# About the Editors & Contributors

## Editors

**Ann Chinnery** is Associate Professor and Director of Undergraduate Programs in the Faculty of Education at Simon Fraser University, Canada. Her research is located at the intersection of philosophy of education and teacher education, drawing primarily on continental philosophy to address ethical issues in education. Specific areas of interest include the cultivation of moral and social responsibility, educating for critical historical consciousness, and the complexities of classroom dialogue in pluralist societies. Her recent work has appeared in the *Philosophy of Education Society Yearbooks* and journals such as *Educational Theory*, *Teaching and Teacher Education*, *Ethics and Education*, and the *Journal of Educational Controversy*. Her current research focuses on the pedagogical potential of critical historical consciousness as a framework for taking collective responsibility for collective harm regardless of one's individual role in committing the harm. This work includes, but is not limited to, educational initiatives intended to address the Calls to Action of the Truth and Reconciliation Commission of Canada, and preparing K-12 teachers to take up that work in their classroom practice.

**Nuraan Davids** is an Associate Professor of Philosophy of Education and the Chairperson of the Department of Education Policy Studies in the Faculty of Education at Stellenbosch University. Her research interests include democratic citizenship education, Islamic education, and educational leadership inquiry. She is an Associate Editor of the *South African Journal of Higher Education* and an Editorial Board Member of *Ethics and Education*. She is the author of *Women, Cosmopolitanism, and Islamic Education: On the Virtues of Education and Belonging* (New York & London: Peter Lang Publishing, 2013) and the coauthor, with Yusef Waghid, of: *Citizenship Education and Violence in Schools: On Disrupted Potentialities and Becoming* (Rotterdam/Boston/Taipei: Sense Publishers, 2013); *Ethical Dimensions of Muslim Education* (New York & London: Palgrave Macmillan, 2016); *Educational Leadership in Becoming: On the Potential of*

*Leadership in Action* (New York & London: Routledge, 2017); *Education, Assessment and the Desire for Dissonance* (New York & London: Peter Lang, 2017); *Philosophy and Education as Action: Implications for Teacher Education* (Lanham, MD (US): Rowman & Littlefield – Lexington Series, 2017); and *Education and the Polemic of Tolerance: Towards Dissent in Educational Encounters* (New York & London: Palgrave Macmillan, 2017).

**Naomi Hodgson** is Lecturer in Education Studies at Liverpool Hope University, UK, and Visiting Researcher in the Laboratory for Education, Culture, and Society, KU Leuven. Her research, situated in the field of educational philosophy, focuses on the relationship between education, governance, and subjectivity, particularly in relation to the figures of the researcher and the parent. Her current research project, funded by the British Academy/Leverhulme Trust, is entitled ‘The researcher disposition as today’s mode of subjectivation: the case of parenting’, and she is currently completing the manuscript of *Philosophical Presentations of Raising Children – The Grammar of Upbringing*, coauthored with Stefan Ramaekers (KU Leuven), and due to be published in early 2018. She has recently collaborated with Joris Vlieghe (Aberdeen) and Piotr Zamojski (Gdansk) to write a ‘Manifesto for a Post-Critical Pedagogy’ (Punctum, 2017). Naomi is the author of *Philosophy and Theory in Education: Writing in the Margin* (coauthored with Amanda Fulford; Routledge, 2016), *Citizenship for the Learning Society: Europe, Subjectivity, and Educational Research* (Wiley, 2016), and numerous journal articles and book chapters in the field of philosophy of education. She is Managing Editor of the PES Yearbook and Reviews Editor for the *Journal of Philosophy of Education*.

**Kai Horsthemke** teaches philosophy of education at KU Eichstätt-Ingolstadt in Germany. He is also a Visiting Professor in the School of Education at the University of the Witwatersrand, South Africa, and a Fellow at the Oxford Centre for Animal Ethics, UK. He has published extensively since 2004 on African philosophy, indigenous knowledge systems, and animal ethics. Additional research interests include social epistemology and environmental education. He is the author of two monographs, *The Moral Status and Rights of Animals* (Porcupine Press, 2010) and *Animals and African Ethics* (Palgrave MacMillan, 2015), and, together with Peggy Siyakwazi, Elizabeth Walton, and Charl Wolhuter, the coeditor of the first two editions of *Education Studies* (Oxford University Press Southern Africa, 2013 and 2016, respectively).

**Viktor Johansson** gained his Ph.D. in Educational Sciences at Stockholm University in Sweden. He is currently Senior Lecturer at the School of Humanities, Education, and Social Sciences at Örebro University. His expertise and research interests are philosophy of learning, early childhood education, philosophy with children, children’s literature, and philosophy of literature. He is the author of *Dissonant Voices* (2013) and of several articles in the field of philosophy of education, including most recently, ‘Killing the Buddha: Towards a heretical philosophy of learning’ (2017), ‘Unserious but Serious Pilgrimages: What Educational Philosophy can learn about

Fiction and Reality from Children's Artful Play' (2017), and 'Questions from the Rough Ground: Teaching, Autobiography, and the Cosmopolitan "I"' (2015). He is the coeditor of the special issues, 'Perfectionism and Education: Kant and Cavell on Ethics and Aesthetics in Society' (2014) and '*Bildung*, Self-Cultivation, and the Challenge of Democracy: Ralph Waldo Emerson as a Philosopher of Education' (forthcoming in *Educational Philosophy and Theory*). He is currently working on two monographs, one in Swedish on philosophy in early childhood with the working title *Omedelbarhetens pedagogik: Filosofi bortom orden i tidig barndom* (The Pedagogy of Immediacy: Philosophy Beyond Words in Early Childhood) (Gleerups) and another in English called *Literature and Philosophical Play in Early Childhood Education* (Routledge).

**Dirk Willem Postma** studied History and Philosophy of Education at the State University of Groningen in the Netherlands. As a junior researcher at the universities of Leuven, Belgium, and Nijmegen, the Netherlands, he wrote a Ph. D. thesis about the ethical and politico-philosophical dimensions of environmental education: *Why care for Nature? In search of an ethical framework for environmental responsibility and education* (Springer, 2006). Later he conducted applied research and published papers and books in the broader field of citizenship, self-organization, social inequality, and cultural diversity, mainly in Dutch journals for an audience of social work professionals. Since 2016, he leads a research group at the NHL and Stenden Universities of Applied Sciences in Leeuwarden, focusing on participatory action research in the field of community development in deprived neighborhoods. Apart from these academic affiliations, he is actively involved in local communities of citizens, working together with institutions on better living conditions for and with vulnerable groups, in particular with LGBT refugees and citizens suffering from mental health problems.

**Claudia W. Ruitenberg** is Professor in the Department of Educational Studies and Academic Director of Vantage College, both at the University of British Columbia in Vancouver, Canada. She is the author of *Unlocking the World: Education in an Ethic of Hospitality* (Paradigm/Routledge, 2015), coeditor (with D. C. Phillips) of *Education, Culture and Epistemological Diversity: Mapping a Disputed Terrain* (Springer, 2012), and editor of *What Do Philosophers of Education Do? (And How Do They Do It?)* (Wiley Blackwell, 2010), the *Philosophy of Education 2012* yearbook, and *Reconceptualizing Study in Educational Discourse and Practice* (Routledge, 2017). She has taught courses on social and political theory, research design, philosophy of education as educational research, critical thinking, and professional ethics. Her areas of research include political and citizenship education; ethics and education; discourse, performativity, and speech act theory; and art and aesthetic education. She was Scholar in the UBC Centre for Health Education Scholarship 2013–2017, exploring philosophical aspects of medical and other health professions education. She is currently developing further research on the challenges of translation between languages, cultures, and discourses, especially as these affect education in multicultural and multilingual contexts.

**Paul Smeyers** is Professor at Ghent University and at KU Leuven, both in Belgium, and Honorary Professor at Stellenbosch University (South Africa). He teaches philosophy of education and methodology of the Geisteswissenschaften (Qualitative/ Interpretative Research Methods). He is the author of numerous articles focusing on Wittgenstein's relevance for philosophy of education, on postmodernism, and on issues of the methodology of educational research. He is President of the International Network of Philosophers of Education and link-convenor for Network 13, Philosophy of Education, European Educational Research Association. He is the Editor of *Ethics and Education* (Taylor and Francis). Together with Nigel Blake, Richard Smith, and Paul Standish he coauthored three books, *Thinking Again*, *Education in an Age of Nihilism*, *The Therapy of Education*, and with Michael Peters and Nick Burbules *Showing and Doing*. With Marc Depaepe he coedited the series *Educational Research* (Springer, thus far 10 books). Recent publications include a coauthored book with Richard Smith (*Making Sense of Education and Educational Research*, Cambridge University Press, Cambridge, 2014) and a collection coedited with David Bridges, Morwenna Griffiths, and Nick Burbules (*International Handbook of Interpretation in Educational Research methods*, 2 vols., Springer, 2015). His latest work focuses anew on Wittgenstein's legacy for philosophy of education. Some of that is included in the collection edited by Michael Peters and Jeff Stickney (*A Companion to Wittgenstein on Education*. Springer, 2017). Attention to Smeyers' contributions in this area is discussed in the Foreword (David Bakhurst), the introductory chapter (Editors), and in a separate chapter by Paul Standish.

**Christiane Thompson** is Professor of Theory and History of *Bildung* and Education at the Goethe University Frankfurt in Germany. She received her Ph.D. with a work on Theodor Ballauff's theory of education in 2002 (published with Leske & Budrich in 2003). From 2002–2008 she worked on a book examining experience and *Bildung* (published with Schöningh in 2009). From 2009–2010 she was Full Professor of education at the University of Fribourg, Switzerland. From 2010–2014 she was Heisenberg Research Professor for 'Education with a Special Focus on the Theory and Cultural Research of *Bildung*' at the Martin Luther University in Halle-Wittenberg, Germany. Since 2014, she is Professor at the Goethe University Frankfurt. Her main areas of research lie in the philosophy of education. In her research, she relates systematical and historical perspectives in order to provide a well-reflected and critical categorical framework for education and *Bildung*. Furthermore, her work focuses on the power relations and formations within educational processes. Here, the analytical work concentrates on authorization practices and subject formations in educational contexts. Recently, she published: 'Autorisierungen des pädagogischen Selbst', Springer 2017 (book edition together with K. Jergus), and 'Zwischenwelten der Pädagogik', Schöningh 2017 (book edition together with S. Schenk). Currently, she is working on a book edition on Adorno's dictum 'Education after Auschwitz' (together with S. Andresen and D. Nittel) and a book edition on 'Anxiety' (together with A. Schäfer).

**Joris Vlieghe** is a Lecturer in philosophy of education at the University of Aberdeen. He studied philosophy and art history and obtained his Ph.D. (KU Leuven, 2010) in Educational Studies, with a dissertation on *The Democracy of the Flesh*. Here he explored the role of corporeality in and for education. His recent research deals with the ways in which the ubiquity and pervasiveness of digital technologies change dimensions that traditionally have been considered as vital to education: transformation, emancipation, community, attention, literacy, formation/edification, and creativity. Central to this line of investigation is the question whether or not we still need schools in digital times. Next to this, he is also interested in the intrinsic educational meaning of school practices, and the role of repetition and rehearsal, as well as the collective nature of the things we do at school. Currently, he is developing a postcritical approach to education and an affirmative ontological account of teaching (in terms of an unconditional and passionate love for a subject matter). He coedited in 2015, with Nancy Vansieleghem and Pieter Verstraete, *After-School: Images, Education and Research* (Leuven University Press) and wrote, together with Naomi Hodgson and Piotr Zamojski, *Manifesto for a Post-Critical Pedagogy* (Punctum Press, 2017).

## Contributors

**Hanan Alexander** is Dean of the Faculty of Education at the University of Haifa, where he serves as Professor of Philosophy of Education and heads the Center for Jewish Education. He has taught at American Jewish University, UCLA, UC Berkeley, Graduate Theological Union, Jewish Theological Seminary, and Bar Ilan University, and was Visiting Fellow at the University of Cambridge. A past editor of *Religious Education*, Alexander has published more than 130 essays and seven books. These include: *Reclaiming Goodness: Education and the Spiritual Quest* (University of Notre Dame Press, 2001); *Ethics and Spirituality in Education: Philosophical, Theological, and Radical Perspectives* (Sussex, 2004); *Citizenship Education and Social Conflict: Israeli Political Education in Global Perspective*, with Halleli Pinson and Yossi Yonah (Routledge, 2011); *Commitment, Character, and Citizenship: Religious Schooling in Liberal Democracy*, with Ayman Agbaria (Routledge, 2012); and *Reimagining Liberal Education: Affiliation and Inquiry in Democratic Schooling* (Bloomsbury, 2015).

**Joop Berding** (1954) was trained as an elementary school teacher and worked subsequently as teacher, civil servant, and educational counsellor. From 2006 till his early retirement in October 2017, he worked as Assistant Professor and researcher at Rotterdam University of Applied Sciences. He has a Ph.D. from the Free University (VU) of Amsterdam, on the educational philosophy of John Dewey, and has published extensively on Dewey, Korczak, and Arendt. Most recently (2017), he edited *Aan het werk met Hannah Arendt* (At work with Hannah Arendt), a collection

of essays about tensions in professionalism. With Wouter Pols he published *Schoolpedagogiek* (2018, 4th Ed.), a textbook on upbringing and education for teachers in primary and secondary schools.

**Charles Bingham** is Professor of Curriculum Theory at Simon Fraser University, Vancouver, Canada. He is author of *Schools of Recognition: Identity Politics and Classroom Practices* (Rowman & Littlefield), *Jacques Rancière: Education, Truth, Emancipation* (Continuum Press), and Co-editor of *No Education without Relation* (Peter Lang). His current areas of research are educational relation, social issues in education, inclusion, meritocracy, and pedagogical aesthetics.

**Michael Bonnett** has held senior teaching and research positions in the UK universities of Cambridge, London, and Bath. Formerly, he was a Visiting Professor at the University of the Aegean. He has published widely in the field of philosophy of education giving particular attention to ideas of learning, thinking, personal authenticity, and the character of the teacher-pupil relationship in education. His book *Children's Thinking: Promoting Understanding in the Primary School* (1994, Cassell) explored the importance of poetic thinking for education. More recently, his focus has been on aspects of sustainability and environmental education, including developing a phenomenology of nature and ways in which human consciousness is inherently environmental. His book *Retrieving Nature: Education for a Post-Humanist Age* was published in 2004 by Blackwell, and his edited collection *Moral Education and Environmental Concern* was published in 2014 by Routledge.

**David Bridges**, BA (Oxon), MA, Ph.D. (London), Hon D Univ (Open University), FAcSS, is Professor Emeritus of the University of East Anglia and Emeritus Fellow of St Edmund's College and Homerton College, Cambridge. He has published extensively in leading journals in philosophy of education and edited works. A substantial collection of his work is gathered in *Philosophy in Educational Research: Epistemology, Ethics, Politics and Quality* (Springer 2017). He is an Honorary Vice President of the Philosophy of Education Society of Great Britain and has served as a council member of both the British and European Educational Research Associations, in both of which he established the philosophy of education networks. Over the last 6 years he has been extensively engaged in the educational, including curriculum, reform movement in Kazakhstan and has previously contributed to curriculum reform in Mongolia, Iran, and Ghana.

**Malte Brinkmann** holds the chair of *Allgemeine Erziehungswissenschaft* at the Humboldt University of Berlin. He is the editor of the series *Phänomenologische Erziehungswissenschaft*, a textbook on the *Phänomenologische Erziehungswissenschaft*, and the organizer of several international symposia on phenomenology. His research areas are theory and philosophy of education, philosophy of training and practice, interdisciplinary and videographic inquiry of practice, and phenomenological research in education and schools. He is the author of *Die pädagogische Übung* and published several articles on learning, Bildung, practising, attention, and phenomenological videography.

**Brian A. Brown** is an Assistant Professor in the Department of Communication, Media and Film at the University of Windsor, Ontario, Canada. His research focuses on the intersections between Marxist theory and digital visual culture. His previous work has been published in *Rethinking Marxism* and *Triple C: Communication, Capitalism & Critique*.

**Carsten Bünger**, Dr. phil., is Visiting Professor for ‘Allgemeine Erziehungswissenschaft/Theorie der Bildung’ at the University of Wuppertal until March 2018. He studied at the Technische Universität Darmstadt and was promoted in 2013 with a dissertation on the political dimension of *Bildung*. Since then, he has worked as a Research Assistant at the TU Dortmund University and the Goethe University Frankfurt and was invited to teach at the universities of Vienna and Zurich. His focus in research and teaching is: philosophy of education; Bildung and subjectivation; and pedagogy in the context of power, authority, and criticism.

**Nicholas C. Burbules** is the Gutsell Professor in the Department of Educational Policy, Organization and Leadership at the University of Illinois, Urbana-Champaign. His primary research areas are philosophy of education; teaching through dialogue; and technology and education. He has authored or edited 16 books and over 200 journal articles and book chapters, many of them dealing with technology issues. He is frequently invited to lecture at universities around the world, and a number of his publications have been translated into other languages. He is currently the Education Director for the National Center on Professional and Research Ethics, located at the University of Illinois, Urbana-Champaign.

**Rita Casale** studied philosophy and history in Bari, Paris, and Freiburg im Breisgau (Ph.D. 1997). She taught at the Universities of Frankfurt a. M., of Zürich, of Vienna, and Fribourg before joining the University of Wuppertal (Germany) in 2009, where she is Professor of philosophy and history of education at the Institute of Education Sciences. Her research interests are: Philosophy of Education (Phenomenology, Critical Theory, Poststructuralism), Feminism and History of Knowledge. Her selected publications include: *Das Pädagogische und das Politische*, 2016 (ed. with H.C.Koller a. N. Ricken); *Der begriffsgeschichtliche Unterschied von Bildung und Differenz*. In: G. Kluchert/ C. Groppe/ E. Matthes, E. (Ed.): *Bildung und Differenz*, 2015, p. 21–38; *Subjekt feministisch gedacht*. In: A. Fleig (ed.): *Die Zukunft von Gender*, 2014, p. 76–96; *Heideggers Nietzsche*. Bielefeld 2010; *Neuer Feminismus? Feministische Studien 2/2008* (ed. with U. Gerhard / U. Wischmann); and *Was kommt nach der Genderforschung?* (2008, ed. with B. Rentdorff).

**M. Victoria Costa** is Associate Professor of Philosophy at the College of William and Mary, in the United States. Her research focuses on political philosophy and philosophy of education, including topics such as justice and civic education, civic virtue, political freedom, cosmopolitanism, patriotism, and nationalism. She has published a book *Rawls, Citizenship, and Education* (Routledge 2011) and articles in *Theory and Research in Education*, *Critical Review of International Social and*

*Political Philosophy, Journal of Social Philosophy, Hypatia, and Politics, Philosophy and Economics*, among others. Her primary research focus at the moment is on the neo-republican theory of freedom as nondomination and its policy implications.

**Brian Coyne** is a Lecturer in Political Science at Stanford University. He received his B.A. in Government from Harvard College in 2007 and his Ph.D. in Political Science from Stanford University in 2014. His dissertation, ‘Non-state Power and Non-state Legitimacy’ explored how liberal theories of justice should evaluate the power of non-state actors like NGOs, corporations, and international institutions. His other research interests include political representation, responses to climate change, and the politics of urban space and planning. From 2014 to 2017, he taught in Stanford University’s Thinking Matters program and has also taught at San Francisco State University’s Osher Lifelong Learning Center and San Francisco College Track.

**Renato Huarte Cuéllar** is an Associate Professor at Mexico’s Autonomous National University since 2004. He holds a Ph.D. in Philosophy and has studied pedagogy, philosophy, and classical studies. He has been tenured in the area of Philosophy of Education since 2015. Within this area, he has dealt with ‘traditions’ as a philosophical problem, especially in Latin America. After his research stay at the Hebrew University of Jerusalem, he has studied philosophy of education in the Jewish tradition. He has translated some texts from Buber, Maimonides, and other Jewish thinkers from their original tongues into Spanish, and has been working on the philosophy of education in several Mexican thinkers. He has published mainly in Spanish, but several articles on Martin Buber’s philosophy of education can be found in English. He has been the President of the Latin American Association of Philosophy of Education (2015–2017) and a member of INPE since 2010.

**Stefaan E. Cuypers** is Professor of Philosophy at the KU Leuven – University of Leuven, Belgium. He works in philosophy of mind and philosophy of education. His research interests are personal identity, free will, moral responsibility, and R. S. Peters. He is the author of *Self-Identity and Personal Autonomy* (Ashgate, 2001), the coauthor, together with Ishtiyaque Haji, of *Moral Responsibility, Authenticity, and Education* (Routledge, 2008), and together with Christopher Martin, of *R. S. Peters* (Bloomsbury, 2013), the coeditor, together with Christopher Martin, of *Reading R. S. Peters Today: Analysis, Ethics and the Aims of Education* (Wiley-Blackwell, 2011), and a contributor to *The Oxford Handbook of Philosophy of Education* (Oxford University Press, 2009).

**Johan Dahlbeck** is Associate Professor of Education at Malmö University. His research interest is in the philosophy of education, focusing especially on the educational implications of Spinoza’s ethical theory. He is the author of *Spinoza and Education: Freedom, Understanding and Empowerment* (Routledge, 2016).

**Suzanne de Castell** is a Professor of Multimodal Learning and former Dean of the Faculty of Education at the University of Ontario Institute of Technology. In her nearly four decades long career, she has published widely and frequently on topics such as philosophy and education, queer pedagogy, multiliteracies, gender and technology, and video games and learning.

**Doret de Ruyter** is Professor of Philosophy of Education and Head of the Department of Educational and Family Studies at the Vrije Universiteit, Amsterdam. Before her return to her alma mater she was (senior) Lecturer at the Faculty of Education, University of Glasgow. Her research interests surround flourishing as an aim of education and the importance of ideals in education and professionalism. Most recently, she also returned to the topic of her dissertation defended in 1993, i.e., responsibilities of parents, the state, and professionals in the upbringing of children. She is assistant editor of *Journal of Philosophy of Education*, associate editor of *Theory and Research in Education*, and member of the editorial boards of *Journal of Moral Education*, *Philosophical Inquiry in Education*, and *Pedagogiek*.

**Samantha Deane** is a doctoral candidate in Cultural and Educational Policy Studies, focusing on Philosophy of Education at Loyola University Chicago. She also works as a post-secondary and career development specialist with teens for a Chicago-based non-profit. She holds a Masters of Arts in Humanities from the University of Colorado Denver. Her current research interests include theories of democratic education, pragmatism, and the problem of gun violence for the practice of democracy. Her recent publications include: "Plato and the Police: Dogs, Guardians, and Why Accountability is the Wrong Answer," in *Educational Studies* and a review of *Strong Democracy in Crisis: Promise or Peril?*, "An Ode to Benjamin Barber and Strong Democracy," in *Philosophical Inquiry in Education*.

**Sarah J. DesRoches** has published primarily in the areas of history and citizenship education and social justice education. Her work has considered liberal theories of diversity, such as Québec's intercultural model on cultural diversity, and radical democratic theory shape pedagogic practice and, consequently, the aims of education. Most recently, her work has explored how radical democracy, informed by the work of Chantal Mouffe, provides the possibility for more equitable social and political relations. She completed her Ph.D. at McGill University in 2014 and a postdoctoral fellowship at the University of British Columbia in 2015. She is currently an independent scholar.

**Eduardo Duarte** is Professor of Philosophy in the School of Education at Hofstra University, where he has been teaching since 1996. He earned both his Doctorate and Masters in Philosophy at the New School for Social Research, and his Baccalaureate in Philosophy from Fordham University. Duarte is the author of *Being and Learning* (Sense Publishers: 2012), and *Beyond Fragmentation, Toward Polyphony* (LAP: 2010), and coeditor of *Foundational Perspectives in Multicultural Education* (Longman: 2000). Duarte has published his scholarship in *Studies in*

*Philosophy and Education, Educational Philosophy and Theory, Educational Studies, LAPIZ, Encounter, Educational Theory, and the Journal of Philosophy of Education.* He was program chair for the Philosophy of Education Society 2015 Memphis meeting ‘The Blues/Soul Music’, and edited *Philosophy of Education 2015* (University of Illinois). Duarte is host/producer of radio programs broadcast on 88.7FM WRHU.ORG (Radio Hofstra University) dedicated to exploring the intersections between improvisational music and philosophy.

**Denise Egéa** is Professor Emeritus at Louisiana State University, USA, and Professor in the Graduate School of Education at Nazarbayev University, Astana, Kazakhstan. She is a Fellow in the American Philosophy of Education Society, a Phi Kappa Phi scholar, and an *Officier dans l’Ordre des Palmes Académiques*. A graduate from the Université de Lyon, France, and Louisiana State University, USA, across disciplines and borders her primary areas of scholarship are educational theory, language and cultural education, and educational research, with a focus on ethics and on human, cultural, linguistic, and educational rights. Recent and current projects focus on: education and the paradigm of complexity; alter-mondialization and local multiculturalisms; growing plurilingual in a multicultural country; education in Central Asia; and Kazakhstani ‘philosophers of the steppe’. Latest publication: ‘Education as/is Ethics’ in *The Wiley Handbook of Educational Ethics* edited by Richard Smith.

**Penny Enslin** is Professor of Education at the University of Glasgow. Her research interests and publications are in political philosophy and education with particular reference to democratic citizenship, cosmopolitan justice, and gender in education. Recent work across these themes has focused on tensions between diversity and universalism in liberal theory, postcolonial philosophy of education, and feminist ethics.

**Oren Ergas** is a Senior Lecturer at Beit Berl College, Israel. His publications focus on understanding the mind from the perspectives of wisdom traditions and science and in relation to curriculum and pedagogy. His work has been published in various peer-reviewed journals including the *Journal of Philosophy of Education* for which he coedited a special issue on Philosophy East/West. His book *Reconstructing ‘Education’ through Mindful Attention* was published in 2017 (Palgrave Macmillan).

**Lynn Fendler** is a Professor in the Department of Teacher Education at Michigan State University, USA, where she teaches courses in educational foundations, curriculum theory, philosophy, and historiography. In 2010–2011, she served as Visiting Professor in Languages, Culture, Media, and Identities at the University of Luxembourg. Since 2000, she has been a member of the Research Community Philosophy and History of the Discipline of Education: Evaluation and Evolution of the Criteria for Educational Research. Her research interests include ethics of knowledge, historiography, genealogy, educational research, and the philosophy of food. She is the author of *Michel Foucault* in the Bloomsbury [formerly Continuum]

Library of Educational Thought, which introduces Foucault's philosophical, genealogical, and literary critique to teachers. Her current research projects include studies of non-representational theory, history of the bell curve, humanities-oriented research, and the educational problems of aesthetic taste.

**Sheron Fraser-Burgess** is Associate Professor of Social Foundations/Multicultural Education at Ball State University where he teaches courses in philosophy and education in the undergraduate teacher licensure/professional education, master in education, and Ph.D. in Educational Studies programs. His primary research interest has been in the principles, practices, and social implications of democracy. Philosophically, this cluster of moral, political, and epistemological questions implies an ideal of schools as deliberative and inclusive spaces. Issues related to advancing equal educational opportunity in a democratic society also have been central in his teaching and scholarship, where, primarily exploring questions of social justice, pluralism, and identity in democratic education, he works in the theory to practice continuum. A democratic society rightly gives pride of place to diversity, critical thinking, and equality of opportunity. As John Dewey maintained, it is the preeminent task of each generation to interpret the meaning of democratic education for its age.

**Norm Friesen** is a Professor in the Department Educational Technology at the College of Education, Boise State University. He has recently published in *First Monday*, the *Journal of Curriculum Studies*, and *Educational Researcher*. Dr. Friesen is the author of *Re-Thinking E-Learning Research: Foundations, Methods and Practices* (2009), and has recently translated and edited Klaus Mollenhauer's *Forgotten Connections: On Culture and Upbringing* (Routledge, 2014) as well as a book on *Existentialism and Education in the thought of Otto Friedrich Bollnow* (Palgrave, 2017). He is currently undertaking funded research into pedagogical tact, and has a monograph forthcoming (2017) from Johns Hopkins University Press titled Friesen, N. *The Textbook and the Lecture: Education in the Age of New Media*. He is currently coediting and cotranslating an edited collection on *Pedagogical Tact and the Pedagogical Relation*, and is coauthoring a monograph on *Human Science Pedagogy*.

**Amanda Fulford** is Reader in Philosophy of Education in the Institute of Childhood and Education at Leeds Trinity University in the UK. Her recent research focuses on the philosophy of higher education and on public philosophy. She has particular interests in philosophical thinking about the university, higher education pedagogy, and educational relationships and has published on issues of student satisfaction, student expectation, and student engagement. Her work is informed by the American philosopher Stanley Cavell, and his readings of Henry David Thoreau and Ralph Waldo Emerson. She is the author of numerous journal articles and coauthored the 2012 volume for Routledge *Philosophy and Theory in Education Research: Writing in the Margin*.

**Heather Greenhalgh-Spencer**, Ph.D., is an Assistant Professor in the Department of Curriculum and Instruction at Texas Tech University. Her research emerges at the intersection of educational technology, pedagogical innovation, diversity and equity issues, and global studies. She explores practices of using technology and pedagogical innovation to create engaged learning in both formal and informal learning spaces, and in both national and global contexts. She explores diversity and equity issues in the STEM pipeline, and also researches embodied and transdisciplinary learning practices that increase engagement for underrepresented populations in STEM courses. She also researches blended/personalized learning (BL/PL) and the ways that BL/PL can create diverse pathways and increased opportunities for all students. She is the chair of the graduate program in BL/PL.

**Stefan Herbrechter** is Research Fellow at Coventry University and *Privatdozent* at Heidelberg University. Until 2014, he was Reader in Cultural Theory and Director of Postgraduate Studies (Media) at Coventry University. Previously, he held appointments at Heidelberg University (Professor English and Cultural Studies) and Leeds Trinity University. He has a Ph.D. from the Centre for Critical & Cultural Theory at Cardiff University and a *Habilitation* in English Studies from Heidelberg University. His publications include a number of volumes and articles on English and comparative literature, critical & cultural theory, continental philosophy, and cultural and media studies. His most recent book is *Posthumanism: A Critical Analysis* (Bloomsbury). He is also a translator of cultural theory and philosophy from French into English (Derrida, Cixous, Stiegler), Series Editor of *Critical Posthumanisms* (Brill), and Director of the Critical Posthumanism Network.

**Chris Higgins** is Associate Professor of Philosophy of Education in the Department of Education Policy, Organization & Leadership at the University of Illinois at Urbana-Champaign, where he serves as Editor of *Educational Theory*. A Resident Associate at Illinois' Center for Advanced Study, he is co-directing a 2-year initiative, 'Learning Publics', examining the role of universities, and in particular the arts and humanities, in public life. His book *The Good Life of Teaching: An Ethics of Professional Practice* (Wiley-Blackwell, 2011) offers one of the first systematic extensions of virtue ethics to questions concerning work and professional identity. His recent and forthcoming publications include 'The Promise, Pitfalls, and Persistent Challenge of Action Research' (*Ethics and Education*), 'The Death Spiral of Contemporary Public Higher Education' (*Thresholds in Education*), 'Teaching as a Hermeneutic Calling' (*Philosophy of Education*), and 'Zombie Liberal Education' (*Educational Theory*). He is currently working on three book projects: the first develops a new theory of humanism and liberal learning and offers a critique of the corporatized, vocationalized multiversity; the second is an anti-textbook on professional ethics; the third is an inquiry into the dynamics of the teacher-student relationship.

**Pádraig Hogan** is Senior Lecturer in Education at the National University of Ireland, Maynooth. He has a keen research interest in the quality of teaching and learning, and in what makes learning environments conducive to rich educational

experiences. During his career at Maynooth he has had an on-going arrangement with a Dublin post-primary school, enabling him to teach at regular intervals at post-primary level. To date, he has published over 100 research items, including books, journal articles, book chapters, and commissioned reports. His most recent book is *The New Significance of Learning: Imagination's Heartwork*.

**Katariina Holma** is Professor of Education at the University of Oulu, Finland. Her work focuses on the intersections of epistemology and education, theories and philosophies of citizenship education, and the philosophy of science in educational research. She publishes regularly on the main journals of her research field and her work has been supported by the Academy of Finland, Kone Foundation, the Spencer Foundation, and the University Helsinki Funds. She is currently the leader of the research consortium Growth into Citizenship in civil society encounters funded by the Academy of Finland.

**Liz Jackson** is an Associate Professor of Education at the University of Hong Kong. She is also Vice President of the Philosophy of Education Society of Australasia and on the Managing Committee of the Comparative Education Research Centre at the University of Hong Kong. She is the author of the book *Muslims and Islam in US Education: Reconsidering Multiculturalism* (Routledge, 2014), which received the Research Output Prize in Education at the University of Hong Kong and a Book Award from the Philosophy of Education Society of Australasia. She has published articles in *Educational Philosophy and Theory*, the *Philosophy of Education Yearbook*, and the *Journal of Moral Education*. Her research focuses on moral and civic education, global studies in education, and cultural and cross-cultural education.

**Ronald B. Jacobson** currently serves as the Executive Director of the School of Education at Central Washington University in Ellensburg, Washington (USA). Prior to this, he spent 10 years as faculty, then Dean of the College of Education at Northwest University near Seattle. He has been involved with mentoring college and university students since the early 1980s, working with a number of nonprofit organizations focused on university student leadership development. He currently also serves as the higher education representative on the Washington State Professional Education Standards Board (PESB). The PESB oversees teacher preparation in Washington State. Having received his doctorate in Educational Leadership and Policy Studies at the University of Washington (Seattle), his research interests include school bullying, teacher preparation, moral development, classroom culture, and educational research (specifically incorporating conceptual research methodologies).

**Jennifer Jenson** is Professor of Pedagogy and Technology and Director of the Institute for Research on Digital Learning at York University, Canada. She has published on technological integration and implementation in K-12 schooling,

technology, video games and gender, and digital games and learning. Currently, she is the Principal Investigator of a Canadian government funded project that is intervening in the misogynist cultures of game design and play.

**Kerstin Jergus** University of Dresden (TU Dresden), Germany, Faculty of Educational Science, Department of General Educational Science. Research interests: philosophy of education and educational research in the fields of university, educational relationships, heterogeneity, and parenthood. Recent books: *Autorisierungen des pädagogischen Selbst* (with Christiane Thompson) and *Elternschaft zwischen Projekt und Projektion* (with Jens Oliver Krüger and Anna Roch).

**Clarence W. Joldersma** is Professor of Philosophy of Education at Calvin College (USA). He has three broad research interests, including Levinas and education; sustainability, climate change, and education; and social justice and education. Recent books include *A Levinasian Ethics for Education's Commonplaces: Between Calling and Inspiration* (Palgrave, 2014) and *Neuroscience and Philosophy: A Critical Appraisal* (Routledge 2016). Recent essays include 'Overcoming lingering dualism in cognition and learning via emotion: freedom, phenomenology, and affective neuroscience', in *Philosophy of Education Society Yearbook 2014* (2017) and 'An Earth Ethics in Education', in the *Oxford Research Encyclopedia of Education* (OUP 2017). He also has guest edited, with Sean Blenkinsop, a special issue of the journal *Educational Theory* (Fall 2017) on the theme 'ecologizing education'.

**Mark E. Jonas** is Associate Professor of Philosophy of Education and Associate Professor of Philosophy (by courtesy) at Wheaton College. His primary research interests are in the political, ethical, and educational thought of Nietzsche, Plato, and Rousseau. Some of his articles have appeared in *History of Philosophy Quarterly*, *Educational Theory*, *Phronesis*, *Journal of Philosophy of Education*, and the *History of Political Thought*.

**Zdenko Kodolja** is Ph.D. both in Philosophy and Education; is a full-time researcher and Head of the Centre for Philosophy of Education at the Educational Research Institute, Ljubljana, Slovenia. In addition, he teaches Ethics of Educational Research on the postgraduate level at the Faculty of Education, University of Ljubljana. From 2008 to 2012, he taught Philosophy of Education at the Faculty of Humanities (Department of Philosophy), University of Primorska, Koper. He is the author of 6 books and his complete bibliography includes more than 600 units (chapters in books, essays, articles, interviews, research reports, etc.).

**Wendy Kohli** is Professor *Emerita* of Educational Studies at Fairfield University, Fairfield, Connecticut, USA. Her primary research focus over the course of her academic career has been on critical educational theory and philosophy. She has published widely in a range of journals including *Educational Theory*, *Studies in Philosophy of Education*, *Educational Studies*, *Qualitative Studies in Education*,

and *Education and Culture*. She is also the coauthor of *Feminisms and Educational Research*, Rowman and Littlefield (2013), and is the Editor of and contributor to *Critical Conversations in Philosophy of Education*, Routledge (1995). She is a Past President of the American Educational Studies Association (AESA) and has served on the Editorial Review Boards for *Educational Theory*, *Educational Studies*, and *Studies in Philosophy and Education*.

**Anna Kouppanou** is a Postdoctoral Research Fellow at the University of Cyprus. She is interested in philosophy of education and in philosophy of technology. She writes on the concept of nearness and its digital instantiations, on metaphoricity – as a basic human and technologically constituted type of relatedness, and on the interesting exchanges between philosophy of technology and literary theory. Her latest book is titled: *Technologies of Being in Martin Heidegger: Nearness, Metaphor and the Question of Education in Digital Times* (London: Routledge). She is a published author of fiction (children’s and young people’s literature and poetry), and she teaches philosophy of education, children’s literature, and creative writing.

