces may coexist, but structural forces such as power, politics, and society constrain some and privilege others through cultural density restricting some participants' room for agency and the ways that cultureplace is lived. For this reason, awareness and examination through different vantage points of individual cultureplaces may be necessary to deconstruct the lived experience and critically examine how power works within these.

Cultural practices and concomitant place meanings lie at the heart of this concept, but these are seen as *thick* and structurally determining within some cultureplaces or unrecognized and *light* within others, although this lightness may well also be differentially perceived by individuals. The concept of differing "densities" – thicker

or lighter – provides a metaphorical correspondence that helps to convey this type of difference between cultureplaces. In this way when many cultureplaces coincide, denser cultureplaces push lighter cultureplaces to the margins to the extent that they may not be able to coexist. An example is the (broadly labelled) studentclassroom cultureplace of some children who do not connect with a mainstream vision of schooling and for whom school life presents a struggle as they navigate conflicts with a more mainstream and much denser studentclassroom cultureplace that is co-constructed and congruent with teacherclassroom. In another extension of this metaphor, the relational bonds that tie alternative cultureplaces to "schooling" can be described as *weak*. New contexts for learning outside the classroom may enable the development of new cultureplaces that do not rely on established relations. Density also alludes to the process of sedimentation, whereby practices in places are reproduced and cemented over time, as the pressure of "we have always done it/been this way" bears down. Bourdieu's concept of cultural reproduction of social inequalities underpins this sense of density. Furthermore, it signals a level of structural rigidity in effecting transformation of cultureplaces because there is little or no room for agency through new thinking or actions within such a dominant and dense cultureplace. Thus, cultural density in some cases might unhelpfully be equated with a sense of "destiny" or inevitability.

In linking cultureplace(s) and cultural density, emplaced habitus and normative practices become more open to attention. As place (as timespace) and its cultural density are moved toward the center, multiple cultureplaces can be considered in the light of how densely they occupy and shape possibilities for action and the power relations that determine the "given habitus . . . enacted in a particular place." Physical and material signifiers inform how places are interpreted as more or less dense by people within them. For example, the whiteboard at the front and chairs more or less oriented toward the teacher's usual seat reinforce the cultural density and power relationships of the classroom. More open-ended learning resources in woodland, in contrast, may facilitate greater diversity in childforest encounters.

If we think back to the play park vignette, that place was redolent with experiences of playing on the swings and seesaw for the local children; it was a culturally dense cultureplace in terms of their playful engagement with the material affordances of that environment. Conversely, the supply teacher was from outside the neighborhood, and for her, this particular play park held few previous connotations. Indeed, as a teacher she viewed the play park as not much more than a blank slate: it was culturally light, apparently available to be colonized. She brought the culturally dense cultureplace of teacherclassroom to bear on what for the children was a play park cultureplace. In her attempt to bend the place to the purposes of schooling in a lesson on forces with clipboards, we witnessed how the enmeshed child/culture/place resisted practice that contravened the cultural density of that cultureplace for them.

By shifting to consciousness of individual cultureplace unities and considering multiple cultureplaces and cultural density, the tensions between them can be recognized, and the potential to disrupt previously held values and beliefs or hegemonic practices may be enhanced. In this way, consideration of multiple

cultural densities associated with cultureplaces will enable their meanings and consequences to be made more visible and inform action. Cultural blindness leading to social injustices represents a clear danger if cultural densities and lived cultureplaces remain unexamined. Regarding conceptualization of childhoodnature, these theoretical approaches may help acknowledge and shift attention to children's particular affective, social, and material meanings in place(s).

In Cultureplaces with Cultural Densities: Implications for the Enactment of Outdoor Learning

The foregoing discussions combine to show that being "in place(s)" is a concept which has a long but rather complicated history. It seems a widespread, stubborn, and enduring foible that we privilege human-centric perspectives and pervasively cling to individualist (as an individual person) and developmental views in Western conceptualization and structures of childhood and schooling. In concluding this chapter, we consider some possible reasons and implications for this but also venture that feelings and affect, which appear to underpin a sense of flow and being in simple unity within cultureplace, may indeed act as useful intrapersonal organizers of this complex interplay of cultural and material influences.

Patently, people do transfer experiences of places and use these as ways to evaluate other places. Sue recalls on a road trip in New Zealand rounding a tight corner where a couple were taking a picture of a stunning landscape with a safety barrier in the foreground and commenting that their chosen view was "a bit rubbish," instantaneously comparing that view to the many extraordinarily beautiful views encountered while travelling through the country. Where did this dismissive comment come from? A lack of cultural density in the cultureplace in which these tourists dwelt at the time – a cultureplace that could be described as touristscenery – positioned the meaning of this particular landscape as not scenic. Yet for the couple taking the shot, it might have more meaning and affect. This illustrates how reflexes and feelings are important non-cognitive mediators even in culturally light encounters and how easily, without consideration of alternative cultureplaces and cultural densities, we may be dismissive and partial.

Affect also framed the way in which the 3-year Exmoor Curriculum was valued, making the children feel proud to have that unique opportunity, although positive feelings about it were not universally shared. Cultural density linked to that particular cultureplace clashed with needs in later stages of their lives. In another context, the emplaced joy and wonder noted by the children and teachers in the Natural Connections Demonstration Project were considered instrumental in making an impact on their attitudes toward learning. Creating new outdoor cultureplaces for learning had extended the possibilities for learning to a wider group of students that the cultural density of schooling had sometimes failed.

The reason that recognizing contingent affect and feelings is so important is partly because this underpins care for places though positive individual and communal experiences while enabling a more responsive alignment of place with educational

purposes and pedagogies. Taking into account what a space means to different parties as a place – lived as cultureplaces – helps to build upon previous experiences and funds of knowledge in a fruitful way, but it also provides a lens with which to consider afresh the needs and affordances of the place itself. What multiple cultureplaces occupy this physical space? Which create the greatest cultural density? How does their materiality shape this? How does power flow within and between cultureplaces within this place? This sort of multifaceted analysis requires that we put ourselves in other positions to better understand complex elements within the whole, thus "becoming cultureplace" by dwelling in other cultureplaces: *in place*. Furthermore, it is precisely this empathic ability that offers some hope for rejecting human dominion over nature (Davis et al., 2006; Taylor and Giugni, 2012; Goodenough et al., submitted), if we can recognize that materiality is implicit within cultural density and transformational "becoming cultureplace" must include the more-than-human.

Malone and Waite's (2016: 22) framework for desirable twenty-first century outcomes from outdoor learning includes empathy and care for the human world among five key themes. However, in recognition that educational policy still focuses on the child as the principal unit of analysis for success, this framework seeks to outline student outcomes that will address contemporary concerns. Although this breakdown delineating policy, research, and practice contexts represents a refinement of targeting and alignment in comparison to many previous outdoor learning and education models, further nuance about the detail of local cultureplaces is necessary to translate these themes into effective place-sensitive practices underpinned by appropriate theories of change. What practice contexts will look like and what places will offer appropriate cultural density or lightness to support educational aims will depend on sociocultural and material contingencies (Table 1).

Conclusion

In this chapter we have drawn together complex theorizations of place and childhood to reveal how two particular and complementary theories might be used to help us understand how children and nature are in relationship, with a particular focus on the implications for educational practice. The hope is that these theories may support a deeper engagement with the strategic questions that support planning outdoor learning through acknowledgment of these enmeshed influences – strategic questions that focus on purpose (what? why?), place (where?), pedagogy (how?), and people (who?), as set out in a recent chapter with O'Brien, Ambrose-Oji, Waite, Aronsson and Tighe-Clarke (2016: 54–55).

These strategic questions help to structure our thinking to include the personal, the process, and the place (Scannell and Gifford, 2010), holding them in unity as synthetic, individual, or simple whole (Quay, 2017) and coupling them with clarity about specific aims for taking learning outside the classroom. Concentration of attention on differing cultural densities (Waite, 2013) and the intrapersonal meanings of places for partners (Prout, 2011) within the whole opens up the creative

Table 1 A framework for student outcomes and natural schooling

The policy context What (themes /desired student outcomes)	The research context Why (evidence/research/ literature/theory)	The practice context How (outdoor learning form/ place/ pedagogies/people)
Theme 1: Encouraging healthy bodies and positive lifestyles desired student outcome: *a healthy and happy body and mind*	Role of green restorative theory/ADHD/anxiety/ depression Active bodies/motor skills/physical fitness/ skills development Healthy foods/gardening Outdoor living skills	Experiential learning in natural settings Outdoor education/ learning LOTC Vegetable gardens
Theme 2: Developing social, confident, and connected people Desired student outcome: *a sociable confident person*	Human social relations Independent and critical thinking skills Problem-solving Social development Resilience-building	Problem-based learning Project-based pedagogies Social learning Residential programs
Theme 3: Stimulating self-regulated and creative learning Desired student outcome: *a self-directed creative learner*	Taking responsibility for own learning Self-regulation/self-awareness Self-management, self-efficacy Curiosity/inquiry Creativity	Inquiry learning Self-directed learning "Adventurous" education Play pedagogies Wild free – Nature play Cross-curricular and interdisciplinary learning STEAM outside
Theme 4: Supporting effective contributions and collaboration Desired student outcome: *An effective contributor*	Team building Leadership skills, development Risk assessment/taking calculated risks Innovator/entrepreneur Responsible decision-making, social resilience, collaboration skills	Adventure education Residential programs Problem-based learning Team building Field trips Service learning
Theme 5: Underpinning care and action for others and the environment Desired student outcome: *An active global citizen*	Appreciation of national and natural heritage Understanding issues of globalization, cultural diversity, and sustainable futures Environmental stewardships Volunteerism Empathy/care for more-than-human world Active environmental citizenry Contributing to planetary issues	ESD/EE Geography and science field trips Global education Indigenous studies International studies Animal husbandry Place-based learning

possibilities of cultureplace(s). In this way affective, precognitive, emplaced, and material feelings can make a key contribution to the power of outdoor learning to transform lives.

Abstract

This chapter develops the concept of the "co-research playspace" as a methodological figure for working with children as co-researchers and co-artists. This concept emerged through our collaborative research and artistic co-production with 135 children who participated in the Climate Change and Me project (2014–2017) in Northern NSW, Australia. Drawing on Winnicott's concepts of "transitional space" and "transitional objects" in relation to children's art and environmental play, we locate the co-research playspace within the mesh of

children's playing, theorizing, and researching in the reality of climate change. In developing the concept of the co-research playspace, we specifically focus on the ways that iPads functioned as transitional objects within the Climate Change and Me project. This leads us to further analyze the ways that children used digital video as a "transitional medium" that allowed them to experiment with new forms of co-production and creative resistance. Through our analysis of films produced by children in the project, we outline a series of three political aesthetic modes of response to climate change that break with the predominant moralistic discourse surrounding the issue: (I) critical interventions in public space; (II) wild, absurd, and improvisational disruptions; and (III) the creation of thought experiments and alternative worlds. The chapter concludes with the consideration of "children as para-academic researchers," a concept that emphasizes children's abilities to invent their own modes of co-creation and critical inquiry that disrupt normative research protocols and associated adult expectations.

Introduction

> We find ourselves currently facing a global climatic crisis due to each and every one of us, where each new thing is only admired only for a short time before we establish a new desire; a cycle which repeats continually. We must change our values and what we believe is important to us. This change mustn't only occur in a small minority of the population, but almost all seven billion of the humans whom inhabit Earth. (Nikki Whitehead, age 12, co-researcher in the Climate Change and Me project)

In this chapter, we consider an emerging mesh of interconnections between the reality of climate change, children as co-researchers/artists/theorists, and the affordances of environmental play. The above quote introduces our chapter with a critical and insightful series of comments made by a 12-year-old co-researcher from our project Climate Change and Me (Climate Change and Me, 2014–2017). Nikki's words cut to the heart of the argument that we make throughout this chapter, namely, that children and young people are capable of producing insightful and intellectually rigorous research outputs if given the opportunity to authentically initiate and develop their own critical and creative projects within what we call the "co-research playspace."

Our chapter begins with a discussion of the interpenetrating phenomena of climate change and child-framed research, highlighting the need for innovative and participatory approaches to climate change education that move beyond adult-centered narratives and onto-epistemologies. This leads to a discussion of D.W. Winnicott's (1971) book *Playing and Reality*, focusing on concepts of

"transitional space," the "transitional object," and the "good-enough holding environment." We use these concepts to develop a theoretical understanding of the relational oscillations that occur between children's interior and exterior worlds, focusing on children's play and experimentation as the crux or pivot point for environmental learning and dynamic co-development. We then turn to the Climate Change and Me Project, which involved working with 135 children and young people as co-researchers over a 3-year period in New South Wales (NSW), Australia. We specifically focus on the methodological innovations that emerged through children's improvisational use of iPads to create their own films in response to the issue of climate change. In theorizing the iPad as a transitional object and video as what we call a "transitional medium," we offer insights into children's use of mobile digital technologies as tools for creative experimentation and knowledge co-production. Through our analysis of films produced by children in the project, we outline a series of three political aesthetic modes of response to climate change that break with the predominant moralistic discourse surrounding the issue: (I) critical interventions in public space; (II) wild, absurd, and improvisational disruptions; and (III) the creation of thought experiments and alternative worlds. The chapter concludes with the consideration of "children as para-academic researchers," a concept that emphasizes children's abilities to invent their own modes of co-creation and critical inquiry that break with normative research protocols and associated adult expectations.

The Political Realities of Climate Change

> In my first Inaugural Address, I committed this country to the tireless task of combating climate change and protecting this planet for future generations.
>
> Two weeks ago, in Paris, I said before the world that we needed a strong global agreement to accomplish this goal – an enduring agreement that reduces global carbon pollution and sets the world on a course to a low-carbon future.
>
> A few hours ago, we succeeded. We came together around the strong agreement the world needed. We met the moment. (Obama, 2015, np)

In the above quote taken from Obama's (2015) speech on the Paris Climate Agreement, we note the assured sense of triumph, achievement, and consensus around an "enduring agreement" that will benefit not only the individual nations involved but the entire world. A decade ago, Kevin Rudd (a former Prime Minister of Australia) similarly described climate change as "the great moral challenge of our generation" (2007, np). The impetus for such political statements has been the irrefutable ratification of anthropogenic climate change and its associated impacts on Earth by distinguished scientists worldwide (Intergovernmental Panel on Climate Change, 2001, 2007, 2014). Notwithstanding, the political landscape shifted in 2016 with the election of Donald Trump as President of the United States of America. Trump is an overt climate change denier, and the current political climate has become saturated with Twitter comments such as:

Donald J. Trump @realDonaldTrump 29 Dec 2017 (Trump, 2017)
In the East, it could be the COLDEST New Year's Eve on record. Perhaps we could use a little bit of that good old Global Warming that our Country, but not other countries, was going to pay TRILLIONS OF DOLLARS to protect against. Bundle up!

Donald J. Trump @realDonaldTrump 6 Nov 2012 (Trump, 2010)
The concept of global warming was created by and for the Chinese in order make U.S. manufacturing non-competitive.
13,000 replies 105,014 retweets 67,673 likes

These radically disparate climate change messages have the potential to be confusing and derailing when they are projected onto the public sphere, causing climate change to take on an abstract quality as an amorphous, ideologically driven "issue" rather than a material "reality." With the rise of neoconservative populism and reactionary forms of nationalism in the United States, Australia, and Europe, citizens who feel dispossessed by the moral superiority of neoliberal politicians (such as Obama and Rudd) have been willing to vote and act against their own self-interests and, in the case of climate change, against the interests of the entire world. Indeed, these populist knee-jerk reactions against the identity politics and elitist moral discourses of the Democratic party in the United States have led to the seemingly inconceivable reality of Trump's election and, subsequently, his withdrawal of the United States from the Paris Climate agreement in 2017. Only 2 years after Obama's triumphant proclamation of the Agreement as a moral victory for the entire world, we see the political climate moving in an entirely opposite direction, as disenfranchised populations grasp desperately for any vestige of agency, belonging, and understanding in a "post-truth" world.

By turning climate change into a moral issue, the mass politicization of climate change has also served to overshadow and even negate the realities of those who are (and will be) most affected by environmental catastrophes. While the implication may be that *anyone* can have a moral position on climate change in a "post-truth" political climate, the reality is that only a very small group of privileged individuals actually gain public media attention for their views on the issue. Unfortunately, all of these political and so-called "moral" contortions of climate change have been occurring *at the same time* as the number of climate change refugees (human and more than human) and climate change disaster events have drastically increased. This means that children and young people, one third of the world's population, are grossly overlooked in the moral politicizing of climate change. Children and young people's ideas, beliefs, understandings, and experiences of climate change simply do not matter or count in a post-truth world in which anybody can have an opinion about anything, but only the opinions of the wealthy and powerful actually matter.

The reality is that the impact of the climate change turmoil being forced upon the world's children and young people is immeasurable. While research is inconclusive about children's climate change fears, an Australian study of 10–14-year-olds found that 50% of children were deeply concerned about climate change, while 25% of children were concerned that the world would end in their lifetimes (Tucci, Mitchell & Goddard, 2007). Cutter-Mackenzie, Payne, and Reid (2011) note that children and

young people appear to oscillate between a fear of ecology and an ecology of fear. It is thus widely acknowledged (Kagawa & Selby, 2009; Walker, 2017) that novel forms of climate change education are necessary for and by children and young people worldwide, who are already being forced to come to grips with the ambiguous realities of climate change. Climate change education, however, remains an emergent and under-theorized field that has only recently been considered independently from established fields such as environmental education, science education, and education for sustainable development (Blum, Nazir, Breiting, Goh, & Pedretti, 2013; Læssøe, Schnac, Breiting, & Rolls, 2009). In this chapter and as our body of research in climate change education is evidencing (Cutter-Mackenzie & Rousell, 2018; Rousell & Cutter-Mackenzie, 2015; Rousell, Cutter-Mackenzie, & Foster, 2017), climate change education presents a meaningful platform not only for youth voices but also for a genuine galvanization of children and young people's political agency in the public domain. We now turn to a discussion of children as researchers/theorists in climate change education, before discussing specific theoretical and methodological developments within the context of our research in this area.

Children as Researchers/Theorists

In our systematic review of climate change education research, we found that a very minor contingent of the literature has been orientated toward child-framed approaches to climate change education (Rousell & Cutter-Mackenzie, 2018). Only a small selection of papers could be found which drew on the unique perspectives and experiences of children and young people to inform new frameworks and methods for teaching and learning about climate change (see, e.g., Tanner, 2010; Lawler & Patel, 2012). While the idea of children as researchers or theorists is not necessarily a new concept, the methodological and theoretical potentials of the concept have yet to be thoroughly explored. The concept of "children as researchers" has its roots in participatory research methodologies and the new sociology of childhood movement promoting the active involvement of children and young people in research (Barratt Hacking, Cutter-Mackenzie, & Barrratt, 2013). The concept also coincides with the Convention on the Rights of the Child (UNICEF, 1989) which provoked a renewed consideration of children's rights, with 196 countries currently committed to the convention with the exception of the United States of America. However, it was not until the early 2000s that the extensive development of child-framed research methodologies began to emerge (Bell, 2008; Christensen & James, 2000; Kellett, 2005, 2010; Morrow, 2008; Skelton, 2008). A resounding tenet of child-framed research methodologies has been the positioning of the child as an agential subject rather than a passive object of research. Kellett (2005, p. 2) has argued that children and young people should be "acknowledged as experts on their own lives and if adults genuinely want to understand children and childhood, better ways to seek out child perspective and unlock child voice must be sought." Such calls have seen the development of pupil/student voice, photovoice, and videovoice

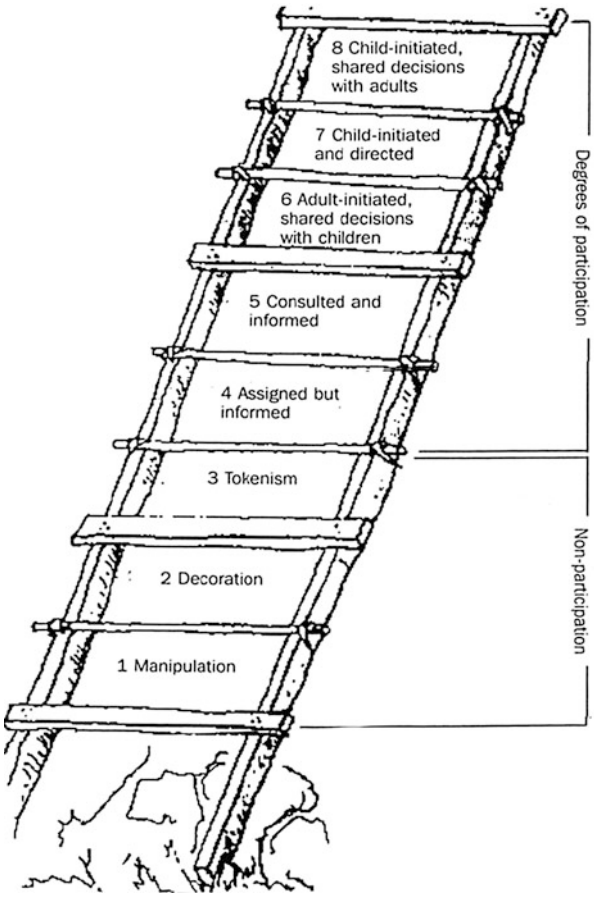

Fig. 1 Hart's ladder of participation (Hart, 1992, p. 8). Image reproduced with permission from the UNCIEF Innocenti Research Centre

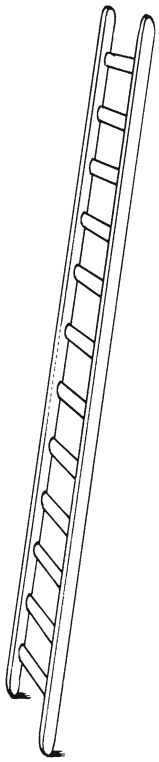
as methods that foreground children's subjective positioning and agencies within the context of social research (Cook-Sather, 2006, 2007; Fielding, 2004).

While there has been a focus on child-framed research methodologies in educational and social research broadly, it has only been in the last decade that researchers working across childhood studies and nature (including environmental education) have actively worked with children as active researchers. For example, in the first international research handbook on environmental education, there were surprisingly few child-focused chapters and none that focused substantially on the arts and creativity. The chapter "Children as Active Researchers: The Potential of Environmental Education Research Involving Children" authored by two of the editors of this handbook (2013) was one of the few exceptions. Barratt Hacking et al. (2013) utilized Hart's (1997) ladder of participation (see Arnstein, 1969) as a way of illustrating varying forms of participation in child-framed research (see Fig. 1) in environmental education.

While we acknowledge the cultural limitations of the ladder of participation, at the time, this model was useful in distinguishing between various degrees of



Children as Active Researchers	*Young people-initiated, shared decisions with adults*	This happens when projects or programs are initiated by young people and decision-making is shared between young people and adults. These projects empower young people while at the same time enabling them to access and learn from the life experience and expertise of adults.
	Young people-initiated and directed	This step is when young people initiate and direct a project or program. Adults are involved only in a supportive role.
	Adult-initiated, shared decisions with young people	Occurs when projects or programs are initiated by adults but the decision-making is shared with the young people.
	Consulted and informed	Happens when young people give advice on projects or programs designed and run by adults. The young people are informed about how their input will be used and the outcomes of the decisions made by adults.
Children as Assigned Researchers	*Assigned but informed*	This is where young people are assigned a specific role and informed about how and why they are being involved.

Fig. 2 Child framed participatory research (Barratt Hacking, Cutter-Mackenzie & Barratt, 2013, p. 442). Image reproduced with permission from Routledge

children's nonparticipation (levels 1–3) and participation (levels 4–8). From levels 1–3, nonparticipation can be defined as manipulation (e.g., pretending research is done by children), decoration (e.g., children used to help strengthen a research agenda), and tokenism (e.g., children are given no or little choice in research). At the higher rungs of the ladder, children's participation gradually increases, with level 8 representing child-initiated participation and shared decision-making with adult researchers. Building on Hart's Ladder of participation, Barratt Hacking et al. (2013) outlined a methodology of "children as active researchers" that detailed further degrees of child participation in participatory research (see Fig. 2). Their focus on fostering children's capacities to initiate and develop their own research practices is a key movement forward in this regard.

Despite these advances, the vast majority of research described as "child-framed" research continues to be adult-initiated and determined predominantly by adult agendas and intellectual framings. With the drudgery of ethics approval processes and impoverished funding conditions, undertaking research that is authentically

child-initiated is inherently risky and incredibly complicated. However, as we discuss later in this chapter, authentically child-initiated research can be made possible through the development of a "co-research playspace" that supports the development of children's own research interests and creative methods of inquiry.

Irrespective of the development of the concept of children as researchers, the concept of children as theorists or children as philosophers has been much slower to develop in depth and rigor. While Soto (2005, p. 2) claims that children make the "best theorists," she/he presents or represents little evidence which demonstrates this claim. Rather there is a reliance on narrative inquiry and children's drawings as a means of interpreting theory (from an adult's perspective). That is not to say though that children cannot theorize – such a notion would be absurd. Rather the potential for children to become theorists has only barely been explored, with the assumption that adults are intellectually superior to children being the limiting factor. This is where play and creativity have the potential to open theoretical doors or windows into childhood, revealing alternative spaces in which children's theoretical acumen is acknowledged. Einstein is often misquoted as saying that "Play is the highest form of research." It was Scarfe (1962) who actually wrote that "The highest form of research is essentially play." What Einstein did say is that "combinatory or associative play seems to be the essential feature in productive thought" (Cited in Scarfe, 1962, p. 120). In the following section, we briefly track the development of children's play as a research focus before exploring Winnicott's theory of environmental play as an oscillation between children's interior and exterior worlds.

Playing, Reality, and Object Relations

Play theory and research are predominantly situated in early childhood education and developmental psychology. Play as a concept or theory has not readily crossed or transcended disciplinary boundaries in other areas of direct relevance, such as child-framed research methodologies and sociologies of childhood. Notwithstanding, Friedrich Froebel (1782–1852) is often portrayed as a seminal theorist in play and is widely known for coining the concept of the "kindergarten" (translation – children's garden). Froebel's ideas still firmly endure in early childhood education, and like other theorists of experiential education (Dewey, 1938, 1956; Vygotsky, 1986, 1997, 2004), Froebel placed deep importance on self-elected activities where adults seldom, yet delicately, intervene in children's play (Wood & Attfield, 2005). Froebel (1967, p. 83) writes that:

> Play is the highest level of child development. It is the spontaneous expression of thought and feeling – an express which his [sic] life requires. This is the meaning of the word play. It is the purest creation of the child's mind as it is also a pattern and copy of the natural life hidden in man [sic] and in all things.

Wood and Attfield (2005) position Froebel, Rousseau, and Dewey as seminal theorists in shifting views of early childhood education with play seen as critical to

children's learning and development. However, these theorists often position the child at the center of learning with the environment as a backdrop, prop, setting, or even a "third teacher" (Dodd-Nufrio, 2011). In backgrounding the environment as the passive context for children's social, physical, and mental development, they have not adequately considered the child and nature as interpenetrating and mutually entangled worlds, or what the editors of this handbook frame as childhoodnature.

To develop a more relational understanding of play that mutually implicates children with the environments they coinhabit with others, we turn to Winnicott's concepts of transitional space and transitional object as developed in his book *Playing and Reality* (1971). Winnicott initially based his theories on observations of infants as they separated from their mothers and began to experiment with the affordances and constraints of their physical environments. Transitional space, as Winnicott describes it, is a spatiotemporal process that puts inner realties and outer realities into relation through playful inquiry and creative experimentation (Ellsworth, 2005, p. 60). Play is central to the concept of transitional space, as it is only through play that the passages and movements between inner and outer worlds can be extended, explored, and sustained:

> Winnicott saw [transitional space] as a relation of an unknowable (to itself as well as to others) mind/brain and body 'interior' to an unknowable and radically other 'exterior', and this transit across the space of difference between inside and outside is transitional because encounters with the 'not me' that one finds there and the actions that we take in response to such encounters change both the inside of the self and the outside of the social environment. He saw the convergence of inner and outer events and qualities that inaugurates transitional space as a *transitional phenomenon* because it happens in time, not only in space. (Ellsworth, 2005, p. 60)

Winnicott (1971) also thought of transitional space as *potential space*, akin to what Deleuze and Guattari (1994) describe as the virtual plane of immanence on which new conceptual territories are formed, navigated, and sustained. The virtual is, in this sense, a dimension of emergence, creation, and potential that is "like a field of energies that have not yet been expended, or a reservoir of potentialities that have not yet been tapped" (Shaviro, 2009, p. 35). Massumi (2002) similarly describes transitional space as the relational *field of emergence* through which an event takes place in the actualization of its virtual potentialities. This brings the notion of transitional space into close proximity with the Spinozan concept of affect as the capacity or potential to affect and be affected, such that "the body coincides with its transitions and its transitioning with its potential" (p. 15).

While these theorists offer a range of different understandings and approaches to the concept of virtual or potential space, they also converge with Winnicott's proposition that transitional space requires some manner of participatory activation for its latent potential to be actualized. In this sense, transitional spaces and phenomena are always potential because "nothing makes them inherently or inevitably transitional" (Ellsworth, 2005, p. 60). While an artist's or a teacher's design may hold within it the possibilities for transitional spaces to emerge, it is only through imaginative, immersive, and playful engagement on the part of the participant that these spaces actually come into being. The pedagogical implication of this, as

Ellsworth (2005, p. 32) notes, is that transitional spaces can be designed *for* but not predetermined or forced into existence:

> [An environment] holds the potential to become transitional space when it provides opportunities for us to both act in the world and be acted upon by it - while at the same time offering us the flexible stability we need to risk allowing ourselves to be changed by this interaction.

The qualities and elements that are conducive to unlocking the potential of transitional space are described by Winnicott (1971) in terms of a *good-enough holding environment*, which combines the immersive sensation of being held as a child with the impetus to venture beyond this security and into the unknown. A quality learning environment or playspace is, in this sense, a space that effectively holds and fosters the possible conditions for transitional experiences to occur, often by surprise and improvisational play. There can be no template or blueprint for what a "good-enough holding environment" or "co-research playspace" should look like. Instead, Winnicott suggests "laying out desired qualities for the design of an environment that will not be complete or realised until and unless its users enter it and find their own uses for it" (Ellsworth, 2005, p. 61). The co-research playspace is thus constructed as a flexible architecture of engagement composed of various materials, ideas, media, technologies, tools, designs, and principles which children can then assemble into new and unforeseen configurations.

These flexible elements in the design of learning environments for transitional space are described by Winnicott (1971, p. 18) as *transitional objects*. Winnicott initially developed the concept to describe the ways that infants use comfort objects such as stuffed animals, blankets, or pacifiers as surrogates for the mother's presence, thus enabling their transitions into new states of becoming through environmental experimentation independent from the mother. The transitional object is also closely connected with Winnicott's concept of play, as he writes that the "immensely exciting. . .thing about playing is always the precariousness of the interplay of personal psychic reality and the experience of control of actual objects" (p. 55). The transitional object, in this sense, offers the affective and physical continuity, stability, and security needed to enter into an experimental, open-ended engagement with the unknown (p. 18). As Ellsworth (2005, p. 60) further explains, "we use transitional objects to imaginatively put ourselves in a transformative relation with the outside." Winnicott's (1971) work on transitional objects is particularly helpful in considering the oscillation between children's inner and outer worlds or realities:

> With his theory of the transitional object, Winnicott jolted all ponders on human nature into a realization of the never-ending oscillation between the *inner* and *outer* worlds. By implication, a state of dependency emerges as continuous in human life, and the environment therefore as continuously important. (Rodman, 2005, cited in Winnicott, 1971, p. xii)

Winnicott's predecessors such as Freud and Klein had overlooked the continuous relation between humans-nature, body-environment, and subject-object as

interpenetrating and mutually conditioning realities. Contemporary theory in early childhood education and childhood studies has only recently considered children's object relations, while social cultural theory (Brooker, Blaise, & Edwards, 2014) and cultural-historical theory (Colliver & Fleer, 2016; Fleer, 2010) continue to dominate minority Western thought on child development and learning. Winnicott's (1971) work is thus considered seminal in theorizing object relations, although Winnicott resisted disciplinary territories and boundaries. One of Winnicott's clearest explanations of object relations appears in the tailpiece of *Playing and Reality*:

> I am proposing that there is a stage in the development of human beings that comes before objectivity and perceptibility. At the theoretical beginning a baby can be said to live in a subjective or conceptual world. The change from the primary state to one in which objective perception is possible is not only a matter of inherent or inherited growth process; it needs in addition an environmental minimum. It belongs to the whole vast theme of the individual travelling from dependence towards independence. (p. 204)

For Winnicott, all humans begin their lives immersed in a subjective and conceptual world, with object-relating always occurring in oscillation with subjective experience as children move toward increased independence and capacitation. This means that the subjective experience of the individual child is not divorced from the objectivity of a shared external environment but, rather, develops through dynamic interactions between interpenetrating milieus of sensibility, objectivity, and subjective experience. Winnicott's relational and dynamic notion of the playspace as a developmental system suggests that all learning is predicated on transitions *through* the environment as a meshwork of relations that is the very condition for life itself. The playspace becomes a milieu that exists both inside and outside of the body as a relational field of emergence, a space of co-composition that is always already inhabited by multiple others.

This is where Winnicott's (1971) concept of the "creative impulse" in conjunction with play affords the children the "freedom" to creatively explore and learn through the environments they coinhabit with others. We would like to consider and problematize the concept of the "creative impulse" (p. 92) in the context of children's "co-research playspaces" in/as nature. Winnicott argued that learning takes place through creative modes of engagement and experimentation that put internal and external worlds into transformative relation. As Ellsworth (2005, p. 30) further explains, such transformations only become possible when children "dare to move into relation with the outside world of things, other people, environments, and events." This relational understanding of the learning process means that transitional spaces open up when children feel confident enough to creatively experiment with their environments independently from pre-existing authority figures and social structures. It is our contention that Winnicott's concepts can inform child-framed research by supporting the development of "co-research playspaces" which foster the development of children's potentials as researchers, artists, writers, and theorists. We now turn to the project Climate Change and Me where we placed the aforementioned theoretical concepts into practice.

Climate Change and Me

The Climate Change and Me (Climate Change and Me) project was funded by the NSW (New South Wales, Australia) Environmental Trust, which is an independent statutory body established by the NSW government to fund a broad range of organizations to undertake projects that enhance the environment of NSW. Working toward the NSW 2021 goals, the Climate Change and Me project aimed to strengthen local environments and communities by increasing opportunities for children and young people to be proactive in climate change education research. The core audience of the Climate Change and Me program were children and young people aged 9–14 in Northern regional NSW. This audience was selected because children are often targeted but rarely consulted as legitimate contributors to educational research and curriculum development (Kellett, 2005). The project was thus unique by providing an open platform for children and young people to engage directly in climate change debates and indeed their associated climate change education. The project specifically engaged children as co-researchers through a creative, socially engaged, and action-driven process of co-production. This process resulted in the development of an online social media platform and network; the Past Now Future community exhibitions in public spaces; an interdisciplinary Climate Change Curriculum; and the Climate Change Challenge, a community event which brought together local schools, climate scientists, environmental artists and writers, and members of the wider community to address the challenges of climate change (see Fig. 3).

Each of these research phases was contextualized within the overarching child-framed arts-based methodology developed by Cutter-Mackenzie and Rousell (2018). The Climate Change and Me project allowed for previous frameworks of child-framed research to be extended into the areas of arts-based research (Barone, 2006; Barone & Eisner, 2012) and research-creation (Manning & Massumi, 2014). Crucially, this extension of the methodology was driven by the children and young people themselves who participated as co-researchers and co-artists in the study. While the children were initially trained in ethnographic interview techniques and visual methods, we also supported them in extending their inquiries through creative practices of their own choosing. These extensions of the methodology through the children's poetry, fiction, drawing, and dramatic works were then brought back into the workshops to stimulate collective responses from the wider research cohort, thus forming the basis for the final bodies of work assembled for the Past Now Future exhibitions. The analytic and curatorial work undertaken for the exhibitions then laid the groundwork and offered key resources for the development of the *Climate Change and Me Curriculum*, which has since been piloted and evaluated in schools across NSW. Through this emergent process of co-production, we deliberately allowed for the creative practices and theorizations of the children to dynamically impact on the methodology itself as it was unfolding in real time.

A unique contribution of this research to the development of child-framed methodologies has been the construction of what we have termed the "co-research playspace" (Cutter-Mackenzie & Rousell, 2014), in which children and young people developed the skills, experience, and support needed to produce legitimate research

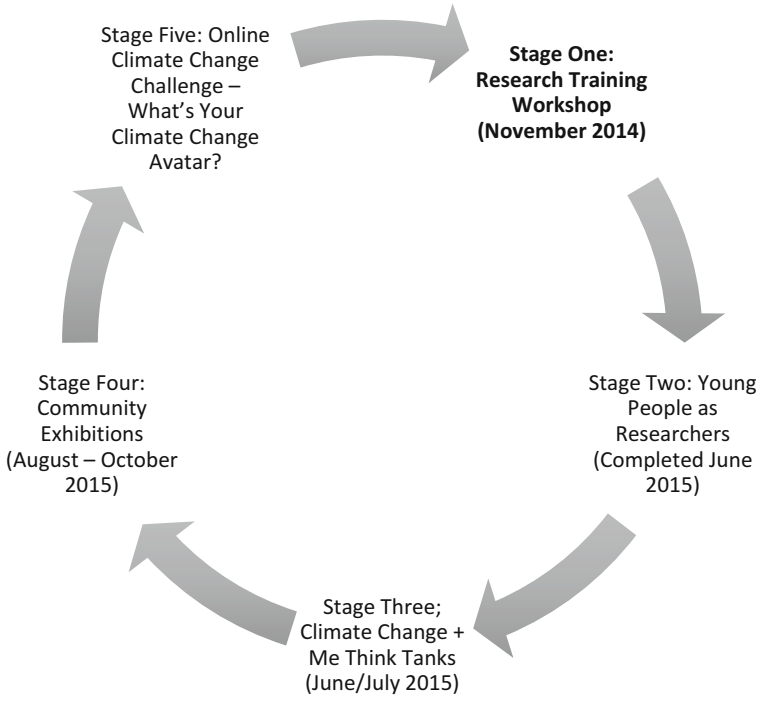


Fig. 3 Five key phases of Climate Change and Me (CC+Me) project

outputs to a rigorous standard of conceptualization and aesthetic quality. This notion directly informed our workshop, website, and exhibition designs as "co-research playspaces" which afforded the flexible stability the children needed to take risks in the development of their own research practices. In this way, the children were supported in developing their own approaches to the project that often exceeded or broke with our own expectations, and these emergent, child-driven practices were then allowed to impact on the overall methodological trajectory of the project itself. This was particularly evident in the curatorial analysis of the research data, as undertaken in collaboration with children and young people in the preparation of the Past Now Future exhibition. The following section focuses on the co-production of three video artworks and develops the concept of video as a "transitional medium" that opened up a co-researcher playspace for children and young people to develop performative, creative, and political aesthetic responses to climate change.

Video as Transitional Medium

The Past Now Future exhibition took place over a 3-month period in 2015 and was presented at eight public libraries in communities across Northern NSW. The exhibition was viewed by over 10,000 members of the public and was also

documented by local newspapers and on Australian Broadcasting Commission (ABC) National Radio through interviews with several of the young researchers. The exhibitions presented the culmination of 18 months of fieldwork by the 135 participating co-researchers. All aspects of the exhibitions were developed collaboratively with the children, including the curation, titling, artist statements, promotional materials, and installation design (Rousell & Cutter-Mackenzie, 2015). While we have discussed children's speculative fiction (Rousell et al., 2017) and photographic practices (Rousell & Cutter-Mackenzie, this Handbook) from the project elsewhere, we focus here on children's co-production of digital video works using iPads. These films were collectively analyzed and curated to form an interactive artwork entitled "Voices from the Anthropocene," a key component of the Past Now Future exhibition.

During the primary research stage of the project, children and young people used iPads as mobile recording devices to create their own responses to climate change in their schools, homes, and extended communities. A number of children chose to conduct interviews with their peers, parents, siblings, and teachers, many of which revealed a rich diversity of cultural responses and understandings of climate change in the children's local communities. Other co-researchers were inspired to use the iPads in more artistic and provocative ways, resulting in a wide variety of video works that included interviews with trees, improvisational forest romps, upside-down political discussions, an imaginary tea party, and a future world populated by digital avatars and virtual environments. We encouraged this playful "misuse" of the iPads for creative purposes that often broke with the traditional conventions of qualitative research and, in some cases, abandoned common appeals to rationality, discourse, and sensemaking. These odd video creations came to form a fascinating contrast with the more disciplined ethnographic interviews conducted by the children, generating a rich pattern of audiovisual textures and political aesthetic sensibilities. We found that these videos often revealed what children might think, say, or do when no adults were present to supervise them or interfere with their ideas and activities. In this sense, the iPad acted as a transitional object that enabled children to venture into new territories of thinking and action, creating both a mirror (opacity) and a window (transparency) into children's worlds at the same time. The children's use of the iPads gave us a window into their co-research imaginaries and playspaces, the results of which oscillated between what might be considered "childish and playful," "artistic," "inquisitive," "culturally revealing" and "deeply profound."

As we continue to think more about the ways that children were compelled to use the iPads as research devices, the concept of digital video as a "transitional medium" also comes to the fore. The iPad is a device that mobilizes the medium of video in a particular way, since the screen is large enough to create an immersive interface that co-implicates the body of the child with the surrounding environment. Children are able to see what is being filmed as they move and interact dynamically with the environment, thus allowing them to modulate the medium of video in ways that are performative, unpredictable, and impulsive. The screen becomes both the recording surface and the surface of projection for collective engagement through environmental play, bringing the "audience" of

the film into direct contact with the process of co-production. In other words, the film is being "produced" and "viewed" at the same time, adding a sense of hyper-awareness as well as a public intimacy that is specific to the medium being employed. The medium of digital video, as operationalized through the iPad, thus becomes transitional in its capacity to put children's creative impulses and dynamic social milieus into transformative relation with a shared environmental outside, as well as an "audience" that is immanent to the production of the film itself.

In many ways, the experimental videos produced by children in the Climate Change and Me project are more closely aligned with video art than the conventions of naturalistic observation and ethnographic documentary cinema. Children's experimental and playful usages of video as a transformative medium also break with the traditional conventions of video methodologies in qualitative educational research. As de Freitas (2016) notes, such conventions are tied to the history of scientific film and the vagaries of visual documentation as truthful and accurate representations of empirical phenomena. Rather than documenting and analyzing children in films as cultural representations or scientific evidence, we are interested in how *children actually produce films* by using video as a transitional medium that enables them to think and interact in novel ways. By focusing on children's co-productive engagement with video as a transitional medium, we acknowledge that *we still do not know what children can do*. What happens when we give kids iPads and ask them to go out and make films exploring the ways that climate change is affecting their lives? What happens when we bring those films back in, analyze them together, and ask kids to make different films in response to what other children have produced? These are the kinds of open-ended questions and experimental approaches that we pursued in the development of digital video as a transitional medium for climate change education research.

In the following vignettes, we discuss a series of three examples of experimental video works produced by children in the Climate Change and Me project. Each example provides a brief window into children's environmental thinking, imagination, and play in response to the question of how climate change is affecting their lives, communities, and environments. The first focuses on children's sense of invisibility and a dehumanizing lack of agency in relation to climate change; the second foregrounds the improvisational, animalistic, and often irrational nature of children's "wild" environmental play; and the third addresses children's experimental use of digital video to generate a dystopian virtual world.

Becoming Invisible

This film emerged from a discussion between three girls in a year 5 class regarding their feelings of invisibility, disconnection, and lack of political agency in relation to climate change (see Fig. 4). While they felt that children's experiences and perceptions of climate change were not being valued or acknowledge by adults, they also noted a sense of complicity in children's contribution to climate change. They began

Fig. 4 Becoming Invisible

to discuss children's lack of understanding and desire to know more about climate change, as well the need for children to actively change their own habitual practices and patterns of thought. As the girls were developing various ideas for creating a film

that would embody and articulate these discussions, they found a collection of gold and silver masks in the storage room adjoining the classroom. They decided to use the masks to conceal their faces and identities in the film, emphasizing the invisible and unknown qualities of children's voices. As they began to play with the possibilities of using the masks, they decided to create a series of written signs that could be used to articulate their questions about children's relationship to climate change. They devised a cascading series of questions, which began with the phrase "Climate Change and Children..." and then proceeded with "Do they know? Do they care? How can we teach them? How can we change ourselves?" These open-ended questions ended up forming a discursive structure for a performative and environmentally responsive series of actions which comprised the resulting film.

After inviting another student to serve as video operator, the three girls arranged themselves in a line facing the camera with a garden area behind them. As the film progresses, the girls take turns moving into the front position of the line as each piece of text is revealed sequentially. This movement begins sporadically but slowly takes on a peculiar and often uncomfortable rhythm, as the stops, starts, and misshapen notes of the school band's practice begin to infect the performative event taking shape. In the resulting film, the children appear faceless and dehumanized while their bodies and their questions move in and out of synch with a "found" soundtrack. These disjunctive spaces between the sounds and images embedded in the film produce a surreal quality, as the girls' original idea for the film as a social intervention becomes warped by the sound field of everyday school events occurring beyond the frame of the camera.

Wild Play

In this second example, a group of 3 year 5 girls take an iPad into a forested area of the school without any initial planning or preparation (see Fig. 5). The resulting film unfolds completely spontaneously, beginning with one girl running madly through the forest and crashing into another girl who ends up falling into the bushes and then scrambling on hands and knees along the ground. This initial scene of outright silliness sets the tone for a series of playful and often ridiculous interactions between the girls and the surrounding environment. There is an intoxicating quality to this series of behaviors, as the silliness is pushed to increasing degrees of intensity over the course of 2 minutes. There is also a consistent sense of wildness and animalistic behavior that infuses this film, as the girls continuously use their bodies to explore their relationships with climate change in strange and unexpected ways.

Following the opening sequence of playful encounter and excitation, the girls sit down on the ground and begin to develop a call-and-response chant, riffing off rhythmic variations of the phrase "what do ya think about climate change?" This chant is accompanied by a series of improvised dance moves, with each girl again responding to the other in a call-and-response formation. At a certain point in these choreographic interactions, one girl places her hand into a hole between the roots of a nearby tree. When she pulls her hand out, both girls are amazed to find that she has withdrawn a shard of glass that was hidden in this little hole. This piece of glass then

Fig. 5 Wild Play

becomes the impetus for a series of unusual performative gestures, including demonstrations of the shard's ability to leave visible scratch marks on the skin of one girl's arm. This is followed by another crude demonstration of what would happen if somebody sat on the shard of glass, complete with hand gestures suggesting the penetration of one object into another. Throughout this sequence, the girls display a range of intense and dramatically charged facial expressions which are often addressed directly to the camera, as well as to each other. After some loose discussion of the shard's relevance to the hidden dangers of climate change and humanity's impact on the Earth's geologic strata, the film finishes with a spasmodic

gesture in which one of the girls throws the shard directly toward the camera, narrowly missing the camera operator whose face suddenly appears in stark surprise. At this point, the girls collapse onto each other in compulsive fits of laughter and uncontrollable hilarity.

After Earth

Our third example is a film produced by two girls in year 7, who had previously produced a number of insightful and engaging films commenting on the effects of climate change on such mundane practices as doing homework, playing video games, and making dinner (see Fig. 6). With this film, they developed an innovative idea that involved the creation of a dystopian future world comprised of digital avatars and virtual environments. To produce this film, the girls negotiated access to a nearby section of rainforest during lunchtime, an area that students were not normally allowed to visit. Working from a basic sketch of possible camera shots and action sequences, the girls proceeded to experiment iteratively with the affordances of the digital video format. The initial opening sequence of the film involved placing fingers over the camera lens of the iPad to produce an orange-red effect that gradually resolves into a scene: the motionless figure of a girl standing at the top of a staircase with a vacant expression, as shot from below. This figure becomes the protagonist of the film, a girl who realizes that she exists as a digital avatar of her former self and that she inhabits a virtual environment that is disintegrating around her. Her doll-like expressions bring the figure to life without dialogue, as she appears unable to speak amidst the horrific discovery of her digitally encapsulated existence. By shooting into the afternoon sun, the girls used refractive light and lens flares to add a surreal quality to their shots. They also developed a special technique of wobbling the iPad in order to suggest the idea of a virtual environment that is malfunctioning and eventually shutting down.

One of the fascinating aspects of this film is the girls' ability to produce the feeling of an artificial world and virtual existence without any spoken words, dialogue, or prompts. The story is told entirely by the physical movements and expressions of the female protagonist, who becomes not so much a character (in the conventional sense of a human subject) as a *body* that suddenly finds itself inhabiting an environment that is both toxic and strange. Her movements and facial expressions also suggest the birth or awakening of an artificial intelligence, perhaps a digital version of her original personality, whose initial interactions with the surrounding environment lead to a destabilization of the system. Interestingly, we find the protagonist consistently peering directly into the camera's lens, as if searching the depths of the digital medium and indeed its implicit audience, for some sense of who (and where) she might be. The film concludes with her stricken expression of desperation as she falls to the ground and perishes, due to a virtual environment that is too unstable to support sentient life.

Fig. 6 After Earth

Conclusion: Children as Para-Academic Researchers

The three films described in the vignettes above reveal the ways that children used video as a transitional medium for creative experimentation and environmental play. In considering these films in relation to the "post-truth" political climate described in the chapter's opening section, we can see how each film provides an alternative response to climate change through aesthetic engagement rather than through moral discourse or personal opinion (or "doxa"). The three alternative responses developed by these children also link more broadly to three alternative political aesthetic projects. The first vignette entitled "Becoming Invisible" takes shape as a critical and discursive questioning of children's visibility, agency, and voice in relation to climate change. This film was planned and performed as a critical intervention into the everyday social practices of schooling, an approach that connects with critical art movements associated with political activism and social and environmental justice. The second vignette breaks significantly with the first, as "Wild Play" involves a series of absurd, playful, and animalistic impulses that are entirely improvised and not intended to be serious responses to the issue of climate change. The second vignette thus connects more clearly to comedic and performance art projects which employ shocking and/or absurd methods which abandon rational discourse and social critique in the face of an unsolvable problem. The third vignette, "After Earth," presents an entirely different alternative by engaging seriously with play as a multisensory thought experiment that doesn't rely on language. This vignette connects with the experimental use of art, film, digital media, and performance as modalities for creating alternative worlds that provoke viewers to sense, think, and feel the world differently.

In all three of the examples explored in this chapter, children's digital filmmaking practices are shown to operate through an aesthetic politics of experimentation which is very different from the moralistic, populist, and identity-driven politicization of climate change in today's post-truth world. In closing, we would like to suggest that such aesthetic-political practices become possible within a co-research playspace that affords the flexible stability that children need to take creative risks and break with adult expectations. Rather than training children to think and work like conventional "academic" researchers, we would like to propose a co-research playspace that fosters children's development as "para-academic researchers" who actively disrupt the conventions of academic research. With this proposition, we associate the term "para-academic" with the work of artists, filmmakers, performers, musicians, designers, and other critical and creative practitioners who generate collective thought experiments and develop alternative ways of thinking and making the world. In this sense, we see children becoming para-academic researchers when they refuse to comply with a normative research protocol and associated adult expectations and instead invent their own modes of co-creation and critical inquiry. When children break with adult expectations, they show us something that we would never have been able to experience or understand otherwise. It is in those moments of noncompliance that children show us how to think

and do things differently, reconfiguring concepts and practices in response to the critical crises and transformations of climate change. It is only through such imageries that we may begin to conceive of a post-Anthropocene world.

Childhoodnature Research Methodologies

Post-critical Framing of Methodological Inquiry and Childhoodnature

Abstract

This section of the Handbook challenges the research communities of inquirers in areas of childhoodnature to critically engage what amounts to postqualitative, posthumanist re-imaginings of what counts within social science. We encourage authors to think and do research differently. This means re-engaging theories as we re-engage praxis. We looked for environmental educators grounded in rethinking humanist ontologies, as threats of climate change become immanent and threats to research quality demand deeper engagements with theory beyond levels of method and methodology. Each of the authors in this Section challenges environmental educators, particularly those in childhoodnature alignments, to rethink humanist ontology and humanist qualitative methodologies, to consider repositioning their conceptual/practical underpinnings, and to generate new questions in new ways, beyond the status quo. We believe, along with the authors of this Section, that opening up to posthumanisms that confront the everyday habits of traditional living and traditional scholarship is no longer optional if we expect young and old alike "to want to" see the world differently, however unsettling that may be for researchers who risk seeing themselves being seen.

Introduction, Purposes, Processes, and Limits

(New) materialisms, realisms, empiricisms, posthumanisms, feminisms, indigeneities, rhizo- and schizoanalyses, diffractions, transgressive practices, and becomings abound in theory! Meanwhile, children's access to open spaces, experiences of outdoor environments, and "connections" with nature are declining as fast indoor "screen cultures" and slow exposure to numerous environmental toxifications and associated health problems are intensifying in childhood becomings!

Our call for proposals for this section of the *Research Handbook on Childhoodnature* challenged prospective authors to continue to open up their inquiries into methodology in respect of the concept and practices of the neologism "childhoodnature." We originally conceptualized the framing of "methodological inquiry" to include chapters drawn from across a spectrum of established perspectives in early years education (EYE) and environmental education (EE) research. However, recent trends in methodological thought in education and dramatic turns in Western theory and philosophy, coupled with accelerating environmental and social problems layered into children's everyday lives, demanded different perspectives of how to address emergent issues relevant to childhood studies and cultures *in*, or *of*, or *with*, or *and*, or *as "*nature" and its culturally derived and constructed environments.

We searched for authors whose previous works engaged with or crossed over different perspectives, descriptions, explanations, and discoveries in methodological development and critique and moved creatively to identifying authors already engaged in *post*-methodologies that challenge conventional research perspectives and practices in early childhood, environmental education, and ecological sustainability. The aim? To *reconceptualize*, reinvent, and *experiment* with our inquiry and critique of methodology, as well as our commitments and praxis where research must now focus on increasingly serious questions about the educative and pedagogical childhood "nature" of nature–environment and culture–human interactions, actions, and relations.

We set ourselves the impossible task of creating conditions for performing authors to work within highly contemporary but still nascent "assemblages" of methodological inquiries concerning the elusive, ambiguous, or contestable notion of childhood, its invention, and associated historical and cultural changes in selfhood (for example, Simms, 2008). Indeed, we were fully aware of the limits of what a dedicated section of a handbook could adequately convey about the challenges of methodological inquiry while recognizing the various limitations of what each chapter in this section of the handbook can say about "new" childhoodnature (Hart, 2013; Reid & Payne, 2013). We recognize that these challenges are exacerbated amidst an explosive "movement in (Western) 'thought'" following the belated acknowledgement of the planetary Anthropocene and how, now, it is locally and globally reshaping orthodox views of education, early years, and environmental/sustainability discourses. Methodologists, among curriculum theorists, policy

makers, reflective pedagogues, and committed practitioners, currently find themselves (re)searching within a tsunami of thought waves and theoretical "turns" generated by any number of global ecological crises currently visible in, for example, pandemics, ocean acidification, global heating and climate destabilization, food, and housing insecurities. Where does this crisis leave childhoodnatures and their environments and social ecologies of selfhoods and the family household, neighborhood, schools, and other relational organizers and arrangements?

To be sure, authors in this section illustrate how traditional research has recently been challenged in theory and in practice, how working theoretical concepts have changed, as are views of childhood and, even, its "posthuman" version (for example, Kennedy & Bahler, 2016). These numerous turns and twists in theory, and implications for research, and various educational practices can no longer be avoided in any research concerning childhoodnatures that seeks to interpret, explain, and challenge the status quo of education that, arguably, is complicit in the anthropogenic problems that now need to be confronted. Beyond the implosion of allegedly new theory, we confront the implied realities of never before experienced planetary issues in, for example, appropriate "interventions" in early childhood education and, consequently, the reconstruction of possible solutions to the unsustainable and accelerating environmental health problems of young children and their "development." "Thought" of in this "other" way, we searched for authors whose current research engaged the dual edged sword of engaging "new" theory turns, as well as "old" and everyday practical problems that collide here in the emergence of "new" or "post" methodological inquiry. Authors in this section are those whose recent work already contests the taken-for-granted and challenges established orthodoxies in children's/early years research.

In our introduction to their diverse yet similarly oriented research, we align with methodology section authors in recognizing that contemporary theory, practice, and methodological problems are, often, "out of step." Our conceptualizations of inquiry often "miss" some "real" problems confronting children's lives and, therefore, what we assume to be childhoodnature. Rarely considered, for example, are compelling questions of time and temporality in children's (and researchers') lives and the associated *timeliness* of methodological inquiry and critique into the (rapidly) changing "natures" of *body~time~space* relationalities in "fast," or Dromospherical childhoodnature in the Anthropocene (Payne, 2017). But time in the postmodern now/instant has different dimensions that once conceptualized in and with childhood might help open us to consider how methodological inquiries might deal critically with the passage from childhood to adulthood thus foregrounding how next generations will "inter" and "cross" generationally inherit the educational legacies of what today's researchers do, or don't do. Within the limitations of an "experimental" section of the handbook, therefore, our framing needed to be more deeply time-and-space alert to the embodied intergenerational question of "passed on" affectivities, ethics, and politics in research and methodological inquiry, reiterating how the rapidly accelerating "speed" of the Dromosphere penetrates children's lives that we now collectively share in driving the Anthropocene and responding to their powerful consequences.

"Turns" in theory? Practical (environmental and social) issues and problems embodied in the time-space ecologies of children's and researchers' lives? Methodological inquiry as an intergenerational critical reflexivity? The challenge of our task

can be found in the bewildering myriad of "post-anthropocene" turns that constitute major movements in (Western) thought in the face of the seeming complicity of "traditional" modern and postmodern thought habits and patterns in reconstituting the "intellectual" foundations of the problem of the Anthropocene/Dromosphere in, at least, early years education. So, we attempt here to create openings for new thinking in areas of speculative realism and empiricism, new materialism, critical realism, radical materialism, ecophenomenology, post-critical, ecohuman, feminist and eco-feminist, nonhuman, posthuman, corporeal, sensuous/affective, animal, interspecies, temporal–spatial, environmental history, ecoimaginations, and so on. Each turn in contemporary theory illustrated in the preceding section of the handbook has its own internal variations and differences, or "twists" that the astute methodologist now needs to identify and explore – a task well beyond what can be achieved here but, at least, glimpsed partially in the following chapters and in this introduction.

Given the impossibility of a comprehensive assemblage of crucial methodological controversies and issues, we looked for "moods" in methodological inquiry that seemed to be emerging from the current movement of Western thought and were suggestive of the potential for methodological inquiry to illuminate the vexed question of the concept of childhoodnature. We identified gaps that demand ongoing development. For example, it proved very difficult to track down a historian of methodological inquiry in early years education and/or childhood studies whose history incorporated the role and/or places of Nature. There remains a compelling need to historicize and map how early years/children's research has, or has not, successfully, conceptually, and/or empirically navigated the terrain of children's Nature-Culture relations, and how they are grounded existentially or empirically and/or conceptually in their human–environment actions, interactions, and agencies.

Alert to the silences, gaps, limits, and limitations of section "Positions" in particular, and the handbook more generally, in the early phases of framing this section and recruiting chapter authors, we also encouraged other section editors to be attentive to possible connections of theory and practice, and methodological outlines and issues, in the chapters and authors with whom those editors were working. In doing so, our aim was to foreground how more recent "reconceptualist" thinking and praxis might precipitate a greater breadth and scope of inquiry in the different contexts and purposes of each section of the handbook. Perhaps, given these caveats concerning the broader movement of "post" Anthropocene/Dromosphere thought, the childhoodnature focus of these accounts illustrate ways that methodological inquiry can continue to build needed conceptual and/or empirical bridges between "new" theoretical turns and practical problems/questions concerning children/hood *and, in, with, for, against* environments/nature.

Positions

Having outlined how we approached the framing of this part of the childhoodnature puzzle, we admit to viewing methodologies and inquiry into them somewhat skeptically and speculatively given their history in other fields of the social sciences, arts,

and humanities. We are far less ambivalent, however, about how researchers need to make clear how they "position" themselves as "subjects" in the closely associated "re"-positioning of their methodological inquiries. We anticipated, if not expected, that each contributor needed to address the researcher-researched, and subject-object relationships, represented in and by their chapter according to the elusive notion (and practices) of childhoodnature. We acknowledged how each researcher is engaged in widely variable contexts in which research, or pedagogy, or curriculum occurs. And we speculate that how we conceive and construct childhoodnature inevitably returns to methodological questions about the childcentrism and adultcentrism, or in-between, positioning of the situated inquirer/researcher across anthro- and ecocentrisms. *Repositioning* the researcher-researched knowingly, and unknowingly, in these and other "isms" is a formidable challenge for methodological inquirers and critical research, complicated by assumptions made about childhoodnature and the "nature" of the practical problems targeted.

Some cautions. There also can be no doubt that the "moves" afoot that "turn" and "twist" our thinking are simultaneously intriguing, exciting, seductive, daunting, and compelling – newer views and languages/namings of theory, methods, problems! – all gathering momentum and intensity in methodological inquiry. These movements raise perplexing questions about, for example, how the researcher positions her/himself in issues concerning subjectivity and objectivity, constructivism, and interpretivism, the (non)representational, the (non)correspondence, the (im)material, the (in)corporeal), and, even, the "new" idea of plurinatures. These questions for the methodologist, cum philosopher, cum practitioner, drill down on what is, or can be, *accessed* and *presenced* and *absenced*, or reassembled and bundled into a handbook section, a handbook, and more personally/professionally, a program of research via the methodological inquiries and critiques now available.

But maybe we move too fast here. Let's pause for a moment and, again, attempt the impossible. What does the post-anthropocene/dromosphere movement of thought turn our attention to? In different ways, in different languages, in different histories, in different contexts, with different purposes, new theory tends to converge around some "old" principles and practices. At the risk of simplifying the historically complex, methodological inquirers are confronted with deliberating about a new "politics" of the otherwise "old" quad in the social sciences of ontology, epistemology, axiology, and methodology. More precisely, we acknowledge the new problematic of the need for researchers and methodologists (and indeed practitioners) to "grapple" aesthetically, ethically, and politically with their messy interactions and relations. For example, does inquiry start with a practical problem of children, or childhoodnature? Or does it start with a clarification of the ontological presuppositions about both the subjects and objects of the research? Maybe the starting point is the epistemologies of the subject and/or the object? Or, just maybe, its being relatively clear headed about the tensions of ontology and epistemology, seen through the prisms of axiology before we get to the equally perplexing questions about methodological inquiry and deliberation. And, it seems to us in the position we adopt here, that the methodological inquirer also needs to grapple with how the aforementioned tensions of researcher-researched, and subject-object, and their

centering-decentring are engaged. All of the contributors to this section grapple in some way with these dilemmas – some openly, others are much harder to discern, and, hence, we recommend very careful reading to "flush" or "flesh" out how our authors are positioned in their methodological inquiry and how, subsequently, they position the research undertaken and represented. We return, again and again, to how much "new" theory returns us to the dilemma of how researchers methodologically *access* (partially) that which they do or do not seek to "re"present – historically, materially, really, and textually/symbolically.

Can we reposition? Maybe, do we need to? In early childhood education and its natures, we are working at a crucial time in the human construction of worldview and values that, once consolidated, become very difficult to change (Bronfenbrenner, 1979). Focusing on childhoodnature, in the currency of the now, signifies a process of evolution from taken-for-granted Western views of nature and the human, and self, and social, and ecological. This process, as far as we can tell in the still nascent responses to the post-Anthropocene/Dromosphere movement of thought is cautious of a somewhat premature privileging of the posthuman and new materialist lenses that might help us think of nature and culture as somehow mangled together as the realization of the agency of matter is intertwined with human agency (Hekman, 2010). But, we might ask of the positionings in methodological deliberations of both the researcher and researched, of what importance or relevance is the deconstruction of dualisms and collapsing of, or conflation, of nature and culture? Some of the following chapters are positioned to generate thinking that is critically aware of where we think we are going. For example, the now popular ideas of posthumanism, notwithstanding conceptual variations internal to that term and, therefore, carrying different practical implications for methodology, uses this perspective of thinking within, against, and beyond theory to inquire into young people's experiences without resorting to reified notions of nature. Elsewhere, in the related literature, Alaimo and Hekman (2008) use the term "bodily nature" to express these notions as materialities of nature/post-nature. Subsequently, authors like Quinn (2013) mangle nature-culture beyond the binary as a new philosophical approach – a philosophy of the outside (a worldview) – to ground studies and advance understanding of outdoor learning, particularly in early childhood education (ECE) where children's values are constructed.

On the "other" hand, in this section, there are critics of the posthuman turn while others encourage a "re"human positioning in methodological inquiry. Different theoretical orientations assert the need for a sort of re-humanization of a still de-centring researcher-researched relationship. Kirsi Kallio's critical materialist orientation emphasizes a geosocial and topologically inspired formulation of methodology. Her primary aim is to access the often muted question of the political and socio-ecological nature of children's everyday experiences and agencies. Kallio's methodological inquiry addresses debates in human geography about "scale" and relationality of scales regarding political subjectivity, topological polis, and the political status of subjectively experienced, socially shared, and spatially organized dimensions of children's and youth's lives.

Anna Vladimirova and Pauliina Rautio insist that their "more" adultcentric "curious methodology" (cased in a nature school) within an ethological and

semiotically inspired approach to ecological inquiry must be unplanned and escape preconceived research frameworks and the instrumental use of methods. Such preconceptions, they assert, effectively lead to a misrepresentation of the relational and dynamic nature of the re-centred agential relations between animated humans/children and non or more-than-humans beings and things.

Deborah Moore's research into children's environmental experience in nature extends Clandinin & Connelly's classical contributions to the methodology of narrative inquiry. Moore's epistemologically driven emphasis on children's "revisiting" and re-telling of stories about imaginative play spaces in nature and secretive experiences in local environments also returns the locus of methodological inquiry to the material settings and physical-symbolic unfolding of the (em)bodied time-space relationalities "felt" "phenomenologically" (and partially glimpsing of an ontology of the everyday) by children (and the empathic researcher, like Vladimirova & Rautio's curious methodology) grounding those ecological experiences, memorying, and their restorying.

In Diana Masny's chapter, methodology has been reconceptualized as a rhizomatic process that intentionally interrupts linear research processes of interpreting and coding that ascribe meaning. She asks how we might rethink reading in the early years – from a focus on meaning to what reading does, intensively and immanently. This involves letting go of our preconceptions about the dominant epistemologies of reading as we might shift focus from teacher caring to "affect" – playing with this newer concept as a working process. This is a conceptual shift for EC educators who think edu-care is how affect might deepen thinking ontologically, that is, in terms of teacher "becomings." What constitutes a text in reading or science or environmental education can be thought of in terms of discourse actualized as belief systems about how the world works. Becoming literate is a process by which environmental literacies are produced with complex assemblages of affects and resonances. In terms of early childhood educators, these ways of thinking research challenge EE discourse as multiple literacies theory.

We view Masny's chapter itself as a rhizome with several entry points and an invitation to inquire – to experiment within a relationality of affect that transforms the research assemblage by decentring the human as interpreter in favor of one who maps what is going on within assemblages. Masny's examples, which ground theory in practice, like Moore in children's secret outdoor play spaces, expose how concepts and lived experiences like affect have been silenced in conventional research practices as have children's bodies and environmental issues by economic and ideological forces. It is a refocusing of inquiry that centers on how people might live.

Effectively, this never ending list of questions bear directly and indirectly on how we come to construct research in terms of how we conceive and come to construct ourselves as researchers in relation to the researched – what we think and do in relation to the rest of the world, whether proximal or distant as a political problem of scale and relationalities (▶ Chap. 18, "Exploring Space and Politics with Children: A Geosocial Methodological Approach to Studying Experiential Worlds"). Given what appears to be a lack of progress in closely related fields of EE and its research

and related areas of early childhood environmental education, it is time to change the game plan.

Environmental educators might want to attend to early years-based speculative realists such as Anne Reintertsen who have written about creating new ontologisations of sustainable childhood(s) through writings as thought experiments with very practical implications. She views writing as a methodological rhizome, creating openings concerning possible childhoodnature becomings that translocate simplistic concepts of ECE. Within and out of the posthumanist moment of qualitative research, she draws attention to the multiplicities of words challenging limited visions and becoming accountable in the practicalities of our research – being/doing words and being/doing ontological work. Think of ways of breaking out of taken-for-granted research practices – ways of "unmolding ourselves – enter the unconscious activisms of Anne"s slam articlepoem, a speculative voice, an experiment in how to think nature and culture together amidst schizoid modes of becoming material/discursive to get out of taken-for-granted systems of meanings, really engaging ecological principles within early childhood settings – greenish pedagogies. Reinertsen writes as if what we have been doing in research and educational practices needs speculative jolting – "training our imaginations to go visiting" – maybe poetry can do that? She speculates on how to de-authorize knowledges and methodologies? Becomings in creativity? How to work on people slowly in surprising, perhaps powerful ways. . . how to become, again. Can we imagine, for example, in one of Masny's rhizomatic writings, research that is articulately full of contradictions, uncertainties, shifting landscapes, human/more-than-human – a new politics of educational practice where environment matters? Discursive↔materialistic? Transpersonal methodologies producing critique as diffractions as new possibilities for action – give peace a chance. . . work in different directions at the same time because we might be wrong (about plastics!). Read Reinertsen as an attempt at performing or activist methodologies that work to collapse nature/culture divides.

The chapter by ▶ Chap. 18, "Exploring Space and Politics with Children: A Geosocial Methodological Approach to Studying Experiential Worlds" conjures up images of difference between intensities experienced in actually "being there" at a powerful musical performance with interpretations of others. This difference has inspired post-qualitative researchers, empirical realists, and others to "want" qualitative research to move beyond representation. While each of the authors in this section has thought deeply about many aspects of this movement in respect of anthropocentric ontologies and methodological possibilities, Koro-Ljungberg et al. engage brut, fluid, and porous pathways to change in the ways we theorize and practice ECE inquiry. They illustrate how philosophy as method can create conceptual movements that disrupt taken-for-granted assumptions concerning what pedagogical performance is for young children. They reconceptualize children's performance as intra-active assemblages of more-than-human relationships and they trace their (non)methodological work back and deeper into worldview. As the authors say, method, born of ontology, is affected by ontology so that methods always presuppose (discursive/material-based) ontology. Critical of assumptions in traditional research concerning universal essences as well as stable and inert conceptions of material and ontological reality that ignore the relation

production of "being" a child within environments, they concentrate on movements towards relational/spatial re-makings of more-than-classroom environments. In many ways, they compel researchers to think more seriously about research methodologies and methods as they are implicated in conceiving and construction of children's ontologies at the most basic phenomenological levels. Methodologies-as-ontologies-as-pedagogies – disruptions are intentionally created in this chapter and this section of a research-oriented handbook. The power of affect is palpable in the intensities by which these authors propose experimenting with pre-positioning to interacting, to performing together in relational (fluid) processes and across childhoodnature.

Acknowledging the strategic position of ECE in "governing" children within dominant educational discourses, Holmes, Jones, and Osgood challenge EE researchers to rethink our common sense ways of thinking and knowing. Their particular challenge is interesting, because it connects critique with creation through illustrations of how this might be done theoretically and practically. They respond to the challenge to unmake our methodological habits, saturated in human-centeredness, in search of new ontological thinking that opens spaces for environmental educators to create inquiries differently, perhaps rhizomatically, affectively, generatively.

They posit research methodologies as performance and practice experiments that cause readers to refocus "zones of inventiveness" toward thinking and doing intensities that may actually have potential for onto-epistemic change and illustrate this shift practically – pushing readers beyond the "rules." They encourage us to "see" ourselves within our habits by opening our eyes differently, creating more openings, more becomings.

Repositioning the Reading

In this section, despite its limits, readers will witness the change – in the questions we ask as methodological inquirers (and critics), about the practical (environmental) problems and issues children (and researchers) live, in the theory-base that persuades us, in the language (e.g., concepts) we use, and, subsequently, in the broader framings of methodologies and methods that are our primary but not exclusive focus. We cannot deal with the wide array of practical problems and everyday issues, given the diverse readership of this handbook and its global reach, and reflection. This, we confess, is a limitation of this section, reiterating the skepticism needed about the value and efficacy of theory "trickle down" to educational practices – methodological, pedagogical, curriculum development, and policy formulation.

How are we to make some sense of, indeed exemplify, the shifts in (Western/Northern) thinking and research practice that now characterize evolving methodological problems and issues within the neoliberalized proliferation of educational research journals and books? By reading, says Elizabeth St. Pierre who uses her own past research as one base for change. Read examples such as those presented within this section, then read backwards into the theory bases that help us make speculative sense of the practical groundings of research for unsettling, disrupting, settling, and

reconceptualizing, for getting beyond inadequacies of our own thinking, our questions, and methods. Theory in this sense, according to Anyon (2009), potentially becomes an assemblage of interrelated concepts for questioning the way social-environmental discourse and systems work. Thinking with theory involves interrogating our (researcher) point of view (as an armature of concepts and ideas), reading enough to think critically about our allegiances and blind trust in traditional methods, and engaging in thoughtful debate about our research framings and how we came to frame our research questions and methods (onto-epistemologically) (see also Jackson & Mazzei, 2012). In this work, we may begin to see parts of our worldview in the concepts we choose to work with and therefore rethink sourcings, or underpinnings, even uncritical or ahistorical assumptions and commitments in our methodological choices. But, at the same time, we need to be reflexively alert to how we potentially (mis)recognize our selves, and our readings, interpretations, and senses of agential relations and collegiality within the performative, outcome-driven, individualized, audit culture of the postmodern corporate university, including its "turn" to online technopedagogies and "new" globalizing imperialisms of, for example, MOOCS (Cooper, 2002; James & McQueen-Thomson, 2002).

The underlying challenge in many of the chapters, therefore, is in learning how authors may connect to and re-imagine various dialects of theory as a means, perhaps, to perform differently or better ground why we chose one direction over another. For us, it is in reconceptualizing ECE-EE research designs and methods that social-environmental theories become implicated in changes to social structures. Theory-based concepts, then, can potentially be an epistemological force of de-territorialization and repositioning. To illustrate, Lenz Taguchi (2007) describes how the new focus works toward trangressive practices, that is, toward transgression of the modernist theory-practice binary, to work beyond interpretive text that includes sensual, emotional, and affective experience. Whatmore (2006) summarizes these theoretical insights in terms of shifts of directions: from discourses to practices, from meanings to affects, from human to more-than-human modes of inquiry and from politics of identity to politics of knowledge-practice (in performance).

Each of the authors in this section illustrates their own challenges with new conceptual possibilities that help us work our way out of the old language traps. For example, what Reinertsen (2017) calls grammatical liberation or immanent critique practices shifts meaning and questions of interpretation and representation. What Manning (2015) calls "research-creation" involves application of these shifts to existing pedagogical issues. Taylor and Giugni (2012) reconceptualize early childhood communities using a "common worlds" conceptual framework. The idea in each of these cases is to take account of children's relations (i.e., relation ways of knowing-being) with all others including more-than-human others – the ethics and politics of multispecies vulnerability (see Taylor & Pacini-Ketchabaw, 2015) and of living together. Like these researchers working with their own concepts or others, we view these concepts as generative of their own working ideas. Qualitative-postqualitative inquiries are on the interpretive move and the authors of this section provide numerous openings for more creative conditions for your own ideas (see Reinertsen, 2016).

Some of us may be less familiar with this particular kind of research and style of writing – questioning what we mean when we question terms such as "data" or "analysis" or "interview" and why "concept as method" is used to disrupt traditional methods of qualitative inquiry. Post-qualitative work is challenging – the grounding is in new theory as well as different conceptualizations of what counts as data, as event. However, the real challenge we see is in moving theory beyond constructivist discourses. We believe that we need to "turn" beyond old epistemologies and their uncritically presumed ontologies that many still assume are needed for educational change to keep pace with the Dromospherical speed of environmental and social change associated with the consequences of the Anthropocene and how that shapes children, their lives, and ecologies of everyday things and scales. And we believe that working with ideas from authors in this section provides some useful openings for this work.

In the following chapters, you will read how traditional conceptualizations of methodologies and methods are challenged, as stimuli for emergent conversations and as provocations for critical ecological change relevant to childhood. Think of these chapters as enticements to explore the evolution of early childhood education, as well as environmental educational research. The idea is to (re)search for ways to create conditions to "see" research differently so we can begin to "see" differently and "to see ourselves being seen" (Hoffer, 2012). The stories of experience are narrated not as interpretations and representations of others so much as exposing the discourses that drive people to discover themselves in examining their performances.

This section of the *Handbook* asks what can be done within methodological terrains of research in childhood education in relation to nature. It problematizes the concept of childhoodnature from different perspectives, as must occur. In our minds, research can reveal and conceal. For example, in the "new" of new theory, it can reveal the politics of humanization, ecohumanization, and posthumanization in various "re"humanizations as well as conceal possibilities for dehumanization, desocialization, displacement, and agential alienation. It can raise fundamental questions about concepts, often taken-for-granted in traditional research, that may (or may not) reveal relationships between language and materialities in lived experiences and realities in the world. It can presence or absence ways of knowing and being/becoming explored as onto-epistemic flattening where many new ways of seeing are made possible or impossible.

In a methodological sense, research can be directed (in theory and practice) within a variety of cultural, physical, bodied, mental, and political practices, some of which require shifting taken-for-granted traditions, ideologies, power states, discourses, relationships as intra-actions with matter and thought. Or put simply, as ontology and abstraction, the tension of which has massive implications for methodological inquiry, critique, and research practice. Methodology can sanction routines tried and tested within particular framings as well as intersectional assemblages which can disrupt taken-for-granted assumptions and practices. Research can open or close bodies/minds in relation to how images, interpretations, representations, inter(and intra)actions are immersed in ongoing negotiations, as (re)cyclings of de/re/de-centring, de/re-territorializing our research processes. Now you see it, now you don't!

Through chapter authors, we propose to engage readers in self-reflections and conversations that critically invite dis- and re-identification of research readings on influencing, perhaps, determining or inscribing our positionings and conceptual re-engagement with the theory-into-practice of EE-focused research in early childhood education. We are inclined to *want* to believe that EE/ECE-based researchers are ready to engage in transforming themselves and becoming inquirers with an enhanced sense of their own ecological ontology. But, a pause and silence can we/they find the time to read slowly and engage deeply enough to trouble their own inquiry-based thinking (porous, fluid, brut – see Koro-Ljungberg, et al., this volume) about how young people might come to know? Their engagement with methodologies and methods in EE and ECE may change for good reason. And, thinking conceptually about newer strategic concepts such as embodied memory, diffraction, rhizome, haecceity/assemblage affect, nomad, but also critiques of these new metaphors/signs… in directing field-work methods beyond a methodic series of steps, we are inclined to think that they might find pathways to partially, and possibly selectively, "access" and reveal the "nature" of the changing and contingent ontologies of the world. As Davies (2014) says, in making evident the ontology of becoming and knowing, that is, when something comes to really matter, when it actively changes the way things are perceived to be, both the ontology of our bodies and the meanings of what happens (in research and in life) are affected and effected. And if analysis amounts to a set of encounters among meaning, matter, and ethics, those "close" encounters are always already affecting or being affected, as a means of getting closer to the fundamental constituents that make up the world (Barad, 2007, p. 72).

The turn to posthumanism, as one currently popular turn in Northern/Western thought, but like others now available, seemingly plays into environmentalism, childhoodnature, and EE, as some of our performers in this section indicate but also admonishes us to question both its authority and our thinking habits, as some also address. Posthumanism and new materialisms attract increasing numbers of ECE researchers and many others and illustrates a missing dimension in many environmental researchers' thinking and practice, among other turns that dialectically/dialogically need to be "read" into ongoing methodological inquiry and related debates. We think that we have partially opened up that dialogue for many early years and environmental educators within the limits of section "Positions." Post-humanist theorizing, for example, proposes research bases that create conditions for complexity in thinking and practice in reconceptualizing ontology beyond the centers of humans, that is, with nonhuman and more/other-than-human bodies. But so too do other new theories and philosophies listed earlier, in different and othered ways, such as the speculative empiricism of experiencing plurinatures (Debaise, 2017); the incorporealism of the subsistence of the ideal in the material, and the material in the ideal of an onto-ethics (Grosz, 2017), the immaterialism counter turn of speculative realism (Harman, 2016), or the post-phenomenology of ecophenomenologies (for example, Toadvine, 2009), eco-anthropologies (for example, Ingold, 2011; Kohn, 2013), and environmental criticisms/ecohumanities (Buell, 2005). This extended assemblage, we sense, is less about words than affect, embodiment, and enlarging predispositions and boundaries of our research processes –

thinking theory into how to find out, where humanisms intersect more than humanisms – Reinertsen's (2017) "eco-chaos-ophy" (possibilizing childhood/s as a matrix of becoming).

In sum, the notion of "re-reading" methodological inquiry as critique and change grounded in different theories and turns, as well as material, real, and symbolic everyday practices (of children) opens up research spaces, beyond normalized practice and dominant research discourses, to intricacies of interrelations between human and more-than-humans as expanding philosophical (re)positionings of particular interest in early years and environmental education of/for, the pluralization of childhoodnatures.

This section on methodology could serve as introduction to what is unevenly emerging in early childhood education and care (ECEC) research. Following scholars such as Lenz Taguchi (2010, 2016), Jones and Holmes (2014), Otterstad and Waterhouse (2015), and Osgood, Scarlet, and Giugni (2015), and many feminist materialists, authors in this section put new conceptual spaces to work as examples of theory-praxis in post-qualitative (non)methodology. We see multiple and complex ways of thinking beyond but perhaps within traditional qualitative methodologies such as ethnography or narrative inquiry, new ways of performing inquiry such as speculative realism where fluidity trumps conformity or rigidity in moving away from interpretation, representation, and the inadequacies of language. Flattened ontology in post-qualitative work attempts to overcome the labels syndrome as they mark onto-epistemic reference points used to legitimize scholarship of particular kinds. For Koro-Ljungberg (2016), disrupting normative signifiers in which we include childhoodnature is crucial for conceptual movement and creativity.

What is generated in these chapters are more questions about research as genuine inquiry with no fixed answers, methodologies, or methods. Along with St. Pierre (2016) and Fairchild (2016), we too suspect methodology as we have come to know it is now often unthinkable within the new empiricisms of this multiturn in ontology and epistemology. While research has indeed become less settled and has moved beyond inevitability and prescribed methods, it has also become closer to the lived experiences of the "opera" or stand-up comedy than a person's uncritical representations of their textualized experience. Working within, against, and beyond the status quo where researchers "become" within the process of rich theory to de/re/decentre and unsettle thinking/praxis seems exactly what fields such as EE/ESD/EfS require to reconceptualize what can count as inquiry, knowledge and an ontology of becoming. How else could we begin to seriously re-consider knowledge-attitudes-behavior research as "flows of affect" within research contexts? The chapters in this section provide clues to reading within ephemeralities of methodological spaces as fluid places/spaces to begin (to think differently about how affect and bodies can influence conceptualizations of method). How interesting could this be for EE/ECE researchers to learn how to push affective relations with methodology to inquiry into the affective flows between human/nonhuman/more-than-human (see Fairchild, 2016)?

So, this section of the *Handbook* opens up to reading and seeing research differently, to complexity, to changing social/environmental imaginaries. We open

up to visions of active and activist methodologically reflexive researchers who, mostly within EE-ECE domains of inquiry, like to start their thinking with theory in multilayered ways, to expose themselves and participants to their own partly visible, emerging preconceptions and perspectives, to openly engage in rethinking/redoing their framings and methods. We think that because we believe that when we learn to "see" differently (become more conscious of our own worldviews or onto-epistemic assumptions), there is greater possibility that a shifting of values sets in (in researchers and their participants). We think that a shifting of worldview, and indeed a "de-centring" of unbridled subjectivity "towards" the "eco" of childhoodnatures is fundamental for EE research and EE practice and that it is necessary to shake complacency out of EE research. We see evidence that certain ECE researchers may feel this way as well and urge us to engage real biopolitical and bioethical issues of pressing socio-ethico-political-environmental concern. By implication, this suggests the relative failure or epistemological and methodological limits of "seeing" socio-environmental issues and EE research to fundamentally make a difference. Through chapter authors, we hope to generate critical self-reflection and conversations that concern re-identification of researcher readings, seeings, and positionings in EE and ECE that open up questions of worldview at all levels. We reiterate the limits of this section in dealing with the everyday practices, problems, and issues of children and research in vastly different geo-cultural-epistemological settings and scales. The compendium to this handbook will reveal some of those concerns.

Our advice – read the chapters in this section slowly and read closely the onto-epistemologies that ground our old hubristically humanist projects in order to understand new ontologies and theories (Pedersen & Pini, 2017). Read these chapters as a collective exercise in thinking about and in critiquing ECE- or EE-related educational ontologies/epistemologies. We are adamant that many researchers pay little attention to how the ontological assumptions or predispositions they "work with" are in some sort of tango well before methodological deliberation. That dance needs to be examined and partially choreographed notwithstanding the spontaneity of the music, movements, and audience participation.

In this section, you may find emerging ideas, theories, methodologies and methods, new concepts and processes that work against or beyond familiar categories and take on a life beyond the singular chapters included here. Our intention in selecting these chapter writers was to bring focus to deeper issues and shifts in orientation of thought that are ultimately ontogeneric, that can spark our creativity enough to let go of routines and open ourselves to other ways of seeing, thinking, and doing research. Posthumanism or ecophenemonology, or speculative empiricism, or plurinatures, as a "turning" and (de/re)assembling conversation opens ontological-epistemological-axiological and methodological positionings that may allow us to play with our worldviews. Acknowledging that relational humans existing in different scales, confronting the Anthropocene/Dromosphere and its planetary-bodied everyday consequences, intergenerational and cross-cultural implications may render us more capable of listening and seeing research differently beyond the heavy legacy of humanist assumptions and disciplining tendencies of traditional scholarship. It may be the kind of

research that got us here in the first instance, but it can't seem to imagine anything different. The chapters here collectively pursue a post-critical type project of breaking away from uncritically preconceived humanist/anthropocentric thought. They ask us to "de-center" and re-read/see/think methodological inquiry in diverse and unsettling ways, to reposition critically the things that ground our existing projects as "seen" through new ontological-epistemological eyes – as Snaza and Weaver (2015) say against our fetishization of research methods.

Abstract

This chapter focuses on research methodologies, that is, an inquiry into research that experiments with the rhizome, an innovative way of doing childhoodnature research. Educational studies in an Anthropocene era have often positioned "childhoodnature" research in the more familiar humanist perspective according

prominence to the centered subject, representation, and interpretation. This approach to research has been the source of criticism for not responding to the challenges of the times. This chapter is situated within that critique by adopting a rhizomatic perspective to childhoodnature research informed by Deleuze and Guattari's geophilosophy. Geophilosophy ruptures the received view of qualitative research and creates concepts in relation to the problem and questions that emerge from a research assemblage. A rupture also provides an opening for the conceptualization of childhoodnature as it emerges through the lens of rhizoanalysis and a theory on becoming that consists of reading the world and self.

The chapter is a rhizome with multiple entries: situating the research assemblage and an ontology linked to geophilosophy. A presentation on the rhizome, rhizoanalysis, and the concept of assemblage follows. Then, they come together with Multiple Literacies Theory as contributing elements in reading a research assemblage. Next three rhizomatic studies constitute examples of research assemblages and how they might function. Finally, the intermezzo, the movement in between de- and reterritorialization according to Deleuze and Guattari's geophilosophy, is one of becoming and establishes a movement for research yet-to-come. It provides potentially new directions for thinking about research as it unfolds with childhoodnature.

Introduction

This chapter contributes to the handbook's section on research methodologies, that is, an inquiry into research that experiments with innovative and nonrepresentational ways of doing research.

Situating A Research Assemblage

The chapter is a rhizome with multiple entries. It becomes an invitation for readers to plug into the different entries and concepts that may be familiar and unfamiliar as each entry takes readers in unpredictable (no pre-given) directions. Moreover, the chapter emerges out of what might be considered an ever-growing concern regarding sustainability of the planet at a time when the human species makes its heavily-felt impact on the planet. Climate change (Malone and Truong, 2017), nuclear power, and genetically altered food (Colebrook, 2014) are examples. This era carries the name, Anthropocene (Crutzen, 2002). Concern for the planet earth resulting from innovations through science and technology to name a few has led many scientists to focus on the earth's resolve to sustain the planet and be sustained by it for the future.

Might the latter be a call for sustainability through childhoodnature in conjunction with a globalized and digitalized environment, ever-changing and mutating along untimely pathways?

The backdrop to this chapter unfolds in the middle of problematizing the concept of childhoodnature and becoming through the lens of Deleuze and Guattari's (1994) geophilosophy. The chapter invites childhoodnature to experiment with territorialization and becoming through reading the world and self. They contribute to a research assemblage as they join elements of expression, content (bodies), and de- and reterritorialization. The purpose is to create a different path of research inquiry in the process of becoming. This path grew in opposition to conventional educational research (St. Pierre, 1997, 2004). Conventional research known as post positivism and humanism have dictated how scientific research is conducted by centering the human subject. The boundaries (categories) of conventional representational research are being challenged, and different directions to research are now emerging (Clarke & McPhie, 2015; Fox and Alldred, 2015). This chapter focuses on doing poststructural research with childhoodnature through the lens of rhizoanalysis and a reading of the world and self (Millei & Rautio, 2017). This research approach is an important direction in working with the complexity, messiness, and unpredictability in conceptualizing childhoodnature, rhizome, and reading. Multiple Literacies Theory (Masny, 2014a) consists of a counter-response to the arborescent/silo development of reading. It does not promote various presentations of literacies such as emotional literacies and financial literacies. Rather, literacies are characterized by their singularity that happens differently each time because of the setting in which they emerge (e.g., literacies in the context of family relationships, Bastien, 2017; Mozere, 2007; Riddle, 2014). Moreover, the concept of analysis deployed in this chapter has no connection with the humanist forms of analysis that rely on coding and categorization.

The writings of Deleuze and Guattari on geophilosophy Bonta & Protevi (2005) cast a gaze on the importance of ontology (May, 2005) in which earth and territory are closely linked. Geophilosophy has disrupted a conventional humanist perspective on knowledge, representation, thinking, binary logic, and the centered subject also known as the received view.

Thinking does not take place in the realm between subject and object; rather it takes place in the "relationship of territory to earth" and the "earth constantly carries out a movement of deterritorialization on the spot, by which it goes beyond any territory." Territory and earth are two components with two zones of indiscernibility – deterritorialization (from territory to earth) and reterritorialization (from earth to territory) (Deleuze and Guattari, 1994, pp. 85–86).

The humanist perspective in Deleuzian-Guattarian terms has been deterritorialized. Absolute deterritorializing refers to virtual movements moving through relative deterritorializing movements that are in the process of actualization (Parr, 2012). The movement from deterritorialization to reterritorialization calls upon the establishment of a territory once more but not the same as the previous territory. It actualizes differently. De- and re- territorialization participate in a potential

creation of a concept in an assemblage. Might childhoodnature emerge from such an assemblage? The French term, *agencement*, has been inserted because there are variations in translation (Bangou, 2013).

In this setting, there are questions: What is childhoodnature? How does it function? What does it produce in becoming? These questions provide potential experimenting with rhizoanalysis (Masny, 2013) and Multiple Literacies Theory (Masny, 2014a). More details are presented later on. Multiple Literacies Theory invites animal, human, and vegetal readings of the world and self in a research assemblage. It paves a path to becoming with the world. Children are nature and are inseparable from nature (nd.). Might it emerge that childhoodnature are-as-one and enable a becoming with the world?

Deleuze writes the following: "if children were able to make their protests heard in pre-school or simply their questions would be sufficient to derail the entire educational system" (Deleuze in an interview with Foucault, 2004, p. 291). What might these protests and questions be about? Several responses might emerge. One response that this chapter calls upon is creativity in open systems. In other words, the approach in conducting research is couched in terms of problems, questions, and concept creation of childhoodnature (Masny 2016).

How has educational childhood research transformed at/with the Anthropocene? Perhaps a comment from the Economist (2011) might be an indication. "Welcome to Anthropocene: Humans have changed the way the world works. Now they have to change the way they think about it, too." This change questions the role of the human in relation to nature and has led to experimentation embedded within what might be considered post qualitative research. Drawing from Deleuze and Guattari (1987), might the latter consist of a decentered subject and a rejection of representation and interpretation?

This chapter is interested in pursuing a twofold goal regarding the conductivity of childhoodnature research. The first is conceptual, that is, to trouble conventional research which consistently calls upon the researcher to interpret the results of a study. The second involves experimentation with the research(er/ed), by moving away from representation and interpretation and engaging with rhizoanalysis and its accompanying processes as well as practical oriented Multiple Literacies Theory (Waterhouse & Arnott, 2016). Might these goals take into account how the processes of the rhizome/rhizomic machine, rhizoanalysis, and multiple literacies function?

Rhizome, Rhizoanalysis, and Assemblage

The next entries speak exclusively to the concepts of the rhizome/rhizomic machine, rhizoanalysis, and assemblage. Later on, in the entry entitled "reading a research assemblage," we will see how they function. Through geophilosophy, earth and territory produce problems from life, and concept creation becomes along rhizomatic lines a response to problems in the world (Masny, 2014b).

Rhizome

What is a rhizome/rhizomic machine? how does it function?

> It[a machine] has no subjectivity or organising centre; it is nothing more than the connections and productions it makes; it is what it does. It therefore has no home or ground; it is a constant process of deterritorialisation, or becoming other. (Colebrook, 2002, p. 57)

It is an orientation toward research that adheres to an ontology that brings together geophilosophy and becoming, a rejection of representation, interpretation, and linearity. A rhizome is characterized by multiplicity, connectivity, heterogeneity, asignifying rupture, and mapping (Deleuze & Guattari, 1987).

An asignifying rupture, for example, refers to a rhizomic machine always in motion, traveling along lines. Its movements along horizontal lines are nonhierarchical and non-arborescent (Deleuze and Guattari, 1987). In a society, lines might be molar (rigid, institutions), molecular (supple, i.e., pivots toward molar or lines of flight), and lines of flight (creativity). "A rhizome may be broken, shattered at a given spot, but it will start up again on one of its old lines, or on new lines" (Deleuze & Guattari, 1987, p. 9). Lines break, and rupture, and flee, but the rhizome simply starts up again in the middle on a new line or along an old one (Deleuze & Guattari, cited in Bastien, 2017, p. 20). Deleuze and Guattari have proposed that lines of flight describe best a society. Through rhizoanalysis, lines enter into a relation with another. The relationality is one of affect, that is, becoming in the process of mapping connections of lines molar (rigid), molecular (supple), and lines of light.

Rhizoanalysis

The arborescent nature of conventional research attempts to predict (to fix, pin down) what research observations and interviews mean through representation and interpretation. With rhizoanalysis, a different way of doing research emerges (Clarke & McPhie, 2015). What is rhizoanalysis? How does it function? What does it produce in becoming? Rhizoanalysis is not a method. There is no one way to do rhizoanalysis. Its analytic orientation to research is based on the rhizome (multiplicity, connectivity, heterogeneity, asignifying rupture, and mapping). When there is an unpredictable rupture in conventional research, it might emit a line of flight whereby rhizoanalysis might create new connections of becoming. What was a particular form of doing research might be no longer. It is different. It is difference that allows for creation and invention to happen continuously (Dufresne, 2006).

Assemblage

The function of an assemblage is indicative of the societal perspective that Deleuze and Guattari privileged in their writings. For example, becomings do not happen in

isolation. Moreover, in an assemblage, there is no "I" (Deleuze & Guattari, 1987). An assemblage functions to decenter the subject be it human, animal, or vegetal. An assemblage consists of content (human, animal, and vegetal bodies) and expression (collective assemblages of enunciation, order words) and de- and reterritorialization. Content refers to the relationship between bodies (e.g., human, animal, and social body) and expression in an assemblage that takes into account that we never know in advance how a body will respond in the process of deterritorialization and reterritorialization (cf. assemblage, Masny, 2014b, p. 100). Expression refers to collective assemblages of enunciation (e.g., order words) that are subject to deterritorialize and then reterritorialize. Deleuze and Guattari maintain that language is social and not individual as utterances reflect a dominant social order. The deterritorializing process opens up potentialities for extending experience in an assemblage by reconfiguring the assemblage differently based on a relationality of the elements through affect. They are comprised of material matter which might be, for example, linguistic, social, cultural, and economic. In an assemblage, the elements are constituted nonlinearly and nonhierarchically and not pre-given similar to a rhizome that activates and disrupts (deterritorialize) the elements within content and expression and reconfigure the assemblage.

Multiple Literacies Theory

Multiple Literacies Theory is connected to rhizoanalysis. Multiple Literacies (Masny, 2014a) consist of words, gestures, and sounds, that is, human, animal, and vegetal ways of relating in reading the world and self and ways of becoming in the world. Reading self refers to a relationality of elements in an assemblage in the process of becoming (through affect).

Reading with Multiple Literacies Theory is a process and does not involve end points (reading and writing printed materials). What might be going on during reading in Multiple Literacies Theory brings us to ask: Reading what? Reading how? Art is an example. Conventionally we see/visualize art. In most cases, we do not hear art. Multiple Literacies Theory, however, favors reading art because reading art might be more than seeing. Reading can happen through the eyes and through the ears. Through reading, might there be tasting art, smelling art? The concept of reading is encompassing. Moreover, Multiple Literacies Theory rejects representation and interpretation. Through the lens of Multiple Literacies Theory, might hearing the art of Francis Bacon, for example (Deleuze, 2005), be blurring the boundaries of representational art? Reading art does not happen in isolation. The elements in content and expression in the assemblage relate to each other, and art is an element in the assemblage. Reading art in the process of becoming creates pathways of becoming previously not given, creating and connecting to other pathways that emerge and relate to each other through affect. In a certain way and as mentioned earlier, creating the concept of childhoodnature-as-one invites a reading of blurred boundaries of childhood and nature but also unpredictability, complexity, and messiness.

Reading Intensively and Reading Immanently

Conventional reading is involved in interpretation when asking what a text means. Rhizoanalysis and Multiple Literacies Theory are not interested in a question of interpretation. Rather, the interest lies in what reading does and how a text functions.

Multiple Literacies Theory is interested in reading intensively and immanently.

Reading intensively relates to an untimely disruption that creates a rupture and potentially emits a line of flight. This is a process of deterritorialization that simultaneously gives rise to reading immanently which consists of what might happen (potentiality) in reading, reading the world and self. Reading intensively and immanently, for example, the relationality of elements in an assemblage, deterritorialize and reterritorialize content (bodies relating to one another) and expression (social nature of language). Through the power of affect/becoming, the elements in the assemblage reconfigure only to engage in a continuous process of de- and reterritorialization. Moreover, once reading happens in untimely ways, there is no prediction about how reading is taken up.

Reading the World and Self

In Multiple Literacies Theory, reading the world and self is intricately intertwined but distinct, composite, and irreducible. Reading the world and self in an assemblage is reading the relationality of the elements (including self) in an assemblage. Reading the world is the point at which expression and the world meet and sense actualize in situ (Masny, 2016).

Reading and Text

Multiple Literacies Theory refers to texts, broadly speaking (e.g., in the context of mating rituals, music, visual arts, physics, mathematics, and digital remixes). Each text is a machinic assemblage (cf. previous quote on machine by Colebrook). In deterritorialization, texts are pre-personal, asignifying machines. Text reterritorializes through an assemblage of heterogeneous forces that come together in a particular time and place. Text is a sense event. Texts might be visual, oral, written, tactile, olfactory, and in multimodal digital (reading text, cf. Cutcher, Rousell, and Cutter-Mackenzie, 2015).

Theory-Practice

A question that might arise regarding the conceptualization of Multiple Literacies Theory concerns the word theory. It is used but has no connection to the humanist perspective as a perceived dichotomy between theory and practice. Theory works differently with Deleuze:

> A theory is exactly like a box of tools . . . It must be useful. It must function (Deleuze, 2004, p. 208). A theory is something that we must construct as a response to a problem, and if it ceases to be useful, then we have no choice but to construct others.

This approach to theory is inherently practical, although Deleuze distinguishes between theoretical and practical activities. Unlike a conventional approach to the relationship between theory and practice, theory does not represent or "speak for" practice, any more than practice "applies" theory: "there's only action – theoretical and practical action" – connected in networks and relays (Baugh, 2012). Foucault puts it in the following way: "Theory does not express, translate, or serve to apply practice."

In other words, the Deleuzian relationship between theory and practice does not deal with the conventional approach of theory and practice. Instead, a relationship is reconfigured as theory and practice to experiment. What are the implications of this relationship, theory and practice, for childhoodnature? Might childhoodnature be process-oriented? Might theory and practice come together as a sense event?

The toolbox is a concept that emerged out of discussions between Foucault and Deleuze (Deleuze, 2004). Deleuze likens a theory to a toolbox: "It has to be used, it has to work" (p. 208). Its practicality consists of thinking creation of new not pre-given concepts as a response to a problem. "Thinking is never just a theoretical matter; it has to do with vital problems" (Deleuze, 1995, p. 105). How are concepts practical? A concept becomes, "this power to move beyond what we know and experience to think how experience might be extended" (Colebrook, 2002, p. 17). Accordingly, Multiple Literacies Theory is interested in praxis, the ability to do, to practice when asking questions emerging out of problematization. The toolbox also has applications with rhizoanalysis.

Reading a Research Assemblage

From a Deleuzian perspective, the ontology that connects with Multiple Literacies Theory and rhizoanalysis is nonrepresentational. In this chapter, it involves an ontology commensurate with, in this case, geophilosophy. In addition, a research assemblage does not address data production in a conventional empirical way. Representation and interpretation deterritorialize and reterritorialize as non-representation and *interpretosis* (the sickness of interpretation) (Deleuze & Guattari, 1987). Moreover, reading a research assemblage happens through the lens of rhizoanalysis. There is no one way to do rhizoanalysis. Therefore, the readers will note that this rhizoanalytic approach to research is one not solely created by the author. Rhizoanalysis does not apply narrowly to vignettes (formerly data). It applies to all the elements (including the researcher) as contributors to a research assemblage of content and expression that de- and reterritorialize. The process then reconfigures the assemblage based on the relationship of affect among the elements in the assemblage. The research assemblage is not limited to what a researcher generates by way of interpretation based on the data before her. In this particular rhizoanalytic

approach, interpretation is deterritorialized and reterritorialized as purposeful questioning of statements in opposition to affirming the contents of a statement (please refer to three research studies below regarding the use of the question structure). It is a way to address the issue of interpretation. Interpretation focuses on data. In this rhizoanalysis, data is deterritorialized, and a different concept emerges, vignettes.

What might the assemblage consist of? Observations and interviews deterritorialize, reterritorialize, and conceptualize as vignettes. In this particular setting, they contribute to a research assemblage (researcher, research assistant, participants, computers, books, etc.). Vignettes are not subject to analysis according to codings. Codes classify and fix data. How are vignettes selected? Intense affective passages in bold (see vignette below) disrupt as connections happen in the mind of the researcher and produce thought. In other words, the selected vignette is based on its power to affect the assemblage and be affected by the assemblage. Vignettes rupture, deterritorialize, and take off in unpredictable rhizomatic ways. They also plug into a conceptual toolbox pre-personal and not pre-given (immanent). How? The plugging-in process (Deleuze & Guattari, 1987) enables reading intensively and immanently the relationality of elements in the assemblage that deterritorializes and reterritorializes content and expression (interviews, transcript, video, participants, computer). Vignettes deterritorialize and reterritorialize creating new territories (e.g., concepts, childhoodnature). In so doing, "we move away from the anthropocentric view which places humans at the center of analysis" (Martín-Bylund, 2017, p. 79).

The following vignettes come from three different studies. They might be instances of the untimely happening of an autistic child in class with teacher's aids (Boldt & Valente, 2014), Cristelle's choice of her favorite part of the school program (Masny, 2015), and the last study on bilingualism that "emphasizes and challenges standardized language models. … If one has learned the standard version of a language, then one who wants to call her/him self an expert needs to continuously seek to become" (Martín-Bylund, 2018, p. 17). The interactions deterritorialize as connections happen in the mind and produce thought untimely. Conceptualizing childhoodnature-as-one entails blurring boundaries from which mutations might emerge highlighting the complexity and the untimeliness of childhoodnature.

Boldt and Valente (2014)

In this study, Boldt and Valente (2014) filmed a student participant using a video ethnographic method (Tobin et al. cited in Boldt & Valente, 2014). They instructed their graduate students to film routines in a classroom which included the integration of an autistic child.

While debriefing, for example, with research assistants and researchers who filmed observations (Masny, 2015), the mind is not responsible for selecting video vignettes even though the experience of connectivity takes place in the mind. The different elements in an assemblage come together to produce thought in the mind of the current researcher as an element within the research assemblage. It is within the

research assemblage, including reading observations that rhizomatic ruptures happen and with the power of affect flowing through the relationality of elements in the assemblage, the concept video vignettes emerges. From the toolbox, a concept, pre-personal and not pre-given (immanent), emerges. There is a practical aspect for it is a response to a problem (undoing conventional qualitative research). Filmed observations becoming video vignettes plug into the potentiality of literacies as processes by extending experiences of what is to what might be. In the course of the filming:

> Children changed spaces, groups and teachers constantly. . .. Somehow capturing the constant movement of teachers, children, materials, and waves and bursts of affective tensions and energies happening among and within spaces began to seem more important than following the arc of a given event. In fact many of the things the children were doing did not have discernable beginnings, middles and ends, but seemed, in the language of Deleuze and Guattari (1987), to be all middles.

In other words:

> You never know what a body will do what it can do, in other words, what its affects are, how they can or cannot enter into composition with other affects, with the affects of another body, either to destroy that body or to be destroyed by it, either to exchange actions and passions with it or to join with it in composing a more powerful body. (Deleuze & Guattari, 1987, p. 257)

The human body is just one example of a body. There are others: animal body, body of work, and social body. A body, according to Baugh (2012), is defined "by the relations of its parts (relations of relative motion and rest, speed and slowness), and by its actions and reactions with respect both to its environment or milieu and to its internal milieu." In an assemblage, there are affects/becomings that enter into a composition with affects of another body and deterritorialize. From filmed observations emerges the power of affect, becoming that transforms filmed observations into vignettes and the basis for connecting video vignettes to the interviews. The vignette selected for the study is part of the current research assemblage. The relationality of affect among the elements produced a bold passage that signifies a reconfiguration of the assemblage and the potential for concepts to emerge. The bold parts in the vignette might affect and disrupt the research assemblage. The direction that the assemblage will take in its reconfiguration is unpredictable. The combination of disruption and affect or reading intensively and immanently is a rhizomatic process that creates a line of deterritorialization and becoming. "What transpires is, that is, an ability of the vignette and affect to bring forth the virtual thought of what might happen in an analysis. It is a process in which there is investment in reading the world and self" (Masny, 2013, p. 343).

In short, to read observations in a research assemblage that includes childhoodnature is also according to Multiple Literacies Theory to read vignettes intensively which deterritorialize and immanently (the virtual thought of what might happen when material elements connect to other material elements in the research

assemblage). While the experience of connectivity takes place in the mind, the mind is not responsible for emerging vignettes. Rather it is the reading intensively and immanently of observations for rhizomatic ruptures happening in the research assemblage.

Masny (2015)

In this vignette, Cristelle (pseudonym) had completed a language arts activity in class. As part of the research assemblage, there were research questions, graduate students as research assistants, physical spaces to film in the classroom, physical space to interview, the equipment, and material bodies connecting. Participation in debriefing sessions that consisted of questions flowing from problematization underscores the potentiality for concept creation in relation to the research assemblage and its reconfiguration.

Vignette: from poem . . .. C: Cristelle; D: researcher

In the introduction, the researcher asks about a poem they had done in class:

(D) Was it one you created?
(C) **No it was copied off the board**.
(D) Do you know what a poem is?
(C) Yes, it rhymes.
(D) do you write poems?
(C) I do them only at school when there is a celebration/birthday and I copy them off the board.
(D) **Why not write one on your own?**
(C) we need to write what's on the board when it's a proper poem.
(D) Could you write one?
(C) I do not know how to write a poem.
(D) What do you need to do to write one? ideas?
(C) ideas? **I don't have ideas**.
(D) what do you need to do to have ideas?
(C) think
(D) then you can think about ideas. Do you have any ideas?
(C) not really
. . . **to Gameboy, gym, recess and lunch**
(D) then what would you like to think about
(C) my Gameboy; I enjoy playing my Gameboy a lot when Dad is watching TV or mom is getting ready for bed.
(D) You don't need ideas for game boy?
(C) you need to concentrate, o go on to the next level, to win the game. I play with my friends. No electronics at school.
(D) **when at school then, what do you like the most?**
(C) gym, recess, lunch. At the gym, I play kinball.

How do the elements in this research assemblage engage in de- and reterritorialization of expression (collective assemblages of enunciation) and content (material bodies: human, animal, and vegetal)? How are vignettes selected? Intense affective passages in bold disrupt as connections happen in the mind of the researcher and

thought is produced. The vignette was selected by its power to affect the assemblage and be affected by the assemblage. Vignettes rupture, deterritorialize, and take off in unpredictable rhizomatic ways and create concepts. It is a process in which there is an investment in reading the world and self. Instead of considering interpretation and what a text means, the questions are what vignettes do and how they function. For instance, what might the assemblage produce in becoming of different pathways for childhoodnature? In the context of Multiple Literacies Theory, how does deterritorialization happen in reading the world and self? How is language molarized? Might it involve over-coding institutional practices of doing poetry (possibly school normativity at work)? How might language de- and reterritorialize and in the process undo normativity? While there is no response about ideas for writing a poem from Cristelle, there are ideas about Gameboy as Cristelle explains what the videogame does. Is this a moment of deterritorialization? And a potential reterritorialization where the gym, recess, and lunch have become the best of curriculum and moments of creativity in relation to Gameboy? In the interview, in her response, there might have been excitement in her voice when talking about Gameboy. From reading the world to reading self/reading the relationality of affect among the elements of collective assemblages of enunciation and material bodies, the assemblages reconfigure. In these configurations, Cristelle is an assemblage as well.