**Heikki A. Kovalainen** is an independent researcher and author from Finland. He holds a Ph.D. from the University of Tampere and has written two monographs on R. W. Emerson, one fictional novel, and two textbooks in philosophy. Recently, he has been working on the concept of Bildung, philosophy of Stanley Cavell, and the ways in which the private and the public spheres of moral life are intertwined. Both in his research and fiction, he is looking for instances in which the gap between self-regard (private projects of self-cultivation) and other-regard (political solidarity) is bridged. In 2018, he plans to publish his second novel, which uses documentary materials related to as well as research into recent streaks of fascism in Finland.

**Lesley Le Grange** is Distinguished Professor in the Faculty of Education at Stellenbosch University, South Africa. He teaches and researches in the fields of environmental education, research methodology, science education, curriculum studies, higher education studies, and assessment. His current research interests are: critically ‘analyzing’ sustainability and its relationship to education; developing *Ubuntu* as an environmental ethic and exploring its implications for education; and exploring ways in which Indigenous and Western knowledge could be performed together.

**David Lewin** is Lecturer in Philosophy of Education at the University of Strathclyde in Glasgow. He has a varied background reflecting his interdisciplinary interests with degrees in Theology, Mysticism, and Computer Science. His doctoral research synthesized these interests by examining the latent mystical theology within Heidegger’s later critique of modern technology, resulting in the publication of his first book: *Technology and the Philosophy of Religion* (Cambridge Scholars 2011). He now works at the intersections between philosophy of education and philosophy of religion, having published several books and numerous articles, including *Educational Philosophy for a Post-secular Age* (Routledge, 2016) and *Mystical Theology and Continental Philosophy* (Routledge 2017).

**Tyson E. Lewis** is an Associate Professor of Art Education at the University of North Texas where he teaches classes in aesthetic philosophy, critical theory, and phenomenological research methods. He has written two books exploring the implications of Giorgio Agamben's philosophy for education, including *On Study: Giorgio Agamben and Educational Potentiality* and *Inoperative Learning: A Radical Rewriting of Educational Potentialities*, both published by Routledge.

**Gerard Lum** is Senior Lecturer in Philosophy and Education Management in the School of Education, Communication and Society, King's College London. Trained initially as an electrical engineer and more latterly as a philosopher, he taught electrical engineering for a number of years before turning his interests to the theory and philosophy of education. A member of the King's Centre for Public Policy Research, his research interests include epistemological issues relating to occupational knowledge and capability, approaches to professional education, and questions about the nature of educational assessment. He has published widely on issues in philosophy of education; his book *Vocational and Professional Capability: An Epistemological and Ontological Study of Occupational Expertise* was published in 2009.

**Niclas Månsson** is a Professor of Education and Didactics at Mälardalens University, Eskilstuna/Västerås, in Sweden. He wrote his dissertation on the stranger in the writings of Zygmunt Bauman (2005) and is the author of *Why do strangers exist? The social construction of unwanted people* (2009). His research interest includes social justice, migration, and education, and he has published philosophical and empirical articles on these themes in journals such as *Ethics and Education*, *International Journal of Multicultural Education*, and *Nordic Studies in Education*. He is currently involved in two projects: one on young newly arrived refugees and their hopes for the future and the other one on resilient youth, migration, and their transition to higher education.

**Christopher Martin** is Assistant Professor at the University of British Columbia. He is the author of *Education in a Post-Metaphysical World* (Bloomsbury Press, 2014), *R.S. Peters* (Bloomsbury Press, 2013; with Stefaan Cuypers), and *Questioning the Classroom* (Oxford University Press, 2016; with Dianne Gereluk, Bruce Maxwell, and Trevor Norris).

**Jan Masschelein** teaches philosophy of education and works at the Laboratory for Education and Society at the University of Leuven (Belgium). His principal interests are in educational theory and social philosophy, mapping and walking as critical research and education practices, and new global and European regimes of governing education. His research focuses explicitly on (re-)thinking the public role of schools and universities and the particularity of a pedagogical perspective. He coauthored (with Maarten Simons): *Globale Immunität. Ein kleine Kartographie des Europäischen Bildungsraum* (2005); *Jenseits der Exzellenz. Eine kleine Morphologie der Welt-Universität*. (2010) and *In defence of the school. A public*

issue. (2013, free downloadable: <http://ppw.kuleuven.be/ecs/les> ). They coedited *The Learning Society from the Perspective of Governmentality* (2007) and *Rancière, Public Education and the Taming of Democracy* (2011).

**Ralf Mayer** is Professor for general educational science at the University Kassel. He studied educational science, sociology, and theology at the University of Applied Sciences and the University of Technology in Darmstadt, worked in different fields of education and as Research Assistant at the MLU Halle-Wittenberg. His research focuses on problem- and process-oriented issues in the relationship of societal structures of power and the formation of educational concepts. This approach concerns questions of Bildung and subjectivity, mediality and normativity, and participation and performance in pedagogical, political, and economic contexts. Therefore, he pursues interdisciplinary approaches and engages in the dialogue of poststructuralistic and critical thinking, social philosophy, and psychoanalysis.

**Peter McLaren** is Distinguished Professor in Critical Studies, International Ambassador for Global Ethics and Social Justice, and Co-Director, The Paulo Freire Democratic Project, College of Educational Studies, Chapman University. An educator and activist, he is the author and editor of 50 books, and his various works have been translated into 30 languages.

**Carl Mika** is Associate Professor in Te Whiringa School of Educational Leadership and Policy in the Faculty of Education, University of Waikato, New Zealand. He is of the Tuhourangi and Ngati Whanaunga iwi. He has a background in law practice and legal theory, indigenous and Maori studies, and indigenous and Western philosophy. His current areas of research focus on indigenous and Western metaphysics, as well as philosophical research methods.

**Koichiro Misawa** is an Associate Professor in the Faculty of Education at Gunma University in Japan. His scholarly interest focuses on the 'social' nature of the mind, knowledge, and human beings, and its relation to issues in philosophy of education. His most recent publications include 'Education as the Cultivation of Second Nature: Two Senses of the Given' (*Educational Theory*, 63(1), 2013), 'Nature, Nurture, Second Nature: Broadening the Horizons of the Philosophy of Education' (*Educational Philosophy and Theory*, 46(5), 2014), 'Animality and Rationality in Human Beings: Towards Enriching Contemporary Educational Studies' (*Cosmos and History: The Journal of Natural and Social Philosophy*, 10(2), 2014), 'Rethinking the "Social" in Educational Research: On What Underlies Scheme-Content Dualism' (*Ethics and Education*, 11(3), 2016) and 'No Need to Worry: Multiple Profiles of Philosophy of Education in, and in Relation to, the World of Education and the World of Philosophy' (*Philosophical Inquiry in Education*, 23(2), 2016).

**Yasien Mohamed** is Senior Professor of Arabic & Islamic Philosophy, Department Foreign Languages at the University of the Western Cape (UWC), South Africa. He took his doctorate from the Johann Wolfgang Goethe University in Frankfurt,

Germany. He is a founding member of the International Society of Islamic Philosophy. He received the international annual prize for his book, *The Path to Virtue*, from the Islamic Republic of Iran. His publications include: *Fitrah: The Islamic Concept of Human Nature*, Taha-Publishers, London, 1996; *The Path to Virtue: The Ethical Philosophy of al-Raghib al-Isfahani: A translation*, with Critical Introduction, of *Kitab al-Dhari'ah ila makarim al-Shari'ah*, ISTAC, Kuala Lumpur, 2006; *Psychology of Personality: Islamic Perspectives*, ed. Y. Mohamed and A. Haque, CENGAGE publishers, Singapore, (edited), 2009.

**Ian Munday** is a Lecturer in Education and teaches on the Initial Teacher Education, MRES, and Doctoral School programs at the University of Stirling. His research activities and output testify to an engagement with philosophical issues in education, particularly those concerning teaching and learning. His publications have tended to focus on various approaches to performatives and performativities, and demonstrate the significance of these ideas for education. The themes explored in these terms include race, gender, construction of authority, power relationships, and the language of schooling. Here, philosophical ideas are treated in regards to their relevance to the details of educational practice. His recent research explores alternative understandings and practices of 'creativity' in education.

**Alis Oancea** is Professor of Philosophy of Education and Research Policy at the University of Oxford, where she is also Director of Research in the Department of Education. She is interested in the philosophical entanglements of different modes of research, of research policy, governance and assessment, of educational practice and teacher professionalism, and of higher education. In her writings, she has challenged divisive interpretations of research methodologies, research training, and of research governance and strategies and has critiqued conceptually underdeveloped metrics for research impact and quality, while arguing for a tighter relationship between philosophical, theoretical, and empirical inquiry in the social sciences and the humanities. Publications include *Assessing Quality in Applied and Practice-based Research* (Routledge, 2007), *Education for All* (Routledge, 2012), and *Introduction to Research Methods in Education* (Sage, 2014).

**Stefano Oliverio** After graduating in Philosophy and gaining a Ph.D. in Education, Stefano Oliverio is currently Senior Lecturer of educational foundations and intercultural education in the Department of Political Sciences at the University of Naples Federico II. From 2013 to 2017, he was the Vice President of ICPIC (International Council for Philosophical Inquiry with Children). His main areas of research concern the educational philosophy of American pragmatism; the educational implications of the epistemological debates within the Vienna Circle; Philosophy for Children; educational cosmopolitanism; and inclusive education. His publications include *Educating for Complex Thinking through Philosophical Inquiry. Models, Advances, and Proposals for the New Millennium* (2012), coedited with M. Santi, and 'Dewey's Democracy and Education a Century Later: A Source

of and a Resource for European Educational Theory and Practice' (symposium coedited with M. Striano and L. Waks in the *European Journal of Pragmatism and American Philosophy* 8/1, 2016).

**Carrie Paechter** is Professor and Director of the Nottingham Centre for Children, Young People and Families at Nottingham Trent University, UK. Her research interests focus mainly on gendered power/knowledge relations in the context of children's lives, especially in the family, the school, and the peer group. She is particularly interested in what it means to be a gendered, embodied child and how this is understood by children themselves. Other research foci include: LGBTQI+ parented families and schools; legitimacy within communities of practice; and informal online learning. Her books include: *Being Boys, Being Girls* (Open University Press, 2007) and the coedited collections *Girls and Education 3–16* (with Emma Renold and Carolyn Jackson, Open University Press, 2010) and *Pedagogical Responses to the Changing Position of Girls and Young Women* (with Rosalyn George and Angela McRobbie, Routledge, 2016). A forthcoming book about LGBTQ+ parented families and schools is coauthored by Anna Carlile.

**Wouter Pols** (1946) was trained as an elementary school teacher. He studied Educational Studies at the University of Leiden (The Netherlands). In 2016, he received his Ph.D. from the Free University (VU) of Amsterdam with his dissertation *In de wereld komen* (Coming into the World), a study of the educational meaning of upbringing, teaching, and teachership. He started his career in education as a teacher in special education. After that, he worked as teacher-educator at different schools and institutions of higher education. He is currently working part-time at the Research Centre Urban Talent of Rotterdam University of Applied Sciences. With Joop Berding he published *Schoolpedagogiek*, a textbook on upbringing and education for teachers in primary and secondary schools.

**Stefan Ramaekers** is Associate Professor in the Laboratory for Education and Society, KU Leuven. He studied Educational Sciences and Philosophy at KU Leuven (Belgium) and obtained a Ph.D. in Educational Sciences in the field of Philosophy of Education about forms of skepticism in educational theory and practices. Over the last years, his research has mainly focused on a critical investigation of the discourse of parenting and the parent–child relationship. Together with Prof. Judith Suissa of the Institute of Education (University College London) he published the book *The Claims of Parenting: Reasons, Responsibility, and Society* (Springer). Together with Dr. Naomi Hodgson (Liverpool Hope University) he is currently researching figurations of parenting in cultural representations, such as film. Their book *Philosophical Presentations of Raising Children: The Grammar of Upbringing* is forthcoming (Spring 2018; Palgrave).

**Rob Reich** is Professor of Political Science at Stanford University and, by courtesy, Professor of Philosophy and at the Stanford Graduate School of Education. He is the Director of the Center for Ethics in Society and Co-director of the Center on

Philanthropy and Civil Society (publisher of the Stanford Social Innovation Review, both at Stanford University). His current research focuses on the relationship between philanthropy, democracy, and justice. He published *Philanthropy in Democratic Societies* (edited with Chiara Cordelli and Lucy Bernholz) in fall 2016. He is the author of *Bridging Liberalism and Multiculturalism in American Education* (2002), coauthor of *Democracy at Risk: How Political Choices Undermine Citizen Participation* (2005), and coeditor of *Toward a Humanist Justice: The Political Philosophy of Susan Moller Okin* (2009), *Occupy the Future* (2013), and *Education, Justice, and Democracy* (2013). He is the recipient of multiple teaching awards, serves as a seminar moderator for the Aspen Institute, and is a board member of [GiveWell.org](http://GiveWell.org) and the magazine *Boston Review*.

**Roland Reichenbach** (born 1962) is Professor of Education at the University of Zürich, Switzerland, since 2013. Starting as a teacher, he was trained in Clinical Psychology, Pedagogical Psychology, and Philosophical Ethics at the University of Fribourg, Switzerland (1984–1989). He made his doctoral degree in 1993 with a study on professional morality of teachers (*‘Diskurs, Moral und Einigung’*, 1994) and wrote a habilitation in the field of democratic education and citizenship education (*‘Demokratisches Selbst und dilettantisches Subjekt’*, 2001). From 2002 to 2008 Reichenbach was Professor of Education at the University of Münster (Germany), and 2008 to 2012 at the University of Basel (Switzerland). His main interests are educational theory, pedagogical ethics, citizenship education, negotiation, and education. Latest book publication: *Ethik der Bildung und Erziehung* 2017 (Schöningh/utb).

**Michael J. Reiss** is Professor of Science Education at UCL Institute of Education, University College London, Visiting Professor at the Universities of Kiel, Leeds, and York and the Royal Veterinary College, Docent at the University of Helsinki, a Fellow of the Academy of Social Sciences, and a Priest in the Church of England. He has been a member of the Farm Animal Welfare Council/Committee (2004–2012), Director of Education at the Royal Society (2006–2008), a member of the GM Science Review Panel (2002–2004), Specialist Advisor to the House of Lords Select Committee on Animals in Scientific Procedures (2001–2002), and Chair of EuropaBio’s External Advisory Group on Ethics (2000–2001). Books of his include Reiss, M. J. & White, J. (2013) *An Aims-based Curriculum*, IOE Press; and Jones, L. & Reiss, M. J. (Eds) (2007) *Teaching about Scientific Origins: Taking Account of Creationism*, Peter Lang.

**Norbert Ricken** is Professor for Theory of Education and Educational Sciences at the Ruhr-University of Bochum, Germany. Main research areas: theory and philosophy of education; theory, history, and methodology of educational research (especially discourse analysis, conversational analysis, and ethnography); anthropology and theory of intersubjectivity, recognition, and subjectivation.

**Nadine Rose** is Professor for General Educational Science focusing Philosophy of Education in the Faculty of Pedagogy and Educational at the University of Bremen, Germany. Her focus of work is: theories of philosophy of education and theories of discourse, research on subjectivation and ‘Bildung’, research on migration, and qualitative methods.

**Klas Roth** is Professor in the Department of Education at Stockholm University, Sweden. He has published articles on Kant’s practical philosophy in journals such as *Educational Philosophy and Theory*, *Educational Theory*, *Ethics and Education*, *Ethics & Global Politics*, and *Journal of Aesthetic Education*. He has also published an edited book on *Kant and Education: Interpretations and Commentary*, together with Chris W. Surprenant. Currently, he is working on the moral and political philosophy of Immanuel Kant, his views on aesthetics and evil, and its implications for education.

**Jörg Ruhloff** was born at Königsberg (Ostpreußen) in 1940. He studied Pedagogy, Philosophy, Archeology at the Universities of Münster, Mainz, München, Dr. phil 1965. He was Research Assistant at the University of Nürnberg, and Full professor for *Systematische/Historische Pädagogik* at the Universities of Duisburg and Wuppertal till 2006 when he became Emeritus. He was awarded a Dr. h.c. at the Humboldt University of Berlin. He argues together with Wolfgang Fischer (1928–1998) a transcendental-sceptical version of Pedagogy. His publications include Paul Natorps Grundlegung der Pädagogik, 1966; Das ungelöste Normproblem der Pädagogik, 1979; Ed.: Renaissance-Humanismus. Zugänge zur Bildungstheorie der frühen Neuzeit, 1989; Problematising Critique in Pedagogy, in: *Journal of Philosophy of Education* 38 (2004), p. 379–383; Bildungsphilosophie. Wahrheitsfragen und kulturgeschichtliche Erläuterungen ihrer Anfänge, in: *Topologic* 17 (2015), p. 113–164. publication in honor of Jörg Ruhloff: Spielräume der Vernunft, Ed. K. Helmer, N. Meder, K.Meyer-Drawe, P. Vogel, 2000.

**Herner Saeverot** is Professor of Education at Western Norway University in Norway. His research interests include existential education, literature and education, national and international perspectives of educational research, and educational policy. He is the Editor-in-Chief of the journal *Nordic Studies in Education*.

**Naoko Saito** is Associate Professor at the Graduate School of Education, Kyoto University. Her area of research is American philosophy and pragmatism and their implications for education. She is the author of *The Gleam of Light: Moral Perfectionism and Education in Dewey and Emerson* (2005) and *America Tetsugaku no Yoake (The Dawning of American Philosophy)* (2018, Japanese), and coeditor (with Paul Standish) of *Education and the Kyoto School of Philosophy* (2012), *Stanley Cavell and the Education of Grownups* (2012), and *Stanley Cavell and Philosophy as Translation: The Truth is Translated* (2017).

**Olaf Sanders** (1967) is Professor of General Education in the Department of Humanities and Social Sciences at the Helmut-Schmidt-University/University of the Federal Armed Forces Hamburg, Germany. In the focus of the Professorship are especially theories of Bildung and education as well as their philosophical foundations. Olaf Sanders teaches and writes in a multidisciplinary manner in the overlapping fields of Philosophy of Education, Media, and Cultural Theory. He is the author of *Greatest Misses. Über Bildung, Deleuze, Film, neuere Medien etc.* (2015) and *Deleuzes Pädagogiken. Die Philosophie von Deleuze und Deleuze/Guattari nach 1975* (2017). Recently, he coedited several books on quality television series.

**Valerie Scatamburlo-D'Annibale** is an Associate Professor in the Department of Communication, Media and Film at the University of Windsor, Ontario, Canada. She is the author of two books – *Cold Breezes and Idiot Winds: Patriotic Correctness and the Post-9/11 Assault on Academe* (2011) and *Soldiers of Misfortune: The New Right's Culture War and the Politics of Political Correctness* (1998), the latter of which earned an American Educational Studies Association's Critic's Choice Award. She has published more than 30 book chapters and journal articles in venues including *Educational Philosophy and Theory*, *Cultural Studies/Critical Methodologies*, and the *International Journal of Progressive Education*.

**Sabrina Schenk** is a Researcher and Lecturer at the Department of Education at the Goethe-University of Frankfurt, Germany. In her Ph.D., she elaborated the educational-philosophical framework of Günther Buck's (1925–1983) 'Practical Pedagogy'. Her research interests lie in the field of educational philosophy, especially 'critical theory' and dialectics of education. Currently, her empirical research combines these issues on phenomena like 'Artivism' or 'Guerrilla communication'.

**Claudia Schumann** is Ph.D. student at Stockholm University, Sweden. Her research focuses on philosophy of education, philosophy of language, critical theory, and feminist philosophy. Recent publications include: 'Boundedness beyond Reification', in *Ethics & Global Politics* 5.4 (2012); 'The Self as Onwardness', in *Foro de Educación* 11.15 (2013); 'Bildung' in Schneidereit/Demuth: *Interexistenzialität und Unverfügbarkeit* (2014); with R. Adami: 'Towards a Critical Cosmopolitanism in Human Rights Learning' in Papastephanou et al. *Philosophy as Lived Experience* (2014); 'Which Love of Country?' in *Journal of Philosophy of Education* 50.2 (2016); 'Knowledge for a Common World? On the Place of Feminist Epistemology in Philosophy of Education' in *Educ. Sci.* 6.1 (2016); 'Wittgenstein and Philosophy of Education: A Feminist Re-Assessment' in *Encyclopedia of Educational Philosophy and Theory* (2016); 'Graphic Contaminations: Cosmopolitics of the "I" in *American Born Chinese* and *Persepolis*' in *Studier i Pædagogisk Filosofi* (2016).

**Amy Shuffelton** is Associate Professor of Cultural and Educational Policy Studies, Loyola University Chicago School of Education. Her current research focuses on questions of gender and political involvement. Her publications have appeared in *Educational Theory*, *Journal of Philosophy of Education*, *Studies in Philosophy and*

*Education*, and *Philosophy of Education Yearbook*. She is an Associate Editor of the journal *Educational Theory*.

**Alexander M. Sidorkin** is currently Dean, College of Education at the Sacramento State University in California. He also holds an appointment at the Institute of Education, National Research University Higher School of Economics. His scholarly interests include pedagogy of relation and economics of education.

**Stijn Sieckelinck** (1980, Belgium) is Senior Researcher at the Institute for Societal Resilience at Vrije Universiteit, Amsterdam, and Visiting Fellow at McGill University. He holds a Ph.D. in Social Educational Theory. His focus lies on social pedagogy, political philosophy, multiculturalism, and governance of youth. Research and consultancy interests lie in the broad field of education, governance, and professional improvement, but with a particular focus on radicalization, conflict resolution, and political education across an array of national and international contexts. After previous books on youth and ideals in ‘The best of youth. A philosophic-pedagogical perspective to youth and their ideal(ism)s’ (2009), ‘Ideals Adrift. A pedagogical view on radicalisation’ (2010), and ‘Unauthorized Authority. How citizens cope with the authority crisis’ (2013), he coedited a research report called ‘Formers & Families. Transitional Journeys in and out of Extremisms in the UK, Denmark, and the Netherlands’ (2015). His latest book is on the power of *re-radicalization* as a philosophy and strategy against extremism (October 2017).

**Maarten Simons** is Professor of Educational Policy and Theory at the Laboratory of Education and Society, KU Leuven. In his research, he studies the relation between education and society with a specific focus on the impact of policy instruments, new forms of power and governmentality and processes of Europeanization. He combines an interest for education theory development with a critical analysis of societal developments. He published several articles and books, including the edited handbook (with M. Olssen and M. Peters) *Re-Reading Education Policies*, a handbook studying the policy agenda of the twenty-first century (2009, Rotterdam, Sense Publishers); and the book *In Defence of the School: A Public Issue* (with J. Masschelein, 2013, Leuven, E-ducation, Culture & Society Publishers).

**Richard Smith** is Professor of Education at the University of Durham, UK, where he teaches courses in the philosophy of education and the philosophy of social science. For many years, he was the University’s Director of the Combined Degrees in Arts and Social Sciences. He was for 10 years Editor of the *Journal of Philosophy of Education* and was Founding Editor of the journal *Ethics and Education*. He recently served as Chair of the Philosophy of Education Society of GB. He was a member of the Education Panel (Panel 25) in the UK’s 2014 Research Excellence Framework. His most recent book is (with Paul Smeyers) *Understanding Education and Educational Research* (Cambridge University Press, 2015). His current research interests focus on virtue ethics, irony, and the epistemology of educational research, and he is attempting to write a book on the virtues of unknowing.

**Paul Standish** is Professor of Philosophy of Education at UCL Institute of Education. His work focuses especially on the nature of language and thought, covering the range of philosophy of education and exploring productive tensions between philosophical traditions. His publications include *Education After Postmodernism* (1998), *Education in an Age of Nihilism* (2000), and *The Therapy of Education: Philosophy, Happiness, and Personal Growth* (2006), coauthored with Nigel Blake, Paul Smeyers, and Richard Smith, as well as *Beyond the Self: Wittgenstein, Heidegger, and the Limits of Language* (1992). With Naoko Saito, he has edited *Stanley Cavell and Education of Grownups* (2012); *Education and the Kyoto School of Philosophy: The Pedagogy of Human Transformation* (2012), and *Stanley Cavell and Philosophy as Translation: The Truth is Translated* (2017). He is Chair of the Philosophy of Education Society of Great Britain.

**Hanno Su** is a philosopher of education at the University of Münster (Germany). His recent book *Auf der Seite der Erziehung* (2017) connects his ongoing interest in social philosophy, systems theory, and epistemology with questions of pedagogy as an academic discipline, social theory of education, and theories of Bildung and Erziehung. His current work in progress includes redescribing the relationship between practices of knowledge, education, and sustainability.

**Judith Suissa** is Professor of Philosophy of Education at UCL Institute of Education, London. Her research interests are in political and moral philosophy, with a focus on anarchist theory, questions of social justice, radical and libertarian educational traditions, utopian theory, the role of the state, and the parent–child relationship. Her publications include *Anarchism and Education: A Philosophical Perspective* (Routledge, 2006) and (with Stefan Ramaekers) *The Claims of Parenting: Reasons, Responsibility and Society* (Springer, 2012).

**Charlene Tan** (Ph.D. Philosophy) is an Associate Professor at the National Institute of Education, Nanyang Technological University, Singapore. A former high school teacher in Singapore, she has taught for close to two decades in a variety of educational settings. She has authored or coauthored seven books and over 120 refereed journal articles and book chapters. Among her publications are *Confucius* (Bloomsbury), *Philosophical Reflections for Educators* (Cengage), *Teaching without Indoctrination: Implications for Values Education* (Sense Publishers), and *Educational Policy Borrowing in China: Looking West or Looking East?* (Routledge). Her current teaching and research areas include Confucian philosophy and education, East-West comparative philosophy, and critical thinking.

**Ashley Taylor** is Assistant Professor of Educational Studies at Colgate University. She specializes in philosophy of education and disability studies/critical special education. She is especially interested in how civic participation is conceptualized in relation to and expressed by people labeled with disabilities and how civic education can better reflect the lived experiences of labeled individuals. More broadly, she writes about the intersections of race, gender, and disability in constructing

citizenship, inclusive pedagogies and practices that challenge ability privilege, and theories and frameworks of institutional inclusion and accessibility. Her recent work is forthcoming in *Educational Theory* and appears in *Hypatia*, *Disability Studies Quarterly*, and *Philosophy of Education*, as well as a number of edited book volumes in educational foundations, educational philosophy, and disability studies. She received her Ph.D. in Cultural Foundations of Education from Syracuse University.

**Barbara J. Thayer-Bacon** Ph.D. (Indiana University, Bloomington, IN), teaches graduate courses on philosophy and history of education, and cultural diversity at the University of Tennessee, Knoxville. Her primary research areas are: philosophy of education, pragmatism, feminist theory and pedagogy, and cultural studies in education. She is Program Coordinator for the Cultural Studies in Education program and Editor-in-Chief of the journal *Studies in Philosophy and Education*. She is the author of over 25 chapters in essay collections and over 70 journal articles, published in professional journals such as *The Journal of Thought*, *Educational Theory*, *Studies in Philosophy and Education*, *Inquiry*, *Educational Foundations*, and *Educational Studies*. She has presented over a hundred conference papers to various professional organizations. She has written six books and coedited one. Most recent: *Democracies Always in the Making: Historical and Current Philosophical Issues for Education* (Lanham: Rowman & Littlefield, 2013) and *Relational Ontologies* (New York: Peter Lang, 2017).

**John Tillson** is a Postdoctoral Teaching Fellow of philosophy of education in the Education Studies Department at Liverpool Hope University. He has a contract with Bloomsbury to produce a monograph based on his doctoral thesis, 'Children, Religion and the Ethics of Influence', which was completed at Dublin City University on a scholarship from the Irish Centre for Religious Education. His publications to date have addressed a cluster of closely connected questions about curriculum content, and due and undue influence in teaching, especially over pupils' religious, political, and ethical beliefs and attitudes. His research interests can be captured under the expression 'the ethics of influence'. Together with David Aldridge, he is coediting a special edition of *Educational Theory* on 'cheating education' through technological and neurological enhancements. He has also presented papers at academic proceedings around Europe, North America, and Australasia.

**Mary Tjiattas** has taught philosophy in the Department of Philosophy and the School of Education at the University of the Witwatersrand, Johannesburg. She now teaches applied ethics at North Carolina State University. Her research interests are in social and political philosophy, moral psychology, and philosophy of social science and psychoanalysis. Her most recent research focuses on global justice and its educational implications.

**Bruno Vanobbergen** (1972) got his Ph.D. in Educational Sciences at Ghent University (Belgium) in 2003 with a research on the commodification of childhood. He published several articles in international journals and books on (the history of) childhood and children's rights. He was Professor at the Rijksuniversiteit Groningen (The Netherlands) and Visiting Scholar at Rutgers University, Camden (USA). He is a member of the editorial board of *Paedagogica Historica* and *Pedagogiek*. In June 2009, the Flemish Parliament appointed him as the Flemish Children's Rights Commissioner. As a Commissioner, he is responsible for monitoring children's rights in Flanders by mediating, investigating complaints, and giving policy recommendations. He is a member of the European Network of Ombudspersons for Children (ENOC). Bruno Vanobbergen is also Professor of childhood studies at Ghent University.

**Susan Verducci** is a Professor of Humanities and Creative Arts at San José State University, where she also coordinates an undergraduate teacher preparation program. Her fields of interest include educational philosophy, art education, teacher preparation, and philanthropy. She coedited *Narratives in the Ethics of Education* (2011), *Democracy, Education and the Moral Life* (2009), and *Taking Philanthropy Seriously: Beyond Noble Intentions to Responsible Giving* (2006). Her current writings focus on the ways that engaging in the literary, visual, and performing arts provide opportunities to cultivate open-mindedness.

**Katharina Völker** After studying history and philosophy of religion in Frankfurt and Leeds, Katharina Völker received her Ph.D. for research on Quran exegesis, from the University of Otago (New Zealand), in 2012. Her book *Quran and Reform* was published by Peter Lang in 2017. Dr Völker has contributed to international conferences on Islam and religious studies at the universities of Bonn, Griffith, Otago, Victoria, Waikato, and Yale. Currently, she receives a grant from the German Federal Ministry of Education and Research to analyze Islamic theologies at German state universities. As part of the interdisciplinary research program 'Religion and Rationality – Faith and Reason in the Life and Thought of Muslims, Christians and Jews in the Context of Plural Societies' her 4-year habilitation project is located at the 'Centre for Islamic Theology', Eberhard-Karls-University of Tübingen. She lives with her husband and three children in Frankfurt am Main.

**Yusef Waghid** is Distinguished Professor of Philosophy of Education at Stellenbosch University in South Africa. His latest books that accentuate his research foci include: *African Philosophy of Education Reconsidered: On Being Human* (London: Routledge, 2014); *Pedagogy Out of Bounds: Untamed Variations of Democratic Education* (Rotterdam/Boston/Taipei: Sense Publishers, 2014); (coauthor with Davids, N.) *Philosophy of Education as Action: Implications for Teacher Education* (Malham, MA.: Rowman & Littlefield, 2017); (coeditor with Davies, I., Peck, C., Sant, E., Kiwan, D. & Paterson, A.) *International Handbook of Citizenship Education* (New York: Palgrave-MacMillan, 2017); and (coeditor with Davids, N.)

*African Democratic Citizenship Education Revisited* (New York: Palgrave-MacMillan, 2018). He is the recipient of the Education Research in Africa Award: Outstanding Mentor of Education Researchers from the Association for the Development of Education in Africa.

**Gabriele Weiss** is Professor in Educational Science at the University of Siegen, Department of Education and Psychology, Faculty II: Education Architecture Arts. Previously she held positions at the University of Vienna, the University of Potsdam and the Humboldt University Berlin. Research interests: educational theory and philosophy, aesthetic education, cultural education and its methods, disciplinary identity of educational science, game and pedagogy, gamification, and museum education. Publications: 'Kulturelle Bildung – ein Containerbegriff?' In: G. Weiß (Hrsg.): *Kulturelle Bildung – Bildende Kultur. Schnittmengen von Bildung, Architektur und Kunst*. Bielefeld: transcript 2017. 'Spiel' In: G. Weiß & J. Zirfas (Hrsg.): *Handbuch der Bildungs- und Erziehungsphilosophie*. Springer 2018. Academic functions: since 2016 Prorector for lifelong learning and diversity.

**Quentin Wheeler-Bell** is an Assistant Professor at Indiana University. His research interests are critical theory, critical pedagogy, and radical conceptions of democratic education. His work has appeared in *Education Policy*, *Journal of Curriculum Studies*, *Philosophical Inquiry in Education*, and *Educational Theory*.

**Emma Williams** is Assistant Professor in the Centre for Education Studies at the University of Warwick. Her research interests are in phenomenological, post-structuralist, and ordinary language philosophical approaches to education. She has written especially on the theme of thinking in education and is interested in exploring the relation of thinking and language, the nature of the thinking subject, and the limits of rationalistic thinking within educational contexts. She is also interested in the intersections of philosophy and literature. Her work has been published in leading educational journals such as *Journal of Philosophy of Education*, as well as in edited collections. Her first monograph *The Ways We Think* is published by Wiley-Blackwell.

**Kevin Williams** is Senior Research Fellow at the Centre for Evaluation, Quality and Inspection, Dublin City University, and a former President of the Educational Studies Association of Ireland. As well as the volume *Education and the Voice of Michael Oakeshott*, he is author of many essays on Oakeshott's work. His other books include *Assessment: A Discussion Paper*; *Faith and the Nation: Religion, Culture, Schooling in Ireland*; and *Religion and Citizenship Education in Europe*. As well as publishing academic articles on the relationship between language and culture and the place of languages in the school curriculum, he regularly features in the media on these issues. He is currently an editorial board member of the *Journal of Philosophy of Education*.

**Terri S. Wilson** is an Assistant Professor in the School of Education at the University of Colorado Boulder. Her research focuses on the philosophical foundations of education policy, including issues raised by school choice, marketization, and parent engagement. Her research explores how to balance the interests of families in choosing distinctive schools – especially ones that affirm ethnic, linguistic, or cultural identities – against arguments for a common, integrated school system. A new project focuses on the values and claims parents employ in opting children out of standardized assessments, and how ‘opt out’ efforts raise longstanding philosophical questions about the proper scope of state and family authority over the provision of education.

**Jeannette Windheuser** (Diploma in educational science) is a Ph.D. student, research and teaching assistant at the Institute of Education Sciences, University of Wuppertal (Germany). Currently, she leads the research and teaching project ‘Sexual Education for Teacher Education’. Her Ph.D. thesis about gender and residential care connects educational and feminist theory and develops a deconstructive as well as difference feminist perspective on methodology. Her selected publications include: *Die symbolische und generationale Ordnung der sexuellen Gewalt in der Missbrauchsdebatte*. In: Budde, J./ Thon, C./ Walgenbach, K. (ed.): *Männlichkeiten. Geschlechterkonstruktionen in pädagogischen Institutionen*, (pp. 201–219). Opladen, Budrich 2014; *Die Kategorie Geschlecht in der stationären Jugendhilfe*. In: Kleinau, E./ Rendtorff, B. (ed.): *Differenz, Diversität und Heterogenität in erziehungswissenschaftlichen Diskursen*, (pp.139–153). Opladen, Budrich, 2013; *Ästhetische Bildung und sinnliche Wahrnehmung*. In: Kampshoff, M./ Wiepcke, C. (ed.): *Handbuch Geschlechterforschung und Fachdidaktik*, (pp.401–414). Wiesbaden, VS, 2012.

**Lynne Wolbert** is a researcher in philosophy of education at the department of Educational and Family Studies, Vrije Universiteit Amsterdam. She hopes to defend her dissertation about human flourishing as an ideal aim of education in 2018. Her interest in the concepts of risk/control/luck has sprung from studying literature on human flourishing, in which the ‘luck-side’ is often less well documented than the ‘effort-side’. She is currently writing a book (in Dutch) on parenthood and the inevitability of risk-taking, using both philosophy and her own experiences as a mother.

**SunInn Yun** is Assistant Professor of English Language Education at Incheon National University, South Korea. She has published articles on the aims of education and freedom in reading of Martin Heidegger and Jean-Luc Nancy. Her work has appeared in journals such as *Journal of Philosophy of Education*, *Ethics and Education*, and *The Yearbook for Philosophy of Education*. Yun is currently working on a range of educational ideas such as the theories and practices of museum education, the internationalization of higher education, comparative educational studies in relation to phenomenology, existentialism, and hermeneutics. She also translates a number of books in philosophy of education and its relevant studies into Korean.

# Philosophy and Education: A Certain Kind of Wisdom

**Paul Smeyers**

This edited collection brings together reflections on the work of well-known authors, various schools of thought, enduring educational debates, and philosophical discussion of new developments within the area of education and child-rearing. It offers a wide variety of possible ways to bring together different philosophical stances and ideas about education and child-rearing; what this field of scholarship has been, what it is now, and how it could or should develop. It is tempting to fall into the trap of legislating what this subdiscipline ought to tackle, yet such attempts sophisticated as they have been, have not proven to be successful in the past.<sup>1</sup> Philosophers have always transgressed the boundaries of their discipline set by their predecessors, and education and child-rearing have developed in unforeseen ways necessitating further work on the meanings of these terms and what is at stake in our

---

<sup>1</sup> Starting from seeing education as a field of study that involves a variety of approaches, in the *Blackwell Guide* (Blake, N., Smeyers, P., Smith, R., & Standish, P. (Eds.). (2003). *The Blackwell guide to the philosophy of education*. Oxford) it was for example argued that philosophical analysis may still concern itself with problems rooted in the use of language in educational discourse. Though this task is not anymore that of a conceptual underlaborer, analytic techniques remain useful. Furthermore, philosophy of education should still address the assumptions and values embedded in other disciplinary approaches in the study of education, whether these are explicitly promoted or tacitly assumed in policy and practice. Evidently, this is now a debate between philosophy and other disciplines on equal terms. Finally, it is clear that philosophy of education has to explore what education might be or might become. It can revisit but also problematize its canonical questions about such matters as the aims of education, the nature of knowledge and the point of particular curriculum subjects, about human nature and human practices. Thus, it might analyze for instance what exactly is understood by quality (and its indicators) and what the hidden normative presuppositions are of the present-day logic of neo-liberalism. Overall, it seems to be accepted that it requires not narrow concentration but a flexible and imaginative drawing from different aspects of the 'parent' discipline in relation to specific but typically highly complex problems of practice.