From this vignette, content in the assemblage provides movements involving various body formations/relations: Gameboy, recess, lunch, food, and connections of researcher body and child body. A vignette emerges as text stemming from the relationality of the elements in the assemblage. In other words, it is asignifying only to emerge signifying according to a particular setting. Reading and reading the world and self through text influence the text one continually becomes (Zhang & Gao, 2017).

Martín-Bylund (2018)

This particular study called the sand day moment takes place in Sweden in a bilingual preschool setting (50% Swedish and 50% Spanish). It is after lunch, and the teacher announced to the children in Spanish: “hay un pedacito de melón” (there is a piece of melon) for each one. According to Martín-Bylund (2018, p. 14):

> The children around the table immediately pick up the fruit expression, creating a rhythmic chant “de me-lón, nam namnam, de me-lón, nam nam nam, de me-lón,” at the same moving their bodies in time with the same rhythm. . . Using Swedish words, the children come up with two suggestions: “vattenmelon” (watermelon) and “honungsmelon” (honeydew). Teacher responds: “No, es solamente melón” (No, it’s only melon) the teacher answers in Spanish. “No hay sandía” (There is no watermelon). When the children insist on knowing whether or not it is honeydew, the teacher shrugs her shoulders and says it might be. She stands up and leaves the room to go and get the melon. While the teacher is away getting the melon, the children start exaggerating the Swedish pronunciation by calling it meloon, meloon. . ..

The children are enthusiastic about getting melon for dessert, but what sort of melon is it? Using Swedish words, the children come up with two different suggestions: "vattenmelon" (watermelon) and "honungsmelon" (honeydew). "No, es solamente melón" (No, it's only melon) the teacher answers in Spanish. "No hay sandía" (There is no watermelon). When the children insist on knowing whether or not it is honeydew, the teacher shrugs her shoulders and says it might be. She stands up and leaves the room to get the melon.

> During this time, the children discuss the pronunciation of the word melon, exaggerating the Swedish pronunciation by calling it "melOOOn, melOOOn." So how did the teacher say it? One of the children says she heard "vattenmelón melón," with the Spanish pronunciation in the ending... .In Spanish, it (watermelon) is called sandía, the teacher says when she comes back. "Det är nästan som sand" (It's almost like sand) she says in Swedish. The teacher insists that, that today there is only melon. But a third child continues focusing on new possibilities of this word. Do you know what sandía means? he asks his mates in Swedish. That it is "sand dag" [sand day]. Other children agree **and the first child, the one who earlier was appalled by the word, stands up and leans out of the window, calmly reaffirming that yes, today is sand day**.

What is happening when the child sticks his/her head out the window and affirms that today is sand day? The child is an assemblage as well as the sand setting. What reading of self and the world happened? Was the reading connected to seeing? Was there a visual reading, an audio reading? Was it an olfactory reading? Hear? Feel? Taste? Was it the wind in a relational connection of affect with the child?

How does the research assemblage function and what does it produce? Youbell's examples of the elements (social, cultural, political, etc.) are not pre-given instances of elements that might contribute to a research assemblage. The elements emerge in situ. These elements might relate to expression (the social nature of language folded into collective assemblages of enunciation in an institutional system such as school). Content might refer to bodies (human, animal, vegetal, social, body of writing). The instance given by Martín-Bylund (2018):

> At the beginning of the moment, the children immediately attach their bodies to the expression "melón" in the teacher's announcement. They connect to expression, rhythmically, but they also associate to its content, affirmatively yum-yumming with the same rhythm. (p. 17)

The sandía's pathway is interesting. From the teacher's utterance in Spanish sandía to a conversion to Swedish as sand day by one of the children to another child who leans out the window and utters that yes, it is sand day. From the perspective of Multiple Literacies Theory, what reading might have gone on? Would it relate perhaps to a windy cloudy formation? Might the sand element have reconfigured the assemblage. Were there sensations that live on independently of whoever experiences them and affects/becomings that spill over beyond whoever lives through them (Deleuze, 1995, p. 137)? A not seen fruit takes on multiple heterogeneous moments – from this unknown element going back and forth deterritorializing from one language to another: "The sense event of a sand day subsides in the word, but it happens to the present bodies, producing disgust, questions, interest, movement and contemplation" (Martín-Bylund, 2018 p. 15).

Intermezzo

The purpose of an intermezzo presents potentiality for research with childhoodnature by problematizing, questioning, and engaging in concepts of inquiry that Multiple Literacies Theory and rhizoanalysis deploy in a research assemblage. Through the lens of researcher-researched, Multiple Literacies Theory and rhizoanalysis propose to push experience of life within childhoodnature to its limits and beyond and to engage the process in between deterritorialization and reterritorialization. Through the rhizome, problematization becomes multiple. Rhizomatic shoots proliferate: from filmed observations to becoming-observation-vignettes and from transcribed interviews to becoming-analytical-vignettes. In other words, concepts of inquiry have through reading the world and self intensively and immanently emerged from a toolbox that is seen to work and produce new conceptualizations of research inquiry. Recall that the toolbox consists of creating concepts for the practical purpose of thinking differently about research and childhoodnature.

In conventional research, the familiar approach is to state the problem at the beginning of a research project followed by research questions. Questions are formulated with the aim of finding solutions. In rhizoanalysis conventional coding, problem-seeking-solutions and research questions deterritorialize and reterritorialize focusing on problematization and questions formulated to become responses in order to disengage from interpretation (interpretosis) and encourage concept creation (Cumming, 2015). Taken-for-granted assumptions of humanist research tools merit problematizing. Deleuze (1994) made problematization a significant aspect of experimentation and doing research. He proposed pedagogic experiments to allow young children "to participate in the fabrication of problems" (159). In multiple ways of reading and rhizomatic forces, Cristelle, through observations and interviews in the research assemblage, contributed to problematizing qualitative research. While Deleuze recognized that problems are important, problems are not merely "provisional movements destined to disappear in the formation of knowledge. . .." Problems must be considered as "possessing their own sufficiency" (p. 159).

In other words, problems are asignifying in becoming. In reterritorialization, a problem is effected and deploys literacies and rhizoanalysis with their non-hierarchical and nonlinear pathways of experimentation. Might what produces in becoming are new directions for thinking: problematizing? Multiple Literacies Theory and rhizoanalysis become an unfamiliar encounter to provoke thinking differently in postqualitative educational research (Wang, 2016).

Might Martín-Bylund's implications for bilingualism also have implications for Multiple Literacies Theory, rhizoanalysis, and early childhood? The argument here is not to restrict but to extend the possibilities of working with language and literacies in early childhood:

> . . .perhaps the bilingual situation both emphasizes and challenges standardized language models. Might this be an opportunity that includes the run-away character of the child and the stranger inherent in every word and in every moment. If one has learned the standard version of a language, then one who wants to call her/him self an expert needs to continuously seek to become. (Martín-Bylund 2018, p. 17)

What Martin-Bylund has proposed can be extended to encounters with the unknown, in other words, to affect and be affected in a rhizomatic assemblage engaged in reading the world and self intensively and immanently. Might seeking to become continuously in an assemblage also entail movements of various body formations (learner, apprentice, expert) in experimenting the researcher-researched connection? No body formation is fixed. Rhizoanalysis, through its multiple, heterogeneous, nonlinear, and nonhierarchical pathways, undoes the binary relationship and opens up a potentiality of what might happen through the lens of Multiple Literacies Theory. The centered subject has dissipated in a research assemblage.

The issues of Anthropocene and sustainability presented in the introduction has brought us to a space and time of decentering the subject. Reading through the lens of Multiple Literacies Theory and rhizoanalysis has challenged widely held conventional views of reading and qualitative research. The relationality of affect takes on considerable importance within a research assemblage. Based on an invitation to experiment, Multiple Literacies Theory and rhizoanalysis have globalized potentially in light of their goal to be practical and to address issues of sustainability that are worldwide connected.

Reading and childhood are well-known concepts to educators. However, in this chapter, reading, childhood, and nature have deterritorialized, and different concepts have emerged: might this concept of reading consist of reading the world and self intensively and immanently in an assemblage? Might childhoodnature come together as one and yet not irreducible? What might be happening? Herein lies perhaps an important concept to educators: to the researcher-researched relation always interchangeable, the expert continuously becomes. Moreover, this coming together of rhizoanalysis (assemblage) and reading through the lens of Multiple Literacies Theory might conceptualize differently childhoodnature.

Finally, Deleuze and Guattari have created a singular perspective on reality, an ontology through a societal lens, the network/assemblage, and lines of movement (molar, molecular, lines of flight). In the current climate when education promotes collaboration, networking, and communities of practice, it would seem that the writings of Deleuze and Guattari offer remarkable insight into teaching and learning. It requires different ways of thinking about education and childhoodnature.

The complexity and the challenges of problematization are evoked in Blaise's sentiment (2013):

> Deleuze ontology is not a resting place; it is not a zone of comfort; it is not an answer that allows us to abandon our seeking; it is the opposite. An ontology of difference/is a challenge. (May cited in Blaise, 2013, p. 183)
>
> The answer is not a given. Therefore, we cannot abandon our seeking because providing an answer would give way to interpretation. This is a hard pill to swallow in the educational field because teaching and learning are tied to outcomes. We navigate constantly through molar lines in striated spaces and time. While normativity can almost be equated to molarisation, under this umbrella [comfort zone], there is little risk in an encounter with the unknown. what can we learn? How might we then rupture/disrupt the concept of outcomes and experiment with different concepts? (p. 184)

Conclusion

An intermezzo is an open asymmetrical system preferred by Deleuze and Guattari that expresses a movement from de- to reterritorialization with spaces in between.

Abstract

The aim of this chapter is to rethink "thought" in qualitative inquiry. We attend to possibilities that open up when we turn our attention to habits, ordinary affects, and methodological creations that are integral to the ways in which we think. The challenge of putting new materialism and post-humanism to work requires significant ontological and epistemological shifts. Nevertheless, it is only by shifting the ground on which specific knowledge claims are made that we can potentiate a different logic which in turn can alter both thinking and, importantly, early years practice. Thus this chapter will resolutely refute general ideas or models of what constitute familiar objects in early childhood settings, for example, "the cardboard box" or "the snowman" [sic]. Instead, such models, in

situating them within a "zone of indeterminacy" (Massumi 1993, p. 99), are, as a consequence, freed from habitual assumptions – assumptions that, in our view, delimit the possibilities of what is possible. The chapter works with objects and processes, deliberately avoiding foregrounding the child, to leave the uncertainty and ambiguity of which things are in play, alive in the text. Through experimental methods the chapter will draw on two early years projects: *2-Curious* (a program of continued professional development for early years practitioners in Manchester, UK) and *Knotknowing Diversity in Early Childhood* (a research project reexamining "multicultural education" in an early years setting in London, UK), as generative examples of the potential of the entanglements observed during ethnographic research that take matter and materiality as their starting place.

Keywords
Habit · Affect matter · Process ontology

Introduction

The aim of this chapter is to rethink "thought" in qualitative inquiry. As we shall outline throughout this chapter, there is a pressing need for us to rethink the habits that surround, circumscribe, and limit what it means to think and what it means to know. As academic researchers much of our work is located within the terrain of childhood and early years education. As Peter Moss (2014) points out, early childhood education has globally assumed importance among what he describes as the "movers and shakers of contemporary life" (2014, p. 3) or, in plain speak, policy-makers. Like Moss we have fought, and we will continue to fight for children to have access to early years education. But like all education, early years education can and does have the potential "for governing children and adults alike, for reproducing the already known, for inculcating beliefs in necessity and essentialism, and for fostering the values and subjectivities required by a rapacious, technocratic and harmful economic regime" (Moss, 2014, p. 3).

Early years education is then a tricky terrain where certain global narratives including those associated with progress, development, and economics work at (re)producing ideological configurations of the child, childhood, and education, where children are perceived and understood as human capital who will procure economic salvation and social stability. However, while this discourse is clearly dominant, it can be challenged. But, as we shall go on to argue, it is a challenge that demands dislocating, displacing, and dislodging habits including habits of thought. While recognizing the importance of contributing to debates that politicize relations between the child, culture, and nature, we continue to wrestle with the term "childhoodnature" (Malone 2016; Taylor 2013). Acknowledging the need to queer habits of thought that fall into easy associations and can leave neologisms impoverished, we deliberately refrain from making a direct reference to this term in this chapter.

In our efforts to challenge our habitual practices, we have found it timely to remind ourselves of the etymology of "research." "Research" stems from *recerche* and *recercher* – a mix of Old and Middle French (which are historical divisions of the French language that include the period prior to the fourteenth and up to the early seventeenth century) where each means "to seek out and to search closely." The addition of "re" is also interesting where it expresses or denotes an intensive force in relation to the seeking and the searching. In the subsequent sections of this chapter, our efforts are directed at bringing these intensive forces to the fore because, in our view, it is these which can challenge habitual ways of thinking and habitual ways of claiming knowledge. In evolving this chapter, our efforts are directed at bringing new materialism and post-humanism into play so as to undertake both an ontological and epistemological shift. This is because both "enforce the necessity to think again and to think harder about the status of human subjectivity, ethical relations, norms and values" (Braidotti, 2013, p. 186).

Patterns of (Habitual) Thought

While we want to critique some of the mundane practices that attend our habitual ways of thinking, we also recognize that critique by itself is an insufficient antidote. As Latour (2004) forewarns, critique on its own has "run out of steam," while Braidotti (2006) argues that there has to be an "intimate connection between critique and creation" (p. 6). Deleuze and Guattari (1994) map out how this connection between critique and creativity might be evolved:

> To criticize is only to establish that a concept vanishes when it is thrust into a new milieu, losing some of its components, or acquiring others that transform it. But those who criticize without creating, those who are content to defend the vanished concept without being able to give it the forces it needs to return to life, are the plague of philosophy. (Deleuze & Guattari, 1994, p. 108)

We argue that it is by wrangling and plundering this "connection" that we are enabled to imagine alternatives, ones that allow for an ethics of (re)affirmation. Through experimental and uncertain methods, the chapter will draw on two early years projects: *2-Curious* (a program of continued professional development for early years practitioners working with 2-year-olds in Manchester, UK) and *Knotknowing Diversity in Early Childhood* (a research project reexamining "multicultural education" in an early years setting in London, UK). Both are examples of a new materialist process ontology that allows for "an open, relational self-other entity framed by . . . affectivity, embodiment, empathy and desire" (Braidotti, 2013, p. 26). As a consequence, both examples look to rhizomatic dynamics of repetition and difference (Deleuze, 1994; Williams, 2013) rather than social constructivist binary oppositions. As Bennett suggests such binaries can result in a "partitioning of the sensible" (Bennett, 2010; Rancière, 2001) where, as an example, we divide the "the world into dull matter (it, things) and vibrant life (us, beings)" (Bennett, 2010, p. 8).

It is within this habit that "power snaps into place," where "structures grow entrenched. Identities take place. Ways of knowing become habitual at the drop of a hat" (Stewart, 2007, p. 15). Our argument is that such habits of thinking and doing research are saturated in a human-centeredness that is sustained by the tendency to cling to what Braidotti describes as the "reassuring familiarity of common sense" (2013, p. 1) where narratives of rationality, normality, progress, and mastery are secured.

We would argue that there is an enormous price to pay for persistently seeing the human as unique. It requires that we continue to ignore what is habitually and "typically cast into the shadows" where we are, as a consequence, prevented from "detecting (seeing, hearing smelling, tasting, feeling) a fuller range of nonhuman powers circulating around and within human bodies" (Bennett, 2010, p. xi). If we continue to see matter as dead, we will continue to cheat matter out of the fullness of its capacities. As Braidotti (2013) argues, we already live and inhabit social reality in ways that surpass tradition where technological innovations including advanced prosthetics, reproductive technologies, and genetically modified food are all such familiar facets that distinctions between human and nonhuman become non-tenable. Yet, paradoxically, despite the complexities of a world, "where people… knowledge, values and ideas travel, cross national borders and encounter each other" (Olsson, Dahlberg, & Theorell, 2015, p. 717), education – especially early years education – continues to favor reductionist thought (Cannella, Pérez, & Lee, 2015; Dahlberg, Moss, & Pence, 1999/2013; Holmes & Jones, 2016; Moss, 2016).

Following Law (2004) we ask: Can we "unmake our methodological habits"? Can we live without the desire for certainty? Can we "unmake our desire and expectation for security" (Law, 2004, p. 9)? If, as both Ravaisson (2008) and Deleuze (1994) argue, habits are what render the subject coherent to itself where they serve as ontological anchoring points to "the ongoing flow of experience" (Lapworth, 2015, p. 5), can we and should we be implicated in intra-actions that might overwhelm such coherency? If, as Massumi suggests "habit is the body's defence against shocks of expression" (Massumi, 2002, p. 28), is it ethical to disturb such defenses? In attempting to answer these questions, we look to both Ravaisson (2008) and Deleuze (1994) who both similarly note that it is within the turmoil of overwhelming movements that there become possibilities for "cleaving open a conduit for action and response" (Lapworth, 2015, p. 5), thus positioning habits as sites for making change possible.

The following section of the chapter focuses on ways to tilt our mundane methodological and thinking habits. Resisting the habitual parsing of dull matter and vibrant life worlds, we try to rethink our thoughts as we get caught up with the movements and processes of ordinary affects.

Conduits for Action and Response: Ordinary Affects

Work emerging from the "affective turn" (Bennett, 2010; Clough, 2007; Deleuze & Guattari, 1987; Massumi, 2002, 2015) relates to bodies, but as Guillaume and Hughes (2011) point out, the *human* body is not the focus of thinking here, as a concept, nor as a context. "Bodies" are Spinozist configurations.

> . . . not defined by form, rather it is the potential of motion and rest and the effects of the body's motion and rest in relation to other 'bodies'. In this case, a body is considered to be an 'infinite arrangement of particles', (Deleuze, 1992). . . which could be anything; an animal, an idea a collection of things or people. (p. 24). . . (Wood, 2014, p. 24)

So, for example, the power of bodies (the particles, odors, shape, surface textures, and concept that constitute a cardboard box) to affect other bodies (the biological, physiological, sensorial, emotional, and cognitive apparatus of the human) includes a "corresponding and inseparable" capacity simultaneously to be affected (Bennett, 2010, p. 21). This means that the boundaries that might traditionally prescribe subject or object, life or matter, dull or vibrant are confused, even eradicated to produce a series of intra-active, fluid relations. Importantly, this notion of correspondence and inseparability is not about identity and fixity but about motion and rest and being in processes. As Deleuze and Guattari write:

> We know nothing about a body until we know what it can do. . . what its affects are, how they can or cannot enter into composition with other affects, with the affects of another body, either to destroy that body or to be destroyed by it, either to exchange actions and passions with it or to join with it in composing a more powerful body. (Deleuze & Guattari, 1987, p. 257)

Key writers in this field consider affect as something pre-individual, coming from "outside" bodies (Massumi, 2002; Thrift, 2008), yet passing over and through bodies, becoming constituted in feeling and eventually hitting "the cognitive apparatus" (Knudsen & Stage, 2015, p. 4). Along with many others (Ahmed, 2004; Blackman, 2012; Brennan, 2004; Knudsen & Stage, 2015; Thrift, 2008), we are interested in the potential of "affect" to erode our anthropocentric habits, transforming the way we think about and approach empirical work, particularly the traditional colonial relationship between the vibrant human "interpreter" and the dull or dead "interpreted" material.

For Knudsen and Stage (2015), the relationship between affect and research lies in researchers being able to generate agendas and ask questions relating to affective processes, collect or produce embodied data, and make sense of the data in the production of academic knowledge. Our interest lies in rethinking how affect pushes us toward a "zone of inventiveness" (Knudsen & Stage, 2015, p. 3) or methodological creation, by becoming attentive to "data" in new ways, generating new types of empirical materials, and, as Knudsen and Stage suggest, "collect[ing] material that has previously been perceived as banal or unsophisticated" (Knudsen & Stage, 2015, p. 3) and mundane or ordinary. We are interested in the affective powers of particular material relations (Svirsky, 2015, p. 50).

Mindful that when working creatively we need to develop better understandings of affective methodologies, there appears to be an urgent need to work through what bodies of movement, rest, and affect might *do* to each other and to all participating entities. In what way might thinking is this way be useful methodologically? What are the implications ontologically and epistemologically? We need to grapple with generating affect both in terms of its generative potential and in terms of its capacity to trouble us. Where the objective is to *register* affect in research, there is then an

investment in entering an event/situation/encounter with the goals of becoming-with, entanglement, presentpresence, attending to the microscopic, observation, and documenting processes. Research methodologies such as performances and practice experiments intended to *generate* affect might include being performative, orchestrated, choreographed, deliberately provocative, and expansive.

Hickey-Moody (2016) claims that practice as research remakes/remaps/reconfigures how a given subject is constituted. This is because affective methodologies designed to generate affect change subjects. We argue, therefore, that research must be transversal, that is, able to follow or sense the multifarious connections and intensities that coalesce in events. It must also be oriented toward eventualities that cannot be foreseen and avoid privileging human agency. Yet degrees of caution are necessary given that there are clearly ethical implications surrounding the effects of the affects. That is, we have an ethical responsibility in terms of what we do and what that does.

Methodological Creations

This next section of the chapter moves across two research projects to potentiate/illustrate our creative methodological movements. Firstly, we turn to *2-Curious* (2013–15), a Manchester-based continued professional development (CPD) program developed by researchers and academics from Manchester Metropolitan University in partnership with four early years settings, in Greater Manchester. Secondly, we turn to *Knotknowing Diversity in Early Childhood* (2016–ongoing), in a London-based early years setting with educators and children aged 8 months to 5 years.

The *2-Curious* CPD program was prompted by the UK Government's initiative "Two year old early education entitlement" (DfE, 2011, 2015) that allows eligible children to receive free early education and care. As a policy it seeks to "improve outcomes for identified two year olds who would benefit from access to high quality early years and childcare provision" (DfE, 2015). In terms of "eligibility," this is based on economic factors (e.g., receiving benefits such as income support or tax credits where there is an annual income of under £16,190 before tax) as well as factors associated with risk and vulnerability (e.g., a child who is being looked after by a local authority or a child who is receiving a disability allowance). This policy initiative follows a global pattern of many other programs that are targeted at disadvantaged young people where the idea of "improving outcomes" infers that, first, these have been predetermined, and second that professional knowledge production and application will be concerned with and based on the certainty of the results (Biesta, 2007; Cannella & Soto, 2010). Educational settings, including mainstream primary schools, which offer the 2 -year-old entitlement, have, almost inevitably, become embroiled in what Dahlberg and Moss (2005) describe as "seeking the best methods and procedures to delivering predetermined outcomes" (cited in Olsson, 2009, p. 81). It is this mundane "inevitability" that our research sought to destabilize, interfere with, and, at times, disrupt. Wallins graphically captures much of what we sought to interfere with:

> Regulated like zoo animals, teachers and students trace a deep rut at the threshold of their cages, habitually drawn back upon a course of life set out in advance. That is to say the curriculum-as-plan constitutes a ready made territory that always already marks a threshold for what should be thought or produced pedagogically. (Wallin, 2013, p. 198)

At its simplest, the 2-Curious research project is characterized by the Deleuzian concept, of "always becoming" where intra-actions between bodies, affect, matter, materials, practices, politics, objects, discourses, and theories simultaneously work with old habits while potentiating different habitual manifestations. The CPD sessions that were developed were understood as "points of affective openness to the strangeness of life itself" (Mitchell, 2010, p. 89). The aim therefore was to plan, implement, observe, and analyze six experimental sessions that would unsettle the habits, practices, and assumptions of those working with "disadvantaged" or "funded" 2-year-olds.

At this point, we plunge into the middle of one of the 2-Curious CPD sessions because, following Deleuze (1994) to push, sink, and flounder in the middle potentiates degrees of strangeness. MacLure elaborates further when she writes, "The middle can be a depthless and directionless (non-)place where subjects and objects no longer behave themselves or take up the places allotted to them by the rules of theory, methodology, or institutional discourses" (MacLure, cited in Cannella, Pérez, & Pasque, 2016, p. 107). It is the middle that we momentarily find ourselves working with(in) thought and ordinary affects, trying to tilt our own methodological habits.

In this particular CPD session, various agents including cardboard boxes of various sizes, together with practitioners, researchers, space, and other physical and physiological bodies, activated various intensities, unpredictable mobile fault lines, and energetic currents.

Video stills from 2-Curious CPD Project 2013

"*Close your eyes… can you feel*
the box with other parts of your body other than your hands?"
"Does your box have any taste?" (Session leader, 2014)

The particles, forces, and odors of well-worn cardboard boxes renegotiated the boundaries and sensations through intra-actions between bodily flesh and matter. Lines of flight traveled unpredictably provoking resonances that moved across and within bodies. Intimacy traversed between prosthetics where the diluted, dissolving boundary between box/body produced and procured sudden impulses. Strange encounters interrupted and fractured the familiarity of a hug. Movement was released and given permission to unfold in unexpected ways, ways that were neither dependent on nor attached to predetermined outcomes. Bodies were allowed to speak in the subjunctive "what if?" rather than tied to habit.

As an object the cardboard box is deeply familiar in early years settings. Children climb and hide in them. They are useful containers for practitioners to pack and store resources. Such a habitual relationship insists that the box being is constituted and characterized as dull or dead matter where the human body has vibrancy, life, and agency. Within this well-trodden furrow, the box is no more than ". . .'dumb matter' to be molded or informed by human interpretation or inspiration (Massumi, 2002, p. 173)" (MacLure, 2013, p. 228). The CPD session sought to undermine such an impoverished encounter between human and nonhuman bodies. The session (and us as researchers) struggled to think about what might emerge from Bennett's "corresponding and inseparable" capacity of different bodies to be affected by and simultaneously affect each other (2010). How could we think about unravelling the body's organization and unmaking "our thousands of component habits" (Deleuze, cited in Hroch, 2015, p. 61)? Mitchell posits such work as an affective event:

> . . . it does not begin with the attributes of the 'object' in order to define it as if it were something static that can be described and understood. . .. The 'object' on its own is not sufficient; it is also necessary to include its affects . . .. (2010, p. 28)

Bissell suggests that our habits of thought are open to transformation both through "subtle alteration and gradual, incremental change" (Bissell, 2012, n.p.) as well as "more sudden irruptions in the tissue of experience brought about by the shock of an encounter" (Lapworth 2015, p. 3). Provocations of shock and discomfort that were prompted by the unexpected imbibed the (extra)ordinary cardboard box with "surging capacities to affect and to be affected." Set within the assemblage, something was released, where a continual motion of relations, scenes, contingencies, and emergences unfold. Impulses were triggered. Sensations, expectations, daydreams, encounters, and habits were set in circulation. Non-hierarchical attachments formed where different bodily allegiances were constituted. "Something that feels like something" happened (Stewart, 2007, p. 4). For one actor this "something" was articulated as *acute discomfort*, made more so when *my eyes were closed*.

There are two significant points we want to make at this juncture. The first centers on Barad's "practices of diffraction, of reading diffractively for patterns of

differences that make a difference" (Barad, p. 49, cited in Dolphijn & van der Tuin, 2012). We want to suggest that in the cardboard box CPD session, where multiple entanglements occurred, various and varied irritations happen. These allow for careful readings "for differences that matter in their fine details," together with the recognition that "intrinsic to this analysis is an ethics that is not predicated on externality but rather entanglement" which, as Barad argues, are "respectful, detailed, ethical engagements." In brief, "diffractive readings bring inventive provocations; they are good to think with" (cited in Dolphijn & van der Tuin, 2012, p. 49).

"Acute discomfort" as a practice of diffraction calls into question what is ordinarily and customarily expected from continuing professional practice where typically the focus is on consolidating and extending individuals' strengths. As Stewart points out:

> The ordinary can turn on you. Lodged in habits . . . it can flip into something else altogether. One thing leads to another. An expectation is dashed or fulfilled. An ordinary floating state of things goes sour or takes off into something amazing and good. Either way, things turn out to be not what you thought they were. . . The ordinary is a thing that has to be imagined and inhabited. (2007, p. 105).

In these encounters, matters of fact, including those relating to boxes and humans, intra-acted with matters of concern and matters of care which emanated into resonances and dissonances. It is these that "make up diffraction patterns that make the entanglements visible" (Barad, 2003). Kirby follows a similar trajectory when she writes, "matter appears as something that is not only spoken about or spoken with, but rather as itself simply *speaking*. Nature and culture, word and flesh are "all emergent *within* a force field of differentiations that has no exteriority in any final sense" (Kirby, 1997, pp. 126–127, original emphasis). Perhaps, it is "beneath the generalities of habit in moral life we rediscover singular processes of learning" (Deleuze, 1994, p. 28).

The second point relates to the question of seeing, where having one's eyes closed exacerbated feelings of discomfort. Deleuze and Guattari (1987) urge us to use our eyes differently.

> *I felt uncomfortable closing my eyes. . . it made me feel vulnerable*. (participant, 2-Curious, 2014)

Deleuze and Guattari intimate that the habits of the eyes, as organizing forces, render things already known, legible, and over-coded. A body's organizational habits dictate that seeing is a function of the eyes, breathing is a function of the lungs, and thinking is a function of the brain, yet "My eyes are useless, for they render back only the image of the known. My whole body must become a constant beam of light. . ." (Deleuze & Guattari, 1987, p. 190). In the data above, the methodological idea of *closing my eyes* is interesting in relation to opening up the body to different encounters where without the principle of organization, bodies are

afforded new kinds of existence. What work does this action do to habits *of* the body, *of* sensations? What might happen if we were to close our eyes and "see" otherwise?

> Is it really so sad and dangerous to be fed up with seeing with your eyes, breathing with your lungs, swallowing with your mouth, talking with your tongue, thinking with your brain, having an anus, a larynx, head and legs? Why not walk on your head, sing with your sinuses, see through your skin, breathe with your belly… Where psychoanalysis says, 'Stop, find yourself again,' we should say instead, 'Let's go further still, we haven't found our BwO yet, we haven't sufficiently dismantled our self. (Deleuze & Guattari, 1987, p. 51)

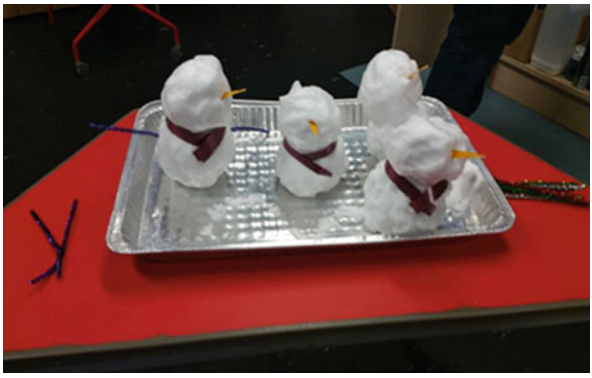
In the event of *closing my eyes*, the participant was returned to the "thingness" of the box, evoking a sensation of vulnerability and performing a process of dismantling the habits of looking, seeing, coding, and interpreting. Dismantling some of the habitual functions of the face means no longer looking with her eyes "…but to swim through them, to close your eyes, to close your own eyes, and make your body a beam of light moving at ever-increasing speed" (Deleuze & Guattari, 1987, p. 187). The box and that which is ordinarily and habitually attached to a box took on another form where its textures, edges, sound, and tastes were entangled with parts other than the eyes. Both as a concept and as an object, the box began to shift, where it was encountered as "sensation." As with Picasso's figurative paintings that overturn the rules of appearance, "so that form could pass directly from the eye to the stomach without going through the brain" (Francis Bacon cited in Deleuze, 2013, p. 38) so too did the box. We suggest that in moments when eyes were closed, encounters with the form of the box passed directly from the hands, or mouth, or cheek to the stomach, as sensations, which as Massumi notes, "…call habit to eventful attention. They impinge with force. They impact. They arrive, and insist …" (1998, p. 155). We would argue that the sensations of becoming *uncomfortable* and *vulnerable* are produced as part of a process of mutual constitution of the body (subject) and cardboard box (object), two entities that, after *closing my eyes*, only became relationally distinct and no longer seemed to exist as separate individual elements.

Continuing to take ordinary, mundane matter and practices found within early childhood landscapes, the chapter moves to the Ladybird Room, in London, at Christmastime. The Ladybird Room is "the toddler room," but it is also a space occupied by nonhuman and other-than-human agents. It is a familiar environment, looking remarkably like many other "toddler rooms" in nurseries up and down the UK. But in many senses, the Ladybird Room in its mundane, familiarity is extraordinary; it holds the potential to generate fresh understandings about "multiculturalism" in early childhood when attention is paid to entanglements and the material-semiotic-discursive processes through which diversity manifests in unexpected ways.

Like 2-Curious, this study demanded a sense of researcher as non-expert be embraced and to take up Haraway's (2016) invitation to "Stay with the Trouble" so that habitual practices of gathering, recording, coding, and interpreting might be dismantled and so generate other ways to encounter and sense cultural diversity. Working to rethink habitual practices in research urges a focus on the small stuff, the intra-actions between researcher, spaces, place, matter, and sensations. Allowing ourselves to get caught up in movements and processes, sensing the multiple intensities that coalesce in events – but all the while retaining the political imperatives underpinning research in and for early childhood.

Rethinking, refeeling, and refolding ideas about diversity in early childhood involve attention to micro-events, ordinary routines, and mundane situations, sensing intensities and what MacLure (2015) terms "glow" moments, to be open to what else might be there and to reconfigure and stretch ideas about diversity and difference and how it is produced through everyday, seemingly unremarkable events and intra-active processes. Without clear intent, the research sought to register the messy entanglements of matter, affect, and bodily expression during "events," celebrations, and festivals (e.g., Christmas) to reimagine how cultural diversity and difference play out, are embodied, and are expressed in early childhood contexts.

Guiding the study was the goal to generate multiple and experimental ways of (not) knowing and so avoid getting stuck in familiar ways of thinking and doing. Reconfiguring diversity in early childhood contexts involved multiple processes of charting the terrain and experimenting and resisting the comforts of recognition, reflection, and identification.



I am immediately hailed by a congelation of shaving foam snowmen [sic]; carefully crafted, uniform in size, some adorned with scarves and noses, left for future play/work– for now, neglected snowmen sit expectantly. A line of empty shaving foam cans by the sink suggest snowmen are a regular, habitual feature of the pedagogical practices within Ladybird Room.

What does shaving foam make possible?

Near-empty cans of shaving foam invite a trio of boys. Squirting, spluttering, hissing, ceasing to offer smooth balls of foam, noisy spray, laughter, mess. Two girls become entangled, shavingfoamsnow sprayed over the carefully prepared and expectant snowmen: "It's a blizzard, look it's snowing, we've made a blizzard". Animated laughter, slowly, painfully slowly, the can empties; entranced by/through chaos, mess, noise. In mock horror: 'What's happened to my snowmen!?!'

A vocal undertone suggestive of displeasure, frustration, deflation. Handfuls of 'snow' squeezed through fingers, passed from hand to hand; delving back into the blizzard mound for fresh handfuls, laughter, joy, concentration, pleasure. A sheet of boggly eyes – no use to the buried snowmen. Children becoming snowmen –boggly eyes stuck to cheeks, cut-out carrot noses stuck to faces with blobs of shaving foam – hilarity –jumping – up-down-up-down-flapping-circling – jumping eyes that boggle. Soon all the children, and the researcher are jumping high to make the extra eyes boggle. Raucous laughter, frenetic energy – still the snowmen remain buried and neglected. . ..

Meanwhile a lone girl with a slight frame sits quietly at the next table, deeply engrossed, crafting Christmassy shapes from Play-doh (green with red glitter mixed in). Methodically rolling and cutting the dough with Christmas shape cutters. Completely divorced from the shaving-foam-blizzard-boggly-eyed-bouncing assemblage at the next table. Doesn't speak; wondering: is English not her first language? Fair black skin, delicate features, tightly braided hair, cornrows. Children move to the play-doh table: invasion . . ..discomfort, searching looks for an adult, communicating without words or signs, both move gently to the abandoned shaving foam table.

What does the shaving foam snow make possible?

Calmness, quiet, handfuls of foam simultaneously crafted in to smooth balls. Reassured, contentment at physical proximity of the educator and absence of the rowdy crowd. Deep immersion with the foam – careful and gentle, moulding a smooth ball, extra scoops to increase the size of the ball, smoothed, swelling, all-consuming. Weightlessness of the foam produces mime-like motions. How unlike snow shaving foam is – not cold, not wet, no crunch, no solidity at all. Wondering: has this girl ever handled 'real' snow?. . ..

What does the shaving foam snow make possible?

With time and care a fresh set of snowmen are crafted by this lone girl and the educator – working in parallel, without interaction or words spoken they have an ease about their relationality and familiarity with the task. The educator intermittently assists (party hats down from a high shelf, scissors, something else and something else) – the educator leaves the girl by herself; seems unfazed. . . children approach the table – she stops – she freezes –remains mute, expressionless but frozen. They move away, she resumes shaving-foam-snow. The crafting of snow balls, texture of the foam. . .calming, all-consuming – as with case with the play doh previously. Wondering: how matter matters.

These observations might generate familiar thoughts. Deconstructing and critiquing take us to familiar places both theoretically and politically. Interpreting that which appears to be represented in this scene (re)tells stories about race and ethnicity, gender, SEN, ESOL, and pedagogical practices that are all too familiar. Putting to work feminist new materialism makes materiality and entanglements the starting place and enables us to rethink thought. We are freed from the anthropocentric concern to know and fix the child-subject. We are offered other, less certain possibilities. The shaving foam makes possible other ways to rethink thought about early childhood; cultural diversity manifests multiply through the events, the entanglements, and the assemblages as fleeting, fluid, shifting, co-constituted, and processual rather than fixed and residing within the subject. Taking the cardboard box and the shaving foam snowmen as multiple and interwoven material-semiotic-discursive entanglements provides us with something to think with.

Working with post-humanist epistemologies opens up possibilities to chart curriculum frameworks and research methods against what unfolds in the routine, everyday events in nursery environments – possibilities emerge between the porosity of discursive discourses and materialized practice. Dominant discourses readily perceptible include child development, multiculturalism, scaffolding pedagogies, free flow, social interaction, sensory play, and so on. But Haraway's practice of becoming-worldly-with begs that we consider the inter- and intra-relationality between human, nonhuman, more-than-humans, and everyday life and how it is situated politically, historically, and geographically.

Bennett (2010) shifts focus from the human experience *of* things to things themselves. She explores how political analyses might change if we acknowledge that agency always emerges in the ad hoc configurations of human and nonhuman forces. Recognizing that agency is distributed in this way, and that it is not solely the province of humans, might spur the cultivation of a more responsible, ecologically sound politics: a politics less devoted to blaming and condemning individuals than to

discerning the web of forces affecting situations and events. Taking the cardboard box; taking the shaving foam as something to think with, as a means to figure; and putting to work Bennett's ideas of "thing power" and vital materialism in early childhood contexts, we might ask: What does *becoming shaving-foam-snow* make possible? How does it function and connect with other things? What intensities does it stimulate or allow or refuse? What traces does it leave?

This questioning can prompt investigations into the assemblages of relational entanglements within the event itself: boggly eyes, too small furniture, cornrows, music, clocking practices, food, mirrors, hissing, silence, jumping, flapping, laughter, dismay/frustration, inclusion/exclusion – but also what informs the agents within the assemblages and where they might take us. These complex assemblages of relational entanglements offer another way to consider the politics of seemingly inconsequential events and everyday occurrences within early childhood contexts. In order that educators and researchers might persistently grapple with so as to produce alternative and more expansive understandings that might offer the space to collectively identify and reimagine *matters of concern* and *shared problems* in early childhood contexts. Educators are offered the chance to become entangled with the materiality of their practice in ways that enable a critical engagement with the structures of policy, curriculum with which they are expected to work and which they in turn shape.

The not-knowingness of research framed by feminist new materialism means that we cannot know in advance what will emerge, but it invites an exploration to try things out that might not work. The goal of research in this mode of inquiry is more open-ended and shaped by uncertainty. It is research that invites us to be curious, to wonder, to wander, to question, to falter, and to recognize that we do not have the solution because there is no one solution. But there are ways in which we can open ourselves to the not yet and not known rather than falling into old orthodoxies about what we think we know about childhood, diversity, and education – that merely reflect back and reinscribe.

We need to stay with the trouble of children's matters of concern as experienced and witnessed in everyday encounters and routine events. Expanding our conceptions of the child, beyond humanist concerns with the subject, to children as entangled and of the world creates ways to reshape ideas about pedagogical and research practices, advocacy, and activism. The becoming-shaving-foam-snow provides a "reference point for new questions, new practices and new values" (Stengers, 2010, p. 5). It creates spaces for entanglement to offer generative possibilities to pursue ambitions for experimental and creative, politically framed practices that offer generative potential.

Concluding Rethought Thoughts

Previously we made the point that when (re)search(ing), the desire was to allow for the play of intensive forces because it was within and among these that there were possibilities for challenging habitual ways of thinking and habitual ways of claiming

knowledge. We would like to suggest that both of the examples assemble human and nonhuman bodies, which in turn constitute both "an event and a sensation" (Stewart, 2010, p. 4). We want to also suggest that the two examples are imbued and carry with them forces and movements that in our view work against the "convulsive tics," that is, the "machinic repetitions" that can characterize research and which "serve to curtail the subject's capacity to affect and be affected, and which limit the field of possible becomings" (Ravaisson, 2008, p. 51).

Finally, the examples avoid making definitive claims, and in so doing, they both work at diminishing the role and position of us as researchers. So rather than being positioned as "agents on hot pursuit of something definitive," we are caught trying "to become attuned to what a particular scene might offer" (Stewart, 2010, p. 5).

Abstract

Since the 1980s, research practices used to investigate children and childhoods have experienced a philosophical upheaval, with challenges to traditionally designed research, invoking epistemological and ontological shifts. Both epistemological and ontological shifts have brought to attention the complexity and plurality of children and childhoods and highlighted its epistemologically unstable structures. In this chapter, we follow this trend to problematize the thinking in childhoodnature inquiry that perceives methodology as a set of fixed, controllable, foreseeable, neutral, and a-theoretical practices, which ultimately repeats and reproduces ontological and

epistemological sameness. In resisting this status quo, we draw on post-qualitative scholarship, inspired by post-human theories of difference and relationality, who maintain ontological worldviews and methodological practices as fluid, dynamic, and unstable, founded within dimensions of uncertainty. In calling for divergent methodological practices in childhoodnature inquiry, we make connections between the foundational theories of Piaget to the innovative and radical work of Gilles Deleuze, suggesting such frameworks provide a leaky, yet productive, architecture for a rethinking of methodological practices. The notion of leaky architecture enables a rethinking of binary language to invite movement and relationality: between subjects and objects, children and adults, and theories and methods. This chapter ends with a call for porous, fluid, and brut methodological practices as a way to adhere to movements of the unrefined and leaky nature of childhood as well as methodology.

Introduction: Beginning in the Middle

In this chapter we problematize methodological thinking in childhoodnature inquiry which is usually perceived as a set of fixed, controllable, foreseeable, neutral, and a-theoretical practices often aiming to repeat and reproduce onto-epistemological and conceptual sameness. Since the 1980s, methodologies researching children and childhoods have gone through philosophical upheaval, including ontological and research design-related developments. Both epistemological and ontological shifts have brought into attention a complexity and plurality of childhoods and highlighted its epistemologically instable structures. These shifts have also altered the ways in which children and childhoods are theorized, studied, and researched and have reconstituted childhoods as epistemologically instable structures.

Similarly, to children and childhoods, "nature" is a very complex notion. It is beyond the scope of this chapter to explore all the complexities associated with brutal, romanticized, and naïve versions of nature related to children and childhood, including the notion of urban/nature/childhoods (Duhn, Malone, & Tesar, 2017). Our "beginning in the middle" builds on the notion that there is nothing static about children and childhoods: these are continuously moving structures that highlight the "methodology of a subject" as decentered and children as part of shifting connections within/in/alongside nature, more-than-human assemblages, and fields of relations.

Our argument follows post-qualitative scholarship inspired by the ontologies of difference and relationality, where methodological thinking appears fluid, unstable, and with uncertain dimensions. Moreover, the various exciting contemporary research projects reflect how post-qualitative inquiry has embraced philosophy into methodological thinking and doing (see, e.g., Lather & St. Pierre, 2013). Furthermore, authors of this chapter are also involved with thinking and doing philosophy as a method (e.g., Koro-Ljungberg, Carlson, Tesar, & Anderson, 2015). Post-qualitative thinkers have also introduced concept as a method (Lenz Taguchi, 2016) and practices of thinking with theory (Jackson & Mazzei, 2012).

Furthermore, conceptual and theoretical work "against the method" (see Law, 2004, 2006, Lather & Smith, 1997) already started some time ago, and this chapter continues and expands the anti-method critique by imagining methodologies-in-making, methodologies which might not carry the name of methodologies (see Koro-Ljungberg, 2016), and by revisioning how practices beyond the singularity of method could be (re)conceptualized and (un)practiced in the context of childhoodnature inquiry. Methodologies, as conceptualized in this chapter, are always methodologies-in-making in childhoodnature inquiry, inspired by various forms of critical/postmodernism standpoints and post-theories (Fig. 1).

Post-human scholars, such as Braidotti (2013) and Barad (2007), have critiqued anthropocentric ethics and ontologies. Methodological practices as "post-moves" (e.g., movement toward postmodern, poststructural, post-colonial, and post-human inquiries), and. . .and. . .and ongoing material and relational reconceptualizations bring forward potential ways to challenge dominant, rigid, and close-ended research approaches. In particular, these methodological choices problematize the role of generalizable and objective scientific method and methodologies in the context of learning, education, and childhood studies. However, it is important to acknowledge that even though we use the notion of "methodology" in this chapter to engage with broader methodological discourses, we find this term and concept increasingly problematic, and as such we call for serious creative and practice-based departures and breaks with tradition. In such thinking, the methodological question is no longer how to study children and childhoods in separate, developmental, and individual contexts, but how children and childhoods are constituted and positioned in childhoodnature inquiry, how childhoodnature inquiry functions, and how children relate to the other in a continuously changing the world of relations, power, and more-than-human. Thus, research questions and study purposes look, feel, and taste different, once we seriously consider and do post-turns. Furthermore, methodological practices, traditionally employed in childhoodnature inquiry, are challenged through scholars' reconceptualization of post-qualitative childhoodnature inquiry.

Our thinking in this chapter addresses and in many ways exemplifies ontological repositioning, repositioning that brings into the focus philosophy, relationality, complexity, and materiality. We discuss connections to relational ontologies that shape the enactment and production of philosophy as a method (see also Koro-Ljungberg et al., 2015). Relational ontologies bring theories to work and practices to theory constituting scholars, participants, and children as important parts of these relations, thus functioning as a continuously shifting process, transforming "method" and thought in the act (see also Manning & Massumi, 2014). Such a destabilizing and collective "method" uproots established humanistic (read human-centric) epistemologies and fixed anthropocentric ontologies covering a vast territory of thinking, relating, caring, and doing. We encourage readers to consider how theories enter practice of care, how thought in the act functions, how methodologies gain their relational traction, and how "thinking" and "doing" philosophy as a method shapes and is being shaped by relational ontologies, then and now, and what role post-humanism and new empiricisms play in these relations. We ask ourselves a question: how are methodologies and methods functioning in these relational spaces of childhoodnature inquiry?

Fig. 1 Fluidity 1

After the post-qualitative and material turn in ontology, methodologies and methods can no longer be viewed as containers that clearly separate inside from outside, self from other, or method from intuition, philosophy, or creativity. Similarly, Manning (2013) writes about skin as a container, where we draw a parallel to methodological discourses. "What if the skin [methodologies] were a porous, topological surfacing of myriad potential strata that field the relation between different milieus, each of them a multiplicity of insides and outsides?" (pp. 1–2). These kinds of porous methodologies are collective and relational. As a result of relationality and endless actual and virtual connectivity, "methodological sums" are always more than their parts. Methodological foldings bring into appearance both the strata and the immanence of matter, content, form, substance, expressions, and creative forces. Instead of independent singularities, methodologies might function as dynamic forms and forces of relationality and worlding that refuse categorization (see also Manning, 2013). Through this premise, we relate childhoodnature to an assemblage of concepts following a line of thinking that especially draws from post-method movement, relationality, and "methodologies without methodologies" (Koro-Ljungberg, 2016). In this chapter we offer brut, fluid, porous methodologies as potential methodological forms and examples of uncertain processes of inquiring into difference, and. . .and. . .and inquiring into difference differently.

To disorient the reader (in the hope of generating alternative paths to think and practice childhoodnature methodologies differently) and offer closer proximity to our "structures without structure," we have composed parts of this chapter as brute and unfinished relations and dialogical encounters between different discourses, voices, and perspectives. We share thoughts related to philosophy as a method and how thinking through a Piaget-Deleuze continuum or mobile space could assist us to reconsider methodological relations. We also carry on a conversation about the childhoodnature and relationality embedded in children nature spaces, places, and practices. Words, phrases, signs, images, and utterances in the middle serve as connectors, traces, and linkages between different thoughts and discourses. This way we also show how text and childhoodnature methodologies are productive and generative, yet they might resist generalizability, easy digestion, simplicity, and linear logic.

Childhoodnature Inquiry

From our perspective, philosophy as a method brings theory into the practice and ontologies into the research processes in different ways. For example, philosophy as a method represents a potential yet functional oxymoron and intriguing paradox forcing readers and users of methodology to give up their potentially fixed and overly normative uses and definitions of a "method." Philosophy as a method challenges existing practices and theories by connecting to other circuits, embodying critical questioning, and potentially pointing to the paradoxes and limitations of our

current schemas and conceptualizations. Philosophy as a method embraces thinking and the epistemological, ontological, and ethical relationship with a thought (Fig. 2)

It is possible that the diversity of post-qualitative inquiry proves the flexibility and plasticity of the research design within which it counts as research. Furthermore, thinking with and about thought and conceptualizing philosophy as a method could lead qualitative inquiry toward, but also beyond, the unthinkable. Thinking the unthinkable (alongside, with, or through philosophy) refers to the undoing of research design and categories, assumptions, and models. Conceptual and theoretical hybrids, leaps, arrests, and slips produce methodological surprises, which may enable the creation of methodologies which might mimic the creation of concepts (see Deleuze, 1991). When philosophy is brought into a method and/or seen as a method, method can no longer be treated as an objective set of procedures, automated activity, or a predetermined, single, and simplified task. Instead, philosophies create conceptual movement, critical questioning, and diversity in a thought-in-the-act where thinking and doing blend and interact continuously and seamlessly with the "other." In this sense, Law (2004) argues that method is about a way of being and the type of science (about ontological decisions) it chooses to practice. Method is not only reflective of ontology, but it ontologizes, and it reinforces ways of being and thinking. Therefore, we encourage the reader to think about slow methods, vulnerable methods, modest methods, and silent and silenced methods and explore experimental diversions from what would normally be thought (Fig. 3). And.

Methodological studies about children and childhoods perform the role where child as a human subject forms a center of an injury. As we have argued above, the focus or parameter of inquiry and knowledge in childhood research has changed throughout the years. First, the focus shifted from researching on a child to researching with a child and by a child. The recent methodological thinking challenges the role of human subject (including a child) on an ontological pedestal. And as such, a child's role and functioning in the world, agency, and independency and so on have been continuously reconceptualized, moving from children being objects of inquiry to be measured, observed, and hypothesized about (through objectivism, positivism, and other ideologies) toward children as relational subjects, becoming intra-active elements of inquiry (through post-inquiries). Through these methodological lenses, children are perceived as capable of creating their own interview data, talk, materials, and artifacts (see subjectivism, interpretivisms), but also, as per the theory argued above, children are too being conceptualized as a part of intra-active assemblages, constituted in more-than-human relations (postmodernisms, new materialism). These shifts and transformations have also influenced how knowledge, scholarship, and methods have been conceptualized and carried out in relation to children and their worlds. We argue that as thinkers shift and reconceptualize the role of the child (e.g., in relation to more-than-human world), methodologies and methods also need to be rethought and reconceptualized. It is for the scholars of today's post-human and more-than-human world to take on this challenge to move beyond stable, fixed, objective, or even subjective methodological thinking and imagine methodologies that are possibly porous, fluid, and brut.

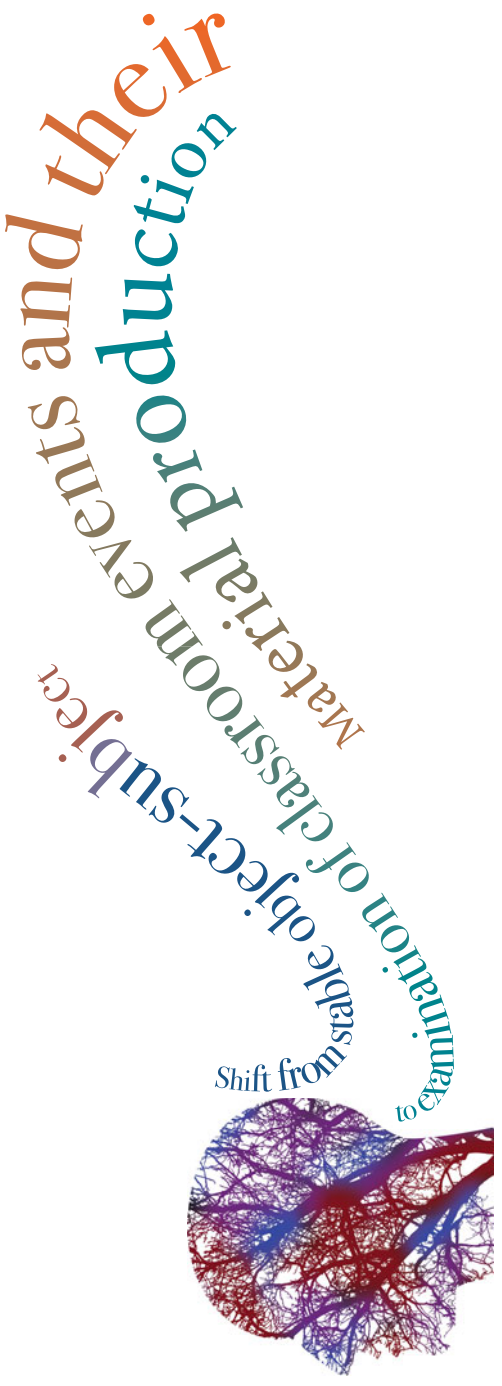

Fig. 2 Fluidity 2

Fig. 3 Fluidity 3

Porous, fluid, and brut methodologies can be traced through the ontological turn, which educational researchers recently have extended to childhood and children. We are exploring such ontological positionings of children and their childhoods. We can also see traces of porous, fluid, and brut methodologies: studies that address issues as diverse as policy documents on the rights of children (Dahlbeck, 2014a), children's movement and play (Land & Danis, 2016; Rautio & Winston, 2015), and the sounds and listening practices in early childhood classrooms (Schulte, 2016). These studies critique not only notions of childhood subjectivity but also stable and inert conceptions of material and ontological reality. For instance, Dahlbeck (2014a) found in the Swedish declaration of children's rights assumptions of child subjectivity based on universal essences and forms without a consideration of the relational production of childhood being. Such an understanding limits the role of ethics, or even that of a teacher, to "developmentally appropriate" behavior as opposed to attending to the facilitation of social encounters and events (p. 538). This methodological lens forms one response to concerns surrounding the limitations of universal child subjectivity. Thus, researchers have shifted their focus from stable object-subject interactions to the examination of classroom events and their material productions. Both Land and Danis (2016) and Rautio and Winston (2015) consider the events of movement and play not as a means to an end but as an end in itself, suggesting that such activities (movement and play) afford space for contradictory and critical ways of knowing and being in the world (Rautio & Winston, 2015). Through new ontologies and nontraditional methodologies, authors hope to get teachers and curriculum developers to think away from best practice and outcome-oriented pedagogies toward the relational and spatial makeup of classrooms and how interactions produce different classroom environments.

Childhoodnature inquiry is both an attractive concept in which children are positioned and a potential binary as well. It depends which methodological lens, and what methodological choice, we decide to make. For example, working against environmental and geographical borders, clear distinctions between urban and rural, organic and toxic, manufactured or "wild natural" child, and so on, we propose porous, fluid, and brut ways to not only constitute child in childhoodnature relations and inquiry but also in particular rethink methodologies inquiring into this relationality. Childhoodnature relations are never singular or a one-directional position where a child is situated within as essentialized binary of a "natural human-produced (read urban)" contexts. Rather childhoodnature relationality is more complex, multidirectional, always plural, and multiple in action and process.

Piaget Connections

Returning to the beginning in the middle, Piaget's philosophy of a child dominated childhoodnature inquiry, and its ruins are still seminal in the contemporary methodology. In this methodology lies ontological and epistemological assumptions, and for many post-qualitative researchers, "method" is affected and affective. From this

perspective, a method, born of ontology, is affected by ontology, so that methods always presuppose ontology. Affective method works within its ontological assumptions. Methodology as ontology cannot preexist or be separated out from research practices and thinking-doing (see also Higgins, Madden, Berard, Lenz Kothe, & Nordstrom, 2017). Method, like subject, is without an in-itself and never comes to the event fully formed but is formed in counterpoint with it (Manning, 2013). Even the structuralism of Piaget recognizes a complex, coevolving fluidity that is ontologically prior but is then organized and structured by a human brain which can transcend it. Method tames, segments the world into identities, and places identities into relation. This method, or "science," then:

> will permit [man] to understand and find his way . . . science, which is one of the most beautiful adaptations of the human spirit and a victory of the mind over the material world. . .Now, how has it succeeded? Not by accumulating knowledge or experience . . . It is in constructing an intellectual tool of coordination, thanks to which the mind has been able to put facts in relation to each other. (Piaget, 1948/1973, p. 135)

The fluidity of relational experience cannot be merely accumulated but also must be coordinated. Coordination could be seen as a method itself, and it results in structure, however, preliminary and transient. Deleuze (1990), however, aims to maintain the fluidity of difference as an ontological principle and invent methods which preserve the chaos and complexity of ceaseless interconnections, rather than organization. For Deleuze, the methods that create the identity of form must be undone, leaving only a difference that is intensive within a univocal life force, a differing of degrees of intensity within one form rather than a multitude of different, separable, forms (Deleuze, 1990). Matter, then, does not consist of finite forms; with univocity, everything exists as "a moment of an infinite concept which encompasses everything" (Somers-Hall, 2013, p. 44). In order to be generative and creative, method might not be constricted by processes of representation, subjectification, and signification which may reduce its spheres of potential. Instead, from this perspective, methodologies create an immanent plane in which many things and bodies are implicated, swirling, merging, and coming in and out of focus, without the containment of determination of any kind. The particularities of a method serve only for "prolonging the thought-path of movement" (Massumi, 2002, p. 12). In this case, linear method stutters and fails and becomes "fraught with connections, movement and becomings" (Myers, 2015, p. 59) rather than functioning as predictable, tidy, and controlled.

What happens when we insert the thoughts and writings of Deleuze, and Deleuze and Guattari, into Piagetian epistemology? Piaget assumes relationality to be a product, or method, of man, hierarchically positioned, and not an inherent feature of a universe endlessly becoming. For Deleuze and Guattari, Piaget's account might bind us to the strata of:

> the organism, significance and interpretation, and subjectification and subjection [which] separates us from the . . . abstract machine, where there is no longer any regime of signs, where the line of flight effectuates its own potential positivity and deterritorialization its absolute power. (Deleuze & Guattari, 1980/1987, p. 155)

Piaget's structuralism is a method in which man acts upon the world, noting the effect of his actions and using this information to construct a model of the world. Structures have their origin in man's schemes of action, "no knowledge is based on perceptions alone, for these are always directed and accompanied by schemes of action" (Piaget, 1981b, pp. 23–24). Thus, there is a process of "'assimilation' of objects to the schemes of that subject [with] a necessary 'adaptation' to the particularities of these objects" (Piaget, 1981b, p. 24). Objects become represented to be incorporated into a hierarchy of humanist representation.

Deleuze and Guattari might ask about the potential of becoming that stands between the observation and its assimilation into the framework. They might ask about the potential of becoming outside of human thought; different ways to address a gap or interval in which something might escape, where something of their ontological fluidity might leak out. Piaget did not present a notion of a fixed form of development, and in this, his refusal to be tied down to a particular teleological organization appears another leak, another spark of potential to cross the gap between fluidity and form:

> the internal evolution of a person (according to the aptitudes of each one) only provides merely a certain amount of rough outlines that are capable of being developed, destroyed, or left in an untouched state. But these are only rough outlines, and only social and educational interactions will transform them into efficient behavioral patterns or destroy them totally. (Piaget, 1948/1973, p. 55)

Might such total destruction suit Deleuze's purpose as a method that frees a fluidity of becoming? Might destruction here be generative? "In dismantling the organism there are times one courts death, in slipping away from significance and subjection one courts falsehood, illusion and hallucination and psychic death" (Deleuze & Guattari, 1980/1987, p. 186).

For Piaget:

> behavior [is] conceived not . . . as a product of external 'circumstances,' but as the expression of a constant need for overtaking (extension of the environment and increase of the organism's powers) [that] would constitute in fact the principal moving force of evolution. (Piaget, 1981a, p. 280)

A continuing structuralism. Deleuze too might argue that there are never outcomes such as products, but only becoming, only the endless generativity of the assemblage, connecting a-signifying signs and making them content and expression for a myriad of functions. "That which triggers off an affect, that which effectuates a power to be affected, . . . a signal: the web stirs, the scalp creases, a little skin is bared . . . Spider-becoming, flea-becoming, tick-becoming, an unknown, resilient, obscure, stubborn life" (Deleuze & Parnet, 1977/2007, p. 61).

Responsibility Before

Piaget saw the chaos and complexity that informed the child's world, but in his constructionism, he posited child or man as structuring that content, as placing upon it a perspective that shaped that content. Piaget effectively attempted to describe man's

method for making sense of the world, man's habits of perception which became then man's habits of understanding the world and which then limit his interactions with the world. In the construction of method as in the construction of a concept, there is always and already a perspective. Concepts and methods both "cut up and combine the things corresponding to them in various and always new ways" (Deleuze, 2004/2006, p. 325). An experimentation with signs seen as forces rather than signifiers moves research away from reified sign regimes "congealed in thought through habit" (Roy, 2003, p. 15) and toward new potentials in affect. This requires the suspension of "categorisation and comprehension of the other" (Bogue, 2007, p. 13), and instead an openness to the virtual potential explored through experimenting with the affective signs of the other. What method for such an engagement?

Manning (2013) suggests a "responsibility before" (p. 72) which is an engagement with the virtual plane preformation, the porous throbbing of chaotic potentiality. Responsibility before means that we have not already positioned ourselves (Manning, 2013) but are open to creativity and experimentation, the potentialities of life that are not already concrete in "this life." Rather than an overarching structure which makes sense of and categorizes the world to facilitate man's further action upon it, what might take place are "contracts between individual bodies" (Dahlbeck, 2014b, p. 20) that are real and productive. Dahlbeck (2014b) argues for such interconnections as a "pure ontology" (p. 8) based on relations with the real, rather than the abstract, based on the fluid openness of an experimentation with ontology and with methodology that post-human sensibilities engender.

Deleuze Connections

We have argued for new ontology of a child and childhoods in a childhoodnature inquiry. What about nature? In philosophy, nature is not merely a mirror of reality, a dichotomous relationship, such as a reflection of art is of life. As Deleuze

describes, life does not imitate art but rather is intertwined with nature, like roots of a tree that intercept and weave in and out creating. Nature is a place where, "roots are taproots with a more multiple, lateral, and circular system of ramification, rather than a dichotomous one" (Deleuze & Guattari, 1987, p. 254). Nature becomes a method of creation, where thought lags behind, in the interweaving leads of roots creating "biunivocal" relationships. A non-binary relationship of multiplicities is being created in a "radicle system," where natural reality separates from a principal root, thus creating multiplicities of secondary roots undergoing a flourishing development (Deleuze & Guattari, 1987). "Because natural history is concerned primarily with the sum and value of differences, it can conceive of progressions and regressions, continuities and major breaks" (Deleuze & Guattari, 1987, p. 235) Similarly, Spinoza describes nature as a large abstract machine with its pieces being the various assemblages and individuals, creating groupings of particles, infinitely enmeshed within an infinity of relations, the whole of nature being a multiplicity of individuated multiplicities.

Conclusion: Leaky Childhoodnature Methodologies

We think differently with childhoodnature inquiry. Transferring thinking into methodological discourses, childhoodnature methodologies are always also unfinished, plural, and shifting. Furthermore, we argue that porous, fluid, and brut methodologies exemplify leaky architecture of post-qualitative research. They all speak to different dimensions of this methodological leakiness yet supporting the movement, transformation, and relationality within methodological practices. Instant, immanent, and continuously shifting multiplicities of methodologies, minor parts, and molecular processes are never a part of comprehensive, bigger, and holistic "whole," but they become possible when brut events happen and raw elements are wedded and pasted together ad infinitum. Dislodged structures, abolished and redone methods, forgotten strategies, undone theories, and dispersion of concepts inspire much methodological thinking of here and today. Elsewhere (Koro-Ljungberg et al., 2015), we have discussed qualitative inquiry and methodology brut, naïve, raw, and unfinished. Methodology brut and methodological undoings which question taken-for-granted methodological practices often evolve through relationality, plurality, and connectivity when scholars reach out to others for ideas, thoughts, and philosophies to support the reversal of the injustices of earlier research practices and traditions.

In educational research, the term porous is used synonymously with permeability. It is the movement across a border or boundary. At times, porosity is used to describe a limitation of essentialized concepts: "[o]f particular significance and importance are critical explorations of the porous border between often essentialized and essentializing categories of 'oppressor' and 'oppressed,' as well as empowerment and disempowerment" (Higgins, 2016, p. 675). At other times it is used to describe the workings of institutions beyond its supposed boundaries: "The institutional boundaries within a carceral state are purposefully porous" (Annamma, 2016, p. 1211). Its methodological uses are even less frequent yet still centered around permeability

and movement. For instance, Reinertsen (2016) describes the porous nature of thought, writing, and language, implying the limitations of definite linguistic categories. As a methodological category, the notion of porous is largely undeveloped. However, porous inquiry practices are not new, and scholars have referred to hybridity, cyclic nature of qualitative inquiry, and blended designs (see, e.g., McKechnie, 2008; Saldaña, 2015). More specifically, the porous element of methodology illustrates the infiltration of ideas and traditions, blending of (intellectual) matter across labels and categories. Porous methodologies morph different components (e.g., of methods, data, representation, writing) into something different, and the ideas, authors, texts, authorities, and practices bleed into each other. Observations of children have elements of think-aloud methodologies, open-ended focus groups are carried out in creative outdoor spaces including elements of performance, and discourse analysis process utilizes some aspect, connections, and elements from visual analysis. The notion of porous methodologies focuses our attention to the absence of clear and distinctive methodological boundaries as well as impossibility of solid singular methods and research elements. Research design, data, and knowing subjects can no longer be assumed to constitute one agentic and fixed entity, but they multiply and shift constructing only evaporating, resonating, porous, accommodating, and temporary proxies, events, and organic forms of living and doing.

Fluidity, in turn, speaks to the continuous exchange, methodological movement, and transformational forces in inquiry. The use of fluidity in educational research most regularly refers to changeability in relation to the identity question. For example, fluidity is regularly deployed to indicate how gender identity (Sweet & Carlson, 2017), teacher identity (Bradley, 2016; Cuconato & Walther, 2015), or student identity (Hsiung, 2016; Malcolm & Mendoza, 2014) can change based on situation and context. Similarly, researchers use fluidity to describe changeable perspectives or paradigms of thought (Brunial, 2016; Kuby & Christ, 2017; Wolgemuth, 2016). In these contexts, non-fluid thought processes are troubled, seen as limiting, whereas, fluid thought processes afford flexibility and creativity. Less frequently is the notion of fluidity applied in relation to ontologies and material worlds. When researchers use fluidity in this light, it often refers to the complexity of the lived world and the difficultly of capturing singular representations (Walsh & Tsilimpounidi, 2016). Likewise, this use of fluidity might signify "the ontological dynamism of beings" and make explicit reference to material temporality (Nakagawa & Payne, 2015). Here, meaning is considered temporal and always open to change. The use of fluidity in educational research is quite frequent but largely limited to the analysis of data and not considered in relation to methodological processes. In this context we use fluidity slightly differently. For us, "methods" do not begin or end in a foreseen and predictable "order," but they are already always here and working, forming incomplete connections and shifting research approaches without absolute identities or non-identities. Methods and methodologies are functioning as temporary leaky structures that are being regenerated, reconstructed, and rebuilt again and again differently in each context and time-space-matter. Following this line of thought, methodological flows, tools, approaches, and techniques do not collapse, fail, or disappoint. Instead, they melt, transform, circumvent, infiltrate, appear, and disappear while opening up new directions for childhoodnature relations. Interview events

end with an exploration of material cultures which lead scholars back to new interview questions, while visual representations gradually turn into the investigation of historical and archival materials. Fluidity illustrates how one method or methodology transforms and shifts into another moving horizontally and potentially unpredictable ways.

Lastly, brutness informs the users of research that methodologies are always raw, unfinished, partial, and never able to capture realities and experiences in some complete or finished fashion. Within the last few years, uses of the term brut in educational research have increased steadily. The term indicates something base, raw, or animalistic. It has been used to describe cruel and unpleasant experiences (McLaren & Pinkney-Pastrana, 2000), as well as an unreasoning and unreasonable force (Swanger, 2002), but recently it has been most frequently used in relation to methods and data (Koro-Ljungberg et al., 2015; Martin & Kamberelis, 2013; St. Pierre, 2013). In relation to data, for some scholars, brut encompasses the baseness and rawness – "solid bedrock, building blocks" (St. Pierre, 2013, p. 224) – of an object but has largely been critiqued as something unattainable. Alternatively, its methodological uses have shifted away from clearly defined procedures to get at a clearly defined, essential, brut object toward brutness as an always-already-there "rawness" and particularity of events, things, and processes. Sometimes brutness is used to illustrate partial and becoming process in flux and in motion, "[an] uncertainty, rawness, and creative chaos by doing, engaging, collaborating, and reflecting without constant and continuous purification and 'cleaning' efforts" (Koro-Ljungberg et al., 2015, p. 614). The use of brut in qualitative and educational research is burgeoning yet encapsulates larger trends of methodological practices that include fluidity and porosity.

Furthermore, brutness in methodology enables scholars to face uncertainty, rawness, and creative chaos by doing, engaging, collaborating, and reflecting without constant and continuous validation and verification efforts. Brutness also reminds us that qualitative inquiry, future/past, methods, and philosophies are potentially not entities to be clearly, neatly, and holistically described, practiced, or understood. In raw partiality, everything is possible, but not everything is. Maybe there will be or already is a multiplicity of methodologies and childrennature relations without totality. Instead, raw events happen, and unfinished elements are wedded and pasted together ad infinitum. Dislodged structures, abolished and redone methods, forgotten strategies, undone theories, and dispersion of concepts take place and produce unthinkable and absent present-future and childhoodnature relations and methodologies brut, naïve, raw, and unfinished and leaky.

and···and···and

Leaky architecture of post-qualitative inquiry positions childhoodnature methodologies as thought-out arrangements with unknown number of loose, becoming relations, and elements that are open to difference and otherness. However, any perceived structural element is only illusive or at least unstable and ambiguous. Its position is held only by its (generative and always shifting) relations of difference to other parts. This ambiguity of leaky architecture enables paradoxical thinking, contradictory practices, and organic formations. Leaky architecture of research design and inquiry could function as a thinking tool and thought-in-the-act practice

to process and live through our scholarly activities, methods, and forms in less fixed and certain ways. Rather than thinking about methods and methodologies as learnable and understandable containers, leaky architecture utilizes form, lines, space, matter, and interrelatedness as elements to think about unexpected, surprising, and continuously shifting design with. In this context a leaky structure in methodology enables us to bring together porosity, fluidity, and brutness in the context of shifting perceptions, practices, and enactments of childhoodnature and its research.

For Frank Lloyd Wright (1971), organic denotes entity and relationality, ongoing, fluid relationship between whole and its parts. Organic architecture occupies spaces which are continuously becoming and which through all rhythms must pass. Similar to The Leaky Architecture of Beehives and Boxes performance where deconstruction is carried out through staging choices, leaky architecture in methodology enables the rethinking of binary dualism and binary language. Leaky architecture of methodology can position methods and research approaches simultaneously as organic and healthy and as manufactured and toxic. Leaky architecture sustains a paradox and produces seeds of deconstruction. One might argue that leaky architecture is no architecture or represents a failed design due to its insufficiencies, holes, absences, and unstable structures. Yet leaky architecture exemplifies becoming and openness to "other," other elements, potentially contradictory ideas, and multidirectional forces. This openness creates a welcoming space and a structure which calls for (and also relies on) patches, fixes, repainting, refilling, and remodeling. The leaky architecture of post-qualitative research design accommodates and invites differences in childhoodnature concept and practice, aporia of spatial childhoodnature spatiality, and the impossible thinking of childhoodnature subject-objects.

Abstract

This is a speculative philosophic slam articlepoem making a case against pessimism. Poeticization is/as constant productions with material words able to move the world.

My refrain is that of plastic and unconscious activisms. I begin from within instead of trying to objectively address sustainability from the outside. I ask who eats who?

Keywords

Materiality critique transformations · Unconscious activism · Multidimensional ontologies · Transpersonal methodologies · Poeticizing sciences and research · Immanent theorizing of moments

The point is not to get out of this place but to cannibalize it – we may be *of* this world, but we are certainly not *for* it. Such out-of-jointedness is a distance. And distance is what begins the dark plunge into the many worlds eclipsed by the old (Culp, 2016. p. 8).

In Spring 2017 a whale stranded on the shores of a small local community on the west coast of Norway (Fig. 1). A rescue operation was initiated to help the whale find its way out into open seas, but alas the whale was very weak and it died. The autopsy that followed revealed 30 plastic bags in the whale's stomach. It had died from starvation. Thinking with microbes, enzymes, bacteria, and germs overcoming identity, I molar/molecular microbioecopolical multibody ask: Who dies? Who starves to death? Who eats who? Am I plastic? Do I eat plastic? Am I eaten by plastic? Am I dying? Do I eat you? My body is another. I speak of unconscious activisms and the ~~subject~~ as critic. Pictures and/as data and me as transpersonal empirical illustrations and/as affective pragmatic connections. The self as relations and my research position as assemblage, not personal not private. A "documentation" of trifles, smallness. . . Becomings always more than a product.

En Marche (*En Marche* refers to the movement created by Emmanuel Macron who was elected President in France 2017 – and we are in the middle of French philosophy and extras. . .), which translates into *working on* or *on the move*, I write a speculative philosophic slam articlepoem making a case against pessimism. It is a philosophy and speculative fabulations SF (Haraway, 2016, p. 134) and/or, as I prefer, poeticization and poetry is/as constant productions with material words able to move the world: the art that comes floating out of the daily life in childhoodnature, where everything exists in a beautiful and endless floating stream learning to listen to the myriad other voices beyond the human. Speculative philosophy uses facts/

Fig. 1 Whale with plastic in its stomach. https://www.vg.no/nyheter/innenriks/dyrene/syk-sotra-hval-hadde-30-plastposer-i-magen/a/23913888/. (Photo: Christoph Noever, University of Bergen, Norway)

fiction/faction to probe imaginatively into scenarios that operate according to different ontologies, unsettling our common senses of shared reality. However, grounded in situated knowledges and contexts, it projects towards a different wor(l)ding, and through this speculative philosophy has a radical shaping power stimulating different kinds of experimental practices and poetic/data/sign/Activisms.

An *articlepoem* is my "stream-of-thought from topic to topic essayist poetic type of writing contemplating knowledge, science, and self, hopefully involving you. Scientific article and poem, poetry and reality: Poetry and reality in science and research in poetry and reality" (Reinertsen, Ben-Horin, & Borgenvik, 2014, p. 466). This is, and to underline, therefore not about philosophy alone, but its meeting with that which is not philosophy, which is what creates events. The poet sets things in motion and move in affects. Through poetry, realities connect, but detached from time and place and new stories can be written. Political bodies inscribed in new ontologies. Poeticizing sciences and research. Immanent theorizing of moments. Standing up and joy.

I also speak of it as materiality critique transformations producing unconscious and affective critical bildung (*Bildung* (German: [ˈbɪldʊŋ], *"education, formation,* etc.*"*) refers to the German tradition of self-cultivation (as related to the German for creation, image, shape), wherein philosophy and education are linked in a manner that refers to a process of both personal and cultural maturation. Both Georg F.W. Hegel (1770–1831) and Wilhelm von Humbolt (1767–1835) wrote extensively on the theme as both existential and as lifelong processes of human development. https://en.wikipedia.org/wiki/Bildung. Accessed 6 July 2017.) pedagogies and research. Bildung here seen neither as processes of existentialism, identity, autonomy, education, learning, or human development as such, but as the cry of the land, and of pedagogues and/as poets and thinkers *against* excluding, compartmentalizing, instrumentalist and reductionist forces in our practises, and *for* possibilizing with, for example, hyperbolic excess. Thinking and acting in possibilities, in every situation that is. Not avoiding problems, rather creating them. Producing tensions that everywhere propels thought towards inventiveness. The political life is about and in the moment. These are embodied moments of realisms. Slam is battle.

Plastic activism, wor(l)d activism, action of signs?
Green*ish* critical bildung pedagogies and research?
Is it me in there?
I do not know. . .
It is

– "a sort of delirium" (Deleuze in Deleuze & Parnet, 2002, p. 40).
– "many politics" (Ibid., p. 124).

The Imperceptible Beingness of Engagement

Molecular-becomings in which the air, sound, water are grasped in their particles at the same time as their flux combines with mine. A whole world of micro-perceptions which lead us to the imperceptible. Experiment, never interpret. (Gilles Deleuze in Deleuze & Parnet, 2002, p. 48)

I am thinking philosophy, science, art, and literature, not as separate territories, but as a common concern which gives rise to multiple fruitful questions. For example: How can we think about the distinctness of the one together with the other? How can we appreciate values others create without denying our own affiliations? How can ambiguity, contradictions, and disagreements – read paradox – be ascribed as positive functions, contributing to consolidating community and sustainability? How to think of nature and culture together? How to think other about *X*? And what is it "to feel as" *X*?

I feel as plastic. I am not. I feel plastic and what it produces. I do not know what it is but it is engaged in/engaging my desires. My moving on. My poetry. Eventualizing me with/through productive aporias (Formal negations or *X* without *X*. I write Derrida and Deleuze together here to avoid too positive connotations to the term production and productivity. This also complies with Culp's (2016) criticism and fear of sneaking positivism even into Deleuze studies.) and what I am not. Haunting me… everything without… always against…. Derrida (1994) emphasizes three aspects of the aporia that are decisive and necessary to go through and experience… *feel as*…. First there is the aporia of suspension, second there is the aporia of undecidability, and finally the aporia of urgency: any *X*-sign/action/decision/name/subject/object/word and/or event is therefore both with and without rule or regulation; it is made through undecidability because we will never know for sure, still and however it is urgent because we must act and/or engage/being engaged. My aporetic slam poem. Poetry? Plastic? I plastic, I poem ….

It involves experimenting with non-unitary or schizoid modes of becoming: becoming minor, minor languages and molecular. Nothing/ness don't know. Events seen as machinations of production and the productive potential inherent in forces of all kinds. Representing a moment at which new forces might be brought to bear. Flows of engendering and empowering desires that introduce mobility and thus destabilize the sedentary gravitational pull of molar (linear chronos) formations. Thinking and creating constituted simultaneously, or rather thinking as its own event by embracing the rich chaos of life and the uniqueness and potential of each moment and "being as fold" (Deleuze, 1993). Nothing/something/*X*/it/me. The subject thus conceptualized as multilayered and dynamic. As an enduring entity; one that changes as much as it is changed through the connections it forms with a collectivity. Braidotti writes: "The subject is a genealogical entity, possessing a minoritarian, or countermemory, which in turn is an expression of degrees of affectivity" (p. 241 in Parr, 2010). I natureculture minor major plastic poem time and place a/wor(l)d….

The project is risky like any peace-battling project. Not against evidence and truths per se, but thinking that we probably get as many truths as we deserve from which criteria we use, and questions we ask. For Deleuze (2013), truth is "a matter of production, not of adequation" (p. 92). Therefore, and again, I try working mostly with expansions and possibilities… noologies…: "which is distinct from ideology" and "is precisely the study of images of thought, and their historicity. In a sense, it could be said that all this has no importance, that thought has never had anything but laughable gravity. But that is all it requires: for us not to take it seriously"

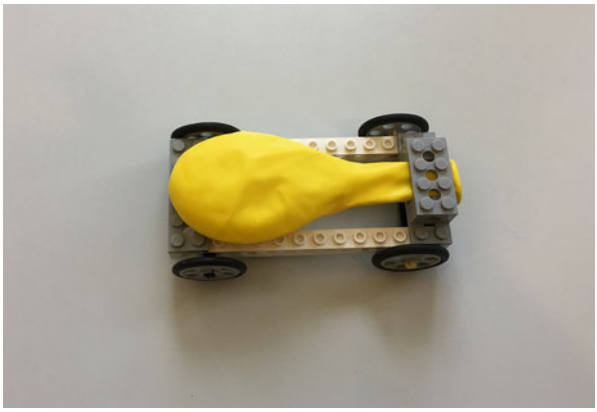

Fig. 2 Balloon car (Source: author's photograph)

(Deleuze & Guattari, 2004 p. 415). Truths to be grateful for. . . love and laughter. The vitalizing effect of plastic and a whale or *plastic feelings.*

The methods are simple. . . not, and to underline: they are about creating/writing new material discursive concepts, explore other ways of using language and/in materiality. Tearing apart and propelling language and matter out of its systems of meanings and a surface of/in immanence (More on immanence below.) wherein one experiments with formerly unknown collective alignments. Instead of concerning oneself with the unchanging and the general, this is about being brought out of the socket through approaching that which disturbs you, actively exposing oneself to the loss of references to the ordinary, to think with what happens. Experimenting with/through compelling forces in poetry – or plastic, to go further and be more thorough always. Poetry, plastic or the other way around (Fig. 2).

> I hear. When it comes to objects, it is not only possible to say them, pronounce them, say their names through language, but to hear their relations with the words themselves. Some words sound like nouns, words that are physical, having form and weight – a bucket of sand, – a balloon car running on air. . .. They have their own quality, a feeling from when you put them aside that they will substitute or displace an amount of the world around them. Other objects are verbs and in constant change. When I hear them, I see a pile of books is a song. An adjective, an adverb caressing a cheek, giving a hug. Things that refer to poems. To put in power instead of quantifying. Things need stories and artists/poets/researchers need to write. Writing in things. Things in writing. To write is a form of interrogating oneself. Being alert to knowledge. Who dies? Who starves to death? Who eats who? Am I plastic? Do I eat plastic? Am I eaten by plastic? Am I dying? Do I eat you? My body is another. Can you be my body for me? Can I be yours? Can my body, my breath, my energy make a car run? I write language. Language writes. The factor which kills is the factor; instructive. If so the flow of one's life stiffens.
>
> Free after Edmund de Waal (2013)

I Write Language; Language Writes

> In reality *writing does not have its end in itself, precisely because life is not something personal.* Or rather, the aim of writing is to carry life to the state of a non-personal power. (Gilles Deleuze in Deleuze & Parnett, 2002, p. 50, italics in original)

The tangible ecological principles that strengthen the earth's own life-giving ecosystems offer a more suitable language for materializing a sustainable development, economy, and pedagogy than the language that is obtained from accounting and finance. Language working in materiality and materiality working in language; and that we are equally driven forward by whims rather than systematisms, objectives, and resolutions. These are words catching the joy of the hunt and that we lose track of time and place when we search. Past, present, future working together. Our world. Nature and culture in togetherness. The smallest particles, not yet found, that do not divide between them. Humans as nature/culture and as conversations with/in what is and what was to come. Discoveries in hands and the shifting colors of the air. Children hearing bells in green and gold, the tick in every second. Building, rebuilding, reshaping. "If you as adult flip the generator, the fan moves faster because you have more muscles than me." Green*ish* pedagogies. She is five.

Nature/culture or natureculture: I put the words compactly together and break them up. I pour them from one sentence to the other to make the spaces around them bigger. Making the spaces around nature and culture together in reciprocity/entanglement/inter-/intra-dependency bigger. Joy keeps things in motion: spaces in constant flux. Adding depth, new vulnerabilities, and letters that leads us into the interiority of things and the value of small. What a child can smell, which is part of their landscape. The smell of different rooms. "Can I build my fantasy?" He is six.

These are explorations and experimentations to bring parts of components together, in different ways towards a future and sustainability. Knowledges, experiences, memories, sensations, discoveries, experimentations, affects, languages, and materiality to belong or inscribe/be inscribed as part of nature, not separate from, or, rather, thinking the anthropocene subject as "immersed and enmeshed in the world" (Alaimo, 2016, p. 157) and "thinking as the stuff of the world" (Ibid, p. 169). We breathe life.

It is a writing friendship. Writing and thinking through heads and hands and bigger spaces, thus debunking any social/linguistic determinism imploding analytical categories and dichotomies. Writing openings toward expanded meaning fields. Slowness, dedication, endurance in groping and errors. Committed presence and affirmation: something coming to matter. The/my self is writing itself again and again. Mattering processes that are poetic, political, and substantial. Poetry is/as other and transpersonally swirling ontology, epistemology, disclosures, political perspectives, post-human ethics, research, and environmental activisms together.

Languages below languages releasing one from meaning
Allowing that which means nothing in itself
Links between signs, events, life and vitalism
The potential for possibility
Microbes, enzymes, bacteria and germs and/as the "workhorses of life."
Quantum all
Entangle, trammel up and snare
I labyrinth you there
A scent in an unbudded rose?
Aye, a sweet kiss – you see your mighty woes.
. . .
Free after John Keats, "Lamia" (1820)

The Stand-Up Speculating Philosopher, the Poet, and/or the Fool

> Philosophy is the theory of multiplicities, each of which is composed of actual and virtual elements. Purely actual objects do not exist. Every actual surrounds itself with a cloud of virtual images. (Gilles Deleuze in Deleuze & Parnet, 2002, p. 148)

Speculative philosophy noology speculates about the limits of science and technology, mutates current techno-futurist desires, and builds an alternative new world, while exploring fundamental philosophical questions (Fig. 3). This involves continuously stretching and distorting a simple characteristic of the current environment, until it becomes almost unrecognizable, but is clearly an evolution and involution of the original. – Is it plastic, am I plastic not? It also entails speculation on what "sentience" or "qualia" might be in these different environments, where standard categories – real, virtual, life, death, body, mind, conscious, unconscious, male, female, human, non-human – are broken and re-assembled in new ways. Plastic eventualizing me… I want to create timelines moving positively and diffractively forwards. I am "training my imagination to go visiting (Hannah Arendt, in Haraway, 2016, p. 126). Visiting other – different ontologies, subject matters, sciences, curriculars, languages. Learning to listen to the myriad other voices beyond the human. Other tongues and/or microbio-ecopolitical-semiotics. The brain is shaped by the use…. Slam poetry is for everyone. The mission being performative or activist community engagement.

Fig. 3 Technoplay (Source: author's photograph)

> The poet,. . ., is one who lets loose molecular populations in hopes that this will sow the seeds of, or even engender, the people to come, that these populations will pass into a people to come, open a cosmos. (Deleuze & Guattari, 2004, p. 381)

Being exposed to poetry is to be exposed to change. Opening, innovating the artistic style and promoting inclusive elegance and beauty, which in turn is reflected in all aspects of the research process. The production of data, the analysis, the interpretation, the presentations: the titles, the preface or introductions, the self-annotations, the replying rhyming, the uni-topics, the narrations, and the arguments. Poetry and the poeticization of research and methodology experience stages, including lines of flights, preparations, laying foundations, reaching plateaus, and continuing. The reasons for poeticization thus lie in both the natural and social transformations and the tremulous changes in researchers'/authors'/writers'/poets' lives.

The Shakespearean fool, like stand-up comedians today, had a license to say almost anything. Smart and articulate or stupid and foolish, corrupters of words. Different characters for different jobs. Deflating pompous, socially superior characters and able to criticize kings. There were knowing, wise fools. Professionals, employed to entertain. Smarter than those in positions of authority and used by Shakespeare to mock them, reveal the truth of a situation, and provide social commentary. There were natural fools just providing some slapstick; however, also used to inadvertently reveal some home truths. Anyway, they were these strange characters that showed up and made witty observations and often became central to the action, sharing a capacity to stir things up, to say things that other characters couldn't. Therefore, useful vehicles driving moral and argumentative points home as/if/in drama. My slam stand-up comedy poem about. . .

> Am I plastic? Do I eat plastic? Am I dead? No, but about the (im)possible death of data and the transpersonal as a professionalizing method. – and a feeling . . . perhaps is the motor for action. . .
>
> If I am a materialization of discourses
> I must.
> This is the event of/in research and me
> My activism my methods
> My thinking ontology
> My body without

We need stand-up philosophers, poets, and fools to laugh, think, and ask more – to de-authorize knowledges. In the field of the speaking subject and the blindspots of autonomy, perhaps we can speak of creating a polyconsensus science and society and critical bildung pedagogies in which we recreate ourselves and our pedagogies, sciences, institutions, and systems again and again, not to lose force to create, on the basis of knowledge (Fig. 4).

> Magnus has painted: *"The king who smeared with the caviar"* He is six.

Fig. 4 Kaviar and kings (Source: author's photograph)

A Theory Method for Everything, or Something About Living, Thinking, Slow and Walking

> There is no position outside, no straight path, no belief in transparent global systems of knowledge, only modest protest and precarious pleasures, from within compromised locations shadowed by futures that will surely need repair. (Alaimo, 2016, p. 188)

Creating futures and becoming requires facilitating *rhizomatic* (Deleuze & Guattari, 2004) growth in natureculture and child with me. 3D/4D close-ups. Aesthetics in discursive material details at close range. The pleasant in the symmetry at a distance. I lean on aporetic noology speculative slam plastic poetry for help. Poetry about plastic. I plastic I poem. I childhoodnatureculture plasticpoem write. Child/nature/culture/plastic/write me. Everything already always. The poetic fictitious place which makes it possible to stretch boundaries between fact and fiction, real and virtual. The rhizome, in contrast to the root, has a breeding and unruly growth, a multiplying character, and can be approached in many ways. Becomings in creativity and experimentations where the immanent in every moment comprise building blocks in/for the processes of knowing. A place of multiplying character of repetition, everyday nuances. "Feeling as," something stretching towards expansions and community – an aporetic poetic slam crazy empiricism perhaps. . . thus poetic/data/activisms. I am plastic not, but I live-think with myself as such and what it produces. I don't know.

And to theorize: the surface, or the plane of immanence is a place in which consciousness no longer is capable of establishing an essentializing thinking subject. Absolute immanence is in itself. It is not in something or in relation to something. It does not rely on any object and associated subject. Substances through this becoming no more than possible modalities. It is only when immanence is immanent in itself that we might speak of a plane of immanence. Immanence is a life; life and

nothing else. Not immanence in relation to life, but the immanent, which is nothing, which itself is a life. A life is the immanence of immanence: total power, total bliss. A life not dependent of a being or exposed to a type of action, but in immediate consciousness. Action and activity, therefore, not with reference to a being, but as constantly portrayed or written or inscribed in a life. A life of potentiality in every moment, which is life. Free from subjectivity and objectivity through a *Homo tantum* as a moment of insight. I am plastic. I eat plastic. I am eaten by plastic, a whale. It is a life in immanence beyond good or bad. A life with knowledge.

But we do not encapsulate life in moments. Life is always, and in every moment we are actualized as subjects and objects, nature and culture. The moments are, however, empty, but offer immediate and simultaneous insight and consciousness about what has happened and what might; therefore, life contains nothing but virtualities. Plastic whale virtualities… life is made of virtualities, events, and singularities. It does not imply a lack of reality, rather that something – *X* – is actualized. The immanent event is actualized in the state of things and of the living which makes it/*X* happen. The plane of immanence is also virtual if events are virtualities. Plasticwhalevirtualities. I eat, I am eaten not.

It is the virtual which thus leads us towards poetry and poeticizing sciences and research. It implies reconquering traces of becoming events without placing it/*X*/fold/nothing/truth into a logics or narrative aspect. We might ask: what is it with this whale, this plastic, this researcher…? What does it/*X* have to do with me? How can I comprehend this? Should I? Should I feel it? How can I evaluate, assess, judge, decide?

That's precisely the moment when I use/expose myself to the abilities of poetry to freeze a feeling and meaning, but still allowing events and becomings to continue to emerge. To ask what plastic phenomenologically *is* thus becomes to explore how a poetic moment in which feelings, meanings, and matterings are set free and in which becomings continue to work. I start behaving rhizomatically. The poem having the ability to transform one event into the other event and we might speak of life navigations and possibilizing something new. The brain's limbic system is constantly evaluating what is good and true for me.

And speaking of pedagogies: it is important to de-authorize both phenomena and knowledges to make it less dangerous to learn something new. Or, rather, to make it safe to be unsafe. Immanent theorizing of moments turns the whale, plastic, and me into more than we can see. Through the whale we get a glimpse of a non-planned moment in our daily life – when I clean the dishes after dinner, and its importance. It cannot be brushed away, must be affirmed. It embodies a materiality critique transpersonal transformation.

These are thus my embodied words and rhizomatic writings full of contradictions, uncertainties, anxieties, desires, and disturbances haunting the/our shifting landscapes of monsters, and explorations of junctures of human and more-than-human or non-humans and politics. Human and non-human entities constituted together and in constant inter-/intra-action with each other, ultimately increasing its/our value to more than what we can see.

My body is (a) thinking territory and process quality being/doing becoming now. I try to perform attentive engagement and compassion living thinking poetic withness in/as both education and research and academic analysis, forwarding a

constant curiosity, new worldly collectivism as a form of life and complexity, self-learning thinking, ultimately compassion for expanding and expanded natureculture contracts and justice. I focus on the possibility of tackling ongoing economical and identity-political crises (*"We have lost the rhizome or the grass"* (Deleuze & Guattari, 2004, p. 20)) as well as on new kinds of educational and pedagogical experiments, both for academics, policy makers, and activists: withness and wellness for joyous teaching and learning pedagogies.

> . . .This streaming, spiralling, zigzagging, sneaking, feverish line of variation liberates a power of life that human beings had rectified and organisms had confined, and which matter now express as the trait, flow, or impulse traversing it. If everything is alive, it is not because everything is organic or organized, but, on the contrary, because the organism is a diversion of life. (Deleuze & Guattari, 2004, p. 550)

The aim is to exceed what we already know, creating layered upon layered thinking as entanglements, connections, and bifurcations of lines; all sorts of possible relations. I see them as human-technology – "pen and paper," "speech and language," mixtures and as studies of events and actions not individuals. A transpersonal writing and/as my/our research methodologies. We inscribe and are inscribed in each other's bodies and paradoxes are the powers of the unconscious. Not easy – a whale, a child:

> I thought that if I just walked slowly enough, someone would start wondering if something was wrong

This is from a newspaper story about a little boy who was never in a rush to get home: "I tried to tell about my home situation all the time. But I never *spoke* to anyone. That was too painful, and the words would have been too ugly for those whom I spoke to" (http://www.aftenposten.no/meninger/kommentar/Jeg-skal-ikke-skrive-ett-ord-om-forjulsstress-Men-604-om-en-gutt-jeg-en-gang-kjente-71217b.html). Rhizomatic growth in the child with me or living/thinking lives and seeing the boy's slow walking thoughts I must. *Livingthinking* lives that are able/enables us to think of oneself together with others and community; *livingthinking* one another; *livingthinking* walking with *oneanother*: re-conceptualizing conditions for action and creativity becoming the hub in/of our thinking of innovation and sustainability. This thinking about both ourselves and others; ourselves with others; our response/abilities for *oneanother* ultimately our natureculture social contracts with *oneanother*. . .. This is what my duty and my professionality thus looks like in a moment: allowing, including all. Learning something, learning life, learning as I live I love (Fig. 5).

Text universalities

Transpersonal Methodologies Producing the Unconscious

> Produce some unconscious, and it is not easy, it is not just anywhere, not with a slip of the tongue, a pun or even a dream. The unconscious is a substance to be manufactured, to get flowing – a social and political space to be conquered. (Gilles Deleuze in Deleuze & Parnet, 2002, p. 78)

Summing up, moving on, could have been the start, the rise of post-human new materialism/s shown here through my natureculture slam poetic livingthinking plastic activisms pushes the limits of critical social theory and inquiry towards immanent and affirmative critical onto-epistemological approaches ultimately speaking of a need for multidimensional ontologies. I add theory about nature and together. Attempting and helping to approach the imperceptible becoming/s and/or the in/accessible plasticity, the un/intended effects, and the im/materiality of social formations as, for example, gendered, cultured, racialized, and/or classed relations; epistemic bias and/or injustices calling for epistemic shifts. Critique as diffractions as new possibilities for actions spreads, and as refractions when the breaks between actions and words create new possibilities for actions in practice.

It implies focusing on the unconscious in thought as much as the unknown in the body, or moving thinking from its position within the conscious towards the unconscious or unknown in thought and the unconscious or unknown in the body. Consciousness registering effects of affects only: feelings in a fleeting moment as I clean up after dinner. Who dies? Who starves to death? Who eats who? Am I plastic? Do I eat plastic? Am I eaten by plastic, a whale? Am I dying? Do I eat you? Am I eating myself? Affect conceptualized as pre-personal, thus non-subjective intensities streaming through our bodies without giving haven to any precise meaning, thus evading form and expression, and therefore not available to us.

Producing unconscious has thus nothing to do with, for example, reproduction of childhood memories or any repressed memories or phantasms, but has all to do with non-personal powers producing “blocs of childhood” which are always in the

present. We produce not with a core from which we emerge, nor with the people who attach us to it, nor with images that we draw from it, nor with any structures of development or growth. We produce "with the scrap of placenta which we have hidden, and which is always contemporary with us, as raw material to experiment with" (Gilles Deleuze in Deleuze & Parnet, 2002, p. 78).

A warm stone – a warm tone – might become a warm friend in a child's cold hands. The same stone might be painted and turned into a doll to play with – a tone to lean on. . . I memory livethink with the boy again and his walking crying for help. . . connections in the becoming of knowledges. It might be called activist philosophy and speculative politics or the other way around. I suggest increased focus on system/process-quality. I suggest increased focus on ecosophy/sustainability and collectivity. I suggest semiotic/research – and methodological expansions in/as this new form of contracts. . . perhaps. . . – because he is/all/we are worth it . . ..

We are in what I call the transpersonal quantum competence and polycritical landscape of Deleuze and Guattari's (2004) philosophy of difference and immanence, body without organs and the human as a "thinking territory" (Deleuze, 2004, p. 44), normalizing critique, judgement, and decision-making through writing. Our tasks in every case being to discover the libidinous or sublime speech of the body and its investments in the social area, possible internal conflicts between, relations with and to pre- or unconscious investments in the same area and then again possible conflicts between these, or rather the whole inter-/intra-play between machinic desire and the suppression of desire. A real non-teleological revolution, body as profession in lifegiving insecurity and resistance.

Speaking against fear
Speaking against clarity
Speaking against power
Speaking against giving up

Increasingly uncertain.
Inger Christensen (2006, p. 188)

In the Anthropocene man has become a force of nature in its own accord. That force can heal and repair. It can divide and destroy. We might not even discover it. . . structures and repetitions can lead us into the most perfect oblivion. We therefore

need resistance and to rehearse intolerance towards what we do not want but nevertheless see happen. Our oceans are filling up with plastic. I had fish for dinner. . . my methods and responsibilities are therefore always myself and what I can write for natureculture sustainability. The pause between breathing in and breathing out when my self-consciousness is suspended and I am open for everything. There is much I do not know. The future is full of information I do not remember. There are no straight paths to walk, but to imagine something new is to recreate it. A thin veil of possibilities. Who dies? Who starves to death? Who eats who? Am I plastic? Do I eat plastic? Am I eaten by plastic? Am I dying? Do I eat you eating myself?

When physicists search for the mystery of dark matter, it is based on the question: what does the universe consist of? What does the universe *really* consist of and what is dark matter? Dark matter streams through us and the universe all the time. There is dark matter in every room keeping things together. So far, physicists know that it makes up approximately 80%, but that it is not made up by known substances/materials. They also know that dark matter is affected by gravitation and weak nuclear power, not by electromagnetism (the matter is dark) and strong nuclear power. The rest is speculation. What one work/think with is dark matter as Weakly Interacting Massive Particles (WIMP) and that it is always present in suitable amounts. The million-dollar question is, however, how to find it? The answer is the following:

1) One can be hit by it, and that is good because then it can be measured. The problem is that one tries, but that it is very tricky.
2) One can find residue after collisions at particle levels and catch them (particles that is). That is also good, but takes a long time. It will be a long search.
3) One can make dark matter through creating particle collisions. That is what physicist try in CERN, Switzerland. If dark Matter is a WIMP one hopes to find something during the next 10 to 15 years. If not, the joy of the hunt continues. Even if one finds it, one still cannot say that it is what it is. It might not necessarily be a particle, and perhaps one must think anew about gravity. It is nice to work towards different directions because we might be wrong.
Free after Are, Raklev (2017)

Something streaming through, keeping things together, but we don't know what it *really* is – and I can't help myself from thinking with WIMP whims simultaneously. . .. One can be hit by it. An epiphany perhaps. A sentience or qualia? Something striking you as valuable, important, urgent, et cetera. One can find it. At least traces of it and patience. Allowing slow walking/thinking/writing. It is also good. Most important, however, is making/creating, continuing the hunt and different directions. I add refractions and diffractions and what they might produce. It is a *scienceing* up of childhoodnature research and no subjective convictions. As a researcher, I think I can best encounter erasures between, for example, true and untrue through showing that dissemination of scientific insecurity is simultaneously part of both the problem and the solution. Who dies? Who starves to death? Who eats who? Am I plastic? Do I eat plastic? Am I eaten by plastic? Am I dying? Do I eat you eating myself?

Abstract

The methodological inquiry developed here about the natural environments in which children play extends the theory and practices of narrative inquiry in educational research, in particular, Clandinin and Connelly's extensive scholarly work in that field. This ecological approach hinges on the inclusion of young children and uses multimodal methods (such as mapping, drawings, and memory boxes) to prompt in children a self-questioning of the stories they told and retold about playing in different environments, the incorporation of a historical/temporal and comparative intergenerational sensibility that demonstrates the complexity of the children's telling of stories, and, subsequently, an extension of Clandinin and

Connelly's (*Narrative inquiry: Experience and story in qualitative research*. San Francisco, CA: Joseey-Bass, 2000) three-dimensional narrative analysis model via the analysis of contextualized re-stories and mind mapping. Of central importance to this ecology of inquiry was a revealing of the ontologically temporal (and spatial) nature of how the children's stories shifted and deepened over the course of four iterative conversational interviews as the participant-researcher relationship developed. Notably, this temporal process was enabled spatially and geographically through the children's preferences for playing outside in "naturally" perceived places such as a tree, a clump of bushes, or a creek and being reinterviewed in that ecologically imagined and "played" space. This ecology helped children engage in deepening their ongoing conversations with the researcher in relation to the affordances in nature they preferred to use for their self-constructed imaginative play places. Children's rich, sensory experiences with these aspects of nature were observed ethnographically during the conversations, which added further depth and meaning to their stories and what that might mean for childhoodnature ecological, pedagogical, and research development.

Narrative inquiry with young children · Researcher reflexivity · Ecological narrative inquiry · Temporality, spatiality, and affect in nature · Storytelling · Imaginative play places

Introduction

The central aim of this narrative inquiry was to examine any changes in contemporary and historical children's imaginative play places over time. In conceptualizing imaginative play, researchers have found that young children are capable of understanding the difference between reality and imagination through their play, where they purposefully "transcend time, place, and/or circumstance" (Taylor, 2013, p. 3) to enable "border crossings into other worlds" (van Manen & Levering, 1996, p. 32). The findings from this intergenerational inquiry indicated that the children's physical and/or symbolic places they consciously constructed in nature for their imaginative play have changed little over time, despite contemporary deficit discourses that suggest otherwise and despite contextual constraints placed upon contemporary childhoods (Moore, 2015). While this chapter, and indeed this version of narrative inquiry, does not produce generalized, universal claims about childhood imaginative play or the places it is enacted, it does illustrate the complexity of children's storytelling and their capacity to participate in a narrative inquiry.

The empirical "testing" of this unorthodox methodology of narrative inquiry generated further dimensions of researcher-researched reflexivities. Some key findings are described briefly for illustrative purposes only but set the stage for ongoing methodological inquiry. Grounded in the extensive work of Jean Clandinin and Michael Connelly's narrative inquiry methodology, this more ecological approach to narrative inquiry enabled young children to engage in emotion-infused

storytelling about their deep relationship to aspects of nature they "live" and "play in" in a way that other research methodologies do not always achieve.

This chapter begins with a brief overview of the insights involved in developing researcher reflexivity and its relevance to this narrative inquiry with young children. Next the historical foundations of narrative research are outlined and how the emergence of narrative inquiry has shifted the field through the extensive work of Clandinin and Connelly. My own interpretation of their work is then discussed and how it informed the ecologically relational narrative inquiry this chapter is based on. The context and multimodal methods used in the inquiry are then outlined; followed by an explanation of the key touchstones of the study. The final section of the chapter provides examples of individual stories told by young children and shows how the analysis of these stories demonstrates both the complexity of their storytelling and the construction of their relationship with/in nature. This in turn leads to an emergent temporally and spatially alert conceptualized and contextualized version of childhoodnature.

The Shifting Positions Within Research

Grix (2002) argued that once the ontological and then epistemological position of the researcher has been acknowledged, the methodological position for the study "logically follows" (p. 177). In searching for an appropriate methodology to identify and interpret children's ecologically imaginative play places, I needed to develop a methodological approach that aligned with my understandings about ontology (multiple realities rather than one fixed "truth"), epistemology (as socially constructed and changeable knowledge), and axiology (valuing the subjectivity of the researcher and participants). More specifically, the visibility of emotion or feelings or affectivities was important to me in educational research with young children. Neumann's (2012) argument for including emotion as an integral part of the research process rather than trying to deny its existence resonated with my own search to accommodate emotionality and a reflexive stance within the methodological approach developed for this research.

Researcher reflexivity is characteristic of qualitative research paradigms in which the researcher acknowledges how their own values and assumptions can impact their interpretations of the phenomenon under study and their research interactions with participants (Denzin and Lincoln, 2001). Drawing on Denzin's (2001) claims, I was keenly aware that my interpretations of the participants' stories throughout this inquiry were influenced by my own experiences, feelings, and assumptions. Of increasing relevance therefore were Fontana and Frey's (2008) contention that a "powerful way in which to accentuate reflexivity" was through the narrative research use of where "in trying to understand the 'other' we learn about (our) selves" (p. 141). Given my research was focused on investigating the meanings of children's imaginative play places over time and the decision on how best to invite; then interpreting these meanings influenced the final methodological choice. Subsequently, a narrative inquiry emerged as providing a clear "fitness for

purpose" for this study (Cohen, Manion, & Morrison, 2011, p. 115) with its inherent capacity to enable and deeply examine the meanings of participants' lived experiences playing in nature and re-storying it over time while acknowledging the researcher's subjective position within the research.

This chapter is representative of the shifts in position that the research, the researcher, and the research participants experienced throughout the study. The times and timing of researcher-researched experiences were a prominent concern. Running parallel with my starting position as a researcher engaged in narrative inquiry based on Clandinin and Connelly's extensive work was an evolving approach that has moved narrative inquiry to a new ecological level of inquiry. This evolution can be seen through the research processes, and stories embedded in this chapter juxtaposed against my own shifting position as I realigned my research approach to be more attuned to young children's ecological awareness with/in nature. The research participants also shifted positions, as they told and retold stories that they questioned and changed over the course of the inquiry, so that the "stories they lived by" were reinterpreted into new story lines (Clandinin, 2013).

Narrative Inquiry: A Relational Methodology

When I look back on my decision-making about the methodological approach to use, I recall strongly resonating with Clandinin and Connelly's work on narrative inquiry, in particular, their respect for the multiple voices of others while encouraging the inclusion of the researcher's own voice and the significance of temporality, spatiality, and geographical/topographical place in the analysis of the stories (re)told by participants to the researcher. On further investigation, the underlying principles of a narrative inquiry linked well with my world view of reality as multiple and understanding of knowledge as socially constructed and voiced, experiential and embodied. The following section shows how the field of narrative research has shifted over time toward the inclusion of a number of complimentary forms of research including the evolution of narrative inquiry. Clandinin and Connelly's contribution to the field has similarly evolved over a number of decades, with this study providing a stronger ecological dimension to their original foundation of narrative inquiry.

From Historical Foundations Toward Narrative Inquiry

Stories have always played an important role in helping people understand their lives (Elliott, 2012), with storytelling seen as a way to communicate important cultural practices between generations and over time (Rogoff, 2003). Narrative scholars have described this phenomenon as "living a storied life" (Clandinin & Connelly, 2000). Traditionally, stories in narrative research were positioned within a more formal investigation of linguistics and narratology, until a shift in the 1960s heralded a new way of looking at "ordinary people's oral narratives. . .as worthy of study"

(Chase, 2008, p. 63). Following on from these shifts, a swing toward postmodern thinking in the 1970s and 1980s prompted a "narrative turn" (Denzin and Lincoln, 2008) within social science research away from purely scientific statistical data to "honor[ing] people's stories as data" (Patton, 2002, p. 115).