P. Smeyers (✉)

[https://doi.org/10.1007/978-3-319-72761-5\\_1](https://doi.org/10.1007/978-3-319-72761-5_1)

understanding of them. Many issues have been discussed: for example, in what sense is philosophy different from literature, and if there is a difference then what is to count as literature? Is education a kind of political action and, if so what is to be understood by 'political'?

## Observations and Reminders

There are good reasons for taking the view that education and child-rearing are practices, and so are their philosophical counterpart. Philosophy seems to supply the central arguments, thus exposing the embeddedness of any one point of view in more far-reaching sets of assumptions. Thus, it can enable us to better understand what might be at stake in any particular viewpoint and to come to a conclusion for which there is discernible, appropriate warrant, albeit one that is always exposed to critique. But the nature and force of such arguments, bear witness themselves of course, to philosophical stances. It goes without saying that in these stances epistemological, anthropological, ethical, metaphysical, religious, and even aesthetical elements are interwoven in various ways, together with societal conditions. Similarly, there is a variety of conceptions of education and child-rearing that inspire practitioners and theoreticians alike. No final word on these can be offered to settle the debate forever, for the simple reason that such practices change, affected for example by different manners of teaching or new types of families such as single parent families, so-called blended families, and gay and lesbian parent families.

These practices and their philosophical implications and underpinnings bring about changes in society at large, as do a huge range of social and material circumstances such as drones (and their delivery of medicine and other goods) and the shopping opportunities offered by the web. Naturally benefits and drawbacks go hand in hand. Smart phones have many blessings, but lead as well in a number of cases to addiction and the need for 'digital detox'. Domotica or varieties of home automation change our domestic lives and burglars adapt the ways they operate accordingly; live images (CCTV from helicopters or people's phones) are now broadcasted to our homes, rendering the future of newspapers redundant; the web has affected the way we satisfy our hunger for news but the overload generated may also correlate with depression, feelings of loneliness, and burn-out. The quick fix does not necessarily make older forms such as newspapers redundant, but has certainly altered our news gathering to a large extent. Similarly, the advent of computers and social media has changed education and child-rearing: for example the use of chalk is for some a practice they vaguely remember while for many others it is more of a museum item and the wide availability of explicit pictures on the web forces parents to rethink their role in talking with their children about sex and relationships. Moreover, things do not only change, they change faster as well this gave rise to the popularity of yoga, to the concept of positive slowness, and of 'slow science'. The influence of all these changes on practices of education and child-rearing can therefore hardly be underestimated. Combined with different conceptions of the

task of philosophy, this has generated a vast array of writing in recent years where varying content is discussed from diverse positions.

Looking for crystalline purity in the analysis of these changes is a sure recipe for disappointment. What we are looking for, some would say, are ‘houses of cards’. To change the metaphor, to try to go beyond the multifariousness of language and meaning leaves us with nothing more than ‘an engine idling’.

We want to establish an order in our knowledge of the use of language; an order with a particular end in view; one out of many possible orders; not *the* order. To this end we shall constantly be giving prominence to distinctions which our ordinary forms of language easily make us overlook.<sup>2</sup>

For Wittgenstein, the work of the philosopher is characterized by “assembling reminders for a particular purpose” (ibid., § 127). Surely, philosophy is about arguments, but what is an argument? It is about meaning, knowledge, values, being human, the good, the beautiful, etc., but none of these can easily be delineated without building on other insights. That is how everything hangs together, has meaning for us: a particular order is made explicit, and though this is for me and for some others the order that appeals most, it should be realized that this is only one out of the many possible orders that can be argued for.<sup>3</sup>

Child-rearing and education too will not fare well with a ‘clear’ – in the sense of ‘crystalline’ – picture. It is often forgotten but true nevertheless, that there are many roads to Rome, and not everyone wants to go to Rome anyway. There may be roads which should be avoided, some may be better, others may pose problems, yet such cases always need to be made with attention to particulars, warranting detailed argumentative content and structure. Educators are pressed to take action to ‘do’ certain things; they want to create certain opportunities; they are often unsure though not only about the ‘how to’; they care deeply for those they are entrusted with and desperately try to avoid mistakes. They too often want to believe that there is only *one* way (or one that is the very best). The emotional disturbance this situation creates and the dilemmas to which one may be exposed make it understandable that the justification they offer for their choices may be worded more strongly than the nature of these matters allows. The illusion of absolute control looms at the horizon, even if one realizes that it is neither possible nor desirable. After all one feels responsible; at the same time, one can neither anticipate all the dangers and risks nor the opportunities involved in leading a human life.

Turning to reflection helps, but it cannot do away with the constraints and tensions in which one finds oneself. Surely, there is joy in bringing things together in making sense of them, but there always remains pain in the realization of what has been left out, and yet still we need to act. This points to the need to be modest about what can be achieved through philosophical reflection, in any particular case, both for the individual person, and also for society at large. Addressing, for example,

<sup>2</sup>Wittgenstein, L. (1953). *Philosophical Investigations/Philosophische Untersuchungen* (G.E.M. Anscombe, Trans.). Oxford: Basil Blackwell, I, §132.

<sup>3</sup>An interpretation surfaces here of the famous dictum that philosophy too is its own time comprehended in thoughts.

the surveillance society and its implications for privacy issues and the well-being of citizens it should be realized that it is one thing to make this explicit, yet another to turn the clock back or to deal with the problem appropriately. This is not to say that there is no place for such a debate, but it is quite another thing to expect from foregrounding what is involved that things will change accordingly and rapidly; however, it goes without saying that such reflection may have the capacity to inspire. In sum, there may not be final answers<sup>4</sup> but there certainly are answers worth looking at, in particular when these offer balanced insights, critically appraised, not overstepping the boundaries of what may be achieved yet not avoiding responsibility for what is argued for, possibly radical yet not one-sided ... aspiring to offer a kind of wisdom.<sup>5</sup>

## Avoiding One-Sidedness

The temptation to (wilfully) neglect the above reminders can easily be observed in work in the area of philosophy and education. It is not impossible but it is demanding, not to overstate one's position. After so much hard work, it is understandable if one has an eye only for what one was impressed by and has focused on, or blows things out of proportion, forgetting the need for balance and thus preaching rather than arguing, and striving to settle things for once and all. Yet the tension between achieving a much-needed sense of order and other possible orders cannot be relinquished without paying a price: either to exclude other valuable viewpoints and/or to stop what is nevertheless in motion. It has not gone unnoticed that certain positions focus almost exclusively on a single dimension, for example, on what to be

---

<sup>4</sup>Incidentally, one thing that impressed me when reading and studying thoroughly several times the more than 700,000 words of this collection is the fact that many over-all positions (for example, the Kantian, the Heideggerian) when criticized from a different stance are able to digest (incorporate even refute) such criticism. I mean of course not that all stances come down to the same insights, but that more often than not philosophical stances have aspects criticized for being neglected but which are unpacked when looked at and studied more closely. What then results is a richer, more sophisticated, and nuanced take on reality of that particular stance.

<sup>5</sup>For a more detailed discussion, I would like to refer to my earlier work in many cases coauthored: Smeyers, P. (1998). Assembling reminders for educational research. Wittgenstein on philosophy. *Educational Theory*, 48, 287–308; Blake, N., Smeyers, P., Smith, R., & Standish, P. *Thinking again: Education after postmodernism* (1998, Bergin & Garvey), *Education in an age of nihilism* (2000, Falmer Press), and *The therapy of education* (2007, Palgrave Macmillan); Smeyers, P. (2006). 'What it makes sense to say'. Education, philosophy and Peter Winch on social science. *Journal of Philosophy of Education*, 40, 463–485; Smeyers, P. (2006). What philosophy can and cannot do for education. *Studies in Philosophy and Education*, 25, 1–18; Smeyers, P., & Burbules N., (2006). Education as initiation into practices. *Educational Theory*, 56, 439–449; Peters, M., Burbules, N., & Smeyers, P. (2008). *Showing and doing: Wittgenstein as a pedagogical philosopher* (2008, Paradigm Publishers); Smeyers, P., & Smith, R. *Understanding education and educational research*. (2014, Cambridge University Press); Fendler, L., & Smeyers, P. (2015). Focusing on presentation instead of representation. Perspectives on representational and non-representational language-games for educational history and theory. *Paedagogica Historica*, 51, 691–701.

done, or on the epistemological or the ethical, paying lip-service or not even that to the importance of other dimensions, the aesthetical, the religious, the metaphysical. This can work for the sake of the argument when focusing on a particular problem, but this can never be truthful to the nature of what is involved in something so complex as child-rearing and education. Resulting in dangerous simplification it carries moreover the danger of making philosophical discussions superfluous (or even worse, in German *Spielerei*) a game for insiders familiar with the jargon. This is far away from the serious balanced reflection which exercises a kind of compulsion, which changes the reflective agent, and possibly passes on a kind of practical wisdom. Often of course this involves joining with others in dialogue where positions are critically yet respectfully scrutinized – reminiscent of the famous saying that a philosopher who does not take part in discussions is like a boxer who never goes into the ring. Conferences among other meetings should provide such opportunities, and though there may be debate about the particular ring that should be looked for, here as elsewhere it seems important to avoid one-sidedness.<sup>6</sup>

As society becomes more and more complex, there is hardly a place left for all-encompassing simple solutions. It is dangerous as well to sacrifice, particularly in the area of education, what has been cherished as worthwhile in the past to something that is new or different just for the sake of it. It is neither the case that everything should be left as it was, nor that it should necessarily be changed instead, over and over again one has to engage in a debate that identifies the merits and shortcomings of a curriculum, a pedagogy, a way to raise one's children. Educators often underestimate the importance of their actions and beliefs on the life of their children and how their identity is shaped by them. And theoreticians may be tempted to deceive themselves, bracket what is nevertheless passed on under the veil of one or other concept of empowerment or child-centeredness. What is passed on in content and manner remains in my opinion overwhelming and vast. Being aware of this may help but does not obviate it. Incidentally, theoretical reflection itself is also indebted to what has been argued for by our predecessors; here too the temptation should be resisted to present one's ideas and reflections as new, forgetting to acknowledge, and to pay tribute, to the relevance and insights of the legacy of a particular philosopher or a particular philosophical stance.

Should education be dealt with through the lens of power, should it be about empowering, about equality, or about passing on what is held worthwhile for the next generation, and should the latter always be seen as containing elements of restorative tendencies, as exploitative, or as gentle paternalism? Should we instead look to the arts for inspiration or start from a religious position? I am not sure, I cannot be certain without invoking one or other all-embracing taken-for-granted viewpoint, in danger of leaving out what is also valid, interesting, and necessary to do justice to the many elements at stake. Does this beg the question for the viewpoint

---

<sup>6</sup>Conferences are essential not only for those who start their career, to hear from colleagues about the intricacies of the position argued for, raising elements that need to be taken into account or possibly have to be weighed differently. Regrettably, in many cases conferences do not surpass the level of networking or even worse are only seen as opportunities to present one's own paper.

that any practice has a life of its own (or is there too much circularity in this argument?), and further that one can never step into the same river twice, that meaning (and human life) is forever evolving in unforeseen ways and cannot be stopped?<sup>7</sup> Is this, i.e., this starting point, more than a descriptive claim? Surely, once this is seen and interpreted as a direction into on the one hand further complexity beneficial to mankind or on the other as a step on the road to decline, obviously a normative stance is at work. It could be argued (and has been by some) that the latter is unavoidable, yet it remains in my opinion questionable whether this implies that such description is impossible. The medium of philosophy is language, and language is used in manifold ways. Notwithstanding the importance of the context, we inherited this language and thus in this sense words have particular meanings. These have to be taken into account in future usage in order for us to make sense, yet the usage itself cannot be legislated. Is this more than a description, an observation of the shifts of meaning? And is it not the case that carefully looking at what is on offer in the world, surprises us, makes us wonder, as least as much as imaginative creative accounts of novels and other works of art can do? The order one has imposed on ‘the world’ may give way to what one is impressed by, created by others who have ‘found’ meaning, and may inspire us to revise our concepts, justifications, and stances, in other words how we and I deal responsibly with just what we are presented with.

\* \* \*

With the above in mind, the *International Handbook of Philosophy of Education* offers in four sections work of more than 100 hundred authors and coauthors from more than 20 countries. The team of nine contributing editors and I have worked intensely for more than 3 years. After an initial lengthy discussion<sup>8</sup> about the ‘what’ and ‘how’, topics were identified and authors we wanted to invite were listed.<sup>9</sup> Though clearly no project of this kind can pretend to be exhaustive, the present selection aspires nevertheless to have chosen what is relevant and needed for students and scholars in philosophy and education nowadays given the state of art of the field.<sup>10</sup> Authors were first asked to write an abstract which was followed by

---

<sup>7</sup>In some sense a Marxist thesis.

<sup>8</sup>All contributing editors were involved in the initial discussions; moreover, input was also received from Doret De Ruyter and Stefan Ramaekers.

<sup>9</sup>The gender and international dimension was explicitly observed in this selection; furthermore, it was felt important that besides well-known scholars able junior researchers would also be included.

<sup>10</sup>One of the constraints was of course the page limit set by the publisher. Although Springer proved to be flexible about this, something around 1200 pages was kept in mind. Through the whole process, from the initial lengthy discussion to the final print, the professionalism of Springer’s staff and in particular of Annemarie Keur was highly appreciated.

comments from the editors; similarly, draft versions<sup>11</sup> were dealt with.<sup>12</sup> The result is four sections each preceded by an introduction identifying the over-all approach. Nuraan Davids took the lead for section one, *Voices from the Present and the Past* (36 chapters); Christiane Thompson and Joris Vlieghe oversaw section two, *Schools of Thought* (14 chapters); Ann Chinnery, Naomi Hodgson, and Viktor Johansson dealt with section 3, *Revisiting Enduring Debates* (25 chapters); Kai Horsthemke, Dirk Willem Postma, and Claudia Ruitenberg handled section 4, *New Areas and Developments* (17 chapters). The sections are followed by two more general contributions, respectively, on philosophy of education and political literacy. The book has 95 chapters in total. Notwithstanding the struggle to survive in many university contexts and research settings, there is as yet no shortage of philosophical reflection in the area of education and child-rearing. Time to count our blessings.

---

<sup>11</sup> For each section, a particular maximum number of words was communicated (respectively 5000 for section 1; 9000 for section 2; 7000 for section 3; and 6000 for section 4). The quality of the submitted material was in a number of cases so good that though the limit was exceeded, nevertheless, the decision was made to accept it.

<sup>12</sup> Though authors could to some extent use parts of their previous work, nearly all chapters turned out to be 'new' and 'original'. The serious critical scrutiny of abstracts, draft, and final versions of the submitted material led in a limited number of cases to the difficult decision not to include what was submitted.

**Section I**  
**Voices from the Present and the Past**  
Contributing Editor:  
Nuraan Davids

# Introduction: Section 1 – Voices from the Present and the Past

Nuraan Davids

In our pursuits to find and attach meaning to the world around us, philosophers of education often refer to or build on a particular position of a philosopher or philosopher of education. As such, we recognise that how we understand a particular encounter or concept is always open to another interpretation and another way of constructing meaning. In opening a platform for the building on past voices, and offering new and re-considered voices, this section consists of 36 original chapters in which the author(s) describe the relevance of the position of the philosopher (of education) to current important questions in the theory or practice of education. To this end, each chapter describes (aspects of) the theory of the philosopher or philosopher of education, and relates it to a particular question, problem or theory, so that what is constructed and contributed addresses a particular debate. The vast volume of theorists, theories, dilemmas and controversies addressed in the 36 chapters offers some insight into the scope and potential contribution of philosophy in relation to education, and its highly complex contexts and contestations.

This section recognises the importance of a philosophical lens when analysing not only educational theory, pedagogy and policy, but is equally concerned with particular ways of being, thinking and acting, which either emanates from or gives shapes to particular constructions of philosophy of education. In this regard, the various chapters reflect some of the major philosophies of education – both from the past and the present – with the intention of bringing together a cross section of ideas, debates and renewed considerations. This cross section of ideas is made evident not only in the wide range of philosophers of education, educationists, critical and literary theorists, but also in the wonderfully diverse range of authors, who have

e-mail: [nur@sun.ac.za](mailto:nur@sun.ac.za)

contributed to this section. Thanks to an extensive and insightful array of chapters, this section reflects a depth of critical engagement with key philosophical and educational contributions in relation to contemporary debates. Subsequently, the aim of this section is not to give an overview of the position of the philosopher (of education), but to embed the position in the educational question(s), problem(s) or issue(s) addressed and to provide arguments (by a critical reflection on the merits of the position) for its value and usefulness in the present debate in philosophy of education and/or current educational questions or issues.

In the early stages of compiling this *Handbook*, two key aspects were taken into consideration. On the one hand, it was determined that the section needed to do justice to seminal philosophers ('voices from the past'), whose work continues to hold sway in increasingly fluid societies, communities and educational spaces. In this regard, the section includes reflections on: why Plato and Aristotle's main distinctions and questions on education – for example, reflections surrounding the relevance of ignorance, the role of negativity within education, or the meaning of learning in knowledge acquisition – remain relevant within the contemporary discourse of educational philosophy. Regarded as one of the most important figures in educational theory, attention is given to Jean-Jacques Rousseau's influence on modern philosophy through exploring his fundamental shift to individual education by discussing the problems of power in educational relationships, paternalism and individualisation. In turn, attention is given to Friedrich Nietzsche's argument that inequalities of talent and achievement may improve the well-being of the highest-achieving and lowest-achieving, and all students in between; why the 'father of existentialism', Søren Kierkegaard's pedagogical principles remain highly relevant to modern pedagogy; as well as Immanuel Kant's conceptions of individuals as efficacious, autonomous and creative beings, and why moral education is an open-ended and never-ending process.

The section contains four chapters that might be classified as being particular to a religious tradition. Of course, there are a number of other chapters that focus on theorists or philosophers, who are associated with specific religious discourses – for example, Emmanuel Levinas and Martin Buber are known for their work in Jewish philosophy – the section, however, also wish to show some cognisance of other influential philosophies of education. In this regard, the chapter on Confucius examines the problem of indoctrination in Confucian education, and why a Confucian conception of reflective learning aims to enhance rather than handicap the learner's capacity to formulate and substantiate one's beliefs, evaluate available options and exercise autonomous agency in life. Of the three chapters which focus on philosophy of Islamic education, two focus on what is commonly referred to as the 'Islamisation of knowledge' project. While one focuses on the contribution of Isma'il Rāji al-Fārūqī's 'Islamisation of knowledge' project in relation to both the Islamic intellectual and social tradition, and plural epistemological demands of the modern world, the other offers a critique of Fazlur Rahman's Islamisation approach, and considers the implications for contemporary debates in philosophy of education. The third chapter explores the philosophical thought of Nasr Hamid Abu Zayd

and its significance for reforming the tasks and processes of learning about Islam, learning from Islam and teaching about Islam, which according to the author, opens the door for respectful inter-religious and inter-denominational learning.

In acknowledging the profound significance of pragmatism on contemporary educational debates, the chapter on John Dewey looks beyond superficially constructed ideas of problem-solving and instrumentality and explores an alternative sense of useful knowledge. R.S. Peters' argument for educational inclusion can be applied in order to develop a more nuanced account of meaningful access for all students. And, while the chapter on Charles Taylor focuses on how he redescribes the making of the epistemic self in view of the interplay of its distancing from the world and its turning inward, and how this leads to the paradox of a scientific view from nowhere and a subjective certainty, the chapter on Emmanuel Levinas shows how his account of heteronomous subjectivity contributes to ongoing debates on autonomy as an educational aim.

In turn, Israel Scheffler's broad conception of education rooted in his wider philosophical framework provides a fruitful conceptual framework for opposing the current neo-liberalist tendency towards reducing the value of education to that of economic discourse. Martha Nussbaum's interpretation of fragility for educational theory offers an argument against the unbridled pursuit of control in education; Judith Butler's conceptions of subject, subjection and subjectivation offer particular perspectives on the meaning of social norms and the dependency of the human subject on others, and hence, pedagogy and the philosophy of education; and Nel Noddings provides a distinctively ethical voice in relation to school practices, which align not only with cultivating the interests and aspirations of individual students but also with the moral and civic purposes of education.

In terms of aesthetic theories of education, Klaus Mollenhauer's voice continues to enrich the debate concerning current educational-philosophical discourse, through questions of aesthetic education, aesthetic experience as a threshold experience, and pedagogy as a cultural science. In turn, Maxine Greene's conception of the social imagination offers a valuable critique of education and schooling in the USA, and provides an antidote to the negative forces of scientism, technicism and instrumental rationality that have dominated educational thought and practice for several decades.

Similarly, the section takes into account issues of language, meaning-making, dialogic education and conversation, as encountered, respectively in Ludwig Wittgenstein's repudiation of the 'picture' of science and his welcoming of a broader conception of knowledge, which remains of great value to educational researchers and social scientists of all kinds; Martin Heidegger, who helps us to see the problems in the basic metaphysical assumptions (consciously or unconsciously) rooted in educational theories and practices; Stanley Cavell, whose concern is not with how we learn to read books, or to speak, but with how our reception of words is ineluctably tied to the political, and to our responsibility for words in a community of speakers; Martin Buber, who does not separate religious from cultural or even aesthetic traditions, and assists educators and students in understanding the

dialogue between traditions in a very interconnected world; and Michael Oakeshott's contention that the benefit of conversation in education relates to the element of intellectual versatility that it both demands and fosters.

In addition to the aforementioned chapters, the section has taken meticulous account of the influence of contemporary political philosophers on educational theory and practice. In this regard, readers are exposed to ideas and debates which include: Hannah Arendt's idea of the school as an 'in-between space', that is, an institution between the private domain of the home and the public domain of the world, in which teachers can introduce children into the world, so that they might acquire experience with the actions by which humans build up their world. Attention is given to the implications of John Rawls' model of a just society on contemporary issues in education policy, such as what justifies the public provision of education, what constitutes a fair distribution of educational opportunity; Jacques Rancière's contention that it is not that the authority of knowledge is given over to students at the expense of the teacher's authority, but rather that both student and master meet in an alternative relation of authority; the potential contribution of Chantal Mouffe's work on the agonistic contestation of any hegemonic order to citizenship, political education and schooling; and an exploration of Giorgio Agamben's three methodological points – suspension, archaeology of the signature, and study – which are important for rethinking educational philosophy.

Interspersed in this section are chapters on key literary and critical theorists, which include: how Jacques Derrida's conception of an 'unconditional university' helps us to understand the importance and necessity of our philosophical and humanities heritage, in order to be aware of, and respond to, the most urgent questions and dilemmas posed by the current socio-political context of education; Paulo Freire's decolonisation project, which is intent on dismantling anti-democratic, anti-dialogic and authoritarian schooling by initiating an entirely new project of liberation education within agricultural campesino communities and beyond; as well as Michel Foucault's philosophy of education, which can be identified by the priority it gives to the concern or curiosity for education, in that it expresses a relation of care and concern, not primarily a relation of knowledge and judgement. Attention is also given to Amy Gutmann's consideration of educational policy issues, as a way to demonstrate how non-repression and non-discrimination can be applied to help communities out of tough educational dilemmas; Gilles Deleuze and Félix Guattari's contention that to learn presumes and means to observe a material, an object or a being in a way as signs spread from the observed – inferring that education is not only learning on a higher stage or learning in a second order, it is at the same time the foundation of all processes of learning; the role, according to Bernard Stiegler, which technologies and digitisation – through processes of education – play in the constitution of subjectivity; and although he does not offer any conclusions, which can easily be inserted into actual topics of philosophy and practice of education, Slavoj Žižek's writings should be interpreted as a provocative 'interruption' in the field of pedagogy and educational philosophy.

As each of the chapters in this section reveals, it is through thinking, reflecting and contesting about educational theories and practices that we will gain clarity about such theories and practices. By bringing together philosophical voices and debates from the past and present, this section demonstrates not only the inter-connectedness between philosophy and education, but the potential of philosophy to influence and shape education and educational practices.

# Nasr Hamid Abu Zayd's Philosophy on Islam and Education

Katharina Völker

## On Abu Zayd

A prolific scholar of Quranic studies, Abu Zayd, who taught in Egypt and the Netherlands, is best known for his project of reforming Islamic thought. Born in British-ruled Egypt in 1943, already in his early childhood, he became a *hafiz*, a carrier of the Quran, by virtue of memorising it. While being passionate about the sound, language and transformative power of Quran recitation (Abu Zayd 1996: 19), he also developed an interest in profane literature. After his training as a technician, he enrolled in literary, rhetoric and Islamic studies at the University of Cairo in 1968. Exposing himself to various socio-intellectual influences, he became member of a “literary society in which Marxists, Muslim Brothers and existentialists were represented” and wrote lyrics and prose (Abu Zayd 2006a, b: 39). In 1977, Abu Zayd earned his Master degree with a work on rationalistic trends in Quran exegesis, as developed by the Mutazila (Medieval school of theology). Ever since, he understood his academic identity primarily as that of a literary researcher treating the Quran as an object of scientific studies. In 1981, Abu Zayd was awarded his doctorate in Arabic and Islamic studies from the Department of Arabic Language and Literature (Cairo University) for a thesis on exegesis of the Quran (*falsafat at-ta'wil*; philosophy of *tawil*) of ‘Ibn cArabī’ (Sufi mystic, d. 1240). After being made associate professor at Cairo University in 1987, he accepted a call to the University of Osaka (Japan) where he taught until 1989. Around that time his research on the Quran was inspired by the Russian semiotician Yuri M. Lotman and the notion of *shifra* or *code* (as modelled by *Shannon-Weaver*) in understanding revelation as a communication process. When he published *The Concept of the Text (mafḥūm an-naṣṣ: Dirāsa fi ‘ulūm al-Qur’ān)* in 1991, Egyptian religious authorities accused

e-mail: [Katharina.Voelker@uni-tuebingen.de](mailto:Katharina.Voelker@uni-tuebingen.de)

Zayd of denying the divine origin of the Quran. Shortly later in 1992, Abu Zayd published the book *Politics and Islam. Critique of Religious Discourse (Naqđ al-kitāb ad-dīnī)* which appeared in German in 1996. This first major work translated into a Western language marked the start of disseminating Abu Zayd's thought to a wider audience. In it Abu Zayd criticises the instrumentalisation of religious language, by both leftist and conservative parties, for the sake of justifying their political decisions and powers. Addressing religious authorities, politicians and in particular government intrusion into universities earned him the wrath of powerful people. In consequence his tenured professorship at Cairo University was denied in 1992. In 1993, the Appeals Court of Second Degree declared Abu Zayd an apostate (*kafir*: unbeliever), therefore making him a non-Muslim. In consequence, since non-Muslim men are not permitted to be married to Muslim women, the court ruled the official divorce between Abu Zayd and his wife in 1995. Finally, defamation and death threats forced the couple to emigrate. Until today this case is cited amongst the most prominent ones of blasphemy laws being applied by contemporary governments, in order to quash dissent (Thielmann 2003).

From 2000 to 2001 Abu Zayd held the 'Cleveringa Honorary Chair in Law, Responsibility, Freedom of Religion and Conscience' and was guest professor at the University of Leiden. From 2002 until 2003 he was fellow at the *Wissenschaftskolleg zu Berlin* and subsequently professor at the Utrecht University for Humanistics until late 2008. There he was the holder of the Ibn Rushd (Averroes) Chair and remained professor emeritus until his untimely death in Egypt in 2010.

## Islamic Thought on Reforming Education

Abu Zayd's philosophy has to be comprehended in the context of pursuing projects that aimed at the improvement of the human condition through education. Actively teaching in countries that only recently had become independent from their occupiers, academics witnessed how freedom had neither expanded into fields of education nor into politics or the social system. Established rankings and hierarchies still existed. Intellectuals were commonly aware of social injustices, gender inequality, lack of freedom of speech and teaching, low literacy rates, religious tensions, lacuna of democratic structures and, generally, the shortcomings of state obligations towards the betterment of the human condition. One principle in line of this modern Muslim thought was to not blame religiosity for the imperfect state of human affairs, nor an alleged 'backwardness' of Islam in particular, but instead to unleash Islam's usefulness for the common people (Abu Zayd 2001: 57). Such a rethinking of Islam by taking a fresh look at religious sources can be viewed in relation to the search for national and cultural identities of Arab-linguistic countries following the end of colonisation. Such ventures should not be understood as simply manifesting anti-colonial sentiments, but with respect to their intrinsic, and – in our case – humanistic originality, sought to reinterpret religion and adapt its contents to better meet and respond to transformed circumstances.

One way to learn from the Islamic heritage and to promote a critical conscience for the benefit of contemporary social contexts was by the application of novel forms of

critical Quran research within the disciplines of literary and religious studies. Representatives of this stream of scholarship included Taha Hussein (d. 1973), Amin al-Khuli (d. 1966), Aisha Abd al-Rahman (aka Bint al-Shati, Egypt, d. 1988), Ahmad Khalafallah (d. 1998) and `Abdullah al-`Alayli (d. 1996) (Y. Rahman 2001, 58–75; Hildebrandt 2007: 369–373). Some were explicitly politically active, like Taha Hussein and `Abdullah al-`Alayli, who promoted free schooling for all children and educational reform at Al-Azhar University in Egypt, respectively (Sing 2007). Al-Azhar, in effect an unofficial 'Vatican' of Sunni Islam, had been strongly influenced by medieval learning and remained effectively impervious to modern philosophy, sociology and psychology way into modern times (Rahman 1982: 138). At the forefront of reforming this significant institution stands the figure of Muhammad Abduh (d. 1905), one of the forethinkers of *al-nahda* (Islamic Renaissance) and Grand Mufti of Egypt. Supported by his distinct approach to the Quran, he formed the conviction that learning and education are the prerequisites for social change. For Abduh, religious education had the advantage of inducing moral values, while scientific learning would assist rational thinking that analyses the socio-political setting and fosters modernisation (Shafie 2004). Others, like al-Khuli, his wife al-Rahman and Khalafallah focused on the literary study of the Quran with no less significant aims: re-interpreting the Quran by way of applying modern scientific methods of exegesis and finding new answers to social challenges. They applied historical and linguistic study, tracing the instructive and aesthetic character of Quranic language, its emotional impacts as well as its significance for the emergence of Islamic culture and science (Abu Zayd 2006a: 55).

In this research, the inscrutability or obfuscation of the text's meaning (*istiqlah ma'nā al nass*), often supported by the notion of *i'jaz* (inimitability of the Quran), could be overcome by human rationality (*'aql*), just as *naql* ("imitation, that is, the faithful transmission of a received tradition") and *naqliyy* (imitative sciences) could be overcome by *aqliyy* (rational sciences) (Akthar 2008: 58).

Others, like Fazlur Rahman and Muhammad Arkoun, expanded similar scientific endeavours onto Islamic heritage (*turath*), classical exegesis (*tafsīr*) and jurisprudence (*fiqh*). As education minister of Pakistan in 1947, Rahman tackled education policy in the newly emerging Islamic state. He anticipated that education had to be islamised in the sense that Islamic metaphysics would implement Quranic guidance towards social justice.<sup>1</sup> Holistic education should infuse students with Quranic ethical ideals as well as with knowledge from any valuable non-Islamic sources whose content does not contradict the Quranic spirit (Rahman 1982: 133) Learning ought to widen 'the horizons of one's vision and action'; hence it should bear upon one's agency and bring forth an accountable and reflective civil society. Only through education, based upon an authentic Islamic *Weltanschauung*, can God's message enter body and soul in order to guide people. Education represents both an entry for divine guidance into the pan-Islamic *ummah* and a gateway for Islam to become the fuel that fires the engine of development.

---

<sup>1</sup>Rahman was not the only thinker of his time to take on the task of rethinking education inspired by Islamic principles. Ismail al-Faruqi and Seyyed Hossein Nasr are known for 'Islamisation of knowledge' and 'Islamisation of science', respectively. Cf. Völker 2016. Chapter on Rahman's reform: 'Education and Islamic Metaphysics'.

Arkoun attributes a slightly different function to education (Günther 2004: 129; Völker 2016).<sup>2</sup> A contemporary of Abu Zayd, Muhammad Arkoun called for a reform of education modelled on the medieval phenomenon of *adab* as represented by Miskawayh's Islamic humanism (Völker 2016). *Adab* is a holistic approach to education that had the potential to create what Arkoun called a new ethos of tolerance and solidarity amongst cultures (Gabrieli 2009; Arkoun 2009: 148). Aspects of *adab* include openness towards various, also non-Islamic sources of knowledge, the surpassing of religious boundaries and the liberalisation of thinking from doctrines and orthodoxies, which should result in 'renewal and creativity' (Arkoun 1994: 77).<sup>3</sup> Education in this sense creates moral thinking and behaviour and contributes to the "fulfilment as individuals and as a species" and to the seeking of "inner sustenance [...] in the clarity and learning of the mind, the rule of reason, nourished not by the sunna of the Prophet but by *paideia*, the *adab* of humanity" (Goodman 2006: 109). Genuine education (*adab haqiqah/alethine paideia*) is achieved through philosophical thinking, not through religious instructions (Kraemer 1992: 231).<sup>4</sup> In the shared context of the Mediterranean region, Arkoun envisages how true education, from primary to university level, can raise awareness of the common cultural heritage and create a tolerant civil society that acts within the frame of universal values. The prevention of an ideological instrumentalisation of Islam, or of religion in general, and of education for the sake of justifying hegemonies of governmental thinking, social hierarchies and religious orthodoxies necessitates a patient humanistic education (Arkoun 1994:26).

Such ideas on education by Muslim scholars of Islam accept the notion of religion as a transformative social factor; that the existence of God and the divine origin of the Quran does not exclude rational human engagement with religion; that the Quran contains historical, non-eternal aspects and is accessible to individual thought; and they accept the necessity of citizen education, critical pedagogy and self-responsibility. Although distinct from each other, these reform projects are liberating in character and help to develop scientific standards for learning and researching about Islam and the Quran.

## Abu Zayd's Contribution to the Reform Debate

Like his predecessors, Abu Zayd supported the idea that the basis for social improvement is learning and a transformed understanding of religion (Abu Zayd 2001: 97).<sup>5</sup> Abu Zayd saw that Egypt's education and scholarship was too impoverished so as to allow for citizen education (Abu Zayd 2001: 49). Elementary signs of this plight

<sup>2</sup> cf. Völker 2016, chapter on Arkoun's reform: 'Society beyond Education'.

<sup>3</sup> Similar views can be traced from Hegel on 'creating knowledge', to J.P. Sartre, F. Fanon and P. Freire.

<sup>4</sup> Kraemer refers to Miskawayh, *Tahdhīb al-akhlāq*, 49–50.

<sup>5</sup> For discussions between Abu Zayd and his teacher Hassan Hanafi about socialist realism, compare *ibid.*

were, in 1990, the chronic shortage of resources, a teacher-student ratio of 1:62 and a literacy rate of 45% (cf. Amirpur and Ammann 2006: 16). In addition, the education sector was abused as battlefield for political struggles (Abu Zayd 2003). Under extra surveillance of religious authorities, there existed no freedom of research and teaching at universities. This influence was also seen upon the general public, since state media invited clerics from Al-Azhar, broadcasting conservative, state-conforming teachings. The participants in the dissemination of Islamic knowledge caused 'ideological bewilderment', by not adhering to any scientific standards, neglecting human reason and the need for proper education and shutting their eyes to the challenges of reality (Abu Zayd 1996: 46). In contrast, Abu Zayd, similar to Arkoun, calls for a revisiting of the scientific Islamic heritage in matters of religion (e.g. in the fashion of Averroism) and pleaded for the distinction of religion (*din*) from religious knowledge (*ma'rifat-i din*) (Abu Zayd 1996: 29; Safdar 2013: 213).

In contrast to linking educational positions with power and self-enrichment, Abu Zayd referred to himself as a servant to the people, an intellectual who, like a street sweeper, merely adds to the improvement of surrounding circumstances (Abu Zayd 2001: 65). One of his efforts was in respect to critiquing the religio-political discourse wherein he discerned possible roots for the plight of education in Egypt. Since 1972, Saudi Arabia, with its petrodollar power, gradually infiltrated Egypt's educational institutions with Wahabi ideology that, amongst other unfavourable aspects, allowed for low educated men to proclaim themselves as authorities of Islam. Furthermore, while this Islamic stream accepts technological innovation at the same time, it neither permits intellectual progress, nor freedom of religion, nor the emergence of individual autonomy, civil society and universal (non-religious) human rights. Hence, and in order to compensate for the failure of a pan-nationalism, Egypt has since 1974 witnessed the emergence of a backward-oriented version of Islam (Abu Zayd 2001: 163–4). Likewise this radicalisation of Islam contributed to effecting president Sadat's political instrumentalisation of religion, which manifested in 1980 with the declaration of *shari'a* as the 'main source for legislation'. In consequence, education became more prone to making concessions to Islamist ideas. To counteract these tendencies, Abu Zayd (similar to Arkoun) argued for the independence of educational institutions from political and ideological agendas (Abu Zayd 2001: 66). As education is freed from political and religious intrusion, Abu Zayd hoped that also the interpretation of religion and scripture would again flourish within the secular realm. Only by being liberated from oppressive influences can exegesis do justice to the transformative and dynamic character of religion (Abu Zayd 2001: 40).<sup>6</sup>

Abu Zayd likewise proposed an inclusivist *Weltanschauung* that carries implications for inter-religious education. For him, cultures are products of acculturation and historical dynamics, and neither cultural purity nor uniqueness, as such, exists (Abu Zayd 2001: 130; 2006b: 10). Hence, essentialist dichotomies such as European

---

<sup>6</sup>Some teachers of Al-Azhar are so closely linked to political power that they instrumentalise Islam in various ways to support political schemes. Despite Al-Azhar's claim on monopoly over the interpretation of Islam, Abu Zayd hopes that secularism will enable a multiplicity of interpretations freed from political influence and mutual backups between political and religious interests.

vs. Islamic culture are rendered impossible. Given that cultures develop dynamically, change constantly, interact with each other and produce philosophies and knowledge cooperatively, Abu Zayd encourages the introduction of philosophy into the curricula on all levels of education,<sup>7</sup> akin to Fazlur Rahman and Muhammad Arkoun. However, furthering philosophical thinking and critical scrutiny does not mean the exclusion of religions as sources of knowledge.

Thought systems that claim to provide knowledge are included in the possibility to entail truth. He draws on Ibn Arabi's philosophy of multiple manifestations of truth, in order to argue for tolerance amongst truth seekers (Abu Zayd 2001: 129). This means the need to point out this possibility to students of different faiths and to yield the necessity of holding absolute truth convictions. In all his work, Abu Zayd is acutely aware of the difference between divine wisdom and human fallibility. One consequence of this awareness is that an inner humility from within other religions can be encountered.

Beyond secularism and religious liberalism, Abu Zayd calls for an all-penetrating humanism, the primacy of human dignity and universal rights. Before we are religious, we are all human. Thus, knowledge derived from religion or some other source for that matter must never violate the primacy of human dignity. For example, the right to physical integrity does not allow for 'amputation of body parts or execution', as some contemporary interpretations of Islam suggest (Abu Zayd 2006a: 95).

## The Nature of the Quran

Abu Zayd believed that social change necessitates theological reformation and that renewal must be achieved through set standards of scientific research. In consequence, his work aims at nothing less than developing a new scholarly theology, which is based on a specific understanding of the nature of the Quran (Hildebrandt 2007: 75). He embarked on developing the following ideas: the difference between eternal and timely aspects of the Quran (Ash'ari), the difference between oral and written Quran, the pre-requisite of rationality for revelation (Abduh), the createdness of the Quran (Mutazila), the distinction between corpus (*jism*) and meaning (*ma'na*) (Khuli). These ideas on the nature of the Quran bear crucial consequences for thinking, learning and teaching about religion.

In order for the Quran to speak to the people, it must be delivered from layers of traditional interpretation, sacralised secondary commentaries and legal opinions that are more likely carriers of political and egocentric interests than entailing the will of God. Abu Zayd's understanding of the nature of the Quran allows for this liberating new approach. The Quran is *dhikr*, a reminder of the covenant between the Divine and humankind, and understands itself as a guide towards salvation and

---

<sup>7</sup>Abu Zayd's ideas are informed by the philosophies of Claude Lévi-Strauss, Ferdinand de Saussure, Hans-Georg Gadamer, Friedrich Schleiermacher, Wilhelm Dilthey, Martin Heidegger, Paul Ricœur and Toshihiko Izutsu.

divine justice (the Quranic essence).<sup>8</sup> The Quran is also considered a sign of God and the Word of God. However, Abu Zayd points out that it is only one sign amongst many others, such as nature and the universe – indeed, God's creation as such. In addition, the Quran is not the entire word of God, since according to 18:109, the word of God can never be exhausted: "If the sea were ink for the Words of my Lord, the sea would be spent before the Words of my Lord are spent, though We brought replenishment the like of it" (Arberry 1996; Abu Zayd 2008a: 69).

At the same time Abu Zayd emphasises the human character of the Quran. His most controversial stances are best expressed in his own words: "I'm ready to say, the Quran is the word of God, absolutely divine. And the Quran is the word of man, absolutely human" (Abu Zayd 2006b). One aspect of the human text (*nass insani*) is its historicity (*tārīhiya*), which refers to all processes that effected the formation of the Quran. These include God's speech (*kalām Allāh makhlūq*) and the act of transmission (*tanzīl*) in time and space to the angel Gabriel, the processing of the message via the person Muhammad (inspiration/*waḥy*), the communication between Muhammad and the first audience (incl. Prophetic speech) and finally the collection and editing process of the Quranic text (*mushaf*). The "text changes its character from the first moment of its sending – which means since the Prophet cited it in the moment of revelation. It transformed from a divine text, became a concept and hence a human text" (Abu Zayd 1996: 87; Sukidi 2009: 184).<sup>9</sup> As a human, Muhammad received non-verbal messages in specific circumstances ('occasions of revelation' or *asab an-nuzul*, a well-established principle of traditional exegesis) that provoked revelations.<sup>10</sup> For Abu Zayd, revelation therefore has a historical and human dimension, and this comes basically down to the fact that "where there is no addressee there cannot be a message" (Abu Zayd 2008a: 58–60). In support of the historicity of the Quran, Abu Zayd rejects the metaphysical assumption that the Quran is eternal and preserved on a heavenly tablet. This idea stems from literal readings of two Quranic terms: 'mother of the Book' or *umm al-khitāb* (43:2 + 3) and the preserved tablet or *al-lawḥ al-mahfūz* (*Quran*) (Abu Zayd 2008b: 94; Kermani 1996: 61; Sukidi 2009: 185; Y. Rahman 2001: 129). How can the Quran be eternal and the tablet and at the same time be created? Together with the uncreatedness of the preserved tablet, Abu Zayd also rejects the idea of determinism, that fate is 'written in stone'. In short, the Quran that is available to today's community is created and part of the human sphere and hence accessible by human rationality. Although Abu Zayd links the historicity of the text to human history and human understanding, he clearly declares that "with historicity of the Quran, understood as text, is not meant that the text is human". The source of the text is divine, as is the

<sup>8</sup>After oneness (*tawḥīd*), justice is the second chief principle of God's nature, according to the Mutazila. It is the nature of the Quran as God's words to essentially entail divine justice.

<sup>9</sup>For a comparison of ideas on Muhammad's contribution to the revelation process between F. Rahman and N.H. Abu Zayd, see Völker 2015.

<sup>10</sup>The traditional practice of studying the occasions of revelation and the distinctions made between Meccan and Medinan verses proves how Islamic scholarship recognises this link between the message and history.

message. However, the tools for accessing the Quran are human, as are the meaning productions. The Quran is also understood as *muntag taqāfi* (product of culture) as well as *muntijan li al-thaqāfa* (producer of culture), in the sense that it is a product of culture, conditioned by the cultural life of the Hijaz, emanated in Arabic with specific semiotics (Abu Zayd 2008b: 86–88). Subsequently, the Quran created a ‘new’ culture, distinct from the pre-Islamic Hijazi culture in times of *jāhilyya*, by initiating a vast body of interpretations that gave practical, political and ethical instructions for the fast expanding Muslim civilisation.

Considering the written Quran only as a text means exposing it to renderings as manifold as the diversity of human understandings and wishful projections. However, the Quran is also a cooperation between sender and receiver in that the intention of the sender, entailed in the message (*risāla*), is processed by the receiver and disseminated with and by human language. Thus, Abu Zayd reads the Quran likewise as a discourse. The latter notion does more justice to the Quran’s history of creation. It is a discourse that aspires to proclaim, believe and ‘initiate a specific action’ from the addressee (Abu Zayd 2008a: 58–60). This event is different from the written and fixed *mushaf*. Hence, the ‘re-invoking’ of the Quran’s ‘living status’ becomes superior to the mere emphasis of the historicity in the engagement with the text. Also, the dialectical relationship (*alāqa jadaliyya*) between the divine message and the human understanding of it must be emphasised, as it becomes apparent in various dialogues in the polyphonic Quran (Abu Zayd 2004: 18–21; *ibid.*, 2008a: 69).

Again, at the core of this discernment of the nature of the Quran is the human capacity of rational thought, a pre-requisite for the act of revelation. If Muhammad had not understood the messages, how could he implement the consequence of their meanings in the newly emerging Muslim society? And how can the Quran’s message remain relevant, if humans were not continuing to produce meanings? Humanity, in Abu Zayd’s philosophy, is an active body that by reflection on surrounding conditions can alter reality. Humanity is not a passive receiver of religious or political authority nor a passive sufferer from status quos.

## Implications for Learning and Teaching About Islam

To understand humanity as an autonomous agent necessitates open access to education, the promotion of rational, philosophical and critical thinking and the freedom in creating fresh knowledge through research. All cognitive endeavours are only restricted by the primacy of justice and human rights. Since Abu Zayd identifies the core of the Quran’s message as social justice, also the practice of exegesis must be directed at instigating liberty, justice and human rights. Although Abu Zayd calls for secularism in education and politics, he emphasises the need for appropriating the Quranic message anew, in a continuous process of creation, as it was intended by God (Abu Zayd 1996: 115). His concept of the Quran as a patient guide and his proposed educational hermeneutics allow for a transformative but humble production of meaning. Such does not accommodate notions of absolute truths, resolute categories of allowed and forbidden or orthodox exclusivism. The production of meaning is always a human act:

individual, contingent and fallible (Abu Zayd 2009). This allows for the existence of plural understandings of Islam, of which no single one could ever be implemented via state politics or legal systems (cf. Hill and Hill 2000). On a global level, plurality of opinions combined with freedom of expression is essential for a common civilisation and its 'universal discourse about human rights and democracy' (Abu Zayd 2001: 67).

In the contexts of non-Islamic countries, Abu Zayd's philosophy supports processes of deculturation and religious maturity by shifting attention to a reflective and personal understanding of religiosity away from the naturally perceived sense of belonging to an ethnic group or an Islamic denomination. Here, individuals of Muslim minorities can embark on the quest for understanding Islam in a specific social setting and reality, without having to rely solely on traditional concepts that are inherited by the parent generation. This way the meaning of Islam is kept alive by the younger generation in readiness for the next generation. They are enabled to think for themselves and to exchange sentiments amongst peers, free from religious or state intrusion. In Abu Zayd's understanding, we are first participants in a humanistic society and, secondly, believers in a faith. Simultaneously, all humanity takes part in God's ongoing creation, and Muslims contribute to this permanent creation by living their faith. Abu Zayd's ideas empower people to free themselves from the shackles of determinism, paternalism and blind adherence. Competent and matured via education, rationalism and humanism, they will identify existing demands and meet them constructively, with the help of Islam and for the sake of the wider human good.

For the example of Islamic education at state schools as being presently established in Germany, Abu Zayd's hermeneutics and Islam understanding bear valuable implications for developing an Islamic pedagogy. Since several years Islam is being confessionally taught at selected state schools, and from 2010 onwards its formation as well as the university training of Islam teachers has been systematically and financially advanced by the German state. The new teachers now face the challenge of creating a suitable pedagogy, crafting school books and planning teaching curricula (Völker 2013, 2014). Particularly at this rather early stage of a nascent Islamic school pedagogy, Abu Zayd's concepts render inspiration. Elements of school curricula are defined both by standard criteria for school learning (formulated by the state ministry of education) and the religious content (as formulated by Islamic communities). Methods suitable for teaching religious content as well as the standard learning objectives must merge in these curricula of Islam education. Here, Abu Zayd's thought contributes on both levels: content and method. In matter of content, Abu Zayd's work is part of reform movements within contemporary Islam. Let us look also at methodological contributions. From his overall thought on Islam stem requirements for education such as critical-reflective thinking, training students in problem solving, connecting pre-knowledge with the newly self-acquired knowledge (hermeneutic reflection) and open-discourse exchange of ideas. All intellectual processes aim at the improvement of current states of human affairs (humanistic hermeneutics). A pedagogy infused with these basic concepts requires teachers to inspire students to think for themselves. In such terms, a suitable pedagogy excludes top-down, black pedagogy (poisonous pedagogy), exclusive forbidden-allowed pedagogy (Meijer 2010: 736) and banking pedagogy.

Furthermore, Abu Zayd's religious philosophy caters for hermeneutic instruction (hermeneutischer Religionsunterricht) and student-oriented approaches (applied predominantly in Germany in the 1960s and 1970s). Both methods have been developed throughout the years and still inform the official didactic. The hermeneutic religious instruction is characterised by its ability and pre-requisite for students to reflect on human affairs and socio-political realities. Here unfolds the dynamic of meaning production between an unstable system (human nature) and the lasting medium of Scripture (preserved, manifested). The *hermeneutische Religionspädagogik* (c.f. influence of Hans Stock, Martin Stallmann and Gert Otto, in Lämmermann 1994) provides grounds for what the standard school curriculum demands today from a competence-oriented learning (*Kompetenz-orientiertes Lernen*). An intellectual student of Hans-Georg Gadamer, Abu Zayd's hermeneutic *Weltanschauung* necessarily leads towards competence. His idea of cooperative production of meaning (emerging between text and reader) intends student competency. The latter first of all springs from student thinking, which necessitates the acquisition and application of cognitive faculties in order to solve problems. Abu Zayd only acquits 'thinking' to such cognitive operations that are divergent in character and lead towards new horizons (Völker 2017: 123). Motivation, will and social readiness then enable the students to apply new solutions to changing situations successfully and responsibly (Klieme et al. 2003: 72). It is Abu Zayd's suggestion (informed by Marxism), that through thought transformation, reality can be altered. Abu Zayd aims at a holistic *Bildung* (education in its entirety, cf. Arkoun's *adab* in Völker 2016), including student empowering, autonomy and self-responsibility. His thought hands students the tools for free thinking and the ability for liberation in many facets within the set frame of school education. Last but not least, the image of humanity in Abu Zayd's philosophy caters for a constructive teacher-student relation, plus an openness for inter-denominational as well as inter-religious learning. His rejection of absolute truths and the demand for enduring learning are cornerstones for a classroom pedagogy as currently developed and urgently needed for German state schools. The entire cascade of religious learning (university lecturers, school teachers and pupils) is characterised by a vast plurality of ethnic and Islamic denominational backgrounds. Such richness is naturally reflected in the demographics of Muslims in Germany. The future will show whether a pedagogy that carries elements of Abu Zayd's concepts can successfully deliver a religious education to millions of long-term German Muslims as well as hundreds of thousands of refugee children that will for a considerable time live as diaspora within a non-Muslim majority country. Abu Zayd's overall religio-philosophical work certainly serves as a valuable inspiration.

## Abu Zayd's Contribution to Contemporary Muslim Thought

Abu Zayd represents a class of cross-cultural intellectuals whose philosophies benefit from fruitful encounters with other mentalities and world views. Presently, dialectical religious thought and dialogue-oriented theology, as embodied in Abu

Zayd's work, find positive echo in the establishment of Islamic theology at state universities in Germany. For example, his ideas on the nature of the Quran and the proposed Islamic humanism are picked up by one of the most prolific Muslim scholars on Islam, Mouhanad Khorchide. Such pluralistic openness in combination with historical-critical approaches, applied in the training of future imams and school teachers, is the most progressive Islamic educational project within Europe.

Contemporary Muslim scholars, who teach in the field of religion, such as Abdullah Saeed, Bassam Tibi and Farid Esack refer to Abu Zayd as an important modernist. A significant amount of recent publications on 'liberal', 'modern' and 'progressive' Islam refer to Abu Zayd's work. In addition, numerous research theses have been written on him, demonstrating the relevance of his work. His influence on liberal theology becomes apparent in the works of Navid Kermani, Katajun Amirpur, Hamid Dabashi, Nurcholish Madjid and Ahmad Baso. Furthermore, his hermeneutics of the Quran already bears fruit within feminist Quran interpretations. Ziba Mir-Hosseini calls his method 'ground-breaking' and 'immensely important' for exegesis in respect of justice and equality and refers to Abu Zayd as 'among the most prominent and radical of the new reformist thinkers' (Mir-Hosseini 2015). Furthermore, his approach can be found in the works of Amina Wadud and Asma Barlas, amongst others. We see that despite his untimely death, his inspiration is still manifest in the works of students and intellectual followers worldwide.

# Giorgio Agamben

Tyson E. Lewis

What could be more obvious than sending your child to school in order for him or her to ‘learn’ about something? We have become so accustomed today to think of education in terms of learning that we do not question the ubiquitous appearance of the language of learning. We see it in the discourses of the new, flexible, information economy wherein workers must become ‘life-long learners.’ We see it written on the sides of children’s toys, which now readily advertise what ‘learning outcomes’ the child will achieve from playing with the product. Indeed, is it not uncommon to replace the very idea of the student with that of the ‘learner’ and schools with that of ‘learning centers.’ In all cases, learning stands for an educational process whereby the learner has an intention and actualizes this intention through specific experiences in order to measure progress toward fulfilling a goal. Learning therefore emphasizes actualizing intentions in order to develop, progress, and succeed at a given task wherein ‘success’ is a measurable outcome. While this might sound like a desirable project, there are many philosophers of education today who at least question its dominance and its pervasiveness, which has an uncanny ability to eclipse alternative—less functionalist and less outcome oriented—educational logics that do not fall within this basic learning pattern (Lewis 2013; Backer and Lewis 2015; Biesta 2006, 2014; Lewis and Friedrich 2015; Vlieghe 2013; D’Hoest 2012; Simons and Masschelein 2008). It is against this backdrop that we can begin to appreciate Italian philosopher Giorgio Agamben’s methodology for intervening in the present landscape of education.

Agamben offers education a wide range of tools and ideas through which contemporary educational practices and theories of learning can be critically analyzed. While broadly influenced by a host of figures better known in educational circles such as Walter Benjamin, Jacques Derrida, and Gilles Deleuze (among others),

Agamben is a unique philosopher with his own methodological approach to doing philosophy. In particular, I will focus on three methodological gestures that Agamben brings to education which are both critical and emancipatory: suspension/inoperativity, archeology, and study. Through these gestures, we can problematize the taken-for-granted equation of education today with learning processes. In particular, I will argue that learning can be rendered inoperative through an archeology of the discourses and practices of the learning apparatus, in order to create a space and time for study. At stake here is finding an educational language that is not predicated on sacrifice—the sacrifice of the potentiality of the student for the actuality of learning assessment. Agamben thus allows us to name a particular educational logic—study—and in the process think potentiality as such, freed from any subservience it might have to specific forms of actualization dictated by learning.

The chapter is organized into four sections. I will begin with a very brief overview of learning, which will give a sense of how it is defined in educational theory. In this section, I will argue that learning always positions potentiality in relation to some specific, predefined actualization, thus preventing us from ever thinking educational potentiality as such. The second section will introduce readers to Agamben's notion of suspension/inoperativity. I will give various examples from his work and then turn to education in order to show how suspension is not only a critical tool for exposing certain forms of educational sacrifice but also a positive idea that enables us to imagine alternatives. Third, I will turn to Agamben's major methodological innovation: archeology of signatures. What will emerge here is learning itself as a signature that must be deactivated. And finally, I will discuss study as the educational form of life that remains when learning is rendered inoperative. Study is, on my reading, a particular educational practice that enables us to at last experience potentiality on its own terms, liberated from measure. I will conclude by comparing and contrasting studying with learning and review a number of contemporary examples of study found in the educational literature on Agamben.

## Learning

For a rather standard definition of learning, we can turn to Cornel M. Hamm who once wrote, learning is “intentionally coming to know (or believe, or perform, etc.) as a result of experience” (1989, p. 91). He goes on to suggest that there are three necessary and sufficient conditions of learning. First, intentionality means that one acts with “a purpose and intention to come up to a certain standard” (p. 91). The second condition is experience (which I will not discuss further here). Finally there is mastery. Learning, for Hamm, “always has an object (x), mastery of which is essential for learning to occur” (p. 92). Think here of learning to swim. First and foremost, one has an intention to learn the skills and knowledge base necessary to understand and perform the basic gestures of swimming. Second, this intention is realized through a series of experiences that involve training exercises, competitions, and so forth. The intention overcomes/negates a former state of ignorance/

impotence through a series of experiences. Finally, one's efforts are quantified through signs of growing mastery. As one wins tournaments, meets personal goals, and acquires increasingly nuanced appreciation for swimming, one becomes a master (as the preferred outcome). Learning is therefore the actualization of an intention that can be quantified in relation to a goal (expertise as it is defined by a field or activity). Learning is an economy, a management of potentiality in the name of future measure and the promise of improvement. This measure might be in relation to one's skill level, developmental growth, or even personal happiness. It enables a person to become whatever kind of person he or she has the potential to be (and thus to possess this personhood in the form of personal skills, talents, aptitudes, knowledge/expertise, degrees, diplomas, and so forth). Of course, this does not mean that learning follows a clear, linear path. Indeed, learning might be digressive at times. The key point here is that there is, overall, some kind of progression, culmination, or development that can be perceived by the subject or by an external observer which can count as evidence that something has been 'learned.' In this sense, learning fundamentally concerns a translation process whereby a potentiality becomes actualized so as to be assessed (hence the close connection between learning and testing).

Now, there is nothing here that appears on the surface to be problematic. Indeed, any number of progressive, conservative, and even revolutionary forms of education would embrace some version of Hamm's definition as a feature of what it means to be educated. To recap, one's swimming abilities can be measured in terms of speed and precision in order to improve, maximize efficiency, and thus meet one's personal swimming goals. Learning enables us to change our state from one of ignorance (not swimming) to knowledge (swimming). There is a passage from a potentiality (for swimming) to an actuality (swimming as such).

But perhaps something is lost when education becomes reduced to (some form of) learning. When education becomes a teleology that moves from potentiality *to* an actuality, we lose the ability to think potentiality as such, as a pure means rather than as a means to another end. Here educational philosophy falls in line with a major trend in Western philosophy as a whole. As Agamben argues, it is not uncommon in the Western tradition to make potentiality subservient to actuality. In *Metaphysics*, Aristotle argues, "actuality is prior to potentiality" (1984, p. 1657). He then continues to list the various ways in which potentiality is subservient to actuality. Actuality defines the nature of the potentiality in question, it chronologically precedes potentiality in a causal chain, and it is the end for which potentiality exists. It is this last point that is most important for Aristotle. He writes, "...actuality is prior [to potentiality] in a higher sense also; for eternal things are prior in substance to perishable things, and no eternal thing exists potentially" (p. 1659). In this sense actuality is the highest reality over and above potentiality, which is merely a derivative/dependent state. The point here is that we begin with what is actual (a soul, for instance), which determines a set of potentialities for particular kinds of living beings, and we end with what is actualizable (for this is the end or *telos* toward which a particular set of potentialities strive). When a teleological end is not achieved, the resulting life is incomplete and thus remains deficient.

Here we can return to our definition of learning. The learner is one who actualizes a potentiality in a verifiable form. Indeed, the learner fails when such potentiality remains latent rather than manifest in the development of skills, dispositions, or competencies. The worst nightmare of a swimming coach (for instance) would be the star swimmer on the team ‘not living up to his/her potentiality.’

Contra Aristotle, Agamben privileges potentiality over actuality: “that which is not (*ta mē onta*) is stronger than that which is” (2005b, p. 41). A large portion of Agamben’s work attempts to think potentiality as such, freed from its subservient position to actuality. To do so, Agamben returns to Aristotle to read him differently. In particular, he pinpoints two notions of potentiality at work within Aristotle’s physics. The first can be referred to as generic potentiality, which is the potentiality that education as learning concerns itself with. This is the potentiality that a child might have to know something and the potentiality to become something. But there is another sense of potentiality in Aristotle which attracts Agamben’s interest. This is the potentiality that belongs to someone who has an ability or a skill already. The architect, for instance, has the potentiality to build something but might prefer not to actualize this potentiality in the form of a building. Agamben summarizes as follows: “The child, Aristotle says, is potential in the sense that he must suffer an alteration (a becoming other) through learning. Whoever already possesses knowledge, by contract, is not obliged to suffer an alteration; he is instead potential, Aristotle says, thanks to a *hexis*, a ‘having,’ on the basis of which he can also *not* bring his knowledge into actuality (*me energein*) by *not* making a work, for example” (1999, p. 179). Such an architect remains in potentiality. And this state of being enables us to think the existence of potentiality as such.

This poses an interesting question for educators, especially for those who have become so invested in learning that it has become the be-all-end-all defining educational life. The challenge will thus be as follows: Can Agamben’s approach to philosophy, and his interest in potentiality, enable us to think of a radically different educational logic that is not reducible to learning (as defined above)? Can we think of an educational experience that does not sacrifice potentiality but rather enables one to experience it? To answer these questions, I will now present an overview of Agamben’s philosophical methodology.

## Inoperativity

Throughout Agamben’s unique and highly unusual body of work, there is a consistent emphasis on rendering inoperative taken-for-granted dichotomies of thinking in order to expose an underlying potentiality that would otherwise be concealed. Often Agamben refers to this as a change of metaphor from philosophy as dialectical opposition, negation, and sublation to philosophy as a kind of magnetic field wherein two opposite charges meet in an indeterminate middle point that (paradoxically) neither fully includes nor excludes either pair. This zone of indetermination or indifference between oppositions is a state of suspension that is neither positive nor

negative. It is a magnetic zero point. Another way of saying this would be that the point of magnetic indifference is the zone wherein the magnet is potentially both positive and negative without actualizing either. To pinpoint the zone of indistinction is therefore to (a) render inoperative the dichotomy between positive and negative and subsequently (b) to discover a latent potentiality that underlies the dichotomy.

Throughout his work, Agamben finds these points of suspension within a host of discourses and practices. A classic example from Agamben would be his work on the human animal divide. In his book *The Open: Man and Animal* (2002), Agamben's dialectic of the anthropological machine continually constitutes the human as the negation of the animal. The animal is therefore only included into the human as an exclusion. Yet in medieval manuscripts as well as in the work of Walter Benjamin, Agamben finds moments wherein the anthropological machine exhausts itself and is rendered idle. What is left is not a new articulation of the difference between human and animal but rather a zone of indifference or a zone of life as such. The problem is precisely that something must be continually sacrificed in order to maintain the appearance of such division, in this case, for instance, the existence of the feral child who is neither human nor in-human—the feral child is precisely the human *as not* human, thus interrupting the process of the anthropological machine.

In education, similar approaches have been used to analyze the construction and subsequent suspension of binaries between the inclusion and exclusion of students from public schools (Lewis 2006), good and evil/justice and law (Shapiro 2015), and citizens and non-citizens (Zembylas 2010; Waghid 2014). In such cases, an Agambenian approach discovers the paradoxical terrain of those who do not fit and thus are excluded/sacrificed. At stake here would be the thinking of an educational practice which is fundamentally not predicated on a sacrifice.

But it is important to note that there is a further move here that is often missed by those interested in utilizing Agamben's method of analysis. In contemporary society, many of the tensions which we find in classical Western thought are themselves already inoperative (including the human animal distinction). If this is the case, Agamben's method does not simply point toward the present as a 'liberatory' moment in history wherein we have been freed from such tensions. Nor does he want to merely return to a previous state wherein the binaries remain operative (and thus something is sacrificed). We cannot think on any other terrain outside or beyond the present. Thus the current state of inoperativity should be viewed as both a problem to be overcome and as an opportunity to think fundamental ideas of life (including education) differently—to think them in their potentiality for being otherwise than they have been or have become. In this sense, Agamben would call for a further move, one that suspends the suspension or renders inoperative the inoperativity of the present. This would be a form-of-life that is both immanent to the present condition of inoperativity yet dramatically different—a kind of absolute inoperativity (Watkin 2014).

## Archeology of Signatures

For Agamben (2009), one way to render the present inoperative is to perform an archeology of its signatures. Signatures exist below the level of signifier and signified. They precede and enable concepts and discourses to enter into unrelated domains or networks of dispersed correspondences. The signature is, in other words, a kind of guarantor that facilitates the transmission of concepts and discourses across time and space. Signatures are the background that make signs intelligible as signs within a system of other signs. In other words, signs presuppose an efficacious background of signatures that are “inseparable from the sign yet irreducible to it” (Agamben 2009, p. 50). In short, such signatures, for Agamben, “have always already pragmatically decided the destiny and life of signs that neither semiology nor hermeneutics is able to exhaust” (p. 64). The efficacy of the signature makes signs intelligible as the kinds of signs that they are.

To collect signatures means that one studies the efficacy which makes certain concepts and discourses intelligible and thus transmissible. But to do so is also, and this is the most important point, to render the guarantee of the signature inoperative. Collecting suspends the efficacy of signatures in order to study their intelligibility. Such inoperativity means that differences within a distributed network of signs become indifferences, there are no longer any operative coordinates for this or that preference, this or that hierarchical distribution, or this or that set of codified meaning. Without the signatory function, the present is rendered strange and the transmission of this or that ceases to function. In turn, the signature’s efficacy is let loose for potential new uses and destinations that are not prefigured within the status quo. Thus Agamben’s work is a collection of signatures such as ‘bare life.’ This particular signature does not appear in philosophy as such, or rather it only appears obliquely, in the margins, or in certain aporias within a given work. Yet this fragile, almost invisible signature enables signs of politics to circulate and proliferate throughout Western history. By exposing this signature (which gives efficacy to our political lexicon), its function is suspended, and we are able to think it, thus producing the intellectual conditions for new political practices not based on the sacrifice of bare life to emerge.

The work of Marteen Simons and Jan Masschelein (2008) might well be characterized as the collection of the signatures of learning in various discourses in order to understand the signatory structure embodied in various learning apparatuses. Learning is a signature that lends intelligibility to multiple contemporary educational practices and enables the suturing of multiple discourses ranging from psychology to design management to financialization of educational resources. Connections between these disparate fields are made possible by the efficacy of the signature of learning, which facilitates translatability across domains. An archeology of learning means that we collect its dispersed signatures, render them inoperative, and thus free the efficacy of the signature for new uses beyond its present possibilities. In this sense, the archeologist carves out a space and a time within learning, making room for something different to appear on the scene.

## Studying

Once archeology renders inoperative the signatures of learning, a new educational practice can emerge from within the present. One that is not merely the negation or destruction of learning but rather the inoperativity of learning. This would amount to learning *as not* learning, or an education practice that is neither learning nor not learning. Such a practice is studying.

Briefly summarized, studying, for Agamben (1995), is an “interminable” and “rhythmic” activity that not only loses a sense of its own end but, more importantly, “does not even desire one” (p. 64). Unlike learning which employs a host of means in order to obtain measurable ends (in the form of assessments), study withdraws from such ends. In short, the studier would prefer not to measure up, submit him or herself to quantifiable assessment, dwelling indeterminately in a space and time of endless study. This is why Agamben cites *Bartleby the scrivener* as well as the Jacob van Gatten as paradigms of study. In both cases, we are faced with enigmatic figures who refuse to ‘learn’ how to properly behave, work, or contribute to their societies in any identifiable way. Instead of resisting socialization, they merely persist in their form-of-life as a kind of perpetual irritant that interrupts any means-end logic. They are, in educational terminology, studiers who are outside the law of measure.

The effect of study is far from merely a-political introversion or passive acquiescence. The action of the studier deactivates the law, suspending it and thus opening it up to new uses. Here Agamben (2007) cites Benjamin and his reading of Kafka: “It is the sort of use that Benjamin must have had in mind when he wrote of Kafka’s *The New Attorney* that the law that is no longer applied but only studied is the gate to justice” (p. 76). Commenting further on Benjamin’s reflections on Kafka’s short story (where the lawyer, Dr. Bucephalus, studies rather than practices the law), Agamben (2005a) continues,

In the Kafka essay, the enigmatic image of a law that is studied but no longer practiced corresponds, as a sort of remnant, to the unmasking of mythico-juridical violence effected by pure violence. There is, therefore, still a possible figure of law after its nexus with violence and power has been deposed, but it is a law that no longer has force or application, like the one in which the ‘new attorney,’ leafing through ‘our old books,’ buries himself in study, or like the one that Foucault may have had in mind when he spoke of a ‘new law’ that has been freed from all discipline and all relation to sovereignty. (p. 63)

Suspended, the law that is studied is deactivated, no longer in force, and thus open to play. In this sense, it is not play but rather the relation between play and study that is most important. Summarizing, Agamben (2005a) writes, “And this studious play is the passage that allows us to arrive at that justice that one of Benjamin’s posthumous fragments defines as state of the world in which the world appears as a good that absolutely cannot be appropriated or made juridical” (p. 63). *Studious play* is the moment when the studier becomes indifferent to the sacredness of the law (as well as his or her position in relation to the law), thus profaning it. Note that the studier does not destroy or negate anything. Rather he or she plays with the law as if the law were a toy. The provocation here is to think an educational

logic that does not merely (a) result in the socialization of students into the order of things (as in learning) nor does it (b) merely negate the law (as in certain forms of free schooling), but rather suspends the law of learning without abandoning it. In this sense, Agamben meets with Hannah Arendt in that education is fundamentally conservative. The teacher places the world before the student so that it can be studied as a pure means without preconceived notions of how such material is to be learned. Rather than the forward momentum of learning, the result of study is a kind of rhythmic sway between certainty and uncertainty, progress and regress, sadness and inspiration that hits upon the very potentiality for learning in the first place.

Commenting on Agamben, David Kishik (2012) summarizes the unique mood of studious play as a “*euphoric* aporia” (p. 69). Indifferent to the desire of learning to actualize potentiality for a particular task so as to measure progress or regress, study offers a *passion* for potentiality as such, freed from the ends of learning. Such passion is equal parts inspiration (euphoria) and sadness (aporia), hence the strange behavior and demeanor of the studier who is lost in the archives, can’t sleep at night, constantly rubbing the forehead, perpetually scribbling down notes, struck stupid by epiphanies that are quickly forgotten, etc.

But such a description might give the false impression that study is simply about *delaying* the arrival of a conclusion. This is not the case. Indeed, a true example of study finds in the rhythms of study a pure means rather than a means to another end. Here we can turn to an obscure reference that Agamben makes to an ancient Greek philosopher for an example of study: the last diadoch of pagan philosophy, Damascius. In 529 A.D. the emperor Justinian closed down the Athens school of philosophy. After struggling to overturn the decision, Damascius and his remaining students took what was left of their library and sought refuge at the court of the Persian king, Khosru Nushirvan. In a state of intolerable exile, lacking a formal school, Damascius began to study. He turned his attention to the aporias concerning first principles. In other words, he turns to the question of the signatures of all thought that enable thinking to take place. As Agamben recounts, he labored on this work for 300 days, and in his text, we find many statements such as: “‘despite the slowness of our work, I have not, it seems, concluded anything,’ or ‘may God do as he pleases with what I have just written!’, or again, ‘all that can be said in praise of my exposition is this: that it condemns itself through its recognition of its inability to see clearly, and its impotence to look at the light’” (1995, p. 32). As a refugee, as one in exile from his homeland, he is adrift without proper status or location. In such a no-man’s-land he becomes a studier-as-melancholic who has entered into the interminable rhythms of thought as it tacks back and forth between pleasure and pain, undergoing and undertaking, progress and regress. Indeed, Damascius’ manuscript amounted to nothing more than a prolonged hesitation, a kind of ceaseless circling.

After so much writing, Damascius suddenly lifted his head from the manuscript proper and gazed upon the writing tablet itself. He was then seized by an idea: the idea of potentiality as such. Agamben writes, “The uttermost limit thought can reach is not a being, not a place or thing, no matter how free of any quality, but rather, its own absolute potentiality, the pure potentiality of representation itself: the

writing tablet! What he had until then been taking as the One, as the absolutely Other of thought, was instead only the material, only the potentiality of thought. And the entire, lengthy volume the hand of the scribe had crammed with characters was nothing other than the attempt to represent the perfectly bare writing table on which nothing had yet been written. This was why he was unable to carry his work thought to completion: what could not cease from writing itself was the image of what never ceased from not writing itself...now he could break the table, stop writing. Or rather, now he could truly begin” (1995, p. 34). The signatures of thought were suspended, rendered inoperative through study but this did not end with mere nihilism. The studier of foundations concerning first principles turned to the writing table itself as a field of pure potentiality for thought. Melancholy over the suspension of meaning became inspiration (a euphoric aporia) at a new beginning.

## Conclusion

By (a) rendering inoperative dichotomous thinking through (b) the work of archeology of signatures, Agamben is able to (c) open up a space and time for a new form of life. In education, this means that the inoperativity of the discourses and practices of learning make possible alternative educational logics such as studying. Studying is the latent potentiality within education that has thus far been included as the excluded, ‘useless’ and ‘unproductive’ double of learning. While (a) might appear to be a form of deconstruction, (b) and (c) are uniquely Agamben’s and thus offer significant resources for developing new methods of philosophy of education. Instead of rendering something unintelligible (as in deconstruction), (b) makes intelligible the signatures underlying signifiers and signifieds. And instead of deferring presence to a future (*act as if...*), (c) makes present the potentiality of  $x$  without actualizing this potentiality in a form that is predetermined ( $x$  as not  $x$ ). Importantly, these moves do not destroy learning. Rather they offer the slightest of shifts within learning—learning *as not* learning. Indeed, something must have been learned in order for suspension of learning to happen. As such, studying is not simply or easily conceptualized as the opposite of learning (as in a dialectical pairing). Rather it is the slightest of moves within learning that release learning from its own ends, opening up a space and time for studying to happen. Conceptualizing this fragile and almost imperceptible shift calls for a new kind of profane educational philosophy that is studious and playful, but most importantly does not sacrifice the freedom of potentiality to prefer not to continue learning. In this sense, we might say that Agamben opens the way for reconceptualizing educational philosophy as a form of *potentialism*.