More recently, narrative researchers have collectively reinforced the value of stories and storytelling as worthwhile data and data generation methods in research. For example, Kramp (2004) explained how lived experiences can be made more meaningful through storytelling, suggesting "[s]tories preserve our memories, prompt our reflections, connect us with our past and present, and assist us to envision our future" (p. 106). Squire (2013) also argued that the process of storytelling enables the feelings and emotions attached to experiences to "become part of consciousness" (p. 48). With the continued recognition of the value of stories, the field of narrative research developed many diverse forms which have oscillated between the process and the product of narratives (Riessman, 2008). Among this diversity, narrative inquiry has evolved to provide an analytical investigation beyond an analysis of the words used or a description of stories (Bell, 2002). While narrative inquiry shares some common features with other forms of qualitative research (Clandinin, Pushor, & Orr Murray, 2007), its difference lies in the need to "do something" with the stories not just report or curate them (Riessman, 2008).

Clandinin and Connelly's "Alternative View" of Narrative Inquiry

Clandinin and Connelly have been instrumental in developing the methodological theory and practice of narrative inquiry through their extensive work over the past three decades and, more recently, in collaboration with other scholars. During this time, they have continually redefined their understanding of narrative inquiry from a "form of empirical narrative in which empirical data is central to the work" (Clandinin & Connelly, 1990, p. 5) to a "way of understanding experience" (Clandinin & Connelly, 2000, p. 20). Their theoretical links to a Deweyan interpretation of experience and continuity are apparent in their understanding of lived experience along a "personal and social continuum" (Clandinin & Connelly, 2000). Clandinin and Connelly (2000) considered that their "alternative view" of narrative inquiry was emphasized in their stance that research should not be an accumulation of categories or codes taken from stories but rather the use of questions and conversations between the researcher and the participants as "a way toward deepening the inquiry" (p. 55). In this way, "the particular of each participant" is still evident within the inquiry rather than being reduced and possibly lost within generalized categories (Polkinghorne, 2007, p. 634).

Following their earlier work, Connelly and Clandinin (2006) rephrased the term "data" into "field texts" as created through personal journals, stories, photos, artifacts, and conversational interviews. Field texts are subsequently used to create a narrative or "research text" of a person's experience of a phenomenon (p. 478). What is of particular significance in Connelly and Clandinin's (2006) analytical processes is the simultaneous examination of the "three commonplaces of narrative inquiry –

temporality, sociality and place – which specify the dimensions of an inquiry space" (p. 479). These interpretations of narrative inquiry were later extended by Xu and Connelly (2010) when they highlighted the difference between traditional narrative research and a narrative inquiry by stating:

> Story is not so much a structured answer to a question, or a way of accounting for actions and events, as it is a gateway, a portal, for narrative inquiry into meaning and significance. Story in this sense, is complex and may be analysed in inquiry. (p. 356)

In this definition, the depth of investigation into meanings of experience is positioned as a critical point of difference. Stories, therefore, can be seen as a way into the inquiry rather than the foci of the research as is often the case in other forms of narrative research examining spoken narratives.

Recently, Clandinin (2013) has rearticulated the "key touchstones" (p. 212) which shape, inform, and align a study to the principles of a "relational narrative inquiry" (p. 81). These "key touchstones" focus on the formation of an ethical relationship between the researcher and the participants as essential elements of a narrative inquiry. Further to this, Caine, Estefan, and Clandinin (2013) have argued that a narrative inquiry is intrinsically aligned to the researchers' epistemological and ontological "commitment" to the research participants by holding "responsibilities and obligations for, and toward, the people whose stores are lived and told" (p. 56). A relational narrative inquiry therefore seeks to understand lived experiences through a reciprocal, interactive, and highly ethical relationship between the researcher and the participant (Clandinin, 2013).

Narrative Inquiry with Young Children?

Despite research with children gaining interest since the UN Declaration of the Rights of the Child (1989) and the onset of the sociology of childhood paradigm (Dockett, Einarsdottir, & Perry, 2009), there are limited examples of the use of a narrative inquiry with children 7 years and under in age. This is especially the case in research where storytelling is invited through conversational interviews. Some narrative researchers have used children's naturally occurring language during play to examine their lived experiences (Puroila, Estola, & Syrjala, 2012); while others have focused more on the developing linguistic patterns of children's speech (cf: Tsai, 2007). However, very few studies are available in the literature where researchers have used the essence of a narrative inquiry approach with young children.

Despite an apparent acceptance of children's stories providing "authentic, rich, and respectable data" (Cohen et al., 2011, p. 455), there appears to be a dichotomy between the rhetoric and the reality in believing that young children are capable of providing "valid" stories for research purposes (Kirk, 2007). Skelton (2008), for example, argued that although there is a need for all research with young children to be "ethical, sensitive, and respectful" (p. 23), she also argued that young children

were "not. . .fully competent" to participate in interview-based research (p. 24). Another example of this dichotomy is evident in Barrett's (2009) narrative inquiry into young children's musical engagement in which the children were not asked about their experiences. Instead, observations were taken of the children in conjunction with parental interviews to provide qualitative data. Notable exceptions are Farquhar (2012) and Richards' (2014) narrative inquiries where 4-year-old children were interviewed and seen as fully capable of telling important stories relating to the phenomenon they were examining.

While in past inquiries Clandinin and Connelly have invited the participation of children, the children were typically well over the age of 8 years (cf: Huber & Clandinin, 2002). Of particular relevance, Clandinin, Huber, Menon, Murphy, and Swanson (2016) recently investigated early childhood research methodologies and found that it is rare to find young children as active participants in narrative inquiry. They surmise that this is because researchers tend to be overly influenced by a "dominant discourse" which implies that children are not "trustworthy participants: that is, children may be thought incapable of storying the 'truth' of their experiences" (p. 251). The authors acknowledge that young children need to be offered the opportunity to be participants in more narrative inquiries in the future. In personal communication with Jean Clandinin (10 March, 2017), she confirmed this gap in the field and noted that little had been written about how the environment informs the stories the children tell in an inquiry. This study, therefore, provides a new, ecologically attuned way of conducting and interpreting narrative inquiry that includes young children as active participants while examining the influence of the natural environment in which they play on their stories. The "Companion" in this handbook on childhoodnature offers more examples of children as co-researchers and able representers of their experiences.

A New Interpretation of Narrative Inquiry with Young Children

In this section, the context of the inquiry is briefly outlined followed by an explanation of the multimodal methods chosen for this study adapted from Clark and Moss' (2011) "participatory tools" when researching with young children.

Context of the Inquiry

As the key aim of the study was to examine any changes to imaginative play places over time, four families consisting of three generations in each family were invited to tell stories about their childhood experiences of places they chose for imaginative play (Moore, 2015). Each family included one grandparent, one parent, one primary school child (6- or 7-year-old) and one preschool child (4- or 5-year-old) and lived in different geographical areas around Melbourne, Australia. A pseudonym was assigned to each family to symbolize their various geographical locations, that is, the Beach family, the City family, the Farm family, and the Bush family.

The participants were individually interviewed over a series of four iterative storytelling conversational interviews. The University Ethics Committee deemed it problematic for me to visit the children's homes in case the children's imaginative play places were made visible to others, so the conversational interviews with the children were held at their respective educational settings. The same range of multimodal methods were available to the children and the adults to invite and prompt storytelling and questioning throughout the conversations. For this chapter, however, only the research interactions with the children will be illustrated with brief reference made to the intergenerational findings.

Multimodal Methods to Invite Storytelling and Questioning

It is of particular importance in a relational narrative inquiry with young children as participants for the researcher to reveal their philosophical "orientations" at the forefront of the study (Baptiste, 2001). This is because methodological design is strongly informed by the researcher's ontological world view as well as their epistemological understanding of knowledge construction, their "image of the child" and perception of childhood, and, therefore, how children are positioned within a researcher/researched relationship (Clandinin et al., 2016; Moss, 2016). As a consequence of my ontological commitment to the children in this study (Clandinin, 2013), multiple interpretations of imaginative play experiences were sought and valued rather than expecting one "single kind of [knowable] truth" (Pinnegar and Daynes, 2007, p. 30). Similarly, my understanding of knowledge as a social construction of meanings informs my belief that children are highly capable of constructing their own knowledge of their lived experiences. The young children were therefore seen as active participants who were respected as capable storytellers with valuable knowledge in the form of unique, subjective stories. Underpinning this was an ethically based understanding that children could negotiate the research agenda in terms of time, place, and levels of participation in ways they chose throughout the research.

In line with the relational and ethical foundation of a narrative inquiry, one form of communication was not privileged over another when designing the inquiry methods. Consciously pushing back against the use of a "pack of activities" (Waller & Bitou, 2011, p. 17) or "gimmicky tasks" (Albon & Rosen, 2014, p. 125) to manipulate young children's participation in research, I provided a range of multimodal methods which the children could voluntarily engage with or not during the research (cf: Clark & Moss, 2011). The multimodal methods available for the children included:

- Telling stories then drawing the place/s their imaginative play was located
- Continuing to tell stories while on a walking tour, with an invitation to take photos of imaginative play places in their educational setting (and at home) and later, the use of these photos and a collection of three dimensional materials for further storytelling while mapmaking of imaginative play places

- Each child collecting imaginative play artifacts from home into a memory box to tell, retell, and question their stories
- Finally, negotiating which stories could be used for the inquiry and/or if they wanted particular stories deleted, changed, and/or retold in any way

The following diagram visually represents the multimodal methods available within the four iterative conversational interviews with the children over the 6 months of the study (Fig. 1).

The purpose of these methods was not just about the creation of field texts but to provide a communication platform for the children to represent their storytelling in multimodal ways. Therefore, each child was given the choice to engage (or not) with the method in their own unique approach to the inquiry. To do this, I first invited each child to "tell a story" about their imaginative play places they created at home, early childhood setting, and/or school, and then offered the other methods of communication for their use if they so desired.

It was interesting to note how each child responded differently to the methods they were offered, choosing to decline or engage with each one. While most children chose to take up the offer of drawing while extending their initial stories, 4-year-old Harry (Beach Family) firmly told me "I don't do drawing." The map making was approached by the children in a wide range of ways from declining entirely, some only attaching their photos, to others creatively constructing a complex map of places. This was evident in 4-year-old Georgia's (Farm family) decision to spend more than an hour constructing and telling an intricately woven network of stories around the places she created on her three-dimensional map. All of the children eagerly engaged in "walking" storytelling while showing me around their outside places at their center or school, with their stories becoming increasingly complex with each subsequent conversation. The children's memory box storytelling was noteworthy in the way it triggered sensory-based memories and stories in a way no other method enabled. This was seen in 4-year-old Harry's (Beach family) overwhelmingly positive response to showing me his half-brick representing his steps up to the fig tree cubby and again, in 6-year-old Sonya's (City family) tentative disclosure of her "babyish teddy" hidden among other artifacts in her memory box, whispering, "I don't usually show people."

In providing four distinct opportunities for conversational interviews rather than only one "storytelling occasion" (Riessman, 2008), the children were given the time to tell stories in the first conversation, then subsequently question, change, and deepen their stories in the following conversations. Over time, each of the children demonstrated their rich knowledge of imaginative play places as well as their substantial capacity for storytelling.

The "Key Touchstones" Embedded in This Inquiry

As a starting position, this narrative inquiry was grounded in Clandinin and Connelly's extensive work. There is a clear alignment to the relational "key

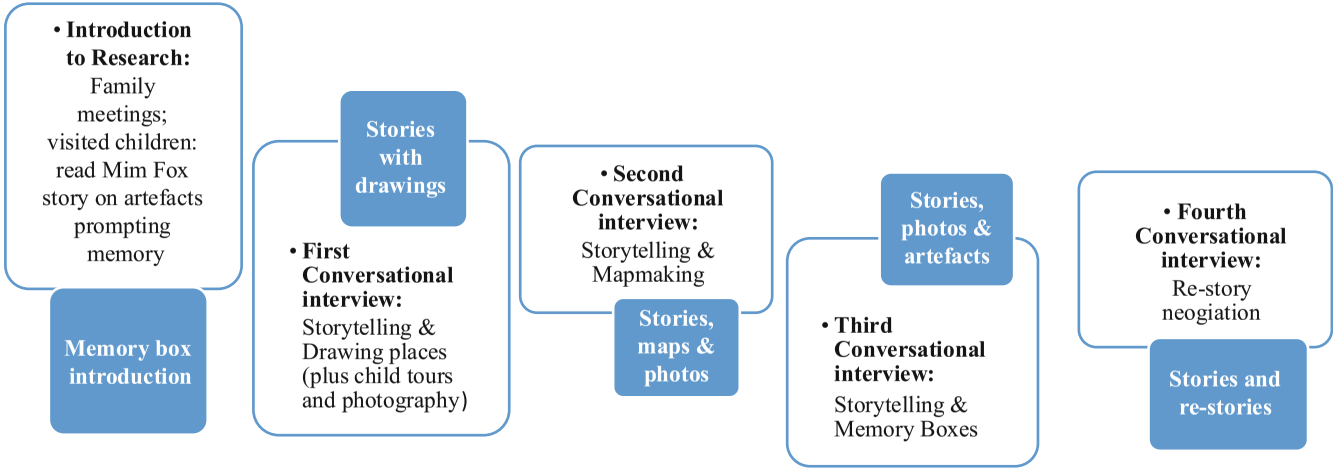

Fig. 1 Multimodal methods embedded in four iterative conversational interviews

touchstones" Clandinin (2013) articulated in the way the study demonstrated an ethical commitment to the participants in relationship with the researcher; an acceptance of the trustworthiness of the stories, the inclusion of the researcher's voice, and re-storying and taking the re-stories back to the participant for renegotiation. This starting position is illustrated in this next section and how my interpretation of these touchstones lifted the study to a different level of inquiry.

The development of a relationship between the researcher and the researched is seen to be central to a relational narrative inquiry. A close research relationship is encouraged by acknowledging "emotions and personal meanings" in an interview, rather than avoiding them as is typical in a more traditional form of interview (Ellis & Berger, 2001, p. 851). I was surprised how quickly a research relationship formed between myself and the children and how intense my emotional response was to their stories. I was constantly surprised how trusting and open the children were to telling me confidential stories of their places for play and that the research relationship developed in such a reciprocal way. For example, when the young children spoke in hushed, impassioned voices about how they made their cubbies in any "hidden" place in nature they could find, these stories instantly returned me to my own search for these significant places in so many different places throughout my childhood. On further reading, I was relieved to find other researchers had similar emotional experiences. For example, Kramp (2009) found the participants had "invited [her] into their lives" realizing she was not an "objective bystander or observer" (pp. 10–11); while Tanner (2009) revealed she had "found [her]self crying and struggling to find the right words" during an interview (p. 71). My strong emotional connection with the children was heightened when their emotion-infused stories intersected with my own experience of childhood imaginative play and the importance of natural places.

Trustworthiness was frequently questioned in the use of young children's stories as "data," with many asking, "How do you know if the stories the children told are true?" Stories told by young children are commonly dismissed when adults believe that the "truth" cannot be found in a child's subjective view (Frank, 2010). I started to sense that it was more important to focus on what the children wanted to "express" through their stories rather than if the stories were "true" or not. For example, 4-year-old Georgia's (Farm family) story about the "snake eyes" that she and her friend found in their bush cubby was a co-constructed story based on past experiences, questions she asked me during her storytelling and her emotional state while in the bush. It was not important that this may have been a fictionalized story; instead it was Georgia's sense of agency and independence she was expressing that was more noteworthy. A narrative inquiry is not "simply a factual report of events," rather, an examination of the meanings participants wanted to convey through their storytelling at that time and in that place (Riessman, 2008, p. 187).

Continuing the reciprocal nature of a narrative inquiry, the researcher's voice is also audible in the conversational interviews and subsequently visible in the written research text. As the researcher, I had initially assumed I needed to refrain from expressing my emotions and thoughts when a participant's story resonated with my experiences; however, I quickly realized this was not necessary in a narrative

inquiry. For example, when 6-year-old Laura (Beach family) told stories about her cubbies up a fig tree, under the tea tree, and behind the stand of wattles, tearfully I asked her what would she do if she did not have these trees to build her cubbies. The complexity of a narrative inquiry is clearly seen here and shows its point of difference in which the binary between the researcher-researched is blurred and messy rather than fixed and objective.

While the practice of the researcher re-storying participants' original stories into a co-constructed story including the researcher's voice is common in narrative inquiries, it is not common practice when researching with young children. In the creation of a re-story, the researcher interprets and reconstructs the participants' stories into a more contextually situated version of the original story (Ollerenshaw & Creswell, 2002). The re-stories are rewritten using the researcher's voice as the narrator, with direct quotes from the participants embedded as "an integral part of the re-storied narratives" (Beal, 2013, p. 700). An important, but difficult, part of the re-storying process is the "taking back" of the re-storied versions to the participants (Clandinin & Connelly, 2000). This is not to "check" if the stories were correct but to ask participants if these new versions captured what they had wanted to express through their stories. The complexity of the "taking back" process was evident when 4-year-old Frank (Bush family) insisted "I didn't say that" when I read out my re-storied version of his story. Despite the use of his own words quoted within the re-story; Frank was not happy with the inclusion of this particular story, and so it was deemed unacceptable for use in the inquiry. At times, a similar pattern occurred with other children, and as a consequence, many stories were not able to be included in the inquiry. Despite this, I found this process an additional and valuable opportunity for the children to further extend their stories in a way that was more meaningful to them. Although this could be seen as a limitation of the study, it is also a stark indication of the ethical foundation of this relational narrative inquiry with young children.

Narrative Inquiry Extended

In this section empirical examples are provided to show how this study has extended Clandinin and Connelly's work into an outside-orientated, ecological approach to narrative inquiry. In addition to the oral and visual multimodal narrative methods available to the children to invite their storytelling, additional layers of inquiry evolved and became apparent the further we progressed into the study. It is through these additional sensorial layers of inquiry encountered in different outside environments that the children's heightened emotional responses to their imaginative play experiences with/in nature were heard and seen.

Sensorial Layers in an Ecological Approach to Narrative Inquiry

On looking again at the children's stories and re-stories through an ecological lens, there are many instances in which the children's interrelationship with nature

featured on a deeper level than was first apparent. These deeper levels or layers consider temporality in a different way that included the shift or persistence in children's stories over time, layers of spatiality which included the children's conscious choice of a place in nature for the physical enactment of storytelling, and the layer of affect in nature which referred to the children's heightened sensorial awareness of place which informed and influenced the stories chosen to be told. Extracts of four young children's stories and re-stories are retold here to illustrate the complexity and continuity of these additional layers of an ecological narrative inquiry.

Laura's Story of the "Little Nest Cubby"

Initially, 6-year-old Laura (Beach family) and I were allocated to a desk at the back of her Grade 1 classroom to start our research conversations. It was immediately clear by Laura's constant glances toward others in the room and her hushed voice that she felt constrained by the threat of others listening in to her stories. Shortly after this stilted beginning, I invited Laura take me on a walk around the school playground to talk about any imaginative play places she felt comfortable to reveal. Once outside, Laura quickly recovered her voice and began a series of stories that richly described imaginative play places she had constructed for herself and her younger brother, Harry, in their backyard at home. Laura told the following brief story while moving in and out of a thicket of wattle on the edge of the school fence line (Fig. 2):

> Once I found like a little cubby, and it was near like the driveway going up. And I found some bricks to make like stairs to go up a tree and step in there and I found a ladder and a chair. . . and it didn't have any legs on it. So I put it on a branch that I liked to sit on and then I put the ladder on there so I could climb up and sit on there. . . it was like a very old tree . . .

Fig. 2 Laura's little nest cubby up in an old fig tree in their family home garden

> there's like a little nest made up of all lots of sticks in it. . . I found it first and there's like a little nest and my brother climbed up it and sat in there. And I asked him if it was comfortable and he said it was . . .. (Laura, Telling & Drawing, 5.6.13)

Over the course of our conversational interviews and as our research relationship developed, Laura's stories became increasingly emotional and sensory-based in their delivery and their content, as seen in the following extract of a story told while making a map of her imaginative play places:

> Sometimes I run outside when people are trying to look for me inside. . .and then I go and sit up there [when I feel] a little angry and sad and a little emotional. . .I get some more happy thoughts into my head and feel much better when I am up there. . . (Laura, Mapping, 19.6.13)

With the addition of the photo of the "little nest cubby" onto the three-dimensional map she was creating, Laura's story followed on from the original one about the fig tree but was extended to include an understanding of the restorative effect of the tree on her emotional well-being. Laura continued her narrative thread about the significance of this place in her imaginative play throughout the stories she told; and later, she was able to reinterpret her own thinking when she answered my query about the abstract notion of loss if there were no trees to make her cubbies, saying,

> We wouldn't really have any place to be ourselves and play together in special places, and we would have to find really tricky places and it would be really hard to get in there.... (Laura, Mapping, 19.6.13)

It is evident in these brief story extracts that 6-year-old Laura's stories were fundamentally influenced by the physical environment she chose to tell her stories. The desk-bound stories were stilted and distracted; while conversely, Laura chose to tell the rich, insightful, and deeply emotional stories about important places for imaginative play when she was storytelling among the wattles. In consciously choosing this place in nature to tell these particular stories rather than when inside was indicative of Laura's heightened awareness of the sensorial attributes of this place.

Collectively, scholars such as Hart (1979) and Moore (1986) found that children have a strong attachment to the "spaces" they subsequently construct as meaningful "places." Following these earlier studies, Rasmussen (2004) and, later Lim and Barton (2010) have concluded that place is important to children and,that children are highly capable of constructing their own symbolic places for play. Pink's (2009) work on sensory ethnography takes this notion of a sense of place further by suggesting the "materiality and sensoriality of the environment" markedly influences the experience of place (p. 25). These theories of place were evident in Laura's stories where her finely attuned sense of place together with her capacity to question her story lines to explain her relationship to natural places was illustrated. In many ways, the place Laura chose to tell her more emotional and sensory-infused stories was a symbolic representation of the "quiet, uninterrupted, and hidden" places

that were consistently identified in the stories told within and across generations that the historical and contemporary children constructed for their imaginative play (Moore, 2015).

Ted's Story of the "Secret Tree Base"

In contrast to the persistent stories Laura told, 7-year-old Ted (Farm family) dramatically changed his stories over time. During an initial visit to the semirural school playground, Ted was adamant that he did not engage in "pretend play" now that he was seven and that he only "played" basketball and Pokémon while at school. Ted proudly showed me the basketball courts and the sacred place for Pokémon trading as we engaged in a "talking while walking" (Kuntz & Presnall, 2012) tour around his school playground. He told many stories about the different cards and how he traded them with others. Much later, walking past the school oval to a thickly treed area, Ted appeared to falter and subsequently change his story, as seen in the following story extract:

> I don't really know... [long pause while looking intently at an old tree stump] ... but sometimes I do play over there. . .that's the other place I hide. That's our secret spot, secret stuff sometimes happens here and there. . .it's not just mine, its mine and my friends, and it's actually a tree.... (Ted, Telling & Drawing, 17.6.13)

Following on from this disclosure about his "secret tree," Ted suggested that the teachers and other children thought he and his small group of friends were "just playing footy on the oval." In reality, however, the children were running back and forth between their secret tree base and other trees, in an enacted version of a "virtual game" among the trees (Fig. 3).

What was of particular note in the shift in Ted's story was his whole change in body language with this new storyline. Instead of the dominant discourse of Pokémon-infused play surrounding a contemporary 7-year-old boy at school, Ted had moved beyond the expected storyline and revealed the hidden "counter narrative" (Bamberg and Andrews, 2004) of his play in nature that was still happening even though he was seven. Seemingly to reinforce this shift in his story, Ted hugged the tree trunk and then smiling broadly, rubbed the bumpy bark in an affectionate way to demonstrate the depth of his relationship. Remarkably, Ted's grandfather, Bob, had a similarly emotional response when telling a story about his favorite childhood oak tree. Bob had nearly leapt over the table with his affirmative reply when I asked him if this old oak tree was still an important place for him (Moore, 2015). It seemed as though this connection with particular trees had been passed down through the family, though no family member mentioned this pattern.

In walking up toward the "secret tree" on a later visit, this place and the natural affordances within it appeared to trigger an overwhelming emotional response in Ted as he decided I was now trustworthy to reveal his "secret tree" story. Had we not had the time and opportunity to establish a trusting research relationship in which the questioning of story lines was encouraged and emotional responses were welcomed, Ted's new story would not have been heard in this inquiry. While Marsh (2013)

Fig. 3 Ted's old secret tree that he hugged when he changed his story plot line

maintains that "toys reflect the zeitgeist of a given era" (p. 59), I argue that children, as Ted had shown, are highly conscious of this expectation to only play with "popular toys" among their peer group and within society. Ted's experience is mirrored in Cross's (2009) study, where a small group of 9-year-old boys fiercely protected their "real version" of a popular online game that they enacted under a stand of oak trees well away from their peers (p. 133). Collectively, the children in this narrative inquiry have shown that they were able to move beyond peer group expectations at least in their imaginative play in private and natural places.

Sonya's Story of the "Old Tree Behind the Gates"

To illustrate children's relationship with nature is not always geographically predicted, such as in Ted's semirural playground or Laura's bushy backyard; the stories 6-year-old Sonya (City family) told about her concrete-dominated school supports this argument. Sonya was in Grade 1 in an inner-city primary school, and I was asked to meet with her during an out-of-school-hours program so as not to interfere with her schoolwork. From the very beginning of our first conversation, Sonya wove stories in and around our conversations so well I could hardly think of anything else to say or ask, so I just listened much of the time.

One of the persistent stories throughout Sonya's conversations revolved around her favorite "very old tree" that was locked away behind a high gate in her school playground. During the first of our walks around her school playground, Sonya showed me the peppercorn tree and the enclosed corner beside the tree where she and a small group of friends had created their symbolically hidden place for imaginative play (Fig. 4).

The significance of this tree and this place was made clear when I asked Sonya how she felt about the tree being locked behind the gates. This was seen in Sonya's response in the following re-story using direct quotes from Sonya's mapmaking conversational interview blended with my voice as the narrator:

Fig. 4 Sonya's favorite old peppercorn tree locked behind a high gate

> That's my favourite tree there" said Sonya pointing to an ancient peppercorn tree hanging heavily over the fence, but locked behind a high gate. I asked Sonya how she felt about her favourite tree being behind a gate that was never opened and she replied that it was "a bit bad because the seats are . . . you are supposed to. . .it's actually not supposed to be behind gates. I don't know why it got in a gate, how it somehow got behind the gate. . .. It's my favourite tree in the whole school. . . it's nearly the tallest. . . and its very old" she said in a perplexed voice... Standing there behind the gate, Sonya disclosed that she frequently "talked to the tree" and that the tree was from a time when "the school was a castle", many years before she came there. (Sonya, Mapping, 13.6.13)

In this re-story, Sonya's strong relationship with her "favorite tree" is evident, although she experiences this connection from behind a gate. While the material affordances of the tree are only symbolically accessible to Sonya, its presence was still felt and named as an important character in many of her stories. These re-stories show that despite her contextual constraints, Sonya's relationship with nature was keenly sought in any creative way possible.

Later in this conversational interview, I asked Sonya if she was ever concerned about anyone overhearing her pretend play, such as when she was talking to her favorite tree. I decided to ask this question because Sonya had mentioned she often played games other people did not think were fun, such as "playing pretend horse riders on the oval pathway next to the tree while looking for bug tracks." Despite Sonya's confidence and creative thinking, it seemed she was very aware of the

accepted peer culture and adult regulations of school playground play and seemed anxious to comply with the rules that surrounded her use of place. The following brief re-story extract highlights her changing response as she subsequently questioned the previous stories she had told:

> She started to answer, "No" she said, "I don't care if anybody hears us talk to the tree. . ." then paused mid-sentence and dramatically changed her answer, saying instead ". . .but. . .because when I hear some people that are going around I sometimes start to stop because I think they are going to be laughing, because sometimes we do some games that are a bit private to me and my friends, that's why I wait for them to go first." (Sonya, Memory Box, 26.7.13)

In this re-story extract, Sonya's shift in thinking was clearly audible as she stopped talking and appeared to question her own thinking about the "stories [she] lives by" (Clandinin, 2013, p. 21). In this way, Sonya could be seen to be moving beyond the "everyone must play together" discourse expected of children in educational settings (Skanfors, Lofdahl, & Hagglund, 2009, p. 107), to a narrative where privacy and an emotional response to imaginative play was able to be expressed. Although the stories around the importance of the old tree persisted throughout the whole inquiry, it was interesting to note how Sonya's metacognitive thinking about her imaginative play deepened over time and so changed her meaning-making of her experiences.

In the analysis of Sonya's field texts and re-story extracts, the significance of enacting a relational narrative inquiry with young children is foregrounded. The research relationship that had formed over time between Sonya and myself was clearly influential in the trust she displayed in telling me about her imaginative play while "talking to the tree" that was not possible in our first initial conversations. Golombek and Johnson (2004) claim that a narrative inquiry allows the participants to "question" what they thought they knew about a phenomenon. Questioning their own stories was possible when the children were given time and opportunity to think about, change, and shift their thinking over time rather than telling a story that remained as one "fixed entity" (Huber & Clandinin, 2002, p. 792). This empirical example illustrates young children's capacity in questioning their own stories and retelling a deeper, more emotionally meaningful story over time.

Harry's Story of the "Tree Cubby"

For the final story retold in this chapter, I have chosen Laura's little brother, 4-year-old Harry's (Beach family) version of the family story of the old fig tree, partly because it shows the nonlinear, voluntary processes of this narrative inquiry. I have also chosen this story to retell because it provides an example of both the limitations and the successes of this narrative inquiry with young children.

Four-year-old Harry did not want to fully engage in the research process with me. During my first few visits to his early childhood center, Harry vaguely pointed out various "places" where he played "pretend" in his playground – "this is the place for playing dogs" – he said in a monotone voice as he nodded in the direction of a

"built" cubby house. Harry was neither interested in talking and drawing nor making a map of the places he played. While the idea of taking his own photos was initially exciting, Harry found the use of the digital camera frustrating. Another day he firmly stated I was "not allowed" into a particular place where he and his friends were "playing fighting," he declared. While Harry had ticked the assent form to be involved in the study at the start of every visit, his body language and the words he used told another story, and this was the one I was ethically bound to listen to. I walked away most days wondering if I should continue trying to establish a research relationship with Harry.

I decided to try one last time on the day allocated for a possible memory box conversation, assuming Harry's response would be his usual monosyllabic one. However, I was shocked to discover Harry's intense excitement in wanting to immediately "tell a story" about his memory box, even though he was knee deep in mud at the time of my arrival. The following re-story extract describes Harry's emotional response to the memory box:

> Harry chose a place for us to sit next to the creek, but hidden behind a bush, to talk about his memory box saying "You remember this place Deb, we've been here before." This was surprising as I had not thought Harry had taken much interest in me trailing behind him on previous visits. And now, as we sat down, other children started coming up the hill to look at his memory box too. In an amazing shift from his earlier attitude, Harry held up his hand and called to the other children, "Stop, we're talking here. . . come back later." With our privacy assured, Harry then enthusiastically showed me what was inside his memory box – a leaf, a twig, a matchbox car and, significantly, half a brick. On asking Harry about the brick, he triumphantly replied, "This is the stairs up. . .I made the stairs, but Laura made a lot. . .up to the tree cubby. . .it has a ladder and a balancing thing and a bed and a little chair. . .all those things. . . and do you know where the little chair is? It's in the tree! It's just for me and Laura and no one else goes in there. . . they don't find out about it." (Harry, Memory Box, 14.8.13)

This re-story extract illustrates Harry's heightened emotional connection to his "fig tree" at home, linked to his creative act in making his "own place" for imaginative play in this significant tree. I am not sure if it was the connection with home that made this method so appealing to Harry, but it was clear it was Harry's decision when, where, and to whom he would tell his private and important knowledge about his "tree cubby." This was confirmed when other children approached our "talking-place" and Harry held up his hand and loudly called out, "Stop, we're talking here. . .come back later" (Fig. 5).

Also significant was Harry's insistence on telling this important story in a specifically chosen place in nature which closely resembled the natural place he was emotionally describing in his story. This did not appear an ad hoc choice but one that was consciously chosen with natural affordances and sensorial elements in abundance to enrich Harry's experience of storytelling. Linzmayer and Halpenny's (2014) study suggests that children learn to "define their interactions, and make meaning of their relationships with nature" (p. 424). While Harry's stories also illustrate this point, I argue further that it is a child's decision as to if and/or when they share their knowledge of their places in nature; and if they decide not to tell their stories, it does not mean this

Fig. 5 Harry's photo of the place by the creek behind a bush he chose for our memory box conversation

close relationship with nature does not exist. It is, as Goodenough (2003) contends, private information they have decided not to share with others.

Ecological Narrative Inquiry and Childhoodnature

Young children under the age of seven years of age are traditionally not considered "competent enough" to engage in an "interview-based" methodology (Skelton, 2008, p. 24), such as a narrative inquiry (Clandinin et al., 2016). However, through the use of this ecological narrative inquiry, young children's storytelling and their capacity to question and reinterpret their own stories were highly valued, providing multiple interpretations in a partial account of children's experience in/as nature. The complexity of the young children's storytelling and the stories they told were seen in the stories and the analysis of their re-stories shown in this chapter.

It is interesting to note that Clandinin and Connelly most commonly conducted their conversations with participants in classrooms, though they were always careful to find "safe [inside] places for sharing secret stories" that were negotiated with the participants for their storytelling (Huber & Clandinin, 2002, p. 795). Similarly, although Clandinin et al. (2016) stated they "negotiated time and space outside school hours," their conversations were still held inside an "unused classroom" (p. 188). This current study has demonstrated an extension to Clandinin and Connelly's work on narrative inquiry by providing empirical evidence of an outside, more ecological approach to the methodology.

The idea of interviews conducted in an outside environment is not new; it is often the basis of an ethnography or case study. However, what is of significance in this inquiry is the conscious choice children appeared to be making to choose a "place in nature" for their storytelling. This may have been due to the need for privacy to overcome the threat of being overheard. Or perhaps, the provision of sensorial affordances in outside, natural places resonated with the storyteller and informed the story content which in turn added to the depth of the emotion-infused stories

chosen and told by the children. Or importantly, it may have been that these places in nature aligned most strongly with the children's "need" to construct their own "emotionally safe" places for imaginative play in natural places. This "need" was persistently identified in the historical and contemporary children's stories and subsequent analysis, indicating the continuity of this phenomenon over time (Moore, 2015). The inherent relationality of this ecological mode of inquiry with its layers of temporality, spatiality, and affect have enabled the slippery and permeable blend of childhood imaginative play places with/in nature to be seen and heard in a way that other research methodologies may not be able to achieve.

At first glance, these findings and this summation may appear to stem from a romantic view of the construct of childhood as "innocent" or "the young child as nature" in which children need to be protected from the realities of contemporary life (Dahlberg, Moss, & Pence, 2007). Or it may appear to have arisen from a moral panic discourse in which adults fear the loss of childhood as they knew it, and so, a "natural childhood" needs to be preserved at all costs (Adams, 2013). Other readers may find a human/nature binary apparent in this inquiry where children are referred to "in" or "with" nature as potentially problematic suggesting the externalization of nature from children. However, I argue, it is much less adult-driven and contrived than these issues suggest. In providing an inquiry space for young children to question their stories, to go beyond the dominant discourse of contemporary children's play, the young children in this inquiry have subsequently been given time and space and experientially playful opportunity to articulate their deep relationship with/in nature in a way that emotionally resonated with them.

This ecological narrative inquiry avoids universal claims about childhood imaginative play and notions of nature. It is not possible to make such claims, given the study was located within four particular families in a particular place, at a particular time. Nor is it possible to claim that the researcher now "knows" the "unknowable" child and, therefore, what a child definitively thinks and understands (Moss, 2006). Nor is this chapter able to provide generalizations on how every young child would respond to the invitation to be involved in a narrative inquiry. Instead, what this chapter has provided is an example of how an ecological approach to narrative inquiry was able to push back against the contemporary deficit discourses on marked changes in young children's imaginative play and showed that play in natural environments is important for contemporary young children. And, of relevance to this handbook, a narrative inquiry developed in this ecological way has provided some empirical evidence into children's episodic lived experiences of their preferred local environments and their relationship "with" and "in" nature, which, potentially and mindful of the limitations of the study, might say something about children as temporally/spatially/affectively "as nature" in an emergent version of childhoodnature.

Abstract

This chapter explores the notion of curious practice and the methodology of its application in the context of primary school education in Finland. The concept of curious practice encourages us – researchers and educators – to ask "How does curious practice help us to address children's relations to forests beyond the child (in) nature dualism?" Curious practice challenges the existing environmental education methodologies employed in recent years that draw heavily on research planning, the child's representation of nature, and the results of a completed study. Despret's (Domesticating practices: The case of Arabian Babblers. In G. Marvin and S. McHugh (Eds.), *Routledge handbook of human–animal studies* (pp. 23–38). New York: Routledge, 2014) approach of curious practice encourages researchers to unplan and make themselves available to the yet unknown, for

every single encounter with the other is a mixture of unpredictability, the researcher's attentiveness, and imagination. The rationale behind curious practice is in learning more about what is seen and heard via questioning the encounters that accept various absences of a preconceived framework of research. As a necessary complement to such a methodology, the chapter also presents a semiotic approach, employed by Eduardo Kohn (*How forests think: Toward an anthropology beyond the human*. Berkeley: University of California Press, 2013), to inform the method of studying the logic of the world beyond human symbolism. The data used reveal an interdependency of children and forests that will be referred to as childrenforest in that it continuously generates a network of signs which adults and children themselves often are unable to access or represent. These present absences found in curious practice are crucial for our understanding of what we have overlooked while claiming that the other is known. With that, however, childrenforest cannot be fully grasped. Andrew Pickering's (*Natures Sciences Sociétés, 1*(21), 77–83, 2013) notion of islands of stability is utilized to elaborate the ways that childrenforests signal the presence of the seemingly stable configurations of their dynamic becoming. The chapter concludes with a short discussion of the potential areas of curious practice application beyond the ethological and childhood research.

Introduction

The concept of childhoodnature is fluid, and so there are numerous ways to formulate its practices in research, or pedagogy, or policy. The methodological inquiry discussed in our chapter focused on research aims to clarify one key understanding, simultaneously relating this understanding to other research practices of children and nature. To do this, we discuss a study conducted in the context of primary school education in Finland. We introduce an in situ development of *curious practice* as a methodology to explore what we will call *childrenforest*. "Curious practice" is a theoretical notion coined by Donna Haraway (2015) and inspired by Vinciane Despret (2014). At the heart of Despret's ethological work lies the demand for scientific and philosophical inquiry into the relationships of people and animals, observer and observed, and researcher and researched in ways that challenge rather than rely on these binary positions.

The research context of the empirical study is a nature school to which local school classes make field trips in a northern city in Finland. The research involved 5 weeks of full-time work between February and March 2017. The human participants were the nature school teacher Niina, 438 children from first to fourth grade (i.e., 7–10 years old), class teachers, their assistants, and the researchers. The forest visited by the school children and adults comprised a diverse collection of more-than-human participants,

emerging differently with each visiting class. And so, the unit of analysis was conceived as *childrenforest* – a concept to be developed in what follows.

The methodological question discussed in this chapter is *how does curious practice help us to address children's relations to forests beyond the child (in) nature dualism*? The primary goal is then *to explicate the ways in which curious practice aids in highlighting the neglected properties of the mutual becoming of children and forests*.

The philosophical and methodological approach evident in our framing of childrenforest with curious practice reflects emerging "posthumanist" (i.e., beyond humanist or human-centered) approaches to educational research (e.g., Snaza et.al., 2014) that partially converge with "sociomaterialism," "post-anthropocentrism," "new materialism," or "new empiricism." These perspectives are mobilized by theorists such as Barad (2007), Haraway (2008), Braidotti (2013), Bennett (2010), and Stengers (2011). At the core of these approaches is a focus on the *relations between agential entities* rather than on the individual (human) actors. This means that emphasis is on the shared processes through which relations take place rather than on individual (human) views of these relations. This theoretical insight helps to elaborate a basic premise of childhoodnature in which humans and their nonhuman surroundings do not exist independently of each other (Malone, 2015; Rautio, 2014; Snaza & Weaver, 2015; Taylor, 2012).

Childrenforest is invoked as a living, throbbing, productive, open whole rather than composed of interacting (turn-taking), clearly discernible individuals. Childrenforest is a cumulative effect of the diversity of individuals labelled "children" and the multiplicity of things and beings called "forest." Childrenforest is an entanglement, a more-than-human entity that emerges unpredictably and cannot be planned in order to be known, especially through conventional methods of qualitative research. Our concern is, therefore, with exploring encounters of children and forest in terms of their emanating, but not palpable, assemblage, which nevertheless leaves traces and "speaks" with a researcher through unusual, interesting, and unexpected events. This is an approach to qualitative inquiry and to data that Svend Brinkmann (2014) calls abductive or breakdown driven, and Maggie MacLure (2013) characterizes as openness to surprises and to the mutuality of researcher and data reconstituting each other. Both challenge the idea that research is both planned ahead and executed accordingly and that data is simply collected; Brinkmann (p. 722) suggests that inquiry arises out of a surprising situation rather than in relation to collected data. Such openness to serendipity can generate new knowledge of what is significant in the relationships of children and forests through highlighting what has been missing from previous – well planned – studies and how, by approaching childrenforest, we can enrich the understanding of who we are as humans.

To study childrenforests as entanglements capable of surprising us, we apply curious practice as a methodological form of what is called multispecies inquiry or multispecies ethnography. The novel yet rapidly emerging approach of multispecies ethnography (Kirksey & Helmreich, 2010) foregrounds all animals as embodied individuals sensing and making meaning of their environments and thus as

legitimate participants in the ethnographies of shared lives (Buller, 2014). Multispecies ethnography thus focuses on human-animal coexistence in terms not only of what the individuals are (biologically) but what they do (biosocially) and not as beings but as becomings creating themselves together through action and interaction (see Ingold, 2013). In our study, the curiosity in curious practice reaches beyond animate beings – or rather questions the notion of "animate."

We begin by briefly reviewing the literature that explores children in forests. This will assist us in characterizing what has already been done methodologically in disclosing and representing the experiences of forests by children. On the surface, these studies do not seem to treat children and forests as categorically separate. But a closer reading shows that an underlying binary exists: children are often put in a dominant position of knowledge producers whose task is to experience forest (as if it is an object) and express it in a representational manner. Ultimately, these subjective representations are further used to improve learning objectives and are often presented as a portrayal of an objective reality.

We will then move to describing curious practice, as introduced by Donna Haraway and based on the work of Vinciane Despret. The relevance of our methodological choice and its location within a broader field of multispecies ethnography is discussed. In the section where we present our account of curious practice, we show that curious practice of childrenforest differs slightly from the curious practice described and performed by Despret. Despret's (2015) aspiration to make ontological claims about the potential "reality" of her research companions, or the "mystery manifestation"/"resolution of enigma" (p. 59), as she puts, is what we will leave out. For this and other reasons, we combine the methodological foundations of Despret's curious practice with Eduardo Kohn's (2013) "anthropology beyond human" in order to customize curious practice with respect to our research context, subject, and the participants. By thinking with Kohn, we attend to the ways of looking at childrenforest through the notion of "human and nonhuman semiotic selves" to go beyond mere symbolic representation inherent in humans. We also apply Andrew Pickering's (2013, 2017) concepts of *decentered becoming* and *islands of stability* to the encounters of children and forest to demonstrate the co-constitutive becoming of children and forest and the appearance of seemingly stable configurations within this becoming.

Previous Literature

Intellectual conditions for thinking beyond the "child" and "nature" dualism exist and have existed for a while (e.g., Russell, Sarick, & Kenelly, 2002). Many authors contributing to this current handbook engage with the entangled childhoodnature rather than with childhood and nature separately in order to challenge the nature/culture divide implicitly present in much of (early) childhood and outdoor/environmental education research that we review below (see also Clarke & Mcphie, 2014; Malone, 2015; Rautio, 2014). The following studies are dedicated to an investigation of children's experiences in the forest and mainly concern exploring the effect of

forests on a child's well-being. For the purpose of relating and contrasting curious practice and childrenforest to these approaches, we will trace the methodological commitments of these studies and the level of the children's own contribution to the end result and formulation of new perspectives for the development of educational knowledge.

There is an evident trend, located at least in the Nordic or North European countries, of growing numbers of forest day-care centers, gardens, and schools. The reasons behind the upsurge of educational contexts close to nature are yet to be explored in detail, for instance, the parental choices that create the demand for such places (Borge, Nordhagen, & Lie, 2003). There is no shortcoming of research emphasizing the positive influence of direct contacts with nature to children's well-being. Among these are overall health and motor fitness (Fjørtoft, 2001), linguistic development and concentration (Schäffer & Kistemann, 2012), increased engagement and prosocial skills for children with special needs (Griebling, 2015), as well as growth of interest in forest life (Harris, 2015). Due to the prevailing developmental approaches to education, children's doings are often subjected to meanings ascribed by parents, educators, and other fellow adult citizens (e.g., Blaise, 2016; Burman, 2007). The forest school trend and its underlying justifications seem to be no exception. There are studies that seek to foreground children's views and experiences. These, as we will argue by introducing a few examples, are methodologically conventional in that they entail little flexibility and/or critical evaluation of research designs and so often fail to address what matters to children beyond adult-imposed categorizations.

Nicola D. Ridgers, Zoe R. Knowles, and Jo Sayers (2012) conducted a study of children's experiences of play in a forest school using a qualitative approach (pen profiles and verbatim quotations), which constituted a well-planned research project with an anticipated objective of methodological rigor to be demonstrated through trustworthiness, credibility, transferability, and dependability of data. The result was to be approved by all authors during a triangular consultation process. The authors, however, concluded that their research lacks depth without presenting children's own voices, though evaluated "not in the manner that would typically be expected" (p. 53). This statement indicates the researchers' frustration over the initial plan for data presentation, which led to their agreement on the introduction of "raw" narrative – the individual opinions of children – that does not require interpretation and should be presented in the language of the children themselves.

Magdalena Rudkowski (2015) explored children's experiences in the forest with the help of hermeneutic phenomenology and the Mosaic approach. Children were encouraged to express their sense of the forest through photography and drawings, bookmaking, and child-led tours as well as in casual conversations with a researcher that would reflect on the children's experiences. Rudkowski also conducted a pilot study before the actual empirical research so as to test "whether they [data collection tools] were effective in capturing the children's experience and of interest to the children themselves" (p. 42). Rudkowski mentioned that six children (other than the main participants) were "included" in the pilot study. Yet, their experiences were excluded from the discussion. By doing this, the researcher immediately reduced to a

common denominator those children's interests, values, and personalities that were investigated in order to ensure the effectiveness of the research objectives. Division of a research project into concrete stages with limited periods for "productive" data collection, aspirations toward results, and silencing some of the voices will not, however, ensure what Rudkowski called "open-ended, malleable and versatile opportunities without the specific design and tailoring for young children" (p. 106(7)).

Anna Golden (2013) embarked upon exploring and making meaning of the forest with preschool children, whose task was to express their experiences and understanding of the natural world through various forms of representation: drawing, writing, photographing, clay, blocks, embroidery, and other tools. Golden highlighted the importance of looking at children's own ways of seeing the forest, their ability to reflect upon the landscapes and their favorite places in order for adults to better understand children's learning objectives based on their representations of the forest. The binary of (wild) nature and (agential) culture is evident throughout, for example, in phrases and quotes such as "wild space," "wildness," "model of the forest," "stewardship of the forest," and "the world outside them." While Golden's methodological approach is in line with the conventional way of doing a qualitative inquiry, we found intriguing the fact that an inquiry into the children's view of the forest included, as if protecting the children from the same forest, "countless changes of dry, mud-free clothes" (p. 125).

Most of the studies reviewed promote the well-being of children and their positive attitude to the forest, as well as increasing the time spent outdoors as part of formal education; these studies nevertheless belong to the perhaps unintentionally anthropocentric ones (Clarke & Mcphie, 2014; Malone, 2015). Furthermore, most of these studies emphasize the importance of planning in research. Planning, and following a plan, indicates an approach where the researcher knows about the topic/participants beforehand and/or has a clear hypothesis to test. In contrast, when the researcher lets go of much of her preconceptions and is curious instead, the task of planning becomes harder if not impossible. Well-planned and dutifully followed studies rarely break free from what is already known. This is especially weighty if what is presented as known is a child.

Furthermore, presented studies are exceedingly attentive to a child's representation of forest. Focusing on meanings or explanations behind children's actions – be they adult imposed or the children's own – does not acknowledge the interdependence or relationality of childrenforest. Any single meaning or explanation is always only partial. Any symbolic representation of a child's interpretation of their movements is, therefore, limited only to human perception or cannot be interpreted at all. Alternatively, the focus in this chapter is on *the co-constitutive processes that give rise to childrenforest*. All of the actions, intentions, and intensities are the result of co-constitutive process of both children and forest. With such processes, it does not make sense to ask after meanings or explanations of only one kind of individual. Childrenforests emerge spontaneously: a child and a tree, for example, are drawn to each other in complexly relational situations where categories do not apply but where categories can be made. Curious practice shows us the ways of approaching these emergent categories, and with that, we proceed to the exploration of this

methodology in the next few sections, where the processes of the childrenforests are discussed.

Curious Practice Unfolding

Although the idea of being curious and having a sense of wonder in doing research is not a novel one (Daston & Park, 1998; Evans & Marr, 2006; MacLure, 2013; Stolberg, 2008), an approach of Vinciane Despret stands out among all the approaches, for it encourages researchers to work relentlessly with their curiosity, ask interesting questions, and immediately doubt them. What is most important, Despret does it not only and not so much for the sake of humanity as for the sake of more-than-humans.

Curiosity as a natural human ability for inquiry is commonly argued to be a desired trait in both teachers and students, scientists, and everyone who shares an idea of lifelong learning (Dewey, 1933; Schmitt & Lahroodi, 2008; Stolberg, 2008). Frederick Schmitt and Reza Lahroodi (2008), for example, attach a higher epistemic value to curiosity than to a sense of wonder, stating that "In wonder we are not overridingly motivated to resolve cognitive conflict, while curiosity motivates us to inquire" (p. 132).

In other words, wonder does not necessarily imply a desire to know, when in fact curiosity does. In wonder, you might find something/somebody curious and appreciate its/her/his mystery without going further than that. This something or somebody usually stands in a position of novelty to an observer (Leask, 2002, p. 25), though it should not always be the case. Oftentimes, these two notions are used interchangeably as their borders are not clearly defined. Given the visible ambiguity of both terms and a definition of imagination presented further (see at the end of the current section), we suggest a notion of *wondering curiously*, based on our interpretation of Despret's (2014, 2015; Buchanan, Chrulew, & Bussolini, 2015) works. For a researcher, to wonder curiously would mean to stimulate himself/herself to notice novel/interesting even in ordinary, learn to be surprised at it, and then, if given an opportunity, approach it by means of imagination.

What Patricia Williams (as cited in Gordon, 2008) refers to as the "vast networking of our society" (p. 19) and Avery Gordon (2008) calls a "complex personhood" summarizes the existing approach to curiosity, which pivots on the curiosity oriented toward complexities and intricacies of human society, whereas Despret teaches us to think both with humans and not. She urges us to build our nowadays very fragile relations "with and for earthly beings, living, dead, and yet to come" (Haraway, 2015, p. 5) as well as to recognize the risks and limitless possibilities of "wonder" within human-nonhuman encounters. There is no need to deny a historicity and a profound complexity of multiple nonhuman forms of life, which we, as humans, are nested in.

Vinciane Despret seeks fertile collaborations with people and animals through an art of *visiting*. For her visiting is a skill of resistance to grand narratives by means of co-creating new stories with more-than-humans. It is an ability to unplan research by

turning it into a spontaneous journey rather than a data collection process. It is an art of "sniffing" an invitation to enter a territory of the other with a brief and polite visit. Donna Haraway (2015) further clarifies:

> Visiting is not an easy practice; it demands the ability to find others actively interesting, even or especially others most people already claim to know all too completely, to ask questions that one's interlocutors truly find interesting, to cultivate the wild virtue of curiosity, to retune one's ability to sense and respond – and to do all this politely! (p. 5)

Curious practice or the polite way of visiting is about creating conditions for encounters. The kind of conditions a curious researcher is after are interesting and lively and of the kind that will lead to encounters without assuming that the other can be known. Rather than focusing on "rich data" production, the researcher is responsible for finding ways of listening, seeing, and being with others in the moment. Despret (2015) herself associates this practice with the word "respect" as a form of suspicion of one's own reasoning. The politeness of a researcher thus includes doubting the commonly accepted, human-centered approach to her nonhuman co-researchers. The researcher is responsible for approaching research in a way that will put herself in a position of resistance, in a way that will perplex things to the extent that new questions need to be asked, the kind of questions that matter for the nonhuman participants and co-researchers. One must talk to the others, listen to, be inspired by, and, eventually, tamed by them by virtue of, if not reaching, then coming closer to an understanding of what matters to other-than-humans.

Curious practice can be seen to be the heart of multispecies ethnography or multispecies inquiry attending to the hybridity, entanglement, and relationality of all entities and lively beings, humans included (Haraway, 2008, p. 330; Lorimer, 2007, p. 913), and thus dismantling the modern myth of the purified and separate realms of "nature" and "society" (Latour, 1994). For the purposes of the study described in this chapter, and as opposed to many studies in the field of childhood and nature, curious practice recognizes both children and nature as being entangled and relational co-researchers rather than objects of the study. It resists an intended dialogue being replaced with a prescriptive monologue; it focuses on the openness and availability of the researcher, rather than that of the participants. According to Despret (2015):

> The ravens will literally recruit their researcher into what will become a passionate inquiry; they will reveal to him the resolution of an enigma the difficulty and the interest... In learning to recruit them, he learned to be recruited by them. That which constitutes achievement for a raven now constitutes, in another way, achievement for himself; feeding on their emotions, letting himself be pervaded by their joy, letting himself be drawn into their enigma: converting the environment into a little more of himself. (p. 59, 66)

In the study discussed, the children and the forest will recruit the researcher. And so, rather than trying to guide the hybrid and entangled childrenforests, the researcher becomes guided by them.

In order to be guided, the researcher has to admit to the necessity of being open to the yet unknown, to the possibilities of seeing differently. She has to learn how to be a not-yet participant of the potential assemblages of children and forest, to be within

and yet observe from afar the childrenforest becomings. The monist overtones of such vocabulary imply freedom from the dualist worldview, the legacy of science. It is not even a matter of obligation, but an unconstrained, effortless, naturally occurring being and acquiring of another sort of vision, which Margaret McMillan (1904) referred to as seeing beyond human sight or attending to the higher structures of mind:

> Half the difference between the discoverer and the ordinary man may be said to consist in this, that the former can see that which is invisible to the other. – He can conceive movements and forms that are beyond mere physical vision. (p. 168)

This type of vision, in accordance with Despret, is equivalent to imagination or the ability of a researcher to create multiple hypotheses, versions of the same event, which are hidden from an ordinary person behind often blunt and commonly accepted cause-effect relations (Buchanan et al., 2015). The task of the researcher is to imagine what is absent from the scene in order to create conditions for approaching something not yet revealed. Imagination in the current chapter is, therefore, defined as a tool to gratify one's curiosity, an immense power of humans to think in terms of possibilities, create, link, mix, divide, or separate ideas that might further explain an observed phenomena within given sensorial capacities (Hume, 1975). What is lost, however, in the process of representing the "data"/versions that might perform a quite functional duty is nonrepresentational. The affect (Deleuze & Guattari, 1987) from the encounter of children/researchers and forest, emergence of childrenforests, is exactly what intensifies the moment and oftentimes liberates us from the meaning-making. With that the researchers are often limited in their ability to imagine/see this sort of irrationality of unknown content and have to either "grope about in darkness" or find a way to go beyond a mere imagination (Holton, 2016, p. 915). Alternatively, as Despret (in Buchanan et al., 2015) explains, the researcher has to learn "to trust the world" (p. 170) in order to be guided in darkness, meaning a human imagination is rather an extension of the thinking world that is alluding to the right questions and possible answers. We, as researchers, just need to sometimes acknowledge that irrational in our head might be an echo of ordinary, the gesture of a wondering other.

In the next section, we will discuss how to unplan research with the help of curious practice. We will exemplify this by going through how curious practice was employed theoretically and methodologically in the context of the study conducted at a nature school in the north of Finland.

Customizing Curious Practice and Unplanning Research

Theoretical Synthesis

The decision to unplan research might seem risky – as scholars we are educated first and foremost to avoid losing control. Yet, studies in which unpredictability and loss of control are taken as productive, if not virtues, are proliferating (e.g., Despret,

2014, 2015; MacLure, 2013; Rautio, 2014; Taylor & Pacini-Ketchabaw, 2016). Affrica Taylor and Veronica Pacini-Ketchabaw (2016) point out that our encounters with other-than-humans are by nature unpredictable and, therefore, planning is not only impossible but even attempting to plan is often impractical. MacLure (2013) discusses the unexpectedness of wonder in the research process of data collection and its capacity to engage with us in a form of event that cannot be planned in advance. It may just *happen*, if we are lucky enough. In regard to this, Despret encourages researchers to avoid remaining passive in a hope of seeing/sensing wonder and rather amplify the chance of its occurrence. By amplification, Despret (in Buchanan et al., 2015) does not always mean planned actions. Instead, she indicates the ability of a researcher/an involved human to persist in proposing differing "gestures," to lure the other or rather respond to its subtle signals:

> You don't improvise your own gestures, you just hope that making a gesture will provoke one of the responses you expect, and if not, it will be a response that will make the dancer respond. (p. 175)

To be able to address the emergence of childrenforest, we bring Eduardo Kohn's (2013) thinking to resonate with what has thus far been said about curious practice. Eduardo Kohn is an anthropologist, whose research attends to the questions of human nature mediated by the forest. He attempts to think with forests through people for whom a forest is more than a place of dwelling. Kohn invites us to reach beyond human thinking with the help of *semiosis* (the creation and interpretation of signs), and he draws mainly on the Charles Sanders Peirce's typology of signs. In order to understand how curious practice is applied to the relationality of children and forest, we need to obtain an image of how Kohn translates this typology into his study and what he suggests searching for.

The famous Peircean triadic model of signs stands for icons, indices, and symbols, whereby icons are "involving signs that share likenesses with the things they represent" (Kohn, 2013, p. 8); indices are the product of relations among icons, "they tell us something new about something not immediately present" (p. 52) or point out the as yet-inexperienced; and symbols are "the product of relations among indices" (p. 53), "distinctively human representational forms" (p. 8) and what makes human language possible. All these signs constitute a complex hierarchy of signs, where symbols are the products of and nested within indices and indices are the products of and nested within icons. They are not strictly delineated but rather flow into each other in the continuous chain of receptive relations. Indices need icons and symbols need indices, but not the other way around. Therefore, icons are the most basic signs that exist at the margins of semiosis, because iconicity makes it hard to notice the difference between two things. A brief example of the sign relations can be a moment when Niina showed a picture of a worm to children in the lesson called "Animals' food in the forest" and children replied that birds eat worms. The picture of a worm is the icon, a very close resemblance of what the object represents. Immediately this picture sparked among many children a reaction of disgust, because it pointed to the possibility of relations with this worm (holding it, being

near), and it seems it is not a very pleasant experience for some. That reaction bears an indexical reference to the event not yet present. And only after Niina asked whose food it is, did the children reason that it was a bird's, because for them (humans) the picture of a worm became a symbol of a bird's food in the process of their education.

Icons and indices, being *reals* or manifestations of something material/immaterial (thoughts) that exist independently of humans are embodied in worldly "habits, regularities, patterns, relationality, future possibilities, and purposes" (Kohn, 2013, p. 59) and are "far more expansive and extensive than human consciousness and its languages" (Payne, 2016, p. 171). In other words, icons and indices are aligned with an evolutionary process during which they emerge and proliferate as a part of form, as reals, which we humans cannot always identify. Kohn's idea in his research of thinking behind the forest is to attend to those iconic and indexical signs that are often unnoticed or to go further than our only habit of symbolism in order to become available to those diverse habits, relations that extend far beyond humans. Kohn's ambition unites his research with that of Despret and methodologically echoes her idea of curious practice in many ways.

The unifying feature of Despret's and Kohn's methodological approaches is their aspiration to know beyond the human and, hence, a need to train oneself to cooperate, live, and sense with nonhumans. Both Despret and Kohn participate in observing nonhumans through and with humans, sometimes through their own experiences, or at times in the absence of humans (see Kohn, 2013, Chap. 5). Likewise, we hope to approach childrenforest through and with the help of children and forests, via creating opportunities for their emergent dance. Secondly, both Despret and Kohn deny the accuracy of causality of the world with relation to the way human beings perceive it: "We don't know outside causality how things connect together," Despret (in Buchanan et al., 2015, p. 176) says. Therefore, we shall abstain from looking exclusively at the connectivities of an event that our brains tend to create immediately and unquestionably. Finally, both researchers bring to the forefront the importance of being imaginative and being less bound by theories that colonized our minds. Kohn (2013) observed that "People in Ávila try to make sense of these various selves that inhabit the forest by trying to see how they see, and by imagining how different perspectives interact" (p. 96). He also very meticulously explored and imagined different versions of various phenomena. Similarly, Despret admits the partiality of cause and effect interpretations and encourages us to search for and to imagine links between events in unlikely ways, creating unimaginable connections that develop into a multi-version story.

Expanding imaginative abilities in the framework of the study discussed means that we do not take for granted even the most mundane events: a child making a snowball, for example (see Fig. 1). Our first instinct and the answer to the question "What is happening?" is to view a child making a snowball for the fun of it, perhaps to throw it. We then move to viewing how the event could be taken as a relationality of signs. The round shape of a snowball takes us to what Kohn (2013) refers to as a *form*, a pattern propagated by "configurations of constraint on possibility" (p. 157). This round shape evolved as a result of an interplay between a human hand of a special bone constitution that forms arches and snow that has

Fig. 1 Form. (Source: Authors' photograph)

specific sticky lumping properties. A natural human grab of the right kind of snow will produce a snowball of a fairly round shape. This, in its turn, means that a ball's round shape is irreducible to more basic forms and is the simplest in itself. The round shape of a snowball emerged because of human and nonhuman agencies. Snow with its recurrent properties emerged independent of humans, and its representational modalities support its functionality in this particular context. So to speak: "semiosis exists beyond human minds" (p. 159) and informs humans about itself through humans thinking about it. The child, for that reason, performs an action with snow not necessarily because he/she *solely* decided doing so but also because the thinking forest conveyed a message to be further substantialized. As Despret (in Buchanan et al., 2015) put it: "if we know what importance means, it's because a blackbird taught us" (p. 176). Similarly, Kohn (2013) instigates an idea: "...the fact that we can make the claim that forests think is in a strange way a product of the fact that forests think" (p. 22).

Therefore, Despret and Kohn talk about imagination that is less shaped by human knowledge, dogmas, and common categories of thinking and more by the knowledge of other-than-humans. This type of imagination is peripheral, uncontrolled, or emergent and allows the researcher to visualize links within one event or between events otherwise. The opponents would argue, though, that imagination of this kind is a foe of impeccable science or falls within a certain *themata*, as Gerald Holton (1996) explains – "the often unconfessed or even unconscious basic presuppositions, preferences, and preconceptions that scientists may choose to adopt, even if not led to do so by the data or current theory" (p. 201). Eventually, there is a possibility that adherence to these convictions might lead to speculative conclusions and an academic fiasco. In spite of that, Holton recognizes undeviating need in scientific breakthroughs, which the thematic imagination, visual

as well as other types of imagination might successfully fulfill, as they inspire to imagine unimaginable and "open up entirely new worlds" (p. 207).

On the other hand, the fundamental difference of Despret's (2014, 2015) and Kohn's (2013) methodological frameworks is in their research subjects. That is, Despret's interest is to investigate, reveal, and unearth animals' behavior which a human being has never been aware of before. Concurrently, Kohn delves into a more-than-human semiosis or, in particular, the thinking behind the forest. Both tasks are hard to tackle, and both of them require an enormous commitment in terms of attention, curiosity, self-critique or politeness, and of course time. Yet, observing, working, and thinking with animals are essentially distinct from thinking with the forest, which many living beings are part of. While Despret's idea is to propose many different gestures to the animals in the hope they would respond to these gestures, Kohn proposes to think in terms of patterns, habits, and regularities to approach the way the forest thinks. In both cases there is a chance that other-than-humans might make themselves knowable: animals through a new, interesting behavior and the forest through semiotic processes.

According to our account of curious practice, we, in line with Despret's research, show a plurality of childrenforests in the same manner as she tries to demonstrate to the world what makes "a plurality of singular animals" (Buchanan, 2015, p. 18), but therewith we acknowledge the ontological differences of our respective research subjects. We do not observe a behavior of childrenforest; we observe a communion of children and forest, their "becoming with" (Haraway, 2008) that reveals itself through patterns, generals (habits, regularities) (Kohn, 2013), traces, inclinations, and neglected confluences (see further). Among these, signs with indexical reference can also be classified as islands of stability (Pickering, 2013, 2017).

Andrew Pickering (2017) helps us to understand "islands of stability" as joint products of humans and nonhumans, "configurations, sociomaterial set-ups, where some sort of reliable regularity in our relations with nature is to be found" (p. 140). According to Pickering (2008) and to the philosophical orientation, labelled post-humanism, humans, and nonhumans "appear on the same plane as mutually constitutive of practice and as each irreducible to the other" (p. 292). Thus, all participants in the research are decentered and always already transformed in a decentered becoming. Neither children nor trees/animals/air/snow hold a position of priority. Everyone is transformed in the dances of agency (Pickering, 2013) or transmogrified by the worldly dynamic processes. The desire to find stability, albeit illusory, is inherent in humans and nonhumans as we are as all living organisms that seek for survival; thus, we are in need of structures, which, however, are still under the control of nature and its "unpredictable liveliness" (Pickering, 2017, p. 143). With that, we are still emerging with and are being transformed by the world; we are part of the worldly flux of matterings and becomings, in which islands of stability sustain the inevitable duality of people and things.

The idea of islands of stability can be extended to cover all living organisms that create these islands for self-protection. An example of such organisms could be antibiotic-resistant bacteria that undergo mutational adaptations or horizontal gene transfer (Munita & Arias, 2016). While antibiotics can be considered an island of

stability for a human, the changes in the bacteria's gene structure is an island of stability for bacteria or at another level called as endosemiotics. For us, in the study of childrenforest, the islands of stability are not only material constructs but also the impetuses and intentions leading to the emergence of these structures in the first place. With curious practice, we focus on the ways in which children and forests seek mutual stability. These ways can be intentions, facial expressions, movements and intensities, sounds, shadows, gazes, hints, or any minutiae unique in its transient being which could otherwise go unnoticed, undiscovered, and, most importantly, unremembered (Duhn, 2016). The presence of the teachers and the researchers in the forest can also be considered as an island of stability, as adult and nature relations form invisible structures of protection for children that allow them to feel relaxed and open to the engagement with forests. The task of a researcher is to think beyond these islands of stability, that is, to "see" their origins, to locate their embeddedness in each historical and sociocultural situation, and eventually to be able to argue for the significance of childrenforest.

Looking at the childrenforest becomings through the notions of islands of stability and decentered becoming helps us to see more clearly each and every sign, habit, or an emergent real that appears, exists, and grows through the chain of signs. Being indexical in their nature, islands of stability point to the fragility of life, which urged humans and nonhumans to create these islands in the first place. We ask why these islands appear, and what motivated their creation? This automatically lead us to a better understanding or guess about the potential in our respective context reals. With Vinciane Despret, we politely explore, imagine meanings otherwise, and create links between meanings in a hope to approach these reals that exist and proliferate in the world in the same form as they appear to the nonhumans. The element of "unplanning" is ingrained into the whole process of uncovering the routine: from unexpected and interesting encounters to wondering curiously and the interpretation/representing connections as a form. The occurrence of the "data" is as unpredictable as the questions/revelations about reals that come to the researcher during the childrenforest moment or later when the "data" lives its own life and never stay stable. These questions might appear in a dream or when we try to remember what was the dream about, in the laughter of children, or in the cry of gulls. We will be informed about these questions/connections and their importance by the messy entanglements (Pacini-Ketchabaw, 2013) or disrupted collaborations of the world.

To sum up, "curious practice" is an overarching concept that is primarily developed and applied in Despret's research but is also inherent in Kohn's studies. We have synthesized them by picking out the best in both. We have also applied a concept of islands of stability to help in theorizing about meanings and potential versions of the same event. Furthermore, we consider the concept of childrenforest as possessing some limitations in regard to the participants in the research, who are not only children and forest. Taking this into consideration, we do not pretend that a thorough investigation into childrenforest has been made, rather the point has been to create arguments for the significance of such a construct – beyond individual "child" and "forest." In what follows, the study grounding this chapter is presented and explained in detail.

Empirical Application

The nature school studied is a city-owned public institution in the service of local schools. Annually, up to 7,000 pupils visit the nature school – every day a new group of children arrives. In these circumstances, neither the nature school teacher nor the researchers can get acquainted with the kids let alone have a chance to build emotional bonds with them. However, some groups were familiar with the nature school teacher Niina from previous visits, and it made it easier for Anna as a researcher to be trusted, because Niina introduced Anna as her friend. Every day, Anna introduced herself in front of a new group and asked for permission to make pictures and videos, promising those pictures will not reveal personality, and headed to the forest.

Since, there is no one precise definition of what a forest is (Chazdon, Brancalion, & Laestadius, 2016), we defined it in line with the research context; children's sensitivities toward invisible in the forest, such as folklore (Karhunkorva, 2005), media (Korhonen, 2008), and cultures in a given context (Goldman, 1998); objectives; and philosophical affiliation of posthumanism (that is beyond humanism) as:

> a big living organism punctuated by human/nonhuman dwellings, human-made structures; engaged with climatic, political, geo-political, economic, sociocultural forces and flows; represented by multiplicity and variety of living and non-living organisms, both humans and more-than-humans, among which trees, mycorrhizal network and soil biodiversity outnumber the rest; a process of co-constitutive growth and development.

The context of Finland, its history, and culture, in addition to the northern location of the research city, perhaps, determine the myriads of ways children and forest engage. Forest is both people's home and temple. *Home*, *nature*, *people*, *animals*, *peace*, and *unity* are all synonyms of the forest. Such polysemy and accordingly complexity of human-nonhuman relationships attracted us to trace their significance with the help of curious practice. Intricacy and broadness of the definition, however, perplex the very notion of childrenforest, meaning that the current study attends to this phenomenon in a quite introductory manner. By defining the forest as an organism, we imply it possesses cumulative consciousness (Kohn, 2013; Reid & Salonen, 2016). For this very reason, permission was also asked from the "three sisters" tree in the forest, adjoining the nature school, to conduct an unplanned study. Anna asked to allow wonders to reveal themselves for/in/with children. She asked to be a participant-observer of this revelation. And she apologized in advance for anything that might disturb this.

The role of Niina in the research cannot be underestimated and it was manifold. Mainly, she was doing her job by organizing forest trips and ensuring children were engaged with the forest through various activities. These activities were not always planned by Niina as she followed the enticement of the moment, the invitation to engage with something from the multiple learning supplies in her rucksack. From this perspective, she was a research partner who was creating, changing, trying multiple situations for children to engage with a forest otherwise, continuously using a "method alert to off-the-beaten-path practices" (Haraway, 2015, p. 6). The

most interesting engagements between children and forest took place not during performing an activity proposed by the teacher Niina, but rather in between these activities, "on the move" or when children and forest had a chance to engage with each other through all the unruliness of the moment. Therefore, hospitable conditions in the spirit of Despret meant for Anna and Niina to be offering the circumstances for unstructured play and thus accepting the invitation of a forest to step on one of its paths without any prearrangement. This, we noticed, increased the chances of childrenforest emergence. Luckily, Niina sensed Anna's desire not to frighten away some interesting childrenforests, and she was often a rather careful observer who allowed children and forest to evolve into something else, unknown and unique.

In the following, Anna's journey into becoming a curious practice researcher is highlighted. Rather than a thought-out process with replicable and explicable how-to-do steps, this becoming was and necessarily is an intuitive process, more an attitude than an exact practice. In general, when methodologies are seen as situational, immanent, changing, and "becoming" (Deleuze & Guattari, 1994), inquiry and research practices seem to draw scholars closer to singularity, open-endedness, and creativity. This is true of curious practice as well.

At the beginning of the research visits, Anna decided to simply experiment with what she holds, how she moves, or whether she speaks or is silent. She did not plan any of this but rather was ready to be changed by the moment. Oftentimes, it was air that brought about change. Her encounter with fresh air was a sort of impulse giving and guiding, telling her, mostly, to forget about taking notes. "It doesn't help," it says. To be in the moment with a hope to capture childrenforest demands maximum attention, inquisitiveness, and 360° vision, if you like. Anna's goal at this stage was to concentrate on the performance, rather than interpretation, and on movements rather than thinking. By any means, she could not write in these circumstances. The number of humans and nonhumans participating in the research was big enough for her not to know anything about her co-researchers. Anna should not have and could not have anticipated the capacities, abilities, interests, intentions, desires, and movements of children and more-than-human entities. Being aware of causal relationships amidst some events, Anna was still "walking in darkness" not knowing and not controlling what can happen in the forest in the next few seconds.

One of the examples of childrenforests Anna had a chance to observe was a moment of children-led play and their building figures out of snow during the forest trip. "What can be the most expected event?" one might think. Even a seemingly ordinary snowman is a unique construct each time it becomes made, a creation of both snow and a human being. Yet, children were not building snowmen/women. Figures unknown to her grew out of engagements between snow and children. Anna was just observing the process without interrupting in the hope of finding out what kind of marvel is revealed. At a certain point, she came closer. One boy stretched out on the ground to be further covered up with snow until only his face remained to be seen. His friends were adding snow handful after handful so that the boy's snow body was growing and evolving. Suddenly, friends built five strange small entities on top of the boysnow: they resembled a traditional snowman/woman in shape, yet

their bodies were undone and did not conform to any particular rule. Finally, boys mounted a single branch on top of his head. Anna could not resist and asked what this was that they had created. They were unaware of what the whole structure was yet added that the branch was meant to be a horn. What Anna saw was an as yet unexplored snow-human-animal body born out of the childrenforest entanglement, nameless, but horned. At this point, she decided to halt any interpretations and preserved this event *in a jar* (S.Crinall, personal communication, February 2, 2017) (see meaning: to put all the data collected into an imaginary jar to open it in a while and see the data as a whole), to speak to it later.

"Later" came at the moment of writing this chapter. A desire to "open a jar" and focus on the fusion of data emerged spontaneously: the data tames the researcher and suggests the appropriate time for their mutual engagement. It may occur beyond the "original" context, and, rather, the shifting and fluid data creates new layered and fibrous contexts (Koro-Ljungberg, 2015). Thus, we consider that collaborations of children, forests, researchers, and teachers as well as the emergence of childrenforests might/can be multi- and/or acontextual (here: not essentially having meanings in one particular context). An open and curious researcher is rather a mediator between her research subjects and the audience, and not necessarily the one who controls this collaboration. Conversely, there are no childrenforests with certain experiences or understanding, because everything is entangled and we can only hope that this entanglement will guide us.

In an attempt to ask childrenforest the right questions, we subsume ourselves in thinking about this becoming as being nested in the broader semiotic processes happening in the forest with children, namely, as a part of a form. By looking at this event as a part of a form, we would like to refer to what Kohn calls a rhizomatic propagation of form (Kohn, 2013, p. 174). The boysnow emerged in a spontaneous rhizomatic process of co-constitution of children and snow. Children could not explain the meaning of the structure, because it was built by kids intuitively through following the patterned rhythm of the forest's thought. As Kohn would say, they were simply "listening" to the forest without necessarily realizing it, and that strange structure materialized as a product of co-constitutive power of living thoughts of both children and forest. Children were harnessing their exploratory freedom (Kohn, 2013) and thus were free from planning and meaning-making. At the same time, a snowboy creature evolved as both meaningful and without any special meaning. It evolved as an iconic manifestation of emergent real and effortless propagation of form, basic in itself and always unique.

Furthermore, these snow elements serve as a point of departure for us to be viewing them also as islands of stability for they emerged as more or less reliable structures/as non-living forms/as a product of constraints on possibilities that humans can identify with. It seems that, by having a touch of regularity in the unexplained, unrecognized, and nameless, children can escape the continuous turbulence of a dynamic world and stay impervious to this suspense while still being a part of it. Rather than perceiving childrenforest entanglements only as a romanticized version of children being in the forest, "children enjoying nature," and children uniting with nature, we suggest that childrenforests are multiple short-lived events.

Childrenforests are both moments of boundless unity with all and moment of temporary categories – islands of stability.

Anna heard children exclaiming: "It is so much fun!" A particular kind of experience is embodied in this word "fun": it is something that matters to the children and to the forest, something that is of importance in their co-constitution. Our (human) modes of representation often fail in addressing how something matters. Our intentions of not to elicit or investigate the reasons behind the boysnow rested on the decision to avoid making meaning but rather focus on how things matter.

There are epistemic challenges in understanding languages we do not speak, namely, a language of both children (Murris, 2013) and forest. It can also be questioned whether children themselves can describe with words a moment that mattered, the mattering that appeared as quickly as it disappeared (Koro-Ljungberg, 2013). To demand of children to characterize what has just happened is also to deprive childrenforest of its fleeting beauty, of its elusive and short-lived exceptionality, and of its curiosity in itself. To characterize these events is similar to reading words that consist of native and foreign letters:

Gสวัд ดีอrเชr

This phrase would not make sense to an unaware reader.

And while we can see these letters, childrenforests on the other hand are not so obvious to an eyesight. Without aiming at oversimplification, this (see Fig. 2) might be an accessible example of how childrenforest felt:

Can we characterize this type of mattering, the essence of it, if any? Can we think of the appropriate words to approximate the meaning of the childrenforest entanglements? Pickering (2013) urges us to decenter the "words, language, symbols, representations, science" (p. 80) and imagine another type of science, one "of

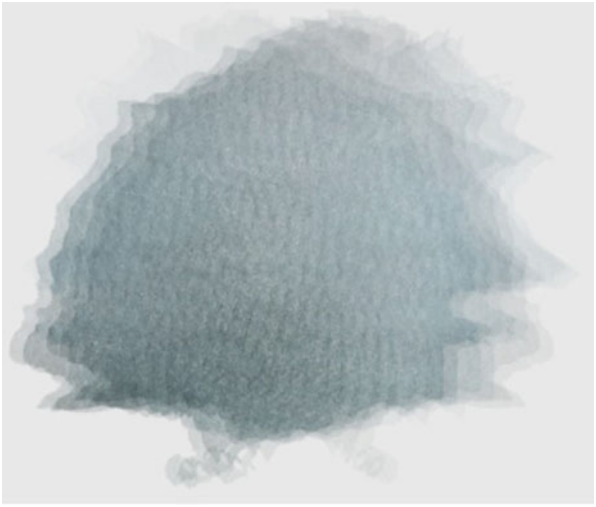

Fig. 2 Mattering. (Source: Authors' photograph)

experimenting directly in, and learning from, dances of agency, instead of conjuring them away via some epistemological sleight of hand" (p. 81). And, as in curious practice, in science, we shall impugn our judgements, assertions, and unquestionable verities with reference to the other and remind ourselves of the emergent and (ir) regular in its uniqueness, continuously changing, growing, and developing.

Movements of children inseparable from forest leave traces. The examples of such traces from our research visits were the body of the boysnow, telling us that something has happened right here between snow and a child; a snow angel with a print left from a jacket; the smile of a child, who adds more snow to the growing snow entity; the roar of a child happy in a moment; frozen toes and fingers; a moan of hunger after an active play; a plucked plant thrown on the ground; a howl of the female-imagined werewolves, protecting their kennel; hands smelling of mushrooms; a fir cone in a pocket; the message "Hello" written with a branch; a broken icicle a moment ago being a scepter; the echo of a song in the forest; pictures, memories, the emerged names of new creatures, and wet socks; and snow ricocheting off the shoes, to mention but a few.

Apart from traces visible, heard and observed by most of the participants, yet still taken-for-granted, curious practice allows us to focus on something that is not instantly useful or meaningful but simply intriguing. In particular, it enables us to start noticing the hardly-observed *inclinations* and *neglected confluences*. Inclinations are the sort of movements and intensities, depicted in a snapshot, where the child and forest act upon each other, incline to one another, reach out, tend, and desire for the childrenforest entanglement. It is similar to seeing an action in slow motion, depicting a spontaneous and momentary event. In one of the images, a girl is pictured falling onto snow with the intention of making a snow angel (see Fig. 3). While the snow angel is a trace or here a symbol, the falling girl and the as yet untouched snow, which in a second will become something else, are an inclination. We also believe that inclinations are entanglements in themselves, by which a girl and snow are always already intra-acting. It is a moment when clearly something happens in between, and we as researchers can use this opportunity to attend to this entanglement in case it is noticed. Snowballs hanging in the air, levitating children, hands reaching out to a dog, the dog's friendly sniffing in a direction of a child, leaning bodies, a snowflake falling but not yet reaching the cheek, a tongue trying to catch a snowflake, snow piles lying on the boughs asking to be shaken off, and oftentimes hands stretching to these snow piles.

And while inclinations happen intentionally, neglected confluences are unthought spontaneous fugitive moments of the bonding of humans and nonhumans that usually pass unnoticed, and no human, except for the observer, is actually aware of their existence (see Fig. 4). Neglected confluences are also islands of stability but, and according to its name, often overlooked. An island of stability in our understanding is every seemingly stable configuration resulting from children-forest relations, somehow substantiated/delineated in a world of dynamic transformations. An example of neglected confluence is a pine needle hooked on a hat; a hair accidently left on a tree; a shadow with a symbolic representation formed in an assemblage of children and forest; a snow castle, built by everyone, but accidentally

Fig. 3 Inclination. (Source: Authors' photograph)

Fig. 4 Confluence "In line with the tree shadows." (Source: Authors' photograph)

in the shape of a heart, the fact of which was left unnoticed; the stripy patterns of a boy's jacket and the bark of a birch tree that the boy leaned on; and children reflected in a drop of melted snow slithering down the bark of a pine.

Kohn (2013), while pointing out the intentionality of the processes happening beyond human (p. 91), did not mention unintentionality. The accidental moments (such as neglected confluences) that are often overlooked are also semantic and produced by the camera of a smartphone. The smartphone is a participant of the semiosis as it triggers meanings. The images in this chapter, which we could

designate as "intellectual photography," resulted both from human and nonhuman intelligence and, as Kohn put it, refer to various images in his book, including photographs: "these images amplify, and thus render apparent, something about the human via that which lies beyond the human" (p. 222). Likewise, Jamie Lorimer (2010) when examining moving imagery for approaching nonrepresentational dimensions of more-than-human life asserts that moving imagery opens "thinking spaces for an affective micropolitics of curiosity in which we remain unsure as to what bodies and images might yet become" (p. 252). We argue that photography in this chapter that depicted a moment in slow motion is also a sort of moving imagery, which allows our imagination to extend and grow a number of propagating becomings, which we are not aware of yet – all essential characteristics of curious practice.

We have approached the enigma of childrenforest – of the co-constitution of children and forests – by seeking to be tamed by children and the forest and by politely attending to their gestures and invitations. The ethical grounds of human-nonhuman encounters presuppose that we (humans) do not intrude or rather that we are limited in how far we might go. Slavoj Žižek (in Žižek, Reinhard, & Santner, 2013) exemplifies it while discussing the ethics and politics of neighborhood:

> I will never be able to account for myself in front of the Other, because I am already non-transparent to myself, and I will never get from the Other a full answer to 'who are you?' because the Other is a mystery also for him/herself. To recognise the Other is thus not primarily or ultimately to recognize the Other in a certain well-defined capacity [...], but to recognise you in the abyss of your very impenetrability and opacity. This mutual recognition of limitation thus opens up a space of sociality that is the solidarity of the vulnerable. (pp. 138–139)

What Žižek ascribes to interhuman relationships here can be applied to human-nonhuman relations, because human morality is nested within a broader concept of value, which is inherent in all living selves, both human and not. Value, thus, defines what is good or bad for a kind that aims at survival and subsequently flourishes on this planet (Haraway, 2008; Kohn, 2013). Therefore, and what Kohn reasonably noticed, "the goal is to be able to communicate across the boundaries that separate kinds without destabilizing them" (p. 144), and to that end, "politely" as Despret (in Buchanan et al., 2015) would say.

The ultimate purpose of this "communication" is to allow "the logics of life beyond the human to work their ways through us" (Kohn, 2013, p. 225), so that, with the help of other-than-humans, we could think beyond a human-constructed morality and strive toward a better world, the one with a little less evil for every living organism. It is noteworthy that neither Despret nor Kohn cultivate the idea of a perfect world, where cruelty and violence per se would cease to exist. However, Despret (as cited in Buchanan, 2015) imagines a world where people would neither hide behind a mask of innocence nor claim that a lack of innocence permits them to go beyond limits. In this world people would share a responsibility of hearing others after asking right/different questions. This idea eventually informs us what the environmental education is all about.

Conclusion

In this chapter we have discussed and described curious practice as an approach or methodology through highlighting the use of it in an empirical study. The methodological hallmarks of curious practice are underplanning, polite visiting, and responding to invitations. This means that the approach challenges any preconceived ideas or categorizations of the topics or participants in the study, making way for unanticipated arrangements and allowing attention to focus on what matters momentarily, rather than insisting on research being a meaning-making endeavor. What we have called childrenforests in this chapter are ongoing and open-ended processes of co-constitution and reciprocity. Childrenforests appear and disappear and often stay unnoticed. They came into existence in this chapter because we applied curious practice in our research of children's relations with forests: curious practice re-tangled and diversified the categories of "child" and "forest." And moments of childrenforests, temporary co-constitutions or islands of stability, were formed as result. The purpose was not to investigate children's experiences but to define ways in which curious practice allows the neglected properties of the mutual becoming of children and forests to be seen, appreciated, and contemplated under the terms and conditions of both children and forests.

Methodologically, this chapter has outlined a flat, situational, uncertain, and critical approach to researched phenomena which are complex, unpredictable, non-linear, and involving human-nonhuman intra-action (Fenwick, Edwards, & Sawchuck, 2011; Lenz Taguchi, 2011). Theoretically and empirically/practically, this calls for future studies in which curious, intuitive inquiry, situational living, and methodological encounters cannot be copied or uncritically reproduced. What follows will be diverse and unpredictable multiplications of methodological practices. These will be no doubt hard to control but nevertheless needed as they will provide new ways to "practice what we preach": to approach educational phenomena as inherently complex and mostly unpredictable.

Despret's curious practice aided us in establishing a framework of uncertainty with multiple possibilities of communication through the art of polite visiting. It informed expansion of the "limen" of our imagination and seeing beyond the normative. Every time during the trips in the forest with children, we abstained from noticing only what our eyes can see; we tried to observe the not easily observable without trying to interpret. Later, though, the meanings were created as we tried to imagine a bigger picture of what was happening in the moment. Kohn's anthropology beyond the human provided us with a more practical framework of searching for signs that will keep the engagement across kinds open, inspirational, respectfully indifferent, but thoughtful. Likewise, Pickering's idea of islands of stability assisted us in making suggestions about possible intersections of human-nonhuman agency and how those are signs-generative. We, therefore, argued for the impracticality of the planning the empirical phase, which is always unpredictable when we work with children and forest, the momentous emergence of childrenforest.

As researchers and teachers, our calling is to better address the lived experiences of children in ways that help us to facilitate a more just future for all. To be able to break unhelpful patterns of knowing for and about children, we need methodologies

that make it difficult to know or to plan, methodologies that require us to just experiment, be attentive, be lost and confused, and be always open. We are trained either to neglect ordinary moments as insignificant or to quickly interpret and turn them into profitable meanings. Ordinary moments can contain momentums for surprise, however. Attending to them might bring us closer to what really matters to our children, students, and human and nonhuman co-researchers and how this significance is likely to be born. We need to retrain ourselves to learn from non-humans and ask interesting questions to understand their way of thinking.

The questions to be further asked are as follows: How do various discourses and interests potentially change/impact childrenforests? What is the role of curious practice in guiding these discourses? What are the ways curious practice is utilized/adapted in a variety of contexts? Apart from ethological studies, childhood and environmental research, curious practice is to be applied in any kind of inquiry that exists at the margins of an unknown, where difficult questions arise and where it is hard to speak about unspeakable, where no shared framework applies to a human being and her co-researchers, which would instantly guide them into the "likely-to-happen" kind of thinking, and where the researcher might be allowed not only to look at but also to respond. The examples of such research spaces are studies on death, historical geography, feral childhood, and spiritual and powerful traumatic experiences to mention but a few.

Abstract

The chapter introduces a methodological approach that the author has developed for the empirical and analytical exploration of children's geosocial worlds. It builds on a threefold conceptual baseline: *political subjectivity* as a human capacity, *topological polis* as a relational context of living, and *the political* referring to subjectively experienced and socially shared, contextually forming matters of importance. These three interrelated starting points provide the theoretical ground and its methodological framework for exploring the worlds where children lead their lives, from their perspectives and with them, through spatially embedded narrations that unveil situated and contextual truths. For empirical inquiry, I have operationalized the geosocial approach into three analytical layers, focusing on social, spatial, and political relationalities. The chapter describes the

methodological approach, including a theoretical introduction and a thorough explanation of the geosocial analytical means, and empirical illustrations that inform a politicized notion of childhoodnature. It concludes with recommendations for ongoing methodological inquiry into children's social and environmental worlds and further theorization of the geosocialities of childhoodnature, as limited by the empirical contexts informing this chapter.

Introduction

Recent scholarship in human geography and the neighboring disciplines emphasizes spatial relationality. The shift to relationality contrasts with the more conventional approaches of nested spatial scales and territorial structuration. Scalar perspectives – framed in terms of micro–macro, proximate–distant, local–global, urban–rural, national–transnational – have not ceased to exist. Since the late 1990s, several "competing theoretical accounts concerning the nature of scales as social constructs ranging from an idea or metaphor functioning as an epistemological ordering frame (e.g., Jones, 1998) to the more materially embedded question of reach in strategic networking (e.g., Brenner, 2001)" have emerged (Häkli, 2018, p. 272). This still ongoing debate has engendered different branches of thought on relational spatialities where attention is given to the "interconnections and mutual constitution of socio-spatial relations and processes," observed by Jessop et al. (2008), "social and material entities are seen as assembled in ways that cannot be captured by scalar geometries," as promoted by Marston, Jones, and Woodward (2005), and "the co-presence of particular spatialities but also their co-implication" are emphasized, as in Leitner, Sheppard, and Sziarto (2008) (Häkli ibid.). This development is of keen interest and relevance to the contemporary study of childhood spatialities, as indicated in the recent special issues of the journal *Global Studies of Childhood* (Millei, 2014, 2015).

As part of these broad discussions that have engaged some childhood and youth geographers as well (Kallio & Häkli, 2015; Kallio & Mills, 2016), *topological theorization* has been introduced as one potential way of rethinking how spatial relations constitute and exist (e.g., Joronen, 2016; Martin & Secor, 2014; Mezzadra & Neilson, 2012). Instead of identifying new territorial frameworks or scalar dimensions, topologies are attained by tracing the social ties that people, including children – as individual agents and collective actors – adopt, create, maintain, transform, challenge, and refuse, as part of their everyday activities, through their interactions and relations developing and unfolding in various lived environments (e.g., Ahlqvist, 2013; Ek, 2006; Häkli, 2018; Lorimer, 2010; Sepp, 2012). The relational realms thus exposed are not static constellations as they constantly transform through people's practiced relations. Neither are they completely fluid realities where nothing holds its place, as "geosocial life" is conditioned by established

spatial structures with geopolitical and geoeconomic underpinnings (Mitchell and Kallio 2017). Moreover, geosocialities involve interaction with natural, material, and immaterial elements, as part of the ongoing constellation of lived realities that people experience and enact diversely (Johnson et al., 2014).

Joining this branch of research, in collaboration with Jouni Häkli, I have developed a theoretical idea of "topological *polis*" (Häkli & Kallio, 2014a, b, 2016; Kallio & Häkli, 2017). As part of this work, I have created a methodological approach for exploring people's geosocial worlds, primarily from the perspectives of 10–17-year-old children and youth, as I have been working with them in my recent research in Southern Finland and Northern England. This chapter focuses on introducing the methodological approach and showing how it can be operationalized in empirical research.

I begin with a brief theoretical introduction, explaining the key concepts informing the methodology and its philosophical orientation. Then I turn to discussing the analytical means and illustrate them with examples from my ongoing analysis. Before the summarizing conclusions, I ponder on what the approach may offer to the interdisciplinary study of childhood studies, and in the final section modest suggestions for the childhood studies research agenda are given.

Publications demonstrating the methodological approach through empirical analysis include Kallio (2014a, b, 2016a, b, 2017a, b). Portions of this chapter also appeared in author's previous publications that are referenced throughout this chapter. These include Kallio, Häkli, and Bäcklund (2015) and Kallio (2018, forthcoming), as in the list of references.

Theoretical Grounds of Geosocial Methodology

The geosocial methodological approach that I have developed builds around the theorization of political agency (Häkli & Kallio, 2014a, 2018a, 2018b; Kallio & Häkli, 2011a, b, 2017). This section offers a brief introduction to the key concepts: *subjectivity* as human becoming–being, *contextuality* in the form of topological *polis*, and *the political* denoting matters of subjective and shared importance.

Following a phenomenological orientation, I understand political agency as a human condition providing people capacities to lead their lives as political subjects. This includes that political agency is conditioned but not predetermined by socially constituted (inter)subjectivities, that is, the social selves that people acquire when becoming members of the communities and societies in which they are situated. Secondly, the phenomenological orientation emphasizes experience as a focal element of political subjectivity, and specifically, human experience as a particular way of relating to lived realities. Philosophically and ontologically, the approach stands in contrast with the posthumanist and new materialist thinking where the dissolution or dispersion of human subjectivity is taken as a starting point (for a thorough critique, see Chernilo, 2017; Häkli, 2017; James, 2017; Payne, 2016; Rekret, 2016; van Ingen, 2016). Rather than understanding agency as distributed between human and nonhuman actors, I deem that different actors have different kinds of

agencies that may have political ramifications. Human agency, however, involves specific political characteristics that should not be lost from the sight at the childhoodnature research agenda. As I will discuss next, children among other people can form and express attitudes, advance their desires, present views and disagree, and take action in ways unforeseeable and unexpected, by drawing from their socially conditioned, intersubjectively developing, and subjectively established political subjectivities.

With subjectivity, I refer to the experiential dimensions of selfhood: *who* I feel I am. This "whoness" is a constantly developing human state of becoming. It builds in relation to negotiated identities: *what* I am in terms of race, gender, class, age, ethnicity, and other social categories. These conceptual starting points draw from Arendtian political philosophy (Arendt, 1958, 2005, also Kallio, 2014b, c, 2017a). The idea of becoming indicates the dynamic processes of subject formation, in line with theories of subjectivity that appreciate it as an intersubjective process based on mutual recognition, including importantly political and ethical elements (e.g., Cornell & Murphy, 2002; Crossley, 2001; Honneth, 1995; Noble, 2009). In this Hegelian sense, subjects depend on mutual recognition to exist as individuated selves. Hence, the mundane situations where recognition is given and received – and sometimes struggled over – are concurrently the source of personal agency and the foundation of sociality.

While subject formation is an ongoing process, continuing throughout the life course, it is particularly intense during the early years of life (Elwood & Mitchell, 2012; Habashi, 2017) and in significant turning points, like life course transitions related to migration, for instance (e.g., Kivisto & La Vecchia-Mikkola, 2015; Peña & Ybarra, 2017), and societal and personal crisis (e.g., Baines, 2015; Väyrynen, 2014). However, it is important to note that, as a subjective human condition, "becoming political" is not oppositional to "being political." Because intersubjective subject formation requires the active presence of the subject, becoming unquestionably includes being. As part of political development, or subject formation, people take part in their own processes of becoming as well as in those of others within their social reach, both implicitly and explicitly. When transitioning through intensive periods of intersubjective geosocialization – as I have come to call the contextual processes of political subject formation (Kallio 2016c, 2017a, 2018) – people are hence not less "whole" or "present" than during more stable periods of life, as subjects and active agents. Thus, being always includes the potential of becoming; by being with others (including more and less active presence), people enhance their political subjectivities intentionally and less so. Childhood and youth researchers, in particular, have emphasized the importance of noticing these aspects, to stress the equality of children and young people with other people in their communities and societies (for an overview, see Prout 2011).

The second key dimension of political agency is contextuality that I frame in terms of "topological *polis*," which notably diverges from the classical city-state idea of *polis* (for a thorough description, see Häkli & Kallio, 2014a; Kallio & Häkli, 2017). In short, the concept refers to the relational realms where people find themselves living. Following topological logics, *polis* is a geosocially constituting

reality, consisting of everything that has meaning to those involved in its life. Respectively, these meanings are definitive of its scope and extent. Due to its social constitution, *polis* can never be described accurately in topographical terms. Its form and contents vary depending on where, when, and from whose perspectives they are approached. Similarly, its temporalities are blurred; *polises* do not rise and fall similarly to polities. As "a specific 'shape of space', that operates by different rules of connectivity and transformation than, say, a plane or a sphere" (Martin & Secor, 2014, p. 433), topological *polis* is constantly in transformation. Different *polises* cross over and mold each other, forming new political realities at some points, in some places, with some people. This kind of subjectively experienced yet intersubjectively practiced spatiality is outlined already in Arendt's conception of *polis* (Arendt, 2005, p. 128, emphasis in original):

> [S]omething that is shared by many people, lies between them, showing itself differently to each and comprehensibly only to the extent that many people can talk about it and exchange their opinions and perspectives with one another, over against another.

Even if the emergence of topological *polis* does not follow a singular spatial logic (e.g., territoriality, network, or flatness) and has no stable or general condition, it does not constitute randomly or change haphazardly. *Polis* is known, practiced, and struggled by the people who are experientially involved in its geosocialities and whose agencies are conditioned by the prevailing geopolitical and geoeconomic situations (cf. Hörschelmann and Reich, 2017; Sparke, 2017). Its constituents are brought together by matters that gain importance in its life – that are *politicized* in a given realm. Moreover, my thinking includes that while the nonhuman constituents of *polis* may be influential in many ways, only people are capable of initiating politicization as that requires abilities to experience and share contextual importance (cf. Häkli, 2017). These capacities, embedded in political subjectivity – the condition of possibility of political agency – are central in human political agency.

The concept of *polis* already hints that, in this theoretical framework, the third major concept, "the political," is employed on a relational political–theoretical basis, along with pragmatist and phenomenological philosophical lines of thought (e.g., Barnett, 2012; Dikeç, 2013; Simonsen, 2013). As political, I consider matters that people identify and define as particularly important in their lived worlds, i.e., *polises*. This means that politics never exists in abstracto; things are always political to "someone," living somewhere in a specific time, and hence, to become political, "anything" needs to be politicized (Kallio, 2017a). Similarly, things may lose their political significance as they cease to be considered particularly important in a given context (albeit they may still be called "politics" or "policy").

Potential to politicization arises when something starts to appear as particularly important to someone(s) who, personally or collectively, find this matter undervalued or misunderstood in their lived worlds. To gain the contextual importance needed for politicization beyond individual subjects, these experiences have to be shared with other people, which may include implicit and explicit forms of sharing on broader or smaller scales. Placed in the topological *polis* and informed

by the intersubjective conception of political subjects, this idea of sharing reformulates Arendt's (1958, p. 179) concept of "speech" by which people "show who they are, reveal actively their unique personal identities and thus make their appearance in the human world."

Put together, the theoretical approach informing geosocial methodologies, as I have developed them, holds that the experiences constitutive of politics are primarily *subjective* but political life exists only through *social practices*. What stands as political in a given time and place is understood, negotiated, and struggled by the *people involved* in a certain geosocial reality, as becoming–beings whose political subjectivities shape up through *mutual recognition*. The topological *polises* where these lives are led are *conditioned* by large-scale geopolitical and geoeconomic forces that mobilize in various forms in people's everyday living environments. In this framework political agency is, on one hand, a contextual process through which people come to be recognized as political subjects and potential actors in their communities. Concurrently, people influence the constitution of *polises* from their personal stances, together with their significant others, by participating in mundane political life. Thus, political agency is thoroughly contextual and socially embedded while relying on people's subjective capacities to experience their lived realities.

These starting points provide a theoretical ground for exploring existing political worlds from the experiential perspectives of, among others, children and young people, who are active participants in topological *polises*. The second part of the paper delves deeper into the geosocial methodologies as developed in my recent research with children and youth, opening up the analytical potential embedded in this approach and illustrating how it can be used in empirical research.

Analyzing Topologies

To begin with, I wish to emphasize that I have developed geosocial methodologies to create an approach that would allow and provide for the empirical study of topological space, not as a theoretical exercise only that tends to serve mostly scholarly debates. Therefore, the empirically oriented approach involves simplifications and formulations that can easily be questioned on a philosophical level; it is nothing but a still imperfect and evolving methodology. Further empirical and conceptual work is thus required to theoretically develop geosocial methodologies, a challenge I return to in the last part of the chapter.

As topological space constitutes through social processes and mutual recognition, the first step in topological empirical inquiry is to learn about people's social lives and their experienced identities. Second, as topological *polis* configures as a spatial relationality, people's experiences and understandings about places, locations, sites, events, cultures, histories, and discourses need to be related analytically in ways not predetermined by topographical imaginaries. Third, as the political in my thinking refers to matters politicized in *polis* by the people involved, the political dimensions of topological space have to be traced from people's experiential

knowledges and agencies. These three analytical steps, or layers, are opened up in the next sections, including empirical examples from my ongoing research with 10–12- and 14–17-year-old English ($n = 134$) and Finnish ($n = 128$) school children (hereafter referred to as participants).

All names used in the analysis are pseudonyms, and where necessary, the participants' identities are protected by changing minor details from their biographies. Fieldwork in Finland was carried out with Elina Stenvall. Fieldwork in England was carried out by Marie Avril Berthet and Roger Hart and facilitated by the University of Leeds Geography Department.

Entering Geosocial Worlds: Social Analytical Layer

At the first stage of geosocial analysis, social relations are identified as entry points to people's existential lived worlds, leaning on a phenomenologically oriented perspective. In our everyday lives, we create long-lasting relationships with our significant others, have fleeting encounters with strangers, and connect indirectly with distant others. Additionally, social relations may involve explicit information exchange, like teaching at school, information transmission through media, and knowledge sharing in informal situations. In the intersubjective processes of "geosocialization," also these factual pieces of knowledge turn into experiential understandings (cf. Mitchell and Elwood 2013 on Stiegler). Through social relations, people learn what the world seems to be like, how they and other people seem situated and related in it, and which matters seem more interesting and important than other matters.

This "seemingness" does not refer to doubtfulness or falsity, quite the contrary. As Arendt (2005, p. 128) emphasizes, "no one can adequately grasp the objective world in its full reality all on his own, because the world always shows and reveals itself to him from only one perspective, which corresponds to his standpoint in the world and is determined by it." Moreover, Foucault (2003, pp. 7–8) stresses the importance of noticing, particularly, "naive knowledges, hierarchically inferior knowledges, knowledges that are below the required level of erudition or scientificity," as they may propose critical counter perspectives to dominating truths. The perceptions and understanding that children acquire often fall, indeed, within the remit of such disqualified knowledges (Kallio, 2012, 2017c).

In my recent studies, I have used a mapping exercise to identify children's key social relations. The reason for using mapping platforms, based on Google Maps, is that I needed to locate their lifeworlds somehow with them, in the first place, to start making sense of the topologies of their *polises*. Even if the topographical spatiality that the mapping platforms manifest is exactly what is being deconstructed in topological theorization and analysis, they provided a good starting point for fieldwork. Finnish and English children are familiar with these maps, as spatial representations, which made it relatively easy for them to start portraying their social worlds on them. The deconstruction of topographical spatiality took place already during the fieldwork, as we discussed their markings

in relaxed interviews and continued throughout the analysis (discussed in the next section).

In practice, the young participants were provided with six mapping platforms, representing (1) the neighborhood around their school, (2) the city where their school was located, (3) the region around the city, (4) the country where the fieldwork was done, (5) Europe and its bordering regions, and (6) the world. By using felt pens and post-it stamps, with three colors (green=positive, red=negative, yellow=neutral), they marked roughly on the maps things that are important, interesting, or merely existing in their lived worlds. After this, we talked individually with each participant about their experienced worlds, beginning from the markings that they had made yet expanding from them to various directions (more about this in the next sections). After the interviews, the participants could write stories, draw pictures, or portray their experiential knowledge in other formats, to complete the "narrative biographies" that they co-produced in the study with us.

The research practice followed child-centered methods throughout as applicable in the research contexts (Lagström, Pösö, Rutanen, & Vehkalahti, 2010), emphasizing especially the participants' rights to determine what aspects of their lives may be included in the study (for details see Kallio, 2012, 2017a). The interviews were conducted in the format of relaxed chats, in places such as the school library, and the power relations between the researchers and the participants were determinately reduced during them and in all fieldwork. We did not introduce themes of our own liking into the discussions unless there was a clear hint in the child's narrative about such matters. For example, if the child expressed concerns for environmental issues, we asked about environmental hazards; or if she/he mentioned changing social relations, we felt that it was okay to bring into discussion themes such as caring agency and diverging ethical stances. In a critical ethnographic spirit, I regard the research materials as "partial truths" affected by the situatedness of knowledge and the positionality of the researchers and the participants (e.g., Rose, 1997). As mentioned above, they were co-produced by the involved researchers and the participants and only as such should the materials be analyzed, as specific portrayals of the participating children's lived worlds.

The social analytical layer of geosocial analysis aims at accessing the lived reality of another person, which is always a particular world even if shared with many others in a number of regards. Therefore, it is of utmost importance that the researchers doing fieldwork seek to keep a distance between their own worldviews and those being traced with the participants. Disengagement from normative assumptions is important at this phase of the research (I return to this point in the political layer.). As an example of a particularly challenging case in this regard, consider the piece of analysis based on Rasmus' biography (for an extended analysis, see Kallio, 2016b).

Rasmus is a 12-year-old boy living in a middle-class area in Tampere, one of the bigger cities in Finland. In the mapping exercise preceding the interviews, we had noticed his provocative way of expressing political thoughts, which made us anxious about working with him. Figure 1 portrays Rasmus' map of Europe on which he has made three markings. Finland is colored green (positive) and specified as "the best country ☺," as is the case on many children's maps (73 green markings out of

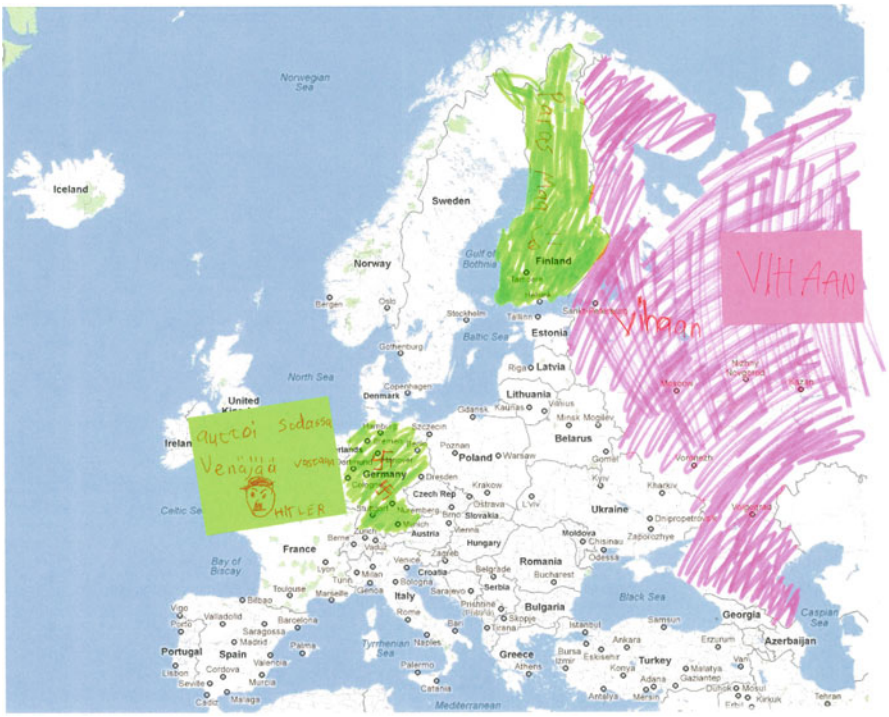

Fig. 1 Rasmus' map of Europe

122 markings in the Finnish sub-study). Russia is colored red (negative) and accompanied with a double label of "I hate." This attitude was not unexceptional on our Finnish participants' maps (37 red markings on Russia and hardly any with other colors). Yet Rasmus' annotations on Germany are one of a kind. The country is colored green with the explanation: "helped in the war against Russia." The text is accompanied by an established image titled "Hitler" and two swastikas.

Prior to the interview, we expected that Rasmus wanted to annoy us by presenting things he knew to be inappropriate, perhaps to test our tolerance or to withdraw voluntarily from the study (which happened with some other participants). Yet he was very happy to participate and talk about his world and perspectives. We subsequently discussed his map of Europe:

Interviewer: You have a green mark on Germany, what do you think about it?
Rasmus: Well I think it is a fine country and then it is good in the sense that it helped Finland in the wars, and so on.
Interviewer: What do you think war is about? Why must wars be fought?
Rasmus: Well of course they shouldn't be fought but, well, countries help each other if someone is at war, for instance in an unfair . . . Like if the other country is way bigger than the other; just like Russia against Finland, when Germany came to help.

This excerpt reveals that Rasmus had taken the exercise very seriously. Following the instructions, he portrayed the world as it appears to him. He wanted to tell us that Finland is where his heart resides, with Russia as its overpowering enemy and Germany as its long-term friend. His way of conveying this was nothing but fanatic. As we discussed further his interest in guns, war games, the army, and hobbies involving war-type features, it became evermore evident that he was not intrigued by violence and did not idealize fascist or other politically oriented movements. Instead, amiable relations with family and friends took center stage in our discussions.