# “This Is Our World.” Hannah Arendt on Education

Wouter Pols and Joop Berding

Hannah Arendt (1906–1975) is a political thinker. However, her work has major educational implications that have been noticed by many modern-day educationalists (cf. Gordon 2001; Lombard 2003). The influence of her work on the educational debate is rising. Arendt studied with Martin Heidegger and Karl Jaspers. When the Nazi party came to power in 1933, she fled the country. In 1941, she arrived in the United States. Ten years later, she became a US citizen. In her new home country, she wrote the books which made her famous: *The Origins of Totalitarianism* (1951), *The Human Condition* (1958), *Eichmann in Jerusalem. A Report of the Banality of Evil* (1963), *On Revolution* (1963) and the posthumously published *The Life of the Mind* (1978). Arendt wrote many articles beside these books, in different magazines and papers.

One finds only two articles on education in her work, including her ‘The crisis in education’. This article was originally written in 1954. In 1961 (and expanded in 1968), it was published in *Between Past and Future*. ‘The crisis’ starts with a diagnosis of American education. According to Arendt, education in American schools emphasizes the life of children, the learning process and the idea that children and young people can only know and understand what they have discovered by themselves. She calls American education ‘worldless’. Not only the ‘what’ but also the ‘what for’ are left in the dark. Understanding education as a learning and developmental process is a misunderstanding. Education is not just a matter of growing up, it is a matter of growing up in the *world*. Therefore teachers and educators should represent the world. Arendt writes:

The teacher’s qualification consists in knowing the world and being able to instruct others about it, but his authority rests on his assumption of responsibility for that world. Vis-à-vis

the child it is as though he were a representative of all adult inhabitants, pointing out the details and saying to the child: This is our world. (Arendt 2006, p. 186).

This chapter deals with Arendt's ideas on education. According to her, educators should introduce children and young people into the world. This statement indicates the central theme of the chapter. Questions we will answer are: What does Arendt mean by 'introducing into the world'? What is the meaning of 'world' and what is according to her the aim of this 'introducing'? And, last but not least, how can educators and teachers put this into practice, and what are the conditions that need to be met?

## A Layered Anthropology

Anthropology is the study of humans and their societies. In *The human condition*, Arendt develops an anthropology, not as social scientists would do it, but as a political thinker. Humans are thought of as thinking beings in the philosophical tradition. According to this tradition, the essence of humankind is the *vita contemplativa* (Arendt 1998, p. 14). According to Arendt, however, this isn't valid anymore for modern humans. It is the *vita activa* that characterizes the lives of men and women nowadays. The current mode of life is the active life.

Arendt distinguishes three modes of active life: labor, work, and action. She understands labor as a cyclical process of production and consumption. Work is a process of making, of bringing forth, and action a process of taking initiatives in response to the initiatives of others. Action implicates plurality; when people act they always act 'in concert'.

The first mode of life, labor, is fundamental. It is "the activity which corresponds to the biological process of the human body, whose spontaneous growth, metabolism, and eventual decay are bound to the vital necessities produced and fed into the life process of labour" (Arendt 1998, p. 7). It is a process of incorporation and digestion, of effort and relaxation, of rising and decline. It is a cyclical process in which life maintains itself: an ongoing, repetitive process. Arendt situates labor in the *oikos*, the household. Originally, the labor process took place in the private sphere of the household. Nowadays, this process has exceeded the limits of the household and is spread out over the whole of society. The economic process of labor characterizes modern society. It is a process of production and consumption, just like the biological process: ongoing and repetitive. It is a process based on always new, emerging needs that should be satisfied, again and again.

The second mode of active life, work, is not a cyclical one. The structure is not biological, not natural; it is cultural. Humans create things by working, not things to consume (consumer goods), but things to use (use objects). "Work provides an 'artificial' world of things, distinctly different from all natural surroundings" (ibidem). Work implicates "worldliness" (ibidem). Work is a process of making, of bringing forth. The things that humans bring forth make the world stable. Things

give the world stability; they are objects, they have objectivity (ibid., p. 137). This is the reason that, in contrast to the mode of labor, work creates a world that transcends “the ever-changing movement” of the lives of “mortal men” (ibid., 173). Work makes the world a human world. The artificial things that humans make are use objects. A hammer is used to drive a nail in the wood, a chair to sit on, a pen to write. They can be used as instruments, as tools. Humans can make new things with these tools. A tool is used to reach a goal. This goal can be a means to another goal. The world of things, of use objects, is a world of means and ends. The things in the world aren’t in the world for themselves; they are “for the sake of,” “in order to” (ibid., p. 154). So, the world that work creates runs the risk to be “a strictly utilitarian world” (ibidem).

The last mode of life Arendt distinguishes is action. Action isn’t a natural process, neither a process of means and ends. It is an inter-human process. A man or woman alone can’t act. “Action,” writes Arendt, “corresponds to the human condition of plurality, to the fact that men, not Man, live on the earth and inhabit the world” (ibid., p. 7). Humans act in the world they have created with the work they did. In acting, they establish a community and with this a common world which they not only maintain but also renew. In acting, each human can appear from the different positions he takes up, each in his own way. The condition of plurality is exactly this: “humans are all the same, [...] in such a way that nobody is ever the same as anyone else who ever lived, lives, or will live” (ibid., p. 8).

In acting, the human comes into the world. Through an initiative in response to an initiative of another, a man or a woman appears in the presence of other men or women. “With word and deed we insert ourselves into the human world,” writes Arendt (ibid., p. 176). She calls this insertion a second birth. It is the birth of the human in the public world; here, he shares the world with other humans. Humans can appear in this shared world; “they can show who they are, reveal actively their unique personal identities” (ibid., p. 179). A human can only be fully human in this shared, public world. Through initiatives, he shows who he ‘is’, and through initiatives, he can make a new beginning. Arendt calls the possibility of a new beginning “natality” (ibid., p. 247). A new beginning cannot be predicted. The reason why is the “human condition of plurality.” Plurality implicates freedom. In acting, people are free. “Men *are* free [...] as long as they act, neither before nor after; for to *be* and to act are the same” (Arendt 2006, p. 151). Natality, as the possibility to ‘be’ and to make a new beginning, is inherent to human action, inherent to the freedom to act.

Arendt’s anthropology is a layered anthropology. Human life is layered. The active life people live is characterized by the three modes discussed above. Humans couldn’t stay alive without labor, they wouldn’t have a stable world (‘a human world’) without work, and this world wouldn’t be a common world without action: a world in which humans take initiatives in response to those of others. Men and women can only appear as subjects by action: unique actors whose sameness is rooted in the fact that they differ from each other. Humans can only be fully human in the public world. Here, they can make a new beginning. From this perspective, the modes of life of labor and work are conditional to the fully human life of action.

In acting, men and women shape a common world; this shaping is in essence politics. This is why Arendt's anthropology is in fact a political anthropology.

Arendt takes a critical stance towards modern society. Modern life tends to be dominated by labor. This tendency goes hand-in-hand with the blending of the private and public spheres. It seems that in modern society the private and public integrate into one sphere. In this sphere everyone is a consumer. As consumers, people take part in the ongoing process of production and consumption. With their emerging needs, men and women are individuals that seek satisfaction, not acting subjects that appear in the presence of others. So, consumption tends to take the place of politics in modern society. What is, according to Arendt, a multilayered political anthropology seems to transform to a unilayered, one-dimensional labor anthropology. This not only has implications for men and women in the world but also for the world itself. It loses its stability. Arendt writes: "This earthly home becomes a world in the proper sense of the word only when the totality of fabricated things is so organized that it can resist the consuming life process of the people dwelling in it, and thus outlast them" (*ibid.*, p. 206). If this isn't the case anymore, the world as a stable, human world breaks down.

## Introducing into the World

According to Arendt, education is a process of introducing children and young people into the world. Some sense of what Arendt means by 'world' already emerges from the above. We will now elaborate on this a bit further, and ask what according to her is the aim of this 'introducing' and how to put this into practice.

As we saw, the world is a furnished world; it is furnished with the things people have made, not only in the present and recent past but in the distant past as well. These things aren't consumer goods; they are use objects, objects which give the world stability. This stability ensures that the world can be a home for 'mortal man'. Arendt writes:

The world, the man-made home erected on earth and made of the material which earthly nature delivers into human hands, consists not of things that are consumed but of things that are used. If nature and the earth of the world constitute the condition of human *life*, then the world and the things of the world constitute the condition under which this specifically human life can be at home on earth. [...] [W]ithout being at home in the midst of things whose durability makes them fit for use and for erecting a world whose very permanence stands in direct contrast to life, this life would never be human. (Arendt 1998, pp. 134–135).

Now we may be able to understand what 'introducing into the world' means for Arendt. It means introducing into the world of things, the world of use objects. These objects are not only material things (a hammer, a chair, a pen, a pair of scissors, a violin, a notebook), they are mental things as well (a concept, a rule, a strategy, a design). Introducing children and young people into the world means to let them get acquainted with the objects the world is furnished with, in order to learn to

use these objects. To be introduced into the world means to be able to use the objects of the world, or more precise: to use the objects chosen by adults as worthwhile. Through using them the younger generation becomes at home in the world that older generations have built.

Learning to use the objects of the world is an important aim in education. As we said before, these objects aren't only material, they are mental as well. When children progress in education the mental objects increase in importance. By using mental objects, they learn what the material objects are and how to deal with them. The different school subjects consist of a wide range of mental objects: numbers, the basic operations of arithmetic, parts of speech, spelling rules, scientific concepts, different forms of writing, art, play, and sports. Using these objects, in other words: using these as tools is work in the Arendtian sense. Children work when they solve a mathematical problem, write an essay, do research, or make a design. In this work, all sorts of objects, of tools, are involved: material and mental tools. However, the work children and young people do in school isn't fully work yet. In contrast with the work of adults, the products of school work are not treated and used by others. This is why we speak of doing 'free work' in school.

When children and young people are introduced into the world as described above, they experience a mode of life, that of work, at the same time. One could say that introducing children and young people into the world implicates introducing them into work. However, work is only one of the modes of life people live. As we saw, labor has to do with the biological basic of life; this life is only a precondition for human life. Human life starts with work and finds its fulfillment in action. The world of things, of objects, is the human environment in which people act. Introducing into the world means introducing children and young people into the world of objects and with it having the experience of work, but don't they need to have the experience of human action as well?

Arendt is clear about action. On her view, children are not able to act. In this respect, there is a big difference between children and adults. The relation between children and adults is not equal; it is an asymmetrical, hierarchical relationship. What the child and the adult as educator “have in common is the hierarchy itself, whose rightness and legitimacy both recognize and here both have their predetermined stable place” (Arendt 2006, p. 93). The child and the adult are not in the same position. This is the reason why, according to Arendt, action cannot play a role on the side of children. This position is criticized by many educators (Meirieu 1995, 2004, 2007; Biesta 2014; Berding 2016). The French educator Philippe Meirieu writes: “According to her [Arendt], education should prepare the child to become a subject; however, one should not yet deal with him as such” (Meirieu 1995, p. 104). Anyone can see the tension here.

We propose to make a difference between political and educational action. In political action, the relationship between actors is nonhierarchical. This is not the case in educational action. A school can only be an educational institution if there is a hierarchical relation between teachers and pupils. The teacher is responsible for the introduction of his pupils into the world. His responsibility makes the difference. This is the reason that teachers and pupils aren't the same. Pupils are the

same, in spite of the differences between them; they are the same in the way the teacher approaches them. He approaches them as capable to be introduced into the world, or in traditional, educational terms: as open to formation (cf. Herbart's statement that "[t]he plasticity, or educability, of the pupil is the fundamental postulate of pedagogics" (Herbart 1913, p. 2)). This doesn't mean that teachers treat their pupils all in the same way. Pupils are different in backgrounds, abilities, and behavior; a teacher should take those differences into account. However, his approach (not his treatment) is the same: all pupils are open to formation. By doing so, he invites them not only to work with the objects the world consists of but also to take up positions, to take initiatives, and to insert themselves with 'word and deed' into the world. These words and deeds reveal the meaning of the objects they deal with, but in doing so they reveal themselves in the presence of others as well. "What matters most," Gert Biesta writes, "[...] is *that* you say something" (Biesta 2006, p. 62). By saying something, the child or youngster reveals and appears, by saying and doing, he can 'be'.

Through action(s), people build up their world. Arendt writes about a "world-building capacity" (Arendt 1965, p. 175). This capacity has to do with the "human faculty of making and keeping promises" (ibidem). Promises and agreements deal with the future and provide stability. Children and young people can't take yet the responsibility for their future. This is the reason that actions in education takes place under the responsibility of the educator. It means that the world-building capacity in educational action is still in budding. Introducing into the world is a process of work and action, but not fully accomplished. It is a process of beginning: a beginning to work ('free work'), beginning actions.

In *The human condition*, Arendt presents the metaphor of a table: "a table [...] located between those who sit around it; the world like every in-between, relates and separates men at the same time" (Arendt 1998, p. 52). In extension to this metaphor, we could speak of the table of the world that teachers install in the school (cf. Masschelein and Simons 2013). On this table they have put the objects ('human artefacts') they want their pupils to get acquainted with and learn to use. In this sense, the table is a working table. But the table with the objects on it is an intermediary as well. The pupils sit around the table under supervision of their teacher; everyone has a different position. Each speaks and acts from the position he takes up: both, *with* the mental objects and *about* the material and mental objects of the world. In this speaking and acting, the world becomes a common world, and, at the same time, each appears in the presence of the other. Arendt calls this humanization. "We humanize what is going on in the world and in ourselves only by speaking of it, and in the course of speaking of it we learn to be human" (Arendt 1995, p. 25).

What conclusions may be drawn from the above about the aim of education? To educate means to introduce the young generation, or in other words: the newcomers, into the world in order to humanize the world and these newcomers themselves. Introducing into the world means letting children work with the objects of the world, but also: speak and act, both with and about these objects. Education is instruction, a matter of tasks and assignments, but it is also a matter of discussion

and dialog: free work and beginning actions. In this free work and beginning actions, the world-building capacity is going to flourish, step by step.

## Education in ‘the In-between Space’ of the School

Natality is the capacity to interrupt and to begin something new (Arendt 1998, p. 246). It is the basis of action. Arendt calls this capacity a ‘miracle’.

The miracle that saves the world, the realm of human affairs, from its normal, ‘natural’ ruin is ultimately the fact of natality, in which the faculty of action is ontologically rooted. It is, in other words, the birth of new men and the new beginning, the action they are capable of by virtue of being born. Only the full experience of this capacity can bestow upon human affairs faith and hope, those two essential characteristics of human existence [...]. (ibid., p. 247).

With the birth of every new generation, there is a possibility for a new beginning. Arendt poses: it bestows hope. This possibility of a new beginning is not evident. A new beginning isn’t possible without being introduced into the world, which means: the old world. Education can’t be other than conservative. The future is up to the new generation. However, first of all, the newly born should be introduced to and grow up in the old world in order to make a new beginning; they must learn to use the objects of this world and make beginnings with working and action in the old world. “Exactly for the sake of what is new and revolutionary in every child, education must be conservative; it must preserve this newness and introduce it as a new thing into an old world [...]” (Arendt 2006, p. 189).

Therefore, Arendt says, school should be a ‘protected’ area. The school cannot be situated in the private area of the home, the area in which only exclusiveness counts, neither in the public area of the adult world where everyone is equal distinguished. The school should be situated in an ‘in-between space’. Arendt states that school is “the institution that we interpose between the private domain of home and the world in order to make the transmission from the family to the world possible at all” (ibid., p. 185). It is not the family (the private world) that requires school attendance, it is the state, that is: the public, adult world. And with this requirement, the adult world takes the responsibility for it. The ‘in-between space’, where the introduction into the world takes place, should be a protected area. The school should protect the new generation against, what Arendt calls, the “full light of the public world” (ibidem), but also against the world of labor that transforms the objects of the world into consumer goods and makes consumers of humans.

Arendt calls this ‘in-between space’ of the school “prepolitical” (ibid., p. 92). However, the school isn’t an island; it is embedded in the current society. The processes that take place in society affect the school. We already mentioned the labor process of production and consumption. The children who enter the school take with them the social sphere in which they live (Putnam 2016). Equality doesn’t count in this sphere; it is “like attracts like” (Arendt 2003, p. 208). The children who enter the school are embedded, like the school itself. However, the educational

mission of the school is not to approach them as members of the group they belong to; its mission is to approach them as pupils: pupils who are ‘open to formation’. From this angle, all pupils are equal, despite the social, economical, and cultural groups they belong to.

Being a prepolitical institution is not evident. The school should fight for it. It should fight for the educational mission it stands for. It is not a commercial, neither a social or welfare institution. It is a prepolitical, educational institution in which all pupils are equal: equal in their openness to formation. However, the school is an embedded institution. The world in which the school is embedded is, as Arendt writes, a world “that is or is becoming out of joint” (Arendt 2006, p. 189). Commercial (“the mode of life of labor”) and social (“like attracts like”) processes jeopardize the public world. A common world is not evident. It must be established, again and again. Arendt speaks of “setting-right” (ibidem). This ‘setting-right’ is a political mission, but it is an educational mission as well. Because the school is an embedded institution, it should ‘set-right’ the educational process that takes place in the school, again and again.

Arendt states that a public area can only exist if it is enclosed. “The law of the [Greek] city-state [...] was quite literally a wall” (Arendt 1998, pp. 63–64). She speaks about a “wall-like law” (ibidem). The public area can only exist and continue to exist when it is enclosed and regulated by laws. This goes for the school as well. The school exists due to a law which regulates the educational process. This law differentiates: between me and you, mine and yours. It is this law that positions actors in relation to one another: the teacher with regard to his pupils, the pupils with regard to each other. Without this law, there wouldn’t be actions, no taking up of positions, no initiatives in response to the initiatives of others; without this law, there wouldn’t be a working-together either. In this sense, the law is indeed a wall, a wall that distinguishes the one from the other. The prepolitical ‘in-between space’ of the school exists due to this ‘wall-like law’. This law is the educational law par excellence. With the help of this law, the school can ‘set-right’ the educational process that takes place in it.

The school in an ‘in-between space’, the table of the world installed in it, the pupils around this table under supervision of their teacher, beginning to work with the objects of the world, beginning to act surrounded by these objects. This is the school Arendt suggests. In this school the older generation takes the responsibility not for only the younger generation but for the world as well. Arendt writes:

Education is the point at which we decide whether we love the world enough to assume responsibility for it and by the same token save it from that ruin which, except for renewal, except for the coming of the new and young, would be inevitable. And education, too, is where we decide whether we love our children enough not to expel them from our world and leave them to their own devices, nor to strike from their hands their chance of undertaking something new, something unforeseen by us, but to prepare them in advance for the tasks of renewing a common world. (Arendt 2006, p. 193).

The authority of the teacher rests on the fact that he assumes the responsibility for the world. But what happens when the world is jeopardized by the consumer and social processes that take place in it, when it is destabilized by these processes,

when a common world breaks up? With this breaking up the authority of the teacher also breaks up. According to Arendt, the crisis in education is rooted in this breaking up. However, the school cannot exist without authority; it cannot exist without assuming the responsibility for the world. A teacher cannot practice teachership without taking up the responsibility he stands for. He must do it, again and again. The French political philosopher Myriam Revault d’Allonnes calls this “beginning to continue, continuing to begin” (Revault d’Allonnes 2006, p. 264).

Beginning to continue, continuing to begin. Wouldn’t be this the educational principle for the schools in our time? Beginning to continue, continuing to begin in order to give the young generation a chance of ‘undertaking something new, something unforeseen’.

## In Conclusion: Bridging the Gap Between Past and Future

Humans live in an interval between past and future (Arendt 2006, p. 10). In our time, there is a gap between past and future, a gap which isn’t easy to bridge. Arendt quotes the French poet René Char: “Our inheritance was left to us by no testament” (ibid., p. 3). In essence, the crisis in education is a crisis of time. Today, in the interval of time, humans miss navigation marks, points of orientation. The past isn’t a supplier of signposts any more. A “pre-established framework of reference” is missing (ibid., p. 5).

What rests is thinking. “Each new generation, [...] inserted between an infinite past and an infinite future, must discover and ploddingly pave anew the path of thought” (Arendt 1978, p. 210). According to Arendt, children and young people are not yet able to think for themselves. Thinking should be done on one’s own, alone, in solitude. Taken from this perspective, the school isn’t a place for thinking. However, the school provides “thought-objects” (ibid., p. 77), mental objects to think with. Introducing into the world means also introducing into the world of thinking: a beginning to think, as a beginning to work and a beginning to act. These beginnings provide the members of the young generation the tools not only to think on their own but also to work together and to act ‘in concert’. So that one day, the present-day boys and girls can bridge the gap between past and future: by thinking indeed, but also by working and acting.

# Dialogue: Buber's Philosophy of Education Revisited

Renato Huarte Cuéllar

## Introduction

One of Martin Buber's students in Germany and a colleague later on in Palestine-Israel was Ernst (Akiva) Simon. In his article 'Buber as an Educator' (1958) he wrote the following:

The building of living wisdom, erected by Martin Buber in ceaseless work, rests on seven pillars. Their names are Bible (translation and exegesis), Hasidism (free versions, faithful reproductions, and narrative form), Zionist politics (planning and critique), social philosophy, philosophical anthropology, comparative religion and education (theory and practice). (45)

Buber's work might seem quite broad and have different aspects, especially those regarding Jewish Thought and History. Buber was also quite interested in Taoism, Medieval Christian Mysticism, among other traditions. Buber was also quite a convinced Marxist, especially with regard to the idea of Utopia and its bond to Anthropology. As a translator of the Hebrew Bible into German started with his friend Franz Rosenzweig, and as the compiler of the Hasidic tales, Buber became a 'medium' to the 'German ear'. As an educator, he was outstanding, not only as a professor at the University of Frankfurt am Main and at the Hebrew University of Jerusalem, but especially as an adult educator at the House of Jewish Learning (better known as the *Lehrhaus*) and in his daily life as an 'informal' educator. In that sense, Ernst Simon says:

There is scarcely a year of Buber's work without its pedagogical appeals and speeches, programmes and institutions, and they are concentrated, in the years of crisis for the world and the Jewish people, with great topicality and density. Nevertheless, it would be wrong to

conclude from the order chosen here that the educational doctrine stood at the peak of his system of thought. Buber has no system of thought and has never claimed to be a philosopher in this sense. The various spheres of application of his many-layered and profoundly penetrating thought do not 'follow' logically one from another. (45)

If Ernst Simon is right, then, how can Buber's educational thought be explained? How is education understood from his philosophical perspective? Why is then Buber considered a great educator?

In this chapter, I would like to show that all of these elements are connected with one another through the idea of 'dialogic philosophy' or the 'philosophy of dialogue'. Although I agree with Simon that Martin Buber does not try to establish a program based on any 'philosophy of education', I will state throughout this chapter that the whole Buberian philosophy has a direct implication in education, not as a strict proposal but as 'dialogue'. This word could be a good summary of other Buberian phrases: 'Pointing the way' and the 'Prophetic view'. By explaining this philosophical perspective, Buber's proposal can still be of great interest for educators worldwide, as well as philosophers and thinkers of education.

## **Buber's Philosophy of Education: 'Pointing the Way' and 'Prophetic Mission' Towards 'Dialogue'**

In order to explain 'dialogue' as a keyword in the thought of Martin Buber in general and with regard to education, I suggest starting from other ideas in order to finally attain what we have just seen in Ernst Simon's words. Thus, let us start with the first phrase: 'Pointing the Way'.

We only have small fragments of Martin Buber's life intendedly. Experience cannot be put together as a continuum. Maybe the life of each philosopher that tries to be coherent with his own way of thinking is vital to understand the philosopher's own proposal. I think that in Buber's philosophy, this is the case. As Maurice Friedman puts it in the introduction to the book *Meetings*, fragments of Buber's life narrated by the author:

These 'events and meetings' are in the fullest sense of the term 'teachings' and perhaps, in the end, the most real teaching that Martin Buber has left us. "I am no philosopher, prophet, or theologian," Buber said at a celebration of his eightieth birthday, "but a man who has seen something and who goes to a window and points to what he has seen." In the highly significant Foreword to his Hasidic chronicle-novel *For the Sake of Heaven*, Buber wrote: "He who hopes for a teaching from me that is anything other than a pointing of his sort will always be disappointed." (Buber 1973: 4–5)

This fragment of his life, a retrospective at 80 years old, is a good way of explaining the notion of 'Pointing the Way', a Buberian phrase that enables him to explain the experience in his own terms. Imagine someone trying to follow the same path as his master or anyone else, in this sense. That would be impossible. Experience is something unique. Even if we try to emulate or even imitate the same passage of our own lives, even with a little change it would be different. Even more so, when we

think about following others, there might be quite a frustration because one experience will never match any other.

I imagine Buber's metaphor about 'pointing the way' in the sense that an educator would always point at his or her own experience as a reference to others, but never with the intention of having the other following his or her own path. Only a mere pointing would be enough in order to 'guide' someone else into his or her own experience, into his or her own path.

This could be much more easily understood if we get a notion of what Buber understands by 'education'. Actually, Buber invented a word in German for one of his most notable speeches: *Erzieherische*. This has the root of *Erziehung*, one way of saying 'education' in German, but with the *-ische* ending mostly used for adjectives.<sup>1</sup> Martin Buber was invited to give this keynote speech to the Third International Educational Conference at Heidelberg in 1925: *Über das Erzieherische*. The speech that was later on written down as an article has been translated into several languages with very different titles.<sup>2</sup>

As Buber puts it in his speech: "The true elements educate him – the air, the light, the life in a plant and in an animal; and the social circumstances educate as well. The true educator represents one and the other; and in spite of his presence, in front of the child, he has to be as one of the elements" (Buber 1982: 11). One may then say that the educator tries to put all the things around the individual, including him or herself, in order for the experience to take place. The educator is a mediator between the individual and the many elements that may be significant for an experience, even from childhood. The educator has to be very careful not to think of him or herself as the essence of education, not even as the 'controller' of the educational act. Experience cannot be repeated, and nonetheless, the conditions for developing those bonds could be fostered. In this very frail line, the real educator has to work. To educate implies pointing a way and not imposing a path already walked, because of experience, according to Buber, is unrepeatable. "The educational function means, a high Askese without rigor towards the world, because of the existence of the responsibility of the dominion of the life that is rendered upon us and in which we must influence, but that we must not be intrusive, neither by the will of power or erotically" (Buber 1982: 15).

This leads to the second Buberian phrase that will lead us to the Dialogical principle: the 'prophetic mission'. Martin Buber was a profound and dedicated researcher of different World traditions, including Judaism. Many say that the influence of his Grandfather, Solomon Buber, a great Jewish scholar, was of utmost importance. Zwi Werblowsky says: "Perhaps it is doing an injustice both to the

<sup>1</sup>That is why I decided to name my translation 'Sobre lo educativo' (a close translation into English could be 'About the educational') keeping the imprecise ending of the adjective form in German as well as the neutral article *das*, plus the root of 'education'. The contents of the text also go in that sense, from my perspective (Buber 2014: 173–204).

<sup>2</sup>For example, in the Hebrew translation made by Tzvi Voiselevsky (Buber 1959) and authorized by Buber himself back at the Hebrew University of Jerusalem, we find the title 'About the educational fact'. Moacir Gadotti and Mauro Ângelo Lenzi (Buber 1982) prefer to translate it into Portuguese with the title 'About the educational function'.

history of religions and to Buber to treat them in one breath. Buber was no historian of religion, and, in the last resort, did not mean to be one” (2002: 166). He continues saying that there could be a number of stages in Buber’s work that cannot be taken as one and adds:

But the constants are no less significant, and one of them is Buber’s *habitus mentalis* as prophet, apostle, and bearer of a message. The message itself may have changed [...], but the stance of the messenger did not. Nevertheless, as a thinker whose literary output dealt largely with the records and great documents of what we call ‘religions’ or spiritual traditions, Buber cannot help coming under scrutiny of the historian of religion who, among other things, studies the ways in which the history of religions can be used as a vehicle for conveying a religious message. (166)

According to Werblowsky, Buber did not mean to be a historian of religions or spiritual traditions but to study the texts, the way they have been written and the possibilities of those traditions in the every-day life. Martin Buber would start with his own tradition, Judaism in general and Hasidism in particular. In Buber’s own words:

When I began my work on Hasidic literature my concern was with the Teaching and the Way. At the time I thought that contemplating them as permissible, but since then I learned that the Teaching exists in order to be learned and that the Way exists in order to walk therein. (Buber 1924: 10–11 in Werblowsky 2002: 167)

A very important remark in this sense is the idea of religious or cultural tradition. For Buber, each tradition has its own way of understanding its ideas, concepts, and other ways of interpreting the World. All of them are represented by words. One might be tempted to assume that a word or set of words within one tradition might be equivalent to another. This might not be the case. This is the main argument in his book *Two Types of Faith: A Study of the Interpenetration of Judaism and Christianity* (2004).

Furthermore, for Buber’s understanding of a tradition, there is no division between the religious and the ‘profane’ like the Christian Church pretended in its own tradition. For Buber, religious traditions are cultural. In his *Paths in Utopia* (1996) Buber explains why ‘utopia’ is important for the Marxist traditions, in the sense that it is prophetic. The ethical emanates from the religious in true dialogue, and not as an imposition. He would very much agree on being against impositions from the religious realm, but not severing cultural traditions. Atheists must not feel ‘fearful’ of Buber’s approach on religion since each tradition has its ethical standpoints. From them dialogue is possible.

In his life, Buber tried to build dialogical bridges to understand each and every perspective: Hasidism, the Hebrew Bible, and continuing with Taoism, Christian Medieval Mysticism, among other. Despite the differences, the common ground is the possibility to ‘listen’ to one another, to learn those differences, and not to assume or impose words or categories upon other traditions. He was willing to ‘encounter’ the other, being an individual that at the same time implies a whole tradition in its being. In this sense, Buber should start with his own tradition. Talking about Judaism

was a starting point for this clarification of terms, and thus, a way in which Judaism could get into dialogue with other traditions.

Having this in mind, Buber understands that these traditions are not necessarily or uniquely 'thought-systems', but rather 'life-systems'. In Buber's words:

To recognize the nature of what we call a 'great civilization,' we must consider the great historical civilizations not at the time of their full development but at an early stage. We shall see that each of them can be understood only as a life-system. In distinction to a thought-system, which illuminates and elucidates the spheres of being from a central idea, a life-system is the real unit in which again and again the spheres of the existence of a historical group build up around a supreme principle. This principle achieves adequate consciousness and articulateness only in sublime moments of the spirit, but its effect pervades, in manifold ramifications and shapes, and, of course, also in varying degrees of intensity, the entire existence of the group. Its fundamental character is always a religious and normative one: a religious one, because it always implies an attachment of human life to the absolute, an attachment that, though susceptible of intellectual comprehension, is essentially concrete, means concrete things, and points to concrete things; and a normative one, because the principle, though always relating to transcendent Being controlling the universe, proclaims that Being as exemplary for man, as that which alone, if imitated by man in his life-attitude and social structure, brings order and meaning into earthly existence, and on whose realization on earth by man depends, in fact, the survival of man qua man. (1967: 191–2)

In this sense, Buber understands the 'religious'. In the Jewish texts, especially the Hebrew Bible, the prophets have specific characteristics: they are able to listen to the Divine and then talk to the people. The prophets were the leaders of the Israelites, but also a political and moral vehicle. Thus, Samuel was in charge of objurgating Saul (1 Samuel: 13–15), and Isaiah talks about a Messianic age to come (2–4). Ernst Simon deals with 'Prophethood' in education in the following way:

No Jew before Buber saw and represented the prophets' innermost life in such a way.

It is his vocational nature of the prophetic mission which makes its agents unfitted to serve as 'educational ideals'. Buber knows this very well, just as he has always decidedly rejected any tendency of the foolish admirer and malicious critic to assign the 'prophetic label' to him. What the prophet has done for education is something else: he himself cannot be imitated, but he stands on the highest step of the 'imitation of God' which is, in fact, the central category of Buber's educational philosophy. That which is imposed on the prophet by the cruel choice of grace – to fulfil God's command to him and the people as faithfully as possible – must be the goal of us ordinary human beings to translate into our own sphere with the utmost effort of will and in hopelessness, if the figure, perfected by the earthly yardstick, did not stand on the horizon, inimitably pointing the way. (1958: 46)

In Buber's thought, the religious has a connection with this World. That connection is a moral and political demand that can be stated on the individual and in the collective spheres. Actually, in Buber's philosophical anthropology, the individual is not the origin or essence of the political model, but rather the community. In any case, the prophetic mission is an ethical one. Thus, we will now see the Dialogic implications of Buberian education.

## Dialogue as a Fundamental Issue in Education

For Martin Buber, in the perspective of the human being, there are couples of words that enable us to approach the world. It is through words, in this case, through these couples of words that we can approach experience. These couples of words are not something else outside of the experience. They are the experience itself. The first couple of words is 'I – Thou' (*Ich – Du*). The second one is 'I- it' (*Ich-Es*). According to Buber, "If *Thou* is said, the *I* of the combination *I-Thou* is said along. If *It* is said, then the *I* of the combination *I-It* is said along with it. The primary word *I-Thou* can only be spoken with the whole being. The primary word *I-It* can never be spoken with the whole being" (1958: 3).

This way of understanding the World taking language as its basis is characteristic of Buber's way of seeing what happens around us (*Weltanschauung*). When one person is speaking, the existence is made possible since our relations with the World are exposed in them. The 'being' is 'becoming'. Buber cannot accept the duality of the experience by being divided in 'internal' and 'external'. For him, "It is said that man experiences his world. What does that mean? A man travels over the surface of things and experiences them. He extracts knowledge about their constitution from them: he wins an experience from them. He experiences what belongs to the things. But the world is not presented to man by experiences alone. These present him only with a world composed of *It* and *He* and *She* and *It* again" (Buber 1958: 5).

Taking into account this premises, as experience, the World, according to Buber, is part of the basic word 'I-it'. The basic word 'I-Thou' is part of the World of relationship. Our thinker explains that, according to his point of view, there are three levels of relationships. The first relationship is the one that is given with the World where we see the creatures that inhabit it in a pre-Linguistic relationship. In this way, we are unable to relate to these beings. On a second level, there is the relationship between human beings, in which we use language. Due to language one human being "can give the 'you'" to another human being. It is language that enables human beings to connect in a way. The third level of relationship, according to Buber, includes the ones that are not based on the articulate language. There is no linguistic contact. We do not perceive them, and thus "we feel we are addressed and we answer – forming, thinking, acting" (1958: 6).

His dialogic proposal is based on the idea of the encounter with any expression of the world as a totality. To have an encounter means to have a meeting with totality. To be related is to be bound to the other as a holistic possibility of sense in which by saying 'thou/you' we are willing to come in touch with the other, without partialities.

We might understand education if we see in the "development of creative powers" (Buber 2002: 98) within the individual what Buber sees in the child. Children are always willing to develop different activities (1959: 240), and this determination is what enables to give form to matter. This is only possible within a human context, as a fundamental condition for the individual. Buber explains it with the metaphor of a choir (Buber 1959: 241) that I might just as well expand in order to explain in a better way the contents of the conference.

There is no such thing as a song that has been badly put together or a badly organized symphony taking into account the individual voices. But it is very important to point out that harmony is not achieved only by hearing the individual voices. Even in the cases when we get to hear a solo, there is a silence from the rest of the participants of the choir. In order to hear one voice, it is necessary to pay attention to other voices. A silence of the rest of the voices of the choir is necessary in order to hear the individual voice. The instruments have to be silent in order to hear the solo of a specific instrument. Much attention is needed in any case, either to be able to sing a solo or to be quiet and be silent for the time needed.

This ability of human beings to go into a relation and to be aware of the other enables 'choirs' to exist. This is the way to reveal "the true life of the human being" (Buber 1959: 242). From this perspective it might be impossible to think about living without taking into consideration the rest of the voices. In Buber's words, the project of the individual and the project of being aware of the other are different from one another. The individual has to be able to consider him or herself, but only when we understand the collective participation, the utmost importance of the being is revealed. The person exists due to the others in a dialogical perspective.

The importance of the being is not given by the perspective of the self per se, but rather within the relationship of one individual to the other. "Only when someone takes someone else by the hand, then we are not in a relationship of a 'creator', but rather in a relationship of creating from his or her own nature in the world, not aiming the art of crying, but as a friend, lover, knows that in his or her heart there is reciprocity with whom he or she belongs. An educational fact that does not seem to repair the creation of the birth of things, will find in its future the conviction of a new loneliness in thinking" (Buber 1959: 243). Dialogic education in Buber's perspective implies the recognition of the other, the avoidance of his negation. By recognizing that my own existence depends on the recognition of the existence of the other, there might be a sort of dialogue in which the 'self' is unable to find itself in a relationship with the other. Nonetheless, there is a real dialogue in which, like in the chorus, one understands him or herself by the relationship with the other. The voice of the other, as well as his silence, enables my voice to be heard. When I have been able to understand this simple fact, then I am also able to understand that my silence is needed for other voices to be heard. The relationship between my voice and the rest of the voices must come into balance or tension, up to a certain point, in order to attain harmony.