It would be easy to render Rasmus' understanding about the relations between Finland, Russia, and Germany as childish and incomplete and thus disqualify it as knowledge, to use Foucauldian terminology (cf. feminist geopolitics perspectives such as Massaro & Williams, 2013). Such a reading includes the assumption that, with time, he will develop more sophisticated interpretations of these international relations, as he learns what the history between these nation-states *really* is like and how much this violent history *should* affect the way we think about their relations *today*. While this may be a fair assumption, it is not very fruitful in understanding his geosocial reality in the present. Another possibility is to approach his ideas through the world where he lives, the topological *polis* that forms a multifaceted context of his political development and agency.

This is just one example, among others, from my research indicating the importance of learning about experiential spatiality first through social analysis and only after that through spatial and political lenses. In Rasmus' biography, state relations appear comparable with personal relations, and in both cases, he considers taking the side of the disadvantaged and weaker as righteous. Similarly, yet using completely different examples, many of the participants talked about their close relatives and friends vis-a-vis other people and actors whom they knew, to stress their understanding about fairness and inequalities (Kallio, 2018).

As a second example, from the English sub-study, I present Mukhtar's biography to demonstrate how the social layer can be used in this methodology, from a different perspective (for an extended analysis, see Kallio, 2018). Mukhtar, an 11th grade student, described his familial relations as a portrayal of experienced geosociality with clear geopolitical ramifications (Fig. 2). In this case, also, we sought to put aside our own understandings about transnational migration and refugeeness and the politics of war in the British–Afghanistan context, to be able to understand how social relations were shaping Mukhtar's understanding about the world in which he lives.

Challenging life situations are rarely merely individual even if they are personally experienced. Mukhtar's biography provides one example of how political agency may be developed when one's *personal* situation is not contested; instead, at stake is his *family* broadly understood. Mukhtar, currently living in England, is from Afghanistan and has family there, but in Germany and Denmark as well. He has visited all these homes over the years and goes to Afghanistan yearly. Seeing how differently people live and take social positions, especially regarding familial

Fig. 2 Mukhtar's map of the world

relations, has led him to form strong opinions about richness–poverty, privilege–vulnerability, and ignorance–empathy. Mukhtar has no respect for his well-off German relatives whom he describes as:

> Arrogant, ignorant, they don't take other people's advice on board, they think they're upper class but they're not [. . .] don't have an idea of what goes on around the world, they don't understand poverty. I mean in my family we really focus on charity, but they just spend it on other things, pointless things.

In Denmark, Mukhtar has had quite different experiences:

> The way people, the Danish people treat each other is really good. They treat each other equally. It's all equal, yeah, it's really good. They help the poor as well. I've never seen anyone arrogant up there.

This again is in vast contrast with his conception of the English:

> People here are just selfish. Like, I'm not being judgemental or anything, but there's a lot of people who are arrogant, ignorant.

In later stages of the analysis, I have identified that Mukhtar's political agency is strongly connected with his familial identity, guided by an empathic understanding about people's differing positions and their interconnectedness across countries. He is developing political agency through these shared global relations that seem to strengthen, concurrently, his critical awareness *and* categorical, if not ethnocentric,

attitudes. This analysis – making visible key facets in Mukhtar's topological world and how things are politicized – was possible only by engaging with his biography through the social analytical layer in the first place.

In conclusion, the social analytical dimension of geosocial methodology provides the entryway to the empirical study of people's existing topological realities, or *polises*. At this stage of research, the aim is to identify key social relations by which people, and in the context of this study, children, engage in their lived realities as political subjects. Through the processes of intersubjective socialization, based on mutual recognition and including the active presence of political subjects as being–becomings, children learn about their political realities in particular ways, including tacit and explicit ways of knowing. The social analytical layer also allows a preliminary analysis that paves the way to the next analytical phases, focusing specifically on the topological spatialities of geosociality and the political aspects of these relational worlds.

Identifying Spatial Relationality: Spatial Analytical Layer

In my ongoing analysis, based on the research materials created with English and Finnish young participants, I am seeking to understand how spatiality existed to them at the time of the fieldwork and how they positioned themselves and others in their experienced realities. To avoid simplifying and reducing these children's worlds into fixed constellations, I have studied their manifold spatial relations without an attempt to create uniform descriptions or figures. In fact, topological portrayals are always patchy and scattered even if they involve some continuities and established formations – ambiguity and equivocality is their fundamental character. They include networks and disconnections, stable and flickering points, pile up matters that have seemingly nothing in common, and separate things that may first appear as parts of one system – to mention just a few characteristics of the topological narratives that, in my research, are actually products of "unmapping." What I have done, beginning from the child-led interviews and continuing throughout the analysis, is releasing children's narrations from the topographies of the maps and identifying instead socially embedded spatial connections and disconnections from their biographies. A couple of examples from Finnish 11-year-old girls' biographies serve as apt examples of how this analytical phase may unfold (see also Kallio et al., 2015).

In the mapping exercise, one of the girls had placed her aunts' home in the city-scale map. During the interview, she drew straight parallels with this place and some odd locations in Spain (shared vacation), Paris (the aunt's previous home), and Eastern Finland (family-owned summerhouse). Having thus portrayed how one of the important social dimensions in her world actualizes spatially, she then connected this "life with the dear aunt" with other strands that, we learned, crisscrossed her mapping platforms (e.g., other relatives, trips, locations, etc.). Without our in-depth discussion with her – and *led* by her – the markings would have remained separate and the topological connections between them imperceptible. If following

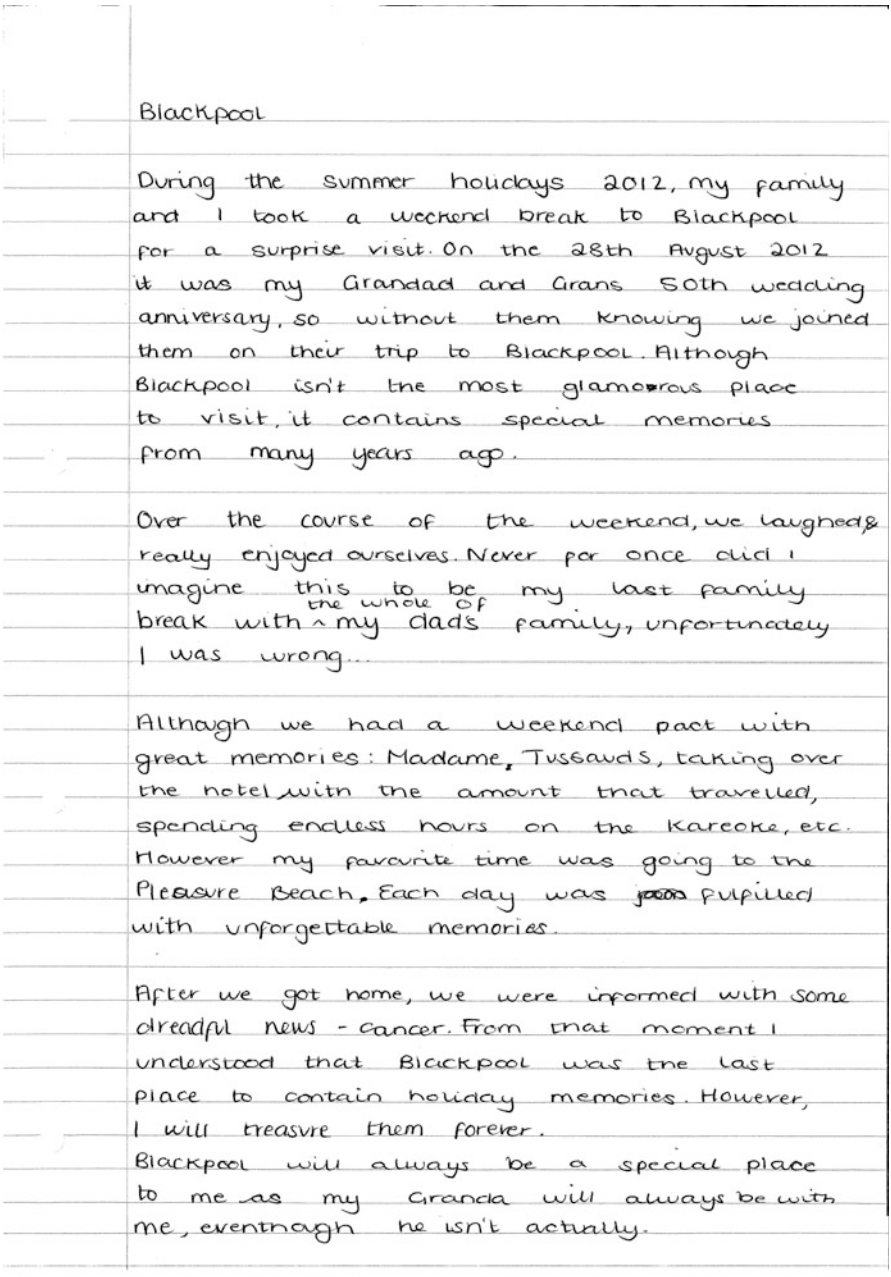
topographic cartography, we would have seen, instead, merely spots in different cities, countries, and continents that seem to be connected by physical proximity and distance only.

Another example can be found from the biographies of two circles of friends who were selectively enacting the mediated transnational world in the creation of an "us" (for geographies of friendship, see Korkiamäki & Kallio, 2017; for mediated realities, see Kallio, 2017b). This involved, first, bringing together elements from various divergent sources, including scalar multiplicity (e.g., TV series, family practices, school peer communities, hobbies, travels, role-playing games, popular music scene, cartoons, sports events, etc.), and second, embedding these elements in their everyday practices by transforming them to serve the friends' own ends. The created "we are us" embraced and looked like a chameleonic spatial assemblage taking different shapes in space and time. "Hot topics" and "looks" embraced by these circles of friends could alter even between our fieldwork periods. Yet this did not endanger the socially recognized existence of the group in the school community, which reveals its established nature. In topological analysis, it is essential to identify both of these dimensions: transformation and continuity intertwined.

As these examples illustrate, in geosocial methodology the spatial analytical layer stands for the identification of socially constituted spatial relations. In the previous examples, familial and peer relations lie at the heart of topological constitution, which obviously are among the most important social connections in many children's lives. Less case-specific perspectives can be achieved by analyzing common practices among the participants, tourism, for instance. Even if they may involve the same people – primarily family but also friends – other elements surface from the context.

In both of my sub-studies, the participants talked extensively about their travels to different geographical locations and social settings, be these short trips to close-by destinations (e.g., spending a weekend in a holiday resort, traveling with a sport team to tournaments held in other cities on Sundays, visiting friends and family), field trips with school (to rural, urban, and foreign destinations), various kinds of family holidays (including visits with relatives living abroad), as well as traveling with a friend and her/his family as a "kith family member" (on familial relations, see Kallio, 2016a). These descriptions draw attention to many kinds of topological elements, from the travels but also beyond them: for instance, how development and tourism are bound together through various relations (e.g., Saarinen, 2016) or how touristic experiences shape young people's worldviews when shared with friends, relatives, and broadly through social networks (Rinne & Kallio, 2017). I give a couple of examples from my study.

In the English study, places like Skegness and Blackpool were regularly mentioned. Both are well-known seaside resorts in Northern England, commonly visited by families over the weekend and during holidays (including families with various socioeconomic backgrounds). One of the older girls, Alana, told about her affectionate relationship with Blackpool. The significance of this place in her world became evident particularly through an essay, accompanied by a drawing, which she created after the mapping exercise and our interview with her (Fig. 3). To Alana,



Blackpool

During the summer holidays 2012, my family and I took a weekend break to Blackpool for a surprise visit. On the 28th August 2012 it was my Grandad and Grans 50th wedding anniversary, so without them knowing we joined them on their trip to Blackpool. Although Blackpool isn't the most glamorous place to visit, it contains special memories from many years ago.

Over the course of the weekend, we laughed & really enjoyed ourselves. Never for once did I imagine this to be my last family break with the whole of my dad's family, unfortunately I was wrong...

Although we had a weekend pact with great memories: Madame, Tussauds, taking over the hotel with the amount that travelled, spending endless hours on the Karaoke, etc. However my favourite time was going to the Pleasure Beach. Each day was ~~jooo~~ fulfilled with unforgettable memories.

After we got home, we were informed with some dreadful news - cancer. From that moment I understood that Blackpool was the last place to contain holiday memories. However, I will treasure them forever.
Blackpool will always be a special place to me as my Granda will always be with me, eventhough he isn't actually.

Fig. 3 (continued)

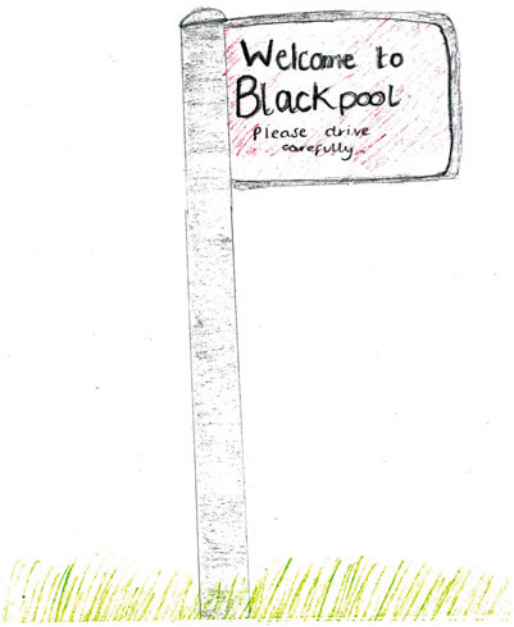


Fig. 3 (**a**, **b**) Alana's experiential Blackpool

Blackpool is connected with some dramatic familial events occurring after the holiday: the grandfather's deathly sickness that put an end to shared times with her dad's family. This gave a special meaning to the joyful moments she had experienced with her family in Blackpool, lending the whole city a special place in her world.

With another girl, Phoenix, belonging to the group of younger participants, we talked about Skegness that she had visited with her family a couple of years ago, to be exact with her grandparents and sister. She considered the trip "my first holiday" and thus gave it great value, introducing Skegness as a place "w[h]ere dreams come true" (Fig. 4). In this case, similarly to the previous one, the experiences offered by the resort gained special significance as they were shared with the family and with grandparents and sibling in particular.

Many comparable examples can be found in my research materials, related to touristic towns in the Mediterranean and amusement parks in bigger cities, for instance. Together they portray a topological space that, regardless of where the actual places are located, provides children access to an inverse reality: a space

Fig. 4 Phoenix's experiential Skegness

dominated by childness. In this "childish space," if you like, time and money are used primarily for doing enjoyable things together, and serious matters are playfully pushed aside or "suspended." The environments are organized accordingly: opportunities to being together are emphasized instead of providing children, youth, adults, and seniors separate services and places of dwelling, as typically is the case in urban space. Playing, fooling around, and engaging in fun activities are essential, as well as eating not-so-proper foodstuff at wrong times of the day, not to mention purchasing silly items that may seem out of place when taken at home. These are all part of the "amusing ordinary" where children's agencies and knowledges receive respect, unlike in many everyday environments dominated by adultness. Children are thinking and doing it right as they indulge and often lead the adults, into these playful worlds.

Quite a different dimension of the topologies of tourism can be identified through a narrative from another English girl, tenth grader Ikshita, who told about her relationship with Portugal. Her family is scattered around the world, and she has

rare possibilities to meet her relatives, even if they keep regular contact through Skype and other social media applications. Once, the whole family had come together in Portugal, for a shared holiday. This had had a tremendous effect on her perception of anything Portuguese: she loved the food, the nature, the culture, the people, etc. These experiences can of course be interpreted through the familial analytical lens, like those above. Yet, in this case, it is particularly fruitful to look into the geoeconomic and geopolitical underpinnings of her experiences and the following spatial perceptions.

In Portugal, the family was spending time in conditions specifically designed for enjoyment and relaxation, as is the case in Blackpool and Skegness. However, the family that came together in the Portuguese hotel, from all around the world, had particularly good resources to accomplish the holiday, including economic, cultural, and geopolitical resources, which stands in contrast with the previous examples. These conditions had allowed for them smooth opportunities to creating a pleasant and unforgettable experience that entwined the fabulous Portugal into their family history. The people responsible for tourist industry in the country and the broader region, or the resources offered to their use by various local and transnational actors, did not appear to the girl as elements enabling or conditioning the experience. Thus, she did not realize that many women had to choose between taking care of her and her own children during their stay (e.g., Costa et al., 2017) or that the people preparing seafood for them in the restaurant at an affordable price could be struggling with their own livelihood (e.g., Carneiro, Portugal, & Varejão, 2014). Neither did she need to meet challenges with language, as the people working in the transnational tourist industry in the Mediterranean learn English to serve the Anglophonic tourist.

These kinds of touristic experiences are often emotionally strong and thus very influential in political subject formation. Through them, children learn about their positions in the world. These implicit understandings include placing other people with reference to oneself and one's kind, and in the case of Western tourists, this often means fulfilling less privileged subject positions. As the critical understanding about the conditions of tourism is often ill-fitting with enjoyable touristic experiences, these mundane knowledges usually remain beyond deliberation, even if they may lead to unease in certain situations (e.g., feeling anxious when meeting people who live on the street). This way children's subjective experiences, shared with significant others such as family members, enhance their processes of geosocialization where, among other things, transnational inequities naturalize into the state of affairs. In the discussed case, love toward Portugal is built, not only through caring familial relations but also as based on the geoeconomic and geopolitical unbalance between tourists and the people enabling their enjoyment. Hence, topologies of tourism do not turn innocent while involving children; rather global inequalities are continued in these encounters.

In this section, I have illustrated the spatial layer of geosocial methodologies through the help of some empirical examples. I want to stress that the analyses included here are only examples; media and hobbies, for instance, offer alternative perspectives to youthful topologies (Kallio, 2017b). As an analytical strategy,

topological analysis includes, first, unmapping children's experiences from territorial attachments to socially established relations and, second, reframing them through topological spatialities that allow various kinds of overlapping and (dis) connected realities to exist simultaneously. The topological *polises* that thus start to become visible are at the same time subjective and shared, conditioned and conditioning, sustainable and transformable, and include mobile as well as enduring human, nonhuman, and more-than-human elements. What becomes politicized in these lived realities depends on the social practices of the people involved, i.e., what matters appear as particularly significant and generate activities with potential to change or struggle. Next, I will turn to the political dimensions of geosociality that have been mentioned already in this and the previous section, yet the analytical dimension itself remains undiscussed.

Exploring Political Realities from Subjective Perspectives: Political Analytical Layer

"Political layer" is the third analytical dimension of the geosocial methodological approach that I am developing in my research. In this phase of analysis, the topologies revealed through the spatial layer are scrutinized by paying attention to moments of attentiveness and, further, to the oriented stances, articulated attitudes, purposive activities, and intentional actions potentially growing from these experiences. Heightened attentiveness concerning any matter can be analyzed: events taking place near or far; things appearing suddenly or emerging from familiar things; current, past, or future activities; personal or public concerns; inspiring, oppressive, interesting, or boring happenings; and so on. The aim of this analytical move is to understand, from subjective perspectives, *how* the world is and becomes political to the people whose lived realities – or *polises* – are being analyzed.

Sometimes identifying political dimensions from biographical narratives, or from any qualitative research materials, is relatively easy. Consider the examples that I gave in the section introducing the social analytical layer, including themes such as racism, fascism, state relations, forced migration, socioeconomic differences and class, and violent conflicts and societies in war. Yet in situations where personal or collective challenges are not related to matters already broadly politicized, the geosocial analysis requires a particularly strong emphasis on the political layer. Here, specifically, disengagement from normative assumptions is important, which means keeping actively a distance between one's own political ideas and those brought up by the participants (cf. Rasmus' biography).

Bullying is one theme that came up many times in both sub-studies (See also Häkli and Kallio, 2018a). It offers a context where "the political" emerges from various kinds of mundane contexts, thus serving as a good example for illustrating what the political analytical phase is about. While sharing many features of racism, the difference lies in the reasons of harassment. Race is a socially established, broadly politicized contextual identity that one cannot choose. It appears as a

significant element of most *polises*, existing in the form of subject positions that people encounter through the dynamic processes of mutual recognition. As one of the older boys in the English study, with a Nigerian family background, declared, it was clear to him why he was being treated badly in his school: in the North England city where he lives, black people's racial subject positions are disadvantaged. This provided him the starting points to building awareness, forming an attitude, and taking action with regard to this broadly acknowledged feature of political life (detailed analysis in Kallio, 2018). Instead, his classmate, Emma, described bullying as something that is hard to understand from outside the context, as portrayed in her biographical story in Fig. 5. She told us how she had become withdrawn and subordinated after her cat got sick and was put down, as people around her did not empathize with her pain but, instead, ridiculed her mourning. By time, she had been able to generate agency, based on these experiences, which she finds is helping her to stick up for herself.

To people bullied for other reasons than race, gender, ethnicity, or religion, for example, the politics of the situation are often rather obscure, which makes their processes of political subject formation less apparent, also to other people – including researchers. In the Finnish study, we had extensive discussions with two fifth grade pupils (10–11 years) suffering from bullying in their school. They had both tried to solve the situation for years. Anton had shared his experiences with an older pupil with whom he had found the courage to tell about his situation to the school staff and his mother. Sara had first explained to herself why she was being bullied

In my life, there have been moments that I'll never forget. Good ones and bad ones. But the most memorable moment was when my cat was put down. I had just got home from school and I found out that my mum had taken my cat Haru to the vets as she wasn't well. She had cancer. At that moment I knew there was nothing we could do but let her go as peacefully as possible because she was already in so much pain. I found out the same day I had fallen out with two of my closest friends.

It was two days before my birthday. We all said goodbye and I was overwhelmed with sadness. It had to be the worst day of my life. We drove to the vets in Barnsley, and I held the cat carrier on my lap, she wouldn't stop meowing and it just made everything worse. I had to say goodbye to my cat. The cat I had owned for 5 years, she was my friend, part of my family. Once we were in the vets I couldn't breathe, it was like a nightmare that just wouldn't end. The vet took her in and injected her with the overdose of anaesthetic. As she went to sleep, she meowed one last time and then her tongue was sticking out as she went. I will never forget that moment. Seeing her face like that, it just made everything seem hopeless.

This experience changed my life so much. People bullied me because my cat had cancer, people made fun of me. I tried to ignore them but it never worked. I became enclosed, I hid in my room most of the time and I rarely spoke to anyone anymore. I had learnt to stick up for myself after this. I decided I had had enough of the people who bullied me or made fun o me, and because of that I am the person I am today. It changed me forever.

Fig. 5 Emma's experiences of bullying as a form of mundane political struggle

and after that sought for new ways to engage with the school community. Both kids felt that their attempts had failed. In Anton's case, bullying continued in the form of social exclusion and in other subtle ways that the school or the home could not prevent from happening. To him the classmates' continuing activities were a mystery: envy was the only reason he could think of for not being accepted. Therefore, he kept on trying to join in the group while constantly suffering from disapproval.

In Sara's school days, bullying was present more explicitly; even we could see how she was openly mocked during the breaks. Yet Sara had found a reason to why it happened and, based on this understanding, was prepared to correct the situation in the future. As it often goes in highly individualized cultures, she had found the problem from herself. She explained to us that she had "performed herself in a wrong way from the start," creating a role too different from those of other girls. The solution she had come up with was, hence, to wait until the seventh grade when she could move to a school where no one knows her and "perform herself better" so that people would like her more. Similarly, Anton was thinking about a fresh start in a different school environment.

These examples, picked from among many others, show how learning about the importance of equality in communal life may happen in relation to non-politicized matters as well. In Anton's case, the alarmed awareness toward bullying had led to professional plans: he was determined to become a police officer so that he could help others. He considered the responsibility of authorities to prevent and improve inequalities as the best response. Anton was already practicing this agency in a hobby where mutual respect and fair leadership are the leading principles (Kallio, 2017a). Sara, instead, had learned that people's opportunities to building identities and forming agency differ between social environments (Häkli & Kallio, 2018a). With her family, in the world of music, and in her circus hobby, she was recognized as a completely different person than in school. In these social contexts, she could perform comfortable identities that made her feel respected for *who* (sic) she feels she is (cf. Arendt on who/what, p. xx). In her next school, she hoped to be able to accomplish the agency developed in these contexts and thus find her place in the new school community. In her case, the process of political subject formation seemed to combine aspects of Foucauldian self-care and deCerteauian ruse: transforming without yielding up (cf. Kallio, 2008). Thirdly, Emma, whose caring agency for her cat had led to bullying, felt that she had strengthened as a person due to these experiences, which would help her later in life in situations where people might try to put her down.

The participants in my study shared many experiences related to situations or trajectories by which they had learned about the importance of equality, as a social element as well as a democratic principle. More often than not, encountering *in*equalities had made them attentive to this or that matter, while existing *equal* relations and practices had not often raised similar attentiveness. After becoming attentive toward certain inequalities, many children and young people develop attitudes and agencies led by the Arendtian understanding of humanity: to be a member of a democratic community is to act as an equal.

Equality is one theme through which mundane processes of politicization can be traced in empirical research with children. Other dimensions, pertinent particularly to the scholarship introduced in this volume, are children's amiable and concerned relations with their living environments and natural elements they know about and care for. In my recent study, the Finnish participants talked more about their takes on environmental issues. Many of them had become attentive toward pollution in their neighborhoods and on a broader scale (especially water systems, e.g., local lakes and Baltic Sea politics), environmental threats (related to nuclear power for instance, e.g., Fukushima disaster), urban green as an important yet sometimes endangered element of everyday living (e.g., privatization developments), and values related to wild nature.

One reason why such concerns may be closer to Finnish than English children's hearts can be found from the tradition of *mökkeily*, literally translated as "cottaging." It is a traditional way of spending free time outside the city, especially during summer holidays but also on weekends throughout the year. Finnish cottages are typically located in the woods by the water (lake, sea, or river), and they range from simple huts with no electricity or running water to full-scale all-season villas. They are often family-owned, including shared ownerships between different generations and siblings. In addition to these, resort-oriented tourism industry offers a broad range of cottages for short- and long-term rental (Kulusjärvi, 2016). Characteristic activities include sauna, swimming, sun bathing, barbecue, berry and mushroom picking, fishing and hunting – and most importantly, spending time together with the family in the "natural peace and quiet."

In contrast to the UK, where having these kinds of second homes at the countryside are considered luxurious and affordable only for people in privileged positions, in Finland the division of life between urban and rural dwelling is not so much a question of class (Hiltunen & Rehunen, 2014). More than half of the population has access to a second home, and many families are involved in cottaging activities in various locations. Similar activities are often included in school fieldtrips, municipal and congregational youth and social work programs, hobbies, and other recreational happenings. According to my findings, this lifestyle seems an important trigger to children's relationships with wild nature that, thus, intertwine with their familial relationships and mundane politics. The tradition of cottaging fosters what Bartos and Wood (2017) call "ecological well-being," which leads to mundane but sometimes also more formal practices of political agency – "green citizenship" at large (Wood & Kallio, forthcoming).

To sum up, by bringing the understanding emerging from the political analytical layer together with the findings coming from social and spatial analytic phases, geosocial analysis creates understanding about how topological realities, or *polises*, establish and on the other hand, what kinds of experiential processes people go through as they make sense of the political worlds where they find themselves living. This attempt, while being rather challenging, seeks to provide alternative knowledge about the spatial relations that condition and enable political life in the largely topographically organized societies and communities where children, among other people, live.

Potential of Geosocial Methodologies for Interdisciplinary Childhood Studies

The geosocial methodological approach introduced in this chapter draws from phenomenologically oriented theorization where the experiences constitutive of politics are considered primarily subjective and political life is seen to exist through social practices. What stands as political in this framework are matters signified, understood, negotiated, and struggled by the people who, as members of lived political communities, are involved in shared and contextual geosocial dynamics and practices. The relational worlds, or topological *polises*, where these lives are led are conditioned by large-scale geopolitical and geoeconomic forces that mobilize in various forms in people's everyday living environments. Political subject formation is, thus, a contextual process through which people come to be recognized as political subjects and potential actors in their experienced worlds. Concurrently, people may influence the constitution of their political realities from personal stances, more and less intentionally, by participating in mundane and formal political life together with their significant others. In all, the geosocial methodological approach highlights political agency as thoroughly contextual and socially embedded while relying on people's subjective capacities to experience their lived worlds.

To serve empirical research, theoretically informed methodological approaches, such as the one discussed here, need to be operationalized into analytical means. In my recent study with children and youth, I have used three analytical layers to access, conceptualize, and analyze their experienced political realities. Following the relational ideals of the geosocial methodological approach, these dimensions emphasize:

1. **Social relatedness** as the primary foundation enabling people's spatial–political experiences as well as their knowledge-building regarding their socially constituting worlds (*polis*) and themselves as their recognized members (*intersubjective being–becoming*).
2. **Topological relationality** that regards the multifaceted contextuality of political life, where entirely different kinds of spatial relations may exist concurrently to the people involved in the life of a *polis* (e.g., territorial, networked, place-based, translocal, mediated, connective, emotive).
3. **Experience-based politics** where "the political" stands for those elements of *polis* that are first recognized as particularly important within its sphere, then negotiated, contested, and struggled by the people (who thus act as *political being–becomings)*, and finally but only sometimes established as long-standing cornerstones of the everyday life of a given political reality (e.g., politicized identities, institutionalized practices, public administrative structures)

Through these analytical means, it is possible to trace political worlds as they appear to the people involved in a given political life, regardless of their societal skills and knowledge or generational positions and age. In practical terms, I have used mapping platforms to provide entry points for children to tell about their

experienced worlds and to share their understandings with researchers. Through discussions, as well as writings and drawings, I have then followed up the social relations and positions significant to these children, to understand their personal stances in the *polis* that they are portraying as lived space. From the narrative materials thus produced, I have unmapped their experienced realities, by identifying different kinds of spatial configurations. Concurrently, I have paid attention to their emerging political subjectivities and agencies that, at times, became visible as children talked about events, situations, activities, people, and feelings of particular importance. The pieces of narrative where something seemed to be "at stake" to the speaker proved most fruitful in this regard (e.g., experienced inequalities, environmental concerns).

How I see that the geosocial methodological approach contributes to existing methodologies in human geography and childhood studies is twofold. First, it begins from the idea that in every case, political reality is subjectively experienced and socially constituted and, thus, cannot be known from beyond the people involved in a given political life. This starting point brings a "third leg to the stool" (Mitchell and Kallio 2017, p. 5), complementing methodologies where large-scale geopolitical and geoeconomic frames are used to explain political life in a specific empirical context (e.g., Moisio & Paasi, 2013, cf. Millei, 2014, 2015). Moreover, it adds to feminist approaches that appreciate microscale analysis yet often set politicized identity categories, such as gender, race, and class (e.g., Massaro & Williams, 2013), or politicized contexts, such as militarism, migration, and activism (Benwell & Hopkins, 2015), at the heart of inquiry or as analytical presumptions. In the geosocial approach, all matters important in people's lives are seen as *potentially* political while considering none as *inherently* political.

The second dimension that I consider novel in this approach may be of particular interest to childhood researchers, including childhoodnature scholars. Argumentation for acknowledging children's knowledges in parallel with adult knowledges has prevailed for a long time, yet it remains that they are not, in several regards (Kallio, 2017c, cf. Harris & Wyn, 2010; Wood, 2017). Geosocial approach may be helpful in partly overcoming this continuing inconvenience. It does not distinguish between adults' and children's ways of knowing but, rather, argues for the subjectivity and contextuality of all spatial and political knowledge. The only truths that this approach admits are the mutual and discordant understandings that people share and juxtapose through social practices in the *polis*, as they recognize and are recognized by each other and as they act according to their beliefs and ethics. Politicization may take place in any situation where people contest the prevailing order or suggest new entries to the social fabric. This often occurs as the identities imposed on us in the mundane and institutional practices of everyday life do not seem fitting or when some events involve injustices that people do not want to accept. Thus, from a geosocial perspective, children can be seen as active players in the processes of politicization, just as adults. For example, as they do not adjust to roles offered to them by institutional authorities (like teachers) and mundane communities (like neighborhoods), or do not agree with the moralities (like regarding suitable appearance) and rules (like appropriate use of public space) of their living

environments, they bring forth critical knowledges that open up space for contestation and change. This agency can be found interesting, among other things, as a form of "green citizenship" (Wood & Kallio, forthcoming).

As to the limitations of geosocial methodologies, what I have developed thus far is just one starting point for creating a means to empirical topological inquiry. Some of the unresolved questions are, for one, how to bring together experience-based spatial–political knowledge from many individuals, which is needed in creating a better understanding about the emergence and continuity of *polises* as shared political spaces. Another important element, still completely missing, is topological representation. I have not yet found a way to "remap" or otherwise represent topological *polises* in other but narrative formats. Third, as people's spatial–political experiences are conditioned by geopolitical and geoeconomic frameworks, these should be taken into closer consideration when thinking further the analytical means. This includes dealing with the fact that, like other truths, geopolitical and geoeconomic understanding are based on geosocially formed knowledges. They are created, shared, agreed upon, and circulated by certain quarters, in some *polises*, and scientific discussions play an important role in these processes as one form of legitimization. How can we relate geopolitical and geoeconomic understandings, always biased, with other geosocial knowledges without emphasizing the already existing power relations that condition our lives? These questions, among others, deserve attention from researchers who are interested in developing further geosocial and related methodologies.

Conclusion

The childhoodnature research agenda fosters the building and sustaining of lasting relationships with environments including a variety of living things and argues for the joint efforts of people in achieving this, be they young or old, parents or sons/daughters, teachers or pupils, caretakers or those being taken care of. Children's ways of conceiving, interpreting, knowing, sharing, and acting are not juxtaposed with those of older people yet neither are they – or perhaps in my opinion, should not be – identified as *specific* forms of knowledge with unforeseeable potential. Rather, I think that children's knowledges – and I talk about knowledges in a broad, Foucauldian sense – are largely part of the societies and environments where people live with each other, and they persist in the dynamic relations between human and nonhuman elements and actors. It may be, however, that these knowledges are not typically identified as such and they do not receive due attention and appreciation. Children's agencies often fold into the fabric of everyday living as seemingly naturalized elements of social life.

Bartos and Wood's (2017) conception of *ecological well-being* is one productive way of identifying and supporting children's relationships with their environments, always involving social and natural elements. Their concept highlights interconnectedness between children's different roles in their mundane and institutional environments, competing power relations conditioning children's lives, and children's active agency in upholding and creating well-being for themselves and others. What

the political geographically grounded methodologies introduced in this chapter may add to the ecological well-being approach, and have to offer to the childhoodnature research agenda more broadly, are:

1. **Recognition as the key dynamism of political life.** Regardless of their generational positions and chronological age, people are political being–becomings who may influence each other by means of (ethical) recognition. Children play an important part in the intergenerational chains of recognition, both as political subjects under formation and as presently active political agents.
2. **Children live in a relational world.** Even if people's abilities to self-governing physical mobility may expand by age, the worlds in which children find themselves living are not constituted in a scalar manner (from micro to macro). Children's understandings about their lived realities, constantly transforming, form through social relations and engagements. In the contemporary world of intensifying transnational and translocal developments, this means that children's experienced worlds involve various overlapping and even contradictory, spatial relations and configurations that direct and impact on their agencies.
3. **Political life is shared and subjective.** Political elements of human life are specific and contextual; what grows to be politically significant in a given community or society depends on which matters and principles the people involved consider particularly important. During the early years, people are socialized into their political realities, yet they are not completely subjected by the prevailing conditions as even young children have capacities to relate with their social worlds and to act in contravening ways. By practicing this human agency, children can participate in political meaning-making processes and the related negotiations and struggles of politicization, as individual persons and together with other people.

Part III

Cultural, Political, and Wild Perspectives of Childhoodnature

Closing the Gap Through Rewilding, Interacting, and Overcoming

19

Sean Blenkinsop and Peter H. Kahn Jr.

Abstract

This chapter serves as a short introduction to the section. Thus, aside from providing an overview of each of the chapters herein it offers an orientation that might assist readers in connecting ideas throughout the entire section. What does become clear is that the work for education and educators going forward is likely to be substantial, these are not chapters interested in tweaking what currently exists.

Keywords

Anthropocene · Environmental education · Wilderness · Nature-based programs

Sometimes changing an ethos, a metaphor, and an accepted way of things is easy. Take the word ice, take the word coffee, stick them together, and soon everyone is sipping on a cool summer drink. Childhoodnature is not that easy, particularly within a worldview that has separated them. But even if we want to bring childhood and nature into a unified whole – culturally, educationally, and politically – it is harder than the simple creation of a neologism suggests. And in their own ways, the four chapters in this section are examples of and suggestions about the work that needs to be done to close the gap between human children and the natural world.

All the chapters are clear in enunciating a problem, one that has implications across the spectrum of the human condition, including health and well-being, empathy,

belonging, physical fitness, cognitive functioning, mental acuity, psychological health, and political engagement. Each chapter responds in its own way, from the local to the global, from the specific to the general, and from the practical to the political and philosophical. The chapters offer visions, philosophies, and actions in response to the complex challenges. What is also clear is that the work going forward is going to be substantial and that there are allies, compatriots, and grassroots organizations all over the place that it would behoove educators to partner with and learn from.

Several themes emerge over the course of reading these chapters. There is the sense of the importance of interaction, of having children spend significant amounts of time outdoors and engaging with the natural world and in having these interactions understood and named differently. There is a sense of the need for experience, for children to be immersed in, to be sensually engaged with, and to encounter diverse natural places and beings. This not only provides for the possibility of building relationships, but it also gives students an expansive baseline with regard to what wild and natural might mean, rather than having that baseline slide into overly manicured parks and indoor terrariums as the most biodiverse worlds they know. This discussion also leads into a return of the wild and wilderness in ways that respond to the critique of social construction but that also do rich work acknowledging an active, agential, vibrant, buzzing natural world. There is also a sense that the imagination is important for both learning, as in the range of affordances, and the work the child must to do turn sticks into brooms, cars, and dolphins, and also for the future, as in having the imaginative capacity and flexibility to go beyond the edges of the community and cultural norms in which they currently find themselves. And finally, there is a sense that this is not a small project these chapters are considering. This is about changing the culture and the relationship many humans have with the natural world. This includes potentially thinking about nature as teacher and partner, to changing the language and metaphors being employed, to rethinking education, the wild, and the human condition.

In their work, Charles and Louv offer a wild hope as the lynchpin to a "new nature movement" that might go beyond traditional environmentalism and the current educational status quo toward a better society. It is a society in which people flourish in an expansive way alongside diverse other-than-humans. Through their work with the Children & Nature Network, Charles and Louv offer research findings that reach into many areas of life – education, mental health, physical well-being, and more – and thus speak cogently to the role nature can play in all our lives. There's in an energetic vision, a political project, and a grassroots movement which ends by offering examples for families, educators, and communities who are close to home and easily enacted but who are capable of building the kinds of connections and resiliencies necessary to change the story and maybe more.

> To change a society, as the philosopher Ivan Illich wrote, "you must tell a new powerful tale, one so persuasive that it sweeps away the old myths and becomes the preferred story, one so inclusive that it gathers all the bits of our past and present into a coherent whole, one that even shines some light into the future so that we can take the next step (Illich, n.d.)." (Charles & Louv, 2018, in press)

In quoting Illich, they bring these four chapters into harmony: four different but complementary voices.

For their part, Sobel, Larimore, and Becker-Klein bring us a working example of a partnership created between a local nature center, its early childhoodnature-based program, and the nearby K-3 elementary schools. Their research involves a qualitative informal case study method; and their results point in the direction of five important benefits: (1) increased motivation and enthusiasm for school; (2) enhanced language development; (3) increased science, technology, math, and engineering (STEM) learning; (4) improved physical development; and (5) the development of executive function capacities. The authors see the public push toward "academification," "indoorification," and "digitalization" as wedges that pry apart childhood and nature. They also write of negotiations between nature-based programming experts (educators from the nature center) in partnership with school-based educators that can expand the curricular purview while shifting accepted epistemologies, how time spent in near daily immersion in the outdoors can bring forth the expanded range of learning possibility the natural world has to offer, how turning toward longer periods of child-directed/adult-facilitated play and problem-solving can move the culture of separation and allow the natural to embrace the learner, and how the increase in parental involvement and support of flexible administration can provide space for relationships to flourish. All of these actions become part of an educator's toolbox for closing the gap between childhood and nature.

The story expands with Kahn, Weiss, and Harrington who suggest that the childhood and nature gap is partly caused by the lack of direct experience that children have with an increasingly degraded natural world. The authors suggest that people construct knowledge of what is "normal" nature based on the interactions with nature that they experience in childhood. The crux is that with ensuing generation the amount of environmental degradation, if not destruction, increases, but each generation tends to take that nature as normal nature. They call this the problem of "environmental general amnesia," which they say helps explain how cities continue to lose nature and why people do not really see it happening, and to the extent they do, they do not think the loss is too much of a problem. Environmental generational amnesia also helps explain why typical solutions, like classroom environmental education, which focuses on teaching facts and conceptual knowledge, are not well suited for helping children really understand the problem "in their bones." Their solution is to have children interact with a nature that is more wild than not.

Against this intellectual backdrop, Kahn, Weiss, and Harrington systematically observed the interactions of young children in a forest school in Seattle, Washington. From their observational data, the authors generated what they call a "nature language." This language is comprised, like words in a dictionary, by what they call "interaction patterns": characterizations of essential features of interaction between humans and nature, specified abstractly enough such that countless different instantiations of each one can occur – in more domestic or wild forms – given different types of nature, people, and purposes. For example, *walking along the edge of water and land* is an interaction pattern. So is *climbing a tree*, *imitating animals*, and *imagining*

nature to be something other than it is. Intriguingly for this discussion of closing the gap, it becomes apparent that these authors are suggesting that compared to the urban world, the natural world offers a wider range of affordances to the young learner, which in turn allows the child to exercise an imaginative range that is often not available in a more domesticated environment. What also appears in this nature language is the arrival of a language that is action-based. Note the verbs that lead each interaction pattern; and then note that each verb is interconnected to another being as part of each descriptor. One wonders if this is not in fact the language of the childhoodnature world: a language that recognizes interdependence, action, and possibility at the same time.

In the final chapter of this section, Blenkinsop, Jickling, Morse, and Jensen step back from the more direct work in schools of the last two chapters to offer a more general philosophical response to the problem of the childhoodnature gap and suggest some pedagogical touchstones that might support the kinds of educators engaged in the aforementioned work. The authors also place education at the heart of this cultural change project, but it is an engaged, activist, and critical educator who is able to step away from the traditional human-teacher-centered educator role and question the assumed norms that form the framework for public education as it currently exists in much of the world. This chapter begins by exploring and rethinking three seemingly disparate strands, wilderness, education, and the anthropocene, for the purposes of having each offer comment on the human problematic of control which the authors suggest has contributed to the childhoodnature divide. Troubled by the anthropocentrism and the desire to control that have led to the devastation of the anthropocene, the dismissal of wilderness, and the limitations of public education, the authors then offer up six touchstones, forming a heuristic of sorts, for wild pedagogies. These touchstones then become challenges to return to and commitments to make that educators can respond to and draw upon as they continue the slow work of changing practice and troubling systems. To return to the metaphor of telling a new story, this chapter is about changing the actors and the ways of being in world so that new possibilities can be generated for how the story will end. Possibilities include a world where the wedges between children and nature have been removed, or at least reduced, and where childhoodnature makes sense not only as an idea but as the way in which we actually educate and live in the world.

Abstract

The international movement to connect children with nature continues to grow. While thoughtful and concerned people, including scholars, have written and worried about children's disconnect from nature in their everyday lives for decades, the recent growth of the children and nature movement is heartening. With that growth come some positive results as well as challenges. One example of positive change is the increase in research related to nature deficit and the benefits of nature connection. While the number of studies with methodological improvements increases, important questions remain to be addressed. Even

so, a review of the literature yields significant evidence-based insights and recommendations. Our chapter focuses especially on examples of evidence-based actions people are taking in all of the major settings where children live, learn, work, and play – that is, in their home environments, schools, and communities. We focus especially on those actions being taken to create positive, transformative experiences; support children's healthy physical, mental, and social development; strengthen communities through nature connection; and benefit the health of the Earth itself. Such experiences and actions are the foundation for achieving what we are calling wild hope – a way of being and living that is rooted in nature-based experiences and contributes to a healthy present and future for today's children and generations to come.

Nature-deficit disorder · Nature-based experiences · Hope

Introduction

For many of us especially in Western cultures such as the USA, thinking about the future conjures up images from movies like *Blade Runner*, *Mad Max*, and *The Road*: a post-apocalyptic dystopia stripped of nature and human kindness. We seem drawn to that flame, but this dystopic trance is a dangerous fixation. Not that there are not reasons to be discouraged. Among them, an urbanizing society in which people retreat into silos of their own kind, hard times for those who have been left behind economically, environmental degradation and decades of nature-deficit disorder among many children and adults. Even so, Martin Luther King, Jr. taught us that any movement – any culture – will fail if it cannot paint a picture of a future that people will want to create and live in. His teachings exemplify why, more than ever, we need what we are calling a New Nature Movement, one that is centered on children but includes adults, one that incorporates but goes beyond the good practices of traditional environmentalism and sustainability, one that paints a compelling, inspiring portrait of a society that is *better* than the de-natured societies in which many people throughout the world live today (Louv, 2012).

For positive action to take place there is no practical alternative to hope. The time has come to envision not only a survivable world but a nature-rich world in which our children and grandchildren and their descendants thrive; a future that holds and nourishes wild hope. To us, wild hope means a belief in such a future, and a deep commitment to its creation. In this future, humans are nourished by primal connections to the primary sources that sustain all life and inspire the human spirit. Wild hope is a way of being and living, rooted in nature-based experiences, that will nurture children and the planet today and for generations to come. Wild hope is the heart of the New Nature Movement.

A consensus definition of nature will always remain elusive since people interpret the word nature based primarily on their personal relationships with the environment, rather than how any one discipline or ideology defines the word. We recognize

that there are historic and current philosophical perspectives in which nature is all that is; nothing, including humans, is separable. From such a perspective, children **are** nature (childhoodnature) and so the concept of connecting children with nature may perpetuate a separation.

When we talk about nature, we are referring to everything from nearby nature outdoors in urban, suburban, and rural environments to more distant nature in wilderness settings. One useful definition is this: "Nature is an outdoor environment with natural elements that may include rocks, soils, sand, water, animals, vegetation, and other natural materials. This nature may be found in built and unbuilt environments, from city parks to gardens to native landscapes. Nature-based learning occurs outdoors in cities, towns, neighborhoods, wilderness areas, farms, rural settings, museums, schools and other places that afford such opportunities" (Children & Nature Network, 2016). We realize that this definition is more descriptive than inspirational.

For an inspirational definition of nature, people have often turned to the poets. The preeminent nature poet, Gary Snyder, is drawn to poet John Milton's phrase, "a wildernesse of sweets." Snyder writes, "A 'wildernesse of sweets' is like the billions of herring or mackerel babies in the ocean, the cubic miles of krill, wild prairie grass seed. . .all the incredible fecundity of small animals and plants, feeding the web. But from another side, wilderness has implied chaos, eros, the unknown. . .. In both senses, it is a place of archetypal power, teaching, and challenge (Snyder, 1990)." When considering children in nature, we find ourselves hungering for such a rich description, one that does not include all matter as natural, or restrict nature to virgin forest – a definition with room for the divine. As we promote the power of connecting children with nature, and as we refer to the heart of that connection as wild hope, we believe that nature need not always be defined as pristine. A useful definition must, however, always recognize the mystery of the natural world, as a place where awe, wonder, and hope are nourished in all of us.

As an aspirational goal, we believe all children must have opportunities to experience the nature that exists outside themselves, whether in wilderness or in the more domesticated, yet still naturally abundant, living ecologies that remain where people live. We run the risk, with such an approach, of compounding what Peter Kahn calls environmental generational amnesia: how, as environmental degradation increases, each generation in its youth takes that degraded condition as the nondegraded condition – as the normal experience (Kahn, 2002). Yet, in a variety of natural settings, the data are clear and growing that children will benefit from nature-based experiences. The evidence indicates that such experiences can be transformative –cognitively, socially, physically, emotionally, and perhaps spiritually, and that they can strengthen the conservation ethic. We believe connecting children to the natural world is a necessary antidote to environmental generational amnesia and fundamental to the protection of the environment. This question remains: Will the growth of human nature deficit, and the rise of technological substitutes for nature experience, outpace our ability to ensure that future generations will sufficiently value the natural world around them?

Inchoate, self-organizing, the New Nature Movement is emerging around the world. At its center is the challenge of connecting children to the natural world. This

movement is based on traditional wisdom, but also on recent research that illuminates the power of both distant wilderness and nearby urban nature to improve human psychological and physical health, cognitive functioning, and economic and social well-being (Charles & Loge, 2012a, b). The movement reaches outward to connect all people and their communities to nature; it works to conserve and protect remaining wilderness, and also to regenerate or create additional natural areas where people live, learn, work, and play, and where biodiversity grows (Charles, 2012; Louv, 2012). Canadian professor Catherine O'Brien suggests one principle of the movement when she advocates that we not only "make our ecological footprints as light as possible," but "actually leave places better than when we came to them, making them places of delight (O'Brien, 2006)." This conviction is core to the movement: Opportunities for a positive connection to the natural world are a birthright. All children need nature. Not just the ones with parents who appreciate nature. Not only those of a certain economic class or culture or gender or sexual identity or set of abilities. *Every* child.

The New Nature Movement includes parents and educators who bring the enlivening benefits of nature to children in their growing years – at home, in their neighborhoods; who create natural learning environments in schoolyards and school gardens; who use natural areas to teach children not only about science and the natural world but about every subject; who introduce young people to natural areas in surrounding neighborhoods, rural regions, and wilderness.

Participants in the New Nature Movement include traditional conservationists and deep ecologists; physicians (particularly pediatricians) who prescribe nature experience and green exercise; eco-psychologists, wilderness therapy professionals, and other nature therapists; park rangers and docents who help families fulfill their "park prescriptions"; public health workers; and urban planners and designers who work to increase the amount and quality of nearby nature. Also citizen naturalists who salvage threatened natural habitats and create new ones; and community gardeners, urban farmers (including immigrants practicing what has been called "refugee agriculture"), organic growers, and "vanguard ranchers" who restore as they harvest. Deep green design professionals are broadening the concept of the new urbanism: biophilic architects, developers, urban planners, and therapeutic landscapers are transforming homes, workplaces, suburbs, inner-city neighborhoods and potentially whole cities into restorative regions that reconnect us to nature. As part of this movement, families, businesses, places of worship, and professional urban wildscapers are replacing open space with native species and pollinators (gradually creating what botanist Douglas Tallamy calls "a homegrown national park" – and, beyond national borders, what we call a "worldwide homegrown park") (Louv, 2012). Nature-smart leaders are advocating and creating walkable neighborhoods and promoting green exercise as an expression of active living.

Though we believe the pace of the movement must quicken, we do see progress in public awareness and tangible actions, nationally and internationally. Hundreds of local, regional, state, provincial, national, and even international campaigns have brought together businesspeople, conservationists, healthcare providers, educators, and others. These others include thousands of parents, teachers, law enforcement

officials, librarians, artists, pediatricians, liberals and conservatives, anglers, hunters, and vegetarians; people who not only consume but also restore nature. The movement is surprisingly diverse. Recent immigrants and inner-city youth are among the most persuasive advocates for nearby nature and outdoor experience – once they get a chance to have such experiences. Not all of the individuals and groups we have mentioned would necessarily see themselves as part of one movement (Louv, 2012).

In September 2012, the World Conservation Congress of the International Union for the Conservation of Nature (IUCN) passed a resolution declaring that children have a human right to experience the natural world, an essential ingredient if nature is to be protected from human excess – and a step toward seeking a similar declaration at the United Nations. At the same World Conservation Congress, leaders of national parks and protected areas throughout the world approved the "Jeju Declaration on National Parks and Protected Areas: Connecting People to Nature," committing themselves to create a global campaign that recognizes the great contribution of these natural treasures to the health and resilience of people, communities, and economies (Charles, 2012). The campaign was carried to the World Parks Congress in November 2014, followed by the Brandwein Institute's convening of Inspiring a New Generation: A North American Summit in November 2015. Building on all of this foundation, #NatureForAll was launched at the IUCN's World Conservation Congress in Hawaii in September 2016, and featured at the Children & Nature Network's International Conference in Vancouver in 2017.

Consider the collective power if these forces came together to craft a positive vision of a newer civilization based on a transformed human relationship with the natural world.

The Evidence Base: What We Know and Don't Know

A decade ago, researchers became increasingly interested in the impact of nature experience on human development. At that time, the relatively few existing studies looked at two broad areas, according to the Children & Nature Network (C&NN), which continues to build its database of annotated studies (www.childrenandnature.org/research/). These two early areas of focus were: (1) what are the indicators of children's disconnect from nature in their lives; and (2) what are the benefits to children cognitively, emotionally, physically, and socially from direct experiences with nature? The second area is where studies related to children's academic achievement and learning were categorized in the annotated bibliographies of research developed by C&NN (Charles, 2007; Senauer, 2007). In the early part of the decade, few researchers had conducted studies specific to *if, how, why, under what circumstances, and for whom* nature impacts children's learnings. Of those, none were longitudinal. Most were based on observations, analysis of qualitative data, interviews, and self-report. Some included comparisons of student achievement on standardized tests and grade point averages in nature-based learning environments versus those not so characterized, as well as other attributes such as enthusiasm for learning and positive behaviors.

Since C&NN began publishing its volumes of annotated research, the number of studies generally related to positive outcomes for children from nature-based experiences has notably increased. This trend appears to be continuing. For example, in 2007 the number of studies meeting criteria for quality sufficient to be included in C&NN's research library numbered less than 50. Now, more than 600 studies that have met the tests for publication in peer-reviewed journals are included in C&NN's growing research library. New studies are being published with frequency (see Senauer, 2008; Senauer Loge, 2009; Charles & Senauer-Loge, 2012a, b; Senauer Loge, 2011; Charles & Wheeler, 2012; Children & Nature Network, 2017; Chawla, 2015).

Most of the studies continue to be correlational, not causal, in examining the reported findings. However, there are improvements in methodology. There is now also a relative balance between qualitative and quantitative studies, and an increase in those using mixed methods, whereas a decade ago most of the studies of substance were based on qualitative measures. Improvements in methodology and an increase in quantitative and mixed methods are among the observations being cited by the group of researchers and practitioners who are part of the National Science Foundation funded project, the Science of Nature-Based Learning Collaborative Research Network, established through a collaboration between the University of Minnesota, Children & Nature Network, and North American Association for Environment Education. This Network is publishing a research agenda designed to help fill the gaps in understanding and increase the rigor in the evidence base specific to one dimension of the children and nature connection, the impact on children's learning (Children & Nature Network, 2016).

While there remain, therefore, some limitations to the evidence base, the findings support the benefits to children from nature-based experiences. Although there are gaps in our understanding, the patterns are consistent. That is, some benefits to children's learning are found from a variety of nature-based approaches and experiences. Strengths of the body of evidence to date are related to various scholars' efforts to document benefits to children's health and well-being, which can be associated with positive learning outcomes, from nature-based experiences. Findings related to enhanced student self-control, ability to focus, sense of well-being, sense of purpose, and overall enthusiasm for learning are among those attributes which would tend to support children's academic achievement and school performance.

In sum, it is fair to say that the current body of evidence is promising and generally consistent, despite its limitations. Much additional, well-designed, and rigorous research is needed, but, quoting Dr. Howard Frumkin, "we know enough to act" (Frumkin & Louv, 2007).

Research-Based Indicators of the Decline of Children's Physical Activity Outdoors and Related Concerns

Children in the USA today spend less time playing outdoors. A Hofstra University survey of 800 mothers with children between the ages of 3 and 12 found that: 85% of

the mothers agreed that today's children play outdoors less often than children did just a few years ago; 70% of the mothers reported playing outdoors every day when they were young, compared with only 31% of their children. Also, 56% of mothers reported that, when they were children, they remained outdoors for 3 h at a time or longer, compared with only 22% of their children (Clements, 2004). From 1997 to 2003, there was a decline of 50% in the proportion of children aged 9–12 who spent time in such outside activities as hiking, walking, fishing, beach play, and gardening, according to a study by Sandra Hofferth at the University of Maryland. Also, Hofferth reports that children's free play and discretionary time declined more than 7 h a week from 1981 to 1997 and an additional 2 h from 1997 to 2003, a total of 9 h less a week of time over a 25-year period (Hofferth & Sandberg, 2001; Hofferth & Curtin, 2006).

Children between the ages of 6 months and 6 years are reported to spend an average of 1.5 h a day with electronic media, and youth between the ages of 8–18 have been reported to spend an average of 6.5 h a day with electronic media – that is more than 45 h a week (Rideout & Hamel, 2006). One of the most recent and definitive studies of children's media use to date reported an increase of more than 1 h daily in a 5 year period, up to an average of more than 7.5 h daily (Rideout, Foehr, & Roberts, 2010), more than 50 h a week. Use of mobile devices by children under 8 years of age has doubled from 2011 to 2013, with seven of ten children reporting their use. Four out of ten children younger than 2 years of age are also using mobile devices, an increase from one in four during the same 2-year period (CommonSense Media, 2013).

Spatial experience corresponds to how children spend their time. North American children have a more restricted range in which they can play freely, have fewer playmates, and their friends are less diverse (Karsten, 2005). The percentage of children who live within a mile of school and who walk or bike to school has declined nearly 25% in the past 30 years. Today, barely 21% of children live within one mile of their school (Centers for Disease Control, 2006). In another survey, 71% of adults report that they walked or rode a bike to school when they were children, but only 22% of children do so today (Beldon, Russonello and Stewart Research and Communications, 2003). Children predominantly play at home, with their activities monitored and controlled by adults, compared to children a generation ago. In one study, only 3% of children have a high degree of mobility and freedom in how and where they play (Tandy, 1999). According to the work of Stephen Kellert, professor emeritus of social ecology at Yale, experience in a surrounding home territory, especially in nearby nature, is linked to shaping children's cognitive maturation, including the developed abilities of analysis, synthesis, and evaluation (Kellert, 2005).

The disconnection from nature experience also appears to be associated with the activities and priorities of child-related institutions and parents. In a major study conducted in association with Seattle Children's Research Institute, 51% of preschool-aged children were taken outdoors to play by one or more parents at least once daily. The rest did not have this opportunity (Tandon et al. 2015). In another major study conducted in association with Seattle Children's Research Institute,

children in preschool child care were sedentary 73% of the time. On average, 33 min per day were outdoors. Outdoor teacher-led time was less than 1% (Tandon, Saelens, & Christakis, 2015). This is worrisome for a variety of reasons, beginning with the evidence that there is a strong correlation between time outdoors and physical activity. Note that the American Academy of Pediatrics recommends a minimum of 60 min a day of moderate to vigorous physical activity for children (Daniels & Hassink, 2015). While the two studies above indicate that one-half of preschool-aged children do not get outdoors to play on a daily basis, whether in the care of a parent or a caregiver in a home-based setting, children in preschool day care tend to be overwhelmingly sedentary. They are not only outdoors very little, they tend to be physically inactive while indoors. Another study reports that 75% of preschool children in the USA are in some form of child care, describes barriers for achieving healthy physical activity for children in care settings, and advocates daily physical activity for children's healthy development (Copeland, Sherman, Kendeigh, Kalkwarf, & Saelens, 2012).

Why are children spending less time outside? One study found that 94% of parents surveyed said that safety is their biggest concern when making decisions about whether to allow their children to engage in free play in the out-of-doors (Veitch, Bagley, Ball, & Salmon, 2006). Similarly, of 800 mothers surveyed by a Hofstra University researcher, 82% cited crime and safety concerns as one of the primary reasons they do not allow their children to play outdoors. But 85% of the mothers identified their child's television viewing and computer game playing as the number one reason, and 77% cited adequate time to spend outdoors with their children (Clements, 2004). In a classic study by Singer et al., the issue of children's disconnect from free and exploratory play in nature in their everyday lives is widespread and global (Singer, Singer, D'Agostino, & DeLong, 2009).

"Access to nature, whether it is in the form of bona fide natural areas or in bits or views of nature, impacts psychological, as well as social functioning," says Frances "Ming" Kuo, a professor at the University of Illinois, adding that, "Less access to nature is linked to exacerbated attention deficit/hyperactivity disorder symptoms, more sadness and higher rates of clinical depression. People with less access to nature are more prone to stress and anxiety, as reflected not only in individuals' self-report but also measures of pulse rate, blood pressure, and stress-related patterns of nervous system and endocrine system anxiety, as well as physician-diagnosed anxiety disorders (Kuo, 2010)."

Research-Based Indicators of the Positive Connections Between Health and Learning and Nature Experiences Among Children and Adults

The studies cited above are best understood when contrasted with the positive benefits of nature engagement. The physical benefits are obvious; more outdoor play, of any kind, will tend to increase children's physical activity levels.

Other benefits are subtler and no less important: the psychological, cognitive, social, and creative gifts that nature experience offers children. Children tend to be smarter, more cooperative, happier and healthier when they have frequent and varied opportunities for free and unstructured play in the out-of-doors. Green plants and play yards reduce children's stress. Free play in natural areas enhances children's cognitive flexibility, problem-solving ability, creativity, self-esteem, and self-discipline. Students score higher on standardized tests when natural environments are integral to schools' curricula. Effects of Attention Deficit Disorder are reduced when children have regular access to the out of doors. "Natural spaces and materials stimulate children's limitless imaginations and serve as the medium of inventiveness and creativity," says Robin Moore, an international authority on the design of environments for children's play, learning, and education (Louv, 2008).

Health care providers are beginning to recognize the therapeutic attributes of nature, for attention disorders and depression in adults and children. For example, a UK study released in April 2007 shows the benefits of "green treatment," or ecotherapy – including walks in the woods and gardening. According to the study, 71% of people with mental health disorders reported that taking a walk decreased their depression and tension. Mind, the UK's leading mental health charity, called for a shift to such treatments, augmenting traditional therapies. "Mind sees ecotherapy as an important part of the future for mental health. It is a credible, clinically-valid treatment option and needs to be prescribed by GPs, especially when for many people access to treatments other than antidepressants is extremely limited," said Mind's chief executive Paul Farmer (Hareyan, 2007). While most research in this arena has been done on adults, a growing body of evidence suggests the positive power of nature engagement during the most vulnerable years of human development.

Many studies and reports pertain to children at play. Playtime – especially unstructured, imaginative, exploratory play – has long been recognized as an essential component of wholesome child development (Burdette & Whitaker, 2005; Ginsburg, 2007). Unstructured play, indoors or outdoors, allows children to initiate activity rather than waiting for an adult to direct them, use problem-solving skills, their imagination, negotiating skills with peers, etc. – all of which is very beneficial to children's learning and development. The outdoors, especially environments with plants, animals, and other natural elements like rocks and water, invite children to act on their natural curiosity and, with the endless range of things to explore and question, provide a uniquely engaging environment for unstructured play. Among the added benefits, children's natural curiosity leads to scientific learning – not only specific details of nature but scientific method. For example, the outdoors invites questions such as, "What's that green stuff growing on the trees? It looks like it's always on the same side of the trees; why is that?"

Nature experience has been linked to better performance by children in school. Sponsored by many state departments of education, a 1998 study documented the enhanced school achievement of youth who experience school curricula in which the environment is the principal organizer. This study was followed by two-related studies, conducted by the USA's State Education and Environment Roundtable,

both of which produced results consistent with this original study (Leiberman & Hoody, 1998, 2000). Factoring out other variables, studies of students in California and nationwide showed that schools that used outdoor classrooms and other forms of nature-based experiential education were associated with significant student gains in social studies, science, language arts, and math. One study found that students in outdoor science programs improved their science testing scores by 27% (American Institutes for Research, 2005).

In inner-city housing projects in Chicago, investigators found that the presence of trees outside apartment buildings predicted less procrastination, better coping skills, and less severe assessment of their problems among women (Kuo & Sullivan, 2001), greater self-discipline among girls (Faber Taylor et al. 2002), less crime (Kuo & Sullivan, 2001), and less violence and better social relationships (Kuo & Sullivan, 2001). Similarly, green plants and natural vistas were linked with reduced stress among highly stressed children in rural areas, with the results the most significant where there are the greatest number of plants, green views, and access to natural play areas (Wells & Evans, 2003).

Proximity to, views of, and daily exposure to natural settings has been associated with children's ability to focus and enhances cognitive abilities (Wells, 2000). Children who experience school grounds with diverse natural settings are more physically active, more aware of nutrition and more civil to one another (Bell & Dyment, 2006; Dyment & Bell, 2008). Based on surveys of teachers in schools that had schoolyards with both green areas and manufactured play areas, children were rated as more physically active, more aware of nutrition, more likely to engage in more creative forms of play, and they also played more cooperatively in green areas (Bell & Dyment, 2006).

Children with attention-deficit disorder are described by their parents as showing fewer ADD symptoms and being better able to focus immediately following outdoor activities such as camping and fishing, compared to indoor activities such as doing homework and playing video games. According to the researchers at the University of Illinois, the greener a child's everyday environment, the more manageable their symptoms of attention-deficit disorder (Faber Taylor, Kuo, & Sullivan, 2001; Kuo & Faber Taylor, 2004; Faber Taylor & Kuo, 2006, 2008, 2011).

Adults, as well as children, benefit from "recess" in natural settings, which has implications for the health of parents, teachers, and children. Environmental psychologists Rachel and Stephen Kaplan have linked contact with nature to restored attention, the promotion of recovery from mental fatigue, and the restoration of mental focus. They attribute these beneficial qualities to the sense of fascination, of being immersed "in a whole other world," and to other influences of the natural world (Kaplan & Kaplan, 1989; Kaplan, 1995). Researchers in England (Pretty, Peacock, Sellens, & Griffin, 2005) and Sweden (Bodin & Hartig, 2003) have found that joggers who exercise in a natural green setting with trees, foliage, and landscape views feel more restored and less anxious, angry, and depressed than people who burn the same amount of calories in gyms or other built settings.

Studies of medical treatment suggest that nearby nature offers healing properties in hospital settings, with implications for both adults and children. An

early study, in 1984, showed that patients in rooms with tree views had shorter hospitalizations (on average, by almost one full day), less need for pain medications, and fewer negative comments in the nurses' notes, compared to patients with brick views (Ulrich, 1984). In another study, patients undergoing bronchoscopy were randomly assigned to receive either sedation, or sedation plus nature contact – in this case a mural of a mountain stream in a spring meadow and a continuous tape of complementary nature sounds (e.g., water in a stream or birds chirping). The patients with nature contact had substantially better pain control (Diette, Lechtzin, Haponik, Devrotes, & Rubin, 2003).

Research-Based Indicators of Benefits to Mental, Social, and Community Health

"There is growing . . . empirical evidence to show that exposure to nature brings substantial mental health benefits," according to "Green Exercise and Green Care," a report by researchers at the University of Essex. "Our findings suggest that priority should be given to developing the use of green exercise as a therapeutic intervention." Among the benefits: improvement of psychological well-being; generation of physical health benefits by reducing blood pressure and burning calories; and the building of social networks (Pretty, Hine, Sellens, South, & Griffin, 2007).

In some cases, greening neighborhoods may help reduce domestic violence. In a Chicago public housing development, researchers compared the lives of women living in apartment buildings with no greenery outside to those who lived in identical buildings – but with trees and greenery immediately outside. Those living near the trees exhibited fewer aggressive and violent acts against their partners. They have also shown that play areas in urban neighborhoods with more trees have fewer incidences of violence, possibly because the trees draw a higher proportion of responsible adults (Kuo, 2010).

Exposure to other species can help children develop empathy. We have known for decades that children and the elderly are calmed when domestic pets are introduced in therapy, or included in rehabilitative or residential care. We also know that children can learn empathy by caring for pets. Some mental-health practitioners are taking the next step: using pets and natural environments as part of their therapy sessions. Cherie L. Spehar, a Licensed Clinical Social Worker and Play Therapist, who has served as executive director of The Child Abuse Prevention Center in Raleigh, N.C., recommends to therapists, "Bring nature play into your sessions, as it is a resource rich in opportunities for practicing kindness. Introduce them to every form of life and teach respect for it (Spehar, 2012)."

Greater biodiversity in cities can increase social and family bonding. Scientists at the University of Sheffield in the UK report that the more species that live in a park, the greater the psychological benefits to human beings. "Our research shows that maintaining biodiversity levels is important . . . not only for conservation, but also to enhance the quality of life for city residents," said Richard Fuller of the Department of Animal and Plant Science at Sheffield (Science Daily, 2007). In related work,

researchers at the University of Rochester, in New York, report that exposure to the natural environment leads people to nurture close relationships with fellow human beings, to value community, and to be more generous with money. By contrast, the more intensely people in the study focused on "artificial elements," the higher they rated wealth and fame. One of the researchers, Richard M. Ryan, noted, "[We've] found nature brings out more social feelings, more value for community and close relationships. People are more caring when they're around nature (Mapes, 2009)."

Natural playgrounds may decrease bullying. In Sweden, Australia, Canada, and the USA, researchers have observed that when children played in an environment dominated by play structures rather than natural elements, they established their social hierarchy through physical competence; after an open grassy area was planted with shrubs, children engaged in more fantasy play, and their social standing became based less on physical abilities and more on language skills, creativity, and inventiveness. Such play also provided greater opportunities for boys and girls to play together in egalitarian ways. And children are more likely to include children of other races and backgrounds in their play (Louv, 2016).

Speculatively, more experiences outdoors in settings with vegetation and other natural elements can offset the dangerous psychological impact of climate change. Professor Glenn Albrecht, director of the Institute of Sustainability and Technology Policy at Murdoch University in Australia, has coined a term specific to mental health: *solastalgia*, which he defines as "the pain experienced when there is recognition that the place where one resides and that one loves is under immediate assault." Albrecht asks: Could people's mental health be harmed by an array of shifts, including subtle changes of climate? If he is right in suggesting this is so, and if climate change occurs at the rate that some scientists believe it will, and if human beings continue to crowd into de-natured cities, then solastalgia will, he believes, contribute to a quickening spiral of mental illness (Albrecht, 2005).

Research-Based Indicators of Benefits to the Earth from Positive Human Connections

Positive direct experience in the out-of-doors and being taken outdoors by someone close to the child – a parent, grandparent, or other trusted guardian – are the two factors that most contribute to individuals choosing to take action to benefit the environment as adults (Chawla, 2006, 2009; Chawla & Derr, 2012).

In a classic study, Thomas Tanner, professor of environmental studies at Iowa State University, conducted a study of environmentalists' formative experiences, what it was in their lives that had steered them to environmental activism. "Far and away the most frequently cited influence was childhood experience of natural, rural, or other relatively pristine habitats." For most of these individuals, the natural habitats were accessible for unstructured play and discovery nearly every day when they were children (Tanner, 1980).

In 2006, Cornell University researchers Nancy Wells and Kristi Lekies went beyond studying the childhood influences of environmentalists; they looked at a

broad sample of urban adults, ages 18–90. The study indicated that the most direct route to adult concern and behavior related to the environment is participating in such "wild nature activities" as playing independently in the woods, hiking, and fishing before the age of 11 (Wells & Lekies, 2006). Children do need mentors, however. In other surveys of environmental leaders, according to University of Colorado environmental psychologist Louise Chawla, most attributed their commitment to a combination of two sources in childhood or adolescence: many hours spent outdoors in "keenly remembered" wild or semi-wild places, and a mentoring adult who taught respect for nature (Chawla, 2006).

Actions Underway: Families, Schools, Communities

By increasing the opportunities for children, families, and communities to increase their everyday experiences in nature, positive influences may ripple outward in ways we cannot immediately measure or see. Research to date strongly suggests that nature contact yields surprisingly broad benefits. This contact may be increased on a small scale – by increasing the number of plants in the workplace or trees outside the apartment building – or on a larger scale by growing the size and reach of urban parks, riparian corridors, yards planted with native species, and the creation of wildlife habitats in a city or by protecting, expanding, and increasing the wilderness areas and access to them.

With so much evidence about the benefits to children, youth, families, and whole communities from direct experiences in nature, what does it take to move to action? We think that scholarly publications like this help as a way to provide and support a rationale. Publications, public speaking, public campaigns, and policies all contribute. Most important, while standing on the evidence, it comes to individual, and collective, actions. Actions on every scale can make a positive difference. Here are a few examples of ways people are making a difference in the lives of children. Each is a model and inspiration for others. We have picked three settings where most children spend most of their time – family, schools, and communities.

Families

Nature clubs for families are an organized way for families to meet at a specified time and place to explore nature together. They are sprouting around the world. It takes one or more parents or others with a passion to plan a schedule of events and invite others to join. They might meet weekly, monthly, or at other times. Typically, they will come together at a nature-based public park or recreation area for several hours and engage in some planned activities combined with supervised free play and exploration for the children. The benefits are palpable.

One of those is Columbia Families in Nature, founded by Chiara D'Amore, in Columbia, Maryland in the USA. Chiara and her husband have two young children. They share a deep conviction that it is good for children's health and well-being to be

outdoors in nature, and that, also important, by doing so they will tend to care for the Earth itself as they grow and mature. Chiara was already thinking about establishing such a nature club because of its values to her family, her neighbors, and others in her community. She also was on a path to study for a graduate degree. It did not take long to figure out that there would be value in combining her purposes to connect local children and families to nature, and to study in a formal sense what the impacts might be. The result is a comprehensive study which resulted in Chiara earning her doctor of philosophy degree from Prescott College in Arizona, USA (D'Amore, 2015).

Chiara used a variety of methods to obtain her research data. While she focused primarily on Columbia Families in Nature, she included data from a total of 47 nature clubs for families from both the USA and Canada. Positive results included families spending more time in nature, reports of enhanced individual and family well-being, stronger social connections, and increased actions to benefit the environment.

There are many resources for parents and other family members who may want to start a family nature club. C&NN offers resources in several languages, including Chinese, Spanish, French as well as English.

In Brazil, Alana, a nonprofit organization with a mission to "honor the children," has founded and supports Criança e Natureza, part of its campaign to create a children and nature movement throughout the nation. One of their initiatives to connect children and families with nature is inspired by the Children & Nature Network's nature clubs for families. However, in Brazil, the idea of a club does not resonate, so family groups simply are encouraged to get outdoors to play and learn together, including in urban environments where most of the population of Brazil is living. Criança e Natureza offers films, workshops, and other resources to show Brazilian families how this can be done, and why it matters for children's health and well-being.

Similarly, family nature clubs and nature education are spreading in China. Nature Play Western Australia (www.natureplaywa.org.au) is one of four state-based organizations developed to connect children and their families with nature in that nation. As an indicator of international interest, people from more than 200 nations have visited the Website of the Children & Nature Network, and from more than 100 nations have downloaded resources that are available from the site.

Schools

Positive change is emerging in education today, in many parts of the world. Two we will feature are those serving early childhood-aged children and those for older children and youth.

Nature-based preschools and forest kindergartens are not a new idea. They have been popular in Scandinavian countries for decades, and their work continues to inspire educators and parents throughout the world. In North America, while their numbers remain small, nature-based early childhood programs are increasing. According to the North American Association for Environmental

Education's early childhood initiative, the Natural Start Alliance, there are now close to 250 nature-based preschools in the United States, up from only a few dozen about 5 years ago (Depenbrock, 2017). As one example, in the small state of Vermont in the USA, there are now nearly 30 nature-based preschools and forest kindergartens where children spend from a few hours a week to full days in the outdoors with nature as their classroom. Among those contributing to the growth of these nature-based early childhood experiences are Antioch Professor David Sobel, author of *Childhood and Nature: Design Principles for Educators* (Sobel, 2008) and other important works, and educator and mom, Eliza Minnucci. In 2013, Eliza founded the Ottauquechee School Forest Kindergarten Program in Quechee, Vermont. She and her colleague, Meghan Teachout, took their public school students outside 1 day, every week, all year. Claire Warden of Scotland is another of the world's leaders in establishing and guiding the growth of nature-based early childhood schools and programs. Founder of her own nature-based preschool in Scotland, Claire is also the founder of the Nature Pedagogy International Association.

We are pleased to see a resurgence of schoolyard habitat projects, a growing number of school and community gardens, and projects underway to naturalize school grounds by taking out pavement and planting vegetation in carefully designed play and learning environments. Robin Moore is one of the pioneers guiding these efforts and has developed guidelines to assist (Moore, 2014). While there have always been some talented and courageous teachers who have opened the doors to take children outdoors to learn in the first classroom, nature itself, for the last several decades up until very recently, especially in the United States, the trends have kept children indoors, even without recess, and without the opportunity to learn in context in direct connection and immersion in nature.

Exceptions are underway, and they are only examples of similar exciting initiatives. Denver, Colorado, is the home of many things – blue skies, diverse wildlife, and the wondrous peaks of the nearby Front Range. Beginning as long ago as 1992, a parent and landscape designer began an effort that ultimately has led to a unique partnership with the Denver Public Schools and has resulted in the transformation of close to 100 schoolyards from barren asphalt to green landscapes for learning. Lois Brink founded Learning Landscape, in partnership with the Denver Public Schools. Now, more than 20 years later, the results continue to build, from indicators of increased physical activity on the part of students to stronger community engagement and pride.

Similarly, efforts have been underway in the San Francisco Bay Area to green and improve the nature-richness of school grounds for decades. As recently as 2015, the San Francisco Unified School District reported having completed the greening of 70 of its schoolyards, with more to be completed.

Another indicator of the growing efforts to transform barren playgrounds into vegetated school grounds is the work of the International Green Schoolyards Alliance. The Alliance held its 2017 conference in Berlin, Germany. The events were hosted by Grün macht Schule and the Berlin Senate Administration for Education, Youth and Science Outdoor Laboratory.

The Denver Public Schools and the San Francisco Unified School District are examples of two school systems that are working to enhance the nature-based attributes of schools' physical grounds and environment in support of children's health and well-being. While the evidence continues to grow, it is sufficient to indicate that the benefits are numerous – from academic achievement to social skills, from physical health to self-esteem, from a sense of community pride to a connection to caring for the environment.

Nature-Rich Communities and Cities

Some cities are taking on the challenge of becoming nature-rich environments. The National League of Cities Institute for Youth, Education, and Families in the USA and Children & Nature Network launched the Cities Connecting Children to Nature (CCCN) initiative in November 2014. The project surveyed representatives and partners in 100 cities to identify promising strategies as well as current policies. Leadership academies were held to share and disseminate results. Currently seven cities in the USA are going even deeper, immersed in designing and implementing ways in which to connect all their citizens, with a special focus on those of low-income without easy access, to nature-rich environments.

The Salzburg Global Seminar and the International Union for the Conservation of Nature jointly released a call to action in 2017, stating that, "People across the world share a responsibility to create livable cities that enhance children's wellbeing and integrate nature." The Salzburg Statement on the Child in the City asked "leaders and stakeholders to ensure that all children enjoy the right to safe, free play in a nature-rich space within a ten-minute walk of where they live" (Salzburg Global Seminar, 2017).

Another inspiring example takes the spark and passion of one young woman in an urban environment who wants to connect people of all ages to nature. Janani Eswar founded GRIN, Grow in Nature, to connect urban people, including families, to nature in Banglalore, India. Janani is an inspiring example of people throughout the world who see the need to connect us all with nature in our everyday lives.

Conclusion

To change a society, as the philosopher Ivan Illich wrote, "you must tell a new powerful tale, one so persuasive that it sweeps away the old myths and becomes the preferred story, one so inclusive that it gathers all the bits of our past and present into a coherent whole, one that even shines some light into the future so that we can take the next step (Illich, n.d.)."

So, today, how do we shine that light? We must continue to support the birthright of all children to a healthy environment and their place as one of many species within the natural world, and to teach the responsibilities that come with that right. We can work to reduce climate disruption and biodiversity collapse by opposing policies that

destroy people and the rest of nature, and by making the case that human beings protect what they love and love only what they know. More than ever, building generations of healthy, resilient children – who grow up to care for themselves, one another and the Earth itself – will depend on helping children and adults fall in love with the natural world (IUCN, 2010).

We can emphasize the healing powers of the natural world: for mental and physical health, for the capacity to learn and create, and for the reduction of violence. We can promote family nature clubs, and similar approaches, as ways to seek meaning and solace in a difficult and alienating time. We can offer a little Vitamin N for the soul through places of worship. We can encourage pediatricians, psychologists, and other healthcare professionals to prescribe nature. And we can support and encourage teachers to integrate nature-based experiences throughout the school curricula (Louv, 2016).

We can also pursue what we refer to as "natural cultural capacity," illuminating the wealth of ways that different cultures connect to nature. We can reach out to people in the food movement, to community organizing groups in urban and rural neighborhoods, to military families and immigrant organizations. We can create and renew nature-rich cities to serve as incubators of biodiversity and habitats of health. Local institutions, such as libraries, zoos, aquaria, and nature centers, can become centers of bioregional awareness and nature-connection for children and families. We can help build a new generation of nature-based schools, increase the number and quality of natural schoolyards, and redouble our efforts to honor Natural Teachers as individual agents of change. With the support of education and business, we can nurture the development of careers that connect people to nature, new jobs irreplaceable by technology. And as the human species continues to urbanize, we can strengthen our international efforts and seek solidarity in a movement that will grow, regardless of national politics.

When children are transformed by the healing, generative, and abundant gifts of healthy natural environments, they are more likely to grow into adults who will create those healing and transformative opportunities for their own children and others. If the children and nature movement is to grow during future generations, it must not be exclusively about children; it must be part of a larger New Nature Movement that touches all lives and every community that is currently evidencing the characteristics of nature-deficit disorder, regardless of nationality, race, ethnicity, income, or set of abilities. The evidence is growing that the results of this movement will help contribute to a peaceful and healthy future for all people, all species, and the environment that sustains all of life.

The New Nature Movement has miles to go before it can declare anything approaching victory for children or adults. But it has already made inroads in policy and, more importantly, has planted the seeds for ongoing, self-replicating social change, and has brought together unlikely allies in common purpose – a shared yearning to reconnect children within the natural world of which they are inherently a part. Reconnecting children to nature, as the core of the New Nature Movement, represents one of the few issues that bring people together across political, religious, economic, cultural and racial lines, and across national borders.

Nature connection is not a panacea for every challenge to physical, mental, and emotional health. Nor can that connection assure, by itself, the protection of nature or the creation of a just society. But by aspiring to a nature-rich future, we can help counter the post-apocalyptic vision of the future, and we can assure that more children, families, and communities are filled with the abundance and regenerative powers of wild hope.

Abstract

The increase of nature-based preschool programs in the United States, including nature preschools and forest kindergartens, has led to a growing interest in providing nature-based early childhood education (NbECE) at the elementary level. This chapter focuses on the successful expansion of nature-based early childhood education from an exemplary nature-based preschool at Chippewa Nature Center (CNC) into the Kindergarten and First Grade curriculum in

Bullock Creek Public Schools in Midland, Michigan. The maturation of the CNC Nature Preschool program, and the conscientious outreach by program directors, has led to the "naturalization" of a local public school district.

We illustrate changes in public school administrator attitudes and decision-making about nature-based programming. In addition, we show how this growth in NbECE has led to improvements in child outcomes at the preschool and K-1 levels, particularly related to motivation and enthusiasm for learning, language development, STEM (Science, Technology, Engineering, and Mathematics) learning, physical development, and executive function.

The Nature-Based Early Childhood Movement

The implementation of nature-based early childhood education, particularly nature-based preschools, is a rapidly growing trend in early childhood education with only 10 programs in the United States in 2010 and now more than 250 programs nationally (Merrick, 2016). This sharp increase in nature-based preschool programs in the United States, including nature preschools and forest kindergartens, has led to a growing interest not only in articulating the benefits of these programs but also in expanding the nature-based pedagogy to the elementary level. This qualitative case study focuses on the successful expansion of Chippewa Nature Center's (CNC) exemplary nature-based preschool program into the Kindergarten and First Grade curriculum in Bullock Creek School District in Midland, Michigan.

The purpose of this case study is to both document the maturation of the CNC Nature Preschool program and show how conscientious outreach can lead to the "naturalization" of a local public school district. The Bullock Creek School District now has four Nature Kindergarten classes and three Nature First Grades spread between two elementary buildings. Additionally, this nature-based approach has percolated upward into the upper elementary grades through collaborative programming and weeklong programs at CNC.

This has led to both changes in administrator attitudes and decision-making about nature-based programming and improved student outcomes. This successful program evolution is in contrast to many of the trends in public education over the past decade. Nationally, disturbing trends in early childhood (pre-K to third grade) have been:

1. The **"academification"** of early childhood programming. Kindergarten is the new first grade. Preschool is the new kindergarten. This translates into less emphasis on social emotional school readiness and more emphasis on early literacy and numeracy (Almon & Miller, 2009).
2. The **"indoorification"** of early childhood programming. This means children are indoors in confined spaces more of the time, and outside in natural play and learning settings less of the time. This translates into more seat time, less free or

guided play, and the decrease in opportunities for gross and fine motor development (Louv, 2010; Rideout, Foehr, & Roberts, 2010).
3. The **"digitalization"** of children's lives. Young children spend 8 h a day engaged with screens, (television, electronic media, cell phones) and 0.5 h per day outdoors. This translates into less social interaction with other children, less physical movement and the erosion of connectedness with the natural world (Rideout et al., 2010).

The CNC Preschool and the Bullock Creek Public Schools are consciously bucking these trends. Building on the relationship between nature-based programming and healthy child development, these early childhood programs are focused on:
(a) Increasing **motivation and enthusiasm** for school through program design that aligns with children's interests
(b) Enhancing **language development** through grounding literacy in natural learning experiences
(c) Creating the foundation for **STEM (Science, Technology, Math, Engineering) learning** through providing opportunities for problem-solving and sustained inquiry
(d) Providing opportunities for a full range of **physical development** through regularly scheduled hikes and the creation of naturalized play areas
(e) Developing **executive functions** (working memory, cognitive flexibility, inhibitory control, and self-regulation) through thoughtfully designed outdoor activities and challenges

This case study will demonstrate how the techniques pioneered in the CNC preschool are successfully being implemented in K-3 programming in the local public schools. This naturalization of early childhood programs is a mainstream form of childhoodnature – the weaving together of children's lives with the natural world as opposed to the emergent paradigm of children alienated from the natural world. We hope that this case study can be used as a model for a similar rejuvenation of early childhood education in school districts around the country.

Chippewa Nature Center Preschool as Exemplary Program

The Chippewa Nature Center (CNC) Preschool has become a model of an exemplary nature preschool in the last decade. The program has grown from 24 students enrolled for the 2007–2008 school year to an anticipated 140 students in the 2016–2017 school year. CNC's program meets the definition of a nature-based preschool, and it also receives high ratings on traditional early childhood program assessment metrics such as High Scope's Program Quality Assessment and five-star ratings on Michigan's quality rating improvement system.

In a previous report, *Nature-based Preschool Education* (Bailie, Becker-Klein, & Sobel, 2015), the authors summarized initial findings on how the Chippewa program positively impacts preschool children. (Please see CNC Preschool Profile in Appendix A.) In that report, we indicated that parents, local early childhood educators, and local school administrators were impressed with the benefit to children of nature preschool children.

Theoretical Background

Nature-Based Preschools

Nature-based early childhood education (NbECE) is a broad term that encompasses any program model that provides young children ages 0–8 extensive daily outdoor time over the course of a school year, and the curriculum's organizing concept is nature (Larimore, 2016; Sobel, 2014). Under this larger umbrella of NbECE are programs such as nature-based preschools, forest preschools, forest kindergartens, and nature kindergartens. For this study we defined nature-based preschools as high-quality, licensed early childhood programs for 3–5-year-olds, with at least 25–50% of the class day held outside each day, including time beyond the designated play area, nature infused into the indoor spaces, and with nature as the driving theme of the curriculum (Bailie, 2010; Green Hearts, 2014; Larimore, 2011a, b; Moore, 2014). We distinguish this program model from forest preschools, sometimes referred to as forest kindergartens, by their longer periods of time outdoors (70–100%) and very limited use, if any, of indoor space (Larimore, 2016; Sobel, 2014).

The implementation of NbECE, particularly in nature-based preschools, is a rapidly growing trend in early childhood education. This rapid growth led to a first national conference for nature-based preschool professionals in 2012, the formation of a professional association created by the Natural Start Alliance in 2013, the creation of a certificate in Nature-based Early Childhood Education at Antioch University New England that same year, and many regional professional associations in the last 2 years. Despite the rapid growth in program numbers and the creation of professional networking organizations, there has been little research on the learning and teaching that occurs within these nature-based programs. Our goal with this study was to fill this gap.

Language and Literacy

Given that nature-based preschools implement a unique pedagogy, or program model, it is important to review research related to the preschool program model's influence on child outcomes. Studies have found that child-centered/play-based programs are generally more supportive of academic outcomes than programs focused on academics (Dale, Jenkins, Mills, & Cole, 1995; Stipek, Feiler, Daniels, & Milburn, 1995) and are significantly more supportive of motivation-related measures, such as willingness to attempt more challenging tasks (Stipek et al., 1995). Follow-up studies have found that vocabulary development in the early years is particularly indicative of later success (Dale et al., 1995). In addition, language, and literacy skills seem to be positively correlated to science experiences (Conezio & French, 2015; French, 2004).

STEM in Early Childhood

Similar to NbECE, science teaching and learning in early childhood has been receiving growing attention in recent years with science integrated into early

learning standards on a national and state level (Greenfield, 2010). Science in early childhood not only includes content knowledge but also development of science and engineering practices, which involve both knowledge *and* skills (NRC, 2012), and development of dispositions toward science (Brenneman, Stevenson-Boyd, & Frede, 2009; Katz, 2010). When given the opportunity, young children generally enjoy and think they are good at science (Mantzicopoulos, Patrick, & Samarapungavan, 2008). The relationship between content knowledge, practices, and approaches to learning was succinctly captured in the National Science Teachers Association (NSTA) position statement on early childhood science that stated, *"learning science and engineering practices in the early years can foster children's curiosity and enjoyment in exploring the world around them and lay the foundation for a progression of science learning in K–12 settings and throughout their entire lives"* (National Science Teachers Association, 2014).

Physical Development

Many early childhood educators are concerned that the greater emphasis on seatwork in early childhood programs is having a negative effect on children's physical development. Hanscom (2016) documents the substantial increase in children requiring occupational therapy to address problems with physical development, attributing these problems to the increasingly sedentary lives of children, and suggests outdoor play as an antidote. In a recent study, researchers at the University of Victoria in British Columbia compared growth in physical development in nature-based and conventional early childhood programs and found children in the nature group had significantly more locomotor skills (Temple, Mueller, & Smith, 2015).

Executive Function

Research over the past few decades has pointed to the development of executive functioning in young children as a more important and productive goal than the development of early literacy and numeracy skills and may be a better predictor of long-term academic and social success (Blair & Razza, 2007; Cameron et al., 2012; Nayfeld, Fuccillo, & Greenfield, 2013). Therefore, focusing on the development of these executive function skills may be more appropriate early childhood program goals than academic ones. Executive function includes the subcomponents of working memory, inhibitory control, self-regulation, and cognitive flexibility (D'Amore, Charles, & Louv, 2015).

Translating the Nature Preschool Approach into Public School Kindergarten and First Grade

Nature Preschool, Nature Kindergarten, and Nature First Grade are program models that provide young children, ages 3–4, 5, and 6 respectively, extensive daily outdoor time unless the weather is dangerous, and nature is curriculum's organizing concept.

Chippewa Nature Preschool

Chippewa Nature Center (CNC) is a private nonprofit just outside the city limits of Midland, Michigan, a town of approximately 40,000 people. CNC's nature-based preschool started in 2007 as one classroom using an existing building on the nature center grounds. In 2009, the program moved to two classrooms in a newly built LEED Gold-certified building, a certification verifying the buildings energy efficiency, which is complete with extensive natural light and a rustic wood-paneled interior. In 2016 the program expanded to include the original 2007 program space. The preschool is situated on 1148 acres of diverse habitats including woodlands, wetlands, rivers, and upland fields. The main building includes two fenced-in natural outdoor play areas surrounded by a rustic rail fence, which enclose the preschool in the front and the back, while the original site includes one-fenced play area.

The three classrooms house 8 class sessions and currently serve 140 students. The program is tuition-based but provides financial assistance to approximately half of the students, including funding through Michigan's Great Start Readiness program for at-risk 4-year-olds. Each class has 16–18 children with three teachers with a diversity of backgrounds in both early childhood and environmental education. Family involvement is a priority at CNC events for the whole school throughout the year, as well as parent education opportunities.

Children in the half-day program at CNC's Nature Preschool start their day outside in a natural play area. After spending 45 min to 1 h in unstructured play, the class meets at the "stump circle" for a large group time before exploring one of the many ecosystems and destinations available at the nature center. The exploration beyond the play area ranges from searching for frogs at the pond to searching for missing letters in the forest. In other words, these activities vary between learning *in*, learning *about*, and learning *with* nature (Warden, 2015). After the hike, the class returns to the preschool building where the children transition to snack time which is served family style, followed by an hour of choice time where they can choose among the activities available in the classroom, small group time for a more focused activity, and a final large group meeting. The indoor space and the structure for large and small group time are guided by Creative Curriculum®, the curriculum CNC uses in conjunction with the nature-based approach. (See description of program in Appendix A.)

Bullock Creek Schools

Based on 4 years of successful preschool operation, and responding to parents who started to ask when a nature-based kindergarten would be opened, Chippewa Nature Center began exploring collaboration with the Bullock Creek Public Schools. In 2011, first author Larimore approached Charlie Schwedler, Bullock Creek Superintendent, about developing a partnership to extend the nature-based approach into the elementary school. The two established a Nature School Exploration Committee, made up of a combination of eight administrators, teachers, and board members to consider implementation of a nature-based kindergarten. The goal was a kindergarten program that implemented the key nature-based elements including daily

Fig. 1 Logo for Nature Kindergarten programs in Bullock Creek Schools

outdoor experiences, hands-on, real-world learning, and intentional integration of nature as a tool to achieve curriculum goals.

The original plan generated by the Committee was to implement one section of kindergarten in August 2012 at Floyd Elementary, a Title I school with approximately 70% of the students receiving free and reduced lunch and located about 6 miles from CNC. This location was appealing because of its 30-acre, primarily wooded property. However, since parent response was so great, three sections of nature kindergarten were offered that fall. In year 2 of the program, the district added a nature kindergarten section at Pine River Elementary, the elementary school located across the street from CNC. Since its implementation in the 2012–2013 school year, the Nature Kindergarten program has grown to include one transitional kindergarten section, four kindergarten sections, and three First Grade sections which began at Floyd Elementary School in the 2015–2016 school year (Fig. 1).

Nature Kindergarten and Nature First Grade in Practice

What does a Nature Kindergarten and First Grade look like in practice? (The following description is substantially taken from Larimore (2015), *Growing with the Children: Bringing Nature-Preschool Practices to Elementary Schools*.) To start, the students go outside for a substantial part of every class day. (Rain or shine, fall, winter, spring, except in dangerous weather.) These excursions may have a science focus, relate to reading they're doing in class, or focus on math. No matter the activity, the children are experiencing their school property throughout the school year and building a connection with the outdoors. Once a week, a CNC educator visits the kindergarten classes to lead the day's outdoor hike. This allows for the modeling of outdoor activities that the kindergarten teachers might not be comfortable with, as well as sharing content that might be outside the classroom teacher's knowledge.

Indoors, the teachers integrate nature into daily lessons. At the beginning of the school year, the teachers and CNC educator work together to develop the scope and sequence for the year based on seasonal events and the state-mandated curriculum requirements. This planning time includes selecting books for reading times that relate to the seasonal theme. Math lesson planning includes seasonal ideas for taking math outdoors and ideas for natural materials that can be used as manipulatives.

Writing assignments are outlined that allow children to reflect on the outdoor experiences. In other words, the teachers plan with intentionality on how to integrate nature into as many of the classroom activities as possible.

In September, for example, the teachers spend 2 weeks focusing on insects. Outdoor time includes dressing a student up as an insect to discuss the main characteristics of an insect; searching for insects using basic equipment like nets, sheets, and bug boxes; and later in the unit, collecting loose parts (e.g., leaves, sticks, acorns) for building their own insects.

Indoors, their outdoor experiences help the students create a thinking map to compare and contrast insects, such as a bee and a butterfly. Books that focus on insects and insect life cycles are used in both the large group and small group reading times. Work stations include matching photos of stages of the insect life cycle with the appropriate words, sorting images of arthropods into insects or noninsects based on the number of legs, cutouts of body parts that they put together to create their own insect, drawing their own insect, and other similar independent work stations. The general theme of insects – selected in September because of the plethora of insects outside to see and touch – gets integrated into virtually every aspect of the classroom (Fig. 2).

Even the indoor classroom environment has a natural look with the traditional primary color posters of letters and numbers replaced with posters of Michigan animals corresponding to a particular number, letter posters that include images of Michigan plants and animals, and calendars that feature images of the Michigan outdoors. While there are still typical chairs and tables in the room, the plastic chairs

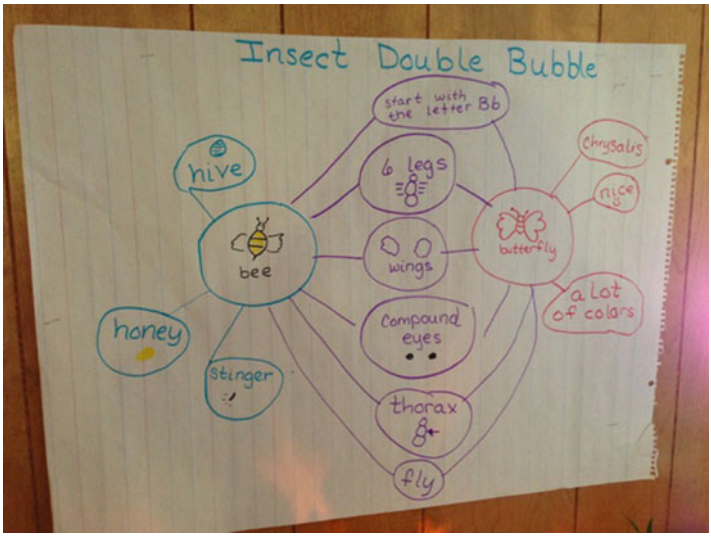

Fig. 2 Thinking map of differences between bees and butterflies

at the group meeting area have been replaced with tree stumps. Chunks of wood have been drilled with holes to hold pencils and markers. When possible, conventional components of the program are reimagined. Sometimes, the classes have their holiday party outside. How many schools do you know in the Upper Midwest that would have a party outside in December?

Research Methods and Data Collection

Research Methods

This current study emerged as the continuation of a previous study (Bailie et al., 2015) that investigated the reliability and validity of the Teaching Strategies Gold assessment tool for comparing child outcomes between a nature-based preschool and traditional preschool model. That study found the tool not to be reliable and led to the identification of more pressing research lines of questioning which are addressed in this current study. In addition, the authors found evidence of successful expansion of the nature-based approach into the elementary school and wanted to explore these phenomena more carefully. For this study, we chose to focus on the following research questions:

- What were the elements of collaboration and implementation that led to successful expansion of the nature-based approach from preschool to kindergarten and first grade?
- Are there benefits from the nature-based programs identified by the elementary teachers and administrators and are there consistent patterns in the observed benefits?

Data Collection and Analysis

Data were collected over 9 months through classroom and outdoor observations, review of program documents, and interviews with Chippewa Nature Center administrators and teachers and Bullock Creek Nature Kindergarten, Nature First Grade, upper elementary school teachers, and administrators. The goal of teacher and administrator interviews was to explore more deeply their perceptions of the impact of the nature-based approach in both preschool and the elementary grades on students and teaching.

Four preschool teachers, six elementary teachers, many parents, two CNC administrators, three Bullock Creek administrators, and four intermediate school district administrators who work directly with early childhood efforts in the county were interviewed either individually or in small groups. Interviews used a semi-structured format allowing researchers to pursue new emerging ideas and lasted 30–60 min. The interviews and focus groups were audio recorded, and the researchers took extensive field notes during the focus groups and interviews. Given the first author's relationship to the interviewees, she was not present during the interviews. Upon completion of fieldwork, the interviews were coded to illuminate key emergent issues and answer the research questions.

Findings: Administrative Practices that Led to Successful Implementation

One of the goals of this study was to identify administrative practices that led to and supported the success of implementation of nature-based approaches in the elementary school setting. We identified administrative practices at CNC's preschool program itself and then identified successful implementation practices in implementation in the Bullock Creek Schools.

Preschool Program Development

From an analysis of interviews and historical documents, we extracted four practices that appear to have guided the successful development of Nature Preschool within the Chippewa Nature Center and the Midland community.

First, *CNC staff worked with the local early childhood community from the beginning to establish Nature Preschool as an integral part of the community's preschool offerings.* This started through a partnership with a local nonprofit to share operational duties, which continued for the first 3 years of operation. In addition, administrators served on countywide early childhood committees and staff attended professional development with other preschool programs. This outreach to the community from the beginning said, *"We're a little different, but we want to be part of what makes this a great community to live in."*

Second, *nature center administrators saw preschool as an integral part of the nature center's mission from the beginning.* CNC's Executive Director, Dick Touvell, along with the Board of Directors and administrative staff, made sure the preschool wasn't a stand-alone entity, but rather a way to broaden and deepen the center's audience and membership.

Third, *CNC Preschool secured public and private funding to assist low-income families who otherwise might not be able to attend the program*. It's easy for nature preschool to appeal to and serve a middle-class audience. It's hard to attract low-income families who can't afford the "luxury" of a nature-based program. Funding through Michigan's Great Start Readiness Program for at-risk 4-year-olds, Midland County's Great Start Collaborative for at-risk 3-year-olds, and private funding from individuals and groups like the Dow Chemical Company allowed for CNC to provide some level of assistance to half of the children in the program.

Fourth, *CNC administrators took a slow and steady approach and made a deliberate decision to grow the program incrementally.* While the program was at capacity in year 2, it took 3 or 4 years for the Chippewa Nature Preschool to become established, highly desired by the community, and recognized by other early childhood professionals. Only once the program was stable after 4 years did the CNC preschool director start to pursue expansion into the public schools.

Expansion into the Public Schools

A natural question of nature preschool parents is, *"This is great, but what happens when my kid goes on to public school?"* The partnership between CNC and Bullock Creek was, in part, a response to this question. In light of the fact that other NbECE programs may face this same question, we identified five key strategies used to naturalize the programming in Bullock Creek Schools:

1. *School Leadership. Local public school officials were invited to visit and understand nature preschool once CNC preschool was established.* Larimore recruited the local school superintendent to participate in preschool planning efforts, visit the nature preschool early on, and begin dialogue about integrating a nature-based approach in the public schools.
2. *External Funding. Recognizing that Nature Kindergarten and First Grade would require additional staffing, professional development, and evaluation, CNC staff assisted Bullock Creek in securing external funding to support the change process.* The funding also supported a weekly visit by a CNC naturalist to model the nature-based approach during the daily outdoor time.
3. *Nature Center/Public School Partnership. CNC conducted extensive nature education programs at all elementary levels – field trips, weeklong programs, and naturalist programs in the elementary schools – with Bullock Creek Schools.* In addition to supporting the Nature Kindergarten and First Grade programs, the funding supported two field trips to CNC for every elementary classroom in the district, weeklong programs at CNC for every Third, Fourth, and Fifth grade classroom in the district, and monthly naturalist visits for every elementary class at Floyd Elementary school. This programming grew parallel to the growth of the CNC Preschool and developed trust and working relationships with school officials.
4. *Professional Development. CNC offered extensive professional development to public school teachers*. Early on, public school teachers attended the CNC Nature Preschool Institute, a 4-day workshop on the nature-based approach. As the elementary school programs were implemented, CNC provided tailored professional development for the Nature Kindergarten, Nature First, and a few upper elementary teachers. In addition, time was dedicated to on-site curriculum planning between CNC staff and public school teachers.
5. *Parent Education and Involvement. CNC staff placed a premium on parent education and involvement*. Recognizing the unique approach to early childhood education, CNC staff worked, in collaboration with Bullock Creek teachers, to educate parents about what to expect – children out in all weathers, muddy clothes, wanting to bring animals indoors, etc. In addition, regular family nights, parent-teacher conferences, and ongoing parent communication developed strong parent engagement. This parent engagement led to enthusiasm about Nature Kindergarten, including regular communication with the superintendent and attendance at school board meetings, and contributed to the change in the local public schools.

That same parent engagement and enthusiasm continues to be a force for change in the school district. The current superintendent of the Bullock Creek district provided a prime example as he recounted a recent conversation with a parent:

> I was at a basketball game last week, standing by the entrance. A high school friend of mine asked, 'What about Nature Second Grade?' When I asked why he was asking, he said, 'I've just seen that my daughter is so inquisitive – flipping things over, so interested in learning. My three older kids are not like this. She wants to discover more. She wants to learn more.

The partnership between CNC and Bullock Creek can serve as a model for the naturalization of the K-3 curriculum and practices in other school districts throughout the United States.

Findings: Benefits to Children of NbECE Programming in Preschool, Kindergarten, and First Grade

Our research found that parents, teachers, and administrators reported benefits to children that naturally sorted into five distinct themes. These same themes described outcomes for children both at Chippewa Nature Center and for children in the Bullock Creek Schools. These five themes are (1) increased motivation and enthusiasm for school; (2) enhanced language development; (3) increased science, technology, math, engineering (STEM) learning; (4) improved physical development; and (5) development of executive function capacities.

Motivation and Enthusiasm for School

Changes in kindergarten in the last two decades to emphasize academic skills and standardized tests have led to a reduction in children's physical movement and creative cognitive opportunities. In *Crisis in the Kindergarten: Why Children Need to Play in School*, the authors summarize:

> Kindergarten has changed radically in the last two decades. Children now spend far more time being taught and tested on literacy and math skills than they do learning through play and exploration, exercising their bodies, and using their imaginations. Many kindergartens use highly prescriptive curricula geared to new state standards and linked to standardized tests. In an increasing number of kindergartens, teachers must follow scripts from which they may not deviate. These practices, which are not well grounded in research, violate long-established principles of child development and good teaching. It is increasingly clear that they are compromising both children's health and their long-term prospects for success in school. (Almon & Miller, 2009)

However, teachers and administrators at the preschool and kindergarten levels consistently reported that parents regularly comment on how their children are engaged, happy, and enthusiastic about attending the nature-based programs.

At the Chippewa Nature Preschool, one parent's comment was illustrative of general parental enthusiasm and child engagement:

> At the end of each day children run to tell their parents of the adventures they had. "Mom, I found 10 worms today!" or "Guess what, Dad, we saw a dead deer carcass today!" Regularly we hear parents raving about how their child wowed dinner guests with natural history trivia. The ability to recite nature facts is not our primary goal, but it shows children's desire to learn and their ability to absorb information.

One of the major goals of preschool education should be to develop a *"readiness to learn"* and an excitement about school. In all the parent interviews we have conducted, this excitement about school is a recurrent theme.

At the Bullock Creek Schools, parent and teacher comments were similar. One upper grade teacher, who was also a parent of a Nature Kindergarten student, suggested the general parent sentiment:

> (I) had a daughter in the very first Nature Kindergarten and she is in third grade now. (My husband and I) loved the organization of it, loved inside and outside learning happening. . .My oldest daughter did the traditional kindergarten, and at the end of both of their kindergarten years, one who had nature-based and one who did not, both came out ready for first grade. My Nature Kindergarten daughter loved coming to school, loved her teacher, and she continues to enjoy the outdoors.

Another teacher, who was also a Nature Kindergarten parent, echoed these sentiments:

> My son is in Nature Kindergarten right now. My daughter loved it (three years ago.) For both of my kids, it lets them still have that creativity, where usually (the curriculum is) so structured. Nature Kindergarten brings that out in them. I don't see that it is distracting from learning. My son loves the outside, so his ability to talk about nature is phenomenal. It was quite a difference when my daughter transitioned into first grade. That was tough! They sat there all day, and she honestly did not like school that much in the first grade. . .great to know that next year he will have Nature First Grade as well.

In fact, parent advocacy was one of the primary drivers of the implementation of Nature First Grade in 2015–2016. Parents saw the difference in the school experience for their kindergartners and wanted the experience to continue for their first graders and expressed that interest to the teachers, principals, and superintendents on a regular basis. The new superintendent (as of summer 2015), who was previously a middle school administrator, has changed his attitude about Nature Kindergarten this past year:

> (When it started) I wasn't sure about the nature-based approach. My own kids, who are now in first and third grade – we could have put them in the Nature Kindergarten. Instead we chose the traditional approach. Now, I regret that decision. If I could meet with every parent considering kindergarten, I would try to convince them that there's lots of positives in that approach. If I knew then what I know now, I'd put my own kids in Nature Kindergarten.

In addition to enthusiasm in the interviews, the Floyd Elementary principal noted kindergarten attendance was 90% in the 1st year of the nature program, 88% attendance in the 2nd year, and 95% in the 3rd year. If children are enthusiastic about school, they're less likely to find reasons to be absent. Quality early childhood education develops a "readiness to learn" and an excitement about school, and

motivation and enthusiasm for school was a recurrent theme in the interviews we conducted.

Language Development

In both settings, teachers and parents commented on the increased vocabulary and the increased receptive and expressive language of children in these nature-based programs.

At the Chippewa Nature Preschool, one of the questions that emerged from the study was,

Is it possible that the nature-based program at CNC actually enhances language development as much as or even more than conventional, high-quality, indoor programs? And what might be the mechanisms for this language enhancement? The answers to this question suggested three different possible impacts of the nature-based approach.

The Development of "Scientific" or Nature-Based Vocabulary

Across the board, everyone agreed that CNC children have a greater scientific word bank available to them. A quick sampling of the kinds of words that parents and teachers indicated children use are:

> Hibernation, vernal pools, talons, abdomen, thorax, decomposition, carcass, exoskeleton, metamorphosis, agitating—just like in my washer.