That is the role of the educator, to be the director of the choir or a conductor. But maybe, just as the conductor, the only way to get to be the one in charge of the baton, and of the whole orchestra or choir, one has to understand what implies to play an instrument or even to play several instruments. Maybe one has to be able to learn how to play several instruments and then understanding the responsibility of the union of voices as a totality. From this dialogic perspective, the totality of voices must be given in a full way, to the child and to human beings in general.

## Evaluating Buber's Dialogue in Education Nowadays

Although I agree with Buber's idea that he himself was no prophet, his teaching, though only 'pointing the way', is even more relevant for the twenty-first century. The philosophy of Martin Buber has to be understood as a totality, despite all the variations in his thought throughout the years. Nonetheless, I will try and explain why following the three Buberian phrases: 'Pointing the Way', 'prophetic mission', and the 'Dialogic Philosophy'.

According to Buber, the experience is fundamental in any educational process. The role of the educator changes with this perspective. One is a part of the person's *milieu*, just like the objects, plants, animals, and other human beings. The intentionality of the educator has to be thought as a mere organizer of the elements provided for possible experiences. The educator (teacher, parent, etc.) has to think of making as rich as possible the environment. He or she is not the center of attention, nor the source of the educational process. I think that educators nowadays, even after many years of different ideas centered on the student, still might think of themselves as the source of knowledge, for example. Buber's ideas also enable us to rethink that the person has no essential being. Not even things, animals or plants are essential in themselves, but part of the world for the other beings. Even God, as the absolute Being, is part of that relationship with the others. Buber calls it "the eternal Thou" (1958).

The relationship between two people is the basis for educability (*Erzieherische*). Buber invents the term in German because I think he wants to lessen the essentiality of human beings as individuals. It is in the community and the relations among its members, and among communities, that we are able to educate human beings. As old sages of any culture, our aim must be only to 'point at a way', at a path we have trodden and only this. We must not pretend to let others follow our own steps, but rather that our experience, as a part of our own complete self may help others on their way.

This community, according to Buber has a perspective of the Divine. Within Buber's way of thinking and according to his own tradition, the 'prophetic mission', in the first place, bonds the 'religious' aspects of the tradition it belongs to. It enables, as well, to open up the tradition as a whole to the possibility of studying itself and its cultural, ethical, political, social, etc. components and its development within its own terms and definitions. In this sense, the 'prophetic mission' is a way that is much needed, from my perspective, in the twenty-first century.

In a world that thought that by eliminating religion a true dialogue would take place, Buber's thought tells us that the contrary might be the option. Knowing one's own tradition in depth makes understanding other traditions possible, especially from the issues that are not shared, but being always willing to accept and understand those issues. Phrases like "All Muslims are terrorists," "All Mexicans are rapists," and other ones politicians around the world carelessly pronounce is a sign that specific (large) sectors of world societies are not willing to hear from the others. The prophetic mission is to be able to say 'no' to slogans that win elections, such as: "All

foreigners should leave.” The ethical and political standpoint of the Biblical prophets is a way of understanding Dialogue.

Finally, the Dialogical perspective in Buber is not just a concept, but rather his whole philosophical standpoint. Actually, as I have tried to show previously, the possibility of encounter is what enables the human being to relate, and by doing so, to connect to the world that surrounds him or her. This dialogue does not necessarily is linguistic. And nonetheless, it enables the thing to be possible. I would like to finish with an anecdote told by Zwi Werblowsky about encounter and dialogue that I think is most relevant to our century:

For Buber, if I may say so, the essence was not really essential. Let me conclude, therefore, with a story that brings Zen and Buber together in Jerusalem, and which I heard from one of our generation's great Zen masters. It is the story of a fruitful misunderstanding, and of an encounter in which one participant did all the talking, the second participant did all the listening and the third participant did nothing at all.

The Zen master was invited on a tour around the word by an ardent American admirer. When the two came to Jerusalem they called on Buber. The American talked, Buber listened, and the Zen master sat in silence. With great verve, the American held forth that all religions were basically one, different variations on an identical theme, manifold manifestations of one and the same essence. Buber gave him one of his long, piercing looks, and then shot him the question: “And what *is* the essence?” At this point the Zen master could not contain himself: he jumped from his seat and with both hands shook the hands of Buber. (2002: 172–3)

## Conclusions

The house that used to be Martin Buber's in Germany is now the headquarters of the International Council of Christians and Jews (ICCJ). In that house, but also at Buber's house in Jerusalem, many encounters were possible. In Heppenheim, Rabindranath Tagore and Albert Einstein met. Buber had an interesting correspondence with Mahatma Gandhi and many others. Buber's house was always open to encounter and dialogue. Maybe, through his ideas on education, we could attain real dialogue among human beings and cultures. Even an educator that conceives him/herself as completely ‘secular’ might be willing to admit that dialogue is possible with the tradition(s) that each person pretended to be educated has.

## Introduction

One of the tasks in (re-)presenting a philosopher of the present, like Judith Butler, and discussing her relevance for a Philosophy of Education here, is her own thinking being *present*. This means her thoughts and conceptions are not only being currently in a very dynamic and almost overwhelming sense ‘present’, as there is *new reception* of her work constantly *spreading* in the humanities, especially in philosophy, political, and queer theory (see for instance Benhabib 2013; Choi 2013; Chadderton 2013; Ferrarese 2011; Stoerzler 2005; Youdell 2003; Fraser 1997). This also means Butler’s theorization is constantly *in progress*, while she is publishing new books and essays (like lately *Senses of the Subject* and *Notes Towards a Performative Theory of Assembly*, both 2015a, b), producing the difficulty that there is no defined or finished corpus of her work available at the moment, to rely on from a retrospective perspective. And to discuss the work of a ‘present’ philosopher like Judith Butler here means to discuss a work that itself also *consists of responses* to such receptions and critics of her work, inspiring Butler to rethink her own thoughts, to sharpen them, and to shift them in the present and hopefully in the future as well. Accordingly, as we try to highlight some of her inspiring and impressive thoughts here, this contribution is also one serving as another occasion to follow Butler’s thoughts, to further discuss them, and to shift them in the context relevant for a Philosophy of Education, though the idea to catch up with it in such a discussion needs to be suspended.

## Four Lines of Thought

Without any doubt, Judith Butler is one of the world's most popular and inspiring recent philosophers with a wide spreading reception within academia, especially in the humanities, but outside of academia as well. She is an US-American philosopher dedicated to 'poststructuralism', holding the Maxine Elliot professorship in the Department of Comparative Literature and the Program of Critical Theory at the University of California at Berkeley since 1998. In addition, she holds the Hannah Arendt Chair at the European Graduate School (EGS), Division of Philosophy, Art and Critical Thought in Switzerland, and is often invited as a guest professor at several universities throughout Europe.<sup>1</sup>

Born in Cleveland, Ohio, in 1956, Butler was raised in a Jewish family and from an early age was in contact with and impressed by the teachings of Buber, Hegel, Kant, and Spinoza in synagogue and philosophy classes. She later studied philosophy at Yale University and was awarded a Ph.D. in 1984 for her dissertation *Subjects of Desire: Hegelian Reflections in Twentieth-Century France* (Butler 1987), already revealing her philosophical involvement primarily in German Idealism, Phenomenology, and the work of the Frankfurt School. In 1990, she received wide recognition for her most famous book *Gender Trouble: Feminism and the Subversion of Identity* (1990), in which she challenged and enriched Feminist Theory by questioning founding categories such as 'woman', 'sex, and 'gender' or, more generally speaking, 'identity'. Overviews of her work, since it is an always renewing suggestion to rethink central and founding categories of modern philosophy, especially concerning questions of the subject and even more questions of autonomy and heteronomy for subjectivity.

Speaking from our point of view, there are four lines of thought central to her thinking and work that we would like to systematically outline and differentiate in the following (although these lines are obviously founding this work as a whole and intervene each other). We also briefly comment on the four lines afterward in their significance for the debate in pedagogy and especially in the philosophy of education. These lines are: (a) impacts on Gender and Queer Theory; (b) questions of contingency, difference, and performativity; (c) theories on the subject, subjection, and subjectivation; and (d) ethical and political implications.

### *Line One: Impacts on Gender and Queer Theory*

As already mentioned above, Butler was internationally recognized in the 1990s for *Gender Trouble* (1990), provoking a discussion of the fundamental categories of Feminist thought. Since then, Butler's name has been associated with the notion of

---

<sup>1</sup>For more biographical details, insight into her academic and nonacademic commitments, the prizes she won and a full bibliography of her work, see her university homepages: [http://complit.berkeley.edu/?page\\_id=168](http://complit.berkeley.edu/?page_id=168), [www.egs.edu/faculty/judith-butler](http://www.egs.edu/faculty/judith-butler), [www.egs.edu/faculty/judith-butler/bibliography/](http://www.egs.edu/faculty/judith-butler/bibliography/)

Gender or Queer Theory; she is already developing in *Gender Trouble* as much as in the following books *Bodies That Matter: On the Discursive Limits of 'Sex'* (1993), *Excitable Speech: A Politics of the Performative* (1997b), *Psychic Life of Power: Theories on Subjection* (1997a), and *Undoing Gender* (2004a): the idea to denaturalize the division as well as the binarity of gender-conceptions and gendered identity and to incite and reveal other ways of *performing* gendered identities, and in doing so subversively questioning culturally dominant ideas of what 'gender' is and means.

From our point of view, Butler outlined two major tasks since *Gender Trouble* to rethink 'gender' in a way that inspired and provoked the foundation of Gender and Queer Theory: firstly, she disturbed feminist thinking in their quite newly division in 'sex' (biological gender appearance) and 'gender' (social gender appearance). While most gender theorists, at the time *Gender Trouble* occurred, were engaged in thinking of 'gender' as a socially constructed one, outlining the ways of 'doing gender' (West and Zimmerman 1987) interactively and practically, they perceived 'sex' as the biological and bodily bound category of gender itself, sometimes perceived as more or less 'natural', or if not, as essential at least for political collaboration and intervention.

Within this discussion, Butler interrupted with the idea that not only are gender-identities socially constructed, but the idea of bodily viewable gender-divisions are likewise social constructions, questioning *who* is speaking or can speak in the name of a 'woman' as well as questioning the category (as political) itself. She therefore states that there is no such thing as a 'natural', 'biological' 'sex', because there is no other way *to read or to live a gendered body as a gendered one*. This means no living or reading of a gendered body is possible without relying on a discourse that already circulates certain norms and regulations of gender-identity and gender-division (for instance into 'men' and 'women'). Or, as Butler herself puts it: "to understand gender as an historical category, however, is to accept that gender, understood as one way of culturally configuring a body, is open to a continual remaking, and that 'anatomy' and 'sex' are not without cultural framing (as the intersex movement has clearly shown)" (Butler 2004a: 9f.).

Secondly, and associated with this first advice, Butler reveals a "heterosexual matrix" (ibid.) underlying such 'natural' gender-divisions (in 'man' and 'woman'), that is directly linked to acceptable and unacceptable relations with desire. Butler criticizes not only the dominant norm of binary gender-division itself, but also the norms of heterosexuality arising with it. Or, to put it differently, she criticizes the way gender-division is tied to a 'natural' orientation of heterosexual desire, suggesting that being a 'woman' and being perceived as a 'woman', for instance, is secured by an adequate performance of gendered identity implying the performance of an appropriate desire for 'man'. In her own words, she reminds us: firstly, "[s]exuality does not follow from gender in the sense that what gender you 'are' determines what way of sexuality you will 'have'" (Butler 2004a: 16); and secondly, "being a certain gender does not imply that one will desire a certain way" (Butler 2004a: 1). What Butler suggests here is to realize the (potential, but socially disadvantaged) contingency in relating 'gender', 'sex', and 'desire' to one another and therefore to

unlock or open up the cultural frames associated with that linkage, stretching the limits of performance and using the options of performativity of speech acts and acts in general.<sup>2</sup>

Even though the arrival of Judith Butler's works certainly marks a break within gender discourse, insofar questions of justice are primarily no longer introduced and discussed as questions of equality, but rather as questions of difference (cf. Benhabib et al. 1995; also Webster 2000), even though and despite this break, Butler's thought is not received by a larger circle of pedagogues until later and is then mainly advanced by a younger generation of thinkers (especially within the German discourse cf. Fritzsche et al. 2001; Hartmann 2002; Plößer 2005, as well as notably Hark 2005). Alongside a greater interest in questions relating to the body and its meaning (e.g., in the context of pedagogical interactions and institutions, cf. Langer 2008), questions related to heteronormativity (cf. Atkinson and DePalma 2009) and the development of the child's sexuality (cf. for example Renold 2005 and Youdell 2005 as well as Renold et al. 2015) gain greater prominence. In doing so, the deconstructive engagement with 'gender' and advocating 'a plurality of lifestyles' (Hartmann) is guiding most debates.

### ***Line Two: Questions of Contingency, Difference, and Performativity***

From the late 1990s on, Butler is also questioning the methodological implications of such an idea of performance and performativity, thoughts that she is already relying upon in her work concerning gendered identities. In her early thinking of *Contingent Foundations* (1992: 3–21) there is an idea of contingency, of opposing universalism, which she is later clarifying and developing further – for instance, in discussion with Ernesto Laclau and Slavoj Žižek (Butler et al. 2000). As a first step, the term 'contingency' outlines the idea that no recent thinking or (political) opinion can be reasoned by or founded in any recent substance or substantial thinking, because there is no safe ground, no a priori, no foundation, unless you rely on the genealogical viewpoint that thinking of 'contingency' means to think of any word and any subject as something, that it is what it is because of a certain historically and culturally formed development of thoughts, also suggesting that it *could* be otherwise as well.

Coming from this insight, as a second step Butler begins "to interrogate what the theoretical move that establishes foundations *authorizes*, and what precisely it excludes or forecloses" (Butler 1992: 7, emphasis in original). She argues that because none of these foundations are 'given' stable and a priori, because they are not transcendent or 'natural', it is essential to reveal a "negativity at the heart of identity" (Butler et al. 2000: 2). This 'negativity at the heart of identity' also implies thinking

---

<sup>2</sup>Though not elaborated here, there is a shift in Butler's attention on *bodily performance* in her earlier books to an *speech act theory based understanding of performativity*, relying on Austin as much as on Derrida, especially discussed and developed in *Exitable Speech* (1997b).

of any identity as founded in difference (with others and itself), which reveals her methodological point. Relying on such an unstable idea of identity allows her to point out the way in which hegemony is established by constructing an (obviously particular) universality as a ‘universality’, something out of question and contingency.

This idea of a hegemony established and stabilized by a (non-) universality suggesting itself as the latter offers insight in two central thoughts of Butler’s idea of performativity: first, that any ‘given’ norm, regulation, or hegemony needs to be stabilized or – in Derrida’s words – needs to be (re-)iterated to become and to appear as ‘given’ or ‘natural’; and, second, that there is an historical line of that process that can be reconstructed and that is implicitly actualized, but that can also be questioned by actions revealing the particularity of that ‘universality’. Constructing hegemony or universality is in that sense not an over expanded or ‘wrong’ construction, but a very powerful or inevitable way of privileging an (at least) particular position, rejecting and excluding others or other potential, but also particular positions. Therefore, Butler suggests in her earlier work: “The only democratic society is one which permanently shows the contingency of its own foundations” (Butler et al. 2000: 86), revealing a way of thought being (radically) democratic, where identity is always haunted by difference, where contingency is always present, and where the unstableness of that construction (of democracy) is viewable. This methodological thinking of the difference – obviously Derrida-inspired – seems to be altered and shifted to the relevance of relation(s) and of human beings being in relation to others and the Other in her later political essays, such as *Precarious Life: Powers of Violence and Mourning* (2004b) or *Frames of War: When is Life Grievable?* (2009).

Even though there have been efforts toward a poststructuralist type of pedagogy since the 1990s (especially in Anglo-American discourse, cf. for example Peters 1996), these do not or very little pick up upon Butler’s work (cf. Peters and Burbules 2004 and Smith 2010; differently Fritzsche et al. 2001). Here, too, the debate begins relatively late (cf. Davies 2008; Ricken and Balzer 2012) and is in part mostly focused on questions relating to the sociology of education (cf. Hey 2006; Youdell 2015). But within the philosophy of education, Butler’s work has become increasingly important to postmodern or poststructural thinking with regard to the subject (cf. more detailed next chapter); especially Butler’s critique of common understandings of ‘identity’ and ‘contingency’ has challenged rethinking the discussion of the ‘human being’, especially within the traditional brand of the philosophy of education, and also to become cognizant of the powerful charge and absence of neutrality in these terms.

### ***Line Three: Theories on the Subject, Subjection, and Subjectivation***

Also already implicit in Butler’s early thoughts on Gender Theory was an idea of the constitution of the subject, as deeply relying on the Other, on discourse and its norms; an idea or better a theory of subject formation she has since followed and

extended, underpinning her philosophical essays as much as the political ones. Especially in *Psychic Life of Power* (1997a), she focuses on the question of subject formation and subjection, revealing the ways the subject is *socially* constructed or constituted. Concerning the subject, Butler insists on two fundamental insights: first, subjects are not ‘given’ as subjects (see above), but they *undergo a process of subjection* to appear as such ‘subjects’ in public, suggesting that they *can* only act and speak ‘freely’ *as* subjected ones. And these subjects’ appearance – as she suggested concerning a “woman” (see above) – is a deeply socially restricted one, though it requires the appearance as being ‘free’ individuals. Obviously relying on and following Foucault’s thoughts, she states “that the point of modern politics is no longer to liberate a subject, but rather to interrogate the regulatory mechanism through which ‘subjects’ are produced and maintained” (Butler 1997a: 32). Because the norms that define who is viewable as a ‘subject’ are not made up individually but rather need to be actualized by others to allow a ‘subject’ to emerge, Butler’s subject is an obviously related and dependent one.

And secondly, to think of such a subject constitution as socially framed and in dependence of others, interpolating the subject as such, Butler is also doubling back to Hegel. On the one hand, Hegel offers a conception of the powerful bondage (between lord and bondsman), a conception of “the production of self-enslavement” (Butler 1997a: 34) or the constitution of an “Other”, a body being produced “as an effect of autonomy [...] in such a way that the activity of its production – and its essential relation to the lord – is denied” (Butler 1997a: 35). On the other hand, Butler relies on Hegel to reveal the (desiring) subject’s attachment to the ways one is *recognized* by others, for instance when she argues that “the Hegelian tradition links desire with recognition, claiming that desire is always a desire for recognition and that it is only through the experience of recognition that any of us becomes constituted as socially viable beings. That view has its allure and its truth, but it also misses a couple of important points. The terms by which we are recognized as human are socially articulated and changeable. And sometimes the very terms that offer ‘humanness’ on some individuals are those that deprive certain other individuals of the possibility of achieving that status, producing a differential between the human and the less-than-human” (Butler 2004a: 2). It is not only a certain dependency or vulnerability Butler insists upon, characterizing the fundamental relation to the Other at the heart of subject formation, but again she also points out – leaving Hegel behind – the normative work of differentiations, underpinning the recognizing act itself, marking who is and can be perceived as ‘human’ – and who is not. Butler suggests that as ‘subjects’, we are in a status of “involuntary exposure” (Butler 2015a: 16) in a double sense; that is, to others, in being impressionable to their offers of recognition as much as desiring such offers, as well as in being vulnerable to the very forms of (mis-) recognition they offer. Therefore, subjectivation, as Butler puts it, implies both, on the one hand to be identified (and identifiable) as ‘someone’ (by others) and on the other hand to be constituted within that logic and terms of others, forming a certain, at least ‘dispossessed’ relation to ‘oneself’.

With regard to the debate in the philosophy of education, especially when debating a poststructuralist understanding of the subject, Butler’s thinking has become a

central point of reference, insofar the increasingly widespread use of the concept ‘subjectivation’ is not fathomable without Butler’s interpretations of Foucault and Althusser (cf. Youdell 2006; Saar 2013). Especially in the discourse of the powerful constitution of the self (cf. Rose 1996), her understanding, where she tied agency and heteronomy together in the pedagogical relevant figure of subjectivation, gained great significance – and in doing so however she points out that these two concepts are not only intertwined, but dependent on each other (cf. Davies 2006 and Rasmussen 2006 as well as Rose 2012). At the same time, Butler’s deliberations touching on subjectivation have encouraged reflection on recognition; in terms of the philosophy of education this included working out an understanding of (pedagogical relevant) recognition and to open such an understanding up to empirical research (see Balzer and Ricken 2010; Ricken 2013; Balzer 2014; Rose and Ricken 2018).

### ***Line Four: Ethical and Political Implications***

From this conception of an impressionable and subjected subject (in formation) Butler draws out, especially in her later work like *Precarious Life* (2004b), *Giving an Account to Oneself* (2005), *Frames of War* (2009), and *Notes towards a Performative Theory of Assembly* (2015b), some ethical and political implications of those thoughts. From our point of view, her political and ethical suggestions are derived from two central insights: first, as outlined already in line two, there is strong emphasis by Butler to conceptualize the world as a radically *socially* conducted one, a social world and its language that is always prior to a single subject’s occurrence and build up in a specific historical manner, but nevertheless one that is also in need of subjects who act and keep on acting, in order to stabilize and reiterate the norms constituting this (social) world. Though this seems to be a very deterministic view at first sight, Butler insists clearly on the political implication of performativity in social life, of the *constant need and chance to reiterate the conditions of sociality*. As already stated above in line three, she argues, for instance, that the terms of recognition offered and displayed as much as other terms, helping us to perceive this world and our status in it, “are socially articulated and changeable” (Butler 2004a: 2), and the political promise of performativity in social life is directly related to this, at least historical and therefore changeable, character of the social world itself, where every act or speech act is (potentially) a *re-signifying* one. Or as Butler suggests, a politic of the performative exploits the possibility of “opening up the term [here: ‘human’, NR/NR] to a history not fully constrained by the existing differentials of power” (Butler 2004a: 14). Secondly, there are some even more general ethical thoughts dedicated to the idea of dependent subjects and their conditions of possibility in Butler’s work. Again, she points out on the one hand that there is a radically, but denied and unmourned, at least *involuntary dependency on otherness* structuring any constitution of the subject as ‘individual’. Mainly relying on Levinas, Butler argues, “[w]here the ethical does enter, it seems, is precisely in that encounter that confronts me with a world I never chose, occasioning that affirmation

of involuntary exposure to otherness as the condition of relationality, human and nonhuman” (Butler 2015a: 16). From this exposure, a fear and a responsibility facing the Other emerges, upon which her ethical implications rely. And on the other hand, she also insists on asking, “Am I responsible for all others, or only to some, and on what basis would I draw that line” (Butler 2009: 35), asking again for the differentials defining ‘humanness’ that are viewable through taking account of, for instance, whose lives are worth mourning in times of global ‘war on terror’. Again, she suggests to realize *where* ‘we’ draw that line, questioning the line itself and also provoking questions such as, who belongs to that ‘we’ and why (see also Butler and Spivak 2007). In the end, these ethical implications involve line two again, in remembering every ‘I’, every stakeholder of identity, to the fact that this ‘identity’, like other terms of self-assurance, are always and deeply (dis-)possessed by the Other, founding a dependency any ‘I’ could ever undergo, while structuring its topography of desire: desiring the (recognition of the) Other, desiring the desire of the (recognition of the) Other, and desiring the (recognition of the) Other to be desirable (to third parties).

Especially the political and ethical implications of Butler’s work have let their mark on general pedagogy and the philosophy of education. Namely, in debating questions regarding the reproduction of social inequality within pedagogical institutions, on the one hand, as well as regarding the meaning of (educational) equality, on the other hand (see e.g. Youdell 2009; Chadderton 2013; Kleiner and Rose 2014).

## The Problem of Becoming a Subject: Subjection and Subjectivation

As outlined above, Judith Butler’s work is not only already complex and comprehensive, but also a very stimulating and inspiring source for a philosophy of education.<sup>3</sup> From our point of view, Butler’s central contribution for a discussion within educational sciences and especially in philosophy of education is her theory of the subject and of subjection and subjectivation (line three, above). No matter in which way you think of and design the educational task or relation theoretically, it is more than obvious that there is a concept of the subject previously involved and needed. And – already outlining a central thesis we develop and rely on later in this chapter – Butler’s way of rethinking the category of the subject and revealing the forces and sources of subject formation is challenging the dichotomy of heteronomy and autonomy that have influenced educational thinking since the Enlightenment.

---

<sup>3</sup>For instance, relying only on the German context this is suggested lately by the works of Nicole Balzer, Bettina Kleiner, Kerstin Jergus, Hans-Christoph Koller, Norbert Ricken, Nadine Rose, and Christiane Thompson, for an overview see Ricken and Balzer (2012), Kleiner and Rose (2014), and especially Jergus (2012) for Butler’s reception in Germany. For instance, a special issue of the *British Journal of Sociology of Education* (David et al. 2006) is giving an overview on Butler’s reception and her relevance for educational thinking in the UK as well.

What Butler's theorization of subject formation and subjection suggests are two simple but nevertheless very challenging thoughts: firstly, that references cannot be made to a 'subject' until that 'subject' is addressed as a 'subject', revealing that any 'subject' needs to be called into existence by others and is related to a nexus of discourse far larger than the constituted 'subject' itself; and secondly, that there is no neutral 'subject' and no way to emerge as a neutral 'subject' because any emergence of a subject is orchestrated by and relies upon an historically formed matrix of difference(s) or better, differentiation(s), where normative obligations are implied, especially and foremost: becoming a gendered 'person' with an 'appropriate' desire, but also a racialized one, etc.

From this first loose and abridged summary of what Butler's theory of subjection and subjectivation is about, it is already viewable that the question of gender, or the line of queer-feminist thinking, within Butler's philosophical theorizations is crucial, with nothing being completely overcome in her later work, where obviously the connection of ethical and political concerns moves, for instance, to current phenomena, such as 9/11, the Palestine occupation (see *Precarious Life, Frames of War*, and *Giving an Account to Oneself*), or movements against precarity (and capitalism) (see *Notes towards a Performative Theory of Assembly*). In order to reduce complexity without losing the crucial concerns of Butler's thinking, we focus in the following on systematically reconstructing Butler's theory of subject, subjection, and subjectivation because we consider it to be the heart or center of her theory, where all the above mentioned lines of thought intervene. Starting from that theory of the subject in subjection, we would like to show within this chapter how these four lines of thought are interwoven.

### ***Subject Formation as Subjectivation***

Normally, if we think about the status of the subject, we are used to thinking of it as natural and self-evident, revealing that the subject itself is more or less a precondition of thought, usually passing from our view; since Descartes, the assumption 'cogito ergo sum' functions like a crucial starting point of Western philosophy. Exactly, this transcendental understanding of the subject, especially linked to (post-) Enlightenment philosophers, was threatened and questioned, first by Nietzsche and later by Foucault; Butler is following in their skeptical line. Therefore, she is, like Foucault, interested in revealing the *conditions of possibility* for the subject to emerge, more precisely: in asking *how* human beings *are becoming* 'subjects' or "made subjects" (Foucault 1982: 208) at all, and which implicit (self-)limitations and normative implications are obliged to that process of becoming.

The perspective of inquiry associated to Butler's (nonsubstantial) understanding of 'the subject' is obviously a very fundamental one, asking "how each of us becomes thinking and speaking beings" (Butler 2012: 15). And she attempts to shape her theoretical idea of this process of 'becoming a subject' throughout her sophisticated work in order to describe it more and more precisely. Already in

*Gender Trouble*, she articulates a fundamental critique on thinking of identity in substantial terms and questioning the binary conception of sex and gender (and desire). She states, “inasmuch as ‘identity’ is assured through the stabilizing concepts of sex, gender, and sexuality, the very notion of ‘the person’ is called into question by the cultural emergence of those ‘incoherent’ or ‘discontinuous’ gendered beings who appear to be persons but who fail to conform to the gendered norms of cultural intelligibility by which persons are defined” (Butler 1990/2007: 23). She therefore argues that the constitution of gendered identity is a *performative* action, but its central effect is the impression of just expressing the ‘natural’: ‘normal’ sexes and genders are both the product of a normative process of constitution, but appear as ‘given’ and ‘stable’, invisibly producing and restricting the ‘Other’ and the sphere of division itself. In her early works (such as *Gender Trouble* and *Bodies That Matter*), Butler is already arguing, following Foucault, that there is a heterosexual matrix (and an appropriate expectation of cross-gender desire) founding and forming the ‘natural’ bodies and genders of ‘men’ and ‘women’ as such. And this also implies that any subject that wants to be considered ‘normal’ or ‘distinct’ regarding its gender-identity has to subject itself to that matrix and its associated norms, while Butler is asking for possibilities of a “disruption and displacement of heterosexual hegemony” (Butler 1990/2007: 25).

Butler suggests that normative discourses circulate within society and that the categories (e.g., of binary gendered identities) involved in them are the opportunities of the subject to emerge as ‘human’. Or, to put Butler’s thesis differently, to offer and to assign the status of a ‘subject’ is linked and bound to the question of whether one is recognizable as a ‘normal’ or ‘human’ subject, including the impression of its ‘normal’ performance as a (coherent and distinct) gendered person, in public. Accordingly, anybody (or any body) whose body, desire, or gender (performance) is viewed as not serving those expectations of ‘normality’ is defined ‘un-normal’, ‘nonhuman’, or just inadequate and inferior, revealing not only the force of adaption within the discourse (and the heterosexual matrix), but also how differentiations and any establishment of an order is producing its constitutive ‘Other’s’, creating repressed figures of abjection that need to be kept outside. Accordingly, Butler concludes that “gender norms have everything to do with how and in what way we can appear in public space” (Butler 2012: 17).<sup>4</sup>

In the line of Foucauldian thinking, Butler implies that discursive conditions and norms are circulating the frames of – and are therefore framing – intelligible subject constitution. Indeed, in her following work she is longing for a more generalized perspective (not solely concerning gender) on such processes, asking “what are these norms, to which my very being is given over, which have the power to install me or, indeed, to disinstall me as a recognizable subject?” (Butler 2005: 23).

---

<sup>4</sup>Already in *Gender Trouble* Butler was – in terms of footnotes – taking other lines of difference (beyond gender) into account, but especially race (and religion) she considers broader in her later works, such as *Exitable Speech* (Butler 1997b), *Precarious Life* (Butler 2004b), *Frames of War* (Butler 2009), or *Who Sings the Nation-State?* (Butler and Spivak 2007).

As Butler – always re-reading Foucault – suggests, the crucial point in thinking of subjectivation is to capture a paradoxical figure (with)in such subject’s formation process: “The term ‘subjectivation’ carries the paradox in itself: *assujettissement* [Foucault’s original French term, NR/NR] denotes both the becoming of the subject and the process of subjection – one inhabits the figure of autonomy only by becoming subjected to a power, a subjection which implies a radical dependency” (Butler 1997a: 83, emphasis in original). The paradox consists of the idea to view the subject, which was within the philosophical tradition the knowing agent of free will and morality, the individual who is responsible for its own action and acting autonomously, as now being subjected to and by prior discursive norms orchestrating its being. But Butler also insists that although there is obviously a strong and prior dependency underlying this subject formation, this does not make agency impossible, but rather changes the idea of agency, itself, too. From Butler’s point of view, agency is not only a way of using the power that prior subjected the subject, but is using it in a way that does not support subjection any further, although there is no opportunity to eliminate that subjection. This is why the subject itself, from Butler’s perspective, *is* a site of power, because to keep the norms in play requires a subject subjected to those norms, confirming and verifying them, but in that requirement lies the open possibility of questioning the norms by subversively undermining their logics as well. In that way, agency is always tied to those norms as much as the norms are tied to the subjects re-iterating them, as Butler indicates, but that does support viewing the subject as neither fully free nor fully determined, but rather conditioned by and related to plays of power that the subject is itself supporting and that are working through their bodies. Therefore, it is crucial to understand that social norms are defining the spectrum of what is thinkable, speakable, and liveable, and as Butler suggests, norms are a “form of social power that produces the intelligible field of subjects, and an apparatus by which the gender binary is instituted” (Butler 2004a: 48).

### *Norms in Play*

Such norms Butler conceives neither as a social rule that needs to be followed, nor as a supra-individual law to which one is subjected, but as an (unachievable) idealization and implicit standard of normalization supplied in social practices, whereby they function ‘naturally’ and mostly self-evident. Therefore, she insists, especially in her newer work, that reducing the impact of norms to a relation of cause and effect is far too simple: “we tend to make a mistake when we imagine a single norm as a kind of ‘cause’ and the ‘subject’ as something either formed or impressed in the wake of, as the effect of, that norm’s action” (Butler 2014: 176).

She is alleging at least three reasons why such a linear and deterministic perspective is inadequate and lacking complexity. Firstly, Butler declares that “norms tend to arrive in clusters, interconnected” (Butler 2015a: 5) and “norms act on us from all sides, that is, in multiple and sometimes contradictory ways” (Butler 2014: 176).

Both arguments score out the idea of coherent and uniform effects of norms on subjects. Secondly, she accents the processual character of subject formation, which is not concluded as long as a human being is alive. Subject formation is an ongoing process because, she suggests, “they [the norms, NR/NR] are not finished with that work once we emerge as thinking and speaking beings” (Butler 2014: 176). In this sense, a lifelong involvement with norms is implied, an involvement that, from Butler’s point of view, will hardly be the same at any time and will also hardly be in absolutely accordance with those ideal(istic) norms as well, especially considering that Butler is perceiving such absolute accordance with any norm as simply impossible, revealing the phantasmal character of the norm itself. And thirdly, she insists that “norms form us but *only because* we are in some proximate and involuntary relation to their impress” (Butler 2014: 176, emphasis’ NR/NR), which is probably the most important point of her thoughts going beyond Foucault. What she states here is the idea of a (psychic) topography within the ‘subject’ already approaching and responding to the norms, although designed by their action, creating their possibility of effecting the subject; an idea she seeks to describe especially in her recent work in terms of “impressionability” and “vulnerability” (ibid.). Already in *Psychic Life of Power*, Butler tries to rethink the idea of a subject that is created by and, in turn, “against itself” (Butler 1997a: 9) and its own desires, already revealing the fundamental dependency of any emerging ‘subject’ on others, driven by desire and refusing desire and fundamental dependency at the same time.<sup>5</sup>

This short recapitulation of some of her arguments already reveals another of Butler’s central insights: our language, our speech, is already *assuming* the ‘subject’ whose occurrence, whose constitution, is effected by norms we are trying to investigate, following Butler. And this fact of already assuming the subject before it emerges within such occasions of address is also problematized by Butler, revealing another (grammatical) paradox in the heart of subject formation, that: “The paradox of subjection implies a paradox of referentiality: namely, that we must refer to what does not yet exist” (Butler 1997a: 4) or, in other words: “To say that I am affected prior to ever becoming an ‘I’ is to deliver the news by using the very pronoun that was not yet put into play” (Butler 2015a: 4).

The central challenge within her conception of subject formation is therefore not only the paradoxical idea of a subject gaining its agency from a subjection to prior power but also accepting their simultaneous occurrence in a scenery of address and dependency – even radicalizing the paradox of this first thought. As one might see, there is a veritable irritation concerning any diametric construction of relation between subjection and agency, of autonomy and heteronomy coming up with that thinking; an irritation of the division in inner-outer-logics, in logics of being acted on and acting, and as Butler puts it: “The task is to think of being acted on and acting as *simultaneous*, and *not only as a sequence*. Perhaps it is a repeated predicament: to be given over to a world in which one *is formed even as one acts* or seeks to bring something new into being. Acting does not liberate any of us from our

---

<sup>5</sup>Leading subject constitution into a melancholy (form of) gender as she unfolds there, relying on and shifting central notions of Freud (see Butler 1997a: 132ff.).

formations [...] At the same time, nothing determines me in advance – I am not formed once and definitively, but continuously or repeatedly. I am still being formed as I form myself in the here and now. And my own self-formative activity [...] becomes part of that ongoing formative process. I am never simply formed, nor am I ever fully self-forming” (Butler 2015a: 6, emphasis NR/NR).

### *Interpellation, Recognition, and Dependency*

Just because such incidents of being formed are nothing to be overcome, there is a strong suggestion of a fundamental dependency coming up with it and haunting Butler’s idea of subject formation. This dependency is not just related to depending on a normative discourse and its offers of ‘humanness’, but it is foremost a dependency concerning the central status of the social other within scenes of *interpellation*<sup>6</sup> and address. To answer the (ultimately Foucauldian) question of how “the subject is produced through norms or by discourse” (Butler 2015a: 5), Butler is relying not only on Althusser’s idea of interpellation, but combines it with Austin’s reflections on the performativity of speech acts, to actually produce – to do – what they only talk about (see especially *The Psychic Life of Power*). Without such naming, without any interpellation by social others, or without a scenario of address, Butler argues that no ‘subject’ can become part of the social world that is always prior to its emergence. The ‘subject’ needs to be addressed, interpellated, and named in order to receive a social recognition, to gain the status of being ‘human’, and to emerge as such.