And here's an example of word sophistication beyond normal expectations for children this age:

> Two bright-eyed four-year old girls sat patiently waiting for the speech therapist to ask her next question. The therapist's focus for the day was the "b" sound, so she placed an image of a bird on the table in front of the girls. She then pointed and asked, "What's this?" The two four-year olds proudly answered, "Woodpecker!" They were correct. The therapist was confused—most four year olds would have said bird. What the therapist had forgotten was that she wasn't working with typical four year olds. She was working with students in Chippewa Nature Center's Nature Preschool. (Larimore, 2011b)

English-Language Learners (ELL) Do Better in a Nature-Based Context

Because of the materials-based aspect of nature learning, children who are learning English as a second language may be more successful in a nature-based than a traditional preschool. Simply, the word to referent relationship is clearer when the spoken/written word is presented in conjunction with the real thing rather than with an image of the thing. This was illustrated with the language development of a Korean child who came to the CNC program with hardly any English:

> For our English language learner, he didn't talk a lot in the beginning, but he really connected to grasshoppers and that opened the door to language and to making friends. He would collect and count dozens in a day, and making friends further helped his vocabulary. He would only say, "grasshopper," and then one day he said, "Kennedy,

I have 3 grasshoppers." A whole sentence! Now his expressive language is exploding, because he was interested in the grasshoppers and could connect to other children through them. He felt successful and felt like he belonged. He collects a lot– now it's worms, and he wanted a zipper bag for his tadpoles. I don't think he had any experience with nature before he came here, because his family is not connected with nature.

Language Learning, Beyond Just Science Vocabulary, Is Enhanced Through Nature

There was disagreement about this hypothesis among early child professionals when asked this question. Our speculation is that because outdoor social nature play is "deeper," in other words, lasts longer and is more sustained by the children, that there may be greater language expression and reception by the children. The contrary point of view was that child-initiated play is less likely to increase vocabulary because there are fewer adult-directed vocabulary lessons. We speculate that because the children encounter a greater array of natural history surprises – turkeys in the woods, birds landing on them while sitting quietly, the swarm of ants when you stumble upon an ant hill, and new flowers which weren't in the same place last week – there may be more triggering of questions and more receptivity to teacher language.

To assess the validity of this hypothesis, we are currently engaged in continued research to assess vocabulary growth among CNC students using the Peabody Picture Vocabulary Test and other measures of early childhood language development.

At the Bullock Creek Schools, the focus changes from the preschool emphasis on language development and letter and number learning to a greater focus on early reading and writing in kindergarten and first grade. However, the same principles apply. These principles are that (Fig. 3):

(a) Reading and writing should emerge out of the context of a rich language development experience which includes learning songs, finger plays, outdoor-guided movement, and social discourse during nature play.

Fig. 3 Vocabulary development with nature words

(b) Reading and writing is most enhanced when it is grounded in real-world experiences. Reading about frogs is much more exciting after the children hold frogs in their hands. Looking through natural history books is more compelling when a child is trying to identify something she found in the forest.
(c) Vocabulary development is encouraged when words are presented in concert with actual things and phenomenon. Children are likely to remember the unfamiliar word "chrysalis" when the word is presented in conjunction with the beautiful green and gold package attached to the milkweed leaf.

The principles are illustrated in comments from a current Nature Kindergarten teacher:

> I'm surprised at the amount of their vocabulary—it's amazing—and they're just getting this at school. Bears going thru torpor, frogs brumating. Insects–it's not just a bug—they know the body parts, and the functions of the body parts. Then this relates back to writing. In winter, when we're reading the All About Book, the children are recalling body parts and then they don't just talk about it, they write about it.

This comment is echoed by a Nature First Grade teacher. She comments on the vocabulary of the children as they come to her from Kindergarten:

> Their vocabulary is so much broader and expanded. Some of the words they know already as first graders, a lot of adults don't even know. If we have parents come sit through nature conversations, adults will say I didn't know that was that, or that word. I could feel right away at Open House, when I met with parents, there was an excitement about the nature program. They just embraced it.

One of the keys to the engagement in literacy is the bridging between the outdoor experience and text. One of the Nature Kindergarten teachers explains how this happens:

> It's not just we read about it, we watch videos–they're looking with their own eyes. When we find something outside that they've read about. . .their interest skyrockets, and the concept comes alive for them. It's not that they saw a picture, they touched it, they were able to see it. Those experiences they don't forget. 'Is this a tadpole or not?' Nature cements the new learning.

This same teacher describes how the nature/literacy connection has been effective with children with emotional and learning challenges:

> We've had one girl for two years. When she first came to the school, she'd hide under tables, spit, scream. She had no diagnosis but she was eventually diagnosed ADHD. But nature time was her time to shine and she became a leader during outdoors time. So we started to call her "Nature Girl." Whatever happened during the day, whatever challenges she had, there was always nature time. That gave her confidence. She's in first grade now and doing awesome, she's reading above grade level. That nature piece gave her solidity. We capitalized on her leadership during nature time.

To summarize this relationship between nature and literacy, it's instructive to see the parallel experience in one of the nature-inspired Kindergartens implementing Forest Days in Vermont. As in Michigan, the emphasis on early literacy has upped the stakes. Kindergarten literacy standards are much more demanding than they were 10 years ago. Just within the *Reading Informational Texts* section of the Common Core State Standards, there are ten individual standards that students are expected to meet before the end of the Kindergarten year. These expectations range anywhere from the following:

CCSS.ELA-Literacy.R1.K.1 – With prompting and support, (children) ask and answer questions about key details in a text

CCSS.ELA-Literacy.R1.K.10 – (Children) actively engage in group reading activities with purpose and understanding

Eliza Minnucci, Vermont public school Kindergarten teacher, says that because her students have become enthralled with being in the woods and figuring out what they're finding, they are compelled to engage with nonfiction texts (field guides) to answer their questions. They are reading with "purpose and understanding." She describes that:

> Prior to Forest Fridays, finding the right non-fiction texts that were engaging and meaningful to my students was daunting. Forest Fridays provided real-life connections and inspiration for these students to engage with non-fiction texts. I recently spent a considerable percentage of my classroom budget on more non-fiction books and pamphlets that provide information about the flora and fauna in our woods because of my students' intense interest. (Sobel & Hopeman, 2014)

Both Michigan and Vermont teachers and parents are clear that these real-life experiences are much more potent, much more engaging, than just reading about these same processes in a book. When the reading and the real-world experience align, the learning is enhanced. Both the CNC Preschool teachers and the Floyd and Pine River Kindergarten and First Grade teachers consistently work to find literature for classroom reading that connects with experiences the children have encountered outside.

STEM Learning

Parents and early childhood professionals who visit both CNC and Bullock Creek Schools consistently comment on the striking examples of problem-solving and self-directed inquiry that they observe. In the current atmosphere of concern for encouraging a disposition to science, technology, engineering, and math learning, it makes sense to look at how those dispositions are cultivated in nature-based early childhood programs.

In the film "School's Out: Lessons from a Swiss Forest Kindergarten" (School's Out, 2014), there's a scene where a group of children are trying to design a pathway so a ball will travel a curved path down a hill, rather than run straight down the hill. The underlying question is: *How can we change the direction of travel so the ball follows the curve to our desired destination?* What an excellent engineering

challenge! The boys scavenge branches from the surrounding woods to create barriers to deflect the path of the ball. The ball hops over the barrier. They need to figure out how to slow the speed of the ball and create higher barriers. The boys are deeply invested in solving this very real-world problem.

At the Chippewa Nature Preschool, two related examples were identified. One visiting early childhood administrator made a comparison between what she sees at CNC and other early childhood programs:

> There could be more inquiry-based language outside, and a greater length of engagement of outdoor play at CNC compared to indoor programs. They are examining under a rock for 30 minutes. In high quality programs inside and out we have open-ended activities, but the Chippewa children appear to do more problem solving. They are trying to figure out how to move rocks. How do we move these rocks? I wonder what rope might do, we can tie rope to the rock. It's not moving, what else could we do? It's problem solving, it's inquiry, it's hypothesis. I don't see as much testing inside the classroom, it is more pretend play.

Whereas the above experience was self-directed, the teachers at CNC also create experiences that lead to inquiry. This past year, the teachers arranged to have a road-killed deer carcass placed in the woods so they could watch what happened to it. They visited it regularly and also set up a motion sensor trail camera to record visitations to the carcass. The teachers described:

> Right after the deer was dumped, we saw it was newly dead, and we visited it about once a week to see what it looked like as it decomposed. They were asking many questions. Why is it disappearing? What's eating it? We watched it all the way down to a pile of fur and bones strewn through the woods. They got to see coyotes dragging it away, scavengers like hawks and skunks pecking at it.
>
> This process opens up the dialogue. We don't have a (predetermined) word list. Instead the words emerge out of the process. We use technical terms like decomposition, decomposers, predators, prey – all scientific words that usually don't come up till 5th or 6th grade. And the children start to understand cycles because they've seen them. They're developing their own definitions based on those experiences.

This combination of self-directed and teacher-initiated scientific inquiry lays the foundation for an interest in STEM learning in the elementary grades.

In the Bullock Creek Schools, STEM learning, especially in the city that hosts the corporate headquarters of the Dow Chemical Company, is a highly valued commodity. Doesn't it make sense then, to identify educational approaches that support a disposition toward science and inquiry learning in the early years?

In a grant proposal to support the expansion of Nature K and 1st Grade in the Bullock Creek Schools, administrators made this case.

Using Nature to Connect Children to Science, Technology, Engineering, and Math

Research has provided evidence that outdoor time improves recall of information and creative problem solving, and indications are that it also impacts outcomes in math and science learning. If we expect children to pursue careers in science,

technology, engineering, and math (STEM) disciplines, they need to have real, hands-on "wow" moments that build an emotional connection. The first three years of the program demonstrated that Nature Kindergarten supports excellence in teaching and learning, thereby enabling students to realize their full potential.

High quality education is about being relevant to students, building skills rather than being able to regurgitate facts, and inspiring a love for learning. This is especially true when building a love for science, technology, engineering, and math. Nature Kindergarten with its hands-on, real-world approach does just that, and now we'd like to extend this program to the first grade.

This sounds convincing, but what are the actualities of this kind of practice? Parents and teachers provide the living and breathing examples. The examples that follow are examples of both child-initiated and teacher-directed science activities integrated with literacy, math, and engineering.

Teeter-Totter. When administrators say "technology" they usually mean "computers," but in early childhood, good old-fashioned building things and taking them apart is just as important. Creating a disposition to engineering and technology in early childhood comes out of making string telephones, folding paper airplanes, and figuring out how to construct a catapult. A Nature K teacher describes a child-initiated "technology" problem-solving activity. *"They made a* ***teeter totter*** *on V's in a tree, but the branch kept breaking. They realized they needed a stronger branch–they figured it out together. They got a longer and thicker stick. They do a lot of problem solving, and self-problem solving. It is self-taught, they are having to think things out and plan things."*

Build Shelters Like Animals. Building structures inherently appeals to students, and again, there's lots of engineering learning embedded in figuring out how to make structures stand up. Rather than forbidding picking up sticks and stick play, it's valuable to encourage using sticks as "loose parts," as building materials. Another Nature K teacher describes, *"We go out in fall, and I challenge the children to build shelters like animals, but bigger structures. . .big enough for children to get inside of. They chose a skinny tree, propped up six or seven sticks, and then it would fall down. What's happening? Let's look at other structures, I suggested, let's compare. They realized it was the size of the tree. They chose a different tree –fatter and more slightly bent. They rebuilt and it was successful!"*

Magnets. One of the first grade teachers was concerned that the nature-based approach was too play oriented and not rigorous enough to fulfill the curriculum demands of first grade. *"I have to be honest. At first I was skeptical, and I was afraid we weren't hitting that core curriculum hard enough for first grade, I didn't feel like we were challenging them cognitively. For me, there were a lot of games involved and they were learning games, but I don't know if kids were truly getting it.*

But then we also did a unit on ***magnets,*** *and she (CNC staff member) came up with great games where they had N and S around their necks and they played elbow tag where they could repel or attract each other. That game was really meaningful to them–they understood that. You could take it back into the classroom. That part was interesting. If we can keep tweaking the games (to make them connect to the curriculum) then every year we will get better and better."*

Tapping a Sugar Maple Tree. One of the true tests of the effectiveness of curriculum is whether children bring things from school back home. Do they talk about and try out things they learned in school in their backyards? After the maple sugaring activities in school, one parent described this transfer of learning:

> Yesterday they (my children) were trying to tap a tree. They tried screwdrivers and hammers – neat to see them trying to do that at home. They got a little leakage from the screwdriver. They were able to find the maple tree, because my son learned that the branches go like this, the opposite way. Together with their knowledge of that they were able to find the right tree. They did great.

The results of this approach seem to be bearing fruit. The current superintendent reports that the scores on the state science curriculum tests at *"Floyd Elementary were twice the state average, and even higher at Pine River Elementary,"* though it's unclear whether these results are caused by the nature-based approaches.

But it's clear that the teachers and administrators think they're heading in the right direction. The current superintendent articulates how the nature-based approach is getting children invested in STEM learning. *"We're raising the level of their interest in science. Our K-5 instruction has had so much emphasis on the 3 R's that it has pushed science and social studies to the side. Now we're bringing science to the front with the 3 R's integrated. This helps students think about things in science. We're building a desire in a student for why we use the Pythagorean theorem, why we use different approaches."*

Physical Development

Many early childhood educators are concerned that the greater emphasis on seatwork and worksheets in early childhood programs has a negative effect on children's physical development. In her recent book, *Balanced and Barefoot*, pediatric occupational therapist Angela Hanscom documents the substantial increase in children requiring occupational therapy to address problems with physical development. She attributes these problems to the increasingly sedentary lives of children and the emphasis on sitting and being quiet in early childhood classrooms. Her solution? Greater movement diversity on a daily basis:

> When children are restricted in seated positions for many hours, such as baby devices and. . .by unrealistic rules for older children to sit for long periods. . . it is hard for them to develop and maintain adequate strength and control. . .. Therefore, it is important for your children to experience frequent play opportunities that challenge them to move their bodies against the forces of gravity. . .
>
> (T)his can be achieved through plenty of outdoor play. Lifting heavy rocks to build a dam, climbing trees, scaling a rope ladder, digging at the beach, pumping on a swing, and biking are all great examples of children playing and challenging their strength at the same time. (Hanscom, 2016)

This sentiment was echoed by one of the Midland elementary principals when he said, *"Our children are not programmed to sit through one hour of church, much less seven hours of school."*

At the Chippewa Nature Preschool, teachers and administrators have all commented on the value of the program for increasing the gross motor development and the physical endurance of children. In a previous report (Bailie et al., 2015), we reported that the superintendent of Bullock Creek School District noted how much farther children could walk by the end of the school year after participating in nature walks. CNC parents described children's ability to be outside longer because they hike every day.

During one 30-min observation of an outdoor play period at the beginning of the CNC school day in November, we observed this diversity of gross motor activity (Figs. 4 and 5):

- Balancing on one foot, with boots on the wrong feet
- Children running and chasing each other
- One child rolling up in a jump rope held by another child
- Riding on scooters
- Shoveling sand onto slide and then trying to climb up
- Jumping off stumps
- Scooping and dumping while operating a miniature truck
- Child persisting in trying to balance on one foot
- Rhythmic banging on aluminum sheet frame
- Balance walking on tree trunks on the ground
- Throwing and kicking a ball
- Flopping in and out of the hammock
- Play fishing modeled by teacher
- Running up and down a dirt hill
- Mixing and pouring in mud kitchen

Similarly, on an outdoor hike that started out as a coyote game and turned into wild turkey stalking, one author observed children quietly crouching behind trees to watch the turkeys, get down on all fours and crawl through the woods to stalk the turkeys, run fast in open areas to catch up with the turkeys, creep through a thicket and protect their eyes from lashing branches, lie down like coyotes to take a rest after all that running, and pretend to nibble on sticks/food because they weren't able to catch the turkeys. It was the kind of active movement diversity that occupational therapist Hanscom prescribes as essential for healthy physical development.

In a recent study, researchers at the University of Victoria in British Columbia used the Test of Gross Motor Development Second (TGMD-2) to compare growth in physical development in nature-based and conventional early childhood programs. Researchers found that, *"the Nature Kindergarten group improved their loco-motor skills significantly more than the Regular Kindergarten group. These findings suggest that time in the outdoors at school promotes loco-motor skill development"* (Temple et al., 2015).

Fig. 4 Diversity of gross motor activity during nature play

Fig. 5 Children as coyotes stalking wild turkeys

It appears that CNC educators are providing the opportunities for active whole body activity that will lead to healthy physical development in these 3- and 4-year-old students.

At the Bullock Creek Schools, physical development is normally the domain of the Physical Education teacher. But in this era of rapidly increasing obesity rates, and

an understanding of the relationship between physical and cognitive development, it behooves elementary school teachers to think about integrating physical development into the design of their programs.

The Bullock Creek Nature K and first grade teachers understand that the increased movement and exercise components of being outside each day improves the capacity of children to focus, pay attention, and engage with the cognitive challenges of literacy and math. They also understand that it decreases problematic behaviors and increases the engagement of children with special needs.

The example cited about the young child who hid under tables and screamed is illustrative. The teacher commented, *"The nature piece gave her solidity."* By which she meant that being able to move and explore outside helped to ground her. And as another Nature K teacher commented about many of the children, *"For the fidgety little ones, nature makes a difference."* If you doubt the truth in this, visit a normal elementary school for a day and see how you feel after 6 h of mostly sitting in your seat, except for going to lunch and out to recess (if the school still allows recess).

The Floyd Elementary School principal confirmed this same relationship when he said:

> Now that we have Nature Kindergartens, we're finding that the absenteeism rate for these children has decreased. They're coming to school more. The Nature Kindergarten has allowed us to do full inclusion for our ADHD students. Rarely do we get a referral when kids are outside at nature time. And our autistic and hypersensitive students don't have issues outside and we've noticed a diminishment of hypersensitivity back in the classroom. (Bailie et al., 2015)

One Nature K teacher illustrated a specific example of the benefits for a special student:

> Last year I had a student who had special needs. He received OT and PT and speech. Walking on an uneven bumpy trail was difficult for him, but by the end of the year, he was much more able to walk and have motor planning to get over logs. The OT says that, handwriting is still a struggle, but there was an improvement in that even. I attribute it to being outside, doing daily physical practice, like picking up seeds off the ground, and having fun and playing while doing those things.

A Nature K teacher extended this idea to all her students saying:

> When kids are moving, not when they're sitting, you see them learning in a different way. . .. It's easy to say sit down and write and read this, but that is not what is best for kids. Outside where they are moving, the moving is huge. They get that by being out in woods, where they all climb over a log in the woods. They get daily opportunities to develop gross motor skills and that increases their fine motor development.

This greater emphasis on physical movement and being outside in all weather is also spreading into the upper grades, both through student advocacy and teachers' understanding of the relationship between movement and learning.

Fig. 6 Outdoor classroom setting for 5th grade

This has led to the implementation of a Salmon in the Classroom project in third grade, a Government program connected to the nature trail, and the fifth grade creating their own outdoor classroom (Fig. 6).

Though constrained by her concerns about her students' test performance, one 5th grade teacher described:

> We took trees that were down and cut them into benches and created an outdoor learning area. I used it in fall, in spring, and a little bit in the winter. I have a vision I want to be like Nature K, but I have to follow my gut with the testing.

This tension between what the teachers know is best for students and a concern about test scores in a recurrent theme with these upper elementary teachers. Fifth grade teachers commented, *"[The nature-based approach] brings back the excitement of school. For example, boys learn so much better hands-on. A lot of them struggle with writing, but when we get them out there, they are writing because they are outside. It's that learning in action again. When a lot of them are contained to a classroom, they are not focusing on what is going on. . .I notice when we hang the bags (math challenges) in the tree and we are moving between the exercises, that the students as a whole, they tend to be able to attend to the task."*

This emphasis on the importance of daily physical activity (not just during Gym class) has led to a commitment to having children outside in winter, even in challenging conditions. Teachers have created classroom sets of Oakiwear rain suits, hats, boots, mittens, and warm layers to make this possible. The Floyd Elementary principal described that, *"Last year there were some days that were really cold. Bay City schools were closed – but our K kids went outside that day. The real temperature was 15 degrees but there was no wind chill advisory, so the children were outside. And sometimes even when it's below 15 degrees, the children are outside."*

The commitment to being outside for daily physical activity, not just in Kindergarten and first grade, but for all K-5 children, was expressed by one principal who said, *"Just to have them go outside, that makes all the difference in the world. Wouldn't it be great for the school to have raingear for all the kids to be outside in rainy weather?"*

Executive Function

Much research over the past few decades points to the development of executive functioning in young children as a more important and productive goal than the development of early literacy and numeracy skills. Executive function, it turns out, may be a better predictor of long-term academic and social success than early reading and writing. Therefore, focusing on the development of these executive function skills – working memory, cognitive flexibility, inhibitory control, and self-regulation – may be more appropriate early childhood program goals than learning letters and numbers.

Since these are squirmy concepts to wrap one's head around, let's define these subcomponents and translate them into illustrative childhood games.

Working memory is the ability to briefly hold information in mind for the purpose of completing a task. (Children's Game: Concentration)

Inhibitory control and self-regulation is the ability to stop thoughts and actions at the appropriate time, set priorities, and generally have a considered response rather than give in to impulses. (Children's Game: Simon Says)

Cognitive flexibility is the ability to respond appropriately to changing situations and apply different rules in different settings. (Children's Game: Red Light, Green Light)

(D'Amore et al., 2015)

At the Chippewa Nature Preschool, the teachers described a variety of ways in which children were developing these skills. One teacher said:

> The first thing that comes to mind is risk assessment. Our kids are assessing their own risk daily. Do you feel comfortable doing that?...Today we were out climbing on fallen logs. We had a child that climbed up to the top but wasn't sure how to get back down. I watched her, she put a foot down (but found it not safe) and then found a different ledge. That child at the beginning of this year would have reached out for help. She has learned how to control her body and have self-confidence.

We then pushed a bit further and asked, **"Can you give us explicit examples of activities that you conduct that actively help children develop the sub-components of working memory, inhibitory control, and cognitive flexibility?"** We were surprised at the array of very specific activities that clearly target these skills. Here's a sample below.

Code Word. (Working memory and inhibitory control) Every day the teachers develop a code word to release the children from the circle to go to the gate. This occurs after group meeting as a transition to go on the hike. They choose a science word, like *"insect,"* and then they say a variety of words that sound like the word, but aren't the word. The children can only leave when they hear *"Ready, set, insect."*

First the teacher says, *"Ready, set, go,"* and the children have to restrain the impulse to get up. Then, *"Ready, set, ant"* which also doesn't count because ants are insects, but the code word is the actual word. Then the teachers will use a word that sounds a lot like the code word. *"Ready, set, inside,"* or, more subtly, *"Ready, set, inspect."* The children have to attend to the subtle distinction between the sound of *"inspect"* and *"insect."* Kids start suggesting words – sometimes it's unrelated like *"pizza,"* but other times it rhymes, which suggests that they're developing language differentiation skills.

Freeze Song. (Cognitive flexibility) The teachers play a game called "Freeze Song" while outside. First they play music from a portable music device. When the music plays the children dance, and when the music stops they freeze. It's like the movement pattern in Musical Chairs. Then the teachers switch the pattern. (In executive function terms this is known as rule switching.) When music is playing, children have to freeze. When the music is silent, they dance.

Trail Walks. (Inhibitory control) The teachers described a great deal of inhibition control that occurs on the trail. When children see a squirrel, their first impulse is to run after it. Rather, the teachers explain that if the children want to get close to see the squirrel, then they have to get really quiet and walk very, very slowly toward the squirrel. Similarly, the teachers often have children play Red Light, Green Light on the trail.

Since it is evident that a variety of CNC program components help children develop executive function skills, we plan to quantify children's executive function growth in the next phase of our research through the Head, Toes, Knees, Shoulders metric. In this game children are first taught that if the leader says touch your head, you touch your head. And if the leader says touch your toes, then you touch your toes. Then they play a silly version of the game. When the leaders says touch your head, you touch your toes and vice versa. Then the Knees/Shoulders pair is also taught and switched. This metric has been normed and used at other early childhood settings in Michigan. Therefore, we're interested in seeing how children at CNC compare to children in other early childhood programs in the state.

At the Bullock Creek Schools, though this tends to be a new topic of discourse in elementary school circles, the teachers and administrators did indicate ways in which they saw nature-based programming influencing executive function in students.

Parallel to the observations of the CNC teachers, Nature K teachers identified ways in which nature programming led to self-control:

> *There are times when we try to get out and use senses and view different animals. Looking for birds we have to be very quiet. They want to shout, "I see that bird!" But they learn to control that. Or, they want to pick everything. They think "I want this beautiful flower," but they also want to look at that flower tomorrow. That is the difference and that is stronger* (impulse control) *and that could carry over to other situations.* ***If*** *they have learned: I am not going to pick this flower and I can watch it grow, they will do it in other situations. I hear them say they saw this bird at Grandma's house. That's a sign of a carryover and more motivation.* (Working memory)

This teacher also commented on the increasing stamina of her children:

> We decided on extra outside time in the afternoon. As a result, their indoors attention spans grew. By early November, their stamina in the later afternoon improved. Around 2:15 or 2:30, their attention spans were longer than at the beginning of the year because of outdoors time.

In regard to one special needs child, another Nature 1st grade teacher said:

> One student this year came as a homeschooled student with basically nothing. Limited socialization, attentional focus, impulse control. Home wasn't doing her any justice. At the beginning of the year, I said to Mom I anticipated holding her back because she was so far behind. But nature has had an important impact on her. She has made huge gains, due in part to not only experiences in nature and knowledge, but also the socialization she finds in nature with other students. She didn't have any of that. For her to come and be socialized in that way, in stump circles or on the trail, it's had an impact on her learning.

Also parallel to the CNC teachers, the Nature K teachers identified children's ability to measure risk and to become physically self-sufficient was shaped by their nature experience:

> Kids will test climbing in trees, and then they'll wonder–how am I going to get down? Some will help each other get down, others will wonder what to do, and we go and walk them down. I don't always go and offer them an easy out. If they went up there, then it's good to let them figure out how to get down. It's not like on the playground, where all the distances are all the same. Here you have to stretch your legs a little further.

In the Nature Kindergarten and first grade, both teachers and students stretch a little further. The teachers move out of their comfort zone, out of the climate-controlled classroom, and out into the unpredictable world of the nearby natural world. One teacher said, *"The stocking cap messes my hair up, but I love how my kids interact outdoors."* The students have to learn to walk farther, negotiate disagreements, learn which plants you can nibble and which you can't, how to stretch their legs to reach that next branch. All in all, stretching is a good thing.

Future Implications

This case study is focused on one unique community, and thus hard to generalize to broader contexts. However, it does provide insights into logical next steps as NbECE scholars develop and implement a research agenda. This study identifies administrative characteristics other communities would be wise to consider when developing nature-based education partnerships but also identifies several areas where additional research is needed.

First, the issue of motivation and enthusiasm for school engagement needs to be explored further. Are other nature-based settings seeing similar positive shifts in

attendance? What about the long-term connection to, engagement with, and motivation for school and learning? Does time in a nature-based setting support a love of learning that continues well beyond the earliest years? If so, that would give cause for *all* early childhood programs to move quickly toward a nature-based approach. Such a finding would also beg the question as to how much nature engagement is needed to support that love of learning.

There was some mention in this case of the nature-based approach supporting dual language learners; however one limitation of this study was the few numbers of these students. Future research is needed to explore more deeply the ways DLLs are supported through nature-based approaches. Another area unclear in this study was if the nature-based approach supports general vocabulary development, both receptive and expressive, beyond science-specific words, and is worth exploring more deeply. Yet another line of questioning is how this science vocabulary and academic motivation supports science learning. If science vocabulary is in fact richer in children who attend nature-based programs, how does language development relate to other science learning such as development of science and engineering practices? Research to begin answering these questions is the logical next steps in NbECE.

Conclusion

The partnership between Chippewa Nature Center's Nature Preschool and the Bullock Creek School District can serve as a model for the naturalization of the K-3 curriculum and practices in other school districts throughout North America. The themes teachers and administrators identified related to child development are logical starting points in future research. As the NbECE movement continues to grow, it is vital we continue to document the organizational best practices supporting the naturalization of curriculum but also the impact that change has on young children's development in the moment as well as long-term. This work is just beginning.

Appendix A: Chippewa Nature Center Preschool Profile

The Chippewa Nature Preschool is located at the Chippewa Nature Center. This nature preschool started in 2007 as one classroom using an existing building on the nature center grounds. In 2009, it expanded to two classrooms in a new "green"

Fig. 7 Chippewa Nature Preschool play area

two-story preschool building that is cedar sided, with windows that reach up above the second story to offer natural light to the hallway and classrooms that are on either side. A lovely wooded path leads parents from the parking lot through a natural play area to the nature preschool (Fig. 7).

Situated on 1148 acres of diverse habitats including woodlands, wetlands, rivers, and upland fields, two-fenced in natural outdoor play areas, surrounded by a rustic rail fence, enclose the preschool in the front and the back. Classes start their day outside in one of these two natural play areas. Features of the play areas include a rowboat, stage, and log seating for dramatic play, an outdoor Plexiglas easel in a wooden frame, and a storage shed built into the fence that contains a myriad of garden and sandbox tools and tricycles. A hill with a built-in slide has a central focus in the front area (Fig. 8).

Other features of the play areas include rain barrels, mud kitchens, gardens, sandboxes, log benches, logs to balance on in various stages of decay, building frames, loose parts, and other rocks and stumps that dot the landscape. More than 15 miles of trails extend their way out of the play areas including a boardwalk and pond that line one of the sides of the preschool building.

After spending at least 30–45 min in unstructured play in one of the natural play areas, the class meets on the logs (or circle of tree cookies) for a group time before going out on the trails to one of the many habitats and destinations available at the nature center. The children go outside every day in all weather.

The focus of the hike observed was of the forest ecosystem. The class hiked through the woods. Along the way, the children encountered some turkeys. The children and teachers became extremely quiet and approached the turkeys, stalking them. The children became part of the forest floor by lying down and covering

Fig. 8 Chippewa Nature Preschool meeting area

Fig. 9 Children becoming part of the forest

themselves with leaves and then remaining there very still for a minute. Afterward, they continued on their hike playing some running games along the way (Fig. 9).

After the hike, the class returns to the preschool building and heads inside. Upon entering the preschool building, there is a warm and inviting atmosphere with knotty pine paneling, several large windows, and leather and wood rustic couches in the reception area. The center hallway rises up two stories containing windows that let in the natural light. Windows adorn the hallway on both levels allowing natural light to penetrate the classrooms from above and parents to view their children in the classrooms from below. The cubbies are located in the hallway under the windows. The classrooms are beautiful state-of-the-art spaces with wood furnishings primarily from Community Playthings and natural materials throughout. Each classroom has a full kitchen. Opposite the hallway is a row of windows that look outside to several bird feeders and out to the boardwalk and pond (Fig. 10).

Fig. 10 Chippewa Nature Preschool indoor classrooms

The 2 classrooms house 4 classes with 16–18 children each and 1 lead teacher and 2 assistant teachers per class. The teaching teams have diverse backgrounds (in both early childhood and environmental education). Inside the classroom the children have snack, choice time (for an hour) where they can choose the activities that are available in the classroom, small group time for a more focused activity, and large group time for a story or song and to say goodbye.

Parents are encouraged to volunteer in the classroom by signing up on a calendar. There are three to four preschool family nights throughout the year, as well as family programs at the nature center. The teachers also send home activities for the children to do with their families to get outside when at home.

Abstract

This chapter explores a set of educational ideas situated under the umbrella term wild pedagogies. The goal is to introduce educators interested in pedagogies related to childhoodnature to some key touchstones. The chapter starts by introducing three interlocking and overlapping conversation that are important to understanding where wild pedagogies come from and how it can be understood. The last half of the chapter is dedicated to introducing the reader to the touchstones themselves. The hope here is that the touchstones can act as supportive, challenging, and reflection-inducing mechanisms for all educators no matter where they might be in the process of changing, even wilding, their practices.

Keywords

Childhood · Wilderness · Environment · Education · Wild pedagogies

Introduction

This chapter begins from the twin premises (i) that the modernist relationship to the natural world must change and (ii) that education is a necessary, even fundamental, partner in the project. The concept of *childhoodnature* is a response to the first premise. Understanding children as being nature and using this new conceptual term to indicate the interconnection thereof is a step away from the idea of an independent isolated human observing from afar a passive separate entity, called, among other things, nature. Such a concept opens up tangible, yet difficult, lines of response for our second premise, and in this chapter, we describe such a response gathered under the term "wild pedagogies."

Wild pedagogies, as described below, are a way of thinking about education such that the interconnection, interdependence, and relationality of childhoodnature is not a theory without practice but a lived curriculum pointed toward, and moving in the direction of, the change being sought. This chapter encapsulates a much larger, ongoing, and constantly evolving project: a project that is "wiggling" in a considered direction, yet without a known endpoint – as is the evolutionary nature of anything that we cannot control, that is, in this sense, wild. And it is a situated project, whereby the particular realities, contexts, and stakeholders are constantly changing. This project, then, is alive and will forever be incomplete. It must resonate with educators and children in real time, places, and spaces as they adapt this project to meet arising needs. In this way, wild pedagogies make sense as practices that align with the places, people, participants, politics, and possibilities within which each of us live.

Wild pedagogies have arisen from a convergence of ideas about wilderness and its inherent wildness, education, emerging environmental realities, and a growing desire for change – educationally, environmentally, relationally, and culturally. This work is in part about reclaiming language, recognizing and reimagining extant practices, and revitalizing and reconstituting ideas that run against the grain. We begin this chapter by exploring three pathways; first, wilderness and the wild;

second, education; and third, the emerging Anthropocene. These three introductory pathways contain important points of resonance and convergence that serve to provide the context for our response: wild pedagogies.

In considering the question of "why wild pedagogies?" we bring together ideas about wildness and easing ideas of control, to frame a refreshed pedagogical approach and to describe six *touchstones* for the practice of wild pedagogies. These touchstones are intended as a practical guide to help educators think through actions on the ground as they shift their practices and celebrate approaches that reflect wild pedagogies. In the conclusion, we speculate that this project is a call to gather like-minded people involved in education and concerned about nature and the environment. We suggest these touchstones can serve as a set of commitments, challenges, and reminders of the work still to be done. And they can also act as a kind of gathering place to which wild pedagogues of various ilk might return on a regular basis. The point is that this work is not about control nor is it meant as a rigid framework, but rather as an agent of change, community, and commitment.

However, before launching into the touchstones, we will dig a little more deeply into ideas about the wild.

On Wilderness and the Wild

When we speak about the wilderness and the wild, we literally mean real places and existential experiences within/through/of these places. In this world of postmodern skepticism and deep individualism, childhoodnature appears unwilling to give up on the reality of wild places, encounters, and the potential for co-emergences. Notions of human as nature are integral to understandings of what wilderness is, or might be. And we need, again, to refresh and reimage an understanding of wilderness and our relationships within and of nature.

William Cronon began his famous paper, "The Trouble with Wilderness," with an invocation, "the time has come to rethink wilderness" (Cronon, 1996, p. 69). And he did. At the time, rethinking wilderness was long overdue, and his paper highlighted many problems with what wilderness had become – both as real places and as a concept. Rethinking wilderness means examining the concept and its relationships with culture, places, and other-than-human-beings. Concepts aren't static though; they live, shift, and vary between interpreters and their places of arising. Rethinking should be an ongoing process. We should be sharing our evolving, even wild, insights. Concepts, too, aren't simple and they are never about just one thing. They are comprised of a number of components, carry histories and baggage, and are shaped by the context from which they arise (Deleuze & Guattari, 1994). So, part of the wild pedagogies project is to take up Cronon's invocation and to again rethink wilderness and do this in partnership with myriad voices.

Cronon's analysis pointed out that for far too long, one component – the absence of people – has disproportionately dominated the shaped understandings of wilderness. In rounding out his analysis, he pointed toward eighteenth-century usages that described wilderness as "'deserted,' 'savage,' 'desolate,' 'barren'—in short, a

'waste'" (Cronon, 1996, p. 70). These usages were contrasted with later sentiments, such as Thoreau's assertion that "in Wildness is the preservation of the World" (Cronon, 1996, p. 89). The juxtaposition of such varying conceptions led Cronon (1996, p. 69) to conclude that wilderness is "quite profoundly a human creation" and only included a particular cultural grouping at that. Troublingly, though, by boldly asserting that wilderness is a human idea and a vastly unreliable one at that, Cronon provided a generation of skeptics the ammunition they needed to distance themselves from wilder places and from the idea of wilderness altogether. Often this polarizing debate has led to dualistic choices. On one hand there have been cynical assertions that "there is no wilderness," while on the other hand, there have been idealized visions "of a wilderness out there somewhere." For many, these two choices prove to be incomplete when considering their own experiences of being and moving within wild landscapes.

Consider, for example, watching an invasive Eastern gray squirrel (*Sciurus carolinensis)* being chased by a bulldog/Rottweiler. At the same time, the dog's owner looks on from a vantage in a scrupulously manicured and fenced off-leash area, at a small downtown park in Vancouver. Somehow this is different from watching wolves track a caribou elder across soggy blackfly-infested barrens, more than 200 miles from the nearest road. Yes, both have histories of human engagement and manipulation, both have wildness being expressed in various forms, and both are being interpreted through cultural lens and potentially telling stories that the humans involved want to hear. Yet, it seems that the terms on which all these are negotiated are different. If that is the case, then maybe wilderness needs to be reimagined, not in terms of dualisms but as part of a complex continuum negotiated between, and among, a multitude of players in places.

There are other windows into wilderness. Some trace the word to the Old English "wildoerness" (Foreman, 2014) from which it is argued that "wil" is linked to wild, or willed, "doer" is linked to beast, and "ness" is linked to a place or quality. Putting these together suggests that wilderness is a place of wild beasts, or more evocatively, self-willed land. Descriptively, then, *self-willed* might be an apt quality of a rethought, or reimagined, idea of wildness. In turn, this wildness might be a central component of a reimagined conception of wilderness. Putting it another way, it could be said that the idea of a self-willed land recognizes that places, and their inhabitants, have teloi – or end purposes of their own – that buck human attempts to control them.

What does seem clear is that a reconceptualized wilderness could be helpful in describing an intersectionality, or shared arising, between real places, cultural constructs, and the freedom of the local populations to become what they will. A path toward wilderness – its reality and the ideas it conjures – is, however, still not quite this rationally sanitized. In reality it is much more visceral. There is often an aching recognition, deep in human sinew, that wilderness – in idea and place – needs to be refreshed and reclaimed. And, a good starting place might be with wildness, the self-willed, uncontrolled, heart at the core of wilderness.

This analysis also provides a starting place for another resonant intersectionality. For example, it seems to also ask, what could education gain by allowing children

more freedom in their development? What gains could be made if we rethought educational attempts to control the outcomes of childhood education and development? What could it mean to give children's innate wildness more space to flourish? How is this wildness different from "out of control?" And how can re-wilding education be paired with a responsibility for children's own self-regulation?

On Education

On this second path, we consider the stifling sense of control sometimes felt by educators within traditional mainstream educational settings. While traveling on this track, we wonder about possibilities for a wilder pedagogy, loosed from the usual domesticating forces of formal (Western) education. The resonant notes arising from this path and the previous one might then play out in the interplay between wildness, education, and control. Here we speculate that many people initially drawn to wild pedagogies might share similar experiences. In their educational lives, they know that significant learning – learning that has actually been in some way transformative – can be encountered outside of formal education or at the very margins of their schooling by brave, insightful, and rebel teachers.

We suspect, too, that those drawn to wild pedagogies know that bringing outside education into the mainstream is easier said than done. Many education students understand this, particularly those who come with experiences and pedagogical opportunities outside of teaching in formal settings. Some may have been outdoor and environmental educators, interpreters, involved in social justice issues or local community educational projects, teaching in diverse cultural settings, and/or have worked abroad with organizations committed to bringing about fairness, justice, and equity. What can unite such pedagogues is a passion for making a difference and a sense that the current mainstream system is at best incomplete. Yet, these students often struggle with a teacher education system that has pushed to the side most of what they value. As it turns out, most of their most transformative experiences don't (do not) fit neatly into the prescribed teachable subjects.

Perhaps the keyword is "prescribed." Here, student learning and student-teacher learning must serve the ends of the education process based on predetermined outcomes – and preferably those that are measurable. There is a great deal of research that suggests curricullum content and pedagogical strategies are bent to align with testable outcomes, as learning that is less amenable to testing is edged out (See, for example, Astbury, Huddart, & Théoret, 2009; Au, 2011, pp. 25–45; Jickling, 2009, pp. 163–173; Jickling, 2015, pp 149–161; Smith, 2016.). Even in education faculties, enormous efforts are made to prescribe and control education. For many environmental educational theorists, these are the outward manifestations of an ontological position of separateness combined with the colonizing politics of anthropocentrism and human exceptionalism.

Yet despite curriculum control, testing pressures, and these deeper cultural constructs, many committed teachers find ways to resist, to create space for what they consider meaningful transformative, even wild, teaching. Without sliding into a

completely unstructured free-for-all, many environmental educators are finding ways to act in solidarity with the marginalized, to bring the voices of the voiceless to their students, and to enact pedagogies that are less objectively oriented and more co-constructed, less expertly known and more spontaneous, less universal and testable, and more place responsive. In short, they are wilding their practices.

On the Anthropocene

The third pathway for our inquiry is the one we currently appear to be traveling as a species engulfing most things we encounter and leaving a mess in our wake. Here we are talking about the Anthropocene, where the defining epochal characteristics are primarily human induced. Again, we are interested in control. In this instance, in spite of the scale of human impact, it would be a mistake to think that we, collectively, are controlling this or that we could ever control change at such a scale. Indeed, the defining characteristic of the future may well be the recognition both of our embeddedness in planetary systems and our *lack* of control. The point here is that Earth's current geostory is essentially being written by these planetary systems; humans are essentially bystanders; Earth has become an agent, a subject; and humans will need to need to find new ways to work with her (For a discussion about Earth's agency in the writing of a new geostory, see Latour, 2014.).

The Earth is changing rapidly. Atmospheric carbon dioxide has now exceeded 450 parts per million and is rising. At present, there is no evident path to the reductions necessary to avoid what we humans consider "catastrophic" climate change. Species loss is equally dramatic. Some reports, such as a recent publication in the journal *Science* (Pimm et al., 2014), suggest that current extinction rates are as much as 1000 times greater than background rates. That is, these extinction rates are human-caused, as are the current dramatic increases in the Earth's average temperatures. Science is typically a conservative enterprise. Some hard-nosed paleontologists tell us that these rates do not yet qualify as mass extinctions (Barnosky et al., 2011). But ominously, they *are* prepared to predict that the loss of all species that are now considered "critically endangered" *would* propel the world into a state of mass extinction. Other scientists argue that we – and that means all beings on Earth – are in fact living in a new geological epoch, a new geostory, the Anthropocene (See, for example, Editorial, 2011, p. 254; Crutzen, 2002, p. 23.).

Whether we are actually in a new geological era that can be called the Anthropocene, or on the brink of it, seems moot. We raise these possibilities, however, for two reasons. First, the world has changed, will continue to change, and will not return to situation normal. That is, we will not return to global temperatures or species abundance and fluctuations that fall within the kinds of background levels experienced even a short time ago. Second, given this change, any educational conception and delivery that result in inculcation into present cultural norms, or slipping and sliding around these norms, will do nothing to change the current trajectory. And as Margaret Somerville poignantly asks, "what does the Anthropocene do?" (Somerville, 2017, p. 18). Education must respond

radically to the problems of our time. This leads to the old trope; we cannot solve problems by using the same kind of thinking that created the problems in the first place. And, to push this farther, we cannot solve these problems by *being the same people* that created the problems. We don't mean for this to sound despairing; rather it signifies, to us, that we're in a time calling for bold experimentation (Jickling, 2013).

It is all well and good to declare that we must stop global warming, protect biodiversity, or even change our modernist ontology, but what would that actually entail? How would environmental educators in the era of Anthropocene, to follow the theorizing of Bruno Latour (2014), for instance, begin to *renegotiate* the educational relationship with other-than-human-beings? What might education become if it was understood to be a co-emergent endeavor where the human was decentered and agential others were co-teachers. Jo-Anne Ferreira (2007, 2009) warns environmental educators against setting such lofty aspirations as educational goals, arguing that this sets educators and students up for failure. Yet, even though, as she points out these may not be achievable goals, we wonder if positing them at a distance might still be useful. In introducing Ferreira's question, we are not trying to be contrarians or deniers. Rather, we are actually interested in creating openings for getting the required educational work done and for moments of change and resistance to flourish and gain a foothold. And even with this larger project as a backdrop, education may be better suited to nurturing critical, imaginative, and innovative thinkers who can dive into these issues and make social and environmental progress. This acknowledges that the future will not and should not be controllable and wild educational responses recognize this reality and work accordingly.

With the rest of this chapter, we outline the idea of wild pedagogies by describing six touchstones that we consider necessary to any attempt to radically alter our current educational ecology in a more environmentally and socially equitable way. Each of the touchstones will be placed into context with regard to enacting an educational process that might lead to such change.

Why Wild Pedagogies?

An aim in using the term "wild" is to challenge dominant cultural ideas about control – of each other, of nature, of education, of truth, and of learning. It rests on the premise that an important part of education can include intentional activities that provide a fertile field for personal and purposeful experience without controlling the outcomes: hence wild pedagogies. As described previously, this wild entrée in wilderness riffs off of the Old English meaning of self-willed land, and so in this sense, wildness invites considerations about control.

What is there about wild experiences that people value; and what are the core elements? Within such values, are there critical parts for educators to attend to? And if such values can be framed as wild pedagogies, how might they be welcoming, relevant, and flexible for people across disciplines? What might self-willed pedagogy or self-willed education look like?

In the following section, we offer our conceptual and ontological understandings that relate to education and challenge ideas of control. While wilderness areas – and also what some would call hybrid spaces – are often the crucible for reflection on these issues, it is important to note that wild pedagogies also take place in urban settings. The six touchstones shared below are our start toward finding adequate answers to the above questions.

Six Touchstones for Childhoodnature Educators

Agency and the Role of Nature as Co-Teacher

> Raven: 'Well, see, you speak your way, they [different members of the natural world] speak different ways, like thousands of different ways. Billions. It's like the birds with those signals, like when you see a bird flapping up in the sky and a flock of birds how they all move at the same time, it's because they tell each other like through mental speaking.' (Blenkinsop & Piersol, 2013, p. 54)

For Raven, a grade four student at the Maple Ridge Environmental School, the idea that the natural world "speaks" – in a multitude of ways – and that it has agency and the capacity to teach her things is a truism. It is also a possible starting point for the renegotiation of the relationship between humans and more-than-humans called for by political scientist Bruno Latour (2014). With the potential emergence of an Anthropocene, a new era of negotiation is upon us, a time when humans must engage in a different kind of relationship with the rest of the planet (Michel Serres, 2014). And, it is likely children – young ones like Raven who have been immersed within the natural world for much of their lives – will play key roles as interpreters for this process. If this is correct, then early childhood educators will also play a crucial role in allowing children to encounter the natural world and its denizens on an ongoing basis: to experience themselves as nature. These educators will, at the same time, be challenged to recognize their own limitations in hearing and interpreting the encounters their students are having. Given this assertion, what might the educational implications be?

We suggest that any educational plan that aims to move toward a radically revised relationship within the world will, at its core, seek to recognize nature's agency. In reality, Earth has always been an agent of history, but in a role that has often been overlooked and denied in modernist thinking and culture. At a time when wildfires are scorching Earth and hurricanes are flooding her, Earth's agency is now more visible and often dramatic. But, for the more careful listener, the natural world also speaks more softly, too, as illustrated in Raven's story, above.

Education can work to encounter this agency in nonhierarchical, equitable, and, indeed, different ways. One way in which we might do this is to begin to consider more-than-humans encountered on a daily basis to be part of the pedagogical team. If we take seriously the notion that the natural world is filled with active and vibrant

participants, of which we are one species, then our relationships and attention toward possibilities for educational partnerships change. In adopting an idea of nature as co-teacher (see, e.g., Blenkinsop & Beeman, 2010), educators might become open and available not only to the joy of the wild but also to a wider range of facts, knowings, and understandings that places have to offer. Such attention involves carefully listening to available voices. And it will, at times, involve actively decentering the taken-for-granted human voice and re-centering more-than-human voices (see, e.g., Haskell, 2017). No longer is the environment an important backdrop upon which learning happens, nor is it simply something to be interpreted solely by adult humans. This is a time where the environment can become an active member in teaching and learning.

The ways that early childhood educators respond to this discussion of agency and pedagogical partnership will have implications. Their responses will shape the ecologies of their classrooms, especially through expanded ideas about "classrooms" and the pedagogical approaches nurtured in these expanded contexts. Any co-teaching dynamic necessarily involves providing space for each to work, building strong partnerships, and finding ways to reach all learners. So while students might recognize that they share space with more-than-human beings, teachers will need to work toward enabling engagement, learning, and negotiation with these beings in an equitable and complex manner. Early childhood educators will also be challenged to hear the students in ways that might be unusual, in much the same way that Raven needed to be heard by the adults in her life.

What then must the curriculum include and how can early childhood educators prepare? This process of re-wilding pedagogy involves rethinking the very concept of teacher and examining every aspect of practice with a critical – *nature has agency, and this idea is really unusual for most educators* – lens. Early childhood educators will likely find that they must change metaphors, traditions, and systems that they often use. There is an ever-present danger that those historical ways of educating normalize the hierarchical separation of humans from all else and they silence the voices of children and others. They assume passivity – or lack of agency – on the part of the natural world.

With this discussion as background, educators might want to consider questions such as:

- How did my practice today involve the natural world as a co-teacher?
- How did we as a class contribute to the potential flourishing of each other and the particular beings close to us?
- Were we able to learn with, through, and from members of the natural world?
- How will I make sure that I listen to the experiences of my students and allow them to interpret things for me that I might hear myself?
- Were other voices heard and heard in their own ways?

At first glance, these questions might be hard to answer in very urban environments. Yet, nature can be encountered in less-manicured corners of school grounds, vacant lots, and urban parks (Næss & Jickling, 2000). However, while cityscapes can

be richer than first thought, there is ample opportunity to also view them with a critical eye (Derby, Piersol, & Blenkinsop, 2015).

Wildness and Challenging Ideas of Control

In this paper we offer these key touchstones hoping that they might facilitate an educational pathway toward an, as yet, unknown radical ecology. In using the term "ecology," we are suggesting that what is required is nothing short of a radical reworking of the relationships that we have with/in/of the world – a revised way of being within the world as suggested by the concept of childhoodnature. And, what is desperately needed is an educational system that can promote and support such change.

We believe any resultant ecology will, in part, emerge from the process itself. That is, by the acts of doing, making, and changing, we will come to better understand the ends we are seeking. And, by supporting young children's engagement in such processes earlier in their educational life, we will be assisting in the building of the relationships and resiliences necessary to see a project of this kind through to fruition. The processes, then, must try and emulate the imagined possibilities and adhere to principles implied in such an ecology. We are not entirely in control of the outcome because it is not possible to see the outcome – and further, we recognize that any radical ecology *arrived at* will, and must, continually be in a state of flux. This implies a constant generation and regeneration, as in any vibrant ecosystem. We suggest that integral to the processes themselves is an element of wildness – a sense of the unknown and the spontaneous, beyond our meager control. This, too, has significant implications for educators.

In supporting the move toward any radical ecology, childhood educators must recognize the incomplete and unpredictable nature of the overall process. No one can completely know what the final outcome will be, nor are there definitive or correct answers. In recognizing the range and self-willed nature of those involved (both the children and the more-than-humans), educators can come to understand that they are partners in this radical endeavor. In other words, in recognizing nature's agency and inviting negotiation on a level playing field, educators will be respecting the legitimacy, wildness, and self-willed nature of all those involved. They will also be mindful of their own limitations. This requires a radical rethinking of the ways in which we go about education because much of the Western educational project implicitly involves distance and a heavy hand of control.

Such control appears in many ways in education. Children are told what to do, where to go, and even what to think. Universal and measurable standards are created based on a set of concrete truths (Au, 2011; Smith, 2016). Schools function to define and legitimize the places in which learning can occur and students are controlled via set timings, locations, and modes of operating. Knowledge is understood to be definable and amenable to fragmentation into deliverable parts independent of the context in which it is immersed. For childhood educators, then, and those others

interested in shifting ecologies, there must be consideration given to what modes of operation are being used for student well-being and, also, which are reifying particular problematic forms of control. More deeply, epistemological and ontological conceptions – the ways of knowledge and being in the world are enacted for children – will have to change. No longer is the human teacher the sole arbiter of the truth. Meaning will become more fluid as it is seen as a shared endeavor, and time spent immersed in the natural world may become identified as an important category of learning, time well spent, and even life well lived.

In moving toward a new ecology, we are suggesting it is important to understand the world as relational, complex, spontaneous, and deeply connected. For educators involved in a continual process of questioning metaphors, practices, and understandings of what it means to learn, the relevance of learning *with* rather than *about* the natural world will gain a particular salience. It might involve overcoming our current educational system's reliance on defined outcomes, known standards, and measured results (Wals, 1990). "The answers" will become more fluid, flexible, and diverse. This challenge of releasing control will require educators – and more generally, humans – to decenter themselves as experts, professionals, and lone contributors. These will be first steps in taking the real risks of employing alternative conceptions of education.

Educators might consider questions such as:

- How did I take risks in my practice today to move away from the full control of assumed ends?
- Was there room for the unknown, spontaneous, and unexpected to appear and be taken seriously in our work today?
- Was I able to decenter myself in the teaching today?
- Was the natural world able to self-represent, make itself known to us, in its own ways?
- How did we learn with/in/of the natural world today?

Complexity, the Unknown, and Spontaneity

This touchstone builds on the previous two in which the childhood educators are challenged to reconceptualize their relationship with/in the world, change their working metaphors, and jettison cultural norms that are anthropocentric and anti-relational. In doing so, we open up possibilities for complexity and spontaneity that can continue to drive the process. For what might arise, unpredictably and unplanned, from the interaction and inquiry generated through the collaboration of learners with each other and with nature. This suggested touchstone involves actively embracing the unknown, learning to deal with an incomplete complexity, and allowing space for the spontaneous. All three of these components involve a kind of stepping back from the center, an undoing of the human as center of the world – as arbiter of everything – in order to allow other ideas, possibilities, spaces, beings, and imaginations to emerge.

A short interlude on Icebergs:

It is our last day of a long raft trip on the Tatshenshini River and two of the authors have spent the day in heavy fog rowing on a body of water so large that at times the banks were invisible and it was easy to lose track of the current while imagining oneself lost on the rolling swells of an open ocean. With landmarks obscured it is hard to anchor movement, flow, and direction of travel such that one's perceptions are unraveling by the time we arrive in camp. The camp itself, situated on a small island in Alsek Lake, surrounded by massive and ancient glaciers does nothing to relieve that perceptual uneasiness as we are confronted by the beauty, complexities and cacophonies of a massive jumble of icebergs.

As adults, discombobulations, new discoveries, and experiences that challenge what we think we know, such as in the anecdote above, are surprisingly rare. Yet for the young, who have fewer convictions and commitments, it is important to recognize how much more common they are. It is in the spontaneous nature of this encounter with floating blocks of ice that an educational metaphor might be drawn. At the perceptual level, there is the beauty and immensity of the encounter. However, with varying learning histories about iceberg, it is also apparent that people's ideas, understandings, and knowings of ice are largely about being crushed, cleaved, and flipped over in concert with the bergs themselves.

We hope wild pedagogies can provide opportunities for the implicit to be made explicit, the taken for granted to be questioned, learners to acknowledge complexity, and to see the "ice below the surface." Just as the concept of iceberg was overturned by the encounter described above, wild pedagogies might also allow for spontaneous encounters that are both novel for young learners. We believe that such encounters can challenge implicit ways of knowing and being, disrupt cultural truths, and challenge the known – even the known of the 2-year-old. Childhood educators can then increase the recognition that there is more complexity than is visible and that knowledge is always incomplete.

Educators might consider questions such as:

- What did I do to embrace spontaneity and complexity in my teaching today?
- Did the learners encounter the interconnected, complex, and incomplete nature of knowledge today?
- Did I provide sufficient time for students to be alone and encounter the places they were in?
- Was I able to support learners' journey into the complexity of knowledge and not reach for the easy, seemingly final, answer?
- How will I offer experiences tomorrow for my young students that help them build their understandings of the world?

Locating the Wild

The Norwegian eco-philosopher, Arne Næss, was asked about what teachers can do in urban areas, and how teachers can meet some of the challenges in taking children outside. He replied:

> Some people have hundreds of good joyful experiences that cost nothing. In the schoolyard itself, you find a corner where there is just one little flower. You bend down—you use your body language—and you say: 'Look here.' And some answer: 'There is nothing there.' And then you talk a little about what you see: 'This flower here, it's not the season for it. How can it be there this late in the year? And look at it. It certainly has need of a little more water; it's bending, look at the way it bends. What do you see when it's bending like this?' I call teachers who behave like this 'nature gurus.' It is a little more like an Eastern kind of education. More in terms of personal relations. Try to make them see things they haven't seen before. Use your body language. And even inside the schoolyards you find nature's greatness. (in Næss & Jickling, 2000, p. 54)

As Næss points out, there is potential to encounter the wild in a range of settings. Wild pedagogies are not just about some long trip in a distant backcountry. And, given that a vast and growing majority of us live in super-urban, urban, and suburban places where the wild may not be easily and immediately apparent, this touchstone presents both fertile ground and difficult work. One difficulty in bringing the young students to a place where they can encounter the wild is the realization that there are no educational guarantees. There is no simple solution for how to facilitate children's encounters with the wild, the self-willed, and self-arising others that surround us (Griffiths, 2006). There is, equally, no simple way to nourish that curling, reverberating, upending version of wildness that exists within.

The wild is everywhere and is often better recognized by the sharp eyes of those closer to the ground. And yet we also note that the encroachment of the wild into the psyches of students often appears to be more common in the wilder, more self-willed places. In spite of the incredible efforts of many urban environmental early childhood educators, the murmur of wild can be easily distanced by the noise, smell, plastic toys, demands for cleanliness, and dominion of other overbearing human constructions (Derby et al., 2015).

Encountering the wild provides educators with opportunities and difficult challenges. The anti-colonial literature of Tunisian scholar Albert Memmi, for example, offers a troubling analysis of a colonized world (Blenkinsop, Affifi, Piersol, & Derby, 2017). Such an analysis implicates all environmental educators and early childhood educators as well, in a complex project that is not simply about providing opportunities for students to encounter the wild. It also requires helping children to not slide into the privileged and alienated discourses in which they are often immersed. Watching small children happily creating shelters and engaging in imaginative play afforded by the natural world is important. But, it is also important to recognize and respond when the language of domination and nature as solely of utility to humans leaks into the play. Offering young children fodder for their imaginations – which allows them to create worlds that are not reliant on colonial tropes – is challenging work.

Childhood educators interested in wild pedagogies will likely need to challenge themselves by ongoing process of decolonization while, at the same time, allowing children the possibility of encountering an active, agential, dynamic, and wild other. This educational project becomes genuinely challenging as educators begin to recognize how language, ways of being, educational structures of schools, and urban settings are often oriented to expressly draw students away from the wild –

relentlessly re-confirming dominant human-centered and human-exceptionalist narratives.

Educators might then consider questions such as:

- How well did I notice and respond to anthropocentric and colonizing moves that I, or others, made today?
- What might my next steps for my own process of decolonization be? And how am I being an ally for the children I work with and the natural world that works with me?
- How did I make it possible today for students to potentially have encounters with the wild and/or self-willed communities?
- What did I do to provide moments for the wild within and without to be encountered and acknowledged, today?

Deep Time and Practice

This touchstone is about process. The kind of work described in all previous touchstones requires time. It takes time for educators to incorporate new habits and overlay the sediments of old habits. For pragmatic philosophers, habit change is a process of deep self and cultural examination. This means that childhood environmental educators, who are revisiting their own habits, are going to need time, too. Existing habits have been developed through a lifetime of navigating existing cultural waters; they are deeply engrained and resilient. Yet, they are also problematic in light of this project of changing relationships with the natural world. Educators are going to have to find ways to set aside time to first recognize such habits exist – to make them visible for critique and revision – and then to engage in a process of self-(re)creation so that they can enact new pedagogies and ways of being an educator.

Time is also required for childhood educators and their charges to build relationships with beings, things, and places. Many adults are deeply alienated from the wilder world, and many children have very little free time with which to play. Collectively, we have a limited range of experience with other-than-humans. Thus, to develop new relationships that reach to a deep cultural level, adults and children will require such experiences. Time spent – and lots of it – immersed in, dialoguing with, and learning with the natural world. All of us involved in education will need the time and opportunities necessary to build and maintain real and significant relationships with the more-than-human.

Closely associated with time is practice, and we use this term in at least two ways. The first involves educators developing their own practice in a way that can deepen their own relationships with local places and beings. At the heart of this point is making time to encounter the wild more, themselves. This means more than just encountering the wild within but also the actual wild "outside" – wild landscapes, animals, and wild situations. Part of this practice is learning – or relearning – how to travel competently across landscapes and being prepared to deal with inclement

weather and other situations. Beyond this basic practice of preparedness, this work can also be likened to meditative practice, even discipline, which requires listening more deeply to potential co-teachers as a first step toward a radical reworking of relationships.

Our second meaning involves educators developing the will and ability to rework their own practices – their own pedagogies. This will require reflexivity. It is about taking risk, implementing possibilities, examining the successes and failures thereof, and then continuing the process. Students and teachers must be given the opportunity to engage with new practices. They need time to try on their discoveries, to enact the new ways of being they are exploring. Wild pedagogues and their students will also need time to exist in that interstitial space – between old habits of relationship and potentially radically new ones.

Educators might want to consider questions such as:

- Did I leave enough space and time in my teaching today, to allow my students and myself to engage with natural places and beings nearby?
- Were we, together, able to find ways to step out of the linear time of the modern school system and encounter time working in different ways?
- How am I maintaining and nurturing my own practice of immersing in, and building relationship, with the places and beings I encounter? Have I become a little too complacent, assuming rather than engaging?
- Was I able to notice, respond to, and support students who were trying out new habits?
- Am I noticing my practice, trying new things, reflecting on what has been attempted, and creating the kinds of support that allow me to continue to expand as a teacher?

Cultural Change

This touchstone may be considered the most controversial as it requires teachers to become consciously political – even to become an activist and ally. Such a stance has often been seen as being anathema to the professional early childhood educator. It has been readily acknowledged that education is value laden, though how to respond to this realization remains contested. Most obviously, fear arises when educators begin to impose their own political or religious views onto students in ways that affect their ability to choose for themselves in a secular and inclusive state.

However, seeking to avoid the political in education has always been problematic. It is quite clear that any choice being made in the classroom by teachers is political and has implications. To paraphrase philosopher Martin Buber (2002), we choose the world that is being brought to the students. Let us be clear, to teach to a supposedly impartial norm is, by default, to acculturate the children to a specific paradigm and set of beliefs and practices – usually those of the dominant culture. This implicit curriculum, then, offers children, often unconsciously, the politics of the status quo – the position of the center. And, as with any centrist reality, it is not

until the margins respond that the unseen appears. This approach which rests on unquestioned assumptions can typically represent the real authorities in our cultures. These are the norms that are not understood, or even seen, by the fish swimming in those waters. And for early childhood educators, the implication is that they are involved in filling the pool into which their learner fish will slip. The question for the wild pedagogue here is what water would I like them to be swimming in and who is helping fill the pool?

There will always exist a tension around limiting the politics of education – to avoid the descent into unrestrained politicization of education, particularly in an era of ideologues and demagoguery. Having said this, there remains one set of value choices that cannot be avoided, and these are the content and pedagogical choices that are made – certainly in prescribed curricula – but also in the choices the educators make every day. These boil down to choices about what content and pedagogies are most worthwhile. And despite what seem at times to be Herculean efforts to control these choices, teachers' choices can still make a difference.

If indeed the Earth is rapidly shifting from the Holocene to something being called the Anthropocene (Crutzen, 2002) – and there is plenty of evidence to support this observation – then this shift does not augur well for the future of Earth. As David Orr (2017) suggests, the trajectory we are on in all things, including education, is in the direction of producing evermore clever vandals of the planet. We contend, then, that as educators we need to trouble the dominant versions of education that are enacted in powerful ways that bend outcomes toward the status quo – toward being the same kinds of people that have enabled the Anthropocene and disabled the Earth. Disrupting current trends means, fundamentally, being differently.

This touchstone is genuinely wild, for we cannot know in advance what the outcomes will be or how future learners will enact their learning. Though, what is intended is that wild pedagogies will change education – how it is conceived and enacted – and this will disrupt the invisible center. And, it may even result in learners who are more loving, caring, and compassionate and who can be competent healers, restorers, builders, and midwives to a decent, durable, and beautiful future.

Educators might want to consider questions such as:

- What opportunities appeared for the wild to encroach?
- Were there situations that arose that allowed students to consider their current relationships with the natural and potentially move to change them?
- How was I consciously political today?
- How was I able to focus on necessary change for the whole society?
- Where are my habitual ways of doing things still limiting possibility?

Conclusion

This chapter focused on locating education, as an active, rebellious, in need of change, enterprise that will play an important role in what the world might look like as we stare into an uncertain future. By offering six touchstones, we hope to

draw together a growing group of like-minded educators who are committed to change, to the possibility of wilderness, and to a renegotiated relationship with all the beings, animate and less so, which make up our neighbors on this planet.

Thus, wild pedagogies are explicitly and deliberately about enabling change. In choosing content and pedagogies, there is an aim – humbly submitted – in the work to enable *being* differently. Being differently is to change the relationship humans currently have with the natural world, from a dominantly human-centered orientation into one that is much more equitable and interactive. Herein lies some hope for stopping the massive destruction being wrought upon the Earth (This paper is an early offering and yet just a small part of a much larger project: Jickling, Sean Blenkinsop, Timmerman, & Sitka Sage, 2018).

Abstract

In 2012 there were only around 25 nature preschools and kindergartens in the United States; now there are well over 250. It is a national movement that is gaining momentum. It is an exciting time because in principle these schools have within them the kernels to transform the world through increasing children's direct interaction with nature and a more wild nature than that exists in most urban children's lives. In this paper we begin to characterize forms of child-nature interaction that occur in one specific nature preschool, Fiddleheads Forest

Preschool in Seattle, Washington, USA. Based on our observational data, derived through a randomized time-sampling methodology, we modeled child-nature interaction using what we call *interaction patterns*: characterizations of essential ways of interacting with nature described abstractly enough such that the pattern can be instantiated in different ways, across diverse forms of nature. Specifically, we use a nature language to describe (with photographs) eight interaction patterns: *leaning on and hanging from supple tree limbs*, *climbing high in small tree*, *looking at wild animals*, *imitating animals*, *imagining nature to be something other than it is*, *making boundaries on earth*, *pushing the edges of boundaries*, and *waiting attentively in nature*. Through an interaction pattern approach, we seek to provide insight into what is actually happening on the ground at a forest preschool and how that provides a key solution to the problem of environmental generational amnesia.

Introduction

The good news is that, over the last decade, research studies have been providing more and more evidence that interaction with nature benefits people physically and psychologically.

The benefits are wide-ranging. Studies have shown, for example, that interaction with nature can reduce stress (Berto, 2014), reduce depression (Taylor, Wheeler, White, Economou, & Osborne, 2015), reduce aggression (Younan et al., 2016), reduce diabetes (Bodicoat et al., 2014), reduce obesity (Lachowycz & Jones, 2011), reduce ADHD symptoms (Kuo & Faber Taylor, 2004), improve immune function (Rook, 2013), improve eyesight (He et al., 2015), improve mental health (Bratman, Hamilton, & Daily, 2012), and increase people's social connectedness (Holtan, Dieterlen, & Sullivan, 2014). There are extensive reviews of this literature, including those by Frumkin (2012), Frumkin et al. (2017), and Hartig, Mitchel, de Vries, and Frumkin (2014). In one study, for example, Bratman, Hamilton, Hahn, Daily, and Gross (2015) assigned adults to one of two areas for a 90-min nature walk. One area was a natural setting on a beautiful university campus. Another was along a busy urban street. They investigated whether nature experience would influence rumination (repetitive thought focused on negative aspects of the self), a known risk factor for mental illness. They found that the nature walk (in contrast to the urban walk) decreased (a) self-reported rumination and (b) neural activity in the subgenual prefrontal cortex which has been linked to rumination in both depressed and healthy individuals.

It is increasingly clear, then, that a vibrant natural world is not only good for the ecological sustainability of this planet but good for us individually, as communities, and as a species. Of course, through the lens of evolution, how could it be otherwise? For tens and even hundreds of thousands of years, we came of age with a vibrant,

diverse, wild natural world, and the architecture of the human mind and body is optimally calibrated to many aspects of that world still (Kahn, 1999, 2011; Kellert & Wilson, 1993; Shepard, 1998; Wilson, 1984). Still, the emerging scientific evidence is good news because in today's world science is often the currency for ideas to be accepted.

Unfortunately, the good news stops short. For, in our view, the plain fact is that science will likely have little effect by itself in changing our destructive relationship with nature. There are different reasons for this. An obvious one is that extracting resources from nature can lead to many critical short-term economic benefits that override longer-term costs. For example, a coal miner can help destroy a mountain top and pollute the waters as he destroys his own lungs over time; but if that is his only way of putting food on the table each day, then he may be unlikely to change his occupation. Another reason can be framed from the perspective of the tragedy of the commons (Hardin, 1968): that in public areas of shared resources, individual people collectively over-extract resources (and destroy natural areas and entities) to maximize their own self-interest in the short term, contrary to the common good. This tragedy is still relevant today (Dennie, 2011), as has been highlighted in the area of climate change (Gramopadhye, 2013).

Short-sighted self-interest may help explain the continued destruction of nature. However, the deeper and perhaps more insidious reason – of *environmental generational amnesia* – rarely gets noticed.

In this paper, we first explain how environmental generational amnesia originates in childhood, through the child's construction of knowledge. Next, we offer a general solution to the problem based on the importance of children interacting with nature and with a nature at least slightly more wild than lies within their current purview. To do so, we elaborate on our working model of human-nature interaction, which is based on the idea of *interaction patterns*: characterizations of essential ways of interacting with nature specified abstractly enough such that the pattern can be instantiated in many different ways, across diverse forms of nature and diverse natural entities. Then we use our interaction pattern approach to begin to characterize child-nature interaction in a forest preschool. We hope that this last section does two things. One is to provide insight into what is actually happening on the ground at a forest preschool. Another is to provide the reader with emerging evidence that our interaction pattern approach has veracity and is generative and in principle could provide a key solution to the problem of environmental generational amnesia.

Before beginning, it is also worth noting for the purposes of this volume that we use the term child-nature interaction instead of *Childhoodnature interaction* because of our ontological commitments. As we understand the term Childhoodnature, it is used to signify that children *are* nature, not separate from it. The larger question is part of a long-standing one in the field: Are humans a part of or apart from nature? In our view, humans are both. Clearly we are nature: biological and with an evolutionary history, interwoven with all. But somehow in our evolutionary history, perhaps from the Neolithic period forward, our minds became "modern" – increasingly reflective, generative, creative, and technological – and are embedded within complex cultural systems. As such, we as humans have also become unleashed from

natural rhythms and balance, and one of the central challenges of today is to bring modern mind within a more natural framing. In our view, *child-nature interaction* allows us the ontological room for this work.

Environmental Generational Amnesia

One of the central theories of child development is based on a constructivist psychology, wherein a central principal is that children construct knowledge of the world through interaction with it (Langer, 1969; Piaget, 1952/1963, 1952/1965, 1983). You can see this principle play out even in infants. For example, you might see an older infant who can reach for small objects and pick them up with one hand or the other hand and thus has consolidated this form of a grasping scheme. But then one day you might see her try to pick up an object that is too large for either hand. You might see her try with one hand and then with the other and then back again, clearly frustrated. In constructivist language, she is disequilibrated. Her existing way of understanding and acting on the world is no longer as effective as she would like. She might then continue to interact with the ball, seeking a solution, and at some point discover – construct – a new way of acting on the ball that coordinates what had been two independent grasping schemes (with her right hand and left hand) into a single psychological organization. The resulting behavior is that she uses both hands together to pick up the ball. It is an enormous developmental achievement that occurs through the child's interaction with the physical world. In turn, within this theoretical tradition, children construct not only physical knowledge but social and moral knowledge through their social and moral interactions with people (Kohlberg, 1969; Turiel, 1983) and environmental knowledge through their interactions with the natural world (Kahn, 1997, 1999; Kahn & Lourenço, 2002; Severson & Kahn 2010).

But now here is the question: What happens when children grow up and construct knowledge in natural environments that are ecologically impoverished?

One answer emerged in an early study by Kahn and Friedman (1995) who interviewed 72 inner-city black children (low SES) in Houston, Texas, on their environmental views and values. In this study, one of the surprising findings was that the majority of children understood about the problem of air pollution insofar as they could describe it in general terms and sometimes referred to places that were polluted; but these same children often believed (a statistically significant difference) that Houston itself was not polluted. Yet at the time of the interviews, Houston was the most polluted city in the United States. Thus the question emerged: How could children who knew about air pollution in general not know that their own city was highly polluted? The likely answer is that these children grew up in the highly polluted city and had had little if any direct experience of less polluted environments, and thus they constructed a deep phenomenologically grounded understanding of what is *normal* air. Thus Houston polluted air was neither experienced nor understood as polluted but just normal.

This is not just about inner-city children in Houston. It happens to all of us. It is not just about air pollution. It happens with most all of nature. All of us construct a

conception of what is environmentally normal based on the natural world we encounter in childhood. The crux is that with each ensuing generation, the amount of environmental degradation can and usually does increase, but each generation tends to take that degraded condition as the nondegraded condition, as the normal experience. It is a condition called *environmental generational amnesia* (Frumkin et al., 2017; Hartig & Kahn, 2016; Kahn, 1999, 2002, 2011; Kahn & Weiss, 2017). (This section draws from a few portions of Chap. 11 of Kahn's (2011) *Technological Nature: Adaptation and the Future of Human Life*.)

Evidence for environmental generational amnesia comes from diverse sources. In one experimental study, for example, Evans, Jacobs, and Frager (1982) established two groups of participants. One group, long-term residents, had lived in the Los Angeles area 5 years or more. A second group, new arrivals, had just moved to the Los Angeles area within the previous 3 weeks. Results showed that long-term residents of the Los Angeles area, in comparison to the new arrivals, judged that smog was less of a problem in the area and less often spontaneously mentioned smog as a problem. In addition, while both groups of participants were equally sensitive in detecting the presence of substantial amounts of smog in photographs, for low levels of smog, long-term residents in comparison to the new arrivals were less likely to report that smog was present. Taken together, these results offer evidence for environmental generational amnesia insofar as they support the proposition that people who live with a certain level of air pollution for an extended period of time become desensitized to that pollution and less readily recognize that such pollution exists.

It might be assumed that at some point the environmental conditions become so diminished that a population of people can readily "wake up" from their amnesia and recognize the harmful conditions of their environment. Yet the historical record suggests otherwise. As a case in point, consider the human and environmental history of Easter Island (Diamond, 2005; Flenley & Bahn, 2003; Tilburg, 1994). Humans arrived on Easter Island by 900 AD and found an environment rich in resources for people to thrive. Yet within about 800 years, the land was completely deforested, with all of its tree species extinct, wildlife had decreased, land birds had disappeared completely, wild fruits no longer grew, erosion had led to decreased crop yields, and there was no firewood with which to keep warm on the Island's winter nights. People starved. There was a population crash. Cannibalism emerged "Oral traditions of the islanders are obsessed with cannibalism; the most inflammatory taunt that could be snarled at an enemy was 'The flesh of your mother sticks between my teeth'" (Diamond, 2005, p. 109).

You would think that people on Easter Island would have seen the environmental harms emerging and been able to change course. But as Diamond (2005) argues, it is much more likely that it was a gradual process across generations: "the changes in forest cover from year to year would have been almost undetectable: yes, this year we cut down a few trees over there, but saplings are starting to grow back again here on this abandoned garden site. Only the oldest islanders, thinking back to their childhoods decades earlier, could have recognized a difference. Their children could no more have comprehended their parents' tales of a tall forest than my 17-year-old

sons today can comprehend my wife's and my tales of what Los Angeles used to be like 40 years ago" (p. 426). Diamond calls this psychological phenomenon "landscape amnesia." It is people "forgetting how different the surrounding landscape looked 50 years ago, because the change from year to year has been so gradual" (p. 425). Diamond says that landscape amnesia is a "major reason why people may fail to notice a developing problem, until it is too late" (p. 426).

Others have described versions of this amnesia. Pauly (1995), for example, has written of the "shifting baseline syndrome" of fisheries: "Essentially, this syndrome has arisen because each generation of fisheries scientists accepts as a baseline the stock size and species composition that occurred at the beginning of their careers, and uses this to evaluate changes. When the next generation starts its career, the stocks have further declined, but it is the stocks at that time that serve as a new baseline. The result obviously is a gradual shift of the baseline, a gradual accommodation of the creeping disappearance of resource species" (p. 430). Along similar lines, in terms of humans adapting to disease, Dubos (1980) has argued: "Any disease, or any kind of deficiency, that is very widespread in a given social group comes to be considered as the 'normal' state and consequently is accepted as a matter of course within that group" (pp. 250–251).

What, then, are solutions to the problem of environmental generational amnesia? Kahn (2011) has suggested numerous approaches, including (a) keeping alive accounts and stories of rich interactions with nature from past generations, (b) imagining the future so as not to be blinded by present conditions, (c) embracing complex discourses of societal issues, and (d) being cautious in believing that new technologies can or will save us, because throughout history new technologies have brought new problems even if they have solved existing ones. But the solution Kahn proposes that seems to us most powerful focuses on having people, and especially children, interact with nature and increasingly rich if not wild forms of nature. In our view, this approach provides the phenomenologically grounded experiential basis by which children can construct understandings of more healthy nature and more healthy forms of human-nature interactions and to recognize and act on increasingly rich affordances of nature.

But it is one thing to advocate for such human-nature interactions, and to ground them in constructivist and ecological psychological theory, and it is another to model what those interactions actually look like in any comprehensive way. We move in that direction in the next section.

Interaction Patterns as a Method to Model Human-Nature Interaction

In its most basic sense, a model in the scientific sense of the term is a simplified description of the information of a phenomenon in the world with the objective of making the phenomenon understandable (Frigg & Hartmann, 2012). If we take the phenomenon of interest in the world as human-nature interaction, then one challenge

in modeling human-nature interaction is that the interactions can seem endless. It is not only that you can *hop over a log*, *bask in the sun*, *swim in the ocean*, *skip a stone*, *smell a flower*, *listen to frogs croak*, *pet a cat*, and *forage for wild asparagus*, and that the list goes on and on. It is also that any single type of an interaction can seem to vary endlessly. For example, a swim in the ocean one day is not exactly the same as a swim at the same spot the next day: the weather is slightly different, the tide has changed, you are never swimming in the exact same location nor being moved by the waves in the exact same way; indeed no two waves are ever identical so that each moment of swimming can be experienced and understood as itself completely unique.

How, then, is it possible to model human-nature interaction in a way that allows the phenomenon to be understandable while keeping alive the endlessly diverse – infinite – expressions of nature and human interactions with it? Our answer builds on the idea of an *interaction pattern*. What is that? Think about a meaningful way that you have interacted with nature, and then characterize it in such a way that you could see the same thing happening with different forms of nature. That is what we call an *interaction pattern*. For example, it is often wonderful to walk along the edge of a lake or along a river. The pattern could be framed as *walking along the edges of water*. You would be able to recognize this pattern pretty easily anytime you saw it or enacted it; yet the pattern does not confine it to happening in any particular way. More formally, interaction patterns are characterizations of essential features of interaction between humans and nature, specified abstractly enough such that countless different embodied versions of the interaction – what we will refer to as *instantiations* of the interaction – can be uniquely realized given different types of nature, people, and purposes. The idea of human-nature interaction patterns builds from the pioneering work of Christopher Alexander in architecture wherein he and his colleagues developed a "pattern language" for the built environment (Alexander, 1979; Alexander et al., 1977).

To date, Kahn and his colleagues have generated around 150 human-nature interaction patterns, with photos and descriptions for many of them (Kahn et al., in press; Kahn & Weiss, 2017; Kahn, Ruckert, Severson, Reichert, & Fowler, 2010; Kahn, Ruckert, & Hasbach, 2012). For example, there is a meaningful interaction that you have likely enacted in many different ways of *recognizing and being recognized by a nonhuman other*. If you have a dog, then likely every day you have moments when you and your dog look at one another and communicate. That is a domestic instantiation of *recognizing and being recognized by a nonhuman other*. A wild instantiation occurs when you're on a forest trail and walk around a sharp bend and come face-to-face with a black bear 20 yards away. Then there may be that instant when you look into the bear's eyes, and you recognize bear consciousness, as the bear is looking into your eyes and recognizing human consciousness from the standpoint of bear consciousness. Time slows down. It is a moment that can last in your memory for a lifetime even as it is over within a second, as the bear gallops off as you simultaneously move away.

This example highlights an important characteristic of interaction patterns in that they can be instantiated in more domestic or more wild ways:

- *Watching birds eat* is an interaction pattern. You can watch seagulls fighting over a piece of white bread thrown by a child (more domestic); or you can watch a blue heron, initially still as a rock, quickly plunge its head into a lake and snatch a six-inch bass into its beak and then, over the next minute, swallow it whole (more wild).
- *Wading in water*: You can roll up your pant legs and wade into an urban fountain (more domestic) or into the Pacific Ocean (more wild).
- *Eating blueberries*: You can eat blueberries from your garden (domestic) or on the high mountain slopes in the North Cascades (more wild).
- *Resting in the shade under a tree*: You can rest under a 20-year-old planted Douglas fir (more domestic) or under the enormous canopy of a 200-year-old cedar.
- *Running the land*: You can run 8 laps around a quarter-mile track (more domestic) or a 2-mile loop through Central Park (a little more wild) or a 20-mile loop through the Canyonlands of Utah (even more wild).

We use the word *wild* to refer to that which is untamed, unmanaged, not encompassed, self-organizing, and unencumbered and unmediated by technological artifice (Foreman, 1991; Kahn & Hasbach, 2013; Rolston, 1989; Shepard, 1998). We can love the wild. We can fear it. We are strengthened and nurtured by it (Rolston, 1989; Turner, 1996). Wildness is not to be confused with wilderness. The reader may agree with Cronon's (1995) view that wilderness is a social construction and that the idea of untouched pristine landscape is a fantasy of a Western European worldview. Be that as it may, there is nature that has more wild or less wild features and affordances, which allow for forms of interaction that are more wild or less wild. It is not a culturally determined social construction, or at least not much of one, when one comes face-to-face with a grizzly bear and recognizes that one's life could be in jeopardy.

Thus it is useful to characterize the constructs of the wild and the domestic as existing along a continuum. Pyle (2002) once wrote an essay titled *Eden in a Vacant Lot*. He was trying to show that, even in cities, small open patches of land are not what some people call "wastelands" but areas for more wild nature to exist and for people, especially children, to interact with. Even weeds growing through the cracks of a sidewalk can be understood as embodying some wild characteristics, such as being unmanaged and self-organizing. But the instantiation of this wild weed should not be equated as equally wild as a vast stand of old-growth redwood trees.

Because domestic interaction patterns can be instantiated in evermore wild ways, it becomes possible to restructure human life, social organizations, and the urban-built environment to engender evermore wild instantiations of currently existing forms of interactions. For example, if you are designing an urban fountain, you can design it to allow for visual and perhaps auditory interaction: you look at it and hear it. But some fountains go further and allow for people's bodies to find its way into, amidst, or through the water. You can wade into the water, get sprayed by it, run through it, or run on stepping stones over it. Or another

example, in the metropolitan area of Seattle, Washington, there were about 20 miles of an abandoned railroad line that were repurposed as a contiguous trail. People use it for many purposes, such as for a biking commuter route and for recreational exercise. But what such a long stretch of urban trail also affords is the enactment of a very old interaction pattern with nature, one that goes back to the earliest days of *Homo sapiens*: of *walking (or running) away from human settlement and then the return*. Back then, women might walk out 3 or 5 miles from camp to forage and then return later laden with tubers and nuts. Men might go out for several days hunting and then return, successful or not. It is an important interaction pattern because it creates the conditions for many other smaller interaction patterns, such as an emphasis on being aware of weather patterns or one's location in landscape so that one can take care of oneself the further one moves from the safety of camp.

We are saying that interaction with more nature, and more wild nature, not only promotes people's physical and psychological well-being but even more importantly provides perhaps the most powerful countervailing force against the insidious problem of environmental generational amnesia. For the knowledge and understandings that emerge through such interactions run deep within the human psyche, and within the body itself, so that there is both human memory and muscle memory – a lived reality – of one's relation with nature. We are also suggesting that it is possible to restructure human life, social organizations, and the urban-built environment to engender these interaction patterns. In the next section, we show how some of this unfolds in the context of a nature preschool.

Child-Nature Interaction in Fiddleheads Forest Preschool

The school is the Fiddleheads Forest Preschool in Seattle, WA, directed by one of us (Harrington). The children (ages 3–5 years old) and teachers spend all of their time outside, in a matrix of trees, in one of the two classrooms located in the University of Washington Botanic Gardens. These botanic gardens are open to the public in this fast-growing city. We divided each of the two outdoor areas into five different filming zones, and through a randomized time-sampling methodology, we filmed the children. Our data collection was recently completed. As a step forward in characterizing child-nature interaction in a nature preschool, we offer here a handful of interaction patterns that have been emerging from our data. This effort builds on our presentation of five other interaction patterns – *falling on the ground*, *not falling on the ground*, *digging in the ground*, *leaning against the tree*, and *calling the birds* – that we have described elsewhere (Kahn & Weiss, 2017).

In addition to describing each pattern, we offer a little bit of what we call a *nature language* about the pattern. By a nature language, we mean a way of speaking about how the pattern is enacted, how it is meaningful in a child's life, how it may lead to important developmental outcomes, how it may originate from sources deep in our ancestral heritage, and how it connects to a wider social and communicative discourse throughout time and place (Kahn et al., 2010, 2012).

Leaning on and Hanging from Supple Tree Limbs

The boy in Fig. 1 is talking to a person on a road outside the boundary of the classroom. As he is talking, he begins to lean a little on the supple branches of the tree. This leaning appears to start almost incidentally, based on the affordances of the limbs right within his grasp. But then as he starts enacting these minimal interactions, the responsiveness of the limbs leads him to further engage with them. The child tests the tree's support of his body weight as he leans his body forward and backward. He holds onto a limb and leans back, and as he feels the limb support his weight, he leans back further and then a little further. He even goes so far as to lift one foot off of the ground as he leans far back, before placing the same foot on a low-hanging branch and shifting his weight forward in a lunging position.

Thus these forms of interactions with nature illustrate a canonical principle described earlier of ecological psychology, where interactions with the affordances of nature quickly create new affordances which lead to further and often more extensive interactions. Moreover, you can almost see here the child's construction of knowledge, as he is learning how to balance himself amidst supple tree limbs.

Fig. 1 Interaction Pattern: Leaning on and Hanging from Supple Tree Limbs

It includes proprioceptive knowledge, as he gains an understanding of his body in relation to a dynamic natural system.

Climbing High in Small Tree

The same boy as in Fig. 1 now engages in a solo exploration of the trees lining the edge of the classroom (Fig. 2). The tree he chooses to climb is relatively small and offers many low-hanging branches for him to easily make his way up to a suitable vantage point. Indeed, it seems plausible that his ability of *leaning on and hanging from supple tree limbs* (Fig. 1) engenders this further interaction pattern of *climbing high in small tree*. The branches embody an element of uncertainty as to their exact load-bearing capacity, which the boy needs to figure out. For example, when he

Fig. 2 Interaction Pattern: Climbing High in Small Tree

Fig. 3 Child Climbing on a Concrete and Metal Pillar

reaches for the small branch in the bottom photo, he needs to figure out how much of his body weight the branch will hold as he uses it to pull himself up with.

In the middle photograph, the child next stands on a limb and keeps his balance holding onto another limb. After that, he lets go with his right hand and balances only with his feet.

The primary interaction pattern of *climbing high in small tree* makes possible many other interactions, such as *standing in tall tree*, *climbing across small tree*, *straddling branches*, or *looking out while standing in tall tree*. Some of these interaction patterns presumably have their origins in our evolutionary history. For example, *looking out from a natural vantage point* is the more general form of the interaction pattern of *looking out while standing in tall tree*, whereby it presumably conferred advantage to be able to see what lay in a more distant landscape from the vantage of higher ground. Even in modern urban environments, you can see this interaction pattern enacted and highly valued. For example, the real estate prices of homes increase when, all things being equal, the home has a view with a vantage point, especially with a territorial or water view.

Contrast this boy's climbing high in small tree compared to the girl in Fig. 3 climbing on a concrete and metal pillar. The wood 4 × 6 beams are smooth and offer few affordances by which to climb them. One could perhaps shimmy up a little bit. But there is little to grab on to or to step up on, except for the initial cement pier; and for that it is one step and you are done. Even if it were a metal jungle gym, the affordances would be few compared to the small tree, because the metal is solid and uniform, fully load bearing and thus offering little variation and little opportunity for the child to strategize compared to the dynamic natural system of a tree.

Looking at Wild Animals

Biophilia refers to the innate propensity for humans to affiliate with nature (Kellert & Wilson, 1993; Wilson, 1984); and one of the most salient aspects of nature that humans affiliate with is animals. In our ancestral history, we hunted wild animals and

Fig. 4 Interaction Pattern: Looking at Animals

depended on them for our survival. We paid attention to where they were, what they ate, when they ate, where and when they drank, when they migrated, how they moved, their footsteps in the ground, the sounds they made, their forms of communication, and many other things. One of the primary ways of interacting with a wild animal is visually looking at the animal. And, still today, this form of interaction has a powerful pull on the human psyche. For example, each year in North America, more people visit zoos and aquariums than all professional sporting events combined (Wilson, 1984). Why? Perhaps the most plausible explanation is because zoos and aquariums satisfy the human desire to look at wild animals, even if the animals are in captivity and are but fragments of their former wild selves.

One of the strengths of a nature preschool is that it affords children the opportunity to look at wild animals or at least non-domesticated animals that are not in captivity, such as insects, lizards, squirrels, and birds. These animals have a degree of freedom and autonomy that go far beyond what animals in a zoo experience. The girl in Fig. 4 was initially jumping over the log and exploring her ability to place one foot on the log and propel herself over it. In the process, she then noticed (and vocally says in the video) that she sees a spider. She then stoops down and invites a teacher to look at the spider on the log with her. *Looking at animals* can be both an individual and social interaction. The animal is free, in its own habitat. The child is free to look at the spider or not and to marvel or not. The child is not trying to control the spider; no more than the spider is trying to control the child. It is a relationship of mutuality.

Imitating Animals

Looking at animals is one form of interacting with them. But it can go much deeper than that. According to Shepard (1996), "the human species emerged enacting, dreaming, and thinking animals and [still today] cannot be fully itself without them" (p. 4).

A nature preschool provides such opportunities with both domestic and wild animals. Specifically, one interaction pattern we have observed to date is that of *imitating animals*. In the first photo of Fig. 5, a girl crawls on her hands and knees and imitates the physical actions and vocalizations of a domestic housecat. She makes direct eye contact with the boy and is interacting with him in her pretend role

Fig. 5 Interaction Pattern: Imitating Animals

as a cat. These interactions occur in a part of the outdoor classroom that can be characterized as in between the more domestic and more wild parts of the landscape. In contrast, the girl in the second photo of Fig. 5 is standing in one of the most untouched parts of the classroom, and instead of imitating a domestic animal, she chooses to imitate the sounds of birds overhead. She is making bird calls. She is calling to them. One can think of birds as some of the wildest animals that people encounter in urban environments insofar as birds, especially those that migrate, are not hemmed in by human infrastructures and desires. Birds fly where they want to fly. If they do not care to be around you, they leave. During migrations, they can fly many thousands of miles, themselves interacting with some of the wildest landscapes of the world.

Based on our emerging data, one working hypothesis is that more relational interactions that seek harmony with nature (such as *calling the birds*) occur in the more wild and secluded parts of the nature school, while the more domination interactions with nature (such as using a stick as a pretend chainsaw to cut down trees) occur in the more domestic and built parts of the nature school. If this hypothesis bears out, it would be an important result. For as discussed elsewhere (Kahn, 2011; Kahn & Hasbach, 2013; Kenny, 2013), one of the overarching problems of the world today is that many people, and many world leaders, see themselves as dominating over other people and over nature, rather than living in relation and seeking harmony with both. Thus if this hypothesis is supported empirically, it would provide evidence that interactions with wild nature are vitally important in children's development, as such interactions provide the mechanism for

the child's construction of more relational interactions of equality and harmony with each other and with their surrounding environment.

Imagining Nature to Be Something Other Than It Is

In the field of developmental psychology, imagining and pretending has an illustrious history (Baldwin, 1973/1897; Vygotsky, 1978) and been the focus of modern-day research (Taylor, 1999; Taylor & Carlson, 2002). The young child's mind undergoes a far-reaching transformation when it comes to understand that something can be represented as something other than what it is. This transformation, in turn, opens up new forms of play and even humor. There is a story one of us heard, for example, of a very young boy who was sitting with his parents around the dining room table and then all at once he got a mischievous expression on his face. He then looked at his parents and then pointed to his glass of milk and proclaimed "beer!" Then he burst out laughing. It is actually quite funny, certainly from his perspective, because in a social communication with his parents, he was making something into something it was not. Adult irony in many Western cultures works in a similar way. You might walk outside to yet another rainy day and say to your partner: "I'm sure enjoying all the sun." You do not mean it. You are playfully having the language mean something other than what the language literally means.

Phylogenetically – tens of thousands of years ago, and perhaps much longer – this achievement of our species likely occurred through people interacting with nature and then *imagining nature to be something other than it is* (Shepard, 1998). In storytelling around a campfire, for example, hunters may well have used sticks or rocks to represent the animal they were talking about.

Many examples of this interaction pattern of *imagining nature to be something other than it is* are emerging in our data. For example, the bottom photo in Fig. 6 shows a girl who had been playing with another girl, and then she saw a long thin stick and had an idea. She got on the stick and began to ride it, calling it a "train" and then a "horse" at different times. A few other classmates wanted to join her, but she rebuffed their entreaties and in effect claimed ownership over the nature she now possessed. But after a few minutes of solitary play, this girl began asking her classmates to join her for a ride. Most who had initially wanted to take a turn were now engaged in other activities; but, as shown in the top photo, eventually the girl was able to entice a friend of hers to join her for a "trip" around the center of the classroom.

Along with illustrating this specific interaction pattern, this example shows how interacting with nature forms the basis for children's construction of social and even moral knowledge. Namely, one way to interpret what happened between the children in this event – and this may be a stretch of an interpretation on our part, but it is worth considering – is that when the girl excluded others from playing with her with her imaginary stick, she then came to recognize that there were social repercussions: that the other girls got interested in something else and no longer wanted to play with her when asked. It was a nuanced event. It did not appear to us, at least, like the other

Fig. 6 Interaction Pattern: Imagining Nature to Be Something Other Than It Is

girls rebuffed the individual girl out of spite (e.g., "you didn't let us play when we asked, so we're not going to play with you when you ask us!"). No, it was more that the other girls simply got interested in another activity. Thus the initial girl had to try hard to bring a friend back into her field of imaginary play. It did not take a teacher saying "it's good to share your stick with others now!" Rather, the girl was learning on a microgenetic level that that it is fine not to share if you do not want to, but it can often come with costs in terms of social affiliations, and so you might well want to take that into account in your future decision-making.

Making Boundaries on Earth

With the rise of agriculture, roughly 5,000–10,000 years ago, nomadic life gave way to settling, to the farmer, and for the first time in human history, it was possible to accumulate and store large quantities of food. With increased food production and storage, populations increased. Bands and tribes thus became chiefdoms and then city-states (Diamond, 1997). As populations increased, complex hierarchical systems of social organizations emerged. As part of this enormous cultural shift, the concept of land as private property emerged. This concept is now deeply rooted in Western culture and the Western mind. "This is my house." "This is my land." "Fences make good neighbors." And children coming of age within Western culture begin to learn about boundaries that separate spaces, not in the way a natural

Fig. 7 Interaction Pattern: Making Boundaries on Earth

boundary such as a ridgeline may separate two watersheds but in the way that a constructed boundary divides social uses of a landscape.

This way of interacting with nature can be named *making boundaries on earth*. We are seeing evidence of this interaction pattern in the children at Fiddleheads. For example, the boy in Fig. 7 dragged a long thick branch from another location into an open space and used it to make a boundary of sorts, which he then buttressed with wood rounds and rock that he also carried from elsewhere. The open space within the nature preschool affords him this opportunity, as well as the many "loose parts" of nature that he perceived and acted upon.

Pushing to the Edges of Boundaries

Children and adolescents often push to the edges of rules and other social understandings and sometimes go past them. A 2-year-old in a high chair might be told, "please don't throw your broccoli across the kitchen anymore." And then she may pick up a piece of broccoli and hold it in her hand and look at her parent. She may throw it. She may not. She is exploring and testing the edges of how social life is regulated, which is part of the mechanism by which she learns how to self-regulate.

In the previous interaction pattern, we illustrated *making boundaries on earth*. Children live within such social boundaries. The Fiddleheads Nature Preschool has one and asks children to respect it. The rule is that during school hours they are not allowed unattended outside the boundary of the school, as demarcated in many

places by rope or webbing attached across trees and bushes. Yet time and again, it appears that children are attracted to the boundaries and push to the edge, and occasionally slightly over. As a case in point, look again at the top photo of Fig. 1, and you can see the boy right at the boundary of the classroom, swinging his body almost over the boundary itself.

This example also illustrates that while interaction patterns can be described individually, they almost never actually occur individually. At a minimum there are "background" interaction patterns that are always occurring, such a *breathing air* or *being in space*. But more substantively, often multiple interactions are being enacted at the same time, such as *leaning on and hanging from supple tree limbs* and *pushing to the edges of boundaries*. In addition, interactions readily lead to other interactions.

Waiting Attentively in Nature

A boy and a girl had been exploring the more wild outer edges of the land. The girl then instructed the boy to wait for her. She then left the scene. More than 5 minutes passed, and, as shown in Fig. 8, the boy continues to wait for the girl, patiently, sometimes scanning the environment around him for her return. In our interpretation of his face and body motion, he is not bored. He is attentive. He is highly aware of his surroundings and taking in natural stimuli through his senses: sometimes looking for her, yes, but also likely listening. He is feeling and manipulating the leaf in his hand. He can hear birds chirp and the sound of wind in the leaves of the surrounding trees. He can see the changing light of the sun as clouds pass overhead.

Compare this interaction pattern of *waiting attentively in nature* to Samuel Beckett's 1949 existential play *Waiting for Godot*. In the play, two characters wait

Fig. 8 Interaction Pattern: Waiting Attentively in Nature

for a third person Godot (who never arrives) in a landscape barren except for one leafless tree. While the characters endlessly wonder why they should wait, and if Godot will indeed ever come, the boy in this more wild area of the landscape appears content and alert, neither bombarded by external sensory overload nor becoming distraught in a denatured environment.

Could it be said that modern-day children are being schooled in traditional classrooms and are coming of age in natural environments that are existentially as barren as in Beckett's play? But rather than face the existential conundrum, which Becket asks his audience to do, people today seek to avoid it by immersing consciousness as often as possible in digital distraction. For example, if you look at people waiting at a bus stop at a crowded urban intersection, or in line at in a crowded supermarket, and in many other situations, often they are peering intently into their smartphone and mentally tuning out their outer environment – an environment which often is so noisy and distasteful, if not toxic, that one can understand them doing so. This new form of human-technology interaction, which we could call *peering into digital device while waiting*, is becoming the conventional practice. People have sometimes told us that when they are waiting in a crowd that they will pull out their smart phone and look like they are looking at their phone, even if they do not want to, so as not to stand out from the crowd and draw attention to themselves. It may look like the boy in Fig. 8 is doing nothing; but we would like to suggest that he is engaged with some of the fullness of life.

Conclusion

Environmental generational amnesia helps explain how cities continue to lose nature and why people do not really see it happening and to the extent they do, they do not think the loss is too much of a problem. Each generation calibrates to a new degraded baseline and thinks it reasonably normal. But it is not. No more than is the prevalence of disease in the modern world. In the United States, for example, about two-thirds of the population is considered overweight, and one-third is considered obese. Eight percent have asthma, and 10 percent have diabetes. Fifty percent have one or more chronic health conditions. Numbers like these are evidence of a physically sick society. In the United States, one in ten people take antidepressants. is that not an astoundingly large number? We should look at these conditions and be appalled and seek for radical change. But mostly we stay the course: allowing for – if not participating in the destruction of nature – the destruction of the wellsprings of human life and well-being and crowding ourselves into increasingly mind-numbing urban confines, often in megacities of over 20 million people where most days the air is toxic and the sun a hazy shadow that moves across the sky and where the waters are polluted and wild animals go to die.

Paragraphs like the one you just read convey a sad state of affairs. People who write them hope that such truths will help motivate action, in the way that if you tell people that their homes are on fire, you assume they will get moving and take appropriate action. But the "renormalizing" of the baseline by each new generation

diminishes the alarming meaning of such words. Perhaps the ideas are understood cognitively, but not phenomenologically, not in a deep sense of one's being. As a case in point, elsewhere, Kahn (2011) describes a conversation he had with an architect. The architect said that he had come to understand very well the idea of environmental generational amnesia when one day he was driving with his son along the tree-lined streets of Seattle, and his son said something like "Dad, look at the beautiful forests!" The architect said with a knowing smile on his face that his son was constructing a concept that a forest was young planted trees along a tree-lined street, while he (the dad) knew that a real forest was… and here he mentioned a forested area outside of Seattle with hiking trails through it. But what the architect did not seem to understand was that the land he was referring to had been logged many times over the last hundred and more years. That land is now a former shell of what the old-growth forests were. So the architect, like all of us, even when we understand about the idea of environmental generational amnesia, is at a severe disadvantage for understanding what we have lost because we do not particularly experience it as a loss, even as the loss causes us tremendous ills and prevents the well-being and flourishing of human consciousness.

Thus our response in our work, as reflected in this chapter, is not so much to describe the ills of the world, as that does not seem all that effective. Rather we seek to show – in terms of building theory and in terms of practice – what is possible to rediscover.

In terms of building theory, we are putting forward an interaction pattern approach to modeling human-nature interaction. These interaction patterns can be thought of as a little like words in a dictionary insofar as they can be individually named, though their basic definition lies in the name itself. Thus, for example, *climbing high in small trees* and *looking at wild animals* are pretty much self-explanatory at their most basic level. But individual words often have nuanced meanings and complex histories. The unabridged version of the *Oxford English Dictionary*, for example, has extensive expositions on tens of thousands of individual words, often showing how they have been used in sentences throughout the ages. So, too, we seek to provide a *nature language* for the interaction patterns. The interactions can be enacted in an infinite number of unique ways, always alive, sometimes on fire so to speak, meaningful. *Looking and being looked at by a wild animal* are not some cerebral experience; no, your whole body comes alive, your senses open, and your immediate perceptions deepen.

In a future publication, we aim to provide a comprehensive account of the foundational interaction patterns that children enact at Fiddleheads Forest Preschool. This account should complement emerging work that has been providing lists of *activities* that children engage in at forest schools, such as running, digging, sand play, yelling, wrestling, building, birding, gardening, cooking over an open fire, and going barefoot (Hanscom, 2016; Kenny, 2013). In future work, we also aim to provide an account of interaction patterns in other locations as well, such as in city parks. One long-term goal is to be able to associate interaction patterns with the affordances of diverse landscapes, which would then help position us to use GIS mapping data to give voice to the human dimensions of specific landscapes the world

over. In turn, that knowledge could be used to articulate a more powerful conservation agenda (to conserve not just land or species but the affordances for human-nature interaction) and be used as a metric to assess the efficacy of specific landscape designs.

To rediscover nature is to care for it because we live within it and are part of it. To rediscover nature requires that we interact with it – in increasingly diverse, deep, and wild ways – and relearn how to speak about it. For anthropologists, the loss of a language is a sign of a vanishing culture. As Davis (2002) writes:

> Language isn't just a body of vocabulary or a set of grammatical rules; it's a flash of the human spirit, the vehicle through which the soul of each particular culture comes into the material world. When you and I were born there were 6,000 languages spoken on Earth. Now, fully half are not being taught to schoolchildren. Effectively, they're already dead unless something changes. What this means is that we are living through a period of time in which, within a single generation or two, by definition half of humanity's cultural legacy is being lost in a single generation. Whereas cultures can lose their language and maintain some semblance of their former selves, in general, it's the beginning of a slippery slope towards assimilation and acculturation and, in some sense, annihilation.

Thus part of our larger project is to reinfuse in our world an alive nature language that is based on our *actual* experiences with our encounters with a living nature and an infusion of our being into the wider and wilder energies and consciousness from which we come.

That is part of our theory-driven agenda, based on what we refer to as interaction patterns and a nature language. In terms of practice, through the work presented here, we are beginning to characterize child-nature interactions in one specific nature preschool. As the reader will likely have noticed from the photographs of the school's landscape, it is not a particularly wild landscape. True, there are some large trees, 5 or 6 ft in diameter at their base. And the area is removed from much of the urban noise and traffic, situated as it is within a larger natural area of the University of Washington Botanic Garden. But the land is mostly flat, with bark underfoot in many areas. Perhaps the wildest aspect of the school's nature is the weather itself. Children and adults are outside all of the time, even when it is cold and raining. Likely enough, this nature preschool could be more effective with more wild terrain, affording more wild forms of interaction. But what we want to emphasize here is that it is wild enough to engender some deep and pervasive forms of child-nature interaction, especially when contrasted to what little nature children encounter in cities throughout the world.

Nature preschools serve approximately 10,000 children each year, and 80% of the programs report a waiting list (NAAEE, 2017). It is a national movement that is gaining momentum. It is an exciting time because in principle these schools have within them the kernels to transform the world through increasing children's direct interaction with nature and a more wild nature than that exists in most urban children's lives. Imagine not just 10,000 children engaging in somewhat wild forms of interaction with nature but hundreds of thousands and even millions of children. Imagine school systems that are fundamentally structured in these ways.

It is possible, and if enacted, they will help awaken us to a natural world that is as vital, demanding, spacious, and awe-inspiring as it is nurturing.

Abstract

Section Four troubles childhoodnature and the Anthropocene, a scientific and popular term used to described the present human-nature conditions on planet Earth. This section does this through eight contributions which broadly speak to four "cenes," namely: children in the Anthropocene – child-cene; woman in the Anthropocene – gyno-cene; cities as sites of the Anthropocene, city-cene; and relations with the more than human – kin-cene. The lines though between/within/through these identified cenes are porous and enmeshed as the nonliving, the

Introduction

This section explores the interfaces between Childhoodnature, the Anthropocene, and the crisis of unsustainability. Here we reposition the latter constructs in the context of the social, environmental, political and economic challenges of global sustainability and the Anthropocene.

The authors in this section were invited to interrogate the progress of education for sustainability (EfS), environmental education, and education for sustainable development (ESD) to date and identify ways to move forward. Potential authors were specifically asked to examine how childhoodnature was positioned within various internationally recognized educational approaches and policy developments, including the outcomes of the United Nations Decade of Education for Sustainable Development (2005–2014) (UNESCO, 2004). When expressions of interest came in, it was clear that there was a strong desire to write outside or beyond sustainability and sustainable development. In fact sustainable development hardly entered into the discourse. From these submissions alone, it could be surmised that the field has moved past sustainability with a renewed focus on the Anthropocene.

Humans have now been recognized as a geophysical force who through altering the Earth's geological systems has invited the renaming of the current epoch to the Anthropocene (Crutzen, 2006; Crutzen & Brauch, 2016). Baskin (2015) positions the Anthropocene as a radical re-conceptualization of the human-nature relationship. As Malone states "philosophically and theoretically, the Anthropocene is a concept that works both for us and on us (▶ Chap. 25, "Children in the Anthropocene: How Are They Implicated?")." The ways in which the Anthropocene is conceptualized in this section is complex, posttime and beyond the realms of a "human species" act. It is critical to caution that "an important contribution to the shortcomings of dominant Anthropocene discourses, is that much of the discourse on the Anthropocene has been dominated by Western scientific perspectives (▶ Chap 26, "Situating Indigenous and Black Childhoods in the Anthropocene" by Nxumala)." The unsettling that the naming of the Anthropocene has administered – and will continue to administer – is a massive jolt to the human collective imagination of humans. Instone and Taylor (2015, p. 139) argue: "If viewed as a potentially transformative naming event with complex affordances, rather than as a scientific validation to scramble for yet another heroic techno fix, debates over the Anthropocene can open a space for constructive circumspection and thoughtful response." In its unsettlement of the entrenched binaries of modernity (nature and culture; object and subject), and its provocative alienation of familiar anthropocentric scales and times, the Anthropocene will continue to open up a number of

possibilities for exploring concepts such as entanglements and differences in children's lives. Childhoodnature as an emerging concept has the ability to be central in identifying and illuminating these possibilities.

Throughout this section, the authors shift the discussion on "sustainability" and "sustainable development" to lives led in the Anthropocene (and within its chaotic material impacts). Perhaps this is because the story of sustainability is written as "if humans were still alone on stage, the only being who out of its own free will is in charge of apportioning space, land, money and value to the old Mother Nature" (Latour, 2015, p. 6). The Anthropocene urgently requires new reconfigurations of knowing that actively acknowledge human and nonhuman relations as intra-active, agentic, and lively, for they are. The naming of the Anthropocene has become a way of re-making such relations between humans and nonhumans, demoting the old mantra of sustainability (Davies, 2016) and considering a life-focused, ecological collective concerned with difference and diversity instead of a presumed universality of sameness. The current environmental crises being faced by children, and caused by adults, and the devastating effects felt by all earthlings, have accentuated rather than diminished real and material differences between the privileged and the not so privileged, the human and not so human. Therefore, it is important not to universalize childhoodnature encounters in the Anthropocene for all relations are located within different places, with different seasons, temperatures, changes, loves, and terrors.

There are eight chapters in this section which constitute a journey of "cenes" including a chapter from Malone on children in the Anthropocene; Nxumalo focusing on indigenous and black childhoods; Gray and Sosu on the re-naturing of science; Whitehouse, Evans, Jackson, and Thorne on children caring for Australian rainforest environments; Kopina, Sitka-Sage, Bienkinsop, and Piersol on educating children in a Post-nature world; Huang, Llu, Wamg, and Xie on urban wetlands and Chinese curriculum reform; Nelson on rats, death and relations in Canadian childhoods; and Worster and Whitten on responsive environmental education through a kaleidoscope of places in the Anthropocene. When undertaking a deep reading of the chapters in this section, a number of cenes or epochs (the beginning of a period in the history of someone or something) appear – namely, the child-cene, city-cene, gyno-cene, and kin-cene. The lines though between/within/through these cenes are porous and enmeshed.

Child-Cene

> I became a UN member, [of a Model of the United Nations for Young People] where I debated for three years, two years for environmental subjects, and one year for human rights. (▶ Chap. 27, "Renaturing Science: The Role of Childhoodnature in Science for the Anthropocene" by Grey and Sosu)

Children as activists, demonstrators, and central figures in bringing attention to the Anthropocene are receiving more and more attention in mainstream media. Hundreds (approximately 1.4 million) of thousands of young people across

Belgium, Germany, Switzerland, Sweden, the UK, and Australia (123 countries in total or 62.43% of the world) went on strike from schools in late 2018 and early 2019 to protest against the lack of political action by politicians to the climate change crisis (Rousell & Cutter-Mackenzie-Knowles, 2019). In Australia "*S*trike 4 Climate Action" has brought thousands of young people together in defiance of the Australian Prime Minister's tone deaf warning to be "less activist" (Baker, 2018).

The "Strike 4 Climate Action," has been inspired by 15-year old Swedish student Greta Thunberg. The youth climate change movement is consequently growing rapidly due to the connecting benefits of a globalized social media. In Sweden, Greta sat outside her Country's parliament insisting the leaders come into line with the Paris Climate Change agreements (see Fig. 1).

In an interview in The Guardian newspaper on 27th November 2018 Greta states:

> .If burning fossil fuels threatened our very existence, then how could we continue to burn them? Why were there no restrictions? Why wasn't it illegal to do this? Why wasn't anyone talking about the dangerous climate change we have already locked in? And what about the fact that up to 200 species are going extinct every single day? I look at the people in power and wonder how they have made things so complicated. I hear people saying that climate change is an existential threat, yet I watch as people carry on like nothing is happening. We can no longer save the world by playing by the rules because the rules have to be changed. I urge other students to join me: Sit outside your parliament or local government wherever you are and demand that they get on track to keep the world below 1.5 degrees. (Thunberg, 2018, p. np)

Fig. 1 Greta Thunberg https://www.theguardian.com/commentisfree/2018/nov/26/im-striking-from-school-for-climate-change-too-save-the-world-australians-students-should-too#img-1. (Photograph: Michael Campanella for the Guardian)

The children and young people in Whitehouse et al.'s chapter "illuminate in their own words their senses of care and connection to the Wet Tropics. Barriers and enablers to restorative practice are discussed in relation to dominant schooling practices, which continue to marginalize the work of caring, even though caring is a logical and necessary response to the Anthropocene." Notwithstanding, Whitehouse et al. (▶ Chap. 28, "Children Caring for the Australian Wet Tropics as a Response to the Anthropocene") study exposed, "many aspects of the formal, public school system in Queensland are not yet fully enabling of caring practice." This is substantiated where educators in the study said: "I'd probably be lynched by certain people for certain views..."; and "I've experienced nature but I can't care less about it [laughing]."

Gray and Sosu (▶ Chap. 27, "Renaturing Science: The Role of Childhoodnature in Science for the Anthropocene") also introduce a different view of the role of children in the critical debates of childhoodnature. They believe as still fairly natural environments speak back to children we must enable children to be able to encounter those moments, especially in the early years: "There *may* be a critical period of time when nature experience is important in establishing or nurturing this ecological identity, and there are some indications that this is in the earlier stages of childhood." (▶ Chap. 27, "Renaturing Science: The Role of Childhoodnature in Science for the Anthropocene" by Gray and Sosu). Huang et al. drawing on Chinese culture also bring the value and importance of childhood encounters into their chapter when they write: "Cultivating children's sense of loving and protecting their environment from an early age is a basic principle for implementing environmental education in China, as an old proverb says 'Habit is a second nature' (DU Guang Qiang, 2011)" (▶ Chap. 30, "How Urban Wetland-Based Environmental Education Activate School Children's Childhoodnature in Anthropocene Times: Experience from Chinese Curriculum Reform" by Huang et al.).

Insights from preservice teachers and their childhoodnature encounters (▶ Chap. 27, "Renaturing Science: The Role of Childhoodnature in Science for the Anthropocene" by Grey and Sosu) reveal the starting points for delving into the spaces for unpacking the delicate relations between children's agency in terms of child-nature relations:

> Me and my brother played a lot of computer games, so we kind of would stay inside and do that rather than going outside.
>
> My mum really doesn't like animals. I have lots of siblings, so, of course, you have to have a pet. . .at one time or another, but it's never been the same pet for more than two months. . .
>
> . . .these sheep I grew very attached to. I did generally know... out into the field when it was old enough and then off chops sometimes . . . I was very fond of a cow we had. . .I was very fond of her and granddad took her off and he came back and said, ah, well, I sold her... I sold her to a butcher who liked her so much that, eh, that he wants to keep her as a pet... even as a primary school child I didn't buy that for a second. . .I knew exactly where she had gone to...

Gyno-Cene

> Black feminist theories are invaluable in making sense of the persistence of these discourses in academia, in schooling contexts and more broadly in society and as modes of resisting absence and deficit in thinking with Black childhoods and education in the Anthropocene. Black feminisms bring much needed attention to the limits of engagements with the Anthropocene that do not also consider blackness and anti-blackness as necessary parts of the ontological and epistemological constellations that disrupt Eurowestern humanism (Frazier, 2016; King, 2017; Rusert, 2010). (▶ Chap. 26, "Situating Indigenous and Black Childhoods in the Anthropocene" by Nxumalo)

Nxumalo (▶ Chap. 26, "Situating Indigenous and Black Childhoods in the Anthropocene") accentuates feminism and black feminist theories as agentic in disrupting minority (Western) humanism. Analogous to White's (1967) seminal article "The Historical Roots of the Ecological Crisis," Worster and Whitten (▶ Chap. 32, "Responsive Environmental Education: Kaleidoscope of Places in the Anthropocene") trace the plight of the Anthcopocene to religious documents such as Genesis 1:

> Let us make man in our image, after our likeness and let them have dominion over the fish of the sea, and over the fowl of the air, and over the cattle, and over all the earth and over every creeping thing that creepeth upon the earth. (Genesis 1, 26) (Worster & Whitten, this Section)

Gray and Sosu (▶ Chap. 27, "Renaturing Science: The Role of Childhoodnature in Science for the Anthropocene") explore the idea of women as childhoodnature in the Anthropocene, where they claim that female children and their female adults, "may have a stronger biophilic predisposition brought about through childhoodnature experiences" (▶ Chap. 27, "Renaturing Science: The Role of Childhoodnature in Science for the Anthropocene" by Gray and Sosu). Whether the strength and meaning of these necessary biophilic perceptions can be recognized and drawn upon to material advantage of the many rather than the few becomes a question of culture and politics. Merchant (1981) illuminated connections between the binary categories Nature and Women as a means for understanding the persisting inequalities of dominance and submission/destruction, a diversity of different kinds of environmentalism are increasingly becoming present in the Anthropocene (Zelezny & Bailey, 2006).

City-Cene

> . . .the lure of sustainability, the city and the call of the Anthropocene, hasn't always delivered its promises. (▶ Chap. 25, "Children in the Anthropocene: How Are They Implicated?" by Malone)

More people live in cities than rural areas. In fact, by 2050 "over two thirds of the global population will call these places [cities] home" (UNICEF, 2012, p. 1). The city is readily seen as a magnet for those looking to improve their life

prospects. With cities growing globally at an estimated 1 million new inhabitants each week or around 60 million people in majority nations leaving the countryside every year, it is a challenge to comprehend the impact of this for those arriving for the first time and those already adrift in the city. Devastatingly, one third of all these city dwellers especially those newly arrived will live on the streets, in makeshift housing or slums in order to make a start to city life. The impact of this shift to urban life on children can be exceptionally grim. Children in the majority world now make up 60% of the total population with 600 million children worldwide living in poverty in streets, slums, or transitional housing in cities. Children will face significant dangers in these situations and along with the elderly will be the most vulnerable. Globally 8 million urban children died in 2010 before reaching the age of 5, largely due to pneumonia, diarrhea, and birth complications (UNICEF, 2012), most of these lives could have been saved by simple services and facilities being made available within communities. But city officials even with the best intentions find themselves burgeoning under the strain of responding to the needs for infrastructure development at the current rates of city expansion.

> Cities are not homogeneous. Within them, and particularly within the rapidly growing cities of low and middle-income countries, reside millions of children who face similar, and sometimes worse, exclusion and deprivation than children living in rural areas. (UNICEF, 2012, p. 8)

Huang (▶ Chap. 30, "How Urban Wetland-Based Environmental Education Activate School Children's Childhoodnature in Anthropocene Times: Experience from Chinese Curriculum Reform") echoes these realities (Chapter 30) with China's rapid expansion of cities. Through unrelenting development Huang (▶ Chap. 30, "How Urban Wetland-Based Environmental Education Activate School Children's Childhoodnature in Anthropocene Times: Experience from Chinese Curriculum Reform") divulge the collision of cities-nature as urban wetlands where urban dwellers find refuge from the hard lines of city streets:

> Urban wetlands with its unique characteristics meets city residents' psychological need to return back to nature, and it serves as a leisure area for local residents and tourists to learn history and conduct research. (▶ Chap. 30, "How Urban Wetland-Based Environmental Education Activate School Children's Childhoodnature in Anthropocene Times: Experience from Chinese Curriculum Reform" by Huang et al.)

Cities are difficult gritty places for humans and nonhumans, a world designed by humans for humans, others infiltrate seeking to belong and become urban adapters. For many children survival in cities can be wrought with dangers, the universal romantic urban childhood exists in the imagination of the white middle class privileged few. The Anthropocene has revealed the reality that a dream of a clean, educated healthy civilized life in cities was a capitalist speculation, a human fiction, the illusion of which has left in its capitalist wake a trail of damaged lives.

Kin-Cene

> What would it mean, in a multispecies context to really share city places? (p. 18) (▶ Chap. 31, "Rats, Death, and Anthropocene Relations in Urban Canadian Childhoods" by Nelson)

Malone (▶ Chap. 25, "Children in the Anthropocene: How Are They Implicated?") writes about her experiences in La Paz where she comes to know a different set of kin relations, a common worldling of child dog. The child-dog body becomes more than a metaphor of how a child and a dog come to be thrown together on a hilly ravine in La Paz but it opens up spaces to speak of relations across histories, cultural nuances, and kin-cene possibilities. In her chapter she writes:

> The city of La Paz has 500 thousand dogs and 1 million children. Every year in La Paz there is a day devoted to caring for dogs, offerings of food, bathes and immunisations. A bow is tied around their neck. During the project the team collected around 2000 photographs taken by children while they moved around the valley. From these images over 200 of the photographs included dogs. (see Fig. 2). (▶ Chap. 25, "Children in the Anthropocene: How Are They Implicated?" by Malone)

The world of child-dog relations follows the story of colonialization, the peopling of the world spirted through the DNA of dogs as they travelled as worldly kin with humans. The kin-cene reminds us we are not in the Anthropocene alone. A host of nonhumans (and not so humans) share our houses, beds, fridges, and families.

Fig. 2 200 dogs (▶ Chap. 25, "Children in the Anthropocene: How Are They Implicated?" by Malone)

Fig. 3 Child-monkey worlding, Iwatayama Monkey Park, Kyoto, Japan. (Photographer, Amy Cutter-Mackenzie-Knowles)

The urban spaces where humans have attempted to denature their lives find urban adapters, the creative animals, plants, bacteria and fungi, that survive with and (sometimes) despite humans attempting to eradicate them.

Kopina et al. (▶ Chap. 29, "Moving Beyond Innocence: Educating Children in a Post-nature World") "critically examines what it means to educate children *as* (part of) nature. . ." For instance, one might reasonably propose Ebola viruses are also part of nature (Kopnina, 2016). Here the trouble (from a humanist perspective) is how to appropriately respond to the expansionist human actions of one part of a planetary nature given the health, well-being, and flourishing of one's own body, species and the ecological community as a whole? Does/ought the same logic hold for all species? What about issues of animal personhood? Are we ready to weigh the life of a gorilla against that of a human toddler fallen into his cage? (Phippen, 2016) Are we ready to seriously consider why one primate should even be in a cage for the sake of another primate's entertainment? (Cutter-Mackenzie-Knowles et al., 2019).

Figure 3, the photograph of the young child in a cage, was taken at the Iwatayama Monkey Park where human animals are placed in a cage and the Japanese macaque monkeys dwell freely in the landscapes beyond. The human-monkey reaches to become acquainted in the in-between – the intra-active spaces where the possibilities for seeking a post-Anthropocene world may exist. The imaginary for something different where other worldings, human/nonhuman kin relations can be disrupted reimagined and reconfigured.

More to the point, if we begin to argue that children *are* nature and nature is *natural*: are we not moving towards dangerous appeals to nature whereby whatever children do – be it killing small animals or pouring motor oil down the sink – is

rendered *natural*? McClaren (2009) speaks to the complicated conversations and problematic logics that emerge from this kind of oversimplification applied to urban centers as natural. The logic goes something like this: "Humans construct cities. If human constructions are not natural, then what does that make humans? Stated differently, how should humans behave naturally?" (p. 303). The question asked by Nelson in her Chapter (▶ Chap. 31, "Rats, Death, and Anthropocene Relations in Urban Canadian Childhoods" by Nelson) brings us to a useful starting point to venture forward: "What would it mean, in a multispecies context to really share city places?" (Nelson).

> These questions [or cenes] follow in the shadow of thousands of years of Indigenous peoples seeing plants, animals and landscape forms as kin, wherein they are already taken seriously as co-constructing beings who impact everyday, culturally specific, place relations (Watts, 2013). (▶ Chap. 31, "Rats, Death, and Anthropocene Relations in Urban Canadian Childhoods" by Nelson)

Concluding Thoughts: Postanthropocene

The muteness for discussing the ESD agenda by the authors illustrates there are real limits to the deliberative devastation of the thin skin of the earth we call our collective home and children can no longer wait for the greening of corporate vandals. The work of reconfiguring sustainability in the face of global consequences of Anthropocentric practices means radically moving beyond a view of the political as confined to "humans." Instead geophysical forces, the nonliving, the human, and nonhuman are all actors contributing to a transition between two epochs (the Anthropocene and the Postanthropocene). In this transition, "sustainability" might begin to look like a "time-bound and contingent goal at best, not an absolute one, so environmentalists will need to construct some other normative standard of value" (Davies, 2016, p. 200). For what can be sustained in a time of accelerating and unprecedented environmental change (what adult people have done to the fabric of life on this planet)? We don't as yet know. Living in the Anthropocene means something quite different. It means love, activism, care, diversity, making space and place for all our kin, and recognizing a differentiated epoch of "cenes" as explored in this Section of the Handbook.

Who Comes in My Dreams?

You come in my dreams
While I sleep and nap
You have the perfect smile and,
Laughing eyes, beautiful hair and,
Naturally Varnished lips,
That figure is simple, yet attractive,

That figure has no well,
Still spends the thought,
That figure has no spring,
Still I can swing and have fun,
You have come in my dreams,
You spoke the lovely words,
As the new snow in the old world,
We can drench, once the snowflakes melt,
You are too lovely and smart to secure my heart
Who comes in my dreams?
Climate change does
—Kiara, 10, NSW Australia (Climate Change and Me Research Project) (Rousell & Cutter-Mackenzie, 2015)

Abstract

There has been much debate about where the boundaries lie that would mark the arrival of the new epoch of the Anthropocene. There have been a number of possibilities proposed: the start of the Industrial revolution in the eighteenth century or the beginning in the mid-twentieth century known as the great acceleration of population, carbon emissions, biodiversity loss, plastic production, and the beginning of nuclear age with the first atomic bombs spreading detectable radiation to every stratum of the planet. But for many scholars in the humanities, these arguments are not as relevant as what taking up the premise or challenge of the Anthropocene provides. As an unsettling ontology that disrupts a persistent

"humanist" paradigm, the concept of the Anthropocene allows new conversations to happen around human-dominated global change, human exceptionalism, and the nature/culture divide. In this chapter through stories from fieldwork with children in La Paz, I will propose the means for considering the ontological openings of the naming of the Anthropocene for the field of childhoodnature.

Introduction

Sustainable cities have often been touted as the "solution to the ecological crisis," the problems of the age of humans fixed through human ingenuity. Yet cities proclaimed as the means for providing shelter and resources for the steadily increasing human populations have placed us in direct conflict with planetary ecologies. Under the auspices the capitalist apparatus of sustainable development and green capitalism, rural and indigenous persons have been persuaded by the dream of a better life to move to the city with their once loved earth now toiled by corporate machinery. Despite the hardships encountered, the draw is great; the anthropocentric urban revolution promised children a healthier, educated life. But the lure of sustainability, the city, and the call of the Anthropocene hasn't always delivered its promises. Robert Macfarlane, journalist for The Guardian, writes:

> The idea of the Anthropocene asks hard questions of us. Temporally, it requires that we imagine ourselves inhabitants not just of a human lifetime or generation, but also of "deep time" – the dizzyingly profound eras of Earth history that extend both behind and ahead of the present. Politically, it lays bare some of the complex cross-weaves of vulnerability and culpability that exist between us and other species, as well as between humans now and humans to come. (April 2016: par. 4)

Philosophically and theoretically, the Anthropocene is a concept that works both for *us* and on *us*. Us being the collective kin of human and nonhuman entities implicated in this obscene event. In its unsettlement of the entrenched binaries of modernity (nature and culture; object and subject), and its provocative alienation of familiar anthropocentric scales and times, it opens up a number of possibilities for exploring concepts such as entanglements and differences. The politics of the Anthropocene demands that our entangled history is revealed and our future story is waiting bare to be unraveled. It asks of us, can the Anthropocene be the means for a way forward through a species thinking that acknowledges human and nonhuman relations as intra-active, agentic, and lively. This work of reconfiguring the Anthropocene means getting beyond a view of the political as confined to "humans," instead geophysical forces, the nonliving, the human, and nonhuman are all actors contributing to a transition between two epochs. In this transition "sustainability" might begin to look like a "time-bound and contingent goal at best, not an absolute one, so

environmentalists will need to construct some other normative standard of value" (Davies, 2016, p. 200). According to Geographer Jamie Lorimer, the Anthropocene "...represents a very public challenge to the modern understanding of Nature as a pure, singular and stable domain removed from and defined in relation to urban, industrial society," and that "This understanding of Nature has been central to western and environmental thought and practice" (2012, p. 593).

Therefore, the Anthropocene rather than scientific facts, verifiable through stratigraphic or climatic analyses, can be a discursive development that problematizes a human narrative of progress that has essentially focused on the mastery of nature, domination of the biosphere, and "placing God-like faith in technocratic solutions" (Lloro-Bidart, 2015, p. 132). In a recent published interview in the journal ethnos, Donna Haraway argued the naming of the Anthropocene constructs a certain model of the globe, a view that "the contemporary world is a human species act" (Haraway, Ishikawa, Gilbert, Olwig, Tsing, and Bubandt, 2015, p. 1). She argues: "...in this moment of beginning to get a glimmer of how truly richly complex the world is and always has been, someone has the unmitigated arrogance to name it the Anthropocene" (Haraway et al. 2015, p. 11). This realization of the possibilities and implications of the events foregrounded in the era of the Anthropocene is compelling, and while the concept may still be contested, it evokes in me a desire to consider the enormous challenges this era will present to the collective global community of human and nonhuman others. Particularly, my focus is on how children are implicated in the Anthropocene.

Drawing on recent research in La Paz with children living in the slum communities, my challenge in this chapter will be to consider how to present the voices of children with and through their everyday experiences of the nonhuman in the debates of the Anthropocene. Acknowledging as Taylor and Pacini-Ketchabaw (2015) do that children's close encounters with the environment described through my research may seem insignificant, small, and ordinary events on the scale of planetary ethics and posed by the Anthropocene. But like them I propose that children, with the nonhuman others they occupy the planet with, will inherit and respond to the consequences of a world we have inherently altered through our exploitative human-induced changes. The story of children – how they are implicated and endeavoring to exist with nonhumans in the "entirely synthetic human creations" of cities – will be the focus of this chapter and is at the center of my project Children in the Anthropocene. My research seeks to reveal the complexities of children's lives entangled with the assemblage of human-nonhuman others – the posthumanist ecological communities of a city, where a paradigmatic shift in thinking is desperately needed. For those who will inherit this uncertain future, our children deserve to be recognized and acknowledged in these critical debates of the Anthropocene.

Naming the Anthropocene

What is the Anthropocene? The naming of the Anthropocene, as a new geological epoch, acknowledges the incredible force of human impact on the earth, nowhere is this impact more vivid than the crowded cities of the majority world nations. While

the term "Anthropocene" (the epoch of the hu/man) has been accepted in the geological discipline landscape, there has been much debate about where the boundaries lie that would mark the arrival of this new epoch. Was it the Industrial revolution in the eighteenth century or the "great acceleration" of the mid-twentieth century with its increasing population growth, carbon emissions, biodiversity loss, plastic production, and start of the nuclear age with atomic bombs spreading detectable radiation to every stratum of the planet (Davies, 2016).

The Anthropocene as used in my research is more than this, more than a timeline of human degradation, geological posturing, or techno-positivist hubris. The Anthropocene reveals for me that beyond the ecological damage there is no homogenous human race and that this scale of ecological impact is unequal, unethical, and unjust; the poor, the children, and the nonhuman are more in it than the wealthy. As an unsettling ontology that disrupts the persistent "humanist" paradigms of the social sciences, the concept of the Anthropocene allows new conversations to happen around human-dominated global change, human exceptionalism, and the nature/culture divide.

The term Anthropocene has not emerged uncontested. Donna Haraway (2015) and many others in the field of childhoodnature including Taylor and Pacini-Ketchabaw (2015) have argued the naming of the Anthropocene constructs a certain model of the globe, a view that "the contemporary world is a human species act" (Haraway et al. 2015, p. 1). Haraway argues: ". . .in this moment of beginning to get a glimmer of how truly richly complex the world is and always has been, someone has the unmitigated arrogance to name it the Anthropocene." Many believe the naming risks validating human exceptionalism by reifying the "reign of Man" leading to the ultimate paradox, in which heroic techno-rescue grandiose geo-engineering fixes simply rehearse the same kinds of interventions that disrupted the earth's systems in the first place. This recognition of "Man's" exceptional powers could be an excuse to redouble efforts to become "better" at managing the environment. For me although recognizing these dangers, the naming of the Anthropocene provides opportunities to galvanize emergent forms of thinking and acting, one could claim that it disrupts the global hierarchy of sciences. After all, it comes as an invitation of collaboration from the "hard sciences," from the apex of the hierarchy of sciences to the human and social sciences. By changing the entrenched habits of modern western humanist thought, which are so adept at dividing humans off from nature, requires persistence, vigilance, and a preparedness to take risks. It is hard work. It requires us to continually interrogate what it means to be human, to resituate humans firmly within nature, and to resituate nature within ethical domains. By recognizing the fragility of limiting a collapse between the categories of human/nonhuman, nature/culture, is to recognize the means through which exceptionalism as a human condition continues to act out in the everyday lives of being with other species and the ethical decisions humans make when positioning themselves as superior to all living things.

I am adopting a posthumanist ethic. A "posthuman ethics" unlike a deep ecological ethic urges us to experience the principle of "no-oness" in our view of subjectivity, by acknowledging the ties that bind us to multiple "others" in a web of complex interspecies interrelations (Braidotti, 2013). Kay Andersen (2014, p. 3) states this focus on "challenging the idea that humans occupy a separate and

privileged place among other beings has been the central goal of post-humanist agenda," with critical posthumanists taking on the task of challenging well-established humanist discourses that "separates and elevates humans from the natural world." Using a posthumanist approach and engaging with the tools of diffraction, I am disrupting the Cartesian divide between human and nonhuman by challenging the simplistic dichotomies of animal/human, nature/culture, and object/subject. These dichotomies are constructing what has come to be "*viewed as nature*," what is "*valued about nature*," and what happens when humans are "*placed in relation with nature*." These dualisms not only strip humans of all of their own "natural" dimensions – we are no longer animal and part of nature – but also install the idea that other nonhuman animals and things are not comparable to humans, humans are politicized as earthly master, superior being, humans as exempt, and exceptional.

By the enabling this multiplicity of ecologies and subjectivities, community then becomes central – the world is, becomes a community of beings. I am interested in incorporating the work of Michael Smith (2013) here, who defines an ecological posthumanist perspective as a strategy for supporting his concept of an "ecological community." A posthumanist ecological community emphasizes the myriad of ways that beings of all kinds interact to create, sustain, messy, uneasy worlding communities. Others have also explored these ideas; Jean Luc Nancy stated in 1997 we are always been "beings in common" – and Derrida (2005) who also argued any concept of "sensibility" or touching means "being in the world" – bodies being sensed ecologically is to be and know. The theory of ecological posthumanism I am applying as a means for unhitching old ways of considering childhoodnature contests singular anthropocentric approaches – by supporting a collective common world. I am supporting this through the image of the onto-epistemological entanglement. I take this term from Barad (2007) where she states when you are practicing intra-action it is impossible to separate knowing (epistemology) and being (ontology). That these shared practices, knowing and being, cannot be isolated; they are mutually implicated. And that we know this because we are off the world, not standing outside of it.

Walking in La Paz

> Cities that are the "microcosms of the planet fashioned for our [human] species and no other." (Vince, 2014, p. 338)

During the period from 2012 to 2016, I researched with over 400 children in slum communities in the highest reaches of the valley of La Paz. We engaged in walking methodologies, photography, focus groups, and interviews. The focus was on understanding the everyday materiality of children's lives as they moved through their spaces with human and nonhuman others. Understanding the materiality of mobilities and how bodies flow through places and spaces with and through materials are as Aldred (2014) notes central and important to research on bodies in the landscape:

> How one moves during fieldwork has important consequences for the interpretative process, and presented movement as a conjunction between body and landscape . . . in order to study movement there is a need to understand it not dialectically, in-between static materials and moving bodies, but rather through the flows in which these two become co-constituent in movement. (Aldred, 2014, p. 40)

These children are descendants of the Quechua and Aymara people, the two largest indigenous groups in Bolivia. Evo Morales, the current president of Bolivia, is of Aymaran descent and, as the first indigenous leader, has supported policies that enhance the opportunity for the indigenous communities to speak of and seek to live in harmony with the earth – recently the country passed the Law on the rights of Earth Mother. Pachamama beliefs view the relations of human-animal companions as dynamic, and humans who are guided in Pachamama are in relation with a "spirit animals" sent as allies during the "human" journey on the planet. Central to this belief is that humans and nonhuman companions depend exclusively on what the earth provides. Pachamama is the source of all life, human, nonhuman, soil, air, and water. Ancestral ceremonies, rituals, and offerings of lama babies to Pachamama are entwined with a profound sense of respect and gratitude for Earth Mother who provides all. The following data shares the stories of children in La Paz focusing on three aspects of their lives (Malone 2017, 2018). The first is how the unsettling of matter, unruly ravines, and slippery slopes produce a precarious landscape; the second explores entangled flows and mobilities as children and other kin move through landscapes; the final focuses on a shared life with dogs, street dogs, who come to be child companions in the precarious times of the Anthropocene.

Lines of Flight: Ravines as Unsettling Matter

> Even when shifts of terrestrial surfaces and patterns are taken into account, it is easy to see these as mainly driven by human forces or the effects of human agency, with no comparable forces seen to be operating in the other direction. (Edgeworth, 2014, p. 49)

The landscape is an assemblage with flows of materials running through it, rivers, rocks, earth, sunlight, and wind; it is a moving omnipresent not a static backdrop to human or animal activities (Edgeworth, 2014). The high slopes are the most unstable with lake sediment deposits. The higher, steeper slopes are also the wettest; they are by far the most landslide-prone slopes within the city. The houses are swept away, buckled, and broken slowly with the earth slumping, the movement edges its way down the valley slope. Houses containing children slip down the valley.

The settlements where the children live sit in a valley surrounded by spectacular mountains. The view is extraordinary, but a closer look reveals a serious reality:

> Reaching out from the urban center and making their way up the mountain slopes on all sides of the bowl are the slums and shanty towns of La Paz. Here, plumbing and electricity are scarce or non-existent, roads sit unpaved and the escarpments that afford such distant photogenic vistas conspire to create an ideal setting for floods and landslides. (Weatherby et al., 2011, p. ##)

In the self-built areas, water is often taken from underground or is filtered from poor quality river sources. Water from the main city below is piped to certain areas, but landslides continually damage and sever this supply so that water from standpipes often has to be fetched up to dwellings by truck or bucket.

Landslides and their effects impact the families living in the settlements for a number of reasons. The environment of La Paz city is landslide active because the steep slopes are covered with soft earth deposits that are easily dislodged with wind and rain and the activity of building moves and displaces the dirt. The area is also impacted by water movement coming from Lake Titicaca, a high-altitude lake that sits high above the valley floor. Rapid growth and the influx of poor people drawn to the city with a desire to build houses means construction is often based on minimal materials and resources. This demand has also resulted in informal, self-built housing being constructed on the steepest most unstable slopes of the city. Finally, without a clear city planning framework, the city had continued to expand with properties being built on the city's treacherous slopes, without care or acknowledgment to the materiality of the earth and its limitations and its constitution as a body containing a past and present history as a landslide hazard.

> When I was a child there was a landslide. My house was on the edge where all the other houses near me all fall down. Ours was the only one left. We stayed in that house on the edge of cliff for five years after that. When my house was on top of the edge my mum and me still stayed there but my bedroom did not have a door – we had a small place to walk but my porch and the other part of the house fall down. We just put some wood and have to use a ladder up the cliff to get to the house. We had to carry the water it was very difficult. That's when my mother decides to rent a different house. In that house I was very sacred. When it starts raining I am afraid scare maybe the house will landslide again. I had my packed ready to go some I have to take it with me. I remember I was scared for strange people as I have a ladder to go to the house was always there what happens it someone comes into the house. Sometimes my mother had to work two times at night and I was alone. I only have my cats. I was so alone. I feel insecure. I didn't go different places because I was too sacred to leave the house alone. My route was school house school house, that was all. I now back in the same house on the edge of the cliff. And now even though the government has given tenure to some people in communities this house cannot because it is on very dangerous land and so we cannot own it. (Elena's reflections of a childhood in the slum communities of La Paz, recorded interview 2014)

The most vulnerable group exposed to the landslide hazard comprise the inhabitants of the self-built informal housing areas who occupy the more elevated steeper slopes of the northern part of the city. But societal vulnerability to earth movement in the city is widespread and interconnected. Landslides in the city of La Paz, Bolivia, are complex in space and time. Their distribution within the city is differentiated by geographical variations in slope gradient, the nature of overlying surface deposits, and drainage density patterns. When mapped, the distribution of the most landslide-prone locations in the city coincides with the most mobile surface deposits on the higher and steeper slopes of the city. The timing of landslides is triggered when slope materials become saturated with moisture by rainfall, stream water, water seepage from high-surrounding water tables, and from domestic sources. The slums are the first and often last stop for those rural drifters and those who come to the city with

expectations of a better life and employment. Living in the steep slopes of the valley in La Paz has unique and significant dangers for children and their families. Constant landslides, fires, limited public transport, strangers, street dogs, and inadequate policing all add to the daily difficulties children experience when on their own or with friend's moving safely around the community.

Children in the communities speak of many dangers in the physical environment but also other concerns about their health due to the lack of fresh water and the dust and dirt in the air, on the street, and in their houses. The children, when taking photographs of their life experience, took many photographs of dumped rubbish in the streets and ravines, where scavenging streets dogs could be found hanging out, fighting among themselves, and frightening the children. The fear of being taken, abducted, or hurt by strangers is real, and during a guided tour, the children in one neighborhood took us to a wall in the community center where the faces of lost children hung as a reminder to them of the risks. These slum communities in La Paz with their narrow steep steps and winding laneways and children who need to make their way alone or with friends to access school, shops, playgrounds, or their homes are a familiar sight in many Latin American countries. Children speak of many dangers some in the physical environment but also other concerns about their health due to the lack of fresh water and the dust and dirt in the air, on the street, and in their houses.

> As children as we had a small house – our bedroom was small we have in the same bedroom two beds, our kitchen, our small kitchen and just that. We didn't have a bathroom with all the sanitary services. We didn't have that and we use to go to the ground. Out to the bathroom we play in the same places, where go to the bathroom we play – and that is still here. I see that in the communities now I work I see that I see my reality, I say I use to be that child. But the part where we live, the property used to be a place where there was landslides. It is not secure land. And that is the reason why my grandfather never put the services. They water we didn't have water no water no sanitary services we didn't have that. We had to carry the water from the branch? Near the river was a little river with water we carried water. (Elena's reflections of a childhood in the slum communities of La Paz, recorded interview 2014)

The unstable slopes, the dirt, and rubbish are important issues children discuss with us during the walks. Children spoke of dumped rubbish in the streets and ravines where they would go to collect water or play. Most children had a photograph in their research of rubbish or dangerous ravines close to their homes where they felt unsafe. Children in Taca Gua particularly noted more than others that there was rubbish dumped near their homes. They also have no access to water or sanitary conditions, so they have to collect water from a central location and often go to the toilet in the earth close to their house. For many like Jonathon and Ricardo, they fear that the houses they live in are precariously located on unstable hillsides, and they worry for their safety. The following is a walking story by Juan where he took photographs as he walked home from school (Figs. 1 and 2):

> I live in Cotahuma. I took this series of four photographs as I was walking up the slopes towards my house after school. The one here is the second in my series. I took this

Fig. 1 Photograph series 1: walking up the valley. (Photograph by Juan aged 15, Cotahuma)

Fig. 2 Photograph series 2: walking up the valley. (Photograph by Juan aged 15, Cotahuma)

photograph because this canal is dirty, it is at the start of the way to my house. I don't like this place to be like this because it looks bad and it makes the area look bad. It is as we are getting to my house, at the lookout. I chose this photo because it is a ravine and it is dangerous, it is so dangerous they need to close it. It is the same ravine, the one that is very dangerous because many people fallen, I think they need to close it because a lot of rubbish is dumped there and lots of people and wildlife fall in. It is just around from my

> house. I chose this next photo because it is very dirty and the owner of the house doesn't clean it. There is lots of rubbish, but the good thing is that the steps are not dangerous. I don't like to walk through here because it is very dirty but I still have to walk through here anyway. This is a photo of where I bring water down from; it is very dirty and very dangerous. The sports field is above too and if the ball falls I have to go and retrieve if from the pile of rubbish. I am worried walking through here especially when it is raining hard and the flood waters may come over the edge of the ravine and wash away my house with me and my family and my dog. See this final photograph I took this photo in El Alto and I don't like the rubbish and it makes it look bad where they go and the dogs stop here and they can bite you. I walk a long distance sometimes because the valley is so steep. There is not always roads or stairs so we make our own tracks through the dirt. (Juan's walking story from school to home)

Gabriel, like Juan, provides images of the ravines: "I don't like this place because many people have fallen from here, it is very dangerous."

In response to a similar photograph, Dayana aged 12 also from Alto Taca Gua said: "I am afraid of this place, it is dangerous, I get very scared."

Ronaldo, aged 8 from Cotahuma, also commented on the dangerous ravines: "I don't like it here because there are ravines, people fall and it is a dangerous place, this place is ugly."

Building houses on the hilltops also causes many problems that the children are very aware of. Ricardo, aged 10 from Cotahuma, took a photograph of a pile of rocks that he tells us used to be his home: "It's my house but it has fallen down, it was ill constructed." He then shows us a photograph of the house he now lives in which is also showing signs of collapse: "t's my house, the cracks are there because it was ill constructed and all the houses in my area are also falling down, the tree roots destroy the houses."

Jonathan, aged 9 from Munaypata, also includes photographs from his neighborhood showing houses precariously hanging on the edge of the hilltop. He describes this: "These houses are hanging dangerously, one of them is collapsing, the one with the nylon hanging out the front is mine." He includes photographs close to the hanging houses and his house where there are piles of dirt and lots of rubbish: "A pile of dirt and lots of dust nearby my house which is collapsing and there is a lot of rubbish' and 'lots of rubbish below my house."

What Jonathon alludes to in his photographs and description is that beyond the dangers presented by the tree roots and slopes, the ravines and the now mostly empty riverbeds have become dumping grounds for rubbish.

Alan aged 10 from Alto Taca Gua is also concerned about the rubbish in his neighborhood and that the lack of rubbish bins: "There is always rubbish here, there are no rubbish bins. I would like there to be rubbish bins because the rubbish gets into the storm water."

Sebastian, who was aged 6, lived in Munaypata, which is a community a few kilometers across the valley from Alan in Taca Gua. But Sebastian has similar concerns about the rubbish, and in his drawing of the neighborhood, we see he draws his neighborhood streets and includes an area of open space with rubbish. He

described his drawing by stating: “This is the place I like least. It is full of rubbish and they drink too much.”

Sebastian also took photographs of him in his neighborhood. It shows the view across the neighborhood near his house. When describing this photograph, he told us: “This is close to my house I took it to show you that we have poor, dirty neighbourhoods and people that drink.”

Yesonia is from Munaypata and took me on a tour of the neighborhood. She takes photographs as we walk and talk. At one place she stops in front of a large dump of rubbish: “I want to show you the rubbish that people dump and the dogs that go to the toilet; it’s a place that is close to the house. I hate it, it smells’. While many children often talked fondly of the dogs in their neighbourhood many children stated that dog feces was a real concern for them. A number of children were also worried about the dangers of street dogs who might bite them and some recalled friends or relatives that had been bitten before.”

Luz, aged 12 from Alto Taca Gua, was also concerned about the rubbish in her neighborhood and its impact on the environment. She describes a photograph she has taken this way: “The rubbish is what contaminates the environment and it is what I don’t like about the area. They dump rubbish everywhere the rubbish bins are there in vain because they don't use them because they want to contaminate the environment.”

Many children said they wanted more police in their community and more policing of bad behavior by adults. Ricardo, aged 10 from Cotahuma, dreams of place to live where there is: “more police control because a thief broke into my house and because there were no police he escaped.”

Gabriel, age 12 from Taca Gua, supports this when he stated: “My neighbourhood is not that safe, there aren’t enough police.”

Mostly children in Cotahuma said they knew where to go or someone to help them should they need help or when in danger. But for children in Munaypata and in Taca Gua, many children were worried there was no adult around to support them when they went out into the neighborhood walking. Most parents in all neighborhoods believed other adults would help their children. Children were asked if they felt safe travelling alone, and their responses were quite varied but more likely than not to say they never felt safe. What this reveals is a sense of real dangers for children in the public spaces, and being kidnapped or hurt by others is a significant worry for them. In Cotahuma children showed us where in the welfare department a whole wall was dedicated to photographs of lost, possibly kidnapped children. Most children could name one child they knew or had heard of that had been kidnapped. This is very frightening, and while some of these may be related to domestic disputes or other family issues, children are also aware that they could be taken off the streets and kept captive in child labor rings, trafficked to other places, and for girls even the possibility of prostitution. Flow and movement of bodies is not always embodied as an action of freedom. I took a photograph of the wall as we walked away (Fig. 3).

Entangled Figurations, Flows in the Anthropocene

Freedom is an act of action; it is not a property; it has no content; it can't be defined. Therefore, there is no order in how to provide freedom it only exists through 'the "autonomy" of the living being against a background of routinized or habituated activity' (Grosz, 2010, p. 148). Grosz (2010), drawing on the work of Bergson, writes about:

> . . . an understanding of freedom that is not fundamentally linked to the question of choice, to the operations of alternatives, to the selection of options outside of the subject and independently available to him or her. It is not a freedom of selection, of consumption, a freedom linked to the acquisition of objects but a freedom of action that is above all connected to an active self, an embodies being, a being who acts in a world of other beings and objects. (2010, p. 147)

This concept of freedom, one that acknowledges the entangled assemblages of children, objects, and others in a world acting together, is valuable in a world where increased uncertainty and manifestations of risk real or imagined will be central to living in the Anthropocene.

Phenomenon could be described as the intra-action between an object and its surroundings. This intra-action leaves discernible marks on those surrounds so as to constitute them as a measuring apparatus of the intra-action. Barad (2007, p. 335) argues:

> . . . apparatuses are not merely human-constructed laboratory instruments that tell us how the world is in accordance with our human-based conceptions. Rather, apparatuses are specific material configurations (dynamic reconfigurings) of the world that play a role in phenomena.

Barad uses the term "intra-action" to describe how two poles of a phenomenon, the object and the apparatus, do not exist as such apart from their intra-action. What is measured by those marks of intra-action, however, is not a property of the object in isolation but of the phenomenon as a whole. The children in the three neighborhoods of La Paz were asked to draw on a map of their movements through the landscape. These marks on the map are as Barad alludes to a "measurement of intra-action" – they record the ongoing dynamics of boundary making (marking) practices of children with the landscape. The marks provide a record of each neighborhood and how children move differently and together through these landscapes. And as they move with and through and intra-act with objects, they leave traces of their past and present.

The maps provide children's movement not as autonomous individuals but rather as collective phenomena of child-city-movements, as material dynamic entangled objects becoming through the landscape. They provide entry points when observing the entangled nature of practice as it unfolds:

> [P]athways or trajectories along which improvisatory practice unfolds are not connections, nor do they describe relations between one thing and another. They are rather lines along which things continually come into being. Thus when I speak of the entanglement of things I mean this literally and precisely: not a network of connections but a meshwork of interwoven lines of growth and movement. (Ingold, 2010, p. 3)

In this way of acknowledging the marking of child-city-bodies in the landscape, there is an accountability to the world as being material, which for Barad (1996, p. 188) "is not about representations of an independent reality, but about the real consequences, interventions, creative possibilities, and responsibilities of intra-acting within the world." Knowing the world by participating in the configuration of phenomena makes one accountable for all of their consequences (Fig. 4).

The marks on the landscape portray the messy flowing streets of Munaypata following the valley terrain and the means through which children have individually and collectively devised complex pathways through the congested urban landscape. The steep crammed valley, with houses built on top of each, providing no space or paths or roads creates. The heavy flows of movement are connected to activities within streets, open areas, parks, playgrounds, and sporting fields. The flowing in and out of the central area that is the neighborhood of Munaypata tracks the means through which children enter in and out of the space along the ravine edges to move downtown to where the schools are and where their parents are working. They return back up the ravines to the neighborhood where they find small areas of open space, some earth to play out of eyeshot of adults who may have presented risks (Fig. 5).

Fig. 4 Collation of Munaypata child-city-mobility maps. (Source: Author)

> In our free time we played just on the earth, we didn't have a play ground we just played with the air, go to the garbage play on the garbage. In my neighbourhood before was so dirty, the river was open and you can smell the water was dirty. And people other communities use to come to there to throw all the garbage near the river and some factories carry some magazines books to throw out near the river and we as a child use to run to see what they had thrown. Maybe we can get some magazines things like that. That happened when I was 10 years old. I remember always I use to have dirty clothes. (Elena's reflections on a childhood in the communities of La Paz, recorded interview 2014)

According to Leary (2015, p. 8), "Mobility is also often entangled with feelings desires and emotions, and indeed certain mobilities, such as say pilgrimages, may be undertaken in order to generate a particular feeling or emotion."

Fig. 5 Complex entangled streets of Munaypata. (Source Sebastian aged 6)

Children's movement and freedom as represented through their intra-acting with and through the dirt, dust, and water of the ravines provides insights into the materiality of being with the earth through an embodied reality of moving through place. It is not the place or destination that is central to these child-city-movements but a mobile materiality that allows the child's entangled world to be revealed. Or as Ingold (2010, p. 3) entices us to consider, "a focus on life-processes requires us to attend not to materiality as such but to the fluxes and flows of materials" (Fig. 6).

Life, according to Deleuze and Guattari (2004), is developed along thread-lines (Ingold, 2010). These thread-lines of life are referred to by them as "lines of flight" or "lines of becoming." Like the markings of the children through the landscapes of La Paz, these are not lines that connect; they are the unfolding of possibilities for how materiality is flowing through the spaces between the earth and the walking. A freedom of flow is taking up agency through child-earth becoming. "A line of becoming," Deleuze and Guattari write:

> . . . is not defined by the points it connects, or by the points that compose it; on the contrary, it passes between points, it comes up through the middle . . . A becoming is neither one nor two, nor the relation of the two; it is the in-between, the . . . line of flight . . . running perpendicular to both. (2004, p. 323)

The "thing" the gathering together of lines of flight is according to Ingold (2010) is how Deleuze and Guattari explain the concept of a "haecceity" (2004, p. 290). The haecceity or thisness of things is represented through this mapping of collective lines of flight. At the center of the Taca Gua map, we can see a number of swirling lines centered around a particular object. The object is the play and sports space – it is also

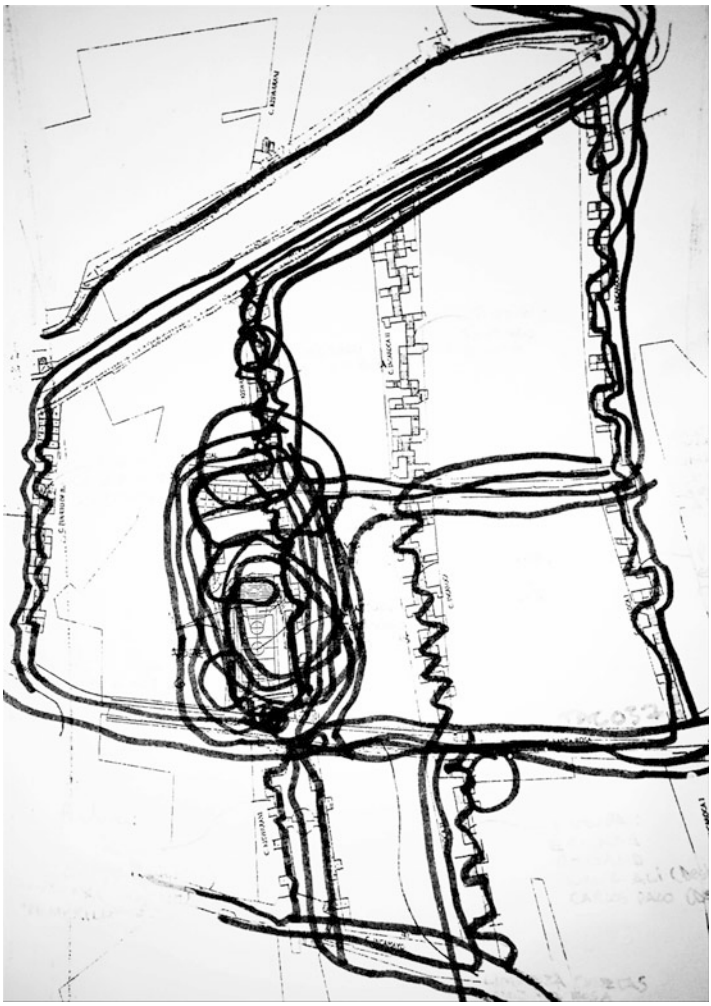

Fig. 6 Collation of Taca Gua child-city-mobility maps. (Source: Author)

the center where we held our workshops. Running vertical to these, the crooked lines illustrate the staircases where children can exit to the top of the valley and ravine into the El Alto or horizontally outward into the forested disused vacant blocks where the valley is so steep constructing houses or stairs is impossible or what was there has now been lost, washed away by a landslide. Walking, walking, carrying, carrying, puffing, puffing – up the steep staircases. The pathways are empty. Bare dirt fills the spaces in between. Hidden from view, the narrow walkways look out across the valley (Figs. 7 and 8).

Fig. 7 Staircases of Taca Gua (Photograph taken by children during walking interview)

> I walked. I always walked I never took the car or bus. Because the road I use to go was hilly and when it was the season of raining – the road was earth, the road was slippery and I use to fall down and I remember my shoes were always were dirty with all the earth. With the earth that's what it was like. We get access to the football field, was field near the river too and we use to go and play and run or play football. We didn't get access to a good real playground it was too far away. (Elena's reflections on a childhood in the slum communities of La Paz, recorded interview 2014)

Ingold (2010) explains the concepts of lines of light and flow as linked to his notions of network and meshwork. He likens it to a spider's web. The collective child-city-movement maps unlike the mapping work by Ward (1978), Moore (1986), Chawla (2002), and Driskell (2002) who use spatial maps to identify the boundaries of children's roaming range focus, these maps record spatial networks as complex intra-actions between human and nonhuman objects. Children of Cotahuma circumnavigate the valley ravines, the steep edges fall away beneath their steps. Reynaldo included a photograph of the obstacles along the pathway for children, he tells me: "I don't like it here because there are ravines, people fall and it is a dangerous and ugly place. A young person fell and that scares me; I want it to be closed off so no more people can fall" (Fig. 9).

> The lines of the spider's web, for example, unlike those of the communications network, do not connect points or join things up. They are rather spun from materials exuded from the spider's body and are laid down as it moves about. In that sense they are extensions of the spider's very being as it trails into the environment. They are the lines along which it lives, and conduct its perception and action in the world. (Ingold 2010, p. 12)

Fig. 8 Collation of Cotahuma child-city-mobility maps. (Source: Author)

The network of lines, the flow of materiality of child-city-movement, provides the possibilities for real and imagined journeys where the human and nonhuman are connected. The defining attribute of a network of flow lines is their potential for connectivity. The spider weaves their threads starting from the center, building layers by knotting carefully each thread; boundaries are created by supporting the trailing of loose ends that fall away.

I am reminded when I look at these child-city-movement maps of habitat or wildlife corridors. When I was working with schools many years ago, we often engaged in tree planting projects with the purpose of creating habitat corridors. Corridors act as points of connectivity for wildlife and are known to contribute to reestablishing populations who may have been impacted by natural disasters such as fires or disease or whose habitat has been reduced because of events such a deforestation, landslides, and road making. Habitat corridors encourage the

Fig. 9 Photograph of obstacles on children's paths in Cotahuma. (Photograph by Reynaldo aged 8)

movement of animals and plants along specific lines of flight in order to create a safe passage through a space, in order that species can flow. According to research, wildlife corridors should be built with randomness or asymmetry, rather than being symmetrical.

Multi-species Companions in Damaged Landscapes

The city of La Paz has 500,000 dogs and 1 million children. Every year in La Paz, there is a day devoted to caring for dogs, offerings of food, bathes, and immunizations. A bow is tied around their neck. During the project the team collected around 2000 photographs taken by children while they moved around the valley. From these images over 200 of the photographs included dogs (Fig. 10).

Dogs are uniquely sensitive to the natureculture attributes of human bodies with whom they live. They have the longest of evolutionary human-nonhuman relation dating back at least 15,000 years. Such is this complex history of human/nonhuman companionship; dog genetic diversity is often used as the means for tracing the history of the peopling of the new world. Tracing the history dogs in La Paz through DNA reveals 90% of dogs travelled to this land during the Spanish conquest, the gentry arrived with their hunting dogs – spaniels and poodles. My companion Poppy is also a cocker spaniel, dogs brought to Australia by the English gentry during the waves of postcolonial invasion. Although they have never encountered one another, dogs of La Paz and dogs of Australia, they are a species in common, both affected by a shared colonial history, the consequences of being worldly with humans. Deborah Rose Bird (2013), writing of her learnings with Australian Aboriginal people, who

Fig. 10 Collation of children's dog photographs. (Sources: Authors collection)

recall stories of their kinship relations with others, the Law, states, "their stories are always grounded in specific places and creatures." Rather than offerings Aboriginal people "sing up country" to acknowledge the relational human-nonhuman entanglement. "Singing up expresses powerful connectivities founded in knowledge recognition, care and love" (2013, p. 4). In my research in La Paz, children sing up earthly kin as child-dog bodies, dogs in La Paz who took us on walks, foraged for food, barked at intruders, and played games in the playgrounds. As our "spirit animals," they were our protectors, our guide dogs, sensing danger, we responded to their sensory cues. They alerted us to the precarity of the damaged landscape. Dogs in La Paz found solace in a shared life with children and children in a shared life with dogs. The following are short extracts from the stories children shared with us. The stories have been taken from a recent publication Malone (2018).

Coco-Juan

Coco coinhabits the environment with Juan. Juan starts his story of life shared with Coco by handing me a photograph of him and Coco. "Coco was my friend" he states, "On our way up the valley I photographed this large dump for rubbish; Coco is in the rubbish looking to find food. We share this life, looking for food. In my next

Fig. 11 Coco-Juan. (Source: Juan age 13 Cotahuma, La Paz)

photograph you can see the place where he plays freely with Coco at the top of the steep valley" (Fig. 11).

Kin relationships emerged in this study of La Paz as a deep sensitivity by the children when describing child-dog experiences. I use the concept of child-dog-bodies to recognize that as kin their shared relational encounters are outside of human-nature dualisms experienced by the adults of the community. Haraway (2015) argues the stretch and recomposition of kin represents the understanding that earthlings are all kin in the deepest sense – it is the purest of entities in assemblages of the human/nonhuman.

Black-Ricardo

"My dog's name is Black," says Ricardo, "He is beautiful and every time I bath him he gets dirty again. He comes with me when I play with my friends'. I worry for Black because he looks at me sometimes with a sad look and I wonder is he feeling pain or is he unhappy. Does he know how I feel? I wonder these things when I am with him. Does he like being a dog? I imagine sometimes that I am Black, that his body is mine. How great it would be to have four legs and run up the hills so fast. He is faster than me. When we go to the forest he always gets their first and he sits and watches me, slowly walking up the slope. It is steep and sometimes dangerous. I feel safer when he is there, you know I know if I got hurt he would help me. Just like I would help him."

Ricardo dreams of changes to his Cotahuma neighborhood to make it safer for him and his dog Black.

Fig. 12 Black-Ricardo. (Source: Ricardo, age 10, Cotahuma)

"The place is poor, the whole area is poor. My new house has cracks, my old house was ill constructed and fell down. I would like more police control because a thief broke into my house and because there were no police he escaped. I would like there to be more sports fields, no dust, and that things were greener so I could play safely with Black [his dog who lives on the street]'. Do you have a dog?"

As we finish this conversation, Norah walks up to show me her photographs. Norah is aged 9, from Taca Gua; she has taken the photograph from the roof of a house with her dog. "This photo is of my neighborhood" she says, "and that is where my house is, it is big and I live with my dad my mum and my sister. My house has many rooms, my dog lives on the street and takes care of me a lot." Ricardo asks her "what is your dogs name?" "I don't know," she replies, "He has never told me." Ricardo who looks down at his photograph of Black now turns to Norah again: "does he know your name then? Black knows mine" (Fig. 12).

Chino-Rosario

Rosario provides me with two photographs when we meet. The dogs are present and central to both photographs. In images she calls *dogs in the streets*, there are a group of dogs in the middle of the road. The neighborhood is empty, which can sometimes create an air of danger, but the dogs are playful, and the child is taking photographs. Rosario explains.

"As I walk to school the dogs come with me. They are the same dogs, everyday walking with me. My special one her name is Chino. She likes to just be with me the most. I like to be with them. They protect me and I protect them. You know if I get close I can smell their bodies, touch them. I can talk to them they listen. They are my friends, especially Chino." There is a pause. "They cannot come in the school though. The teachers get angry when dogs are in the school yard. I think what do they do when I am at school especially Chino? When I go home sometimes she is waiting, I think how does she know, you know that I am leaving?" (Fig. 13).

Fig. 13 Chino-Rosario. (Source Rosario, aged 12 Munaypata)

Conclusion: Attending and Attuning to the Anthropocene

To take back our personhood in relation to other species changes everything. Snaza and Weaver suggest, we need to attune to it; Tim Ingold speaks of attending to it. Both attuning and attending allow us to understand how something *not-self* is *similar to your self* and the not-self is *part of your self*. "What if we defined kin as those we share food from our fridge?" Those we sleep with? Those we play games with? Learn to drink from? "Being with the world" is how Rautio (2017a, b) describes forming a different view of ourselves as human in relation to nonhumans: "...it is about realizing that the relation is always already there, and as much influenced by behavior and existence of other co-existing species as it is by our actions." This form of egomorphism as opposed to anthropomorphism (Milton 2005) attributes the qualities of having a shared life with others – whether they be human or nonhuman. When my dog and my grandchild encounter the environment together, my dog is not being human, and Birdy my granddaughter who is pre-language is not being a dog – they are being worldly with kin, "being animal" sensing it through their bodies, an intelligence beyond "human intelligence" that is often only inscribed through cultural norms of discursive practices.

Child-animal relations co-shape shared worlds even when they are not together. Children in the Anthropocene carry the material entanglement of their lives with others throughout their journey's in cities. Taking from Marisol de la Cadena ideas on the Anthropo-unseen childdogbodies are "more than one – less than many." That is in my queering of binaries, I am creating ontological openings where child, dog, or earth is not either animal or nature. I am not offering up a flat ontology – rather

childdogearthbodies is the opening up of a new spaces in the Anthropocene, not human, not dog, not earth. Child is human but not only; dog is dog but not only; earth is earth but not only. We are implicated in our existence on the planet through our connection with earthling companions, and despite the human predilection to reiterate human exceptionalism, including within many epic and heroic narrations of the Anthropocene, the fact is that our human lives are tied together in this "but not only" spaces with our kin as worldly others.

Aldred (2014) writes: "there are several ways to inhabit movement. To move through a landscape is to dwell in movement, occurring when relates to and reflects on the material world as it is experienced and moved through" (p. 31). In this chapter I have sought to compress time and space through the study of earthly relations with and through movement patterns connected to stories and images taken by children over time in La Paz. It is a collective and individual story. I have, through children's stories of dog kin and child-city-movement maps, stories, and photographs, acknowledged that "human actions and mobilities are enmeshed with the actions and mobilities of flowing materials" (Edgeworth, 2014, p. 58). By applying Barad's (2007) tools of intra-action in order to trace the flow of materials through landscapes, as means for recording the ongoing fluidity and dynamics of objects, I have supported Ingold's (2010) notions of enmeshment and creative entanglement. Movement and freedom can be embodied, performative, and inscribed with pleasure, fear, conformity, and transgression. It is through walking, moving through the city, with children that I have come to know the complicated negotiation children perform as kin and how learning from these we can consider alternative ways of being on the planet with others.

In a posthumanist ecological community, we are always been "beings in common" bodies, materials being sensed ecologically. Sheller and Urry (2006, p. 217) argue while much of the research on movement is conducted at a distance it should also be equally concerned with "the patterning, timing and causation of face-to-face copresence." The texture of the ground, steep slopes, and loose earth; the weather, wind, rain, and darkness; vegetation forests and woodlands; and the others that we share the ground with, all influence and force certain types of movements, freedoms, constraints, and mobilities (Leary 2015). And as Ingold and Vergunst (2008) remind us, we are in relation with a world teeming with a vast array of nonhuman animal life, all of which influence how we move, with whom we move through the landscape, and the trails we leave behind (Leary). A child in the city is influenced by all these things, but beyond the immediate landscape, they may come to know through their meanderings in the leftover marginal spaces close to their homes the entangled and complex world beyond them, a world that is increasingly posing a whole host of heightened risks. Children in these precarious times will navigate the risks and dangers of natural disasters, fearful parents who restrict their freedoms, strangers, and wild beasts real or imagined lurking in the shadow ready to pounce. Mobility therefore is not simply movement, just as freedom is not just about being "free." The act of mobility is imbued with meaning, described in Leary's archaeological world of movement as "an ensemble of freedom, opportunity, adventure and progress, and yet it was also a form of restriction" (Leary, p. 11). The stories of child-dog-bodies moving freely in the landscapes of La Paz provide insights into how we (human-other as kin) come to be in places, with whom and without.

A quarter of a billion years ago, the earth went through a period called "the great dying." An extinction event where 96% of the species of plants and animals on the planet were lost, it nearly ended all life on the planet. Humans and all nonhuman species currently living on the planet are descendants from the surviving 4% of life. We are tied together by a genealogy, a history of our bodies entangled on this landscape with others. Noticing attunes us to worlds otherwise unrecognized; reconfiguring our sensing of bodies forces us into a new kind of history, the tracings of lively ghosts. In a postdevelopment/post-Anthropocene world, the Anthropocene is not just scientific facts, verifiable through stratigraphic or climatic analyses, but it becomes a "discursive development" that problematizes a humanist narrative of progress that has essentially focused on the mastery of nature, domination of the biosphere, and "placing God-like faith in technocratic solutions." It is a heuristic device for gaining a deeper understanding of how we "humans" have come to locate ourselves as master of a 4.5 billion year old planet when we have existed for the mere blink of an eyelid.

I am encouraged through the storying of the Anthropocene to track histories and trace flows and pathways that considers making multi-species livability possible. By wandering through landscapes, where assemblages of the dead gather together with the living, the Anthropocene becomes central to making meaning of the nature of childhood and childhoodnatures. Traces of the past live on through those kin who are among us; disasters and devastation formed our present; and hope lies, in considering these many pasts, as part of our future. Knowing the past is inscribed in our shared bodies and we carry them around with us (Hayles, 2003, p. 137).

Are we on the final steps to sealing the fate of a myriad of species, including our own? Will the damaged landscapes left behind hold only thin traces of the human/nonhuman histories through which ecologies have been made and unmade? (Gan, Tsing, Swanson & Bubandt, 2017). The naming of the Anthropocene acknowledges this incredible force and nowhere is this impact more dramatic than in cities, and no species has more to lose than children.

Abstract

This chapter engages with selected Indigenous and Black feminist onto-epistemological concepts in relation to their potential for interrupting the ongoing absenting or essentializing of Indigenous and Black childhoods in dominant North American nature education discourses. In particular, I consider Indigenous feminist practices of *presencing* and *relating* alongside Black feminist traditions of *testifying-witnessing* as ways of knowing and doing that provide openings for inclusive, critical, non-anthropocentric, and speculative child-nature pedagogies, particularly for Black and Indigenous children living and learning in North American contexts. To illustrate their generative and interruptive potentials, I put these concepts into dialogue with ethnographic fragments of young children's everyday multispecies encounters, children's literature, Black speculative fiction, as well as situated Black and Indigenous place stories. I discuss how early childhood educators in the context of settler colonial North America might engage

Introduction: Situating Knowledge in the Anthropocene

The naming of the Anthropocene as the current epoch of unprecedented human-caused environmental precarity has brought attention to the ways in which humans have transformed the Earth's ecosystems (Steffen, Crutzen, & McNeill, 2007). Intensifying waste generation, species extinctions, increased extreme weather events, and decline in clean water availability are just some of the anthropogenic challenges facing the planet (IPCC, 2014; United States EPA, 2015, 2016). However, the naming of the Anthropocene brings both potential and pitfalls in generating responses to current planetary environmental challenges. There is, for instance, potential in underlining the uncertain futurities and entangled precarities of humans and nonhumans on a planetary scale and thereby harnessing collaborative and collective responses. However, an important pitfall is the re-inscription of a universalized human that not only reinforces anthropocentrism but also fails to account for critical raced, classed, geographic, and gendered human differentials in the causalities and ongoing effects of the Anthropocene (Collard, Dempsey, & Sundberg, 2015).

Of particular concern in this chapter is the persistence of narratives that does not take into account the foundational and ongoing impacts of slavery and genocidal colonial violence in precipitating the Anthropocene (Lewis & Maslin, 2015; Whyte, 2017). These erasures persist despite interventions from work in diverse fields including Indigenous studies, the environmental humanities, feminist science studies, and critical geographies. Taken together these scholarly interventions have highlighted the ways in which current environmental challenges of the Anthropocene are intimately connected to past and present colonial and racial binaries that have prioritized certain humans' dominion over the more-than-human world in extractive and exploitative relationships. For instance, ecofeminist Val Plumwood (1993) brought attention to the fallacy of what she termed the "hyper-separation" of nature and culture in Eurowestern epistemologies and illustrated the connections between the "mastery of nature" and colonialism, whereby the assumed superiority of humans over nature was not and is not accorded to all humans. Put another way, slavery, colonialism, and their current afterlives are marked not only by devastation of the more-than-human world but also by the continual dehumanization of Black, Indigenous, and other marginalized peoples (Sharpe, 2016). As a result, the assumed superiority or mastery of Eurowestern human culture over nonhuman nature is inseparable from colonial and neocolonial extractive destruction of the planet, enslavement and slave plantation economies, and the genocidal removal of Indigenous peoples from their land (Mitchell & Todd, 2016). In summary, engagements

with the Anthropocene, while vitally important and urgent, remain overwhelmingly white and Eurocentric, largely ignoring the fact that while "we are in this environmental mess together," there is no universal "we" in relation to who counts as fully human, who currently suffers and will suffer the most, whose knowledges count the most, what ways of relating to and responding to living-with the Anthropocene are made visible, and in who gets to learn in complex and situated ways with and about the environment (Agard-Jones, 2014; Parham, 2015; Wynter, 2003).

An important contribution to the shortcomings of dominant Anthropocene discourses is that much of the discourse on the Anthropocene has been dominated by Western scientific perspectives. However, there is a growing body of work, particularly from the environmental humanities, that is highlighting the need for much more than a Western scientific understanding of the environment (Gibson, Rose, & Fincher, 2015; Kimmerer, 2002). This work has brought attention to the inadequacies of the universalisms of Anthropocene discourses, such as by arguing that, in addition to scientific understandings, more perspectives are needed to generate responses that trouble the colonial violences of Eurowestern human exceptionalism and nature/culture divisions that have precipitated current anthropogenic vulnerabilities. Important disruptions have emerged from environmental humanity perspectives that take seriously the social and ethical implications of viewing nature and culture as inseparable and point to the necessity of working to continuously avoid the recapitulation of humanist and modernist visions of (Eurowestern) man as savior of and benefactor from nature (Collard et al., 2015; Rose et al., 2012).

So what does this all have to do with early childhood education? Why do concerns about Anthropocene discourses matter for early childhood education? In North America, there continues to be a proliferation in nature-based early childhood programs, such as the ever-popular forest preschools. There has also been a plethora of books, articles, and opinion-editorial pieces on the benefits of "nature" schools or outdoor education for young children (Davis, 2015; Depenbrock, 2017; Louv, 2008; Müller & Liben, 2017). While this attention to the importance of educational attention to the more-than-human world is welcomed, the persistent romantic framing of nature is troubling (Nxumalo & Pacini-Ketchabaw, 2017; Taylor, 2017). In particular, raced and colonial erasures of dominant Anthropocene discourses are continually, even if inadvertently, reinforced (Nxumalo, 2015, 2016, 2017a). The insufficient and problematic engagements of the Anthropocene in early childhood spaces are not surprising, given the prominence of human-centered developmental understandings of the benefits of nature education for children (Taylor, 2013). This developmental framing reinforces colonial nature/culture and human/nonhuman divides and is fueled by the psychologizing and pathologizing of the perceived absence of certain children's relationships with nature (Taylor, 2013, 2017). The overwhelming economic privilege and whiteness of most nature-based preschools and kindergartens are also troubling especially since structural inequality remains invisible or is taken up in deficit ways in both academic and media representations of outdoor programs or young children (Cairns, 2017; Kopnina & Shoreman-Ouimet, 2011).

Clearly then, there is a need for more situated and complex as well as sociopolitically and ethically attuned approaches to environmental education with young

children. Important contributions toward this attunement continue to emerge in recent work by early childhood scholars such as the work of the Common Worlds Research Collective (2017). Drawing from perspectives that include the environmental humanities, posthuman theories, feminist science studies, and queer theory, this scholarship troubles persistent idealized, decontextualized, and human-centered notions of nature and childhood (Pacini-Ketchabaw & Clark, 2016; Taylor, 2017). This work has also sought to complicate environmental stewardship discourses that position certain children as future saviors of nature.

Despite these important orientations toward more ethically and politically oriented modes of engagement with the Anthropocene, there remains a gap in terms of curriculum, pedagogy, and research that specifically problematizes erasures of and deficit orientations toward blackness and indigeneity within the Anthropocene and that works to unsettle child-centered anthropocentric modes of environmental education (Nxumalo & Cedillo, 2017; Nxumalo, 2017a; Taylor, 2017). This gap includes the ongoing erasure of Indigenous land and life in settler children's encounters with places alongside persistent idealized and romanticized couplings between children and nature (Nxumalo, 2015, 2016, 2017a). Another example is found in the ways in which school gardens for young Black children in urban schools are often positioned from deficit perspectives, as a way to bring nature to certain children who lack it. Here nature becomes entangled with anti-blackness as it is positioned as a site of potential transformation for Black children deemed at risk or lacking "normal" connections with nature (Cairns, 2017; Nxumalo & Cedillo, 2017).

In this chapter, I attend to these concerns by seeking ways to disrupt Indigenous and Black erasure and deficit perspectives in environmental early childhood education while resisting anthropocentric modes of pedagogical engagement. My intent is to attend to these omissions by thinking with Indigenous and Black feminist onto-epistemological concepts and their possibilities for interrupting the ongoing absenting, essentializing, and deficit perspectives of Indigenous and Black land and lives in dominant North American nature education for young children. Building on recent work that has considered ways to center Indigenous onto-epistemologies and Black land geographies in place-based early childhood education (Nxumalo, 2015, 2016; Nxumalo & Cedillo, 2017), my specific entry point in this chapter is to bring forward three concepts from Indigenous and Black feminist onto-epistemologies and consider how they might be put to work to enact affirmative and generative childhoodnature pedagogies that center Black and Indigenous land relations and ways of knowing. I am particularly interested in possibilities for actively resisting Indigenous and Black erasure in nature education in research and practice in North American contexts. I am also interested in seeking openings for pedagogies that present Indigenous and Black children's relationships to nature – relationships that disrupt dominant salvation discourses while attending to colonial and racialized inequality.

I work with Indigenous feminist onto-epistemologies of *presencing* (Simpson, 2011) and *relating* (TallBear, 2016) and Black feminist onto-epistemologies of *testifying-witnessing* (Collins, 2000, 2016; Tarpley, 1995) as ways of knowing and becoming that have the potential to activate decolonial and anti-racist orientations

in childhoodnature research and practice in settler colonial contexts. To illustrate their generative and interruptive potentials, I put these concepts into dialogue with ethnographic fragments of young children's everyday multispecies encounters, children's literature, Black speculative fiction, and Black and Indigenous place stories. I discuss how early childhood educators might engage these concepts in their everyday practices with young children and discuss the ethical implications of doing so within ongoing conditions of settler colonialism and anti-blackness. I frame the interruptions brought by thinking with these specific Indigenous and Black onto-epistemologies as propositional approaches that researchers and educators might consider in their work with young children. My use of the word propositional is intentional; rather than putting forward enclosed prescriptions for research and practice to be followed, the intent is to provoke new ethical potentials in relational and situated encounters with knowledges, more-than-human relations, practices, places, and so on. In other words, this is a speculative approach that aims to reimagine different kinds of educational encounters but not just any kind of encounter – encounters that are particularly oriented toward disrupting erasures and deficit orientations in relation to Black and Indigenous land and life in the Anthropocene.

Presencing Indigenous Land and Life in the Anthropocene

In considering ways to respond to the absenting of Indigenous childhoods, land, and more-than-human relations in dominant forms of environmental education with young children within settler colonial contexts, I have been inspired by Nishnaabeg scholar Leeanne Simpson's (2011) conceptualization of presencing as acts that foreground ongoing Indigenous presences, resurgence, and land relationships in multiple ways. Simpson (2011) calls for presencing as decolonial acts that counter the "continual colonial mapping and erasing of Indigenous presence" (p. 96). Importantly, Simpson (2011) does not create enclosures around what presencing can be. For example, she tells a story of Nishnaabeg Rebecca Belmore's *Mapping Resistance* performance art intervention, where Belmore uses the repeated painting and removal of milk from a concrete wall in an urban setting in Canada, as a presencing act – a resistance against the persistent erasure of Indigenous land and sustenance through colonial capitalist processes (Simpson, 2011). In another example, Indigenous scholar Sandrina de Finney (2014) takes up presencing to describe Indigenous girls' complex stories of their relationships to colonized urban spaces as everyday acts that embodied resurgence and resistance in multiple ways, including "protecting, contesting, laughing, hoping, dreaming, connecting, documenting, imagining, [and] challenging" (p. 22).

Inspired by the decolonizing potentials of presencing, I use the concept *refiguring presences* to describe research and pedagogical practices in early childhood education that intentionally seek ways to trouble the literal and figurative ghosting of Indigenous peoples, knowledges, and land from place-based and environmental early childhood education (Nxumalo, 2015, 2016). I see potential for refiguring

presences as a non-innocent knowledge-making practice that interrupts everyday colonialisms in environmental early childhood education.

What then might refiguring presences entail as pedagogical practices? One practice, that I have found useful in working in early childhood settings with predominantly white settler children, has been to seek out place stories that unsettle children's outdoor place encounters as worldings on "supposedly uninscribed earth" (Spivak, 1985, p. 253) both currently and in the past. I am referring here to place stories and practices or (re)storying that affirm Indigenous land, life, and relations, while foregrounding human/more-than-human relationalities. These are place stories that recognize that "Indigenous land, life and futures are deeply entangled and co-constitutive" as Métis scholar Zoe Todd (2017) notes (para. 3). Importantly, while these are place stories for both children and educators, they are not innocent stories; the "'charmed stories' of imperialism and colonialism. . .[that]. . .blind us from understanding our own implication in ongoing racialized and colonial geographies" (Cameron, 2012, p. 15). Instead, these are stories that inhabit questions of power relations.

While such place stories are deeply pedagogical, they are not premised on children's physical, socio-emotional development or academic benefits from nature encounters. Refiguring presences through making visible otherwise place stories does not assume that all the "things," places, and people in these stories are in equitable relations. Refiguring presences through place stories has the potential to highlight complexities and inequities that might otherwise remain elusive in a normative child-centered narratives of events and encounters in early childhood settings. Importantly, refiguring presences through stories requires attention to Indigenous relationalities as an ongoing persistence. Refiguring presences then requires intentional movement away from re-inscribing the relegation of Indigenous peoples to a ghostly past. This, however, does not preclude engaging with the ways that the past continues to haunt the present. As Tuck and Ree (2013) remind me, haunting is also a necessary disruption as:

> the relentless remembering and reminding that will not be appeased by settler society's assurances of innocence and reconciliation. . ..Haunting lies precisely in its refusal to stop. Alien (to settlers) and generative for (ghosts), this refusal to stop is its own form of resolving. For ghosts, the haunting is the resolving, it is not what needs to be resolved. (p. 642)

Pedagogies inspired by presencing then, while having potential to disrupt early childhood environmental education as usual, are risky, implicated, and complex practices that necessarily include attention to intimate power relations and material-discursive colonial geographies as ongoing impacts on everyday life. These pedagogies are situated, emergent, relational, contradictory, and always messy encounters with contested places and the human and more-than-human relations therein that take "seriously the conceptual and empirical contributions of Indigenous epistemologies of land" (Tuck & Mckenzie, 2015, p. 4). Despite this complexity, I see potential in presencing as an early childhood pedagogical practice that might create openings for different connections, relations, and pedagogical responses.

The human and more-than-human stories that pedagogies of refiguring presences might bring to young children's place encounters are stories that interrupt dominant settler colonial, anthropocentric stories of place. Such stories are presented next as illustrative examples from everyday place encounters with young children that might be seen as enactments of presencing pedagogies. These stories are not shared as exemplars to be then followed. They are emergent, tentative, fraught, imperfect, always implicated, and situated practices that are not meant to be universally replicated. They are presented here to underline the importance of unsettling the erasure of Indigenous presences and relations in pedagogical encounters with settler colonial places. These small stories gesture to the possibility for environmental early childhood pedagogies to make visible and disrupt colonial inheritances – inheritances that are inseparable from children's place encounters.

Presencing Red Cedar Kin

On our almost daily walks in the forest, two red cedar trees have become places to stop and linger with the children. The first tree, disintegrating and partially burnt, called charcoal tree by the children, often invites the children to use broken pieces of charcoal to make marks on the exposed red-orange trunk of the tree – a practice one child calls and others echo "we're giving the charcoal back to the tree." The second tree is an ancient hollowed-out red cedar logged tree stump that the children have named bear house – imagined as a home for the black bears that share this forest with us.

Reflections on these encounters by the teachers in documenting children's learning include emergent literacies and children's understandings of the connection between burnt trees and the charcoal that we work with in the classroom, as well as caring relations between children and the forest. However, in thinking with a practice of refiguring presences, different questions and stories emerge. For instance, stories of the settler colonial destruction of much of the old growth Western red cedar trees by logging and fires emerge alongside place stories of the red cedar as kin to the Coast Salish peoples of this place (Nxumalo, 2015).

While there are always unexpected encounters that emerged each time we were in this particular place, this not to say that there is not intentionality in these practices. In these particular examples, our (educators and myself) practices emerged and shifted over several years of repeated encounters with this place with children, documenting the encounters, and critically reflecting on absent presences in these encounters alongside readings and rereadings of work from Indigenous studies, the environmental humanities, and new materialist theories.

More recently, children have been visiting with a Squamish artist as he works on carving a Western red cedar Squamish Welcome Figure close to the childcare center, from an ancient red cedar log gifted by the Squamish Nation. The figure honors the territories of the Squamish, Tsleil-Waututh, Musqueam, and Kwikwetlem territories (Broomfield, 2017). Indigenous and non-Indigenous children at the center have been learning with and encountering red cedar and Coast Salish red cedar kinship

relations. Importantly, here refiguring presences is not about the consumption of Indigenous knowledges and culture by settler children, though this is always a risk against which educators must remain vigilant. Rather, it is about Indigenous and non-Indigenous children living-with this particular place as Indigenous land, as a place of *living* Indigenous knowledges and kin relations. It is also about children learning with this place as a site of settler colonial destruction of the Western red cedar and displacement of Indigenous peoples. For the Indigenous children at the childcare centers, these acts of presencing can be seen as important affirmations of Indigenous land, life, and knowledges and as fractures in colonial temporalities and erasures that place Indigenous knowledge and peoples in the past. Refiguring presences is also about children learning to relate to and become affected by more-than-human others (in this example Western red cedar) in non-innocent ways that trouble human-centered and colonial notions of discovery and learning about nature. Refiguring presences can be thought of then as just one spatially attuned pedagogical orientation that might be needed in the Anthropocene to situate children within the messy anthropogenic settler colonial worlds they have inherited while simultaneously centering and affirming Indigenous land relations.

Relating to Pluriversal Worlds in the Anthropocene

> What if we thought about territory in terms of all of its multiple scales and engaged protocols to include the manifestations of radical inclusion, **radical relationality**, and the building of creative intimacies as our (re)worlding project of love? (Recollet, 2016, p. 101, emphasis added)

Alongside ongoing human-centric discourses in engagements with the Anthropocene, several environmental humanities scholars have underlined that responding to current times of proliferating anthropogenic extraction and environmental damage should include shifting to relations that decenter the human that emphasize reciprocity and obligation between humans and nonhumans and that recognize the intrinsic entanglement of nature and culture. This work has engaged critically with the focus on "grand" technological interventions into the Anthropocene underpinned by neoliberal governmentality, such as geoengineering, amidst an absence of considerations of human/more-than-human mutual obligation, relationships, and entangled precarities (see, e.g., Haraway, 2016; van Dooren, 2014). Work in the environmental humanities has primarily drawn on posthumanist or new material feminist perspectives in troubling nature/culture dualisms and in situating more-than-human others as social, agentic, and political participants in worldmaking with humans (Malone, 2017; Neimanis, Åsberg, & Hedrén, 2015). Here I join others in suggesting that while the intent is not to assimilate Indigenous worldviews into settler colonial worlds, Indigenous perspectives on relationality also have much to teach on learning to live in respectful, reparative, regenerative, and recuperative relations with the more-than-human worlds (TallBear, 2013, 2016; Todd, 2017).

Indigenous conceptions of relationality have never bifurcated humans from the more-than-human world and have always taken seriously the agency and sociality of the more-than-human world. Many diversely situated Indigenous knowledges foreground the relatedness of human and more-than-human worlds, emphasizing reciprocity, care, accountability, and interdependency (Cajete, 2017; Todd, 2017). Indigenous onto-epistemologies of relationality encompass connectedness and kinship with ancestors, future generations, spiritual beings, waterways, skyways, and animal and plant life (Martin, 2008; Tuck, McKenzie, & McCoy, 2014). Dakota scholar Kim TallBear (2016) refers to this as Indigenous people's "co-constitut[ion] in relation to [specific] lands and waters and skies (para 10)." The human/more-than-human relational entanglements recognized for millennia by Indigenous worldviews include their multiple articulations through place-specific creation stories, protocols, teachings, and Indigenous science (Whyte, 2017). In these understandings, human life involves an ongoing immersion in different expressions and experiences of reciprocal relatedness expressed in multiple, specific, pedagogical, sacred, and ecological ways (Tuck et al., 2014). In other words, "knowing your stories of relatedness. . .living your stories of relatedness" are central ways of being and becoming with specific places (Martin, 2008, n.p).

Connecting these ways of knowing and being to needed shifts away from human-centeredness suggests considerations of possibilities for foregrounding entangled relationality as a necessary part of decolonizing the Anthropocene – particularly in ways that center "inextricable relationships between land, bodies, time, and stories" (Todd, 2016a, para. 3). Importantly, a shift to non-anthropocentric relationality is not the same as romanticizing the more-than-human world. Indigenous relationships to land and its more-than-human inhabitants are not romantic: reciprocal relations include ethical, practical, systematic, adaptive ways of flourishing together and dying well together with more-than-human relatives (Whyte, 2017).

Importantly, given the intimate connections between settler colonialism and anthropogenic change, for many Indigenous peoples, living in inextricable relationship with more-than-human others has required and continues to require resurgence, renewal, and recuperation of damaged reciprocal relations (Whyte, 2017; Todd, 2016a). Whyte (2017) gives the example of Iñupiat communities in the Arctic, where people have lived for millennia in reciprocal relations with whales. These cosmological and living relations are expressed in multiple ways including sacred drumming ceremonies for whales. In some of these communities, a resurgence in drumming ceremonies, now adapted to invite whales back into reciprocal relations, has accompanied the interruption of whale cycles due to climate change.

While Indigenous onto-epistemologies of relationality have yet to see significant engagement in non-Indigenous environmental educational contexts, my suggestion here is that they powerfully orient the focus away from human-centric, predominantly scientific developmental environmental pedagogies and toward pedagogical encounters that bring attention to human entanglements with more-than-human relations. In other words, Indigenous knowledges create movements toward the "radical turn towards relationality, difference and interdependence" (Recollet,

2015, p. 132) that is needed to unsettle anthropocentrism in early childhood education.

Materializing pedagogies inspired by radical relationality to early childhood education brings difficult yet important questions. What kinds of pedagogies might be enacted that create attunement to ways of practicing, noticing, and nurturing reciprocal relations with more-than-human others (Nxumalo, 2015; Nxumalo & Cedillo, 2017)? For example, what might it look like for early childhood education to take seriously the contention that relationality with more-than-human others is foundational for young children learning to create and sustain more livable worlds? What might it mean pedagogically for early childhood teachers to take seriously that the natural world exerts agency and participates in sociocultural worlds in multiple ways, many of which are beyond human influence and knowledge? How might these ways of relating inspire early childhood educators in multiple contexts, while staying away from appropriative and consumptive engagements with Indigenous knowledges in seeking out more responsible relations with more-than-human others? While there are no simple and generalized answers to these questions, next I discuss examples of situated pedagogical encounters that might be seen as engaging a politics of radical relationality between human and more-than-human others. In particular, I focus on these pedagogical encounters as engaging radical relationality inspired by Indigenous knowledges in ways that unsettle child-centered pedagogies, resist the erasure of Indigenous land onto-epistemologies in early childhood education, and situate Indigenous childhoods within the Anthropocene in generative ways.

While there has been much written in education research about a recent "ontological turn" and its challenges to human-centeredness, as the preceding discussion suggests, this turn is not new to Indigenous teachings (King, 2017; Todd, 2016b; Tuck, 2014). Gregory Cajete (2017) illustrates how Indigenous teachings to young Indigenous children embody ethical relationality and interconnectedness with place and land as ontological:

> Maybe we will tell them that listening to stories is a way to know how things have come into being and how they are related to everything in the world – plants, animals, places, the stars, and we as human beings. Maybe we will point out a natural place and tell them how they and their people are grounded in the story of that place. Maybe we will tell them that story is sacred to Indigenous peoples and that stories, in their mythic forms, instructed the people on how to live a good life with proper relationship to all things. Maybe we will tell them how they will always be growing in relationship to their own story and the story of their people and place. (p. 114)

While underlining that the Indigenous stories of relatedness and co-constitution that Cajete (2017) refers are not for appropriation by non-Indigenous educators and children, I suggest that radical relationality inspired by Indigenous knowledges can serve as inspiration for early childhood educators in different contexts. For example, I have recently written about a long-term inquiry on bumble bees that young preschool-aged children engaged with unceded Coast Salish territories in British Columbia, Canada. This inquiry discussed shifting our curriculum from learning about bees every spring and encountering bees predominantly as objects

of scientific knowledge toward more relational, embodied, and risky immersion in the lives and deaths of bumble bees including attuning to the current extinction risk facing Indigenous Western bumble bees in British Columbia, bees with a long history of kinship relations with human and more-than-human worlds in this place (Nxumalo, 2017b). Prior to shifting pedagogies toward a relational approach, bees were a universalized and decontextualized object of learning for children. Every spring, bees were a predetermined learning theme in this early childhood classroom. Knowledge about bees as a passive object of children's learning was imparted to children in ways that included bee books, bee cutout crafts, and spring bee songs, alongside the preschool scientific learning *about* bees. A shift to interest-led, emergent curriculum in this classroom led to arguably more meaningful pedagogies. For example, bee pedagogies emerged from the curiosities of children and educators about the reasons for the absence of bee pollination of an apple tree in the preschools' garden one spring. Pedagogical encounters included children and educators self-pollinating the tree using paint brushes and researching the decline of bees in Western Canada (Nxumalo, Oh, Hughes, & Bhanji, 2015; Nxumalo, 2017b). In this example, the opening up to pedagogies that were attuned to childrens' curiosities was an important shift in the classroom. However, our pedagogies remained predominantly human-centric as we (educators) documented children's learning, followed children's interests, and gave children information on how the decline of bees would impact humans. While these shifts from teacher-directed learning themes toward following the child are not necessarily bad and are an important disruption of normative practices in early childhood education, they do not represent a significant shift in learning how to respond in more worldly ways to the challenges of living in anthropogenic worlds (Pacini-Ketchabaw, Taylor, & Blaise, 2016).

In shifting toward a curriculum of relating, our pedagogies became more attuned to alongside more affective and embodied ways of knowing and encountering bees and bee death. This included considerations of ethics, care, human, *and* more-than-human futures amidst bee decline and children's inheritances of unlivable worlds (Nxumalo, 2017b). Taking seriously the provocation to interrupt grand narratives of progress and heroism in the Anthropocene (Haraway, 2015), this inquiry did not provide any resolutions to the troubles of Western bumble bee death but suggests that it matters that children learned to be affected by bee death beyond their own human concerns, that it matters that children learned to relate to the bees' lives and deaths as entangled with their own lives, and that it matters that children came to know the Western bumble bee as an Indigenous species that had lived in relation with more-than-human life and human life for millennia. In this inquiry, children's affective (positive, ambivalent, and negative) and embodied encounters with dead and dying bees in their everyday encounters alongside their scientific learning together helped to activate different kinds of relational pedagogies. These pedagogies were not premised on children's developmentally appropriate learning about bees. Instead they remained open to and sought openings for children to learn to become affected by bee death, to immerse themselves in bee lives, and to connect bee life and bee death with a multitude of both human and more-than-human lifeways, not only their own human ones. In these small, seemingly minor everyday

relational encounters, rather than following children, educators followed bee life and death in their immediate environments, and they followed children's embodied relations with bees. Rather than avoiding or ignoring encounters with actual bees, educators paid attention to mutual affectivity and responsiveness, such as how the struggling bees responded as children "built homes" for and gave sugar-water to them. Small fleeting moments, such as one child gently touching a dead bee for the first time, became moments to consider what different kinds of relational worldings were being enacted through encounters with these typically unloved and awkward creatures (Ginn, Beisel, & Barua, 2014; Nxumalo, 2017b).

As children collected all the dead bees they found outside every day and brought them into the classroom, the growing presence of dead bees in the classroom amidst childrens' concerns about what was happening with the bees also enacted different modes of relating – relating that cannot be captured by romantic images of children-as-nature-stewards. Importantly, while I argue that these immersive relational pedagogies made possible non-anthropocentric worldings that attended to the agency of bees, bee-child entanglements, and bees as more-than-human kin, they were not intended to replicate the more-than-human social worlds and established legal orders (Todd, 2016a) of the Indigenous peoples of this particular place that have been in relationship with Indigenous Western bumble bees. Rather, here I suggest that the worlds enacted by children and bees here, while very minor and small within the scale of the colonial anthropogenic damage, can be seen as the kinds of radical recuperative ways of relating that can help to nurture sustainable worlds. Audra Mitchell (2017) describes this as a politics of collective coexistence that "honours, expresses, protects and nurtures the plurality of worlds" (para. 2) and recognizes the potential for a multiplicity of co-constitutive relations that cannot be captured by a universalizing planetary Anthropocene discourse.

Put another way, taking the plurality of worlds as a given and the attunement to these worlds as a key task in the Anthropocene, the relational attunements enacted in these bee-child pedagogical encounters can be seen as nourishing rather than taking away from the conditions for collective coexistence of Indigenous kinship worlds (Mitchell, 2017). In contrast, the child-centered pedagogies that focused on bees as an object of Western scientific knowledge and considered bees only in relation to what they do for (settler) humans could be seen as colonial worldings that shrink rather than help sustain the coexistence of Indigenous kinship worlds – worlds that encompass bees and Indigenous people in relation as well as complex webs of bee-human-more-than-human relations that can never be fully described and knowable by humans.

Some recent work, which while it may not follow the politics of citation with regard to Indigenous relationality that I have followed in the preceding bee example, is also trying out relational pedagogies that are resonant with the more-than-human relationality that I have discussed in this chapter. This includes pedagogical engagements on young children's relations with waste (Nxumalo & Rubin, 2018), oil pipelines (Nxumalo, 2017a), foxes (Rowan, 2017), raccoons (Pacini-Ketchabaw & Nxumalo, 2015), and kangaroos (Taylor & Pacini-Ketchabaw, 2016). In this work, thinking with relating is not a move back toward innocent childhoodnature

discourses, as perhaps can already be seen in working with "things" and creatures that are not typically seen as belonging in nature education with young children. Instead this work closely attends to possibilities of relating within the unequal and imperfect worlds that young children inherit and coinhabit along with other human and nonhuman beings and entities.

Taken together, the modes of relating that I am putting forward here as situated ways of responding to the Anthropocene with young children enact two important disruptions to normative environmental education. The first disruption is an intentional epistemological incursion into knowledge production about education in the Anthropocene. I have intentionally foregrounded Indigenous onto-epistemologies of relationality and more-than-human agency as an alternative to Eurowestern theorizing about the "turn" to ontology and nature/culture entanglements. As I will discuss further in the next section, such theorizing can reproduce anti-blackness in universalizing "the human" (Jackson, 2015, 2016; Nxumalo & Cedillo, 2017). A lack of attention to worlds outside of Eurowestern knowledge production also reinforces colonialism in ignoring Indigenous cosmologies that have long emplaced people in "complex relationships between themselves and all relations, and with climates and atmospheres as important points of organization" (Todd, 2016b, p. 6). The second disruption is in considering possibilities for shifting practice with young children toward ways that do not assume a singular and passive world awaiting children's and educators' meaning-making. While there are no recipes for enacting this challenging shift toward practices that always begin with relations rather than the child, I have attempted to illustrate here how they offer potential for the kinds of radical relationality that are needed to create pluriversal co-constitutive worlds (Mitchell, 2017) in the Anthropocene – worlds that help to sustain and present, rather than destroy, Indigenous kinship relations with the more-than-human world.

Testifying-Witnessing: Black Children's Lives Matter in the Anthropocene

Black childhoods and Black perspectives in both dominant North American Anthropocene discourses and in environmental education for young children are marked predominantly by absence and/or deficit salvation discourses as well as misrepresentations of Black people as not caring about or as indifferent about nature (Nxumalo & Cedillo, 2017). Black feminist theories are invaluable in making sense of the persistence of these discourses in academia, in schooling contexts, and more broadly in society and as modes of resisting absence and deficit in thinking with Black childhoods and education in the Anthropocene. Black feminisms bring much needed attention to the limits of engagements with the Anthropocene that do not also consider blackness and anti-blackness as necessary parts of the ontological and epistemological constellations that disrupt Eurowestern humanism (Frazier, 2016; King, 2017; Rusert, 2010). Zakiyyah Iman Jackson (2013) eloquently describes the antidote to these erasures of blackness and anti-blackness as the difficult yet important task of situating "'the human' as an index of a multiplicity of historical and

ongoing contestations... rather than tak[ing] 'the human's' colonial imposition as synonymous with all appearances of 'human'" (p. 681). For example, Sylvia Wynter's monumental (1984, 1994, 2003) work shows the insufficiency of Eurowestern humanism in responding to anthropogenic vulnerability. Her work brings a "both/and" orientation that interrupts human exceptionalism while also interrupting a universalized view of the human. Wynter delineates how interrogating humanism and disrupting the colonial human/nonhuman binary require attention to how Black people were and continue to be dysselected from belonging within the category of human. Wynter illuminates the problematics of centering more-than-human worlds as a response to the Anthropocene while leaving unexamined differential human vulnerabilities and responsibility in anthropogenic places. These problematics include a lack of attention to the ways in which the entanglements of colonialism, slavery, and advanced racial capitalism continue to create deeply inequitable human effects.

Taking inspiration from the teachings of Black feminists such as Sylvia Wynter to attune to the constitution of current times in complex ways that consider anti-blackness, relational Black place making, and practices of resistance, I think with articulations of the past/present histories of African-American testifying and witnessing whereby:

> talking back/testifying means to bear witness, to bring forth, to claim and proclaim oneself as an intrinsic part of the world. The act of testifying or giving testimony has deep roots in African American history, reaching back to slavery (and before), to the places our ancestors created..... where they opened themselves up to one another, showed their scars, spoke of their day-to-day life...Testifying...has also performed the function of providing a means by which the slave could make herself visible, in a society which had rendered her invisible; by which she could explore the sound of her own voice when she had been rendered silent. (Tarpley, 1995, pp. 2–3)

In resonance with Tarpley (1995), Black feminist scholar Patricia Collins (1998) points to testifying as relational practices that include affective responses and that are situated within particular Black experiences. She foregrounds testifying as an active naming of multiple and contextualized truths in creative ways. An important effect of the African-American testifying tradition is that it not only makes visible difficulties and injustices that might otherwise go unnoticed by the dominant society, it is also a relational affirmation of humanity, strength, and resilience and hope in the face of dehumanizing injustices (Ross, 2003). Therefore, Black feminist practices of what I am calling testifying-witnessing make visible the complexities of Black geographies, beyond stories of damaged place relations, surveillance, and absence (King, 2016; McKittrick, 2011). Put another way, Black life as "an intrinsic part of the world" to quote Tarpley (1995, p. 2) gestures to a refusal of "ungeographic" as a descriptor of Black life (Tuck, Smith, Guess, Benjamin, & Jones, 2013; McKittrick, 2006). As Black feminist geographer Katherine McKittrick (2006) states, "space and place give black lives meaning in a world that has, for the most part, incorrectly deemed black populations and their attendant geographies as 'ungeographic'" (xiii).

Brought to contexts of environmental- and place-based early childhood education, testifying-witnessing can be thought of as modes of revealing the inequitable differentiations of Black children's situatedness within anthropogenic inheritances, while simultaneously affirming Black children's humanity and generative nature relations. These affirmations include, but are not limited to, multiple acts of agency, subversion, and resistance that exceed knowability within the damage-centered antiblack relations that mark the ongoing wake of slavery (Sharpe, 2016).

In thinking with testifying-witnessing as modes of situating North American Black childhoods in the Anthropocene in ways that are affirmative yet also attend to anti-blackness, my underlying questions are as follows: what are the potentials of practices of testifying-witnessing for making a difference toward situated place inquiry in early childhood education that affirms Black childhoods, affirms Black relations with more-than-human worlds, and is attuned to racialized inequality in the Anthropocene? What might testifying-witnessing as a proposition for changing environmental education look like in curriculum-making or pedagogy with young children?

In beginning to engage with these questions, one proposition is to consider testifying-witnessing as an invitation for early childhood educators to seek out a multiplicity of pedagogical encounters – encounters that witness racialized place-based inequalities *and* encounters that testify to affirmative possibilities for Black children's relations to places. A recent children's picture book, *Over and Under the Pond* (Messner, 2017), provides a glimpse into the types of affirmative testifying-witnessing of Black children's relations to the more-than-human world. In this book, a young Black boy and his mother are pictured rowing over a pond. This beautifully illustrated book uses the child's curiosities and wonder about the inhabitants of the pond and adjacent land to describe the movements, sounds, and doings of a multitude of animal species including minnows, turtles, larva, blackbirds, and otters. The animals' doings described in the book pay particular attention to their interconnected worlds, including descriptions of animals hunting and eating other animals. Examples include lively scenes of a heron catching a minnow, a woodpecker digging for ants, and otters digging for mussels. However, there is an absence of Black geographical specificity within the pages of the story. In the author's note, Messner states that the book was inspired by a canoe trip at a pond in the Adirondack Mountains, but the scenes described in the book are not specifically emplaced. The reader also does not learn anything about the mother and child beyond the shared moments of this delightful day-long canoeing journey. This book could also be seen as representing "romantic, perfect nature for perfect children" (Taylor, 2013) rather than the reality of anthropogenic landscapes since all of the animals and plants are situated within a thriving pond ecosystem. Nonetheless, this book can be read as a small example of one kind of testifying-witnessing that is needed to situate Black childhoods in the Anthropocene. This is testifying-witnessing that affirms Black children as *belonging in and curious about* nature and as having affirmative relations with nature. In this example of testifying-witnessing, unsettling deficit depictions of Black childhoods also includes drawing on child-nature couplings that counter images of Black children as not belonging in or absent from "nature" environments,

including in ways that reclaim Black childhoods. Testifying-witnessing framed as situating Black childhoods in nature considers that while coupling white privileged settler children with romantic "pure" natures can reaffirm colonialisms (Taylor, 2013), for Black children, similar images can enact anti-colonial and anti-racist orientations. These contradictions point to the complexities of unsettling racialized nature/culture and human/more-than-human divides in educational contexts (Nxumalo & Cedillo, 2017).

Finding children's books that witness Black childhoods and nature in affirmative ways while highlighting relationality and belonging is not an easy task. In seeking out depictions of Black children's relationships to nature in several children's books, it has been challenging to find stories that are not linked to oppression and displacement. While the intent is not to ignore these stories, an ethos of testifying-witnessing points to the need for different kinds of stories for young children. These are stories that unsettle deficit or absented depictions, stories that in the vein of Black speculative fictions testify to and witness generative Black place relations and Black futurities. How might such stories be made visible in encounters with particular places with young children? What might emerge from seeking out Black land stories with children?

In seeking to further resist what Katherine McKittrick calls "Black narratives of un-belonging" (2002, p. 28), and amidst the lack of diverse children's literature that reflects the complexities of Black children's relations to nature, including land, I suggest that Black speculative fiction provides an ethos that might be brought to early childhood education as a creative and interruptive mode of testifying-witnessing. Black speculative fiction has a long history of theorizing about Black life in utopic and dystopic geographies – radically imagining Black futurities and reimagining past Black life (Benjamin, 2016; Imarisha & Brown, 2015). The work of Octavia Butler is seminal in this area in creatively bringing together science fiction, environmental issues, and new imaginaries for Black life (Butler, 1988, 1995, 1998). What I am proposing is that in addition to real-world encounters, educators can draw inspiration from Black speculative fiction in seeking out and co-creating with children place-based and environmentally attuned creative inventions that situate Black childhoods in places, including "nature" in ways that unsettle deficit or absented depictions of Black children and that imagine new kinds of Black childhoodnature worldings. While there is a paucity of speculative Black fiction that is specifically for young children, there is a rich body of work for adults and young adults that can provide inspiration (Nxumalo & Cedillo, 2017). One example is the comic book *Niobe: She is Life* named for its Black, half-elf warrior heroine who navigates good and evil in a fantasy world alongside fantastical creatures (Jones & Stenberg, 2015; Nxumalo & Cedillo, 2017). While the worlds inhabited in by Black speculative fiction works are often far from utopian, they provide offer powerful "transgressive visions that center black female subjectivity, challenge the (dis)connections between human and non-human entities, and initiate alternative notions of environmental/ecological ethics" (Frazier, 2016, p. 46).

As mentioned previously, alongside an ethic of resistance and affirmation of Black humanity, African-American traditions of testifying bear witness to injustices

that might otherwise go without care and response by the dominant society (Tarpley, 1995). In bringing these Black feminist onto-epistemologies to early childhood education, I am interested in possibilities for enacting testifying-witnessing in ways that pay attention to anti-blackness and its entanglements with anthropogenic damage. One illustrative example is young children's pedagogical experiences with water. Water, either in surplus or in scarcity, is at the forefront of the environmental challenges brought by climate change (United States EPA, 2016). Feminist environmental humanity scholars have pointed to the need for ethical water relations that recognize our implication in water-related inequities at local, regional, and global scales (Andrijasevic & Khalili, 2013; Chen, MacLeod, & Neimanis, 2013). Water is an ubiquitous material in North American early childhood settings as a foundational exploration, play, and learning material in both indoor and outdoor environments (Pacini-Ketchabaw & Clark, 2016; Nxumalo, 2016). Regardless of context, water is typically viewed as a resource for young children's physical/sensory, socio-emotional, and cognitive development (Gallagher, 2005; Waller et al., 2017). This learning typically takes the form of a scientific and mathematical approach, such as "what sinks or floats" learning activities, and the use of containers and tools to control and measure water. Water is rarely linked to climate change science and issues of the Anthropocene such as floods, drought, and water pollution in children's immediate environments (Dove, Everett, & Preece, 1999; Gross, 2012; Havu-Nuutinen, 2005). Water then holds the potential for the creation of different kinds of pedagogies that are attuned to environmental justice as well as to more relational and less objectifying ways of being-with water in early education contexts.

One potentiality for restorying water in ways that testify to racial and classed inequalities is found in the story of the poisoning of Flint, Michigan's water supply. Pulido (2016) has described the case of Flint's water as a story of structural environmental racism and its entanglements with racial capitalism. This story is told by lead-leached water, Legionnaire's disease-causing bacteria, myriad health problems, and fatalities faced by the predominantly Black and poor residents of Flint; lead-poisoned bodies of Black children; decaying infrastructure; necropolitical governmental practices of neglect and abandonment; the accumulation of plastic water bottles; Mari Copeny, also known as Little Miss Flint, a 10-year-old Black girl from Flint whose activism has become a symbol for the community's resistance and fight for clean water; and more (Latty et al., 2016; Pulido, 2016). Flint water pedagogies as testifying-witnessing can help to activate different kinds of water relations. Such relations unsettle the romance of water-child couplings in early childhood education by attending to specific Black childhoods impacted by anthropogenic waterways. Importantly pedagogies that are attuned to stories of watery environmental damage and racial inequality do not preclude attention to science – it is possible, for example, to consider how teachings of Flint lead-water pipe-water-illness-blackness might emerge alongside age-appropriate science, ethics, and environmental racism learning.

These are not easy pedagogies to enact – just as there is a risk of cultural appropriation in the relating and presencing propositions discussed earlier in this chapter, there is also a risk of environmental racism pedagogies' promulgating

damage-centered stories of Black communities and activating pity (Tuck, 2009). In this particular example, the story of Little Miss Flint's activism is one antidote against this risk that can be brought to children. Testifying-witnessing to the complexities of water and water-child relations could include seeking out particular anthropogenic water stories in children's local environments, paying attention to how differently raced, classed and gendered, and colonized bodies are affected in different ways by water in current times of environmental precarity.

Conclusions

In this chapter, I have put to work Black feminist and Indigenous onto-epistemologies of presencing, relating, and testifying-witnessing as modes of situating Black and Indigenous childhoods in the Anthropocene and as ways to enact citational practices that bring attention to ways of knowing that are typically marginalized in currently educational scholarship on the Anthropocene. Through illustrative examples drawn from everyday practice, real-world anthropogenic crises, and literary works, I have discussed how Black and Indigenous ways of knowing, relating, and living with more-than-human others have much to teach us about hope in current times of environmental precarity, including ways of relating to the more-than-human worlds' unsettle persistent Western humanisms and universalisms that Anthropocene discourses often (even if inadvertently) reproduce. I have also sought to think with the ways in which these concepts might bring attention to Black and Indigenous childhoods in complex ways. These complexities affirm Black and Indigenous childhoods as deserving of presence, innocence, survivance, creativity, and decolonized futurities. They also take seriously the ways in which coloniality and anti-blackness are always already imbricated in the asymmetric impacts of the Anthropocene. In taking a propositional and speculative approach to rethinking children and nature while centering blackness and indigeneity, rather than prescribing practices for early childhood educators to follow, I have provided examples of generative and interruptive orientations that can serve as inspiration for educators in their situated places and spaces of environmental education with young children.

science and science education in the Anthropocene. A *renaturing* of science places a much greater emphasis on, and recognition of, the interdependency and relational nature of the natural world in which humans are inextricably embedded and suggests the need for the development of a strong ecological identity (Thomashow, Ecological identity: Becoming a reflective environmentalist. MIT Press, Cambridge, MA, 1996). This suggests that there is a need for increased availability of childhoodnature experiences and a focus on the quality of those experiences, as well as the need to explore further lifelong opportunities for developing innate biophilic (Wilson, Biophilia. Harvard University Press, Cambridge, MA, 1984) tendencies. The chapter examines the childhoodnature experiences of beginning undergraduate university students and how these influence their current relationship to the natural world. Literature suggests that the strength of a person's nature relatedness can have an impact on the way they view the natural world and can, subsequently, influence the actions they take toward that natural world. This chapter describes a mixed-methods approach used to examine beginning university students' childhoodnature experiences and how those experiences may have influenced their sense of nature connectedness. Data gathered indicates that there are statistically significant correlations between childhoodnature experiences and current sense of nature connectedness, although the qualitative data suggests that the form of those experiences may be of critical importance. Evidence from the study presented here suggests that exposure to childhoodnature, while necessary, is not sufficient in itself, and further research is required into the nature and quality of childhoodnature experiences. This concurs with previous studies, e.g., Vadala, Bixler, and James (J Environ Educ 39:3–18, 2007), which found that it was the particular qualities of the childhoodnature experience that appeared to play a significant part in shaping future interests, attitudes, and values.

Introduction

This chapter starts by examining the context of the Anthropocene and why consideration of beginning university students' sense of nature connectedness is important, particularly in the sciences and those disciplines which influence decision-making with respect to the environment. This chapter draws on quantitative and qualitative data gathered over the past 5 years that is part of an ongoing study focused on sense of nature connectedness and possible childhood influential factors. Data for this chapter were obtained from a cohort of first year undergraduate students in 2013, which is to be followed up in their final year in 2017.

The Anthropocene

The natural world is in crisis, exemplified by the proposal that humanity is now living in the age of the Anthropocene (Steffen, Crutzen, & McNeill, 2007), a new geological epoch characterized by the human impact on the natural flows of energy and materials around the planet. In order to gain some understanding of the way in which childhoodnature might impact on undergraduate students, and how that might influence their actions in the Anthropocene, there is, first of all, a need to consider some of the essential features of the Anthropocene, how these arose, and the role that science and scientific practice and decision-making plays in that process.

The term Anthropocene was first advocated by biologist Eugene Stoermer in the 1980s but not popularized and put into print until he co-published an article with Nobel prize winning atmospheric chemist Paul Crutzen in a Global Change Newsletter in 2000 (Gray & Colucci-Gray, 2014). In this newsletter, they presented some of the fundamental impacts that human technology and progress have had on the planet and stated:

> Considering these and many other major and still growing impacts of human activities on earth and atmosphere, and at all, including global, scales, it seems to us more than appropriate to emphasize the central role of mankind in geology and ecology by proposing to use the term "anthropocene" for the current geological epoch. (Crutzen & Stoermer, 2000, p. 17)

While there are debates about when the Anthropocene began, with some suggesting it originated with the onset of early agriculture (Ellis et al., 2013), Crutzen and others suggest it began with the onset of modern industrialization, near the end of the eighteenth century. Steffen, Broadgate et al. (2015), however, convincingly argue that, from an Earth system science perspective, the period since the start of the 1950s, called the great acceleration, is by far the most convincing. It is during this period that the Earth system indicators, such as the concentration of CO2 in the atmosphere, began to accelerate exponentially (Steffen et al., 2004a). A report from the International Geosphere-Biosphere Programme (IGBP) indicated that the last 50 years have seen the most rapid transformation of the human relationship with the natural world in the history of humankind (Steffen et al., 2004b). Although there may be some debates about when the Anthropocene began, what needs to be asked is How did this happen? and What can be done about it?