This is why the categories through which recognition is offered and displayed, the categories that interactionally offer the status of the ‘subject’ (e.g., ‘girl’ or ‘Muslim’) to someone, are working productively and powerfully within that relation of ‘I’ and ‘Other’, as Butler reminds us: “But the moment I realize that the terms by which I confer recognition are not mine alone, that I did not single-handedly devise or craft them, I am, as it were, dispossessed by the language that I offer. In a sense, I submit to a norm of recognition when I offer recognition to you [...]. Indeed, it seems that the ‘I’ is subjected to the norms at the moment it makes such an offering, so that the ‘I’ becomes an instrument of that norm’s agency. Thus the ‘I’ seems invariably used by the norm to the degree that the ‘I’ tries to use the norm. Though I thought I was having a relation to ‘you’, I find that I am caught up in a struggle with norms” (Butler 2005: 26). This conception of recognition and recognizability reveals that acts of recognition are, though they are displayed individually (I know who I am in your eyes because you are signaling it to me), not an individual and neither a harmonic or innocent relation. Moreover, not only the one receiving recognition, but also the one giving recognition, is entangled into the play of powers developing the norms of recognizability implicitly involved in such a process, basically functioning limitedly, in the way Butler puts it: the need of/for a

---

<sup>6</sup>Original term of Althusser – Butler is relying on Althusser here, as we state a few lines later.

social recognition by other's ties any 'I' to a fundamentally dependent position within the social world, longing to be recognizable in the eyes of the other and longing for recognition – even if this recognition is displayed in terms of misrecognition and insult.<sup>7</sup> And on the other hand, Butler also suggests, relying on Hegel's idea of reciprocity in recognition, that there is also “a desire to offer recognition to you” (ibid.). So this (double) reciprocity or dependency is not just constituted in the moment of address, but is an attending one; as one might imagine in, e.g., refusing the recognition of a ‘girl’ to/for someone, or at least the recognition of an ‘accurate girl’ to/for someone, who will probably suffer afterward to recognize and understand herself as a ‘girl’.

This is why within this circle of recognition, built on reciprocity, both sides are in the end ‘dispossessed and dispossessing’, as Butler points out, because, on the one hand, to long for recognition is obviously exploitable, but, on the other, also giving recognition is revealed as an act of dispossession and potential violence, receiving its power from far beyond that concrete scenery of address, it is actualized in and opening up the possibility that “the *form* in which I offer it [recognition, NR/NR] is *potentially given to me*” (ibid., emphasis NR/NR). So Butler reminds us, especially in *Hate Speech*, that there is a comprehensive history and historicity lying within our term or categories of recognition, one that is always de-authorizing the author of speech but not leaving him or her irresponsible for actualizing such terms.

Indeed, such scenarios of interpellation and forms of address also reveal how and in which way agency is related to accepting such terms of recognition without fully accepting all their implicit –and probably offensive – implications, as Butler states: “So addressing someone as ‘you’ may well solicit a recognition that it is ‘I’ who is meant by that second person, but that ‘I’ may well resist or shift or reject the various semantics that get associated with that ‘you’. [...] I could [even] act as if I am not being addressed, or I can turn around and offer a clarification of the pronoun I prefer, but whatever I do, I understand that that particular misrecognition was intended for me” (Butler 2015a: 12 f.). This not only outlines the difficulty of offering a form of recognition that is perceived as a misrecognition by the addressed person, but also the general difficulty of (somehow) not being impressable for such offers of recognition. This is another reason why Butler conceives agency as a “radically conditioned form of agency” (Butler 1997a: 15). And following that line, agency paradoxically means to deal with and act within the conditions of subject formation offered by others and available in the social world or prior discourse that become actualized within such scenes of address, or as Butler puts it: “My agency does not consist in denying this condition of my constitution. If I have any agency, it is opened up by the fact that I am constituted by a social world I never chose. That my agency is driven by paradox does not mean it is impossible. It means only that paradox is the condition of its possibility” (Butler 2004a: 3).

Summarizing the very thoughts we reconstructed insofar, it is obvious that Butler's conception of the ‘subject’ is in several aspects a *related* one. She reminds

---

<sup>7</sup>See especially *Excitable Speech* for a more detailed conception of that argument, also Balzer (2007) on the question of recognition leading into misrecognition.

us that the categories (with)in which one can only appear as a ‘subject’ are circulating within a social world and its discourses far before “it touches upon us” (Butler 2014: 176). This also suggests that there are prior norms of recognizability circulating and limiting our occurrence, as well as the possibility of that occurrence. Also, Butler suggests these possibilities of occurrence are possibilities within language or speech acts, and are also socially offered possibilities, because giving and receiving recognition is more or less displayed in social categories that are linked to ‘humanness’ and therefore grant the status of a ‘subject’, while others (partly) deny such statuses and work as offensive. And lastly, from Butler’s point of view, agency cannot consist in denying these obvious dependencies, constituting the ‘subject’ in subjection to nonindividual norms beyond its control, but in perceiving such norms of recognizability and such categories of subject formation as historically evolved and therefore *contingent* and potentially open to change in the first place. And, secondly, agency is articulated – in a political sense – whenever such norms or normative “frames” or “framings” (see especially *Frames of War*) are questioned, become re-signified or shifted, or perhaps in some ways also exceeded.

### *An Ethical Turn?*

Based on this conception of fundamental dependency on the Other, combined with insight into a certain ‘impressionability’ and ‘vulnerability’ of that subjectivated and subjected, subject’ and its formation processes, Butler is also turning these insights into ethical questions. Especially in her recent work (in *Frames of War*, *Precarious Life*, and *Giving an Account to Oneself*), she focuses on ethical questions that are themselves not new to her work, but are arising with another emphasis, such as: “who are you?” (Butler 2005: 30); “what counts as a liveable life?” (Butler 2004b: XV); and whose lives or who “will be publicly grievable and who will not?” (Butler 2009: 39).

But how can Butler’s ethic be discussed while she is conceiving a ‘post-sovereign’ subject, a subject not even fully transparent within itself and therefore hardly able to be responsible for his or her (not precisely ‘own’) actions? By asking in this way, one can already see that within Butler’s conception of subject formation there has been an ethical dimension implied from the start that has now been turned into a more explicit one. Obviously, as reconstructed above, Butler’s ‘subject’ is a related one, deeply dependent upon the social others, their recognition, and the terms of discourse offering the status of a recognizable ‘human being’. Relying especially upon Levinas, Butler emphasizes the fact of this precarious and existential exposedness, funding the subject in social relation by whom he or she gets dispossessed and also constantly called into a scene of responsibility. From Butler’s point of view, it is the radical dependency within subject formation that designs the ethical task for the subject. Following Levinas, she suggests in *Precarious Life* as much as in *Giving an Account to Oneself* that there is a primary scene, an “initial impingement by the Other” (Butler 2005: 86) invoking a “primary trauma” (ebd.)

that is constituting the ‘I’, which is deeply affected by this “touch” (Butler 2005: 87) – “without consciousness, without cause, and according to no principle” (ibid.). With this idea, the central conception of Levinas’ ‘face’ is concerned and his assumption that it is unconvincing to think of freedom, sovereignty, or free will as an essential condition for responsibility among human beings. Instead, Levinas and with him Butler argue that the fact of “impressionability”, being the effect of a prior “persecution” (Butler 2005: 85) and “accusation” (ibid.) by the Other, is serving as a crucial condition for responsible relations among ‘humans’ because “we must think of a susceptibility to others that is unwilled, unchosen, that is a condition of our responsiveness to others, even a condition of our responsibility *for* them” (Butler 2005: 87 f.). Following Levinas, it is a “persecutory” scene of (passively) being affected by others and threatened by their ‘face’, allowing and conditioning the (acting) subject to emerge, but only as a vulnerable, susceptible, and related one, being herself hopelessly responsible for others. If existence is only conducted by being affected (and addressed, as Butler suggests) by the other, then this existence is within that constitution already a vulnerable and precarious one. But at the same time, the ‘face’ of the other recalls, as Levinas outlines, the divine command not to kill another human being, revealing that the other, who is threatening me and reminding me of my responsibility, is him- or herself related to me, vulnerable and exposed to my ‘face’ – and this threat and vulnerability on both sides of the relationship may ensure that each act in the least violent manner possible to one another.

Butler’s ‘ethic of nonviolence’ – inspired by Adorno and insofar negatively defined – is derived at least from a “war”-relationship (Butler 2004b: 137) or a sort of doubled resistance against fear, resulting from that fundamental vulnerability of human existence. “There is a fear of one’s own survival, and there is an anxiety about hurting the Other [...] a constant tension between the fear of undergoing violence and the fear of inflicting violence” (ibid.), and this tension needs to be balanced. Accenting this tension of fear founded in vulnerability and susceptibility, Butler again points out the potential violating structure of address from which the subject is emerging – a fact she already thematized broadly in *Excitable Speech*. She is emphasizing the ethical task based on the recognition of the Other as a vulnerable human being and granting the Other maximum openness and nonspecification concerning the central question, “*Who are you?*” (Butler 2005: 30). Therefore, the task is to reduce ethical violence within such specifications and differentiations, nailing persons to certain subject or not-fully-subject positions while undoing their historical contingency. An additional task is to initiate a “critical reflection on those exclusionary norms by which fields of recognizability are constituted, fields that are implicitly invoked when, by a cultural reflex, we mourn for some lives but respond with coldness to the loss of others” (Butler 2009: 36), as the ethical questions mentioned above already signaled. In sum, from Butler’s perspective, dependency is nothing to be overcome, but the foundation of that relationship is revealing the ethical task of living together, addressing each other, and giving to and being given recognition from others.

Summing up these lines of thought within Judith Butler’s work, differentiated here, there is a various and politically relevant philosophical discussion of central

categories of modern thought occurring. At its core, it is about overcoming dualistic and oppositional ideas, especially of autonomy and heteronomy, by introducing and promoting differential and relational figures of thought. One of the most impressive aspects of Judith Butler's work is the assumption that such new figures involve radical transformations for concepts of the ethical and political, as shortly outlined above.

## Impacts for a Philosophy of Education

From the viewpoint of educational theory, or more precisely, of a philosophy of education, there is a special challenge outlined in the comprehensive work of Butler. Not only are special themes relevant to education, such as gender, heteronormativity, identity, or recognition, no longer discussable without relying on Butler's thoughts, but moreover, it is her *way of thinking* that seems to be vital for rethinking central problems of educational thought. From our perspective, if educational theory is committing to the challenges deriving from Butler's way of thinking, reformulating, and questioning central categories such as gender, identity, universality, and contingency, the problem of education itself needs to be redefined and readressed (a reformulation that has not yet been done).

To address only some relevant aspects, we outline three perspectives an educational reception of Butler could follow:

- (a) Butler suggests overcoming the established dichotomy of autonomy and heteronomy in modern thinking and this is involving a central and new conception of the task of educating others. Classical-modern thoughts on education are relying on education as an inevitably paradoxical process, where the educand is, on the one hand, heteronomous, *directed to* seek and *develop autonomy* while, on the other hand, such an educational impulse cannot be secured at any time. Therefore, the modern educational thinking tends to build up an inconclusive alternative between directed 'instructions' and a 'laissez-faire' orientation leading to Reform- or Anti-Pedagogics. Butler's thought of heteronomy, as nothing ever being overcome, is offering the much more challenging insight to conceptualize heteronomy beyond something that interferes with and restricts a given 'subject', but as something creating the source and the possibility of being set(tled) into a relation with its one 'self' as much as with others. It is her categorical move to conceptualize the constitution of figures of autonomy *through* heteronomy and subjection, revealing that there is no 'founding' or primal autonomy to which any human can return, other than to enable an idea of agency within dependent conditions. These ideas suggest thinking of education as a process in which 'subjects' *learn who they are* and can become, through others and their recognition, especially in processes of being addressed (see more broadly: Rose and Ricken 2018). From our point of view, suggesting that others are and become constitutive Other's for any 'subject' emerging and any 'I' articulated is essential in revealing and treating the 'pedagogical problem' (Dilthey) adequately and systematically.

- (b) This is why we also suggested Butler's discussion of subjectivation as being central to pedagogical thinking and especially for a philosophy of education. Her basic idea of subjects being 'made' as such does not only imply the (re-)thinking of epigenesis radically as 'dis-possessed' and constituted by the Other, but it also reveals the idea of autonomous 'subjects' as a specific Western or European concept of self-description, as an historically and culturally designed and 'founded' idea, treated as primal or universal. Thus is *Bildung* as the modern inner core of education, with its characteristic ideas of self-reference, autonomy, and self-reliance, contingent and a special educational paradigm (see Masschelein and Ricken 2010). From Butler's point of view, subjectivation is a process involving speech acts, forms of addressing and re-addressing, revealing the 'subject' as a responsive one, being impressionable, vulnerable, and recognizable. This 'impressionability' is shifting pedagogical thoughts to (re-)consider conceptions of formability and individual learning as more socially grounded concepts of (cultural) acquisition or adoption (see Ricken et al. 2017).
- (c) At least these ideas give entry to an – from the start ethically contoured – idea of pedagogical action, not strongly focusing on autonomy of the educand and the normative orientations viewed necessary, but perceiving and designing this action more clearly as a response and responsibility concerning such an impressionable being as the addressee (see Ricken 2015). Such a perspective allows one to not only identify and criticize certain forms of 'pedagogical violence' (see Masschelein 1996), but also question widespread reform-pedagogical thoughts of a 'Pedagogy from the Child', trying to keep the 'authenticity' of the child intact. Such ideological ideas, which obviously try to hide the powerful impacts of educational actions, can be overcome by such an idea of agency or freedom as Butler is offering. The capacity to act (as a 'subject') from Butler's point of view is not dominated by the idea of acting out as far or as long until the freedom of others is threatened, but it is the capacity to relate to, to question, and to re-signify the cultural and social conditions of life itself, while being impressed by them and the others in specific (cf. Butler 2002). Following these thoughts, education can be perceived – analogue to the paradox of subjectivation, tying agency to subjection – as a necessary and paradoxical coincidence of 'in-ducation' ('Einziehung') and 'e-ducation' (in the way Masschelein reconstructs it as a way to lead someone out, 2010).

Amanda Fulford

## Stanley Cavell

Only rarely can you read a newspaper, browse social media, or in particular, consult the academic journals in the field of education, without happening upon an article concerning the state of language and literacy teaching, learning, and achievement in contemporary education. Often, such accounts paint a rather negative picture of the state of affairs. Reporting tends to headline crises in various sectors, particularly over declining standards in reading levels, writing ability, and basic oral communication skills, particularly in spoken English. This is not simply a failure of the school system, it seems; research points to the increasing number of young children *entering* school with wholly insufficient language skills to enable them to fully benefit from the transition from home to formal education (NLT 2005; Roulstone et al. 2010). But many school-leavers are then reported to lack the requisite language and communication skills for entry to university (Pring et al. 2009), or into employment (DBIS 2016). Added to this is the seeming moral panic in the face of international comparisons, and league table position for language skills. The situation is exacerbated when, for English-speaking countries, the serious decline in the take-up of study in modern foreign languages is considered in relation to the importance of foreign language competence to support a country's need for strong economic growth, development, and international cooperation (Board and Tinsley 2013, 2016).

Philosophers have long given attention to issues of language, particularly the problems of language use, meaning, the relationship between language and thought, and between language and reality. In ancient Greek philosophy, Plato's dialogue, *Gorgias*, discusses the place of rhetoric, with Gorgias himself questioning whether

it is possible that language can capture thought. More contemporary uses of the term ‘philosophy of language’ tend to refer to work within the field of Anglo-American analytic philosophy from the mid to late nineteenth century. Some of Gottlob Frege’s early work on sense and reference in expressions (1892), and Bertrand Russell’s analysis of the logical role of descriptions (1905) were later taken forward by the Vienna Circle, and the logical positivists, through their idea of the verification theory of meaning. Put simply, this theory claimed that the truth of sentences could be confirmed through logical analysis. Subsequently, some of the central tenets of logical positivism came under criticism from figures such as W.V.O Quine, and particularly from the ideas in the later work of Ludwig Wittgenstein, whose *Philosophical Investigations* stated that: ‘the meaning of a word is its use in the language’ (1958, #43). From Wittgenstein’s later work rose an interest in the pragmatic dimensions of language (epitomised by John Austin’s (1962) speech act theory), and in ordinary language philosophy that stressed how language is central both to the method and content of philosophy. So it is against such a background of thinking in philosophy of language that Stanley Cavell comes to write. In his now celebrated work *Must We Mean What We Say?*, Cavell claims ‘That what we ordinarily say and mean may have a direct and deep control over what we can philosophically say and mean is an idea which many philosophers find oppressive’ (1976, p. 1).

Cavell’s concern with language persists throughout his work. He tackles Benson Mates’ criticisms of the ordinary uses of expressions (Cavell 1976), undertakes an analysis of Wittgenstein on criteria (1979), discusses Austin on examples and on performatives in language (1979; 2005), and offers a vision of what is at stake in our relationship to language in his 1981 reading of Henry David Thoreau’s work, *Walden* (1854/1999). Given these introductory remarks about his philosophical interests, it might seem strange to include, in this volume, a contribution pertaining to Cavell. What distinguishes his work is the breadth of his thought in relation to matters such as ordinary language, literary theory, scepticism, psychoanalysis, film, literature, and opera. But he does not write explicitly about *education*. Moreover, his autobiography, published in 2010, contains little more than passing references to his own education. He recalls a teacher telling him that he had no talent for drawing (p. 81); remembers reading *Les Misérables* in the yard during a lunch break, and being late back for a lesson (p. 104); gives an account of his learning that there was a ‘normal’ time in which to complete work in junior highs (and that he did it more quickly – p. 103); and recounts his developing interest in biology from a textbook studied in high school (p. 111). These fleeting accounts of his schooling reflect the description he gives of them as being ‘my coma years’ (p. 154). Though he recalls the profound impression made on him by one teacher’s recognition of his work – what he calls the ‘permanent effects of an act of acknowledgement’ (p. 155) – it is learning out of school<sup>1</sup> that appears to hold the strongest memories for Cavell, especially the pleasure of learning the pawn shop business from his father (p. 119).

---

<sup>1</sup>This idea of learning out of school calls to mind the (1984) title of another of Cavell’s works: *Themes out of School: Causes and Effects*, a text dedicated to the memory of his father and mother.

Cavell's work does not directly address education – in terms of schooling – in the way that, for example, John Dewey's does, nor is the intended audience for his discussions of language one specifically comprised of teachers in educational institutions. His body of work is, however, significant for thinking about contemporary educational debates and questions. These debates, though, are not discussed in his work using the kind of language with which we have become familiar, and that is often enshrined within policy documentation, or litters the strategic and corporate paperwork of educational institutions, be they schools or universities. There is no talk in Cavell's writings of curricula, of learning objectives, of skills acquisition, or of progression in learning; nor is he interested in the formal role of the teacher as pedagogue. Rather, his interest lies in the fact that 'we are educations for one another' (Cavell 1990, p. 31). The kind of education in which Cavell is interested is given expression in a number of interconnected ideas that recur throughout his writings. In what follows, the limited space means that it is not possible to give anything amounting even to a partial account of the richness and complexity of the educative force of Cavell's thought. However, a useful place to start is to consider one of his central claims about philosophy, and to use this as a point of departure for examining his particular take on reading, and his understanding of voice, before concluding with a consideration of the value of these understandings to contemporary debates in education.

In his seminal work, *The Claim of Reason* (1979), Cavell identifies philosophy with education, with the education of grownups.<sup>2</sup> These ideas signal not only that education – in terms of teaching and learning – is central to philosophy, but also that our human lives into and through adulthood are concerned with a kind of education that we might think of in terms of transformation. Central to this form of education (as to philosophy) is language. Cavell writes: 'In philosophizing, I have to bring my own language and life into imagination... This seems to me a task that warrants the name of philosophy. It is also the description of something that we might call education... In this light, philosophy becomes the education of grownups' (1979, p. 125).

## Cavell on Reading

For Cavell, it is from our encounters with language through *reading* that the possibilities of transformation and conversion arise. As Saito and Standish (2012) point out, Cavell's philosophy-as-education cannot be separated out from the question of how we should read. Reading – reading *philosophically* – is a mark of our ongoing education as grownups. But this is not an elitist account. Cavell is not advocating the acquisition of sophisticated techniques that are the preserve of a select few. Rather

---

<sup>2</sup>See also Hilary Putnam's (2006) chapter: Philosophy as the Education of Grownups: Stanley Cavell and Skepticism (in Crary, A. and Shieh, S. eds., *Reading Cavell*. London: Routledge, pp. 119–130). The idea of philosophy as the education of grownups then became part of the title of Naoko Saito and Paul Standish's (2012) book, *Stanley Cavell and the Education of Grownups*.

he recognises a relationship to the written word in particular that affords the possibilities for the transformation of the self. Cavell sees these possibilities fleshed out in the work of Ralph Waldo Emerson, whom he describes as ‘a major mind, one worth following with that attention necessary to decipher one’s own’ (Cavell 1990, p. 1). Cavell finds, in the reading of Emerson’s prose, a moral outlook that he terms Emersonian moral perfectionism. This idea does not imply final perfectibility. Perfectionism rather implies that each state of the self is complete – what Emerson would term elsewhere a circle,<sup>3</sup> but that the self is always deferred, and always moving to a further next. Cavell writes: ‘I do not see Emerson as saying...that there is one unattained/attainable self we repeatedly never arrive at, but rather that “having” “a” self is a process of moving to and from nexts’ (1990, p. 12). Cavell specifically resists any final definition of perfectionism but suggests that it is ‘something like a dimension or tradition of the moral life...and concerns what used to be called the state of one’s soul, a dimension that places tremendous burdens on personal relationships and on the possibility or necessity of the transforming of oneself and one’s society’ (1990, p. 2). But while Cavell avoids listing a definitive set of features that constitute perfectionism, he claims that its outlook is ‘embodied and developed in a set of texts spanning the range of Western culture’ (ibid, p. 4). This brings us back to the place of language and reading. But the set of texts that Cavell suggests (ibid, p. 5) is neither exhaustive nor conventional, in the sense of a recognised canon of philosophical writings. While it contains some works of philosophy (including selections from Kant, Heidegger, Nietzsche, and Kierkegaard), the list also includes works of literature, drama, poetry, theology, and 1940s Hollywood film.

In outlining how these perfectionist texts afford the possibilities for the kind of transformation of self and society of which he writes, Cavell claims that reading them is a ‘mode of conversation’ between writer and reader (1990, p. 6). The words stand as an invitation to the reader, a gesture to participate, that requires her to ‘determine her own position with respect to what is said’ (ibid, p. 8). It is through this particular mode of reading that Cavell suggests the reader finds herself attracted to the alterity she encounters. The reader then ‘recognizes [her]self as chained, fixated, and...can turn (convert, revolutionize [her]self) and a process of education is undertaken...in which each self is drawn on a journey of ascent to a further state of that self...it is a transformation of the self which finds expression in the imagination of a transformation of society’ (1990, pp. 6–7).

There is a sense in Cavell’s account of reading of a kind of reversal at work; this feature is brought out by Timothy Gould’s characterisation of Cavell’s ‘model of reading’ (1998, pp. 128ff). Gould highlights that the reader is less in possession of a text, but rather becomes possessed *by* it. Encountering language – through the type of reading that Cavell’s work invites – engages the reader in a cooperative encounter which to some extent reflects the therapeutic processes of the psychoanalytic relationship. Stephen Mulhall (1994) also identifies the psychoanalytic practices of reading in Cavell’s work. The practices of psychoanalysis work metaphorically to

---

<sup>3</sup> See Emerson’s essay ‘Circles’ in Emerson, R.W. (1944). *The Essays of Ralph Waldo Emerson*. New York: Random House, pp. 175–188.

describe the relationship between a reader and a text: the reader as analysand and the text as analyst. Central to these ideas is the thought that a text possesses us, reads us, and elicits something like confession. This is what human beings are sentenced to if they are awake to the possibilities of language.

One of Cavell's most detailed discussions relates to his reading of a particular text: Henry David Thoreau's book, *Walden* (1854/1999). Cavell's *The Senses of Walden* (1981), written as the Vietnam War was reaching its denouement, is both a reading of Thoreau's text *and* a text about what it is to read. To read well, and to read *Walden* well, requires what Thoreau terms 'reading in a high sense', that 'we have to stand on tip-toe...and devote our most alert and wakeful hours to' (1854/1999, p. 95). Cavell is not reading Thoreau as suggesting that we should prescribe texts that are complex, capable of being read on different levels, or are even obscure. What is at stake here in our reading of any text is rather how we encounter the words within it. It is about recognising the responsibility for the words that address us through the reading of them, and for how we choose to respond. Cavell is here adverting to a relationship with written words (in particular) that is characterised by a sense of strangeness to them. This is not to encounter words through our initiation into the language community and our mother tongue. Rather it is to experience a father tongue relationship to these same words; one where we are discomfited by them, or at a distance from them, a state that requires us to re-encounter them, and take responsibility again for them. The mother tongue is, for Thoreau, 'commonly transitory, a sound, a tongue...and we learn it unconsciously...of our mothers'. The other is 'the maturity and experience of that; if that is our mother tongue, this is our father tongue, a reserved and select expression, too significant to be heard by the ear, which we must be born again in order to speak' (Thoreau 1854/1999, p. 93). It would be wrong to see in these ideas any sense of the hierarchical (the father tongue preferred over the mother), or that one acquires the father tongue only at a certain stage of development. It is rather that these concepts emphasise our human relationship with language, one that is characterised both by nearness (mother) and distance (father); it is marked not only by our initiation into, but also our departure from, the language community.

## Cavell on Voice

For Cavell, the possibility of perfectionism comes not only through the educative possibilities of our encounter with words through reading, but also can be represented as our search for voice. Gould summarises Cavell's ideas when he writes: 'Voice is meant to provoke us to recover possibilities that we had either dismissed outright or kept at a distance' (1998, p. 51). The concept of voice is both significant and prevalent in Cavell's writings. But to think in terms of 'the' concept of voice, as if it were a unitary idea, would be to misunderstand its complexities within Cavell's work. Gould suggests that Cavell understands voice as: 'epitomizing an entire region of questions about the means by which human beings express themselves and the depth of our need for such expression' (Gould 1998, p. xv), and that it serves

as a ‘centripetal undertow’ to his work (p. 51). Voice in Cavell should not be understood as the mere outward expression of opinion (as when we think, for example, of measures to ‘collect’ the student ‘voice’ through questionnaires). Rather, it is a richly nuanced concept that relates to the aspect of our human expression that Cavell sees as having being repressed by the workings of philosophy, especially in some of the kinds of philosophy of language that were outlined in the early part of this chapter. In writing about the ‘arrogation of voice’ (1994, p. 11), Cavell is signalling his desire to ‘talk at once about the tone of philosophy and about my right to take that tone’ (ibid, pp. 3–4). ‘It is’, writes Cavell, ‘a matter of reinserting or replacing the human voice in philosophical thinking, that voice that philosophy finds itself to need to deny, or displace’ (Cavell 1996, p. 63). Here, voice is one way by which we might pursue ordinary language philosophy, but is also the goal of such a philosophical pursuit. Cavell develops this idea of the repression and recovery of voice through his discussions of Hollywood films of the 1930s and 1940s (Cavell 1996). Typically, he finds in a genre of films that he calls the ‘melodramas of the unknown woman’,<sup>4</sup> the recurrent theme of a woman’s demand for an education, a voice, or ‘the right to tell her story’ (1996, p. 3). Just as the woman’s voice is repressed (by the leading man in the films), only later to be recovered, so Cavell writes of finding *his* voice in the field of philosophy – and so makes his claim that philosophy is autobiography (Cavell 1994).

To think of Cavellian voice in terms only of the philosopher’s right to take a particular tone might lead us towards an individualistic understanding of voice. This would be to misunderstand the importance of the political inherent in his concept of voice. It is in its claim to speak for the human, to speak universally, that Cavell sees what he calls the ‘systematic arrogation of voice’ and its ‘arrogant assumption of the right to speak for others’ (Cavell 1994, pp. vii–viii). Cavell is struck by ordinary language philosophers’ use of ‘we’ in phrases such as ‘when we say...we mean...’. In thinking about what we say, it is significant that the phrase is both first person, and it is plural. That is first person indicates that there is consent from the speaker to what is said; she shows her commitment through her assent. Put another way, she “owns” what she voices’ (Saito and Standish 2012, p. 84). That it is plural shows that she speaks on behalf of others, that others have consented with her, and that her community is hers, *and* that she is answerable for it. Such agreement signals community; as Cavell puts it: ‘The philosophical appeal to what we say, and the search for our criteria on the basis of which we say what we say, are claims to community’ (1979, p. 20). To agree in criteria is, for Cavell, to be ‘mutually voiced...mutually attuned top to bottom’ (1979, p. 32). What we consent to is, for Cavell, an indication of our membership in a polis. It is about what *we* say. This does not suggest some kind of generalisation based on a majority view. Nor is it the case that we come together on a particular occasion and arrive at an agreement. It is rather an idea of ‘being in agreement throughout, being in harmony, like pitches or tones’ (Cavell 1979, p. 32).

---

<sup>4</sup>Cavell (1996, p. 3) identifies the following films as representative of the genre: *Stella Dallas* (1937), *Now Voyager* (1942), and *Gaslight* (1944).

Just as in Cavell's notion of reading, our responsibility to, and for, language cannot be separated from our responsibility for the community, so also Cavell's treatment of voice is not only about individual expression, but is similarly tied to the society in which our voices find expression. Cavell writes of 'the voice I lend in recognizing a society as mine, as speaking for me' (1990, p. 27). So both the mode of reading that Cavell espouses, and the development and expression of grownups, are therefore inherently political actions; the relationship between reader and writer epitomises the relationship between the self and the other. These are relationships of which Naoko Saito and Paul Standish write; it is as if we are engaged in a 'finding together...an ongoing aspiration toward the common...through which we are confounded'. This they argue is our 'fatedness to language and to the other' (2010, p. 429).

## Cavell and Education

Saito and Standish claim that mainstream philosophy tends to neglect the educational force of Cavell's work and that his work has yet to receive sustained critical attention in the field of education; yet to understand his work as a whole requires an acknowledgement that his concern *is* with a kind of education. They write: 'Cavell is...very far from the writing of anything like "educational theory", yet his concern throughout his work is with a kind of education, and he has been inclined sometimes to name it as such' (2012, p. 2). So, the approach adopted here is not to take Cavell's writings, and then apply them, as something like a panacea, to help solve the very kinds of problems that the introduction to this chapter outlined. Indeed, Cavell's ideas about reading – where texts possess us, and we as readers are 'read' – are unlikely to be taken up easily in contemporary educational contexts. He writes: 'I imagine that reading, so motivated, will not readily lend itself to classroom instruction' (1982, p. 176). He points to what 'normal routines of education' are inclined to 'ignore and suppress' (1984, p. 113) and reflects on what was 'rigorously closed off' by his own education (ibid, p. 201). The title of his 1984 work, *Themes out of School* hints at the idea of philosophy in, and out of, school (as a discipline in itself, *and* through works of literature, drama, and film); perhaps what is also signalled here are the educative possibilities that lie beyond the confines of formal schooling.

So in thinking about Cavell's work in relation to education and language learning, we might conclude that Cavell has nothing of practical use to say in matters of reading, spelling, grammar, acquisition of a foreign language, and the like. It is true that Cavell gives no advice on pedagogy that might inform a primary school classroom. His work does not provide the kind of easy answers to pressing educational concerns relating to the teaching and learning of language; neither should it be used as evidence to inform the educational practices that are privileged in an educational culture dominated by ideas of impact and measurable outcomes. It is rather that his work on language through an engagement with writers as diverse as Thoreau, Wittgenstein, Derrida, and Austin open out onto broader themes of the political, of our relationships with others, of whether we can know other minds, and of how we

might live together in the city of words. This is a perfectionist task; Cavell writes that the city of words is one in which ‘I am – or I am invited to be – already reading, participating in. This implies that I am already participating in that transformation of myself of which the transformed city, the good city, is the expression’ (1990, p. 8).

Cavell’s idea of education, and specifically of what it means to learn a language, is paradoxical. In one sense, it is not overtly practical; yet on the other hand, he uses very practical examples such as a child learning the name of something, a matter given detailed consideration in his ‘Excursus on Wittgenstein’s Vision of Language’ in his seminal work, *The Claim of Reason* (1979). Here, he explores what it means for us all to learn a language and to be initiated into forms of life. In a similar vein, Cavell is interested in what it is to read and write (philosophy). Through his work *The Senses of Walden*, he provides us with a reading of Thoreau’s text, *Walden*, in which he argues that the task of *Walden* is to discover what writing is, and how we might, or should, read. This is not just about how we read books, but also about how our reception of words is ineluctably tied to the political, and to our responsibility for words in a community of speakers. Cavell’s interest is in how ‘reading a book is metonymic of the more pervasive reading of the world that is required of us’, and with how our education is both ‘into adulthood [and] through adulthood. Indeed it represents a crucial aspect of our ongoing acquisition of language, the condition of continual rebirth’ (Standish 2006, pp. 149–150).

Just as in reading ‘in a high sense’ – where the text convicts us, and we are sentenced to the possibilities of language<sup>5</sup> – is central to the idea of education that is woven throughout Cavell’s work, so the idea of the education of grownups is similarly essential to understanding the educative force of his writings. Thoreau states in *Walden* that we have ‘a comparatively decent system of common schools’ (p. 99); but both Thoreau and Cavell are interested in what constitutes our ‘uncommon schooling’, or the education of grownups. For Cavell, as for Thoreau, our uncommon schooling as grownups is through our ongoing relationship to language – our initiation into, and departure from, it. It is uncommon in the sense that it challenges the common (the near, the mother) and is characterised by a father tongue relationship of distance to language in which we realise the educative possibilities of such an encounter with words.

What underlies Cavell’s emphasis on ideas of reading, and uncommon schooling, is an idea of education that requires, and constitutes, continual transformation. He writes: ‘The anxiety is that...I myself require education. And for grownups this is not natural growth, but *change*. Conversion is a turning of our natural reactions; it is symbolized as rebirth’ (1979, p. 125). This does not place Cavell alongside philosophers of education whose writings address the aims of education as they are variously understood; rather, that Cavell’s understanding of education in terms of change, or of transformation, lies beyond schooling. The kinds of transformation

---

<sup>5</sup>Thoreau uses the following illustration for this kind of relationship to words: ‘If you stand right fronting and face to face to a fact, you will see the sun glimmer on both its surfaces, as if it were a cimeter, and feel its sweet edge dividing you through the heart and marrow’ (Thoreau 1854/1999, p. 90).

that we perpetually require are ones that are ineluctably related to what it is to be human, and to live together in the world. But the idea of transformation should not be understood as Cavell's espousal of a kind of lifelong learning through our adulthood that is current in contemporary political and educational discourses. Transformation is not the natural result of continued schooling; it does not come about either through attending courses, amassing qualifications, or through progressing onto ever higher levels of formal education. Nor does it imply the kinds of economic transformation, and social mobility, that governments say come from improving one's life chances through continued attendance in education, and the development of competences that meet the so-called skills gap. In this sense, Cavellian transformation is unrelated to being a student within the confines of any educational institution.

In the current culture in many educational contexts, student surveys, student voice, and in particular ensuring student satisfaction, seemingly drive much policy and practice, particularly in higher education. Education must satisfy, but satisfaction here seems to equate with a form of contentment, with the positive and happy feelings that derive from everything being settled.<sup>6</sup> Cavell's attention to transformation – inseparable from the education of grownups – sits uneasily with these developments. Education through transformation is simply not the same as the education that one gains from schooling. To experience the former is to undergo 'conflict, external and internal; [it] is the very process of our education as grownups: we are destabilized and, in the process, convicted by our every word' (Saito and Standish 2012, p. 6). For Cavell, there is something important in Thoreau's claim that 'Our moulting season, like that of the fowls, must be a crisis in our lives' (1854/1999, p. 23). Our transformation is not natural, like that of the fowls that Thoreau observes at Walden Pond, but is necessary (Cavell draws attention to the imperative 'must' here). Thoreau's experiment in living at Walden Pond was *his* moulting season, his crisis. But the point is that we must undergo our *own* transformations (crises, moulting seasons). And this, claims Cavell, 'will make for more crises' (1981, p. 45). This is unsettling, but is part of our perfectionist education, the education of grownups.

So, Cavell must be considered an important figure for this volume. That he can be thought of in terms of relevance to educational thinking is, to a great extent, due to the way that he keeps returning to ideas of teaching and learning. This is not explicitly through notions of schooling, but rather is seen through the kinds of transformation that our ongoing perfectionist education of language demands. It is in this initiation into, and departure from, our words that he finds an aspiration towards our own best selves, and this is then fleshed out more fully in the writings of Ralph Waldo Emerson. But there is also something important at stake in reading Cavell's work. To read Cavell is to engage in the education of grownups; it is *itself* educative: it demands the very kind of reading that is a recurrent theme in his work, and opens the possibilities for the kind of education of grownups that he espouses.

# Confucius

Charlene Tan

## Introduction

‘Confucius’ is a Latinised version of ‘Kong Master’ (*Kong Fuzi*; 孔夫子). The most famous and influential philosopher and teacher from China, Confucius (c. 551–479 BCE) and his teachings have indelibly shaped the political, social and cultural worldviews and developments in China. Given that much has already been written about Confucius, this chapter does not aim to rehearse the details of Confucius’ thought (for an in-depth discussion of Confucius’ educational philosophy, see Tan 2013). Instead, the purpose of this chapter is to relate the key concepts of Confucius to a perennial concern in education: indoctrination. The chapter begins by briefly introducing the concept and problem of indoctrination. This is followed by an exploration of a Confucian response to indoctrination through Confucius’ notion of reflective learning. The last part considers the possibility of indoctrination in Confucian education by discussing two objections to Confucius’ educational approach.