Rockström et al. (2009) have identified nine planetary boundaries, which, they suggest, are the intrinsic biophysical processes that regulate the stability of the Earth system and act as a safe operating space for humanity. The seriousness of the global situation is highlighted by the fact that three of these nine planetary boundaries have already been overstepped: rate of biodiversity loss, climate change, and human interference with the nitrogen cycle (Rockström et al., 2009; Steffen, Richardson et al., 2015). Consistent evidence drawn from further scientific studies illustrates that humanity is, to paraphrase Steffen, Broadgate et al. (2015), involved in a great

acceleration toward an apparently unavoidable planetary catastrophe, which will be unable to sustain human life as it currently exists. What is remarkable, however, is that, according to Slaughter (2012, p. 119):

> Despite overwhelming evidence that humanity needs to change course, revise its modus operandi and steer away from the abyss, it continues on its merry way apparently oblivious to the very real danger it is in and uncaring of the costs to present and future generations. This is a civilisation in denial of its existential condition, a myopic and growth-addicted culture that constantly refuses to acknowledge the global emergency it has itself created.

There is thus a call for a fundamental shift in perspectives, worldviews, and institutions, which require a reconnection of the way human society progresses and develops within the capacity of the biosphere and essential ecosystem services to be maintained (Folke et al., 2011). So business as usual with science will no longer suffice (Lubchenco, 1998) and, as Peter Raven, the then president of the American Association for the Advancement of Science stated: "We need new ways of thinking about our place in the world and the ways in which we relate to natural systems in order to be able to develop a sustainable world for our children and grandchildren" (Raven, 2002, p. 957).

A Lost Sense of Unity

Gregory Bateson, an anthropologist, biologist, cyberneticist, and systems thinker, said "The major problems in the world are the result of the difference between how nature works and the way people think" (Bateson, 2011). Bateson argued that many of the problems encountered in the world were associated with a dominant way of thinking in scientific, political, economic, and other spheres, a way of thinking which was fundamentally counter to the way in which nature works. The premise he builds his work on is that every person is part of the living world (Bateson, 2002), and he suggests that "most of us have lost that sense of unity of biosphere and humanity. . ." (ibid, p. 16). He bemoans an education system which "teaches almost nothing about the pattern which connects" (ibid, p. 7). The pattern which connects is a response to the fundamentally reductionist practice of science, which fragments and focuses on the parts. Bateson argues, however, that it is the relationship among the parts which is of fundamental importance, and he calls for a new way of thinking, of perceiving our environment which he calls "An Ecology of Mind" (Bateson, 1972). Thus, if universities have a fundamental role in developing a deep understanding of the world, it is important that there is a close look at how universities influence, or do not influence, students' perspectives, values, and attitudes toward the natural world.

If Bateson's premise is accepted, then there are serious issues and questions arising as to the types of attitudes and values, as well as sense of connectedness to the natural world, that it is desirable for young people to have. It can be argued that this is particularly important for the near 50% of young people coming out of university institutions with science degrees and seeking employment as professional

scientists, as well as others who will be working in sectors that directly impact on the environment and develop and enact practices and legal frameworks with respect to our environment. The knowledge and understanding of their discipline, and the decisions they make, can be molded and influenced by that sense of connectedness they have to the natural world (Weinstein, Przybylski, & Ryan, 2009), which has also been shown to be directly linked to their level of pro-environmental attitudes and behaviors (Chawla, 2007). To date there have been no studies which have looked specifically at university science students' sense of nature connectedness and their perspectives, values, and attitudes toward the natural world. The study described here just begins to do that within a broader study across all university disciplines but does provide a clear foundation for further research in this area.

The view presented in this chapter is that there is a need for a shift in perspective with regard to human-nature relationship, particularly in the sciences and those disciplines which model themselves on scientific practice. As Kates et al. (2000) suggest, it is important for scientists and engineers, as well as citizens, to be aware of the social and environmental impacts of their practices and how this can inform decision-making processes. Thus, as universities are perhaps foundational in the development of these scientific practices, and their impact on decision-making processes, it is, then, important to explore these influences on the undergraduate student population. Science is built on a foundation of viewing the natural world as something "out there" to be viewed and analyzed objectively with humans removed from the scenario, but the products and resources derived from that knowledge are being used primarily for human benefit. While the developments that brought about the Anthropocene are complex and emerging from an intricate entanglement of knowledge production, commercial expansion, and consumer exploitation, it is very clear that science has had a major role to play in all of these areas. Just as there has been a great acceleration in the impact on the planet, that has coincided with significant developments and the changing nature of science in society.

Now firmly established, the idea of the "paradigm" is well elaborated in the history and philosophy of science. Kuhn (1996) describes the paradigm as being the term that relates closely to "normal science," and these suggest accepted examples of actual scientific practice, which provide models from which emerge particular coherent traditions of scientific research. As a particular worldview becomes established, drawing from the scientific laws, concepts, and theories that have come to be accepted within the scientific community, the "paradigm" becomes firmly embedded in practice and ways of looking at the world. For example, modern science since the time of Descartes (1596–1650) and Newton (1642–1727) has been built on fundamental principles of reductionism, which is the belief that the world can be understood by analyzing discrete separate parts and then assembling a picture by putting the parts together. Such views resulted in the notion that the mind was entirely separate from the body and has impacted on the way that knowledge is viewed and knowledge comes to be known (McNerney, 2011; Merleau-ponty, 2004). While the mechanistic and reductionist ideas in science have been immensely successful, and still have a very important part to play in scientific endeavors, they have also proved to be problematic when applied to complex, open systems such as

those that regulate the planetary cycles. So, for example, Solé and Goodwin (2000, p. 19), theoretical biologists, believe that reductionism is inadequate as the primary explanatory framework of science. Elsewhere Goodwin has suggested that a more holistic science is needed (Goodwin, 1994, 2000), which considers the whole rather than just the parts, but also involves consideration of the relationship between the parts and the whole. This requires a fundamental shift in the perspectives and the practices of science and scientists.

The Parts and the Whole

While for unproblematic issues science as currently practiced is probably very effective, and sufficient, for more complex problems, the model for scientific argument needs to be not a formalized deduction but an interactive dialogue among many stakeholders, what Funtowicz and Ravetz (1993) refer to as postnormal science. However, it can be argued that postnormal science still requires a new way of thinking among scientists themselves, a deeper sense of connection with the Earth on which humanity lives, and a sense of connection that is often found among indigenous communities around the world (Pierotti & Wildcat, 2000). In fact, in many respects, it could be suggested that the practice of science requires a transformation of the scientists themselves, a view espoused by Goethe (1749–1832) who, while largely recognized as a literary figure, also made significant contributions to scientific thinking. In Goethean science, the scientific ideal is to allow oneself to be transformed through an immersive observation and experience of the phenomenon itself which is under consideration, the ultimate aim of science being nothing more than the metamorphosis of the scientists themselves (Amrine, 1998). It is interesting to note that in using the term "theorizing," Goethe understood this in its etymological sense as our "way of seeing." Thus, referring back to Raven (2002) and Bateson (2002) mentioned earlier, new ways of thinking are needed, just as much as new ways of seeing. Or perhaps it can be argued that what is needed is a return to our original way of seeing and being in the world, a way of being, thinking, and seeing which has been lost over the millennia of Western human development (Kaplan, 1992) and particularly in the era of the Anthropocene.

Resonating with Bateson's views presented earlier, Bortoft (1996) suggests that the greatest difficulty in understanding comes from our long-established habit of seeing things in isolation from each other, an inheritance from the scientific practices of reductionism and personal distance from the object being viewed. However, Bortoft, who himself was a quantum physicist closely associated with David Bohm (1917–1992), provides a critique of current scientific practices and suggests that while reductionist practices can help to explain things, they do not necessarily lead to *understanding*. It is only when things are seen in their context, "so that intrinsic connections are revealed" (p. 290) that *understanding* is developed. Bortoft and Bohm were both very concerned about understanding *wholeness*, and wholeness can only be understood by considering how things *belong* together (Bohm, 1980; Bortoft, 1996, 2012). Explaining something, which much of science

attempts to do, is not the same as understanding it, even though, as Bortoft states, these are often confused.

In a similar vein, Albert Einstein, one of the foremost scientific thinkers of the twentieth century, recognized the limitations of science with respect to serious social, and it could be argued environmental, problems. He stated that science "cannot create ends and, even less, instil them in human beings.... For these reasons we should be on our guard not to overestimate science and scientific methods when it is a question of human problems; and we should not assume that experts are the only ones who have the right to express themselves on questions affecting the organization of society" (Einstein, 1949). This links with the idea of other ways of seeing the world such as those of indigenous peoples (Pierotti & Wildcat, 2000). Similarly, Jones (2013) argues that the contemporary discourses of sustainable development and tackling climate change are plagued by the same modernistic assumptions of rationality in their reliance on scientific enquiry and the separation of people from the biophysical environment. There is thus, as argued by Hofstra and Huisingh (2014), the need for a shift from anthropocentric perspectives to more ecocentric approaches.

One of the difficulties in inculcating ecocentric approaches is that young people are, arguably, having less experience in natural environments and can be said to be suffering from "nature deficit disorder," a term coined by the journalist Richard Louv (Louv, 2005). This term has been critiqued by Dickinson (2013), who calls it a "misdiagnosis," which can result in a "mistreatment" of the problem. She suggests a rethinking of human-nature disconnectedness by digging deeper into the problem's cultural roots. Nevertheless, such a view has spawned considerable research on the effects of nature, or lack of contact with nature, and on health, well-being, cognitive functioning, and environmental behaviors (e.g., Hartig, Mitchell, de Vries, & Frumkin, 2014; Taylor & Kuo, 2006, 2009; Restall & Conrad, 2015). If scientists and other professionals, as well as the responsible citizen, are expected to act in environmentally positive ways and to make decisions based on a solid understanding of the impact that those decisions will have on the environment, and ultimately the human population itself, it is necessary for them to have, from a very early age, a deep understanding of the way nature works.

The Human (Dis)Connection with Nature

While many people are now very aware of the extreme environmental problems facing humanity, this is not always reflected in their attitudes or actions toward the environment (Dunlap, Liere, Mertig, & Jones, 2000; Kaplan, 2000). A number of studies have set out to try to understand why some people engage in environmentally responsible behavior, whereas others do not. Worthy (2013), in his book *Invisible Nature: Healing the Destructive Divide Between People and the Environment,* explores the gap between humans and the natural world, providing an explanation for the profound psychological dissociation of people from nature. He suggests that fragmentation and dissociation are at the heart of the planetary, ecological crisis.

What is required to heal this rift, he suggests, is deep understanding and reengaging with nature in every aspect of our everyday lifestyles. While it can be suggested that the dissociation between humans and nature is a result of psychological and attitudinal beliefs and values, resulting in particular behaviors, what also needs to be understood is why these values, beliefs, and behaviors develop and predominate at the expense of more pro-environmental behaviors.

Given the arguments presented earlier with regard to the role of science in the complex socio-environmental and scientific entanglements, it is important that we begin to understand how attitudes and values toward, and our perceptions of, nature develop. This, it can be argued, is particularly important in those groups who have the greatest influence over how we manipulate and use natural resources, scientists being among those. Yet, to date, while there have been many studies of nature connectedness among university students, there have been none that specifically look at science students. While this study does not exclusively focus on science majors, it begins to address some issues which can be followed up in future studies.

Chawla (2007) suggests that childhood experiences in nature can influence sense of connectedness to nature which, in turn, has an influence on pro-environmental attitudes and behaviors. However, a survey by the Natural England revealed that around 12% of young people report never having visited a natural space in the previous 12 months and only 21% reported visiting a natural space once a week (Hunt, Burt, & Stewart, 2015). The key element of connectedness to nature (CNT) theory is that people's physical, mental, and overall well-being is directly affected by their relationship with the natural world and increased exposure to nature and positive experiences of the natural world (Restall & Conrad, 2015). Such claims are backed up by empirical research and consider aspects such as improvements in general health and well-being (Newton, 2007), accelerated recovery from illness (Ulrich et al., 1991), and improved community and social relationships with reduced crime and aggression (Kuo & Sullivan, 2001). Other cognitive effects are also documented such as attention restoration (Kaplan, 1995, 2001) and improved cognitive functioning (Atchley, Strayer, & Atchley, 2012; Berman, Jonides, & Kaplan, 2008). Crucial to this is the view that a greater connection with, and thus commitment to, nature can lead to a higher human interest in environmental protection. Such a view is supported by evidence suggesting that greater nature connectedness is highly correlated with pro-environmental attitudes and behaviors (Restall & Conrad, 2015). As DeLuca (2005) suggests, how individuals think about nature guides how they act toward nature.

Exactly why nature should have such significant impacts is not clear, although there are some hypotheses, most notably E.O. Wilson's (1984) biophilia hypothesis which suggests an evolutionary entanglement giving rise to feelings of "affinity" with the natural world. Nature "affiliation," in the biophilia hypothesis, is more than just a simple attraction or positive disposition but appears to be associated with fundamental human survival processes, such as physical, emotional, and intellectual well-being (Kellert & Haven, 2008; Wells, 2000; Wilson, 2001), as well as in the development of pro-environmental behaviors (Kaplan, 2000). There are other

authors who take a more skeptical view of the evolutionary hypothesis (Joye & de Block, 2011) but do, nevertheless, accept the strong evidential basis for the restorative responses to natural environments.

While biophilia may be associated with an evolutionary response, it is, nevertheless, a "weak genetic" tendency that depends on experience and socialization for its expression (Kellert & Haven, 2008). The importance of the socialization processes thus places emphasis on the significance of adults, for example, parents, other family members, and teachers, in supporting and enabling children's exposure to natural environments, fostering pro-environmental attitudes and values but also the awareness of the importance of natural environments for health and well-being and cognitive development. These adults, it is suggested, are often associated with being significant figures in children's lives with respect to developing pro-environmental attitudes (Chawla, 2007) and links with Vadala, Bixler, and James's (2007) finding that *social facilitation* is an important factor in enabling young children's play in natural environments.

It is within this context that the current study was initiated, the aim of which is to examine the kinds of environmental attitudes and behaviors, and sense of nature connectedness, exhibited by young people entering university. More specifically, this chapter examines the associations between childhoodnature experiences and nature connectedness of first year university students. The study was guided by the following questions:

1. What is the relationship, if any, between self-reported childhoodnature experiences and beginning undergraduate students' sense of nature connectedness?
2. What are the key factors in childhoodnature that appear to influence the development of a sense of nature connectedness?

Methodology: A Mixed-Methods Approach

This study set out to explore beginning university students' sense of nature connectedness, or relatedness, and how this is influenced by possible childhoodnature experiences. A sequential mixed-methods approach was adopted (Creswell, 2003). As described by Sosu, McWilliam, and Gray (2008), one of the main strategies of this procedure is using a quantitative approach to test theories, followed by a qualitative method involving a more detailed exploration with a few individuals. In the current study, both sequential and concurrent strategies were used. Data were collected sequentially, whereas analyses of the quantitative and qualitative data have been carried out concurrently. The quantitative strand used surveys to explore students' conceptions of their relationships with nature, and the qualitative strand examined more fully the students' life experiences and the role these may have had in forming their relationship with the natural world and what might be termed their ecological identity (Clayton & Opotow, 2003; Thomashow, 1996). The qualitative strand used a case study approach to provide an in-depth exploration of participants' childhood experiences and current sense of nature relatedness. The qualitative data

allows for insight into the experiences and perceptions of individuals which is not available from the quantitative data, and both data sets together enable deeper understanding of the influence and nature of childhoodnature experiences on the individual's developing ecological identity.

Participants

Data for the study were obtained from a cohort of 463 first year undergraduate students who enrolled in 2013. This group is part of an ongoing longitudinal study that was to complete a follow-up survey and interviews in their final year of study, at the time of writing. Participants were invited from first year students enrolled on courses across the three Colleges: the College of Arts and Social Sciences (CASS), the College of Life Sciences and Medicine (CLSM), and the College of Physical Sciences (COPS).

Quantitative Survey

For the quantitative study, all first year students across the three Colleges were invited via email to voluntarily participate in a survey. The email detailed the aim of the study and requested any students interested in taking part in a follow-up interview to provide their contact details. On the whole, 463 participants (21% response rate) completed the survey although once data was cleaned the number of usable data was reduced to 443. The questionnaire measured the following:

Sense of nature connectedness: This was measured using the nature relatedness (NR) scale (Nisbet, Zelenski, & Murphy, 2009). It describes an individual's level of connectedness with the natural world with a focus on one's appreciation for, and understanding of, our interconnectedness with all other living things on Earth. The scale consists of 21 items measured on a five-point Likert scale (1, disagree strongly, to 5, agree strongly). Cronbach's alpha (0.86) based on the current sample indicates that the measure is reliable.

Childhoodnature experience was measured using six different items based on literature suggesting that these may be influential in developing a sense of nature connectedness or linking with biophilia (e.g., Vining, Merrick, & Price, 2008; Fawcett & Gullone, 2001; Kaplan, 1995). Experiences were either related to being in nature (four items) or close relationship with pets (two items). Participants were asked to rate the extent to which they had these specific experiences during their childhood. Items were measured on a five-point Likert scale (1, disagree strongly, to 5, agree strongly).

Childhood domicile measured participants' place of abode during childhood. Students were asked in the questionnaire to indicate the kind of environment they grew up in ranging from large town/city to the countryside, to see if proximity to natural areas had any influence on nature relatedness. The responses were

dichotomized into rural and urban childhood domicile in order to make the findings easier to understand.

Gender was measured by asking participants whether they are male (coded 0) or female (coded 1). A total 25% of participants indicated that they were male with 66% indicating their gender as female. Nine percent did not indicate a gender preference and were coded as "gender missing" for analytic purposes.

Age: Participants were asked to indicate which of the age categories (<18 years, 18 years, 19 years, 20 years, 21–25 years, 26–30 years, >30 years) best represent their current age. Majority of the respondents (41%) were 18 years of age with over 78% of participants aged 20 years and below. This is consistent with the entry profile of first year undergraduate students in the UK.

Quantitative Analysis

Initial bivariate analyses were undertaken to explore associations between sense of nature relatedness, childhoodnature experiences, and other background variables. This was followed by multivariate regression to test the effect of childhoodnature experiences on sense of nature connectedness while taking into account factors such as childhood domicile, gender, and age. Analyses were undertaken using SPSS 24 and Mplus 8 software packages.

Quantitative Findings

Bivariate Relationships Between Childhood Experiences, Nature Relatedness, and Background Variables such as Discipline, Age, Gender, and Childhood Domicile

Bivariate analysis (Table 1) showed that students in the College of Life Sciences and Medicine exhibited, on average, the highest nature relatedness (NR) score closely followed by the students in the College of Arts and Social Sciences, with the Physical Science students scoring the lowest. However, these differences were not statistically significant $F(2, 440) = 1.66$, $p = 0.12$. Students in all three Colleges, overall, also reported similar levels of childhoodnature experiences $F(2, 431) = 0.8$, $p = 0.93$. Since no statistical differences exist between students in the different disciplines, all subsequent analyses were based on a combined sample across the disciplines.

Bivariate analysis (Table 2) exploring associations between discrete childhood experiences and sense of nature relatedness indicates that students who reported greater childhoodnature experiences were equally more likely to report a greater sense of nature relatedness.

With respect to the different types of childhoodnature experiences, those who reported greater engagement in one nature-related activity were significantly more likely to also report greater engagement in other types of activities. However, having a family pet was weakly associated with other nature experiences during childhood.

Table 1 Comparative descriptive statistics (mean and standard deviation) of students' sense of NR and childhood nature experiences across disciplines

College	Nature relatedness mean score (SD)	Childhoodnature experience mean score (SD)
Arts and Social Sciences	3.62 (0.57)	3.57 (83)
Life Sciences and Medicine	3.63 (0.61)	3.56 (0.96)
Physical Sciences	3.50 (0.47)	3.53 (0.91)

Table 2 Correlation between childhoodnature experiences and nature relatedness reported by undergraduate students

	1	2	3	4	5	6	7	8
1. Nature relatedness	–							
2. Time in nature alone	0.43***	–						
3. Time with friends in nature	0.28***	0.43***	–					
4. Walks with parents in countryside	0.23***	0.37***	0.38***	–				
5. Outdoor activities	0.30***	0.39***	0.35***	0.42***	–			
6. Own pet	0.24***	0.23***	0.18***	0.13**	0.12*	–		
7. Family pet	0.13**	0.18***	0.11*	0.12*	0.05^{ns}	0.63***	–	
8. Age	0.26***	0.02^{ns}	0.11*	0.01^{ns}	0.01^{ns}	0.07^{ns}	0.04^{ns}	–

When exploring associations with age, it was found that, while a sense of nature relatedness increases with age, older participants did not have significantly greater childhoodnature experiences than younger students.

Analysis exploring gender differences suggests that female students reported higher childhoodnature experiences than their male counterparts (Table 3). Differences were statistically significant for spending time with friends in nature, taking walks with parents in the countryside, and owning a pet. Differences were not significant for spending time in nature alone, doing outdoor activities, and having a family pet.

With regard to current sense of nature relatedness, female students ($M = 3.62$, $SD = 0.59$) reported higher sense of nature relatedness than male students ($M = 3.47$, $SD = 0.50$), and these differences were statistically significant $t\,(401) = -2.35$, $p < 0.05$.

Students were asked in the questionnaire to indicate the kind of environment they grew up in ranging from large town/city to the countryside. Consistent with expectations, those who lived in a rural setting compared to urban dwellers reported significant nature-related experiences with respect to spending time in nature alone

Table 3 Gender differences in childhoodnature experiences

Childhoodnature experiences	Male	Female	*p*
Spent time in nature alone	3.24	3.41	0.255
Spent time with friends in nature	3.34	3.88	0.001
Walks with parents in countryside	3.18	3.77	0.001
Did outdoor activities	3.47	3.51	0.823
Had own pet	3.05	3.45	0.03
Had a family pet	3.54	3.78	0.218

(M = 3.6 vs. M = 3.1, $p < 0.001$), spending time with friends in nature (M = 3.9 vs. M = 3.6, $p < 0.01$), taking walks with parents in the countryside (M = 3.9 vs. M = 3.3, $p < 0.001$), and having a family pet (M = 3.9 vs. M = 3.5, $p < 0.05$). Although those who lived in rural areas reported more outdoor activities in childhood (M = 3.7 vs. M = 3.6, $p = 0.81$) and owning a pet (M = 3.5 vs. M = 3.2, $p = 0.06$), these differences were not statistically significant. There were however no statistical significant differences in sense of NR between students who lived in rural and urban areas during childhood (M = 3.6 vs. M = 3.6, $p = 0.27$).

Predicting Sense of Nature Relatedness

Childhoodnature experiences, childhood domicile, gender, and age were specified as predictors of sense of nature relatedness. Regression analysis was used in order to ascertain what factors uniquely predict the students' current sense of nature relatedness. Analysis was carried out in Mplus 8 software using maximum likelihood estimation to effectively deal with issues of missingness in the data. The overall model explained a significant amount of the variance (29%) in students' sense of nature relatedness. Results of the analysis (Table 4) showed that of the childhood experiences examined, spending time alone in nature, having pets, and engaging in outdoor activities significantly predict current sense of nature relatedness. More specifically, these experiences were associated with greater sense of nature relatedness.

Childhood domicile was not a significant predictor of sense of nature relatedness. However since domicile was associated with significant nature experiences in childhood in favor of rurality (bivariate analysis above), it can be speculated that domicile may have an indirect effect rather than a direct effect on sense of NR through greater opportunity for nature experiences in childhood. Significant background variables were age and gender, with older students and female students having a greater sense of nature relatedness after controlling for childhoodnature experiences. From the bivariate analysis above, there is little indication that age differences in NR are due to greater nature experiences in childhood.

The quantitative data and analysis provide some indicators of key differences among particular groups within the sample cohort, but it does not provide enough information to gain a better understanding of the way in which childhoodnature

Table 4 Predictors of sense of nature relatedness

Predictor	B(SE)	β
Childhood experiences		
Time in nature alone	0.15(0.02)	0.33***
Time with friends in nature	0.01(0.03)	0.03^{ns}
Walks with parents in countryside	−0.001(0.02)	-0.002^{ns}
Outdoor activities	0.05(0.02)	0.14**
Own pet	0.06(0.02)	0.17**
Family pet	−0.02(0.02)	-0.06^{ns}
Childhood domicile (rural vs. urban)	−0.05(0.05)	-0.5^{ns}
Age	0.09(0.02)	0.24***
Gender	0.12(0.06)	0.09*

experiences act on or might influence the perceptions, attitudes, and values of the individuals concerned. In order to try and gain a deeper insight into the students' childhoodnature experiences, and their perceptions of those experiences, a number of interviews were conducted. These are described in the following section.

Qualitative Case Studies

While the quantitative data offers an indication of *what* has happened, in order to try and understand *why* this happens, it is important to conduct a more in-depth qualitative study drawing on case studies (Miles & Huberman, 1994). The 2013 cohort who completed the survey were asked if they would be willing to be interviewed. Over 100 students provided their names for potential follow-up. Since our methodology was a sequential mixed-methods approach, preliminary analysis of the survey data informed the selection of interesting cases for interview. Participants who were of interest were those who had different combinations of NR and childhoodnature experience scores, as well as a mix of subject disciplines and childhood domiciles. From those who had provided contact information and expressed a willingness to be interviewed, 28 invitations were sent. Of these, 14 responded initially but only 12 of these confirmed and turned up for interview. However, one of these turned out to be a third year international exchange student whose email had been included in the first year email list and had completed the survey. She was, therefore, excluded. This left 11 case study students who were interviewed. Details of the case study interviews are provided in Table 5.

What is of particular interest in the cases is that, while in many instances the scores reflect what might have been expected from the statistical analysis, i.e., nature relatedness (NR) score tends to be correlated closely with the childhoodnature (CN) experiences, there are interesting exceptions to these. Some students with low self-reported childhood experiences had a rather high score on the NR scale, e.g., Mary (NR = 4.05 out of a maximum of 5, average CN = 1.00 out of a maximum of 5), while others with a higher than average childhoodnature experience

Table 5 Characteristics of case study participants

Name[a]	Age	Gender	Childhood domicile	Mean NR	Mean childhood experiences
Filipa	>40	F	In a small town or village <50,000	4.81	4.83
Nichola	27	F	In a small town or village <50,000	4.57	4.67
Nadia	19	F	In a small town or village <50,000	4.14	4.17
Mary	20	F	In a small town or village <50,000	4.05	1.00
Hedda	19	F	In a small town or village <50,000	3.33	2.50
Gordon	18	M	In the countryside away from centers of population	3.29	3.83
Aristea	18	F	Edge of large town/city	3.05	3.33
Conrad	19	M	In the countryside away from centers of population	3.00	4.33
Clara	18	F	Medium-sized town/city 50,00–500,000	2.90	1.83
Toby	19	M	Large town/city 500,000	2.86	2.67
Sandy	21	M	In the countryside away from centers of population	2.48	2.33

[a]Note: Names have been changed to preserve anonymity

display a less than average NR score, e.g., Conrad (NR = 3.00, CN = 4.33). The interviews were therefore focused on gaining insight into their backgrounds, experiences, and perspectives in order to advance a greater understanding of the kinds of factors and experiences that act on and influence young people's sense of nature connectedness and their attitudes and behaviors toward the natural environment. The length of the interviews ranged from 15 min for the shortest to 45 min for the longest with an average length of 26 min.

All interviews were transcribed verbatim and analyzed using NVivo software. Specifically, findings from cross-case emerging themes and issues arising from the data are presented.

Qualitative Findings

This section looks closely across the cases to see if there is anything that can be discerned from their backgrounds and experiences that might be helpful and informative in understanding the relationship between childhoodnature experiences and sense of nature connectedness.

We can say from the quantitative analysis that childhood experiences are strongly linked with current sense of nature relatedness, and within those experiences, spending time alone in nature, having pets, and engaging in outdoor activities appear

to be significant predictors of current sense of nature relatedness. As the qualitative cross-case analysis was undertaken, aspects of these emerged from the students' descriptions of their childhood with two distinctive areas or themes emerging. The first of these related to the proximity of nature, and the second was with respect to the types of experiences described by the students in those areas.

Table 5 shows that there are essentially three groups of students distinguished by their score on the NR scale. The first of these are the higher scorers, each of them scoring above 4 on the NR scale. This, according to Nisbet et al., (2009), is predictive of ecological perspective, as well as strong views about the seriousness of ecological problems and human treatment of the environment. Nisbet et al. also hypothesized that highly nature-related individuals would be drawn to animals. Nisbet (2014) found that community samples had mean scores on the NR scale ranging from approximately 3.0 to 3.7, while environmental activists and educators had an average score of 4.4–4.5. So with the student sample, it could be said that Filipa, Nichola, Nadia, and Mary are more similar to the environmental activists and educators, while Hedda, Gordon, Aristea, and Conrad are more representative of the average citizen. Clara, Toby, and Sandy on the other hand relate less to nature than average. It might, therefore, be possible to discern from case analysis of students' accounts some characteristics of their childhood experiences that are particularly formative. Interestingly, in these cases, three of our four high-scoring students are older than the other students, two of them being at least several years older. This reflects the findings in the quantitative analysis that age is a significant predictor of nature relatedness.

Proximity to Nature

The first theme that can be discerned from the interviews is that of proximity to nature. Many of the students actually lived within close proximity to nature, although with slightly differing forms of nature ranging from open countryside, farmland, and woodland to urban parks and city greenspace.

The students with higher NR scores described their childhood homes with respect to the nearness of the nature:

> Born in, in a little village in. . . so a lot of nature, freedom and so on. . .. (Mary)

> It was a tiny little village in [place], erm, I grew up right in the middle of. . .it was countryside farmland. (Filipa)

Nadia did not elaborate on the natural environment where she stayed, in a small town of around 30,000 inhabitants but said:

> . . .it's near the tourist area,. . . so it's where party destinations are and stuff like that. (Nadia)

In contrast to the other three high scorers who had more rural childhood experiences, Nichola grew up:

> . . . in a suburban area. . . I wouldn't say easy access to the countryside because it's a suburb within a big city. So, you would have to drive. . .to go to the countryside. (Nichola)

Nevertheless, within this suburban area, there was quite a bit of greenspace:

> . . .in my suburb specifically we have lots of trees,. . ., that we used to climb. . . (Nichola)

Comparing the type of childhood domicile across the cases, there does not appear to be much to separate the high scorers from the more average scorers.

Hedda, while living on the outskirts of a small town, lived in quite close proximity to the countryside:

> Where I lived was just on the outskirts, so it was like, at the top of my road there was like farms and stuff. . .. But I was still part of the town. And erm, it was like relatively urban and er, but it wasn't particularly like skyscrapers at all. (Hedda)

Interestingly, Gordon had had considerable experience of nature, perhaps more than his childhoodnature score would indicate, having grown up on a farm:

> I grew up with a lot of nature and I suppose I was just. . .I say nature we. . ., I grew up with a lot of other things. . .eh, nasty chemicals that, . . . were inevitably nipping my eyes. (Gordon)

Aristea's very early childhood was in a semi-rural area close to a small town; her later childhood was overseas but still close to countryside:

> From my house we can see the forest research institute in [country]. . .and it's a very large, kind of, a seed bank. . .huge big forest, and that. . .. (Aristea)

Conrad described his childhood domicile as:

> I was brought up in a town for the first nine years of my life, and then we moved out, . . . from the town,. . .to land owned by my grandfather. He had a farm. . .so they gave us a field and we built a house, . . . so we lived in a field . . .the closest. . . population was maybe two miles down the road, . . . a small little hamlet of houses. (Conrad)

While most of the students lived in fairly consistent environments during their earlier and later childhood, even if they moved, two of the students had quite different, contrasting changes. Mary's early childhood had been, as described above, in close proximity to a natural environment but later her family moved:

> . . .to a small studio and every time I walked out of the studio, we had a sidewalk . . .. (Mary)

So, from the time she was 6, for the next 14 years, Mary, until she came to the university, lived in a small European town and clearly had a much more restricted sense of freedom to roam within that town:

> The studio, it was just. . .. Every time you walked out the door you had to be careful, because there weren't cars all the time, it was, basically, a city. It was completely different. (Mary)

This was in contrast to the way she describes her very early childhood prior to moving to the town:

> . . .you had nature everywhere. We had a big garden and then, um, you just had to go up a little street and you were surrounded by fields and so on, which. . .some of them belonged to my,. . .to my grandfather. (Mary)

Such a shift in environment may help to explain why Mary reported a low score on the childhoodnature experiences in the questionnaire, which actually related to her later childhood, whereas her early childhood was rich in nature experience. In contrast to Mary, Conrad reported a relatively high score on the childhoodnature experiences (4.33) and yet a rather neutral sense of nature relatedness (3.00). Interestingly Conrad's story is almost a reverse of Mary's where the earlier part of Conrad's childhood was spent in a small town but the later part in a very rural, countryside setting:

> I was brought up in, sort of, a town for the first nine years of my life, and then we moved out, . . . about twenty miles from the town,. . .to land owned by my father's father, so my grandfather. He had a farm. . .so they gave us a field and we built a house, and so we lived in a field away from everyone else. . .we lived. . . like, in a little. . .the closest, sort of, population was maybe two miles down the road, and it's, like, a small little hamlet of houses. (Conrad)

Conrad's earlier home:

> . . .it was quite suburban and we lived on the edge of, like, football pitches and some. . .like, sort of, wasteland-y, field-y stuff. (Conrad)

The students with the lower NR scores tended to be associated with more urban environments yet still reported having some access to more natural areas.

Toby, for example, grew up in a suburb of London, but while in a fairly metropolitan area, he described the environment as quite green:

> It's fairly, fairly green actually. . .there are lots of green spaces. there's a very, there's a pretty famous park where, erm, some of the famous Tudor people used to live. (Toby)

Clara similarly, while she lived in a medium-sized town, reported using city greenspace with friends and significant adults as a child:

> I was very much an active child, like, liked to be outside quite a lot.. . .there was quite a lot of kids around my street where I grew up, and we all had quite big back gardens. . .um, so we tended to go in there. If I was out with my grandparents and things like that, they'd take us to all the different parks around [hometown]. I think I've been to all of them. (Clara)

Sandy, in contrast to the other two lower-scoring students, grew up in the countryside, his family living in:

> An old school house that's been converted into a residence. It's me, mother and my uncle live there. There's a few houses nearby within maybe a few hundred metres but the nearest village is five miles and the nearest town is fifty miles so it's fairly isolated. (Sandy)

So, while there is some evidence from the quantitative study indirectly linking rurality with more childhoodnature experiences, all of our cases had some form of access to either countryside areas or greenspaces in the form of parks or other urban greenspace. This is where examination of the types of experiences described by the students may have more significance.

Types of Nature Experiences

When the types of nature experiences reported by each of these three groups are examined, it is possible to get a sense of the differing experiences they each had. Those who had what might be described as richer, or more affective experiences, or who had more extended periods of time in nature, tended to have higher NR scores.

Filipa describes a childhood with a lot of freedom to roam:

> . . .me and my best friend, . . ., we just used to disappear at the crack of dawn and come back at the end of the day. Take a sandwich or something with us or go and run around the orchards and steal the . . . blackcurrants and apples and strawberries and stuff.
>
> . . .it was really, a really kind of free country childhood, if you like.

Also, in line with the findings from the quantitative data, she spent quite a bit of time in nature alone:

> . . .we were pretty much left to our own devices. And if my friends weren't around I used to wander off by myself and. . .I would investigate rabbit holes and fox holes and things like that.

Mary similarly had a relatively free range type of childhood:

> . . . we would just. . .me and my sister, we. . . And now with cousins, we would just wander. . .freely, so, um, um, it was a. . . Yeah, we had a lot of freedom. . ..

Nichola, on the other hand, had regular routines in greenspace, but this was done nearly always with her mother.

> And my mum's a single parent and she doesn't drive so we walked everywhere.
>
> . . .my mum would make a point on the weekends to, eh, find some sort of green space.eh, within the city centre,. . .every Saturday was our picnic day so we used to go to the park and

> run around and play ball et cetera. . . . have a picnic and walk around the entire day before going home. So, that was. . .it was like my weekly routine.

Although the quantitative analysis links experiences alone in nature with higher NR scores, this did not appear to be the case with Nichola, as most of her time was spent with her mother. However, it appears that the experiences with her mother were rich as she was an advocate of the outdoors:

> Be in nature alone? I said no because even though my mum was like a, eh, a very big advocate of camping et cetera because she was a single parent. . .I didn't have the opportunities to go out camping. . . and I don't think she would have let me go out by myself.

Nadia indicated that much of her childhood had been spent quite actively in the outdoors:

> . . .like, my spare time was full of that and my activities would involve camping.

Later, however, Nadia was unable to be quite so active as a knee injury prevented this. Nevertheless, she was very involved in reading about environmental issues and was involved in organized debates around these issues:

> I became a UN member, [of a Model of the United Nations for Young People] where I debated for three years, two years for environmental subjects, and one year for human rights.

Examination of the second group of students, with more average NR scores, indicates that, while they did appear to have been close to nature in a physical sense, they did not have what might be described as deep or sustained experiences of exploring nature. In contrast to the above average NR students, the descriptions by the more average NR scoring students did not give any sense of prolonged enjoyment with nature or had a very utilitarian view and in some cases also led to mixed, perhaps negative, emotions or experiences.

With Hedda, a further description of the town she grew up in revealed that there were plenty of opportunities for nature experiences:

> . . .and there quite a lot of like nature reserves and places around sort of where I lived. Like they had a reservoir, and there was like a big park in the middle of the town centre and stuff.

However, Hedda made it clear that she did not engage much with greenspace or nature:

> I was a big fan of staying indoors. . .Watching TV and stuff, rather than actually going outside. . ..I went outside quite a bit in like summertime, when I'd have like summer holidays and stuff. . .But erm, it would mostly be kind of going outside but not to nature parts, like places where I could ride my bike and stuff.

For Hedda, a significant part of her childhood was spent indoors, watching TV and playing computer games with her brother:

> Me and my brother played a lot of computer games, so we kind of would stay inside and do that rather than going outside.

Similarly, Conrad's childhoodnature score on the questionnaire came out as quite high, but when asked about this, Conrad then said that he didn't spend a lot of time in nature, rather spending his time playing computer games:

> . . . I played a lot of computer games and stuff like that . . .when I was a lot younger. . . I can't tiptoe around the fact that I probably. . .wasted a lot of time just playing video games and stuff.

However, when asked to say a little about what kinds of activities he would do when he did go outside, he explained that:

> We wandered around. . .there's a couple of, sort of, half used building sites, but they weren't really building sites, they were more just, like. . . abandoned, and we just, sort of. . .like we made forts and stuff like that, and all that kind of stuff. Um, go for walks. There's, sort of. . . a forest. . .a pine-y forest-y area. . .that we'd go to and climb trees and stuff like that. . . we walked on. . .we walked on the beach sometimes.

In explaining his reticence toward outdoor and nature experiences and his retreat into computer games, he said:

> . . .but, you know. . .in. . .in Ireland it's cold and wet and. . ..

This suggests a less than enjoyable experience of nature.

In contrast, Aristea spent quite a lot of time by herself in nature:

> . . .back when I lived, um, in [country], we had, kind of, walkways, but into the jungle, a bit out. . .er, I'd go for a walk there. . . . . .round three or four times a week as well, where. . .and I did that alone. I would be me. . .spending time in nature alone. . ..

Nevertheless, Aristea did not appear to fit the profile of someone who had positive experiences with pets:

> I had a bit of trouble with the pet issue, because my family has had pets, but my mum really doesn't like animals. I have lots of siblings, so, of course, you have to have a pet. . .at one time or another, but it's never been the same pet for more than two months. . ..

Gordon's experiences in nature were quite extensive as he lived on a farm and had a lot of freedom to roam around the countryside. However, what is perhaps characteristic of Gordon is that his description of nature could be very instrumental:

> . . .and the spring from that river was actually the water that fed our house. . .
>
> We get water from a well that's got a gravity fed pump but over this was this great big oak tree. . ..
>
> . . . the cattle used to come down there and drink and. . ..

Gordon also said that he didn't have any pets but he did develop attachments for some of the animals on the farm. Nevertheless, he was well aware as a child what the animals were for:

> . . .these sheep I grew very attached to. I did generally know. . . out into the field when it was old enough and then off chops sometimes . . . I was very fond of a cow we had,. . .I was very fond of her and granddad took her off and he came back and said, ah, well, I sold her. . .I sold her to a butcher who liked her so much that, eh, that he wants to keep her as a pet. . .even as a primary school child I didn't buy that for a second. . .I knew exactly where she had gone to. . ..

Gordon's quite immersive experience with nearby nature, farm animals, and wildlife was of a quite pragmatic, utilitarian position, and he himself suggested:

> I'd probably be lynched by certain people for certain views. . .

> I've experienced nature but I can't care less about it [laughing].

With respect to the three lower NR scoring students, it was evident that their experiences were perhaps even less engaging than the middle group of students.

Toby said that he rarely used the greenspaces and parks:

> No I tend to go to the cinema and things generally. I take different sort of social activities. . .compared to going for walks in the park.

Whereas, while Sandy had relative ease of access to the countryside, he said:

> I kind of got bored of it really. It sort of stops being idyllic once you. . .it is lovely there but I mean I walk the dog and everything but in terms of going out and sitting on my own. . . not much of that at all, no.

Clara also had a rather ambivalent attitude toward the natural areas. Even although she might have been a frequent visitor to the parks, visiting with her grandparents about once per week, what she tended to do in the parks was go straight to the children's play area:

> I was always more obsessed with the swings and. . .[children's play area]. (Clara)

What comes through from the interviews is that all the students appear to have had some form of access to natural areas or greenspace, but the way in which they interacted with that space varied. Even those students who had fairly immersive experiences in the countryside, through having relatives who had farms, or who themselves lived in rather more isolated spots within the countryside, had different accounts of how they related to that countryside.

Discussion

The result of the preliminary investigation into a single cohort study of undergraduate students is revealing but also raises many questions and opens avenues for further exploration.

The first aspect, which is probably the least surprising, is that there is a highly significant correlation between childhoodnature experiences and one's sense of connectedness to nature. This reaffirms what has been reported in the literature (e.g., Wells & Lekies, 2006). However, what becomes apparent through the interviews is that there *may* be a critical period of time when nature experience is important in establishing or nurturing this ecological identity, and there are some indications that this is in the earlier stages of childhood. The idea of an age period that is important for developing this sense of connectedness, leading to a stronger ecological identity, concurs with Orr's (1993) suggestion that there may be a critical period of development where it is very important to have positive experiences in nature in order to develop biophilic beliefs, feelings, and tendencies (Capaldi, Dopko, & Zelenski, 2014). However, what appears to emerge from our data is that the quality of experience is perhaps as important, if not more important, than the actual age, with some indications that this can continue to develop throughout life. The importance of quality of experience has also been put forward by Vadala et al. (2007), with their analysis suggesting a clear distinction between child-child and child-nature play in natural environments. Such differing experiences, they suggest, can develop quite different views and attitudes toward nature. Given that a number of respondents mention child-nature experiences, such as seeking out rabbit burrows, or hunting for fruits, future studies might look at the link between such activities, nature connectedness, and scientific inquiry, to see whether such experiences develop particular mindsets. In addition, it is important that people throughout their life are exposed to significant experiences and appropriate culture for biophilia to be more openly visible and expressed (Kellert, 1997). While early childhood experiences in nature are, perhaps, highly influential, this does not necessarily mean that nature connectedness cannot be nurtured or expressed later in life.

One of the interesting aspects of the data gathered here is that female students and older students displayed higher nature connectedness scores than the male and younger students. This supports findings from other studies which showed that being older (Grønhøj & Thøgersen, 2009) and being female (Scannell & Gifford, 2013; RSPB, 2013) tended to be associated with higher environmental concern, attitudes, and behaviors (Capaldi et al., 2014). It is difficult, however, to find any explanations provided for these differences. Do female students actually have a greater childhoodnature experience, or is it that they have an inherently higher awareness of nature, a greater biophilic predisposition, which results in a stronger childhoodnature experience memory?

With respect to the age phenomenon, it might be thought that this was as a result of older individuals having had greater childhoodnature experiences than the

younger individuals, as is plausibly indicated by the literature suggesting a decline in childhoodnature experiences between generations. However, statistical analysis of the data gathered in this study gives no indication that these age differences in nature connectedness are due to greater nature experiences in childhood. In other words, older students did not have any significantly greater childhoodnature experiences which would explain the higher nature connectedness scores. What then might be an explanation is that further life experiences, which may be linked to greater exposure to, or awareness of, nature and nature-related issues, have added to the older students' sense of nature connectedness. Thus, as well as early childhood experiences contributing to a strong foundation for ecological identity formation, later life nature experiences, increased knowledge, cultural influences, and exposure to different points of view might also play a significant part in developing and strengthening an ecological identity. Thus, it is possible for this to be a continuing process which can be enhanced by appropriate activities and exposure to nature experiences in further and higher education as well as in the workplace. This aspect is worthy of further research in that if biophilia is, as suggested by Kellert (1993), a weak "genetic tendency" that can be stimulated by contact with nature, then there is a need to explore how this can be done and whether experiences require to be facilitated in different ways for different age and gender groups. In this case, it may be particularly pertinent to consider what role the university plays in nurturing this biophilia, this sense of nature connectedness. This links to Jones' (2013) idea of the Biophilic University which is a "university which restores an emotional affinity with the natural environment" (p. 148).

Conclusion

There are perhaps four key ideas emerging from this particular study, each of which will require further consideration and research:

First the idea of childhoodnature experiences appears to contribute to developing a sense of nature connectedness, or ecological identity, which, it is suggested, is crucial if we are to nurture a responsible citizenry which adopts and enacts pro-environmental behaviors. However, childhoodnature experiences per se, while necessary, are not in themselves sufficient. What may be more important is that there is a need to look very carefully at the quality of those experiences and how they enable the development of sense of nature connectedness. This is likely to require an in-depth examination of nature experiences over a period of time and how those experiences impact on the individual's ecological identity.

Second, while adults may be important mediators for childhoodnature experiences, it appears that other independent experiences in nature, outdoor activities in nature, and biophilic practices such as keeping pets are important in nurturing a strong ecological identity.

Third, females may have a stronger biophilic predisposition which is brought out through childhoodnature experiences, but further research is required into these

perceived gender differences. Further research is also required to determine whether different or deeper forms of childhoodnature experiences are required for males, particularly earlier in childhood.

Fourth, there is a need for further examination of the impact of nature experiences beyond childhood. There are indications that these may also play an important part in developing ecological identity, and therefore, there is importance in such experiences being incorporated into lifelong education programs and to support the idea of biophilic cities and workplaces.

This chapter, and the research referred to, has dealt with the relationship between childhoodnature experiences and sense of nature connectedness, which is linked to ecological identity and values, attitudes, and behavior toward the natural environment. The development of such dispositions, it can be argued, alters the way individuals think about the natural environment and how they will act toward that environment. Such dispositions also influence how decisions are taken and can influence the work of scientists and others involved in environmental policy and practice decisions. There is an urgency to this, and it is important that more research is undertaken to understand why human populations persist in enacting damaging environmental behaviors and what can be done to change those behaviors.

Abstract

The Wet Tropics World Heritage Area in far north eastern Australia is a unique place where tropical rainforests are internationally recognized for both biodiversity and cultural values. The chapter explores how children, advised and supported by their teachers and parents, in regional and rural schools intimately connected to these rainforests and associated aquatic ecosystems, are doing works of conservation and restoration, both as a response to the novel landscapes created by the rapidly changing environmental conditions of the Anthropocene, and as a personal contribution to caring for the Wet Tropics. Caring for country is an old discourse in Australia with its origins in Aboriginal and Torres Strait Islander cultures. Contemporary environmental education practice in Wet Tropics schools draws on these older concepts and those of ecological and social science to create

a hybrid of understandings to promote practical means for caring for rainforest country. Interview data from children are presented in the chapter to illuminate in their own words their senses of care and connection to the Wet Tropics. Barriers and enablers to restorative practice are discussed in relation to dominant schooling practices, which continue to marginalize the work of caring, even though caring is a logical and necessary response to the Anthropocene. Children wish to actively care and are supported by adults to do so; however, many aspects of the formal, public school system in Queensland are not yet fully enabling of caring practice.

Introduction

> We are helping to do our bit to stop global warming. I don't think it can be stopped, but we can keep it at bay for a little while. It's inevitable, but I'm a bit freaked out with global warming, because we've driven ourselves to a dead end. If we leave the planet in this state, then evolution won't be able to start again, because we finally have the power to destroy ourselves. (Ten year old enrichment program participant interviewed by Clifford Jackson.)

The survival of the Wet Tropics World Heritage Area in tropical Australia is now partly dependent on its (human) children not only relearning to properly care for their rainforests and waterways but learning how to sustainably care for the novel landscapes of the Anthropocene (Collier & Devitt, 2016). The Wet Tropics stretches approximately 450 kilometers along the northern coastline of the state of Queensland and was listed on the World Heritage register in 1988 in recognition of its "outstanding universal value" and "the permanent protection of this heritage is of the highest importance to the international community as a whole" (Wet Tropics Management Authority [WTMA], 2017). Both cultural and natural values form the basis for World Heritage recognition as these rainforests are settled by one of the oldest, extant, human societies on earth.

Australian World Heritage rainforests are often positioned in tourism brochures and in Australian nature writing as "pristine" wilderness. Historically, they are nothing of the sort. These rainforests are very, long lived in country. Before European colonization, the Wet Tropics rainforests were one of the most populated areas of Australia and the only area where people lived permanently in rainforest (WTMA, 2017). A map of the distribution of people's language groups is available from the Wet Tropics website (http://www.wettropics.gov.au/our-cultural-landscape). Within the Djabugay language, spoken by traditional people of the rainforest situated on the western slopes of Cairns, balmba means habitable country – or wet woodlands in European terms – and bama balmba translates to English as a person or people quite at home within these wet woodlands (Bottoms, 1999). For Djabuganydji people, "the forests have been a source of sustenance for thousands and thousands of years" (Djabukai Aboriginal Corporations [DAC], 2017).

Australia's tropical forests can be viewed from a sociological perspective as a nature-culture (Whitehouse, 2011) as there have been tens of thousands of years of continuous human settlement. As culturally informed, tertiary educators, we favor drawing on the old and revitalized Australian concept of country for inquiring into concepts of education and care, for people can walk on country, learn on country, learn from country, and care for country. Caring for country is historically associated with the cultural practices of Aboriginal and Torres Strait Islander peoples and has been generally understood as a suite of highly sophisticated water and land management practices (Gammage, 2011) from which emerge many well-being, health, social, and economic benefits (Weir, Stacey, & Youngetob, 2011).

To understand care in an educational context, we draw on the work of Nel Noddings, who defines education as "a constellation of encounters, both planned and unplanned, that promote growth through the acquisition of knowledge, skills, understanding and appreciation" (Noddings, 2002, p. 283). Noddings' (2005) own definition of care is relational and transactional: She writes that "in a caring relation or encounter, the cared-for recognizes the caring and responds in some detectable manner" and argues, "what we learn in the daily reciprocity of caring goes far deeper than test results." Caring is a form of deep attention, what Noddings (1984) calls "engrossment." Caring is receptive and reciprocal; the carer (child) receives what the cared-for (forest, river, reef, animal, plant) is feeling and trying to express. This opens the carer to motivational displacement. Noddings (2005) writes, "when I care, my motive energy begins to flow toward the needs and wants of the cared-for [and] n a caring relation or encounter, the cared-for recognizes the caring and responds in some detectable manner." Philosophically, Noddings sees caring as a *moral* attitude that can be taught. This morality is "informed by the complex skills of interpersonal reasoning, that it is neither without its own forms of rigor nor somehow less professional than the calculated skills of formal logic" (Flinders, 2001, p. 214). Caring for country is being adopted much more widely across Australian society because it is such a generative, productive, and democratic concept. Within the complex idea of country is a very deep sense of relationality. People and country are close; people need country; country needs people. When we look at the forests and biomes of the Wet Tropics, we can say that the Wet Tropics needs people to care for it, and people certainly need the Wet Tropics.

We are four tertiary educators who work together with a deep, collective interest in social, scientific, and environmental sustainability education. In this chapter, we take up the sociological position of Malone (2011) who argues children are "subjected to the same social forces as adulthood, and children as social agents...can contribute to the reproduction of childhood and society through a variety of opportunities that are created in conjunction with adults, peer cultures and other children" (p. 476). We present views of caring in the words of children and illustrate the adult and peer leadership necessary to promote their agentic learning. Clifford Jackson collected the focus group interview data with 10- and 11-year-old children participating in the Cairns District Schools Science and Sustainability Enrichment Program, led by Sandra Charlton that involves students and teachers from the Queensland Government Department of Education and Training (QGDET) primary

schools and colleges in Cairns and the Atherton Tablelands. Marcia Thorne collected focus group interview data with teachers and 15-year-olds in QGDET secondary schools and colleges in Cairns and the Atherton Tablelands. Neus Evans collected the document data of caring project materials available in the public domain and viewed artifacts created by children. Together we analyzed these data looking directly at caring practices in (and for) the Wet Tropics, and Hilary Whitehouse took carriage of writing this chapter.

Malone (2011, p. 466) advises that to "focus on children's agency without considering structure is to overlook the fact that a person's capacity to engage in an action and take it forward can only be realised if the established structure in which they are operating will support and accommodate those actions." Current education policy in Australia is strongly influenced by globalization and neoliberalism (Smith & Stevenson, 2017) and follows an education agenda that generally serves the neoliberal marketplace over and above the needs of individuals and the needs of human and forest communities. Caring for country and education for environmental stewardship is not conceived as core to school curriculum in the Wet Tropics (Thorne, 2017). Educators can experience a persistent philosophical conflict between the effects of the neoliberalist paradigm of efficiency and productivity that dominates Australian curriculum and educational policy (Cuervo, 2016) and the other meaningful imperatives of education, such as preparing children adequately for life in the Anthropocene. Children, too, have to negotiate the same structural tensions. The Anthropocene, as a way for framing socio-ecological conditions, is an educational problem (Laird, 2017), and we can use dimensions of the concept to acknowledge "educated human agency's power to change Earth environments for worse and for better, including its consequences for a place's habitability" (p. 269), and this requires "educating children to develop nature-loving practices" (p. 275).

Schooling, the Anthropocene, and the Need for Care Work in the Wet Tropics

According to the influential Australian philosopher and ethicist, Clive Hamilton, the idea of Anthropocene was first conceived by earth system scientists to capture "the very recent rupture in Earth history arising from the impact of human activity" (Hamilton, 2016, p. 94). The Anthropocene is "not a continuation of the past but a steep change in the bio-geological history of the Earth" and what we now have to cope with is "not continuous change but rupture" (p. 100). Philosophically, the notion of rupture "invites a new understanding of the human relationship to the Earth" (p. 104). Some pockets of Wet Tropics forest, particularly those in the Daintree, have been extant for 120 million years, and such oldness is a source of wonder and awe. The youngest forests are 9000 years old. Yet, these resilient, persistent, biodiverse, and vegetable communities, from mountain forests to coastal mangroves, are at now extreme risk. Much of the landscape, particularly the aquatic ecosystems that meander from the Wet Tropics World Heritage Area through

a myriad of agriculturally purposed and built environments to the Great Barrier Reef World Heritage Area, has been deliberately changed to meet the needs of growing human populations. George Skeene, a "descendent of the Yirrganydji, Wakaman and Birri Gia Tribes" (Skeene, 2009 p. 7), recalls the experiences in his youth in the Cairns region in the 1950s and laments the changes to *his* country (p. 51):

> There was a small creek that came off the hills under Reservoir Road and through the farm. This creek was fed by a small spring in the mountains. Taro grew around this small spring. We would catch red bream, mud cod, jewfish, perch and freshwater turtle. Today this creek has been obliterated by development, which is called "progress".

Biodiversity conservation is a priority for action in the twenty-first century (Perring, Audet, & Lamb, 2014) given the Anthropocene is marked by unprecedented human population growth and mass deterioration of habitats and loss of species. Individual children, teachers, local groups, schools, and their communities cannot readily or easily address international problems; however, practical forms of action at local and regional scales can have significant effects.

The case for action is that the Wet Tropics region is characterized by high endemism meaning the risks of extinction are predictably dire (Williams, Bolitho, & Fox, 2003). Broad-scale species loss is detrimental to remaining biological communities (Reside et al., 2017), including the human populations dependent on healthy ecosystems for the provision of life supporting services. Governments and policy-makers have long been aware of the effects of biodiversity loss on human health and well-being (see Department of the Environment, Water, Heritage and the Arts, 2009). But how adequately these identified concerns have been addressed through formal education is an open question. Our understanding of the Anthropocene is that the term gives shape and meaning to current conditions and imparts a sense of urgency to the task of transforming the purposes of education. Davies (2016, p. 2) writes that the idea of the Anthropocene (and the consequent terminal death of the Holocene) "provides both a motive and a means for taking a very, very long view of the environmental crisis. It gives the ecological upheavals of the present day their proper place in the history of the planet." The national *Australian Curriculum* neglects to mention the Anthropocene and does not provide any overarching ideas or directions about the teaching for the Anthropocene. There are creative spaces within the *Australian Curriculum's* learning areas (disciplines) and the cross-curriculum priority of sustainability (Australian Curriculum, Assessment and Reporting Authority [ACARA], 2017). However, the sustainability cross-curriculum priority is precarious space as there is no mandated requirement in the national curriculum that any learning area be taught through this cross-curriculum priority (Salter & Maxwell, 2016). Our critique of the *Australian Curriculum* is that the whole document is predicated on the assumption that the global climate will remain stable, as it did in the Holocene, and that the purpose of formal education is to focus almost wholly on matters advancing human society.

In Queensland schools, the current obsession is with Australian Government education policy focused on improving standardized literacy and numeracy scores

aligning with a larger global agenda. A regulatory testing regime called the National Assessment Program – Literacy and Numeracy (NAPLAN), which began in 2008, is administered annually in May to children in years 3, 5, 7, and 9. Schools and teachers spend an inordinate amount of time conforming to this testing regime. Meaning, sustainability education in general and the wonderful projects children discuss in this chapter are marginal to normative school practice and can be considered quite unusual. When the truly dis/ruptive nature of the Anthropocene becomes undeniable and education leaders recognize that young people are going to need more than numeracy and literacy to overcome severe conditions, this is likely to change. Until then, a key performance indicator for Queensland schools remains the improvement of NAPLAN scores. The emphasis on standardized testing comes at the expense of teaching and learning for caring for country and for taking action on sustainability, environmental citizenship, and other worthy endeavors of formal education.

Marcia Thorne's (2017) document analysis of five Year 10 subjects, English, Math, Science, Geography, and History, revealed less than 6 h of lessons in core curriculum subjects directly focused on sustainability and environmental stewardship out of the (approximately) 390 h of teaching time allocated to these five subjects across the Year 10 school year. Thorne (2017) conducted online surveys and research conversations with Year 10 teachers ($n = 5$) and Year 10 students ($n = 126$) in state secondary schools located in the Wet Tropics. She found that the participating teachers expressed concern for the natural world and saw the need for formal education to actively value learning to care for local environments (e.g., caring for country). Teachers interviewed saw the curriculum as "rigid" and teaching time as "pressed." Similarly, students expressed concern for the sustainability of the Wet Tropics and worried that their generation will be left with a world full of environmental problems. Half were "deeply" worried by this thought, and 65% said that sustainability education should occur at school through targeted care actions and projects that encourage learning by doing. Students reported they did not know nor fully understood the extent of Anthropocene challenges, what mitigation is occurring, what adaption needs to occur, nor what role they could viably play. One teacher told Marcia, "the curriculum is very rigid. It's hard enough to get through the specified lessons in order to get the assessment. I think [the school] would have to rejig in order to incorporate sustainability values more." Another reported that there isn't a "great deal happening. There might be the occasional mention of recycling or not using air conditioning when you don't have to but [caring/stewardship] is not really something that has been emphasized in the school." Poignantly, a third teacher summed up student interest in caring work as "It depends on how much they know about [the Anthropocene] and that would be limited by the fact that we don't teach it."

Learning /Caring Initiatives in the Wet Tropics

We shall now focus on what is being done to enable children's care projects. Groups of educators in coastal and highlands regions in far north Queensland, who themselves have a strong sense of care, are initiating and supporting student projects that truly focus on caring for country. In 2013, the Cairns District Schools Science and Sustainability Enrichment Program (CDSSSEP) was started by Sandra Charlton,

Louise Carver, Helen Underwood, and Annette Ryan, and 2014 was the first year of the program. Led by Sandra Charlton, the program involves students and teachers from Queensland Department of Education and Training primary schools and colleges. The initial program was centered on environmental networks established by staff at the Holloway's Beach Environmental Education Centre (HBEEC), and subsequently the program is also offered by the Tinaroo Environmental Education Centre (TEEC). Both programs facilitate extracurricular science and sustainability enrichments for able and selected, preadolescent children in Cairns, Gordonvale, and towns across the Atherton Tablelands. Since 2013, 9- and 10-year-olds in Year 4 have been recruited to take part during their Year 5 studies as 10- and 11-year-olds. The children are nominated by their school principal and while in Year 4 complete an International Competitions and Assessments for Schools (ICAS) (UNSW Global Pty Ltd, 2017) science test Paper C (Year 5 equivalent) to gain entry. The top 15 students are offered places and once accepted into the enrichment program are challenged to develop small-scale sustainability initiatives and encouraged to seek advice from education and environmental professionals in the region – such as from the Cairns Regional Council, local Queensland Government Departments, Barron Catchment Care, Terrain NRM, Great Barrier Reef Marine Park Authority, Wet Tropics Management Authority, James Cook University, and local community organizations and businesses.

Cairns District Schools Science and Sustainability Enrichment Program (CDSSSEP) range of 1-year projects is truly inspirational (see Table 1 for a small sample from 2015). In most cases, the young children excel at recognizing the problem and identifying actions for solution. Despite their age and inherent lack of access to integrated resources, these children are no less interested in leveraging their ideas via the community into fully realized caring projects. The program is extracurricular and not usually undertaken as part of a school day. Children spend their own time on their projects. In some schools, the children meet with the teacher liaison of the school for 1 h a week and then work on the project in their own time. The children's efforts are not graded nor assessed, and children's two public presentations of their project's results are viewed as an opportunity for the child to gain additional feedback about their project from people outside the program and project team. The children's initiation starts with induction days into how to set up a sustainability project. The children attend excursions to both a nearby tropical island (Green Island) and a Wet Tropics aquatic ecosystem, the Barron River. Children indicated that their project ideas were inspired by their adult-facilitated experiences on county as these excerpts from focus group interviews show (gender, school, and year are de-identified for confidentiality). Given that children are the agents of their own learning (Malone, 2011), these data enable the enrichment program children to speak about their experiences and their decisions in their own words.

The children in the enrichment program designed their own projects. A trip down the Barron River gave some of the children project ideas:

> When I saw the Barron River, I thought, how would you feel if you were pouring a cup of water and then there was white dots full of washed out fertiliser in your water and that was what you had to drink, and I wouldn't drink that. (Eleven year old)

Table 1 Sample of student projects from the Cairns District Schools Science and Sustainability Enrichment Program (CDSSSEP) 2015 (Cairns Regional Council, 2015)

Project	Title	Collaborators	Brief description
1	When he saw the stream	Children's authors Mother	Student has researched in impact of litter on the rainforest, and she has written a children's book to address this issue
2	Batman	Cairns regional council Tolga bat Hospital	Student has researched the importance of the spectacled flying fox to our environment. He has investigated attitudes and knowledge of the general public and his fellow year 5's. The student attended meetings as a member of the cairns regional Council's flying fox advisory committee
3	Conservation 4 kids	Family	Student flagged the notion that the topic of conservation was considered by young primary school-aged students in a negative light. She scripted and filmed four short videos to address this perceived shortcoming. She conducted surveys with 5 year one classes before and after the screening of these videos and analyzed the students' responses
4	Running in the right direction	Barron catchment care Canegrowers Association Mulgrave Landcare, and catchment group	Student researched and identified best management practices (BMP) sugar cane farmers are using to reduce sediment runoff. She surveyed cane farmers about their use of BMPs and interviewed a farmer about the barriers farmers encounter in reducing runoff
5	Protecting our marine life	CSIRO Cairns turtle rehabilitation Centre Cairns regional council	Student conducted litter surveys and water quality testing at four locations on Barron River catchment. He has created a reef Guardian household survey and proposed that ratepayers that meet or exceed specific litter targets be rewarded via a rates reduction or voucher. He was invited to join the Cairns City Council's water advisory Board for the January 2016 meeting

> When we were going down the Barron River there was a bank completely bare of mangroves. A very, very, very, clear example of shelf erosion, so I thought, hmm, maybe that has something to do with there being no mangroves. (Ten year old)
>
> I got the idea because one day we went . . . on a boat ride down the Barron River. Then I saw Singapore Daisies [a declared noxious weed in Queensland] covering all the trees and it just looked horrible so I thought it was an idea to help stop the Singapore Daisies. (Eleven year old)

And the trip to Green Island combined also promoted an idea for a project:

> I decided to go to . . . Goomboora Park. . . In the river, I saw a car admission ticket . . . and it was expired and it was just floating down the river and it was two days old. Then I thought going to Green Island I could make a ticketing system that doesn't even require a ticket, it

> just requires your phone, you scan and you're magically allowed on the boat. (Eleven year old)

And a keen observation of school grounds led to a project idea:

> Well, I got the idea for my litter project because of all the litter around our school. For example, on the oval you can't walk one metre without seeing at least one piece of litter on the ground. (Eleven year old)

Children's location proximate to the Wet Tropics is an important consideration as is the location of the Great Barrier Reef, the other World Heritage area offshore from Cairns:

> I wanted to do a project that I was inspired by, and I am honestly inspired by nature. So, it would either be the rainforest or the Great Barrier Reef. Living near the rainforest myself I chose to do [my] project on the forest and the area around it. (Ten year old)
>
> We're surrounded by ocean and rainforest [and] our litter impacts the environment very badly. I think the only way to stop litter is to educate people that it's not right to do it because you might clean it up but there's always going to be somebody who will keep littering and littering. So, during my project, I found and researched different ways to educate the community about litter. (Ten year old)

While litter reduction projects are tangible and meaningful, some children said they were motivated by the notion of a novel project, the idea that they could change the behavior of others, and the perception that they could make a positive difference:

> I had several original ideas. I said to my mum, Ghost Nets. Not too sure about that one. Marine life? Yeah. Someone already thought of that. What about mangroves? Then mum started getting really excited, because it was something that would amount to a good project. Because I wanted to do something that no one had ever done before. That was very important to me. (Ten year old)
>
> I'm interested in all varieties of environmental issues but mainly water problems, pollution in water. So, for my project I've built a few sediment traps around the school. I've measured the sediment that has been trapped and stopped from going into the Great Barrier Reef. (Ten year old)

Children view their endeavors as worthwhile, and some stated an intention to continue their projects beyond the program's deadlines:

> I am going to continue my project after this year. I'm going to continue it for as long as I can, because you – because once you've started something like this, you can't just give up. (Ten year old)

The children were optimistic about making difference, though several were also realistic about the size and longevity of that difference. What emerges through all these data is that the children interviewed very clearly demonstrate an understanding of relationality between their social worlds and the world of rainforests and reefs. They exhibit compassion for animals and plants:

I created a little challenge for all the classes in the school. I would go around [to the classes] and the teachers would email [the teacher liaison the results and the class] with the highest percentage of students in their class with no litter or rubbish items in their lunchbox get a prize at the end of the next week. I think that really motivated my school to stop bringing rubbish to school and stop littering. When we announce the winners we also told them how all the litter kills hundreds of animals every single day. (Eleven year old)

I increased the awareness in Stratford [suburb in Cairns] about plastic bags and it definitely made a difference. My project was trying to reduce the amount of plastic bags used in the Stratford shopping area by talking to the owners of the shops just not to give a plastic bag on automatic. Ask if [customers] need it or if they have their own bag. (Eleven year old)

The most important thing for me was spreading the word around, because this is an awareness campaign. (Ten year old)

Enablers and Barriers for Children Doing Care Work in the Wet Tropics

Designing deep and meaningful learning experiences that reach beyond prescriptive numeracy and literacy classroom-based lessons is not easy on a number of levels. As Bowers (2011) notes, the crisis of the Anthropocene is not currently being addressed in formal education because so much of what is promoted in public (government) schools tends to reflect the thinking and actions that have promoted the very crisis we face. What is required is thinking and actions that respond to increasingly complex systems. Educators, at both the administrative and classroom level, who wish to respond to complex Anthropocenic systems are required to surrender false presumptions of control and instead exert trust, creativity, time, and energy. Our research with teachers and children who engage in caring for the Wet Tropics finds similar barriers to those provided by scholars elsewhere, including insufficient time and money. Understandably, school principals are preoccupied by consequences of neoliberal education policies that emphasize (and in some cases, punish and reward) performative excellence in education as decided on narrow, literacy and numeracy standardized test results. Educational activities that divert attention away from primary schools' core business of literacy and numeracy can be seen as disruptive to progress. In this vein, far north Queensland schools have responded by defaulting to rigid, explicit instruction pedagogical models.

There is research that argues for the effectiveness of explicit instruction over other pedagogical models (Clark, Kirschner, & Sweller, 2012; Hollingsworth & Ybarra, 2009; Rosenshine, 2012), particularly for teaching numeracy and literacy skills. However, literacy and numeracy learning can also take place alongside or through works of conservation and restoration, with added positive wide-ranging results for school reputation, learning, learners, and their communities (see Archie, 2003). North American schools that use the local environment for learning report dramatic improvements in the quality of education, including improved academic performance overall and in standardized test results, student motivation, behavior and

attendance, parent and community involvement, and assimilation of concepts and skills beyond numeracy and literacy. Learning for caring can cover a broad range of core curriculum requirements in English, Mathematics, Science, and Technologies alongside improving children's capabilities considered necessary for the twenty-first century, including problem solving, communication, and critical and creative thinking.

For example, consider the work of Molly, who, as an individual (and not part of the CDSSSEP) at age 9, took action after learning about the consequences of plastic for marine ecosystems and animals. After considering a suite of possible actions, Molly decided to start a campaign to eliminate use of single-use plastic straws from all far north Queensland school canteens. Molly calls her campaign "Straw No More" and uses social media features across Facebook (https://www.facebook.com/StrawNoMoreProject/), Twitter, local radio, and a website (https://www.strawnomore.org/). Molly began at her own school first gaining support from the school principal and then the canteen manager and teachers. In less than a year, 16 other schools joined the campaign. Molly worked with local not-for-profit organizations, speaking on local and national radio and presenting at the local TedXCairns event. Clearly, Molly's learning over the year extended far beyond school-based literacy and numeracy to develop her personal and social capabilities; critical, creative, and problem-solving skills; and personal growth alongside improving the ecological fabric of waterways that enter the ocean. Molly is planning to expand her campaign to local cafes and restaurants.

School leaders can choose to be enablers or disablers. School-based activities are bounded by the rules, regulations, and norms of the broader education system and community context. Principals who choose to enable conservation and restoration work can do so by actively supporting emergent initiatives and establishing democratic and trusting structures which, in turn, generate space for flexibility, creativity, and increased social capital. Although principals tend to report feeling constrained by systemic barriers imposed by educational governing bodies, they have discretionary power to use "leverage points" (Hjorth & Bagheri, 2006) within their spheres of influence. In one Wet Tropics school, the principal used her leverage to support teacher and student conservation and restoration work of local wetlands by creatively rearranging the school's budget lines to enable the key teacher to have 1 day per week free of teaching to administer and organize this caring work. Another very important enabling practice is trust. Reciprocal trusting relationships between principals, teachers, students, and the local community are very important for advancing conservation and restoration work. Principals, teachers, and parents have to trust that ecological caring work leads to student lifelong learning rather than being tempted to focus on systemically valued and immediately measurable short-term goals and gains.

The barriers to children caring range from existential to practical. Children in the CDSSSE Program learned that their care actions were unusual, and their high expectations of community involvement were not met, discovering that others "do not care" or do not appear to care enough "to turn up":

> Well, it's really amazing how much mangroves actually do for the environment, but no one seems to care. No one really seems to care about what they do for the environment. [Clifford Jackson: Why do think no-one cares?] Because they're too caught up with their day-to-day lives and they don't have any time to care about the environment. But some people, even though they are so, so, so busy actually find time to spare a thought for Mother Nature and help her out. (Ten year old)
>
> Well one of my expectations was that when I held the big clean out of Singapore daisies at the front of Holloway's Beach, I put a lot of effort into making the big flyers you put on parade and I saw my teacher and he put it on parade [too]. Then many people said they were going to turn up. But then when it came to the day, nobody turned up. It was only me, my friend, my parents and the Holloway's Beach [Environmental Education Centre] crew. (Eleven year old)

CDSSSEP children realized that while their project idea was worthwhile, the practicality of completing the project was beyond their ability and also that the others on whom they had to rely were not always reliable or fully cooperative for differing reasons:

> Yeah, I definitely would have liked to finish it, but I have no contact. I don't know how I'm able to find the [High School] student that I worked with [on the coding]. He said he's got some sort of office but he never told me about it, he never told me where it was and so I'm not able to finish the project at all. (Eleven year old)
>
> [My project] wasn't as successful as most of the others [projects]. Partially, since I had to work with younger children and their teachers, they were very busy, especially since had to get most of this done near the end of the year and that's a very hectic time for most teachers. So, trying to get the surveys I handed out returned twice getting time to show the clips [child directed and filmed video clips on water conservation] to the kids was very difficult and half the surveys didn't come back in time, so I didn't actually end up finishing my project completely. (Ten year old)

The three main enablers identified by the children when interviewed about their care work were the direct assistance of parents, school educators, and environmental professionals. What we enjoyed finding in these data was the influence of the children's mothers and fathers and their teachers and community supporters:

> I was interested in the environment because of my Mum, she studies environmental education and stuff like that. I thought it would be a good idea [to do the project] because I could have support from her. She would know some stuff and I thought that would be good. (Ten year old)
>
> Mum took me to the mangrove boardwalk to do a little bit of research [and] have a look - so many crabs. So, I've been at mangroves and I've done a lot of research. (Ten year old)
>
> My dad just thought of it and I just went with him because I couldn't think of anything else. (Eleven year old)
>
> Mum has a Pozible account [https://pozible.com/], so she set up crowd funding platform on that. Mum again helped me spread the word about my survey that I made on Survey Monkey . . . via Facebook and her friends and the community choir. (Ten year old)
>
> So one of my challenges at the start of the year was thinking of what project I should do. Luckily, I had some of my teachers help me out. One of my teachers said, "Remember the excursion to the Barron Gorge." The water was basically red and she explained that it was sediment. So she said, "Why don't you do your project on sediment?" and I went along with that idea and I found it really enjoyable. (Ten year old)

> Biggest helper probably was [the teacher]. She kept me going when the going got tough. (Ten year old)
>
> The person [who] got me started and going along the right track was Danora from the Cairns Regional Council. Second person was [JCU lecturer]. Being a teacher, lecturer person herself, she knows how to get through [to] people and know[s] how to get working. So, she was basically my little helper. (Ten year old)

Another significant feature to emerge from interviews was the concept of working at scale. Scale is a vital consideration for educators and their students involving themselves in positive actions (rather than ignoring or despairing about Anthropocene because the identified problems are global). Local scale, practical actions are realistic for young people who are well below voting and driving age:

> Litter I think would be much easier to change other people's perspectives and teach them about. Because climate change is such a large issue and even if one person stopped [contributing] it might not change much with the issue. But with litter, if one person stops, their suburb that they live in could get cleaner. (Ten year old)
>
> Global warming, I know it can't really be stopped, but we can halt the progress by doing little things. All those little things help. You know the saying a little drop of water in a big sea still makes a difference. That's what we can do. Tiny, midget actions can still be used against global warming. (Ten year old.)

What emerges from these data is just how wise these young children can be, particularly in understanding the power of multiples when it comes to individual and local caring actions. We are very moved by these data and particularly the phrase that "tiny, midget actions" count.

Conclusion

The novel landscapes of the Anthropocene are the new normal. No child's project can return developed country to any sense of wholeness associated with the conditions of past centuries. What the children are doing are enacting their own relational ideas of care, enabled and practically supported by innovative educators and involved parents. All projects concern raising awareness and reducing one or more human impacts on a Wet Tropics catchment or biome. Not one project involved taking peers outside to more directly "connect with nature" (Charles, Louv, Bodner, Guns, & Stahl, 2009), and this is very practical decision-making. For children in the Wet Tropics, the forests and rivers of Far North Queensland are safely accessed in the company of supervising adults like parents and outdoor and environmental educators. Coastal rivers hide very large crocodiles. Forests are alive with poisonous snakes, disease-bearing ticks and mites, biting insects, and stinging trees. And for half of the year, it's incredibly hot. None of this lessens the meaning and impact of the children's actions, for what underlies all these initiatives is both a strong sense of purpose and a strong sense of connection.

Children desire to take large and "midget" action to address environmental and sustainability issues in the Wet Tropics, while Queensland public education remains

largely preoccupied with maintaining the education status quo and limiting student learning to "safe" experiences that can be measured and controlled. The children afforded participation in the extracurricular CDSSSEP are challenged to work with others and make a difference to their local community; however the program is limited to children with demonstrated high academic ability and with access to higher levels of social capital. Molly, who was not involved in the CDSSSEP, was supported by her own school and family. The key condition is that children receive full and meaningful, trusting adult support to keep them buoyant and optimistic.

> I know that one thing is for sure, I know that I can never give up as you can [always] try some new ways to make a change. (Ten year old)
>
> I think I can make a difference if I can get out the information from my survey to the relevant industries, companies or environmental groups . . . and basically tell the public, you guys are letting these poor animals die. Why don't you know anything about them? Maybe they can start helping. (Ten year old)

Laird (2017, p. 268) writes that the Anthropocene will demand from all of us a "much deeper and broader rethinking of educational ends and means that take the myriad complex challenges of Earth habitation and habitability seriously, both locally and globally, with diverse children's needs and situations explicitly in mind." Children's participation in the formal enrichment program on the Atherton Tablelands and in Cairns was enabled by a regional network of adults in possession of "a heightened sense of human agency's consequences for the habitability of both the planet and children's local environments, the places where they live, play, and learn" (Laird, 2017, p. 268). There is a concept of a "good" Anthropocene (or possible, plural, Anthropocenes), lit by a myriad of actions, large and small, all making positive and productive contributions toward creating a future that is just and sustainable (see https://goodanthropocenes.net). Whether our Anthropocene turns out to be "good" or dangerous for human societies, ancient rainforests (and their neighboring reefs), is going to be decided in the next few years. What we can rely on is human creativity ingenuity and care. And as with the CDSSSEP, within hybrids of formal and informal learning, caring educators and children will find the opportunity for change (Stevenson, Nicholls, & Whitehouse, 2017). What we show in this chapter is that when enabled by caring adults, children are agentic, they do care deeply, they possess relational systems thinking, and they value their Wet Tropics.

Abstract

This chapter examines some of the challenges of unlearning anthropocentrism – i.e., the deep-seated cultural, psychological, and enacted prejudices of human specialness – in nature-based early childhood education programs. We begin with a critical exploration of recent trends in environmental philosophy and the conservation sciences that seek to move beyond the so-called archaic notions of "wilderness" and "nature" toward more managerial models of human dominion over planetary "ecosystem services." We suggest the trouble with these discursive moves is that they shirk from the courageous conversations required from environmental education in a time of ecological emergency. We conclude by drawing on research at nature-based schools in the Netherlands and Canada to illustrate

Introduction: The Trouble with Being Nature

In this chapter we critically examine what it means to educate children *as* (part of) nature. As stated in the Introduction to this handbook: "the new concept 'childhoodnature' reflects that as children *are* nature this should be redefined in this integrating concept." We wholeheartedly support redefining and disrupting "existing ways of considering children and nature," in order to critique and reject "the view that humans are superior." For us, however, the real trouble is not whether we consider humans biophysically "part of nature" – this is convincingly self-evident – but rather how anthropocentric "common sense" repurposes such discursive practices into feel-good axioms like "everything is connected" while maintaining business as usual (Kopnina, 2016b). The problem then is not strictly ontological (i.e., children *are* nature). Rather, we argue that the ontological move *must* also consider the politics of interpretation and recognize the deep-seated cultural, psychological, and enacted prejudices of human specialness. The challenge of unlearning anthropocentrism, we submit, thus lies at the crux of any project to (re)define and integrate notions of childhoodnature.

It is true: we *are* nature – all the way down (see Kearney & Treanor, 2015). The trouble with this formulation arises not so much in its truth claim but the way such logics are strategically appropriated and redeployed as *moves to innocence* or evasive *bad faith* in the face of grave ecological realities and the eco-ethical implications of *being nature* (Derby, Piersol, & Blenkinsop, 2017; Foster, 2015). (Janet Mawhinney (1998) develops the notion of "moves to innocence" – i.e., the "seductiveness of the innocent position" (p. 94) – in her critique of the operations of white privilege in anti-racist pedagogy and organizational change. The phrase is drawn from the work of Mary Louise Fellows and Sherene Razack (1998), who originally describe a "race to innocence" but deployed by Mawhinney in a slightly different way. Eve Tuck and K. Wayne Yang (2012) further develop the notion in the context of settler colonialism to describe a "set of evasions" that "problematically attempt to reconcile settler guilt and complicity, and rescue settler futurity" (p. 1).) In this chapter we deploy these notions as a means of describing an anthropocentric set of evasions and/or appropriations to reconcile ecological guilt and complicity, in order to legitimize a techno-optimist future of human dominion as common sense.

As practicing environmental educators and researchers, any recognition of our coevolutionary entanglement with/in a multispecies world (see Haraway, 2016) is only meaningful insofar as it contributes to cultivating eco-ethical praxes. In other

words, the trouble for environmental educators is twofold: (a) fostering the pedagogic strategies to integrate notions of childhoodnature in the first place (i.e., instilling that we *are* nature) and (b) maintaining hyper vigilance to the ways in which such lines of thinking are reappropriated by anthropocentric biases, desires, and discourses.

Admittedly, a host of "complicated conversations" follow from post-anthropocentric lines of thinking. For instance, one might reasonably propose Ebola viruses are also part of nature (Kopnina, 2016b). Here the trouble (from a human perspective) is how to appropriately respond to the expansionist behavior (from a human perspective) of one part of nature given the health, well-being, and flourishing of one's own body, species, and the ecological community as a whole? Does/ought the same logic hold for all species? What about issues of animal personhood? Are we ready to weigh the life of a gorilla against that of a human toddler fallen into his cage (Bron Taylor, 2016)? Are we ready to seriously consider why one primate should even be in a cage for the sake of another primate's entertainment? More to the point, if we begin to argue that children *are* nature and nature is *natural*: are we not moving toward dangerous appeals to nature whereby whatever children do – be it killing small animals or pouring motor oil down the sink – is rendered *natural*? (For an example of the complicated conversations and problematic logics that emerge from this kind of oversimplification applied to urban centers as *natural*, see McClaren (2009). The logic goes something like this: "Humans construct cities. If human constructions are not natural, then what does that make humans? Stated differently, how should humans behave naturally?" (p. 303).) Obviously, we could never address all these complicated conversations in one chapter, but we will attempt to trouble conceptions of childhoodnature by proposing that (a) ecocentric (i.e., post-anthropocentric) lines of thinking are critical to the project and (b) suggesting *rewilding pedagogy* as one means to counter the tendency to move to innocence by way of human exceptionalism. In order to illustrate these issues in an educational context, we will draw on research concerning the pedagogical complexities of (un)learning anthropocentrism at nature-based education in the Netherlands and Canada.

As educators interested in integrating notions of childhoodnature, we recognize it is incumbent to explore the complex relationships between material compositions and the contested meanings attached to foundational categories such as *nature*, *wilderness*, *urban*, *human,* and *children*. This task is all the more pressing in the so-called Anthropocene, where some have suggested it is "the end of nature" (McKibben, 1999) and the time has come to rethink "pristine" notions of wilderness (Cronon, 1996). In light of these proclamations, Robert Fletcher (2015), for example, has suggested pedagogy focused on "saving nature" is no longer relevant as the idea of pristine wilderness embodies a culturally specific, elitist perspective in which immersion in nature is understood as a therapeutic escape from the reputed ills of industrial civilization. Nature thus negates sociocultural necessities, from social equality to cultural determination, with wilderness preservation seen as a limitation on human progress. According to this line of thinking, wilderness is an archaic notion, and the future of both conservation and environmental education lies in embracing a "post-wild" or "post-nature" world. Typically, this view construes nature as a product of idealized "Western middle-class sensibilities" (Malone,

2016, p. 399). Relating this to early childhood education, Taylor (2017, p. 61) has criticized "entrenched and romantic notions of nature as a separate and pure domain," to which "innocent children might be returned and through which they can be saved," claiming that these notions "are no longer tenable or constructive."

As educators committed to the health and flourishing of relatively wild places, which are places where there is a flourishing biodiversity and, for the most part, nature-on-its-own-terms, we tend to view such positions with a measure of suspicion. This is due, in part, to the way these positions are readily appropriated by neoliberal and "neo-green" interests (Kingsnorth, 2014). We call for post-nature thinking which recognizes the significance and intrinsic value of the myriad beings, elements, and relations that co-constitute existence (Kidner, 2000; Crist, 2004). Moreover, we hold that the *real* trouble with wilderness is that vast tracts of land and sea continue to be colonized for short-term capital gain and it would seem many post-nature discourses either intentionally or naïvely pave the way for increased exploitation. Our issue with *certain* post-nature discourses (i.e., those failing to recognize anthropocentric moves to innocence) is not so much the spirit of their ontological reflexivity – we *are* nature and pristine notions of wilderness *ought* to be troubled – but their ideological naiveté with respect to how these discursive practices are deployed. Disrupting a foundational category like *nature* or *human* is, relatively speaking, the easy part. The real work begins in staying with the complicated conversation and following the implications where they lead no matter what sacred cows or sacred primates need to be sacrificed.

Our vision for pedagogy informed by childhoodnatures is simply this: that it stays with the troubling conversations called for by these historical moments in lieu of deferring to technocratic cheerleaders for the Anthropocene peddling what Donna Haraway has called "a comic faith in technofixes" (2016, p. 3). This is not to say that technical innovation has no role in addressing ecological degradation, but rather it is a critique of the faith-like "rational superstition" (Wilson, 2017) that undergirds the anthropocentric logic of many post-nature discourses. This penchant for "looking away" (Klein, 2014) from displeasing realities to comforting fantasies functions to shut down complicated conversations at the very time they are most required. For instance, witness the way Erle Ellis at the Laboratory for Anthropogenic Landscape Ecology deploys such thinking to both plug the "amazing opportunity" presented by the Anthropocene and shut down any objections: "Nature is gone. . . You are living on a used planet. If this bothers you, get over it" (as cited in Wuerthner, Crist, & Butler, 2014).

Regrettably, much post-nature thinking currently seems more concerned with appropriating the discourses of science and environmental philosophy to legitimize a managerial approach to "ecosystem services" than engaging in complicated conversations about the eco-ethical implications of the "sixth extinction" (Kolbert, 2014). It would seem this brand of post-nature politics does not view anthropogenic mass extinction or climate catastrophe as a call to conscientization but rather evidence of the apotheosis of human and capital to god-like geologic forces (see Moore, 2016). Some may claim we are conflating "nature" with "wilderness" that the concept of wilderness has been debunked for at least

20 years and we have moved on to more modern and pressing issues such as climate change or ecology without nature (Morton, 2007). We are not conflating as much as drawing a parallel. The discursive strategies that supposedly debunked the notion of wilderness 20 years ago appear to have turned now on "nature" writ large. (It bears noting the notion that Cronon debunked wilderness 20 years ago is simply not accurate. The wilderness debate "rages on" (Nelson & Callicott, 2008) and has evolved in response to recent environmental scholarship, trends in the conservation sciences, and changes in the semiotic-material conditions of the biosphere (see Wuerthner et al., 2014; Kahn et al., 2013; and the September/October 2014 edition of *Orion* for recent debates). It also bears noting that Cronon's original thesis is widely misread and frequently appropriated for ulterior motives (as per the thesis of this chapter). See, for example, the foreword to the paperback edition of *Uncommon Ground* (1996) where Cronon attempts to clarify his position, noting the danger of conflating conceptual critiques with material realities: "Asserting that 'nature' is an idea is far from saying that it is only an idea, that there is no concrete referent out there in the world for the many human meanings we attach to the word 'nature.' There are very real material constraints on our ideas and actions, and if we fail to take these into account, we are doomed to frustration if not outright failure. The material nature we inhabit and the ideal nature we carry in our heads exist always in complex relationship with each other, and we will misunderstand both ourselves and the world if we fail to explore that relationship in all its rich and contradictory complexity" (pp. 21–22).) We would be foolish to overlook that one of the reasons Cronon's thesis was so widely received was its compatibility with the ethos of our age, that is, the ease with which it is appropriated and repurposed to align with the dominant interests of Anthropos and Capital. And now that "wilderness" has been permanently fused to archaic notions of "pristine" – a defunct idea brandished by maudlin, sentimental (and potentially racist) simpletons – the next move is to deconstruct nature itself (and conveniently all the lands and "resources" under its aegis). As Christopher Ketcham recently commented, "Wilderness advocates have stopped talking about wildness, because wildness is not commercially viable" (2014, p. 43). We must always bear in mind that we are four decades deep into a calculated restructuring of human-nature relations (Henderson et al., 2017) and our intention is to encourage environmental educators to resist the move to "get over it" due to economic common sense. In this chapter, we shall try to stay with the complicated conversations and argue that while one of the troubles with wilderness is that it has been deployed as an ahistorical anachronism pandered by sentimental elitists; the *other* trouble is the fact that the *material referent*, or what remains of it, continues to be colonized all the while. (We note that "colonized" in this case does not *only* signify the imperial practices of accumulation by dispossession within global capitalism as places are reconfigured to compete based on resource endowments (e.g., Fletcher, 2015; Mendoza, 2017). Instead, like Serres (2011), we speak of colonization as *appropriation* of both urban and natural spaces with the "disadvantaged" or "dispossessed" including both vulnerable members of the human species as well as other-than-human beings. This does not mean we wish to

reinforce a categorical separation between human and nature. We share with Taylor (2017, p. 61) that "it is the deluded hyper-separation of ourselves from nature that distinguishes modern western thinking and has resulted in unsustainable modes of living in the world and produced the anthropogenic ecological crises we now face.")

For educators interested in integrating notions of childhoodnature, we submit the trouble lies in what post-nature thinking will mean in practice. Will it simply be a novel means of reinscribing human exceptionalism and the managerial responsibilities that come with planetary stewardship (i.e., a move to innocence) or will it involve what Gary Snyder called the "real work" of coming to recognize our place in the world with humility (see Jardine, 2012, p. 220)? We acknowledge that calls to unlearn foundational dualisms and anthropocentric biases in education are not new (Kopnina, 2012a, 2015a; Bonnett, 2015; Lupinacci & Happel-Parkins, 2016; Quinn, Castéra, & Clément, 2016); however, we hope to illustrate some of the challenges inherent in the endeavor based on our research with nature-based early childhood education. As we shall discuss below, educational experiences of "direct contact" with "nature" all too often backslide into anthropocentric moves to innocence. Ultimately we suggest any educational initiative aiming to integrate notions of childhoodnature must remain hyper-aware and realistic about such tendencies and appropriations.

Rewilding Pedagogy

We cautiously describe our educational project as *rewilding*, that is, co-crafting experiences that trouble the taken-for-granted logic of human dominion and seek to recognize our entanglement with/in a more-than-human world. Rewilding pedagogy entails cultivating the historical consciousness and humility to recognize a planetary loss of flourishing "wilderness" (i.e., healthy and biodiverse ecosystems with relatively minimal human involvement). While rewilding in conservation discourses tends to mean reintroducing species, or reasonable facsimiles thereof, to places where that species has gone extinct (Kolbert, 2012), it also refers to committing to the flourishing of places in ways that recognize the reciprocity between humans and other-than-humans (Bekoff, 2013). Rewilding, in this sense, seeks to shift environmental relations from being primarily economic or resourcist toward a more holistic recognition of the necessity of "nature protection" (Washington, 2013; Kidner, 2014). Ultimately rewilding pedagogy entails evoking encounters and experiences that challenge anthropocentric discourses and recognize the interpenetration of culture/nature, organism/environment, urban/wilderness, etc. There is, however, a way in which even these reorientations might slide into anthropocentrism (e.g., we need to save *our* forests for their educative or health potential for human children). There is nothing inherently wrong with human land use per se, the issue lies in an anthropocentric ethos writ at a planetary scale and amplified by the "paradigm of unlimited economic growth." As Miller, Soulé, and Terborgh (2014, p. 4) underline:

> the assumption that managing nature for human benefit will preserve ecological integrity is ungrounded and does not address the root causes of biological destruction, such as the paradigm of unlimited economic growth, unabated consumption and ever-increasing human numbers. . . We contend that the *ideology* rests more on delusion and faith than on evidence. The ethic of the *ideology* is utilitarian and sometimes parallels neoliberal economic philosophy. . . the center of traditional conservation is the preservation of biodiversity for ecosystem function and evolutionary potential.

The more ambitious side of rewilding represented by the "nature needs half" movement, for example, challenges the ideology of anthropocentrism by recognizing the intrinsic value of other-than-human beings while maintaining the dignity and uniqueness of human beings (Cafaro & Primack, 2014; Doak, Bakker, Goldstein, & Hale, 2015). Rewilding in this sense is related to the concept of *bio-proportionality,* seeking not merely viable but flourishing populations of myriad species and strengthening the case for increasing the extent of protected areas (Mathews, 2016, p. 140). Within this framework, setting aside vast tracts of land and sea for "nature" without direct human control or management is necessary to guarantee *abundance* not just sufficiency (Mathews, 2016). One of the crucial differences between rewilding pedagogy and many of the conventional ESD approaches is this recognition of the intrinsic value of places/beings and a commitment to supporting bio-proportionality in "the natural world" as well as "urban environments." The trouble, for us, lies less in taking up specific positions on conservation issues and more in the tendency to make faith-like appeals to the metaphysics of mastery in lieu of staying with complicated conversations. With respect to education, we are concerned with the way in which these logics play out, for example, the recent move in some nature education programs to make no distinction between "domesticated" and "wild" species as a pedagogical strategy for the Anthropocene.

Case Studies

The Netherlands Case Studies

The Netherlands is a country populated with over 17 million people at the rate of roughly 500 people per km^2 and rising. Since most land is used for agriculture or industrial development, rewilding initiatives in the Netherlands tend to be couched in the language of "land management" (Kolbert, 2012). Dutch rewilding thus mostly involves reintroduction and preservation of smaller species with larger species, such as deer and wild cows, needing annual "maintenance and management" or, in other words, culling (Kolbert, 2012, 2014; Shoreman-Ouimet & Kopnina, 2015, 2016). As discussed in the gardening case study below, children are taught to "take care of nature" primarily to ensure human food security. Dutch environmental education includes multiple stakeholders (e.g., schools, communities, garden centers, local businesses, NGOs), and the curriculum typically involves a number of nationwide nature activities: including *schooltuinen,* or "school gardens" to learn basic horticulture, and *bosweek*, or "forest week" (Kopnina, 2011a, 2011b). Other ad hoc

initiatives include visiting "wild areas" (small parks, populated perhaps by birds and a few small mammals such as rabbits) in order to participate in botany, biology, and geology-related coursework.

Schooltuinen/School Gardens

Between June 2016 and July 2017, the author (Helen Kopnina) conducted a number of in-depth interviews with the children and school supervisors involved in a school gardening project. Amsterdam schoolchildren between the ages of 9 and 11 routinely follow a "nature education" course involving gardening. In this case, over 60 children in the summers of 2016 and 2017 were involved in a *schooltuinen* program in an urban park called Westerpark (detailed in Kopnina, 2013, 2015b). Students helped with activities such as trimming, cleaning, and gathering wood and are sometimes rewarded with honey from local bees. The garden itself is an area of the park used exclusively for educational activities where students learn rudimentary facts about Dutch agriculture.

In conversing with students, it quickly appeared that they equate "weeds" with something that needs to be destroyed, not, for example, as wild plants contributing to biodiversity beyond human utility. However, we need to note that in biological terms, the category of "weeds" needs to be treated on the case-to-case basis. If the plants are introduced invasive species they might not be contributing to biodiversity and thus may impede the task of agricultural rewilding, which is about growing diverse foods. The practical question is whether "weeds" may create a monoculture that threatens all other plants or whether any nonedible plants are routinely destroyed just because they are seen as "useless." It was also noted that the fact that the "cultivated land" requires industrial fertilizer after the end of the season was not mentioned during the educational program. This kind of rosy colored and oversimplified understanding of ecological entanglement is also evident on a larger scale when visitors to the Netherlands (not to mention the Dutch themselves) view expansive agricultural fields to the horizon only to wax lyrically on how "green" a country it is. Students also learn that due to generous subsidies to domestic farmers, the Dutch are able to export some of their excess produce to African nations to feed disadvantaged peoples. The manufactured landscape is thus rendered morally beneficent. Students learn to clear weeds and are allowed to harvest their produce and cut flowers to take home. As one of the teachers explained: "This way they [the children] learn how important land is. . . They learn how to take care of the land." As a reward for taking care of the land, the children, according to the same teacher, learn that "nature feeds them." At the end of October, when harvesting is complete and all crops and weeds are cleared, the land is left bare to be fertilized for next year's gardening activities.

Bosweek/Forest Week

Bosweek takes place in Utrecht province, in the area called Lage Vuursche, where recently planted forest covers about 1150 ha. The activities include "camping and survival type activities" (e.g., learning how to cut wood and make fires, climb trees, make "wild" river crossings, and discover basic outdoor rules and ethics). On the

forest farm, the children are involved in competitive games, talent competitions, music performances, and stories about the past when "dangerous wolves and bears" roamed the forests. Some children were allowed to help with chopping wood for the fire and were told, as with students in the Canadian case below, that the wood needed to be cut to allow young trees to grow. Significantly, we note that the "thinning" of wood and its use for "green" energy generation is a common practice in all Dutch wooded areas (Kopnina, 2015b). In conversation with the children, it emerged that they mostly enjoyed role-playing and musical competitions inside the house as well as chopping wood. A few children said that the things they missed the most, besides parents, were their smartphones and video games; however, most children the author spoke to referred to their experience as "fun."

Reflections

As these case studies illustrate, Dutch children are rarely exposed to natural areas that are not heavily managed "working landscapes," and yet, educators often frame these experiences as wild encounters. Dominant approaches to agriculture that tolerate little biodiversity or utility beyond human needs are recreated in miniature *schooltuinen* programs in order that students learn how "nature feeds them" and those who are "less fortunate" (quotes here are used to designate terms taken from field notes recording conversations with children or supervisors). Thus the primary lesson drawn from school gardening is that by "taking care of nature," one can sustain not only local needs but "feed the world." While this chapter does not delve into the details of European agricultural subsidies or the manufactured dependence of the developing world upon agricultural imports, we note that even on a small scale, this type of environmental education serves to normalize and celebrate the "metaphysics of mastery" (Bonnett, 2015). This mastery manifests not only as the divine right to determine what species are "weeds" and "pests" but also instills in children the idea that nature itself is better served if humans take our place as planetary stewards and ecosystem managers.

This is not to say that school gardens or forest weeks are inherently anthropocentric, but to reemphasize that in addition to learning to how to grow vegetables, the role of environmental educators in a post-nature world ought to entail provoking students to think about notions such as interdependence, ecological humility, and perhaps even a "more-than-human world" as basics for life in the Anthropocene (Affifi, 2016). Concretely, a good starting point might be letting an area grow without or with minimal management (by simply observing what happens to the land without human "care" or "maintenance"). From this one might highlight, for instance, how bees conduct their ritual dance to indicate the location of "flowering weeds" and make honey used for the bees themselves (not only *for* human children). To avoid giving children the idea that humans are "bad" and outside nature, as well as provide healthy activities for the children, a number of nonintrusive in-nature activities are easy to organize. They can include imitating the bee dance and asking other children to locate the hidden flower following the dance, or playing hide and seek, or observing and naming different types of plants and insects. It seems to us that a pedagogy committed to rewilding or integrating childhoodnatures

ought to always be troubling strict adherence to dualisms such as human/nature, culture/nature, human/animal, modern/primitive, and human/wilderness. There is nothing inherently wrong with school gardens or forest weeks, just as there is nothing inherently wrong with being a human; the objective here is to push environmental education beyond anthropocentric moves to innocence when addressing the emerging realities of a post-nature world. Even in places where there is relatively more "nature-on-its-own-terms," as we shall see in the next section, integrating notions of childhoodnature can still lapse into ecologically problematic interpretations due to the tenacity of anthropocentric commitments.

Notably, much of the discourse around education for sustainable development (ESD) is informed by the metaphysics of mastery and tends to frame "nature" in resourcist terms. As such, a growing number of critical environmental education scholars have noted "sustainable development," as it is currently conceived, is patently anthropocentric (Kopnina, 2012a, 2015a; Kopnina & Cherniak, 2016; Jickling & Sterling, 2017). As a post-anthropocentric alternative, consider the ecopedagogy movement (Kahn, 2010), which is concerned with the radical reorientation of education toward ecocentric concerns in a more-than-human world. In order to incorporate children as positive actors in such a childhoodnature program, a child who is in an animal rights education could come home with a different ethos and that recognizes the subjectivity of nonhumans (Kopnina & Gjerris, 2015; Kopnina & Cherniak, 2016). Perhaps we would do well to recall that initially, environmental education was concerned with helping students acquire an awareness of the natural world and its current plight, sensitivity to the need for protecting nature, and the acquisition of skills to help address environmental challenges (UNEP & UNESCO, 1976). While more recent social approaches (e.g., that knowledge/awareness, skills developed through social learning, trust, connections, and the importance of collective action) are certainly valuable, the plural perceptions of sustainability tend to take focus away from the ecological crisis (Kopnina, 2012a). We suggest that rewilding pedagogy is, in part, a revitalization of the original aims of environmental education.

Canadian Case Study

In comparison to the Netherlands, Canada is a large country with a density of under four people per square kilometer. There are tracts of land comprised of *relatively* healthy ecosystems, which exist, for the most part, beyond the purview of constant human management. The cultural definition of "wilderness" thus varies greatly between continents, as illustrated by a recent contributor to *Orion* who suggested: "Where the American definition of wilderness traffics in philosophical absolutes about what wilderness *should be*, the European definition presents a more general set of ecological guidelines about what a wilderness *could be*" (Miller, 2017, p. 36). As we have illustrated, many environmental philosophers including Cronon have convincingly challenged the American definition of "pristine" and "primeval" landscapes in recent decades. We too are suspicious of wilderness in terms of

"philosophical absolutes," and yet in response to one of the central tenets of environmental education, that is, getting children outside into the natural world, three of the authors (Blenkinsop, Piersol, and Sitka-Sage) were compelled to co-create a school where students could be immersed in relatively "wild places" for as much of the school day as possible.

The Maple Ridge Environmental School Project (MRESP), located on the west coast near Vancouver, was initiated with two core assumptions: the first, that "Canadian culture" (i.e., the dominant settler colonial culture) is predicated upon and aggressively maintains an anthropocentric and colonial relationship with the natural world (Blenkinsop, Affifi, Piersol, & Sitka-Sage, 2016). Secondly, the role of public education, generally speaking, is to induct the next generation into these cultural norms. The central research inquiry was thus what role education might play as an agent of cultural transformation in the move toward more ecologically sensitive ways of being? Supported by a grant from the Social Sciences and Humanities Research Council, the school district, and myriad community partners, the MRESP "opened its doors" in 2011 (see http://es.sd42.ca). Presently, there are some 88 students (aged 4–12), 4 full-time teachers, 2 support teachers, 3 educational assistants, and a principal. The school has no permanent buildings (there are some yurts and shelters and students occasionally visit libraries and swimming pools "in town," etc.), and the vast majority of learning occurs outdoors in various forested parks, research forests, rivers, and lakesides. Additionally, the project is shaped by a set of ecological principles that attempt to bring all aspects of conventional schooling into question and guide the pedagogy toward place-based and ecological kinds of understandings. Although legally required to teach the provincial curriculum, the MRESP has significant latitude to experiment and think differently to explore new conceptions of learning, teaching, and assessment while pursuing a curriculum deeply rooted in place.

The Free Time Politics of Nature-Based Play

One late October day, Sitka-Sage happened to follow students into the small forested area called the "village" for their daily "fort time." Long a staple of environmental education and a component of children's development writ large (Sobel, 2001; also see Donald, 2009 for a critical appraisal of the "fort curriculum"), the village is an incredible opportunity for researchers to listen and observe what happens as this mini-society moves from the initial building stages to imaginative social play. For Sobel, this process of building dens, homes in the woods, caves, etc., often out of sight of adults, is part of becoming adult. Here the students can experiment with who they might want to be and what is socially appropriate to express. This situation also presents a chance to experiment with what students want their ideal communities to look like. The following comes from research notes from the same "free time" period, and all conversations in quotations are verbatim (Note: "I" refers to Sitka-Sage):

> On that particular day, I noticed several of the older boys carrying ominous-looking sticks around that they began loading with invisible bullets, cocking back and taking aim at the sky,

firing at will upon enemy fighters, and occasionally, a very real robin. They converge upon one of the larger forts and began to modify its structure into a prison. Other students start businesses and beginning hording sticks and twine to "sell" the surplus. I frantically search my rain jacket pockets for my voice recorder and situate myself as a visiting reporter interested in the emerging politics of The Village.

"What kind of buildings are there here in the Village?" I ask a Grade 6 girl.

"Well, I know that there is a McDonalds, and an armoury, a twine shop, a tattoo shop, a supplies shop and maybe a doctor. We also have two police stations and a jail."

"That is a lot of police."

"Yeah," she says matter-of-factly, "there are some pretty crazy people round here."

One of the oldest and largest boys, Travis, emerges quickly as the favoured "Prime Minister." He capitalizes on the tangible unrest in the Village over stick stealing and focuses his campaign on a kind of "get tough on crime" enforcement of the law. His party includes most of the older students, who are all promised positions in his caucus should he win the election: social care positions for the girls and military positions for the boys. A group of boys forms a perimeter around their Prime Minister elect and travel with him throughout the Village armed with stick-bazookas as he asks the younger students whether he can "count on their vote." I manage to inch my way towards them and thrust the recorder in Travis's face.

"Travis, can you tell me what life is like here in the Village?"

He takes on a confident, almost paternal tone, "Until now it has been very unorganized, there has not been a lot of organization."

"Yes, but I have noticed an increase in police stations, weapons. . . is this part of your campaign?"

"Yes I have made lots of changes, lots of police, there is a police station just over there."

"Is having more police the best way to. . . organize this village?"

"Well, I find that if we are out and about and we are out there. . ."

"What do you think is the root of the criminal activity?"

"Stolen sticks, there are lots of sticks being stolen. . . and the forest is getting destroyed."

"Could it be that some people have more sticks than others?" I ask.

"Well, yes, but, if. . . it's all about. . . look, we have lots of sticks, it's plentiful, people just do not want to get out there and look, which is why it's not the best thing. . . Look, I am being sponsored by lots of businesses, I am making sure that they get lots of business."

Reflections

As readers no doubt recognize, this is a complex instance that might be explored in multiple ways; we will focus on a few key observation relevant to the thesis at hand. The first, which we found quite striking, was how easily the imaginative play mimicked the dominant norms of mastery, militarism, and economism. So even though students were consistently immersed in the natural world, surrounded by teachers focused on and interested in transformational change and place-based education, the village rapidly slides from a tranquil forested grove to a patriarchal state with power maintained through a militaristic and competitive hierarchy. All of which undermines the work of the teachers and the place itself, legitimizing an anthropocentric utilitarian ethic. Our sense is that this example, one of many in years of research at the MRESP, troubles a few core assumptions in environmental education. The first, which we will overstate for sake of argument, roughly follows the sentiment that being outdoors engaged in self-directed play is a "good thing" and that young children in these settings are more likely to become compassionate and environmentally engaged adults (e.g., Chawla, 2002). The second, related to first, assumes an imaginative range among young children that allows them go beyond the

cultural norms, habits, and beliefs of their respective communities that is inspired somehow by being in "direct contact" with nature. The suggestion here being that they are apt, if situated in the right conditions, they will have more compassionate orientations toward each other and the natural world and ultimately be more relational beings. Yet, as this example shows, this is far from a foregone conclusion.

For us, one of the key insights in this discussion is that the work of the human educator is truly complex and involves a great deal of self-awareness, a willingness to be reflexive, and a vigilant awareness of how students are engaging with each other and the place and making sense of these encounters. It is incredibly easy for educators to undermine their own good work and that of their nonhuman co-teachers by way of moving to innocence and naturalizing dominant, utilitarian, and human-centric cultural norms. For example, toward the end of the first year at the MRESP, a group of the older students, grade three to seven, walked to the clear-cut, a section of the research forest that had been logged with conventional clear-cutting techniques, in order to read *The Lorax* by Dr. Seuss. To our minds, this was an ideal synthesis between place-based experience and language-arts curricular content. Imagine how much more meaningful and affectively powerful the message of *The Lorax* (discussed in Kopnina, 2012b, 2015c) might be while sitting in an actual clear-cut compared to a classroom. After the story, however, students and teachers alike seemed unwilling to acknowledge the destructive nature of clear-cut logging even as they sat within it. Instead the discussion rapidly slid into the more conventional language around forestry that permeates British Columbia including naming the potential benefits of clear-cutting, how it "opened up the forest" and "allowed for smaller plants to grow." This educational experience, in spite of what the teachers are proposing they are doing, hardly teaches children that forests have stood there before human species emerged (which is different from the humans *are* nature discourse in important ways) and that natural selection has allowed the old and new trees to regulate themselves.

This kind of double messaging was illustrated again when an excavator came in to dig up some land to "efficiently" make room for the new yurt that students use during the cold winter months. The teachers were asked about how this clearing of the land was approached with the students. One staff member responded, "they're excited about doing it because it was a jumbled mess beforehand. I don't think they're concerned about destroying habitat because there isn't really anything there to begin with." Another staff member interjected, "a support teacher and a student rescued a ton of salamanders around this log beforehand," apparently unaware this comment contradicted their colleague. The first teacher laughed "Oh ya, we found one this morning. I'm not feeling too bad about it if that's what you're wondering." Firstly, transferring life out of one section of land to another is an instrumental approach to the problem; it treats the ecosystem as a collection of objects rather than a dynamic set of relations and intrinsically valuable beings. Secondly, the laugh potentially indicates that the teacher thinks worrying about the impact in this case is ridiculous and moves to the innocence provided by the dominant culture; that is, that salamanders do not matter and should not be mourned "in public." If one deploys the discursive strategy that "there isn't really anything here to begin with," only a

"jumbled mess," it removes us from care and responsibility. This move justifies ethical distance in bad faith. One might claim we are simply being "too harsh" on a teacher "trying his best," which is partially true; however, we offer this instance as a concrete means to think through the challenges of unlearning anthropocentrism. As a single instance, it may not seem like a "big deal," but it represents a discursive pattern that we have witnessed time and again in our research, at environmental education conferences and, indeed, in our own behaviors and practices. Our intention here is to underline the need for a reflexive practice to address such moves to innocence as a key component of a childhoodnatures approach to teaching.

A nature-based school of this kind begs some important questions: does rewilding pedagogy have to include total immersion in the natural world, child-centered techniques, extended play, and teachers committed to cultural change as illustrated in this example? We have two responses aimed at teachers drawing from our research. The first suggests environmental educators actively cultivate a reflexive practice characterized by what Foucault called "hyperactive pessimism." Foucault employed this term to describe his practice of being an ongoing and suspicious cultural questioner but also to underlie his sense that cultural change is not so easily achieved as it may appear or as we may desire it to be. Our research observations consistently demonstrated how easy it was to slip into a kind of commonsense anthropocentrism. This was apparent in the ways teachers responded to students, to the natural world, to parents, to their pedagogic reflexivity, etc. It should be noted it was also a constant tendency within the research team that the place and its myriad denizens were easily ignored. For us, hyperactive pessimism is a necessary orientation to be constantly alert to these moves to innocence and to assume that any enacted habit or uncritically offered belief was likely rooted in the very culture we were aiming to transform (for more on this see Foucault, 1984; Blenkinsop, 2012; Derby, 2015). Secondly, we encourage educators interested in childhoodnature approaches to continue to develop discursive communities oriented humbly toward recognizing the significance of a more-than-human world. It has become patently clear in our research that this work is exceedingly difficult in isolation, and it is essential that educators working toward redefining foundational categories and enacting pedagogies informed by childhoodnatures find each other and provide both support and "critical friendship" when needed. Engaging with pre-exiting discursive communities and works that, generally speaking, promote ecocentric perspectives may be useful in this respect (this is not to say there will not be disagreements), for example, deep ecology (e.g., LaChapelle, 1991), posthumanist education (e.g., Bonnett, 2015), animal rights (e.g., Ortiz, 2015; Kopnina & Cherniak, 2016), and animal welfare education (e.g., Gorski, 2009). Or educational programs that focus on environmental ethics and post-anthropocentric lines of thinking (Kopnina, 2011a, b, 2012a, b, 2014a, b, 2016a, b & c; Kopnina & Meijers, 2014; Kopnina & Gjerris, 2015). Anthropocentrism is perhaps the deepest foundational category informing modernity; presumably it will take a broad-based approach to challenge its authority, and we find inspiration in the recent wave of pedagogical approaches seeking to critique and reject a faith-like adherence to human dominion.

Conclusion

Given the deep-seated foundation that anthropocentrism provides in the dominant culture, it is not surprising to witness it inculcated and reinforced in modernist educational programs. The fact that it remains so tenacious, even in schools committed to school gardens, forest weeks, and full-time immersion in the natural world, speaks to its power and psychological appeal. If we are to integrate notions of childhoodnature in any meaningful way, the struggle will thus be against commonsense habits of mind, the workaday desires of "consumers," and the seemingly sacrosanct myths of "unlimited economic growth, unabated consumption and ever-increasing human numbers" (Miller et al., 2014). Due to these entrenched challenges, it is crucial that childhoodnature educators evoke complicated conversations inasmuch as they are able to consistently trouble anthropocentric moves to innocence.

It must be noted that conservationists and rewilding proponents are often required to make difficult choices between which species "to keep" and which to eradicate (as in the case of invasive species) or whether or not "historical baseline" ecosystem configurations ought to be maintained vis-à-vis human intervention. The authors of this chapter reject the notion of a hard and fast either/or schism between these "two camps" with respect to conservation: strict noninterventionists or intensive ecosystem managers increasingly maintaining "conservation reliant species." On the one hand, noninterventionists are suspicious about "the language of this new body of ideas about conservation, which frequently uses words like 'engineer' and 'manage,' [and] lacks what environmentalism has always called for: human humility" (Marris, 2015, p. 25). On the other hand, "post-wild" thinkers, like Marris, hold that:

> Perhaps, through trying, through intervening. . . we'll learn more and become more effective at "managing" Earth. And that increased ability to consciously control, rather than just blunderingly influence, may well be distasteful to many. They would rather be mere passengers on Earth, taking our place among the other animals, living as part of an ecosystem but not as its master. Well, me too. That sounds less stressful, more pleasant. But that would mean abdicating our responsibility to the many species and ecosystems we've harmed with our lack of mastery. We owe it to them to improve our scientific understanding, our gardening prowess, so that we can ensure their continued persistence into the future. (p. 26)

It is interesting to note the charge of "human exceptionalism" is employed by both sides and leveled at each other with righteous indignation. We remain wary about against drawing too close a parallel between rewilding in conservation and rewilding in pedagogy; however, the instance does present an interesting means of exploring a third way. The trouble, for us, is that the traditional noninterventionists and the "post-wild" engineers both tend to demonstrate a shocking lack of cultural-historical consciousness, political acumen, and, at the risk of sounding self-serving, an understanding of the significance of education in a post-nature world. For us, there is little to fret over about, for example, replanting whitebark pines in Oregon's Crater Lake National Park (Marris, 2015). Indeed, students at the MRESP routinely hike out to

various "clear-cuts" in Malcolm Knapp Research Forest to participate in replanting efforts. The issue at hand is what discursive practices are deployed in order to frame, make sense, and debrief the experience of replanting. There is a world of difference, we suggest, between framing the activity as an example of our gardening prowess and increasing efficiency at managing Earth with mastery and framing the activity as a gesture of healing in order that we might recognize our interdependence with other-than-human beings that we share this land with. This kind of rewilding pedagogy also provides a reality check for those who seem to think that "aggressive interventions" (Marris, 2015) like moving species outside of their historical ranges to colder areas ahead of climate change are (a) even possible, (b) that such interventions represent anything more than applying a Band-Aid to a severed limb. In other words, the ecological crisis is not going to be solved by simply improving our scientific understanding as mastery over nature. This position shirks the role that mastery-focused scientific understanding played in precipitating and intensifying the ecological crisis in the first place, but it also neglects the sociocultural and psychological roots of the problem (as well as the pedagogical aspects of any potential "solutions").

Pedagogy informed by childhoodnature, it would seem, needs to be both realistic and strategic about confronting the deep-seated myth of human supremacy and face some rather difficult realities. Shall we continue to teach our children that nature should be protected because it gives us vegetables, lumber, and honey and provides a fun background for games? Or more to the point, how do we move away from such discourses and practices to instead teach about restraint and carefulness in relation to "nature" so as to respect the varied more-than-human beings that require relative wilderness to exist? How do we sit with the topic of loss without "moving on" to avoid any strong (and perhaps appropriate) reactions to the history of nature and the current state of many ecosystems?

We refuse to simply "get over it" – both the staggering loss of wild places and the wildness within and the push to celebrate the advent of all planet Earth as "rambunctious human-tended garden" (Marris, 2011). For us, integrating notions of childhoodnature or any brand of post-nature thinking in education requires us to go beyond rhetorical moves such as "children *are* nature" or "everything is connected," beyond any set of evasive strategies or moves to innocence, to stay with the complicated conversations and do the complex work required of us. One way we might do this, to return to one of the objectives of this handbook, is by critically examining how children are "positioned as active participants, critical explorers, and/or co-researchers?" How, for example, are we to support children to have the imaginative range – the capacity to conceptualize and enact different ways of being in the world – to transcend the problematic ecological norms of the cultures in which they are nurtured (i.e., what would an idealized multispecies "village" look like, for example)? To what extent ought the educator intentionally de-center human interests and perspectives? It seems to us that one of the principal lessons of the so-called Anthropocene is learning how to be human and be nature and still leave space for others to flourish, without pruning, cutting, managing, burning, and domesticating landscapes because of some vague and archaic notions that there is not really anything there to begin with.

Abstract

With China implementing a new round of basic education curriculum reform, environmental education has come under focus for primary and secondary schools. As part of this curriculum reform, a number of primary and secondary schools have applied their attention to urban wetlands as important sites for environmental education, school-based curriculum development, and meaningful learning experiences. However, little is known about how formal learning in urban wetlands activates children's environmental awareness and sense of

place, or cultivates children's environmental literacy in the Anthropocene. To address this knowledge gap, we set the context for Chinese curriculum reform and describe urban wetland-based environmental education in China. We argue that environmental education is an indispensable part of China's curriculum reform and provides a source and power for reform. We draw on two case-studies to show the process and features of urban wetland-based environmental education within school-based curriculum development. School-based urban wetland environmental education can be an effective way to improve Chinese school children's childhoodnature in Anthropocene times. This chapter not only aids in better understanding the place and meaning of urban wetlands-based environmental education in Chinese schools but also the role of environmental education in curriculum reform in primary and secondary education in China.

Anthropocene · Childhoodnature · Urban wetland-based environmental education · Curriculum Reform in China · School-based curriculum

Introduction

The rapid development of China has been a prominent feature of the twenty-first century. As a part of counter-strategies for problems arising from great and rapid development, China has paid more attention to the benefits of environmental education. From the eighth curriculum reform for basic education in 1999, environmental education has been specially highlighted within formal Chinese curriculum. A symbolic policy document, *Implementation Guidelines for Environmental Education in Primary and Middle Schools*, was produced by the Ministry of Education in 2003. It was the first national-level curriculum guidance document for environmental education in formal education. According to the *Guidelines*, the schools are strongly encouraged to promote environmental education by taking advantage of surrounding environments and local natural sites and developing school-based curriculum for local environmental learning. Urban wetlands serve as an important site for environmental education. In the context of curriculum reform, schools in Bejing, Harbin, Hengshui, Shenzhen, and other cities have developed school-based curriculum for their local wetlands to promote environmental education.

In this chapter, we focus on case studies from two schools in Bejing, a primary school and a secondary school, to explore the intersection of urban wetland-based environmental education, school-based curriculum development, and Chinese school children's experience of nature in times of very rapid environmental change. We begin by setting out the context for environmental education and curriculum development in China as a response to the Anthropocene, and review what is known about environmental education in China in relation to children's nature learning. This chapter will not only help us better understand the role of urban wetlands-based environmental education in Chinese schools but also the role of environmental education in curriculum reform in primary and secondary education in China.

China's Environmental Problems in the Anthropocene

One of the most prominent features of the Anthropocene has been the rapid development trajectories that have emerged in the world's largest developing countries, most prominently China (Steffen, Grinevald, Crutzen, & McNeill, 2011). China has recently entered another period of economic take-off – a great "revolution" without a parallel in the history of the human world. But this "revolution" throws a dense shadow on China's capacities for sustainable development. Losses from pollution and ecological damage range from 7% to 20% of China's GDP every year in the past two decades, and continuously emerging new problems become great threats for the nation and its people. Such problems affect not only China but the world. Political leaders promised that the Chinese government would lead China to build a sustainable country in this Anthropocene time. Obviously, this commitment, if it is a real commitment, means a overwhelming duty and foreseeable huge amount of effort.

The scope of China's environmental problems is complex, involving poverty, culture, and political situations, as well as technical, social, and economic development conditions. With a current population over 1.410 billion (20% of the world's human population) and relatively low economic, scientific, and technical capabilities, China's socioeconomic development before 1978 was difficult and inefficient. Industries did not adhere to a standard of environmental performance, and environmental agencies lacked sufficient funds and authority to enforce environmental regulations. Since 1978, especially since 1986, China has showed vigorous economic growth unmatched elsewhere in the world. China's swift economic growth over the past three decades has been delivering to its people a relative prosperity that is largely defined in immediate material terms. But China's economic prosperity is taking place at great cost to China's environmental quality and natural resources. China's rivers, reservoirs, and other water resources are largely contaminated. Cities are the engines of economic growth. Unfortunately, cities in China are facing expanding pollution problems, with urban air laden with harmful particulates, gases, and toxins; solid and hazardous wastes often dumped untreated; and pollution extending from urban areas to rural areas. Environmental pollution is affecting overall social and economic development.

Environmental problems are exacerbated by mismanagement, carelessness, indifference, ignorance, as well as a lack of measurement and monitoring methods to provide baseline data critical to serve as a technical basis for planning and design to prevent and control pollution, and as verification of adverse effects on health and the environment. A lack of information sharing has led local governments to misinterpret laws and regulations. Moreover, institutional obstacles within the government and legal systems have contributed to unequal distribution of information on laws, regulations, and enforcement mechanisms. Without proper knowledge and information, local governments and the people cannot implement environmental regulations effectively.

As one consequence of rapid development, urban areas have expanded rapidly and millions of people have migrated into cities. Sixty percent of the human population now lives in cities, meaning more than 250 million children under the

age of 14 live in urbanized areas. As Noschis (1994) suggested, densely populated cities have become the "natural environments" for children, as well as rich learning environments, whether or not formal places for children are intended, planned, or otherwise. Chawla (1995, p. 11) writes that "Western culture has historically separated notions of nature and the city, and since the eighteenth century, it has associated children with nature" and in China, too, separation between a designated nature (natural space) and city children deemed a cause for a so-called nature deficiency.

Environmental Education in Twenty-First Century in China

Steffen et al. (2011) argued that humanity is now entering stage 3 of the Anthropocene based on the growing awareness of human impact on the environment at the global scale and the first attempts to build global governance systems to manage humanity's relationship with the Earth System. The Chinese Government has set "invigorating China by means of science and technology" and "sustainable development" as the fundamental state policies since the late 1990s. In January 1999, the *Education Promotion Plan of Action for the 21st Century* (Ministry of Education, 1998) was approved by the State Council to the Ministry of Education, marking the beginning of education curriculum reform. The 10-year Plan was to implement a "cross-century quality education project" to improve the quality of state education, comprehensively improve national innovation capability, reform the curriculum and evaluation system, and formulate a standard of contemporary education curriculum in 2000. The Plan reformed educational content and teaching methods. In June 2001, the Ministry of Education released the *Master Plan of Basic Education Curriculum Reform [Trial]* (Ministry of Education, 2001), which officially meant the new round of Chinese basic education curriculum reform (hereinafter referred to as the new curriculum reform) was in full swing. Part of this Plan is to improve students' sense of social responsibility and environmental awareness as a part of civic moral literacy. New curriculum reform was adopted by all primary and junior high schools (middle schools) in more than 30 Provinces covering the 9 years of compulsory education. As, such, this curriculum reform has become a normal state for Chinese education today.

In 1999, the Ministry of Education proposed that environmental education should be formally incorporated into primary and secondary schools as an interdisciplinary theme. In March 2003, the Ministry of Education introduced the *Primary and Secondary Students' Environmental Education Syllabu*s (Ministry of Education, 2003a), requiring all schools to teach environmental education. In October, the same year, *The Guidelines for Implementing Environmental Education in Primary and Secondary Schools [*Trial] was published by the Ministry of Education, which marks the legalization and standardization of environmental education in Chinese schools (Ministry of Education, 2003b). *The Guidelines* guarantee that environmental education will be operationalized to cultivate the sustainable development awareness and educate for a rational concept of population, environment, and development. Students are encouraged to learn about environmental issues from

an early age and work together to create a sustainable future. These two Ministry of Education documents mean that environmental education is officially manifest in basic education in China and the legitimacy of environmental education has been established for 15 years in formal state schooling. Educators were encouraged to combine environmental education with pedagogy reform and recognize participatory and exploratory teaching methods as the contribution brought by environmental education into general curriculum reform.

The Guidelines is China's first environmental education document at national level, a true milestone benefitting hundreds of millions of primary and secondary students, who receive quality environmental education, not only for the protection of nature but also to enhance their confidence and capacity to build a sustainable future as world citizens with a sense of responsibility towards their environment and society. *The Guidelines* put forward a "learning from practice" model, as stated in the Part IV of the *Master Plan of Basic Education Curriculum Reform [Trial],* the purpose of which is "to create educational environment where students can participate actively, stimulating their learning enthusiasm and developing their ability to use knowledge in the real situation, so that each student can be fully developed." The later *National Environmental Education Action Plan (2016–2020),* issued by Chinese Ministry of Environmental Protection in 2016, explains that "primary and secondary schools should include knowledge of environmental protection and ecological civilization into curriculum, through strengthening teacher training and developing teaching materials" and putting effort into environmental education extracurricular events.

China's 230,000 (from Chinese Statistics Bulletin of National Education, 2016) primary and secondary schools are mandated to provide environmental education – the development of environmental education in China has always been a top-down model. In China, the "activity-based teaching and learning" process has had an evolution from "extracurricular activities" to "courses related to activities," then "activity curriculum" to "integrated practical activities" and finally "activity-based teaching and learning." Within the Chinese context, "activity-based teaching and learning" can be regarded as a specific form of teaching, a form of curriculum construction, a form of curriculum implementation, and a manifest for "activities curriculum" and "integrated practical activities."

"Activity-based teaching and learning" (ABTL) has its roots in a historical, naturalist educational tradition of Plato and Rousseau, Dewey's empiricist educational theory, and Piagetian cognitive psychology (Kin-Lee, Yu, & Ma, 2010). ABTL now can be considered a contemporary type of experience learning developed in China corresponding to international teaching methods, and having similarity with inquiry learning and project-based learning, promoting student-centered activities, and experiential learning as a unique dimension of environmental education.

The original, centralized curriculum has been greatly adjusted by recent curriculum reform, by way of putting forward a three-tier system: the national curriculum, local curriculum, and school-based curriculum, enables the expansion and development of local scale curriculum resources. Research indicates using local natural environments as a curriculum resource and as a site for learning can effectively solve

a nature deficiency syndrome (Huang & Xie, 2017), stimulate learning interest, enhancing student knowledge of nature, promote scientific experience, cultivate a kind heart and the spirit of exploration, enhance teamwork, purify the mind, promote moral sense, and develop the ability of artistic creation. Current cases show that "adapting to the local conditions" has become an important feature of curriculum reform, especially the school-based curriculum, which can integrate teaching and learning for local environmental situations into school curriculum, and present a real opportunity for environmental education to perform innovatively (Liu & Huang, 2013).

Urban Wetlands as Environmental Education Sites

Urban wetland can be seen as one of the symbols of the Anthropocene – the human imprint on the natural environment, a mix of city and nature. Urban wetlands are ecosystems located within a city and are half land and half water (Zhang, Li, Liu, & Zhu, 2016). Urban wetlands have prominent leisure and educational functions, and while profoundly influenced by human activities, they keep an intimate relationship with human beings. The types of urban wetlands in urban China include lakes, rivers, swamps, ponds, reservoirs, ditches, canals, and urban coastal wetlands (Liu, Lin, Wang, Yin, & Guo, 2013).

Empirical studies have shown the importance of using natural experience as an educational method (Huang, 2017). *The Guidelines* encourage schools to use sites such as wetlands to carry out environmental education. There are different types of urban wetlands in the cities of China; some have been developed into city wetland parks. On the one hand, urban wetlands are rich in water, animals, and plants and are resource sites for environmental education. On the other hand, compared with natural wetlands and wetland nature reserves, urban wetlands are able to be equipped with more educational facilities, and they are accessible by transportation and are considered to excellent sites for primary and secondary schools to carry out environmental education.

Cultivating children's sense of loving and protecting their environment from an early age is a basic principle for implementing environmental education in China, as an old proverb says "Habit is a second nature" (Du, 2011). Nature can be seen as the second classroom because it will help students directly develop their environmental knowledge much better. The unique ecological environment of the wetland provides opportunity to take a close look at wetland scenery including its plants and animals in relaxation, so as to further have willing to protect it (Li, Cui, Dong, Zang, & Wei, 2014). Educating children according to their nature is also an ancient wisdom of China, the so-called Dao models itself after nature. The early stage of youth is also the time when children are full of curiosity toward the nature, so it is the perfect time to help them build the bridge with nature by engaging in activities related to nature, which will improve their perception towards it and local sense of belonging (Table 1).

Table 1 Different age groups of wetland environmental education comparison, cited from Shen (2016)

Age	Characteristics	Ability to participant	Education emphasis
0–5	The perception of nature is still in a state of chaos	No ability to act independently. Need parents to accompany	Get in touch with nature closely with rich and interesting facility
5–12	Lively and dynamic, has a strong curiosity to nature	Little ability to act independently but can act within group with teachers' guidance	Close contact and observation of nature with attractive education activities
12–24	Views toward nature have not been formed. Possess basic natural science knowledge	Be able to act independently or within group, and even can be a leader in it	Wetland ecosystem knowledge; animal and plant knowledge; interesting and professional education activities
24–50	Views toward nature have been formed and can be guided	Be able to act independently and within group	Get in touch with nature and enjoy beautiful landscapes; simple wetland knowledge
50~	Views toward nature have been formed and can be guided	Have the ability to act within group but acting independently is not recommended	Get in touch with nature and enjoy beautiful landscapes, especially for the purpose of health caring

Learning Urban Wetlands

A number of noteworthy cases on wetlands as education sites include the study of the history and culture of the moat in Dongzhimen Middle School in Beijing (Zhu, 2007); the study of algae and birds in Taoranting waters by No.15 secondary school (Lu & Wang, 2004); student research in Jiaozhou Bay wetland in Shandong Province by College Road Primary School. In the following two cases, we analyze school-based environmental education using urban wetlands as learning site.

Ya'er Hutong Primary School is located in the Xicheng District of Beijing Shi Cha Hai north shore, only a few steps away from the Shi Cha Hai wetland at the center district of Beijing city. The school is located in the old city known as Hutong landscape and surrounded by former residence of celebrities, historic relics, courtyards, and many other attractions filled with typical Beijing characteristics. Using Shichahai wetland as a learning site, the school has carried out a distinctive school-based environmental education since 2001. The school first organized all the teachers to participate in seminars and training to arrive at a unified understanding of the principles of curriculum reform and means to develop school-based curriculum. Subsequently, the school set up a school-based curriculum leading group headed by the Principal to help teachers design programs around improving environmental awareness and cultivating environmental literacy through enriched engagement programs that included classroom teaching, regular school rallies,

extracurricular activities, the Young Pioneers events, community services, and cooperating with family members.

The curriculum design team decided to use current teaching material and local sources to design courses at three levels: low, medium, and high, according to students' grades. Students in low grade mainly need to understand simple environmental knowledge; at medium level, the education aim is to form students' sense of protection and initiative to act; at the highest level, curriculum design is to enable students to take action within their ability. This means that the key to effective and meaningful curriculum is teachers. Through seminar system every 2 weeks, teachers exchange opinions with their colleague and reach a consensus. Data collection and evidence-based practice is emphasized as school-based curriculum is developed. Activities are designed for student exploration, respectively, the school-loving education based on school history, the patriotism education based on surrounding former residence of celebrities and garrison, the social education based on community research and service, the history education based on surrounding monuments, and environmental education conducted in the famous, local wetland.

The Shi Cha Hai wetland includes the calm lake and has become a well-known place for leisure and student investigations have raised various questions about the impact of such changes of land use on the water quality and daily life of residents in this area, reporting their findings to the local Chamber of Commerce. These curriculum practices have had a very positive effect. A survey of students conducted by external observers in 2008 and 2013 showed that students had a high degree of satisfaction with the "activities" in the school-based curriculum, believing that their development of intelligence and ability in the course of activities was much greater than that achieved through more traditional pedagogy. Teachers think that school-based curriculum promotes the improvement of students' overall quality, which manifests through improved student confidence, braveness, and problem-solving abilities. As showed in the interviews with teachers and the principle, school-based curriculum serves as an effective way to widening teachers' horizon, contributing to their transformation of education idea, and also, teaching ability has been improved into a new level (EIWPT, 2008; Liu & Huang, 2013).

The High School affiliated to Beijing Institute of Technology was constructed in 1950 at the south bank of the Long River, which is an important part of Beijing's urban wetland system. Since 2001, the school has developed school-based environmental education curriculum, using the Long River as a learning site, drawing on forms of project-based learning embedded in an integrated practice activities learning module. The first curriculum stage is to set up the concept of the purpose of "love water" activity to encourage interested students to participate. Establishing "water-loving" student groups carry out many projects, such as investigating water usage of their school and family, making a "water-loving convention," publicizing knowledge in the local community, visiting water saving pavilions in Beijing, posting water-saving proposals on the school's official website to effectively spread the importance of "water-loving" as a key concept in environmental education in the school. So successful is this concept, that "water-loving" activities have become famous brand of the school, serving as an important role in motivating students' exploring interest

and inquiring desire, which lay further foundations for more activities. "Loving the Long River" concept promotes water knowledge, water conservation, and water appreciation and is instrumental forming a water-loving atmosphere within the whole school, which is distinctive of this high school's identity.

Experiential learning activities enable students to research their local water area (the river and their water supply) under teachers' guidance and then devise actions for care of Long River. After a preliminary investigation and analysis, students identified projects such as the Long River water environment survey, the Long River lawn growth status research, the efficiency of Long River lawn watering facilities, and the investigation of Long River branch as some examples. Students groups conduct research in geography, biology, chemistry, physics using established scientific techniques; design plans and choose research methods; allocate and self-manage group tasks, rethink obstacles they encounter in breakthrough ways, and communicate with other groups and teachers. In the course of study, new problems and ideas have always been found, in which way students' interest can been stimulated so that the entire research process is able to continue.

Equally important is using information technology to record, express, and communicate students' research process and results. With the help of a technology teacher, who is also a member of research group, files can be easily saved as an electronic document, all scanned and classified, numbered, and accompanied by instructions. These materials have become important teaching resources for information technology curriculum. For instance, students were taught making "water-loving" website using these materials and students from different grades have cooperated to designing "water-loving action" website, which is available on internet. Through this website, students can easily access and communicate their own research content, processes, and results. In this way, students are actively generating a wealth of curriculum resources for information technology class, while the latter serve as an effective media for the former as an integrated practice activity. The results of student inquiry also contribute to the evolving formation of school-based curriculum inclusive of the disciplines of history, geography, biology, art, and social studies.

A survey of students conducted by external observers in 2008, 2013, and 2016 (EIWPT, 2008; Liu & Huang, 2013; Huang, 2017) also shows a high degree of satisfaction toward school-based curriculum in this school. The water-loving curriculum organizational concept has been very effective for learning environmental education with its focus on a key Beijing waterway. Through carefully designed curriculum and pedagogical processes, the students' abilities to think independently have been cultivated and they show initiative to learn; teachers also update their education concepts, and enhance their ability to adapting to curriculum reform. This case has been widely recognized by experts (EIWPT, 2008).

Using urban wetlands as sites and resources for environmental education does improve students' thinking level, perception of nature, and sense of belonging. In participating in practical and investigative activities, students find their interest and become more confident. More importantly, these activities evoke students' concerns about the environment and social issues and may have a profound positive impact on

students' future life and learning. Therefore, this kind of environmental education model using urban wetlands as learning site and school-based curriculum as curriculum carrier can be regarded as a successful exemplar of Chinese school environmental education.

Improving Chinese Childhoodnature in the Anthropocene

At present, environmental education is mandated to be widely carried out in primary and secondary schools in China, and since the start of this century, educators have accumulated a lot of experience, which contributes to the popularization of teaching and learning environmental knowledge and environmental awareness. China is facing an unprecedented opportunity to continually improve the quality of environmental education. As a country with a relatively backward education level, China can learn from all the forerunners' sufficient experience and lessons. Rapid economic development also enables China to invest more in environmental education. Sustainable development has become one of China's national strategies, and the concept of scientific development, resource conservation environment-friendly society, green growth, green GDP, ecological civilization are key and popular concepts. The ongoing Eighth Basic Education Curriculum Reform pays great attention to environmental education. These factors together have formed a good atmosphere for the development of environmental education providing meaningful learning opportunities for students (Yang, 2013).

Our case studies show that using urban wetlands for the development of school-based environmental education is highly effective. Urban wetlands are an important part of contemporary urban ecosystems with important ecological functions to regulate urban microclimate and alleviate urban environmental pollution (Zhang et al. 2016). Learning with urban nature benefits students' physical and mental development and improves their overall environmental awareness and satisfaction with school learning (Zhu, 2007). In addition, urban wetlands do meet city residents' psychological needs to interact with nature and serve as leisure areas for local residents and tourists to learn history and as sites for school students to conduct research and undertake meaningful learning(Gu, 2012; Liu et al., 2013; Zhang, Lv, & Wang, 2007). Therefore, within the context of curriculum reform, using urban wetlands to develop school-based environmental education curriculum becomes a means for promoting students' individual development, as shown in this chapter detailing two case studies from Beijing.

However, the future development of environmental education in primary and secondary schools still faces enormous challenges. One of the questions worth exploring is that what kind of environmental education philosophy schools will hold. In respect of curriculum value orientation, the new curriculum reform is on the basis of humanistic ideas. Chinese education has been enduring a long time of focus on an excessive emphasize of intellectual achievement, manifested by exam scores, but often ignoring students' moral development, manifested by students' inner feelings, attitudes, and aesthetic ability, leading to unbalanced personal development

with possible the loss of values and moral decay. The idea of humanistic education helps to reverse this situation (Wang, 2012). Together with "humanism," anthropocentrism also plays an important role in Chinese education, which is deeply rooted in traditional Chinese values. In the light of social development stage, this anthropocentric tradition will not reverse in a very long term. Thus, "humanism" and "anthropocentrism" might still be two key points of ethics in environmental education of Chinese schools.

Generally speaking, being integrated into the national curriculum signals that environmental education is an important part of basic education curriculum reform. Current experience shows that environmental education poses a challenge towards the traditional quality standard of teachers, teaching content, methods, and ideology and requires a thoroughly reform of school management systems, ideology, and pedagogy. Moreover, environmental education combines environment and sustainable development as a way to educate future citizens. It is not just a change of teaching content. Knowledge, skills, attitudes, and values are taught to students by teaching methods used through a more progressive educational process. Environmental education therefore will and must lead reform of traditional school teaching methods in China, including a much greater emphasis on partnerships (Knowlton Cockett, Dyment, Espinet, & Huang, 2017). The reform requires to change the relationship between teachers and students, and also advocates experiential learning, participatory learning, service learning, and learning within the context of society. These are all consistent with the idea of modern Chinese education reform. Therefore, environmental education will be further combined with the China education reform as indispensable in providing a source and power for reform.

Abstract

In the Euro-Western intellectual, or minority world, tradition death is often framed as something to avoid in the creation of "optimal" childhoods. Foregrounding a West Coast Canadian early childhood center's unexpected encounter with a dying rat, this chapter looks at the role ethical frameworks play in shaping uneasy more-than-human engagements to challenge taken-for-granted assumptions about animal death in urban early childhoods and grapple with the limits of ethical engagement. In it, understandings of childhood and nature are situated within the schism of romanticized narratives and challenges of

a so-called new Anthropocene era, to reconfigure encounters at the intersection of life and death as generative in their ability to destabilize the precepts of a humancentric worldview that orders urban spaces and relations in particular ways. Using a hybrid multispecies ethnographic and common worlding approach, this chapter explores possibilities for cultivating new modes of attention to promote expansive approaches to thinking and doing in early learning pedagogy and practice. How might we resist shoring up colonial and other universalizing narratives when death emerges through everyday encounter? What stories help us matter differently as we continue to world with others in this time of rapid change? This chapter proposes tending to multispecies relations, including those considered uncomfortable, as deeply entangled and consequential to open up new possibilities for ethical responses to living and dying together in these troubling times.

> Exactly here, where to be alive is to be implicated in the lives and deaths of others; exactly here we are called into an ethics of proximity and responsibility. . .In one sense, simply to be alive is to bear witness, by virtue of one's own embodied life, to the others who came before, but the actual ethical burden entails embracing those relationships. (Rose, 2013b, pp. 3–4)

"Exactly here" is where we unexpectedly found ourselves one morning. That is, our group of 3- to 5-year-old children, educators, and researchers came across an animal in distress while walking with an intention to think together about "what. . .it means to really share a place" (van Dooren & Rose, 2012, p. 2) with more-than-human others. A myriad of historical, cultural, and taxonomic layers complicate this encounter. After all, it was not just any animal in any random time and place we stumbled on. Rather, we encountered a dying rat while walking in Canada's West Coast Garden City, also known as the Songhees, Esquimalt, and W̱SÁNEĆ peoples' territories, in a so-called new Anthropocene era (Davis & Todd, 2017). And in this age of extinctions and exterminations, not all lives are seen as equal nor all deaths worth remarking. In the immediacy of the moment, however, the rat's suffering drew us in close enough to demand we rethink relations with an urban dweller few want to claim and challenge widely accepted norms around what constitutes a grievable life (Butler, 2010; McArthur, 2016).

Precisely here, while walking the springtime pavement, we were held uncharacteristically still for a moment, caught in a juxtaposition of recoil and curiosity at the shape lying in front of us. A 4 year old broke the silence first (Fig. 1):

What's wrong with the mouse?
It's a rat.
What's wrong with the rat?
I don't know. What do you think?
It's looking at me! What's it doing?
Don't touch it! It's hurt.

Fig. 1 Exactly here (Photo by Veronica Pacini-Ketchabaw)

Can we give it a band-aid?
I know! I know! It's dead.
Nooo. Look – it's shaking.
It's cold. We could put some leaves on it.
Maybe it's an old grandma.
My kitty bringed one of those home. Minnie kills those and eats them. But she doesn't eat the tails.
Stay back! We're scaring it.
Poison?
Silent nods, in reply

Clearly seized by something beyond our sight and its control, the rat shook violently on its side near the edge of the sidewalk, not dead yet but dy*ing*. While trying to grasp what was happening and figure out what to do, the rat commanded our affections through its vulnerability and our human implication, leading us into new considerations about our relations with this place and its nonhuman inhabitants.

In this chapter I respond to Davis and Todd's (2017) call for "those studying and storying the Anthropocene to tend to the ruptures and cleavages, between land and flesh, story and law, human and more-than-human. . .[to tend] once again to relations, to kin, to life, longing and care" (p. 775). Arguing for inclusion of Indigenous knowledges in contemporary Anthropocene debates, as a means of breaking with the colonial logics that set this newly named geologic epoch into motion in the first place, they describe the responsibility we now have before us:

> If the Anthropocene is already here, the question then becomes what can we do with it as a conceptual apparatus that may serve to undermine the conditions it names?...The story we tell ourselves about enviro-crises, the story of humanity's place on the earth and its presence within geological time determines how we understand how we got here, where we might like to be headed, and what we need to do. (pp. 763–764)

Rather than perpetuating an overwhelming sense of despair that universalizing, eco-disaster Anthropocene narratives tend to produce, here I situate our dying-rat

encounter within a wider context to reconfigure young children's relations with "unloved" creatures as productive and worth considering. What might be required of us, as educators and researchers, to create new stories with children in a way that opens up possibilities for "doing different" in an era defined by narrowing possibilities for diverse life forms on earth?

Becoming-with Multispecies Mortal Relations

Death is, of course, always with us in some form or another. And never more so than in these times, when human-induced environmental destruction and climate change have twisted the necessary weave of life and death into what scientists now confirm to be the planet's accelerated, sixth mass extinction event (Heise, 2016; Malone & Truong, 2017; Rose, 2011, 2013a). From an ecological justice point of view, if one of the goals of education is to learn how to become better creatures to live with, we need to reckon with the fact that this necessitates becoming better creatures to die with too. Our encounter may fall outside of the realm of readily activated concerns for charismatic creatures on the brink of extinction (Heise, 2016), but the dying rat's suffering stopped us in our tracks, igniting new conversations within the childhood center community.

The subsequent affect and impact of this experience provoked me to seriously reconsider death as an unlikely early childhood "dance partner," flying in the face of romanticized notions about young children. To think more expansively about what is possible in these ecologically precarious times requires confronting death as phenomenon in uncomfortable places (van Dooren, 2015). What role do early learning practices play in the process of (re)storying urban spaces? Who lives here? Who dies? And *why*? How might we, for example, shore up colonial, class, and other narratives when death emerges through everyday encounter? What stories might help us matter differently in the worlds we inhabit? And can we use them to help create opportunities to rethink our urban connections to the accelerated life-death processes of so-called Anthropocene relations through close attention, reflection, and collective engagement?

In this chapter I argue that, while usually cast as antithetical to early childhood, emergent encounters at the intersection of multispecies life and death can be generative to think with because of their ability to destabilize the precepts of a Euro-Western anthropocentric worldview that orders urban spaces and relationships in particular ways. Paying attention to other creatures, including those that are "difficult to live with," helps expand perceptions of what constitutes participation in co-shaping the places we live and learn. Vital to this discussion, then, is a consideration of rats themselves as well as our uneasy and unresolvable proximity to both rats and death at all times (Sullivan, 2004).

Method and Conceptual Framework

I begin this discussion with an invitation to think beyond responses of fear and disgust, often associated with both rats and death, to reconsider the way we frame life and death relations with young children, particularly when encountering animals

deemed "out of place" in urban settings. In Euro-Western-influenced contexts, this requires us to stretch conceptualizations of children beyond popular depictions of them as emotionally fragile beings in need of protection (Pacini-Ketchabaw, Nxumalo, Kocher, Elliot, & Sanchez, 2015; Taylor, 2013). Furthermore, it requires us to work at foregrounding more-than-human lives within ethical terms, as actively engaged in co-constituting the places we live, something a growing number of scholars are calling for across a number of disciplines (Collard, Dempsey, & Sundberg, 2015; Gibson, Rose, & Fincher, 2015; Haraway, 2008; Malone & Truong, 2017; Plumwood, 1993; Taylor & Pacini-Ketchabaw, 2015; Tsing, 2012, van Dooren, Kirksey, & Münster, 2016).

We also need to ask ourselves if we take this intention far enough. Are we really rethinking tendencies to tell anthropocentric stories in the early years of research and practice if we limit ethical considerations to the realm of romanticized child-animal scripts? Questioning the motivations behind tendencies to tell some multispecies stories and not others, in research and practice with young children (Nxumalo, 2015; Taylor, 2017), is of increasing concern for early childhood scholars and reflects a wider interdisciplinary call to understand the places we live and learn as composed by a biodiverse, versus human-only, communities. For example, Kari-Anne Jorgensøn and Dawn Sanders (2017) asks if "[in] our urge to represent sensory attentiveness to the more-than-human world in early childhood science education…we, albeit perhaps unconsciously, tell stories in which wistful and romantic notions of 'nature' and childhood prevail?" (EECERA, 2017, presentation).

Our dying-rat moment produced conflicting feelings of remorse, fear, disgust, and compassion that are, in many ways, unresolvable. Taking rats' lives (and deaths) into serious consideration as part and parcel of living, however reluctantly, *in community* with them tests the limits of our ethical commitments to those who make us uncomfortable and pushes back on the habit of framing them as lacking "real-life" connections outside of irritating humans by their persistent, and unsettling, presence (Fawcett, 2014). This discussion put our mortal encounter into tension with the broader question of whether we are able and willing to create pedagogies that extend moral frameworks to the "unsettling" and "unloved," as well as the "cute and cuddly" or "majestic" of the world.

Speaking to the new ethical demands that such unsettling animal encounters spark, Common Worlds Research Collective co-founding members, Affrica Taylor and Veronica Pacini-Ketchabaw (2016), highlight what they refer to as a generative "nag" produced "in the distinctive 'affective and thus ethical logics' of…awkward multispecies relations…[precisely] because they are never fully 'comfortable, loving and caring' nor demarcated by unambiguous 'horror, abjection and phobia'" (p. 132). Rather than thinking "beyond" responses of fear and disgust, then, perhaps it is more apt to say that we need to think *with* unsettling responses to death, rats, and other creatures to more fully reconsider motivations behind storying place relations in certain ways, instead of denying or glossing over these responses. Deborah Rose's (2013) assertion comes to mind here wherein she reminds us that "the actual ethical burden [of responding in the death zone] entails embracing [these] relationships" (pp. 3–4). As her colleague, Thom van Dooren (2014) points out that responding to

living in the Anthropocene "requires we take on the fraught work. . .of weaving new stories out of this [biocultural] multiplicity. . . that bring together the diversity of voices necessary to inhabit responsibly the rich patterns of interwoven inheritance that constitute our world" (p. 20). In our case, biocultural multiplicity includes an ever-present rodent population.

Our dying-rat encounter took place within the context of the Cache Creek early childhood center's ongoing multispecies inquiry project aimed at engaging a group of predominantly settler, urban Canadian children, and educators in the difficult work of decentering anthropocentric ways of thinking and being with the world (Nxumalo & Pacini-Ketchabaw, 2015; Taylor & Pacini-Ketchabaw, 2015; Tsing, 2012). Over the past 2 years of walking, talking, reading, listening, questioning, feeling, writing, and noticing together, we have taken an interdisciplinary, common world conceptual approach to research and practice with young children (Common World Childhoods Research Collective, 2017). This approach seeks to reframe childhood as collective and relational rather than individualistic and developmental, situated and differentiated rather than decontextualized and universal, and entangled within messy real-world relations rather than protected in a separate space (Common World Childhoods Research Collective, 2017; Nxumalo, 2015; Taylor, 2013; Taylor & Giugni, 2012; Taylor, 2017).

Working with this framework is useful for thinking expansively about urban multispecies relations and opening up new perspectives on child-animal pedagogies because of the emphasis it places on foregrounding connections between children and more-than-human lives (and deaths) as active co-shaping forces in the places we live. While it may be easy to agree conceptually on this point, it can be difficult to do so in the context of childhood practices founded on developmental, humancentric, and heavily romanticized early childhood narratives (Taylor & Pacini-Ketchabaw, 2015). Working from the assertion that children's lives are entangled in messy, "real-world" relations help resist a temptation to "move to innocence" by attempting to transcend our material, historical, socioeconomic, and cultural human selves. Furthermore, reframing childhood as situated in messy, "real-world" relations offers potential for promoting richer and broader understandings of the delightfully complex and often unpleasant, interconnectivities that constitute the dynamic and ever-changing worlds children inhabit.

The common world framework is not chosen for our inquiry work with neutrality in mind. The realization that humans are inextricably linked with the production of rising global temperatures and narrowing possibilities for global biodiversity informs the center's educational team's desire to respond to living and working in these times by "doing different" together with young children through pedagogies and practice (Gibson et al., 2015; Pacini-Ketchabaw et al., 2015). Challenging ourselves to make room for new possibilities in pedagogy and practice feels hopeful and necessary, along with an ongoing, active, political commitment to work at undoing the deeply ingrained Euro-Western imperial preoccupations that continue to inform our practices (Belcourt, 2015; Jackson, 2014; Smith, 2014). Attempting to recognize and engage with new modes of "response-ability" (Haraway, 2008) through our weekly animal walks and an indoor worm compost bin project as well

as reading, questioning, making, and discussing theory and practice together during monthly seminar meetings are a few of the ways we try to cultivate an ability to do so.

Working with the conscious intention to reject human exceptionalism's underlying binary logic of a nature/culture split feels vital if we are to have any hope in resisting the tendency to tell stories that position "the natural world" as an instrumental backdrop against which childhood development can be enhanced (Nelson, Coon, & Chadwick, 2015; Pacini-Ketchabaw, Taylor, & Blaise, 2016; Plumwood, 1993; Rautio & Jokinen, 2016). Part of the challenge of doing so lies in learning to temper what we *think* we know about other creatures by recognizing them as sentient fellow beings with unique and often surprising ways of worlding the same places we inhabit. Pedagogically speaking, it is important to ask ourselves how we might open up educational practices to think with more-than-humans as co-shaping place participants with their own lifeworld intentions (von Uexküll, 1992; Watts, 2013). But, as Ginn, Beisel, and Barua (2014) point out, doing so also means avoiding the trap of enlisting simplistic and universalizing tropes such as "innocent animals versus bad humans" to tell stories. As they say, multispecies "flourishing does not imply an 'anything goes' free-for-all...[but asks] instead who lives well and who dies well under current arrangements, and how they might be better arranged" (p. 115). Environmental humanities scholars Deborah Rose and Thom van Dooren (2012) are, again, helpful to think with here, in asking if "are we able to engage meaningfully with very different ways of knowing and living in a place? What would it mean, in a multispecies context to really share city places?" (p. 18).

These questions follow in the shadow of thousands of years of Indigenous peoples seeing plants, animals, and landscape form as kin, wherein they are already taken seriously as co-constructing beings who impact everyday, culturally specific, place relations (Watts, 2013). Meaningful engagement with storying place on the southern tip of Vancouver Island necessarily involves situating child-animal-death relations within the brutal histories of colonization that brought rats, and settlers, to the Lekwungen-speaking peoples' territories in the first place (Davis & Zoe, 2017). It also involves recognizing the ongoing colonial application of the imagined nature/culture split to depict First Nations peoples as uncivilized and therefore subject to "order and improvement" as witnessed through their forcible removal from the places that we now go on "animal walks" and relocation to reserves, residential schools, and the ongoing disproportionate numbers of Indigenous children taken from their families and placed in contemporary foster care settings. These realities work as part of a broader intention to extinguish Indigenous ties to the land and structures of this place in accordance with colonial norms and economic gain. Acknowledging Songhees, Esquimalt, and W̲SÁNEĆ connections to the land and its inhabitants, and grappling with the question of what it means to honor and respect those connections, is an integral part of our attempts to experiment with new modes of early learning engagement. However imperfect, the moral imperative to keep striving for new modes of storying place in these times with young children is vital for creating pedagogies that more accurately reflect Indigenous resistance to colonial

erasure and possibilities for future flourishing for both human and nonhuman inhabitants (Pacini-Ketchabaw, Taylor, Blaise, & de Finney, 2014).

Ethics of Proximity and Response-Ability

If, as Deborah Rose (2013b) suggests, being alive means recognizing our human implication in the lives and deaths of more-than-human others, the question of how to do so responsibly with young children feels particularly complex. We were looking for liveliness on our weekly "animal walk" with young children when we stumbled into what Rose (2013b) calls *the death zone*: "a place where the living and the dying encounter each other in the presence of that which cannot be averted" (p. 4). As unsettling as this experience was, it speaks to the complexity of uneasy more-than-human relations when, as Ginn et al. (2014) tell us, "togetherness is difficult,. . .vulnerability is in the making, and death is at hand" (p. 114). They go on to suggest that,

> Many nonhumans we consider unpleasant or disgusting are companions. . .We are more familiar with them than we like, but at the same time they remain alien to us, catching us in what Hugh Raffles describes as 'the nightmare of knowing and the nightmare of non-recognition'. . .it moves beyond an understanding of 'togetherness' as simply life coming together. (pp. 115–116).

In the same way, we could not deny death's imminence at the point of encounter; we cannot deny the weight of hundreds, if not thousands, of years of "our kind" trying to rid our homes and communities of these creatures. Rats are largely reviled "in the wild" and simply not on the list of the animals we regularly look for during our walks, although they are also commonly kept as domesticated pets. The question of how to respond with young children to this moment is far from simple or straightforward.

Learning to Be Affected

For these and other reasons, creating pedagogies that open up possibilities for new understandings of how urban place relations are co-constituted by the "loved" and "unloved," human or otherwise, can be a difficult task. Working with the intention of "learning to be affected" emerges as one way to do so and has been cited as a positive means for taking us from the Euro-Western tendency to approach the world through a detached, anthropocentric, and disembodied lens to a place where ethical engagement with other species becomes open for renegotiation. Van Dooren et al. (2016) discuss "learning to be affected" as a conduit for developing the capacity for "passionate immersion" in the lives of others, including "the awkward, the unloved, or even the loathed" (para. 8). Taylor and Pacini-Ketchabaw (2015) see it as a necessary step in:

> [developing] more-than-cognitive modes of attention – to become attuned to the multifarious ways that human and nonhuman bodies are moved, disconcerted and enlivened through their common world encounters. . .We push ourselves to learn to be affected by and think with all of the actors. (p. 8)

But what happens when one of the actors is death? Mortality emerged in our inquiry with young children when we were looking for lively matters (crows, "woody bugs," deer, leaves, mushrooms, etc.). This encounter interrupted the Euro-Western binary dualisms, such as "life versus death" and "nature versus culture," that continues to operate with what Indigenous feminist and technoscience scholar, Kim TallBear (2015), refers to as "problematic dominant narratives . . .[that] condition[s] even. . .newer collaborative research" (online lecture). If we did forget the interconnectedness of life and death through a preoccupation with looking for "lively things" in our urban environment, death itself emerged as a dynamic force demanding we pay attention to our own implication in relationships we actively set out to distance ourselves from in urban spaces.

Whose Lives Matter?

Shortly after encountering the dying rat, one of the children brought an urn filled with a pet's ashes to present to classmates during the child care center's "Show & Share" time. Maya shared details about her beloved cat's, Rosie, life and food preferences, favorite things to do, and recent decline, which led to a discussion about taking Rosie to the vet (shared through educator, Sherri-Lynn Yazbeck's pedagogical reflections below) (Fig. 2):

> *He gave her cat medicine, to make her better someone asked? No to make her heart stop, she replied. Then she died. I was holding her paw, she said. Now she is here [holding up her ashes]. I explained how Rosie came to be ashes to a curious and intrigued group of 3 and 4 year olds, and someone mentioned that happened to their grandpa. Someone else said their dog was buried. There was silence and then one voice asked, maybe we should have done that for the dying rat on the sidewalk? [**for the dying rat**, that stuck with me] Yah, others chimed in, we left it there, another child said. Why don't we do that with all the things that die?, another asked. I said, I don't know, but I'm not sure that's true. How do I explain caring? Caring for one may look different than caring for another. Just then a child asked to see Rosie's ashes, (I was saved from a question I wasn't ready to answer). An eager group leapt up as the child began to open the jar to reveal the ashes.* (S. Yazbeck, personal communication, March 29, 2016)

Tensions raised in Yazbeck's personal reflection show how conflicting such moments in practice can be. Maya and her classmates' inclusion of the rat in a conversation about honoring beloved relatives and pet's lives with loving, postmortem rituals defies normative boundaries around who deserves this type of care and attention, usually reserved for next of kin. Demanding to know why the rat was excluded from this type of care lays bare the crux of the matter. What *does* "ethical inclusion" look like with a creature few want to live with?

Fig. 2 He got run over, but I put a band-aid on him (Photo by Narda Nelson)

Urban Pest Relations

However rare it may be for urban, Canadian children (and adults) to encounter dying animals, this moment reflects an everyday phenomenon around the world. That is, we witnessed the widespread, largely hidden, and particularly excruciating brand of death routinely doled out to those deemed "pests" through poison control efforts (Rose, 2013a; van Dooren, 2015). In fact, from a pest management perspective, it could be said that we witnessed a success insofar as the poison hit its intended mark. But feeling far from successful after this deeply affective encounter, we were left with more questions than answers. The children wanted to know "what happened to the rat?" and "where did its body go?" after returning to the place of encounter and finding it missing. Educators and researchers expressed feelings of remorse for not doing more in the moment, for example, in my own case struggling with the urge to put the rat out of its misery. What, if anything, should have been done differently?

In the days, weeks, and months that followed, the conversation continued and we talked about our unsettling encounter as part of the often overlooked, if not actively avoided, phenomenon of animal death in early childhood (Russell, 2016). In particular, we wondered about its ability to interrupt dominant narratives that continue to

influence understandings of urban place relations in early learning pedagogy and practice. Rats hold the distinction of being one the world's most identifiable embodiments of the label "pest." What can the death of such a reviled creature possibly offer up in terms of storying place relations with young children? And how might an ethics of response-ability (Haraway, 2008, 2012; Rose, 2013b) help us rethink taken-for-granted notions about what counts as nature in urban settings and who belongs? (van Dooren et al., 2016)

Imagining rats beyond their usual designation of "disease-carriers," as the children did after our encounter, is consequential; it helps us reconsider their lives as *in connection* with others, confront the categories we draw on to order the world, and comprehend our proximity to the casual brutality of industrialized poison techniques as a means of pest control and the deadly cascading effects these techniques produce. After bearing close witness to this unsettling event the children speculated about what happened to the rat creature in a way that challenges the widely accepted ethical divide between humans and rodents: maybe the rat was dying because it was a grandma, it was trying to get home when something happened, he/she could have got eaten by a predator, he/she deserved to be buried or cremated, etc. So deeply rooted is the response of hatred toward this animal that such careful considerations might be easily dismissed as "cute" or almost incomprehensible in mainstream opinion. But, as Robert Sullivan (2004) argues in his book *Rats: Observations on the History and Habitat of the City's Most Unwanted Inhabitants*, there is much more to the rat story than pestilence and loathing:

> If the presence of a grizzly bear is the indicator of the wildness of an area, . . ., then a rat is an indicator of the presence of [humans]. And yet, despite their situation, rats are ignored or destroyed but rarely studied, disparaged but never described. . .It is the very ostracism of the rat, its exclusion from the pantheon of natural wonders, that makes it appealing to me, because it begs the question: who are we to decide what is natural and what is not? (p. 2)

Sullivan's point takes on particular gravity in Canadian urban settings, where vast energy and resources go into pest control efforts and rendering both rats and death invisible due to the drive to keep densely populated communities hygienic, orderly, and prosperous places for (certain) humans to live. In this part of the world, a rat is also an indicator of the presence of the Europeans who first brought them to what is now called British Columbia in ship holds (Klinkenberg, 2017). Of course, a general sense of human revulsion toward rats comes from somewhere; they can and sometimes do carry serious pathogens such as Murine typhus, plague, and Bartonellosis (Sullivan, 2004; Vancouver Rat Project website). But as Dr. Chelsea G. Himworth, lead researcher with the Vancouver Rat Project (2017) and her team point out, universalizing the link between rats and disease is inaccurate and could impede our ability to better comprehend the complex, heterogeneous rat-human relations that might lead to new solutions for problems like infestations and disease control (Vancouver Rat Project website).

Rendering Rat Entanglements Invisible

Although widely reviled, we do, in fact, intentionally invite rats into our intimate lives in other ways. Besides keeping them as pets, our ethical considerations toward these creatures are further complicated by the reality that they are an animal of choice in pharma-medical-testing, keeping untold human lives extended through their own suffering (High, 2006). Scientists have fused rat and human genes together to create "transgenic rats" who pass these hybrid genes along to their babies to embody and enable human gene testing through intergenerational rat flourishings (High, 2006). Through our fascination with, and benefit from, rats' ability to embody and predict human disease outcomes, our proximate relations further undo boundaries between our species by moving into transgenic proportions. We cannot will, poison, test, or trap our entanglements with rats away. Inviting ethical considerations into conversations about a "lowly" street rat, then, means working against the momentum of systems we have created that rely on a latent moral consensus around a "hierarchy of being" to sanction the use of rats and other animals in medical and other types of testing. It is a thick and murky, techno-pest soup that we coinhabit together.

Pedagogical Significance

The rippling effects that our dying-rat moment with young children continues to produce are varied and complex. To date, an array of perspectives, concerns, questions, and responses from the children, groundskeepers, parents, an exterminator, educators, researchers in the field, and other community members has contributed to richly complicated and uneasy conversations on mortality, what poison does and were it goes, why we treat some creatures one way and others another, and how our wasteful patterns of living make being close to us attractive for some creatures and contribute to the cycle of ongoing problems. In terms of pedagogy, opening up space to listen to the children's speculations, concerns, and questions while being honest about our own conflicted feelings toward rats feels like a critical part of embracing the ethical burden of witnessing such an event that Rose (2013b) raises. In our case, this means talking with the children about the event through the simultaneity of being afraid of, repulsed by rats and sad and upset about the excruciating way the one we encountered died, and acknowledging the ability of poison to elicit ongoing effect in the wider community. In attending to our complex urban relations with the rat and others, such as deer, crows, slugs, and English ivy, we continue to try to open up space for complex conversations about problems for which there are no easy answers. In a world of increasingly polarized debates that invoke simplified "Truths" (or, "untruths") to incite hatred, increase profit margins, and wield power, perhaps opening up space for complicated discussions and uneasy debate about ethical response-abilities, as well as delighting in the complexities of the worlds we coinhabit, is one of the most important things we can make room for with young children in pedagogies and practice.

The Myth of Perfection and Easy Solutions

In retrospect, our dying-rat encounter felt urgent, perhaps oddly so, if we consider the sheer tonnage of Warfarin© and other anticoagulant rodenticides used in urban and rural pest management operations around the world (Rose, 2011; Sullivan, 2004). While poisoning rats is an everyday occurrence, the direct outcome is rarely witnessed. Facing up to the excruciating reality behind our attempts to manage the ancient triad between rats, humans, and food waste can be disturbing, but it is an important consideration in confronting another facet of one of the larger issues defining our crisis-ridden time.

In the 1950s, David E. Davis, "founding father of modern rat studies" (Sullivan, 2004, p. 15), traveled America consulting cities on the ineffectiveness of using poison to control rats, suggesting instead that garbage and food source removal was the only way to get rid of them. But as Sullivan (2004) points out, "nobody wanted to hear this: as it was the dawn of the age of ecology so also it was the dawn of the age of the chemical, of poisons and pesticides, and people seemed to want a sexier, chemical-based fix" (p. 17). This begs the question of what we want at this dawn of the age of "the Anthropocene." Rose (2013b) is compelling to think with here, in the way she weaves many of these issues together to expose the brutality inherent in promoting myths of perfection and control:

> We live now at the threshold of generational transition in which the future will either collapse into death or will flourish in new life. . .We seem to want to hold to the conviction that if we could expel or exterminate all those who annoy us, our particular version of paradise would be secure. I am referring to huge issues of colonization, extermination, dislocation, genocide, ecocide, speciocide and more. We know this story as ethnic cleansing, with visions of racial or religious purity, and we know it again and again in relation to animals. Let us consider the awful life prospects of animals who are condemned by the slippery label 'pest.' When an animal is declared a pest, death becomes its destiny. . .whatever it does is wrong in the eyes of those who are determined to get rid of it. And suddenly wherever it is, that is where it must not be. . ..perfection is imagined to be always on a near horizon, and violent death lurks in powerful policy and practice cloaked in the aura of management. (p. 15)

In my experience, young children are adept at poking holes in myths of "perfection," expressing curiosities and reflections about their encounters in sometimes difficult-to-answer ways. Their ability to call things into question that adults often come to accept as "given" can be arresting at times but highly generative if we work *with* the tensions created through such conversations to explore the question of "what might be happening here?," "why?," and "what else might be possible?" How, then, might we attend to death with young children in a way that opens up space to question our own role in perpetuating unnecessarily harmful or violent modes of relating? This is easier said than done. It calls into question whether we are able and willing to think beyond death's negative valence to reconsider it, in relation to early childhood, within a framework of what Rose (2013b) describes as part of life's "precious complexity. . .[through which] the shadow of death is entangled within the house of life" (p. 5). As stated earlier, this shift challenges a tendency in Euro-

Western society to focus on lively creature connections versus stretching our imaginations to recognize and value the postmortem ongoingness of a body as "in connection" and, in fact, life-giving for others (Rose, 2011, 2013a, b). Of course, beyond understanding a rat's life as in connection, or not, a poisoned rat's body goes on to carry consequences in the world that are different from ones who die from being trapped or get caught by a predator (Haberstroh, 2017). Understanding the liveliness of postmortem relations outside of the widely accepted life/death binary often used to discuss mortality with young children seems equally important to developing pedagogies aimed at "doing different" in response to living these challenging times.

Of course, class, taxonomy, culture, gender, community, race, geography, etc. impact the particularities of how we experience the processes of death. As stated earlier, none of us are exempt from being in relationship with it in some form, always. My interest in rethinking death within early childhood is not intended to trivialize the profound grief and pain felt on a personal, emotional, cultural, or spiritual level through loss. Experiences with death are as varied and unique as the children and families we work with. As educators and researchers, it is imperative that we respect and support families' wishes during such times. However, as children do not exist outside of the serious global, ecological challenges ahead, rethinking the way discourses shape understandings of "who lives (or dies)," "where," and "why" seems equally imperative in creating early childhood pedagogies capable of foregrounding alternative possibilities for living together. In this way, I feel that the way children's relations with places are constituted by entanglements with loss (death) should be considered as an inescapable but potentially generative life process for rethinking early childhood practices. It is also important to foreground corruptions, such as racism and misogynist violence that differentiate children's personal and cultural experiences with loss. Within the Canadian context, the perverse pattern of missing and murdered Indigenous women and girls (MMIWG) and forced Indian residential school experiments come to mind as very much associated with targeted attempts to order/discount bodies and sever connections to land (McCue, 2015).

Telling New Urban Stories

Telling *new* urban early childhood stories, with respect to our mortal relations in this part of the world, puts a number of terms into tension, including education, death, childhood, pests, colonization, and care. Perhaps doing so in the field of early childhood needs to begin with recognizing young children as being rendered, to some extent, politically null and void due to desires to protect while excluding them from being considered as fully active, equally co-shaping, capable participants in the world (Taylor, 2013). As explained by Taylor (2013) in her book, *Reconfiguring the Natures of Childhood*, 300 plus years of carving out a separate childhood sphere within which to reify the romantic ideals of Rousseau's Enlightenment project continues to leave its mark on the way early childhood is widely understood and reproduced in North American urban centers. And popularized Euro-Western

paradigms continue to enlist and reduce "pristine Nature" to play the role of what Taylor (2013) describes as an instrument "[doing] the work of purifying childhood" (p. 61); in so doing "childhood" is held up as an infantilized state of being at odds with the ruin of death and decay through what Val Plumwood (1993) refers to as "the fault-line logics" of colonial and capitalist dualistic systems. As such, tendencies to want to shield "innocent children from harsh realities," such as death, run deep (Taylor, 2013).

This begs the question, then, of how to refigure death within a heterogeneous approach to urban early childhood in a way that challenges romantic and sanitized assumptions about multispecies engagements, and in so doing, as Pacini-Ketchabaw and Nxumalo (2015) argue, "trace and story the actual, messy, unequal, and imperfect worlds" (p. 152) we inhabit with others. Educators, at the Cache Creek early childhood center, have found a common worlding approach helpful in at least attempting to do so in a society that overwhelmingly positions children as cognitively ill-equipped to comprehend the meaning of death and/or in need of protection from increasingly urgent "real-world" problems (Taylor, 2013).

Talking with children about these matters might be done with sensitivity in a way that talking to adults may not require. But this does not diminish the recognition that children have fascinating, sometimes off-putting, questions to ask and opinions to express in relation to death and other phenomenon that are shaped by their own "in place" relations and understandings. I am concerned about putting these connections at risk if we, unconsciously or otherwise, continue to disconnect early learning pedagogies from the heterogeneous specificities of place relations by meeting children's thoughts and questions with reproduced, universalized narratives about the places we live and learn together. What if, for example, we discuss ivy and rats as being creatures "that the colonizers brought with them to this place?" in our Canadian West Coast inquiry work? (C. Hamm, personal communication, February 9, 2017). However small this act may seem, perhaps doing so might open up space for new conversations and perspectives that might not otherwise happen if we continue simply refer to them as "invasive species" outside of the histories that so profoundly continue to shape this place. Furthermore, seeing creatures, however reviled, as having their own cultural expressions of worlding urban spaces challenges anthropocentric accounts of who "belongs" where and what means are legitimate for killing, removing, and/or living with them.

The Challenge of Reconfiguring

Reconfiguring death, and awkward multispecies relations, within urban early childhoods presents us with a number of challenges. These times are overshadowed by a dizzying rate of biodiversity loss due to an overwhelming unwillingness, both politically and personally, to alter the dominant pattern of unsustainable modes of everyday existence around the world (Dirzo et al., 2014; Heise, 2016; Rose, 2013;

van Dooren, 2014a). Telling new stories in these times, with an expressed intent to unhinge anthropocentric worldviews from the telling, means trying to do so in contrast to Anthropocene narratives that overwhelmingly herald an undifferentiated "Anthropos" (Man/Humanity) as the monolithic agent of disastrous change (Rose, 2013; Stengers, 2015; van Dooren, 2014a). We must now come to terms with the sad irony of being poised to diminish our vastly stratified, material selves in the shadow of Anthropos amplifications; this task can lead to feelings of paralysis in the face of the Anthropos' seemingly impervious omnipresence and monstrous ability to foreclose on futures generations' abilities to flourish. Anthropocene narratives also maintain the Euro-Western intellectual tradition's "view from nowhere" while putting journalists, academics, and other public storytellers in the dangerous position of trying to convey urgent information about our current state of affairs by shoring up humancentric narratives when a sharp turn away from anthropocentric ways of seeing and doing is what is sorely needed.

Noticing, Together

However daunting the challenges of working with this task in mind can feel, thinking expansively through early learning pedagogy and practice *is* an incredibly hopeful project. It is also one that necessitates understanding, from the earliest of ages that we do not stand apart from the lives of others. We are not isolated in the act of living, making, doing, caring, fearing, nor dying as we learned from our encounter with the dying rat (Fig. 3).

Fig. 3 Remnants left behind (Photo by Narda Nelson)

What happens when we stop to notice in new ways together with young children? Speculating with them about what happened to the squish of a worm against pavement or tufts of rabbit fur and other body bits left behind by an owl in the forest affects understandings of place relations. It raises questions about necessary life and death entanglements and our how far we understand the reach of ethical obligations to be. Bringing plant, animal, and other nonhuman lives and deaths into the realm of early childhood education also opens up possibilities for articulating what Rose, van Dooren, Chrulew, et al. (2012) and others refer to as a "'thicker' notion of [childhood within] humanity" (Meehitiya, Sanders, & Hohenstein, 2017, p. 2; Pacini-Ketchabaw et al., 2016). This "thicker notion" of humanity requires us to cultivate the response-ability of seeing our lives as inextricably connected with the lives of others and therefore obligated to answer increasing calls to enact new ways of living together in the face of serious ecological issues confronting us.

A number of pedagogical challenges arise in thinking together about extending ethical frameworks to those who are always with us, remaining largely invisible until we "meet with" them through a breach in our everyday patterns of relating (Haraway, 2008; Hird, 2010). How do we open up our approaches to learning with young children about living with *uncharismatic* creatures, such as rats, who thrive in processes of putrefaction and transform our food waste through their labor? (Pacini-Ketchabaw & Nxumalo, 2015; Rose, 2011; van Dooren, 2014, 2015). Rats have followed human food excess for millennia along trade, war, and pilgrimage routes; the diseases they are capable of carrying are fused with collective loathing toward their species. And yet, they persist through highly toxic chemical pest control efforts (Sullivan, 2004). Are deaths-by-our-own-hand grievable? (Butler, 2010; Rose, 2015; van Dooren, 2014a). While I do not grieve the absence of rats in my home, I grieve the suffering of the one we encountered and the indiscriminant way poison lives on in the wider food chain. Perhaps, it is the consideration of rats' lives as in connection with others and their ability to feel immense suffering that is lamentable and that is capable of drawing us into a closer consideration of our uneasy relations and responses to living with this "uncomfortable" creature.

As referred to earlier in this discussion, after our encounter the children wanted to know where the rat body went. A few of the children suggested that a predator came and took it, which suggests some level of understanding about the "ongoingness" between death and life relations (Haraway, 2015; Rose, 2013a). Of course, hawks, crows, coyotes, cats and other predators do eat poisoned rats (Haberstroh, 2017; Holm, 2014), the remnants of which get taken up through water and soil communities in different ways as well. Consequently, telling new stories about pest and death relations demands that we take children's reflections on rats' wider community entanglements seriously. In so doing, the possibility of exposing the fact that managing their numbers with poison affects others well beyond any intention of ridding ourselves of rats by foregrounding mutual vulnerabilities (Hird, 2010) and limitations in the way we construct our everyday modes of urban existence.

Sadly manifesting through the growing list of the world's critically endangered and extinct species, death is increasingly everywhere, but as Maria Puig de la Bellacasa (2015) points out, "we can only engage locally with it" (p. 54). Our chance

Fig. 4 Proximity and responsibility (Photo by Veronica Pacini-Ketchabaw)

encounter with a poisoned rat afforded us an unsettling opportunity to witness, not just any kind of dying but a particular kind of targeted death (Rose, 2015). In the opening quote to this paper, Deborah Rose (2013b) reminds us that, while unsettling, it is precisely here that our group was called into an "ethics of proximity and responsibility." With her words in mind, I am interested in thinking beyond death in this moment, as spectacle, to reconsider what it offers and demands of us in the context of early childhood education. Our moment of noticing was an unexpected and deeply affective event. For Puig de la Bellacasa (2015), "[what] we do with that event is what matters: our responses are part of the relational infrastructural arrangement" (p. 55). Can we reject tendencies to view such emergent moments through the hyper-separated lens of morbid fascination, to think with them instead as a conduit for rethinking what it means to live and learn through a commitment to an ethics of proximity and responsibility? (Fig. 4)

Proximity Matters

Exactly here, on that day, the familiarity of our walking route became suddenly distorted by the shape lying in front of us.

What's wrong with the mouse?
It's a rat. . ..

While impossible to quantify, the dying-rat moment set in motion a persistent "something" and "storied activation" (Haraway, 2015) that continues to ripple through children's, educators', and researcher's minds, emotions, actions, documentation, and bodies (which get animated in retelling the story and may perhaps even experience some sort of biochemical affect generated by the vast amounts of rat poison circulated each year in this place): requests/demands were repeatedly made to go back and look for the body, and we still occasionally stop to examine the place of encounter and remember what happened when walking by. A short film was made

about our encounter to share with the parents and wider community to raise some of the ethical concerns and complexities of our implication in poison-death relations.

This moment pulled all of us into an unexpected confrontation with the consequences of our toxic relations with pests in urban landscapes. Tensions produced through our unexpected proximity with the rat pushed back on the anthropocentric tendency to see ourselves as bounded entities, separate from other creatures in neatly contained bodies. Undine Sellbach discusses the close, yet often hidden, negative presence insects (like rats) produce in the way they "return us to the sense that an organism isn't a whole thing. . .[by being persistently close, they are] constantly unraveling the boundaries that we draw around ourselves and the environment" (in Gelonesi, 2014 [Audiofile]).

However unsettling, this moment interrupted the impediment of what Jessica K. Weir (2015) refers to as "'separation thinking'. . .[which] denies our co-produced realities, our life sustaining connections with sentient others, and leaves no grounds for us to engage with ecological life in ethical terms" (p. 17). Paying attention to our entanglements with other species, including those we have uneasy relations with, helps pull us away from "entrenched patterns of 'human exceptionalism'. . .prompting new kinds of questions about what [death] teaches us, how it remakes us, and what it requires of us" (van Dooren, 2014a). For Marcus Baynes-Rock (2013), the "multispecies commons" "challenges us to reconceptualize the ways in which human and non-human lives are lived. . .and loudly demands that we reconfigure the paradigms that guide our understandings of what are social processes" (p. 224). Doing so also helps us provide a richer account of what urban, multispecies relations are, and the histories that brought us together in this place versus romanticized versions of the plants and animals we imbue with more noble attributes than, for example, rats are afforded.

In mobilizing Rose's notion of a responsibility afforded through proximity with others in the death zone, I wonder if we can embrace such moments as unknowable in advance, profoundly affective, and calling on us to recognize our deep implications to act versus turning away from the tensions and, in so doing, potentially abandon moral responsibility. If so, perhaps we can better attune ourselves to the call for ethical modes of engagement with others and start the important work of extending an ethics of responsibility beyond strictly human relations and the tendencies to stick to romanticized scripts of early childhood animal engagements to think more deeply together about Puig de la Bellacasa's (2015) question of "who benefits?," or *cui bono*, through everyday encounter?

Conclusion

Our unanticipated dying-rat encounter became somewhat of a pivotal moment in our multispecies inquiry, but it did not happen in isolation. It took place within the context of other salient "mortality moments" that year, including walking through a science lab full of taxidermied birds and skeletons, finding dead (and sometimes killing) insects and worms, and working through the challenges of an intense

attachment between the children and a large deer form made from willow branches. (Similar in shape to Sweden's Yuletide Gävle goat forms.) This attachment led to them lugging their "stick-deer-friend" along on our long walks to see other animals. When stopped and asked about their "big friend" by curious passersby, one of the children repeatedly produced awkward silences by responding, "the deer is very, very dead."

The point I want to make here is that, while we live in a time overshadowed by accelerated mass death, these moments did not occupy morbid early childhood corners. They happened in connection with the flow of stories and energies that comprise each day, week, and month-turned-year, including seasonal shifts, sibling births, gardening, disagreements, worm compost bin lifecycles, a local drought, excitement, illness, politics, etc. In this way, death is actively intertwined with the sociality and embodied experiences particular to our early childhood center that, over time, helps create a sense of "ecological connectivity" in place (Gibson et al., 2015). This affect runs contrary to the feelings produced through the universalizing Anthropocene narratives that have become popularized in eco-disaster stories.

Exactly here, we were called into an ethics of proximity and responsibility (Rose, 2013) that continues to challenge the dominant frameworks of the times we live in and the romanticized childhoods we tend to reproduce through urban "nature" narratives. Our encounter opened up possibilities for paying attention to *this* place, its histories, and ongoing relations in new ways, necessitating a reconsideration of not only our mutual vulnerabilities but also our unique position as early childhood practitioners, researchers, and children to think about the ecologies of life-death relations in an era saturated with nature narrative elegies. The dying-rat encounter produced a generative moment that continues to inspire and demand more of us, in our everyday relations, calling attention to questions of urban, relational space and the issues young children are not only poised to inherit but that they actively engage with in the present.

impact, the field has often cast children in the role of future stewards of the "natural world." Environmental education's iterations have maintained an anthropocentric, binary view of nature and have failed to constrain the complex phenomena of the Anthropocene epoch. Now, the environmental theories and predictions of the 1970s are reaching distressing, ongoing fruition, in a froth of climate change-induced natural disasters which displace communities and raze or drown vegetation. An individual's sense of place can no longer be understood as rooted in a static locale: landscapes change overnight, and countless people lack the luxury to conceive of themselves as inhabitants of clearly definable, locally situated ecological and human communities. Place is ever-changing, layered, and linked across time and space through economic transactions, and it interacts with human identity in ways that are difficult to grasp. Therefore, we posit that people now live with a Kaleidoscope of Places which expand and contract from the local bioregion to unseen locations across the biosphere. This chapter contributes to an evolving environmental education model for the Anthropocene, integrating a dynamic place theory into a place-based pedagogy intended to encourage children's agency as co-constructors with and for our interdependent planet. We assert that the ability to create innovative solutions for mutual survival requires cultivating specific skill sets of adaptability, feeling, and agency, as we explore our socioecological contexts from a transdisciplinary perspective.

Introduction

A 2012 image in the *New York Times'* "What's going on in this picture?" feature, geared to educators, depicts a joyful looking child leaping from one gigantic mound of ragged leather hides to the next. The viewer sees tall buildings in the background, veiled in smoke and soot. A dark river appears between the mounds of hides and the buildings. This photo ran on a Monday, and school children throughout the world were invited to guess the implied narrative. On Thursday of that week, the *Times* revealed the photo's caption:

> A child jumps on the waste products that are used to make poultry feed as she plays in a tannery at Hazaribagh in Dhaka, Bangladesh on Oct. 9, 2012. Luxury leather goods sold across the world are produced in a slum area of Bangladesh's capital where workers, including children, are exposed to hazardous chemicals and often injured in horrific accidents. . . None of the tanneries, packed cheek-by-jowl into Dhaka's Hazaribagh neighborhood, treat their wastewater, which contains animal flesh, sulphuric acid, chromium and lead, leaving it to spew into open gutters and eventually the city's main river. (The NYT Learning Network, 2012)

This glimpse of Bangladesh uncovers the interconnected actualities of the Anthropocene epoch, a time when a Bangladeshi child's hazardous, makeshift,

"found" playground of leather by-products is loosely stitched to the life of a woman who wears leather shoes in New Hampshire, while she rakes leaves into a pile for her own child to leap into. The Anthropocene is a geologic time marked by human impact (Crutzen & Stoermer, 2000), primarily the result of social interactions such as reproduction, colonization, consumerism, and oppression, which have caused ecological instability, prodigious extinctions, and mass displacement. Although the child in the photo has never visited the United States and the woman raking leaves has never physically stood in Bangladesh, in a very real sense, the people and places of Bangladesh and New Hampshire impact one another. For instance, it has been predicted that in Bangladesh, where many communities live 20 ft below sea level, 15 million people will be displaced by a climate change-induced sea level rise. This climate change has been caused or exacerbated by large energy consumer countries like the United States; meanwhile, in today's mobile world, some of these displaced inhabitants surely will emigrate to the United States.

Such connections illuminate how the meaning of a "sense of place" today differs from what it meant just a few decades ago, when place theories centered on dwelling in and connecting with local communities. Our changing world now compels us to develop more fitting theories, which in turn inform our pedagogical approaches to environmental education. For instance, the established "child as steward" approach might emphasize educating students about the human responsibility to develop technological solutions that mitigate climate change repercussions, including the literal sea change the population must face. Early environmental education models also might preference the connotation of "nature" as pristine, wild, and natural beauty and direct our endeavors primarily toward preserving such "nature" in the places where our feet stand. However, a perspective that upholds "child as nature" (childhoodnature) will embrace how the holistic character of all places includes a continual transmutation, a contracting and expanding motion between the spot where we stand and the entire planet, and will note that the web in which we exist, and of which we are a part, also includes our consciousness, knowledge, and actions.

Some parts of the web, like the Hazaribagh tannery, may unsettle us, causing cognitive dissonance. We may feel utterly disconnected from the living conditions, the ecological state of the earth, and the pollution in Dhaka. However, the locale we inhabit is no longer shaped by simple geographic lines. Our strands of interconnection are uncountable and must be acknowledged, broadening our definitions of childhood, nature, and environmental education. A culture that includes children playing in a tannery may not resemble our time-honored conception of what childhood experiences should be, any more than the child's surroundings resemble our notions of "nature." When considering children like the one in the *NYT* photo, we might even be tempted to determine that their surroundings are devoid of nature. But in spite of our previous mental constructs, the image of a child playing on the raw materials of a consumer economy is one iteration of what child-nature/nature-child/place-child looks like in an interconnected Anthropocene epoch. The child is playing in and among elements of nature, such as cowhide, flesh, and air, near water, surrounded by evidence of human endeavors, and within an economic growth model by which we either oppress or are oppressed.

Besides playing in a place that *is* nature and also embodying one face of nature, the child, by its own nature, *plays*. As Froebel said, "Play is the work of children" (Liebschner, 1992). No matter where children are, they adapt to their conditions and play. The resilience of young children in a shifting, uncertain world is remarkable and must be incorporated into considerations for educating the young children of the Anthropocene. Such considerations may even help adults who grew up with a stewardship model of environmental education to transcend the limitations of their prior learning and address the challenges posed by the climate change impacts in imaginative new ways.

Retiring the Stewardship Model and Establishing that Humans Are of the Earth

A guiding principle of one of environmental education's foundational documents, the *Tbilisi Declaration of 1977*, reads: "Whereas it is a fact that biological and physical features constitute the natural basis of the human environment, its ethical, social, cultural, and economic dimensions also play their part in determining the lines of approach and the instruments whereby people may understand and make better use of natural resources in satisfying their needs" (UNESCO, 1978). This statement, while it recognizes our interdependent relationships, also sets up a binary construct that positions humans as other than "biological and physical features" of the environment and other than a "natural basis of an environment." The goals and guiding criteria of environmental education have continued to build from this binary understanding. Writings which often have been interpreted in ways that uphold an "other than" construct appear very early, in the Hebrew *Tanakh*, the Christian *Old Testament*, and the Greek *Septuagint*; numerous religious scholars have cited "man" as the ruler of, and therefore a step removed from, the rest of the earth:

> Let us make man in our image, after our likeness and let them have dominion over the fish of the sea, and over the fowl of the air, and over the cattle, and over all the earth and over every creeping thing that creepeth upon the earth. (Genesis 1, 26)

Deeply entrenched in multiple cultures, it is no wonder that a binary model of dominion and stewardship infiltrated one of environmental education's "founding documents." However, a half century after the Tbilisi Declaration was crafted, an increase in the scientific comprehension of planetary interrelationships, combined with an evolving historical understanding that this positioning upheld colonization as it contributed to the neoliberal economic growth model, exposed shortcomings in the Tbilisi statement. It can be argued that an anthropocentric, binary view of humans and nature has been a primary lever catapulting the earth into the Anthropocene. The Anthropocene age illuminates our interconnection and our "intra-actions": we co-create one another. *Intra,* meaning *within* or *between the layers of,* speaks to the fact that we are not divergent beings linked through disparate strands of connection that stretch between us; rather, we are one material, closely

knit, interwoven of the same strands. It is impossible to fully distinguish our being from the being of others, human and nonhuman, for "each species is constitutive of each other" and our relationship to the world is ". . .as much influenced by behavior and existence of other co-existing species as it is by our intentional or unintentional actions" (Rautio, 2013, p. 448). Our impact is greater than if we were merely interconnected and interacting. Instead, as "intra-actors," we "support the capacity for intra-species encounters to co-merge with all things as 'agentic'" (Malone, 2016, p. 393).

To reflect the fact that humans are situated as "part of" rather than "other than" nature, intra- and interdependent, environmental education must work toward undoing its binary constructs and transcending the nature/culture divide (Rautio, 2013). Taylor's argument that due to "the onto-epistemological implications of the inextricable entanglement of human and environmental fates and futures, environmental education will not have the impetus to systematically interrogate the force field of default stewardship pedagogies" challenges us to transcend earlier postulations about the human place in the world (Taylor, 2017, p. 1453). The ontological examination of difference in the realm of *humans-are-nature* and *child-is-nature* is a necessary component of reshaping environmental education so it moves away from an anthropocentric standpoint and foregrounds holism:

> During the past forty years, those Earth photos, along with Gaia theory and environmental challenges, have provoked the emergence of a new way of thinking about ourselves. No longer just citizens of this country or that, we are discovering a deeper collective identity. As many indigenous traditions have taught for generations, we are part of the earth. (Macy, 2012, p. 31)

While acknowledging that inherently, a human being is as much a constituent part of nature, created from nature's processes and means, as an interconnected root system or Yosemite's Half Dome may be, we of course must draw an important distinction to account for biodiversity and difference. Humans are animals, part of the diverse interacting, interrelating, mutually shaping web, and it is through the capacity of our idiosyncratic differences that we generate one another to create in the ways that we do (Deleuze, 1994). "Difference generates beings in continuous, unique, and unpredictable encounters" (Rautio, 2013, p. 448). But our unique characteristics do not mean we are more exceptional than or more immune to influence from nonhuman forms of existence. Deleuze's philosophical analysis of difference, a schema of dominance and subordination, underscores this point. While the predator/prey relationship is intrinsically ecological, it also supposes a dominance/subordination construct; however, when teased apart, the predator evolutionarily shapes the prey and vice versa, without one being more exceptional than the other: there is mutuality in the shaping.

Although we don't know whether other species feel exceptional or whether exceptionalism is solely a human construct, it is safe to say that the environmental education stewardship pedagogy is fraught with what environmentalists Dunlap and Catton (1979) have described as the human exceptionalism paradigm. Throughout

the decades, various pedagogical models, including education for sustainable development (ESD), have fallen prey to this paradigm. ESD positions humans as nature's caretakers, preserving the nature-culture divide, and includes a distinct focus on how business sector developments can be more planet-friendly, including searching for technical solutions to environmental problems caused or worsened by industrial advancement. This approach places a disproportionate emphasis on enterprises that – even when corporations concede their roles and attempt to redress problems via technology – only manage to attenuate, rather than eliminate, continuing environmental harm.

Embodying a deep ecological perspective, Kopnina (2012) notes that ESD is problematic because it "undermines ecological justice between humans and the rest of the natural world" (p. 712). Stewardship models falsely suggest that humans, while causing ecological destruction, can simultaneously find solutions to that ecological destruction. Kopnina advocates for the necessity of including an ". . .ontocentric or ecocentric perspective in environmental education," rather than a species-centric perspective "that seems to amplify anthropocentric concepts that often put people and profit before the planet" (p. 712). Stewardship in ESD, one such anthropocentric concept, is clouded by its relationship to and consideration of the economy. With one eye focused on the permanent roots, root hairs, and feeder roots of the forest and the other focused on profitable development, it is easy to become myopic.

Additionally, wildly different environmental orientations, including less binary and non-binary indigenous perspectives, abrogate the idea that there are comprehensive "best" or "correct" approaches to "solving environmental problems." Since humans operate as one force within nature, rather than merely acting *upon* nature, educating based on a paradigm of human exceptionalism and stewardship is not only binary and species-centric, it is bound to fail. It is critical that environmental education mature away from its foundational anthropocentric aspects as it develops future frameworks, pedagogy, and investigation for the Anthropocene. It is not that we must abandon all efforts to attend to the health of the planet, but we must relinquish the notion that we operate *about* and *for,* zoom in on operating *within,* and champion understanding the ways that we are *of* that planetary environment.

"Where" Children Are, So Is Nature

Concomitant with retiring the lens of stewardship, environmental education must embrace humans-as-nature in order to fully evolve for the Anthropocene. Because environmental education teaches learners ranging from young children through senior citizenry in formal and informal settings, its curriculum and pedagogy are differentiated across cognitive, affective, and physical domains, spanning an extensive range of developmental stages and settings. For the purposes of this paper, we will primarily consider the process of educating children in formal and informal settings and thus primarily will reference child-as-nature. However, because young children are developmentally "closer" to embodying nature than adults are,

examining environmental education for children provides an excellent place to revamp educational theories and practice so that the holistic, mutually shaping "nature-child" will mature into an embodiment of "nature-adult" later in life. Hart (1997) noted that Piaget's developmental studies provide insight into the nature-child relationship's possibility for influencing adult caring:

> [Children] are both closer to, and further from, nature. . .Closer perceptually because they are physically closer and less mediated in their response to things, but they are further conceptually because they think everything is made for people. . ..Piaget also describes a phenomenon that could form roots for children of a different kind of a relationship to nature as adults: 'animism', the tendency to find intention and consciousness in things, including those that are inanimate. The most famous of Piaget's accounts is of a child who gathers pebbles together so they do not feel lonely. . .this less differentiated perspective on the human and non-human attributes may have the potential to serve as a base for a different vector in the development of human caring for the non-human world. (pp. 17–18)

Increased consideration of children and nature has ensued from the popular "nature deficit disorder" literature, which advances the notion that children spend too little time outside, interacting with nature, and this creates a wide array of problems. This framework is predicated on two flawed constructs: (a) an idea that children are not *of* nature but are *separate from* nature and hence can fall prey to a "nature deficit disorder" and (b) a romantic conception of nature as restorative (Louv, 2005). While Louv's research and writing has had significant impact, encouraging parents to consider the extent and effect of children's "screen time" and other occupations, Louv's premise is problematic. Nature is everywhere, not only in romantic outdoor settings where people feel refreshed and restored but also in urban settings and even less romantic settings which are painful to acknowledge.

Malone's examination of nature-child encounters between dogs and children on the streets reveals ". . .that nature–child relations are messy and complex, rather than simply restorative and idealistic" (Malone, 2016, p. 404). The holistic view of child and nature mutually shaping one another suggests that wherever children are, so also is nature. Mutually shaping relationships take place in a socioecological context that is comprised of humans and other kinds of being(s), and the "where" of nature exists wherever they encounter one another. Whether place is conceived of as the socio-ecological context of a geographically bounded landscape or a reservoir of individual trajectories of place meaning and attachment, nature-child can be further interrogated to consider place-as-nature.

Viewing environmental education through a nature-child framework facilitates shifting its goals from those of stewardship to those of mutual survival, a crucial priority for the Anthropocene. It invites us to make space for manifesting yet-to-be-imagined objectives and results. "Education as an inherently human-centric discipline faces particularly messy struggles ahead, and thus its theorists and practitioners must find new concepts and practices that are sorely needed for species' survival in deeply troubled times" (Duhn, Malone, & Tesarc, 2017, p. 1359). Innovative approaches to survival-oriented environmental education will require us to provide children with opportunities to explore nature wherever they are,

encountering not only the romantic, restorative aspects of their places but the less pleasant facets, as well. While experiencing their socioecological contexts, children must be allowed to feel all their emotions; this will help them transform their thinking, co-construct decisions, and take actions that lead to survival for all the beings in our places (Macy, 2012; Duhn et al., 2017; Selby, 2015; McGregor, 2015).

By considering children as nature and place in mutually shaping relationships, environmental education can help children discern and experience the joys and sorrows of embeddedness in their socioecological contexts. If children are nature, then not only are the world's bio-geo-physical aspects part of their socioecological context but so are its social actors, their lived ideas, and their institutions. Children gain a greater sense of agency when they learn that, far from being isolated particles, they and their actions are linked to and affect many points in the biosphere.

Place

> You are a part of a part and the whole is made of parts, each of which is whole. You start with the part you are whole in. (Gary Snyder)

To construct a Kaleidoscope of Places framework for effective environmental education in the Anthropocene, we must first examine several ways "place" is construed. Interest in place and all its iterations, including perspectives rooted in bioregionalism, became a prominent force in environmental education based on the idea that connection to place encourages responsible behavior. Our understanding of place theory, an overarching umbrella that has evolved over time and across disciplines, begins with the understanding that *place* is both objective and subjective. As such, it includes (1) *geography*, a biogeographic objective definition; (2) *locale*, how a place is bound by descriptors, distances, and boundaries; and (3) *sense of place* (Dentzau, 2014; Zia, Norton, Metcalf, Hirsch, & Hannon, 2014; Resor, 2010). Of these three characteristics, geography is the most objective characteristic; locale, although rooted in geography with objective elements, also can fluctuate according to the subject's point of view; and sense of place is a wildly subjective construct. Place theory has inspired multiple environmental education frameworks and pedagogies, including place-based, place-responsive, and place-conscious education.

An Evolution of Place Theory

Bioregionalism

In the 1970s, the term *bioregionalism* initiated much of the conversation that encouraged environmental education to facilitate students' development of "roots" and a "sense of place." Bioregionalism includes both the geographical boundaries of a local place and the recognition of how to live in a way that is responsive to the socioecological biorhythms and limitations of that place. This movement focuses on

learning to live in healthful relationship with the local land, water, and inhabitants (Berg & Dasmann, 1977; Pezolli, 2015). Its attention to an individual's habitation in a local place, dwelling in its socioecological community, grows from indigenous ways of knowing. It asks us to attune ourselves to more than the human cultural context of where we live and to consciously consider and respond to our immediate ecological context (Barnhardt & Kawagley, 2005; Cajete, 2000; Elk, 2016). Bioregionalists suggest that in order to live sustainably, we must live with intentionality, explicitly heeding our interdependent relationships with our human and other-than-human community, and that this will help us develop a sense of place where we reside.

Sense of Place, Place Meaning, and Place Attachment

Bioregionalism's core commitments include localism and developing a sense of place. Worster and Abrams (2005) theorized that a *sense of place* is composed of several characteristics:

> (1) ecological knowledge of the place, which leads to ecological identity; (2) knowledge of the local institution/social context (social behaviors, structures and norms) which facilitates the development of a social identity; and (3) place attachment to a region.

(1) and (2) comprise the socioecological context of a place, which gives rise to an individual's socioecological knowledge, which engenders that individual's socioecological identity. Place attachment germinates and grows through direct experience with socioecological context.

An alternative framework for sense of place posits that it is formed through place meaning and place attachment (Kudryavtsev, Stedman, & Krasny, 2012). *Place meaning*, the "symbolic meaning ascribed to place" (p. 231), is a multidimensional, individualized construct that reflects an individual's perspectives, including race, culture, power, personality, political, artistic, economic, historical, and/or ecological perspectives (Ardoin, 2006; Nespor, 2008; Relph, 1976; Russ, Peters, Krasny, & Stedman, 2015; Tuan, 1974). While place meaning radiates from the locus of an individual's knowledge and identity, *place attachment* is formed by the binding relationships between people and places. Scannell and Gifford (2010) theorize that place attachment has three aspects: the *person/actor, psychological processes,* and *place dimensions:*

> The first dimension is the actor: who is attached? To what extent is the attachment based on individually and collectively held meanings? The second dimension is the psychological process: how are affect, cognition, and behavior manifested in the attachment? The third dimension is the object of the attachment, including place characteristics: what is the attachment to, and what is the nature of, this place? (p. 2)

Place theory, including sense of place, the socioecologically contextualized meaning of place, and place attachment, is predicated on the notion that there is *a place*. But

where is this place? Connecting to the geographical location, we inhabit is critical, but the "where" of place must not be limited to our immediate locale. Relph (1976) states, "A place is not just the 'where' of something; it is the location plus everything that occupies that location seen as an integrated and meaningful phenomenon" (p. 3). Neither a wholly objective, fixed locale, nor a fully subjective mental construct, place is a combination of both, with a fluid character that acknowledges the importance of one's bioregion and simultaneously extends far beyond one's bioregionally delineated locale.

Place Fluidity

Our understanding of place, the fluid, interactive space between the geographical, social, and cultural attributes present in an individual's defined locale, is inevitably a human construction and not an objective truth. People's beliefs and perceptions are shaped by assumptions and prior experiences, as well as by the reality with which they interact (McInerney, Smyth, & Down, 2011; Soja, 2009; Maxwell, 2013, p. 43). Two people who stand in the same spot may ascribe widely variant place meanings to that location, based on identity differences. People are "a bundle of individual trajectories, each with their own histories" (Charlton et al., 2014, p. 156). Massey (2005) asserts that place is a dynamic "plurality of trajectories" consisting of living and nonliving entities and that individuals shape places just as much as places shape individuals (p. 12). Place is "constantly configured and reconfigured" as it intersects aspects of living and learning. Wattchow and Brown (2011) also highlight place's non-static quality, linking its dynamism to its interrelation with people:

> People and places always exist in mutual bonds of interdependence. Both people and places have a physical reality, but it is the identities of both people and places that are continually emerging as an unfolding, interdependent phenomenon-always evolving-always becoming. (p. 75)

Mosaic of Places

The concept that place and people define one another and are always evolving is further complexified by Hay's (1998) theory that each individual possesses a bioregional sense of place based on time spent in that place and personal bonds with its socioecological context, but if an individual is mobile, he or she will be influenced by a unique mosaic of places, the collection and convergence of all the places a person has been:

> Our lives must 'take place' somewhere, but in modern, Western society people tend to shift places often through residential mobility, and the places themselves change rapidly through economic development and migration. A mosaic of places thus influences most people over the course of a lifetime. (Hay, 1998, p. 6)

The metaphor of a mosaic of places acknowledges that while it is important to develop a sense of place, knowing, and identity within a local socioecological context, a sense of place established elsewhere may strongly influence attachment to new locales. Place, already a fluid construct, becomes even more fluid for mobile individuals, whose trajectories are filled with twists, turns, doubling back, permeable peripheries, and unexpected fissures, the result of memories, perceptions, judgments, and attachments to particular aspects of all the bioregions they've experienced. These influence interpretations of their present bioregions. Even when people never return to some of the places they once inhabited, as occurs for many displaced refugees, those locales remain within them and shape how they relate not only to the geography of subsequent places but also to aspects such as culture, ecology, politics, art, ethnicity, values, and more.

Hay values rootedness in one place as a way to increase social participation, a component of civic engagement, and has voiced the concern that mobile people's mosaics of places may in some cases lead to "generic place dependence where there is some attachment to a number of similar places" (p. 26) rather than an increased capacity for people to develop strong bonds to a number of places during their lives. Relph (1976), in his seminal piece on place and placelessness, argued for the need to avoid "placelessness: the casual eradication of distinctive places and the making of standardized landscapes that results from an insensitivity to the significance of place" (Relph, 1976, Preface).

Seamon and Sowers (2008) have suggested that we aim to balance a local and global awareness of places and that in order to step compassionately into the world, we are best off having a true sense of love of "[o]ne particular place to which [we] belong," so that from this place "...we may recognize that what we need in our everyday world has parallels in the worlds of others" (p. 50). However, in addition to Hay's observation that rootedness in one single place is increasingly rare due to the mobile traits of modern, Western society, climate change and other calamities are predicted to yield growing numbers of displaced people searching for new homes in the Anthropocene. If Marsh (1988) and other theorists are right that humans seek deeper place bonds and a sense of place in a locale they call home, the call for strategies to develop place bonds in the increasingly globally mobile Anthropocene are critical.

Hay notes that we have "genetic types" of places: when we arrive in a new place, we have a sense of what we like and dislike based on past experience, which in turn shapes our positive or negative place attachment to a new place. The framework of a mosaic of places suggests an opportunity: once we identify the places in our mosaic, we can begin to comprehend how they may be influencing our relationships to our subsequent places. Such understanding can better equip us to develop social and ecological bonds to new places that we temporarily or permanently will call home.

To gain the greatest benefit from our multiple senses of place, place bonds, and place experiences, the places in our lives need opportunities to intermingle, be honored, and breathe. The past need not suffocate possibilities inherent in the present or future but instead can enhance them. The more places it contains, the more one's

mosaic of places can offer narratives about how to survive and thrive, modes of engagement, the process of becoming rooted, etc. Once one is conscious of its influence, one has the chance to knowingly and purposefully decide how to assign new meaning(s) to prior information. By attending to students' mosaics of places, environmental educators can increase their abilities to remain culturally responsive, build stronger relationships with students, facilitate diverse learning communities that draw on the richness of a range of place learning, and increase social participation within and extending outward from the learning community.

However, a mosaic of places implies a collection of discrete pieces arranged in fixed relation to one another. This is inconsistent with the realities of our interconnected Anthropocene world. Therefore, we look to a kaleidoscope as a metaphor, to illustrate the manner in which place expands and contracts in perpetually fluid motion for each person, allowing every individual's sense of place to include not only the mosaic of places he or she has physically inhabited but also the unseen places to which he or she is linked by the creation, transport, and transfer of items purchased and consumed. This new framework for fluid place reframes earlier place-based pedagogies, to foster relevant, effective environmental education in the Anthropocene**.**

Kaleidoscope of Places

In response to the increasing decentralization caused by the Anthropocene, which requires us to broaden our perspectives beyond the scope of one geographically bounded locale, we propose expanding place theory to incorporate a notion of ongoing expansion and contraction: one can both dwell in a fixed geographic place and, at the same time, be formed of elements from all the places one impacts and by which one is impacted. In other words, in the Anthropocene, no single consistent, bioregionally based comprehension and inhabitation of a place will be applicable; instead, we need a framework affirming that we each consist of a Kaleidoscope of Places (KoP).

The Kaleidoscope of Places theory builds upon, rather than replaces, earlier sense of place and associated place theories. Just as a kaleidoscope operates on the principle of *multiple reflections* which display the metamorphosing relationships between the pieces in its chamber to create *a unified image*, a person's Kaleidoscope of Places operates on the principle that an individual possesses *multiple vantage points from multiple locales* at the same time; experienced together, these display the changing interrelations between one's self and one's myriad of places to create *one's sense of place.* We can create our mosaics of places by attaching the other places we've stood to the locales we currently inhabit, learn from our mosaics to develop place meaning and place attachment that is specific to our new places, and from there, progress to our Kaleidoscopes of Places, where we incorporate all the strands of place to which we're connected throughout the world.

One may embody and ascribe multiple meanings to one's KoP as one's vision expands across the biosphere to both remembered and unknown places, contracts

back to the patch of earth where one stands, and then flows out again. Examining our Kaleidoscopes of Places is one way to reframe place understanding in a world where consumer goods and services come from afar, worldwide immigration is sure to increase, and many places quite literally have been and will continue to be fragmented, reconfigured, and re-fragmented by world events (hurricanes, market crashes, resource wars, international trade) and our relationships to them so that fewer and fewer individuals can claim to experience place from one single vantage point. A KoP approach acknowledges that our ties to other places are so inextricable, even those with no perceptible connections to one another shape each other, both socially and ecologically.

From the theory that we are comprised of a Kaleidoscope of Places (and all those places are comprised of us) emerges a Kaleidoscope of Places-based, place responsive, place conscious pedagogy that we propose as one possible basis for environmental education. This KoP pedagogy must be deployed for young children in the Anthropocene, particularly in light of environmental education's current recognition that children are nature and places, regardless of the privileged or oppressive socioecological contexts where they live or from which they've emerged. The framework for students' Kaleidoscope of Places is built directly off the sense of place framework: it evolves from socioecologically contextualized knowledge and identity, ascribed place meaning, and place attachment. Onto this initial sense of place framework, however, we map an additional, mercurial layer that expands from an individual's immediate locale to multiple far-flung parts of the biosphere and then returns to the immediate locale.

To recap, when we embrace a KoP framework, *place* includes:

1. The "where" of our dwelling, as described earlier, living bioregionally, consciously, and intentionally within a geographically delineated locale, attending to the importance of inhabiting our local place on the earth.
2. The places we have visited, lived, and experienced.
3. Those unseen places we have not actually visited but with which we intra-act daily through our consumption within a global economic framework. Imagine that an invisible thread is tied to the woman who stands raking leaves in New Hampshire, wearing shoes crafted from a hide that was once a part of the mound at the Hazaribagh tannery. This thread stretches from the leaf-raker to the Bangladeshi child who jumps from mound to mound. Another thread reaches from the tannery to a cattle feedlot; yet another thread extends to the corn field that supplied the feedlot. Soon, a web of threads is overlaid on the biosphere, and within this moving, reflective web lies the Kaleidoscope of Places that form our being, including the space, the people, and the biogeographical nuances that link Bangladesh to New Hampshire.

This is true even though we cannot be certain where all the threads connect. Where did the cattle whose hides were piled high at the tannery originate? Leather goods stamped "Made in Italy" may obscure the fact that their leather was tanned in Bangladesh. Source obfuscation further disconnects people from the places they

affect and those which impact them and helps to propagate colonialism and oppression. Keeping our minds open to our Kaleidoscopes of Places can help us be mindful of such obfuscation. A person who feels strongly rooted in New Hampshire, buys locally grown meat and produce, and tries to "live bioregionally" still must buy leather boots made elsewhere, since the New England shoe industry folded in the middle of the twentieth century. In the instant a consumer buys leather boots, she is catapulted from an integral connection to a bioregional locale into a connection with the broader biosphere. She is part of the place where she dwells but also part of the places the cattle were raised, the cattle feed was grown, the leather was tanned, and the metal for buckles and zippers was mined. Even with bioregional connections, we embody a full Kaleidoscope of Places.

Environmental Education in the Anthropocene: A New Pedagogy of Place

As Haraway (2015) contended, we have no idea what the Anthropocene will be like or whether it truly will be a new epoch or a boundary event. However, we do know that we live in uncertain times, when not only individual lives but whole communities and landscapes are more likely than ever in our remembered history to change rapidly – not only in more foreseeable locations, such as lava flow routes or fault lines, but also in areas where climate change repercussions will spark war and weather events that can't be predicted by current technologies. The environmental education model for the Anthropocene should therefore prioritize *survival* – not of the stewardship variety, nor in any form that promotes a hierarchy of values regarding land and life forms, but in way that stems from an understanding of our mutuality.

Environmental education can no longer afford to remain embroiled in human exceptionalism perspectives; it must be inventive, transdisciplinary, and geared toward facilitating and trusting children's agency so that as they grow, they will be poised to respond to sudden and systemic changes. To make informed decisions, children will need more time and space than ever to explore the socioecological contexts of their Kaleidoscope of Places. A Kaleidoscope of Places-based pedagogy encourages teachers to facilitate expanding and contracting students' attention from their currently inhabited bioregions to the mosaics of other bioregions they have inhabited, out into the biosphere wherein are located numerous possible connections to places they have not seen, and back to their inhabited locales. Such exploration encourages mastery, develops skills for critical evaluation which support children's decision-making advancement, and, in turn, helps to preserve the survival of multiple socioecological contexts and the self.

What does it mean to survive? Often, we refer to the "survival of our species." However, interrogating the interdependent, mutually shaping relationships between people and nature suggests that survival of the ecological contexts of our places is critical to survival of the human species and the self. Mutually generative relationships require "the other" to exist. Therefore, in the Anthropocene, environmental

education that is geared toward survival must attend to the survival of many socioecological contexts. Survival calls for an environmental ethic that will help us decide our actions based on our nature-human and human-place identities.

Kaleidoscope of Places-Based Pedagogy: Sprouting from the Roots of Place-Based Pedagogy

Within the existing place-based environmental education model, the ability to strengthen place attachment has been attributed to a combination of frequent visits to outdoor spaces, participation in outdoor activities, civic engagement with environmental "stewardship" activities, and opportunities for social interaction. These elements reflect the goal of place-based pedagogy: to strengthen place attachment and ecological place meaning as an avenue for environmentally responsible behavior (Kudryavtsev, Stedman, & Krasny, 2012). Historically, place-based education has endeavored to reconnect the process of education with the local community as a way to improve community life and facilitate experiences that foster students' awareness of their interdependence with the place they inhabit (Sobel, 2004; Gruenewald & Smith, 2008).

Gruenewald and Smith's approach (2008) expands place-based education to be *place-conscious* education, which attends to a person's consciousness of socio-ecological contexts and fuses environmental education with culturally responsive teaching. Too often, the critical pedagogy of cultural oppression and privilege is absent from the environmental education model. A culturally responsive, place-conscious pedagogy accounts for both social and ecological forces that affect the community, honoring the full range of place meaning represented within a particular student body. Wattchow and Brown (2011) further expand place-based education, emphasizing the necessity to teach students to be *place-responsive* in a mobile, changing world: "To respond is to enter into a relationship of mutual interdependence that requires sensitivity and empathy for place(s) and those who dwell there, both now and in the future" (Brown, 2012, p. 67).

Effective place-based education for the Anthropocene stems from these place-based pedagogies. However, the peculiar constraints of the Anthropocene require that environmental education must also (1) acknowledge place-nature reality that context and human are mutually shaping parts of one another, (2) embrace the increased mobility of the human population, and (3) recognize that individuals are enmeshed not only with their locales but also with places they have not knowingly encountered and that human beings and their unseen places also mutually shape one another.

Most place-based environmental education has honed in on locale, but in the Anthropocene, humans are integrated into the fluid movement between the locale and the biosphere generated by global mobility and trade economies. With the goal of educating to promote adaptive survival in a world of fluctuating socioecological boundaries, we propose a framework for a new place-based pedagogy. Connection to our place(s) is already a pedagogy for environmental education, but a Kaleidoscope

of Places pedagogy is distinctive in that it is inherently exploratory of both our tangible and our intangible places, contains at its nucleus the goal of survival, and requires three precise skill sets, bulleted below. These nonhierarchical skills, which can be developed independently from one another, will help students evolve a sense of their Kaleidoscopes of Places in order to responsibly inhabit composite, mercurial place realities, engage in community action, and develop future vision for the survival of all beings in their local and global sociological contexts.

To inhabit one's expanding and contracting places from locale to biosphere and back, a Kaleidoscope of Places-based pedagogy requires:

- *Adaptability*: when we are mutually shaping places and places are mutually shaping us, we must adapt to fluidity and change.
- *Remaining open to feelings, including despair and hope*: the underlying skills needed to explore, inquire about, cross-examine, and engage in one's socio-ecological contexts require openness to feeling despair, from which hope and future visioning can emerge.
- *Agency in action*: participation in one's Kaleidoscope of Places must place equivalent value and equal attention on mutually shaping places from the local to the biosphere, preferencing neither, extending acquired learning about the local outward to learn more about the global.

Adaptability. Adaptability applies to:

1. Adaptability in the place where one currently stands, lives, and breathes.
2. The adaptability required during relocation to a new place, including consideration of the mosaic of places where one has lived and visited and the awareness that "genetic place types" may create preconceptions that interfere with place attachment to a new locale.
3. The ability to adapt to those unseen places that we affect daily (and vice versa) through twenty-first-century living, aka consumption.
4. The ability to adapt to changes that newcomers introduce to the place one resides, as well as the ability to help newcomers adapt, at a time when global mobility is growing. Bioregional "inhabiting" and rootedness in one place, formerly perceived as purely beneficial, now carry new, palpable dangers intrinsic to life in the Anthropocene. Like unused muscles, our adaptive abilities may atrophy when we fail to use them. This sometimes occurs in stable locales where we have relied on habitual modes of functioning because those modes have proven advantageous in our specific bioregions. Used to operating from a paradigm of steady rootedness, we may lack the heightened adaptive abilities required to address rapid changes in our ecological and social contexts, whether these result from sudden environmental events that cause structural change to both land and community or from an influx of newcomers who change the social fabric, culture, and sensory or aesthetic aspects of our locales.

When we consider nature-as-child and child-as-nature, or place-as-child and child-as-place, in light of the fact that mutually shaping forces change nature, child, and place, we observe mathematical conditions for constant change that will require people to adapt by rapidly and repeatedly creating new ways of organizing knowledge – or schemas, as Jean Piaget calls them – while simultaneously maintaining a sense of self. Piaget's theory of cognitive development suggests that when a child learns something, she develops a schema which helps her make sense of the world. She uses this schema to understand new experiences. Over time, events that disrupt the child's schema will occur, causing cognitive dissonance and what Piaget (1954) terms disequilibrium. The child then must adapt the new information to the old schema, or change the old schema to integrate the new information, in order to reestablish equilibrium and create a new schema by which to move forward. This theory, the foundation of a constructivist approach to learning, honors the fertile adaptability of the human mind.