## Indoctrination

Usually viewed derogatorily, ‘indoctrination’ is often contrasted with ‘education’ and other educational ideals such as rational autonomy and critical thinking. The problem of indoctrination is not a new one, originating in the last century over allegations of political brainwashing by the Soviets and Chinese. But the issues and

---

e-mail: [charlene.tan@nie.edu.sg](mailto:charlene.tan@nie.edu.sg)

concerns surrounding indoctrination remain contemporary, with policymakers, researchers and educators grappling with existing and new challenges. An example is the initiative of some American public schools to teach religious knowledge to students that has triggered controversies over whether such a move is educational or indoctrinative (Wertheimer 2015; Nemzoff 2016). On the global front, we are confronted with news of the indoctrination of suicide bombers and the indoctrination of patriotism through school textbooks (Mackinlay 2002; Shahriar 2017). Against a backdrop of globalisation and modernisation, Jarvis (2007) cautions against the indoctrination of the “ethos of consumer society generated through the media at the behest of advanced capitalism” (p. 31). Identifying ‘cultural indoctrination’ as the basis of nationalism in a digital age, Christiansen and Koeman (2015) critique the effects of culture on cognitive strategies and professional methodologies.

To date, there is still no consensus on the definitions and characteristics of indoctrination (Tan 2008, 2014a). For the purpose of this chapter, it suffices to note that indoctrination occurs when a person’s capacity to rationally justify one’s beliefs, consider alternatives and make autonomous choices in life is paralysed (Tan 2004, 2011). An indoctrinated person is unable to independently inquire into the worthiness of beliefs based on relevant evidence. Indoctrination undermines the conditions for humans to form intentions, evaluate desires, make and implement decisions. It is dehumanising as it diminishes a person’s intellectual and moral horizon to accept only those beliefs and actions imposed by others. An indoctrinatory culture is a closed tradition that prescribes and permits only one monolithic belief system for its members. By insisting on the strict transmission of and adherence to the sanctioned ideology, an indoctrinatory culture censures alternative beliefs, suppresses contrary evidence and ultimately imperils the development of rational autonomy and moral agency in its members.

It should be clarified that the reference to rationality, autonomy, independence and agency in the preceding does not imply that human beings are viewed as disembodied subjects who possess universal and abstract principles of rational justification. On the contrary, this chapter contends that the individual’s wants, desires and choices are naturally embedded within and shaped by communal forces. Rather than pitting reason and freedom against cultures, religions and customs, the cultivation of rational autonomy necessarily presupposes the existence of a tradition that supports and sustains individual growth and well-being (Jonathan 1995; Tan 2014b). But a challenge faced by educators is how to initiate learners into the culture of their community without indoctrinating them. At the outset, it is important to acknowledge a possible objection to the agenda of initiation. Given that the construction of ‘one’s community’ may imply the existence of a singular community, is this statement in itself not an example of doctrinaire thinking? How then is the initiation into the culture of one’s community dissimilar to indoctrination? Put otherwise, how can indoctrination be avoided if learners, even as they are encouraged to learn and reflect, are simultaneously initiated into ‘the culture of one’s community’?

My response to the above objection is this: most people would agree that initiation in the form of enculturation is essential for all human beings. Enculturation provides members of a community especially children with the cultural coherence

to acquire a substantive set of practices, beliefs and values within a stable environment (Ackerman 1980). Underlining the fact that “we are all the creation of our own historical traditions, both in our acceptance and our rejection of them”, Fox (1997) maintains that “without a linguistic and historical ‘fore-structuring,’ creative and critical thought would be an impossibility” (p. 578). Whilst enculturation usually involves receiving the culture of the community that one is born into or chooses to be a member of, the socialising process does not necessarily presuppose the existence of a singular, essentialised and unchanging community. A community is comprised of a plurality of discourses that is (re)constructed over time, involving dynamic meaning making and internal contestations, conflicts and negotiation. As noted by Anderson-Levitt (2012), “Even when they are alone, people doing interpretive work draw on and respond to resources generated by other people, and in doing so they are interacting with other people” (446). The evolving and multi-faceted nature of a community means that enculturation is not tantamount to an imposition of a narrow set of beliefs and practices. Furthermore, it is possible for educators and parents to choose to initiate learners into the culture of communities instead of ‘one’s community’. The ultimate goal of educators and parents who wish to avoid indoctrination is for the young to learn to develop their own views and critique their own tradition at a later stage (Tan 2004). The necessity of an acquisition of a preliminary tradition for learners, especially children who are too young to exercise their rational faculties and appreciate the rational basis for their beliefs, has given rise to the ‘paradox of indoctrination’ (Tan 2008). As articulated by Macmillan (1983):

The problem of indoctrination is this: in a modern democratic society, the desired goal of education is that each student develop a set of beliefs that are rationally grounded and open to change when challenged by better-grounded beliefs. In order to develop such students, however, it would seem that they must acquire a belief in rational methods of knowing which must itself be beyond challenge, i.e., must be held in a manner inconsistent with its own content. Thus, students must be indoctrinated in order not to be indoctrinated: a pedagogical dilemma or paradox (p. 270).

Thiessen (1993) proposes the following approach regarding the initiation of learners into the culture of their community without indoctrinating them:

After the initiation or nurture phase of children’s development, there should be a gradual opening-up phase where they are exposed to other influences, other beliefs, though still from the vantage point of the tradition into which they were first initiated. To fail to encourage this opening-up phase should be labelled indoctrination. Still later, perhaps at adolescence, young people should be encouraged to begin to reflect critically on the traditions into which they were first initiated. Maturing individuals should also be taught to reflect critically on the alternative traditions, past and present (p. 236).

Whilst I agree with the tenor of Thiessen’s argument, I think the phases of initiation and opening-up are not always linear and clear-cut. Rather, the process is likely to be fluid, iterative and cyclical with overlaps and various possible sequences between the initiation and critique phases. After all, any form of learning, to be efficacious, requires *both* understanding and critically reflecting on the knowledge presented. I therefore propose a more interactive and dynamic approach to avoiding

indoctrination whereby the learner's critical faculties and autonomous agency are developed in both the initiation and critique phases. This next section elaborates on this approach by discussing indoctrination in the context of Confucian education.

## Confucius' Educational Approach

Confucius' thought can be gleaned from the *Analects* which is a Confucian classic that compiles Confucius' sayings and actions (all quotations in this chapter are taken from the *Analects* and translated into English by the author; square brackets denote additions made by the author for the purpose of clarity). Confucius places a great importance on initiating the Chinese learners into *wen* (文) or 'culture', as highlighted in this passage:

9.5 子畏於匡,曰:“文王既没,文不在茲乎?天之將喪斯文也,後死者不得與於斯文也;天之未喪斯文也,匡人其如予何?”

When the Master [Confucius] was surrounded in Kuang, he said, “With King Wen long dead, does not our culture (*wen*) reside here in us? If heaven were going to destroy this legacy, we latecomers would not have had access to it. If heaven is not going to destroy this culture (*wen*), what can the people of Kuang do to me?”

King Wen is one of the sage-kings praised by Confucius for his virtuous rule and adherence to the normative tradition in ancient China. Confucius' belief in the preservation of this normative tradition is implied in his remark that the culture of King Wen now resides in his generation. The continuity of culture is reiterated in another verse where Confucius observes, “The way of Kings Wen and Wu has not yet fallen to the ground but lives in the people” (文武之道,未墜於地,在人) (19.22).

That Confucius treasures the culture of King Wen and desires to propagate it suggests that this 'culture' is not any culture but one that embodies the best of Chinese tradition. Confucius singles out the Zhou dynasty as embodying the culture that should be upheld and propagated (3.14). The Zhou culture, comprising the sum of the knowledge base, values, beliefs, presuppositions and practices of the Zhou dynasty, is manifested through various forms such as traditional texts, ceremonies, social institutions and the exemplary conduct of sage-kings. To distinguish the culture (*wen*) championed by Confucius – modelled by sage-kings such as King Wen and found in the Zhou dynasty – from the ordinary meaning of the word 'culture', I shall use 'Zhou culture' to denote the former for the rest of the chapter.

The initiation into Zhou culture involves *xue* (學) which is 'learning'. Confucius exhorts all to “learn (*xue*) as if you cannot catch up and as if you fear losing it” (學如不及,猶恐失之) (8.17). What then does the learning of Zhou culture entail? First, it involves a broad-based curriculum that is encapsulated in 'the arts' (藝 *yi*) (7.6) of the sage-kings. In ancient China, 'the arts' refers to the following six subjects or domains of learning: propriety or normative behaviours (禮 *li*), music (樂 *yue*),

archery (射 *she*), charioteering (御 *yu*), calligraphy or writing (书 *shu*) and mathematics (数 *shu*). Confucius is described as one who is “broad in learning” (博學) (9.2) and “quietly stores up what is learnt” (默而識之) (7.2); a student of Confucius professes that Confucius “broadens me with culture” (博我以文) (9.11). Mastering the arts initiates the learners into Zhou culture so that this knowledge coupled with moral self-cultivation would prepare them to walk in the footsteps of sage-kings such as King Wen.

But the initiation into Zhou culture neither necessitates nor endorses indoctrination. Recall that indoctrination refers to the paralysis of one’s capacity to rationally justify one’s beliefs, consider alternatives and make autonomous choices in life. To see how indoctrination is eschewed and avoided by Confucius, it is helpful to bring in another concept: *si* (思) or reflection. Learning goes hand in hand with reflection, as asserted by Confucius: “Learning (*wen*) without reflection (*si*) leads to bewilderment; reflection (*si*) without learning (*wen*) leads to perilousness.” (學而不思則罔, 思而不學則殆) (2.15). Confucius’ point is that a person who learns without reflection is perplexed as such a person has not fully grasped the significance of what is learnt. Conversely, a person who reflects without learning is on a shaky ground as such a person lacks the necessary foundational knowledge to act confidently. Noting that reflection (*si*) is not abstract reasoning, Hall and Ames (1987) emphasise that reflection for Confucius is “fundamentally performative in that it is an activity whose immediate consequence is the achievement of a practical result” (p. 44). Learning that is accompanied by reflection or what I call *reflective learning* enhances rather than handicaps the learner’s capacity to formulate and substantiate one’s beliefs, evaluate available options, and exercise agency in life. Let me explain each characteristic of reflective learning, starting with *the ability to formulate and substantiate one’s beliefs*. The passage below expresses Confucius’ teaching approach:

7.8 子曰：“不憤不啓，不悱不發。舉一隅不以三隅反，則不復也。”

The Master said, ‘I do not enlighten a person who is not striving [to understand]; I do not provide [the words to a person] who is not already struggling to speak. If I have raised one [corner] and the person does not come back with the other three [corners], I will not [teach that person] again.’

Rather than utilising didactic teaching and passive learning, Confucius encourages his students to actively construct their beliefs (Tan 2015). The engaged learning that takes place involves making connections (‘striving to understand’), articulating one’s views (‘to speak’) and making inferences (‘come back with the other three corners’). Elsewhere, Confucius also teaches, “When the multitude hates a person, you must examine the matter; when the multitude love a person, you must examine the matter.” (衆惡之，必察焉；衆好之，必察焉) (15.28). This means that we should make up our own mind about a person through careful investigation and not simply rely on popular opinion.

The second characteristic of reflective learning is the *evaluation of available options*. Confucius himself demonstrates this quality in the following two examples:

9.3 子曰：“麻冕，禮也；今也純，儉，吾從衆。拜下，禮也；今拜乎上，泰也。雖違衆，吾從下。”

The Master said, “A ceremonial cap of linen is prescribed by ritual propriety. Nowadays, a silk cap is used instead. This is frugal and I follow the majority on this. To prostrate oneself before ascending [the steps to the hall] is prescribed by ritual propriety. Nowadays, one prostrates oneself only after ascending [the hall]; this is arrogant. Although this goes against the majority, I prostrate myself before ascending.”

In the first instance, Confucius approves the masses’ modification of ritual propriety by substituting the material used for the ceremonial cap. However, he opposes the popular practice of prostrating oneself after ascending the hall in the second example by choosing to prostrate before entering the hall. In both cases, Confucius weighs the options and arrives at a decision based on the moral standard modelled by the sage-kings: frugality in the first example and reverence in the second.

Not only does Confucius critique particular beliefs and practices of his time, he also interrogates the culture that he and his peers have been initiated into. During Confucius’ time, the prevailing cultural norms and guiding discourse were predominantly shaped, modelled and perpetuated by the political rulers. Confucius criticises the rulers, specifically the princes of Lu state, in this verse: “As for the *di* sacrifice that follows the opening libation, I do not desire to watch it.” (禘自既灌而往者，吾不欲觀之矣) (3.10). The *di* sacrifice is a special ceremony that should only be performed by the emperor of the Zhou dynasty. By deliberately appropriating the sacrifice, the princes of Lu not only abuse and pervert the Zhou culture, but also propagate a climate of disrespect, arrogance and rule by might rather than by virtue. The *Analects* records other occasions where Confucius castigates the rulers for violating the Zhou culture (for other instances, see for example 3.1, 3.2, 3.26). Confucius also expresses his disappointment with the widely-held view of filial piety:

2.7 子游問孝。

子曰：“今之孝者，是謂能養。至於犬馬，皆能有養；不敬，何以別乎？”

Ziyou asked about filial piety.

The Master replied, “Nowadays a filial person means one who provides for his parents. But even dogs and horses are provided for. If you show no respect [towards your parents], what is the difference?”

By comparing the prevailing culture of his time with the Zhou culture, Confucius concludes that the former is detrimental to social order and harmony, and calls for a restoration of the latter.

The last characteristic of reflective learning is the *exercise of agency in life*. Learning and doing, according to Confucius, are two sides of the same coin. The Zhou culture is manifested through *li* (禮) that traditionally refers to religious rituals but is expanded by Confucius to cover all normative behaviours. As Confucius puts it:

12.1 子曰：“非禮勿視，非禮勿聽，非禮勿言，非禮勿動。”

The Master replied, “Do not look unless it is in accordance with normative behaviours (*li*); do not listen unless it is in accordance with normative behaviours (*li*); do not speak unless it is in accordance with normative behaviours (*li*); do not move unless it is in accordance with normative behaviours (*li*).”

Confucius’ point is that we should always conduct ourselves in alignment with the tradition of the sage-kings. The essence of normative behaviours (*li*) is the supreme virtue of humanity or benevolence (*ren*). As noted by Confucius: “A person who does not have humanity (*ren*); what [has the person got] to do with normative behaviours (*li*)?” (人而不仁，如禮何?) (3.3). This means that all our actions, whether we are conversing (10.2, 10.15), receiving gifts (10.23), sitting (10.12) or eating (10.10), should stem from and reflect our love for fellow human beings. The intrinsic connection between Zhou culture, learning and normative behaviours is made by Confucius in his description of the *junzi* (exemplary or noble person):

6.27 子曰：“君子博學於文，約之以禮，亦可以弗畔矣夫！”

The Master said, “An exemplary person (*junzi*) who learns culture (*wen*) broadly and is restrained by normative behaviours (*li*) can be relied on to not go astray.”

The above verse informs us that the extensive learning of Zhou culture should be applied in everyday life through the restraint or guidance of normative behaviours.

Confucius’ support for human agency is further evident in his exposition of the quality of *yi* (義) that means rightness or appropriateness. Upholding the exemplary person (*junzi*) as a paradigmatic moral agent, Confucius explains that such a person, “in one’s dealings in the world, is not for or against anything, [and instead] goes with what is appropriate (*yi*).” (君子之於天下也，無適也，無莫也，義之與比) (4.10). The trait of appropriateness directs one to arrive at the best possible judgement or decision in a particular situation. The following passage illustrates the premium Confucius places on the quality of appropriateness:

17.23 子路曰：“君子尚勇乎?”

子曰：“君子義以為上，君子有勇而無義為亂，小人有勇而無義為盜。”

Zilu asked, “Does the exemplary person (*junzi*) regard courage as supreme?”

The Master said, “The exemplary person regards appropriateness (*yi*) as above all. An exemplary person who has courage but lacks appropriateness will be disorderly; the immoral person (*xiaoren*) who has courage but lacks appropriateness will be a thief.”

Overall, we see how Confucius’ notion of reflective learning is instrumental in educating the learners without indoctrinating them. A balance is achieved between initiating members into Zhou culture (*wen*) and enhancing their rational autonomy through learning (*xue*) and reflection (*si*). It is evident that both the critical and moral dimensions are integral to reflective learning. Underscoring critical thinking, Confucius expects the learners to engage in inferential thinking (7.8) and form their own judgement (15.28). In addition, they are encouraged to critique the values, beliefs and practices they have been initiated into and taken for granted. Critical thinking is seen in Confucius drawing his students’ attention to the shortcomings of the prevailing culture (3.26, 2.7) and calling upon them to replace it with

Zhou culture. Characterising Confucius' approach as a 'critical appropriation of tradition', Chan (2000) posits that "ethical reflection and self-cultivation would enable the individual to challenge particular claims of tradition" (p. 245). It should be added that the exercise of critical thinking, for Confucius, is underpinned by moral considerations. Repudiating indoctrination, Confucius recommends a life of self-directed normative behaviours (*li*) that is motivated by humanity (*ren*) and satiated by appropriateness (*yi*). Normative behaviours "offer persons the opportunity to contribute novel meaning to the community and thereby to be integrated in a way enriching to the community" (Kim 2004, p. 119). Jones and Culliney (1998) concur that such behaviours contain "the inherent potential for growth or diminution over time" to the effect that the "structure, sustainability, and orderly flow of information within the system could and would change" (p. 399).

## Indoctrination in Confucian Education

Despite an educational project that abhors and prevents indoctrination, Confucius' educational approach is not immune to the threat or possibility of indoctrination. This section considers two objections to Confucius' teachings as an effective antidote to indoctrination.

The first objection concerns Confucius' recommendation of Zhou culture as the normative tradition. A question is whether indoctrination may occur through the unquestioning and wholesale acceptance of Zhou culture. In other words, is it possible for the learner's rational thinking and agency to be undermined by the imposition of a privileged and totalistic ideology in the form of Zhou culture? To be sure, it is plausible to indoctrinate learners to accept Zhou culture (or any other cultural content, for that matter) blindly. But such an outcome is not inevitable and is in fact avoidable when we take cognisance of Confucius' interpretations of tradition and Zhou culture. Rather than seeing tradition as immutable and essentialised, Confucius regards it as evolving and progressive. The *Analects* informs us that Confucius values the Zhou culture not for its own sake but for its success in selecting, synthesising and preserving the best beliefs and practices of earlier dynasties: "The Yin built on the normative behaviours of the Xia, the abolitions and additions can be known; the Zhou built on the normative behaviours of the Yin, the abolitions and additions can be known." (殷因於夏禮，所損益，可知也；周因於殷禮，所損益，可知也) (2.23). It is also noteworthy that Confucius urges human beings to "broaden the way" (弘道) (15.29) and not to simply follow or preserve it. The 'way' is the way of the sages as embodied in the normative tradition of the Zhou dynasty. To broaden the way, it follows, is to actively and creatively appropriate, modify, enrich and propagate the Zhou culture as part of the on-going endeavour to improve and transform one's tradition. The indoctrination of Zhou culture, therefore, contradicts Confucius' desire to empower human beings with "the freedom to evaluate, criticise and seek to reform the practice tradition itself" (Slingerland, 2001, p. 103).

The second objection spotlights on historical instances where Confucian doctrines have been used to justify and perpetuate ideological indoctrination (e.g. Franke 1960; Hansen 2004; Guo 2012; Tan 2016). Foregrounding the phenomenon of unconditional obedience and rote-learning in Confucian societies, Frederickson (2002) avers that “Confucian ideas came to be used to subjugate others, and less-than virtuous bureaucrats were much a part of the decline of government by the scholar-rulers” (p. 624). If Confucius really opposes indoctrination and champions reflective learning, how do we account for cases of Confucian indoctrination in reality? The first point to note about this objection is that the focus is on the practice rather than the philosophy of Confucianism. These instances do not, in themselves, prove that indoctrination as well as the Confucian doctrines used for indoctrination are consistent with the teachings of Confucius. I would argue that Confucian indoctrination is likely to occur when Confucius’ teachings are selectively manipulated by those in authority to further their political and social agendas through indoctrination.

A case in point is the truncation of Confucius’ notion of reflective learning. An incomplete conception of reflective learning may take the form of marginalising or jettisoning the critical and moral dimensions of reflective learning. Stripped of critical thinking, learning is reduced to mere knowledge transmission, rote-learning and regurgitation. The learners will be ill-equipped to freely inquire, justify their beliefs, critique their traditions and make autonomous choices in life. It is instructive that Confucius alerts us to the danger of memorisation without reflection and application:

13.5 子曰：“誦《詩》三百，授之以政，不達；使於四方，不能專對；雖多，亦奚以爲？”

The Master said, “If [a person] can recite three hundred *Songs*, but is unable to perform an entrusted official duty and exercise [one’s] initiative when sent abroad, what good are the many *Songs* [to that person]?”

What is paramount for Confucius is not learning via the regurgitation of the *Songs* which are ancient Chinese poems. Rather, successful learning is demonstrated through a critical awareness of the practical significance of the *Songs*, which can be achieved *only* when learning and reflection go in tandem.

Besides the critical component, the moral dimension of reflective learning is also essential for learners to become moral agents. Learning that is not premised on and motivated by humanity may lead to actions that do not contribute towards the good of human beings. Worse, such form of learning is open to miseducation and indoctrination where moral agency is denied. Confucius chastises the rulers of his time for ignoring the ethical values of tolerance, respect and genuine grief:

3.26 子曰：“居上不寬，爲禮不敬，臨喪不哀，吾何以觀之哉？”

The Master said, “[One who] in occupying high office is not tolerant, [who] in observing propriety is not respectful, [and who] in overseeing the mourning rites does not grieve – how could I bear to look upon [such a person]?”

Without the critical and moral elements of reflective learning, indoctrination may occur as the members' capacity in rational autonomy is paralysed and their intellectual and moral horizon diminished.

## Conclusion

This chapter has argued that indoctrination may be avoided in Confucian education when the initiation into the culture of one's community is accompanied by learning and reflection. Confucius' educational goal is for the Chinese learners to appreciate, critically appropriate and advance their normative tradition based on the Zhou culture. The chapter explained how Confucius' concept of reflective learning aims to enhance rather than handicap the learner's capacity to formulate and substantiate one's beliefs, evaluate available options, and exercise agency in life. Rather than being indoctrinated, a learner is nurtured to become a reflective and autonomous person who internalises and demonstrates the quality of humanity through normative behaviours. Admittedly, Confucius' educational approach does not guarantee that indoctrination will not or is not likely to take place. The chapter also explored the possibility of indoctrination in Confucian education when the moral and critical dimensions of reflective learning are sidelined or discarded. That Confucian doctrines have been used for indoctrination in reality shows that the prevention of indoctrination requires the creation and sustenance of a conducive social, political and pedagogic culture led by policymakers and educators who are themselves exemplary persons (*junzi*). Arguing that a good leader is one who governs through virtue rather than punitive legal measures, Confucius states that such a person "leads [the common people] with virtue and keeps them in line through normative behaviours" (道之以德, 齊之以禮) (2.3). The short supply of such exemplary leaders in history suggests that Confucius may be too sanguine about human nature and the attainment of his educational vision.

# Deleuze/Guattari

**Olaf Sanders**

A handbook chapter on Deleuze/Guattari has to start with a serious warning. Their philosophy does not work like most other philosophies. Even well-trained scholars cannot extract key concepts or single figures of argumentation without destroying the plane of immanence as the basic layer of their philosophy. Since it is a philosophy of immanence in a very strict manner, you lose everything with the destruction of its plane of consistency. Deleuze and Guattari would vanish instantly. This chapter has to take another way Deleuze himself refers often to Lewis Carroll's *Alice* novels. After passing the rabbit hole everything changes. Learning to deal with this challenge can be described as a process of *Bildung* itself.

## Who Is Who

Gilles Deleuze (1925–1995) was a French philosopher, whereas Félix Guattari (1930–1992) was a French not-philosopher. He was analyzed by Lacan and educated as psychoanalyst; he worked in the anti-psychiatric *Clinique de La Borde*, also as its head for a while. He acted pedagogically, and as a political activist he was deeply involved in the actions against the wars in Algeria and Vietnam. Guattari met Deleuze in the aftermath of May 1968 at the reform University of Vincennes. Deleuze was teaching there as a professor and at this time he had already published some books about Spinoza, Hume, Kant, Nietzsche, and Proust. Up to this point, Deleuze's most important publications were *Différence et répétition* (1968) and *Logique du sens* (1969). In his review of these two books, Michel Foucault (1970)

speculated about the century becoming Deleuzian one day. Despite Deleuze's increasing popularity worldwide, the twentieth century did not turn into a Deleuzian century, unfortunately from a Deleuzian point of view.

Deleuze wrote some of his most important books together with Guattari. The first and best known book of Deleuze and Guattari is *L'Anti-Œdipe* (1972). Foucault (1977: XIII) characterized this book in his preface to the English edition in reference to François de Sales as "an Introduction to the Non-Fascist Life." The book has to be seen as an ethics, offering itself as an orientation for pedagogy, probably in a sense of Schleiermacher as an ethical bias, and after all the catastrophes in the twentieth century. Guattari's contribution to the joint work is commonly underestimated.

Since the publication of *The Anti-Œdipus Papers* (Guattari 2006), his contribution can be appreciated a bit more. Deleuze states in *Dialogues* (1977: 18) that Guattari had constantly been struggling with a kind of wild rodeo in his head, partly against himself. Gary Genosko (2002) presents an introduction to Guattari's frantic thinking in a very solid manner and—albeit shorter—to Guattari's emancipatory pedagogy as well as to his relationship to pedagogy itself (cf. Genosko 2008). The *intersections* of the lives of Deleuze and Guattari are described by François Dosse (2010) in a double biography. We have to face at least three different authors, Deleuze, Guattari, and Deleuze/Guattari, for Deleuze/Guattari claim in the introduction to *Mille Plateaux* (1980:9) that they have been copying themselves over writing and became a multiplicity. The second volume *Mille Plateaux* closes the *Capitalism and Schizophrenia*-project started with *L'Anti-Œdipe*. Deleuze and Guattari develop psychoanalysis up to schizoanalysis, following the streams of differences through many of their differentiations. Between *L'Anti-Œdipe* and *Mille Plateaux*, their book about *Kafka* (1975) was published. Their last joint and at the same time most pedagogical book bears the title *Qu'est-ce quel la philosophie?* (1992) asked with the wisdom of age.

After the first collaborations with Deleuze, Guattari starts to write own, mainly rather thin but nevertheless profound and ambitious books filled with sustained actuality. The books *Les trois écologies* (1989) and *Chaosmose* (1992) can be seen as the most influential. For both of them, Deleuze and Guattari, it can be stated that the purpose of their writing is to be of use.

## Problems

In the *Abécédaire*, Deleuze suggests under *Q comme Question* to emanate from problems. Questions and problems are bound together. Questions are not only instruments of questioning to prove knowledge or to explain facts. Questions are meant to start thinking or bring thinking into movement. Deleuze pleads for a positive concept of problems. His concept does not devise problems as something to eliminate but as a challenge, which is changing while working on it. For a philosophy of education in general one can take for granted, what can be considered Deleuze's challenge: explicitly *to do* what the great philosophers did instead of just

*repeating* what the great philosophers *wrote* and thereby simply copying or attaching it to the pedagogical field. This is the way to grasp Deleuze's perspective in which the first and most important task for the philosophy of education is to create new pedagogical concepts and to revise established ones. What does learning mean? What does education mean? Why are fear or money no pedagogical basic concepts?

The *Abécédaire* is a movie document and paradoxically a nearly seven and a half hour long interrogation, hold by Clare Parnet, who wrote the book *Dialogues* together with Deleuze. The paradox moment can be seen even in the title of the movie. The German translation for *abécédaire* is 'Fibel', the English one is *spelling book*. The movie title suggests a simplification of the kind Deleuze is rejecting in the *Abécédaire* under *P comme Professeur*. One is not playing a simplified Berg or Beethoven for nonmusicians. So, nobody should simplify Hegel or Deleuze for nonphilosophers. From this point of view, a handbook chapter is in every case completely unDeleuzian. From what kind of problems—except from this completely irresolvable one—one has to emanate without simplifying in an unacceptable way:

- (a) Philosophy of education is deeply Eurocentric for it holds on to the logic of subject/object. Deleuze and Guattari develop figures of a different logic that are, e.g., compatible to the far eastern or indigenous South American way of thinking. As another reason for eurocentrism, it may be acknowledged that the action-theoretical basis of pedagogy, like the events and situation potentials that are more important in the Chinese culture, are systematically underestimated. Finally, the system/method concept contributes to the eurocentrism as well. Rhizome—rhizome is one of the most popular concepts of Deleuze/Guattari and at the same time it is the title of the introduction to *Mille Plateaux* outsourced in advance as book—grow everywhere.
- (b) Philosophy of education largely avoids 'epochal typical key problems' (Klafki 1991) like globalization, Anthropocene, big data or Posthumanism because it lacks appropriate concepts. Quite early Deleuze/Guattari, Deleuze, and Guattari developed intellectual approaches that help to work on the key problems because they put a brighter spotlight on those key problems than the subject-object-logic.
- (c) Concerning the philosophy of *Bildung*, the works of Deleuze/Guattari, claimed and labeled by themselves as pop-philosophy, help to release the concept of *Bildung* from its high culture bonds. Considering Punk as one of the most critical popular genres one can ask: How could such a post-punk-pedagogy be like?
- (d) Although we understand socialization, learning, education, and *Bildung* as processes, we do not have a profound process concept or a process logic that knows other movements and *dancefloor moves* than the Hegelian "dialectical Prozess-Walzer a priori" (Bloch 1971: 131). In this context, cinema proves to be very informative.
- (e) The loss of significance of the critical pedagogy emerging from the marginalization of the Critical Theory can be slowed down if not reversed by developing its fundamentals into schizoanalysis and post-Deleuzian Marxism. In this spirit, Antonio and Michael Hardt wrote the *Empire*-trilogy (Hardt/Negri 2000, 2004

and 2009). Negri was a good friend to Deleuze and even more to Guattari. Hardt is the author of one of first English introductions into the thinking of Deleuze (cf. Hardt 1993).

- (f) And and and ... Deleuze/Guattari are at least exerted to develop a logic of *and and and*

### Three Pedagogies

Deleuze and Deleuze/Guattari create three pedagogies that are structuring their late works since 1975 (cf. Sanders 2018). The names of the three pedagogies are opposite to their order of origin:

- (a) Pedagogy of concept
- (b) Pedagogy of minor science and
- (c) Pedagogy of perception or of the cinema

It is worth to read the later works of Deleuze and Guattari first. The pedagogies of Deleuze and Deleuze/Guattari build a philosophy of *Bildung* in terms of a Hegelian format.

The age need to become pedagogic to work on the named problems and other important ones. Deleuze and Guattari bring philosophy and pedagogy closer to each other in their last joint book *Qu'est-ce que la philosophie?* (1991). They do this by proclaiming a pedagogical era. The reason for this is the fading of the encyclopedical age whereupon Deleuze and Guattari do not refer to the French encyclopedists but to Hegel's encyclopedia, the *Enzyklopädie der philosophischen Wissenschaften* (1830), which demanded to elaborate philosophy on the basis of Kant's critical philosophy and bring it to an end by doing so. Hegel's claim was impudent from the beginning on. So philosophy survived its predicted end like history did. Nevertheless, the closing gesture had a serious side effect. For its encyclopedic claim, philosophy lost the event of thinking and the event to marketing. Deleuze and Guattari name marketing with regard to thinking an impertinent rival. Through marketing, education is limited to the process of gaining marketable competences. This movement needs to be counteracted. Consequently, Deleuze and Guattari formulate as task for the pedagogy of concept to regain the event from marketing. The pedagogy of concept inherits from the encyclopedia, which wanted itself to be understood as the last valid composition of prepared concepts. Opposite to the encyclopedia, concepts remain in the becoming within the pedagogy. The becoming (devenir) had been put aside to *Sein* (being) by Deleuze/Guattari and Guattari even earlier. As well, becoming is a different mode than history. Deleuze/Guattari interpret history as recorded being. Within Deleuze and Guattari, becoming and *Sein* (being) coexist as two strands or lines of a double articulation. Articulation has, like *aufheben* with Hegel, three definitions: structure, connection, and expression. With Hegel, just as in the German everyday language used, *aufheben* means preserve, abrogate, and elevate. Especially, Deleuze is often labeled as 'anti-Hegelian' as did Foucault in

the abovementioned review. But, strictly speaking, Deleuze is not ‘anti-Hegelian’ because he is not taking a position against Hegel but he is widening Hegel’s philosophy: either-and-or. There is not only history but also becoming. Within the becoming concepts become events. With the use of the pedagogy of concepts they shall be enabled to become this again.

Deleuze and Guattari unfold a theory of concept and produce philosophy, science, and art as a plurality of three equal manners of knowledge. Concepts consist of components and they are created or newly cut by conceptual personæ which do not have to be famous or identical to female and male philosophers—they are just their cover or do house them. Some of the well-known conceptual personæ in the history of philosophy are Plato’s Socrates, Kues’ idiot, and Nietzsche’s Zoroaster (Zarathustra). Conceptual personæ even compose concepts from components that mainly have history. But, also new components can be invented. Deleuze and Guattari state composition as an artificial basic engineering. With this determination, philosophy is again becoming a creative discipline. Philosophers can start again to do what great philosophers always did, namely, to philosophize instead of repeating what great philosophers wrote just as the professors of philosophy often do, who still keep an encyclopedic attitude even after the end of the encyclopedic era by interpreting philosophical texts hoping for, at least for the moment, ultimate interpretation. Again, interpretation is not fulfilling, philosophy has to change something and to make a difference. Deleuze and Guattari draw theoretical *lines of flight* in the tradition of Feuerbach.

Deleuze and Guattari distinguish philosophical concepts from scientific notions. Philosophical concepts are self-referential, scientific notions have at least one empirical element that connects them to reality or the world. Science is always made from the current. Philosophy instead develops the virtual, which is not only containing the essence of *Sein* (being) but also the possible and the impossible. In science, partial observers take the role that conceptual personæ do take in philosophy. Artists do creative work. So do philosophers. But, artists do not only create insubstantial concepts but also substantial monuments. By this means they connect the virtual and the current. The two different manners of knowledge develop their own pedagogies.

The phrasing ‘pedagogy of the minor science’ cannot be found in Deleuze and Guattari although they suggest the existence of such a pedagogy at the end of *Qu’est-ce quel la philosophie?* The phrase is my invention: *Mille Plateaux* can be read as a theory of the minor sciences. Deleuze and Guattari oppose minor science to royal science. Parts of the minor science developed into royal science after abandoning its nomadism and integrating into states. The royal science serves the state, whereas the minor science follows the substance like once the metallurgy. After the rise of the royal science, minor science wandered through the peripheries of knowledge and the academic activities where it even now follows the things and the contexts before they get ordered. By doing so it develops innovations which are then collected and absorbed by the royal science. Occasionally royal science tolerates minor science at its peripheries. Psychoanalysis and psychology are a correlated pair of, even today, predominant minor and predominant royal science.

This pair usually has a comparatively strong corpus of methods, which increases its resistance against paradigm jumps. Paradigm jumps are supported by the minor science through micro-shifts. Royal science uses the knowledge of the minor science for innovations. It can be easily seen at the peripheries that permanently something is developing and meanwhile something is vanishing. Also, education and de-education are two lines of a double articulation.

The pedagogy of perception is the eldest of the three pedagogies, and it mainly descends from Deleuze. This specific pedagogy is due to the simple circumstance described by Foucault in the introduction to *Histoire de la sexualité II: L'Usage des plaisirs* (1984), that in some moments is most important for further thinking and further seeing to see differently from the way of seeing so far. Deleuze is also engaged with other arts, so he wrote a book about the painting of Francis Bacon (cf. Deleuze 1984), but to him the 'highest' among the arts is the cinema. He wrote two books about it: *L'Image-mouvement* (1983) and *L'Image-temps* (1985). Both cinema-books are named after the two types of cinematic images Deleuze is distinguishing: the movement-image and the time-image. Basically, every movie image is both movement-image and time-image, because something is always moving on screen—even if it is only minimal—and every scene lasts. For Deleuze, the movie-still is not a cinema image. When he talks of movement-image or time-image he talks about the moving image which is emerging on the screen. Deleuze takes the screen for the brain (cf. Deleuze 2003: 263 ff.). On screen one can furthermore—and therefore the cinema becomes an ontological laboratory—watch the being becoming. Even in the beginning of *L'Anti-Edipe*, Deleuze/Guattari write: Flux' or streams and cuts everywhere, 'toujours des fleux et des coupures'. Movies consist of nothing else but of flux and cuts. Thus, we did film much longer than the cinema does exist. Plato's cave is an example for a very poor and bad early cinema. The caves of Chauvet shown by Werner Herzog in his documentary movie *The Cave of the Forgotten Dreams* (CND a.o. 2010) are a much earlier good cinema (cf. Sanders 2014).

The book *L'Image-mouvement* functions like a short history of cinema, from its beginning in France and the United States through the European between-wars-avant-garde up to Hitchcock who accomplished cinema. In this respect, *Vertigo* (USA 1958) is a paradigmatic as well as encyclopedic movie. Hitchcock develops mental images that force the audience to think ahead. But, his movies stay didactic because they allow only to rethink the already devised just as directed teaching units and Socratic dialogs do. Deleuze distinguishes between more than one type of movement-images, namely, the perception-image, the affection-image, the action-image, and finally the mental image. Concerning the theory of signs by Peirce, Deleuze relates three image signs to each of the movement-images. Out of the last image sign, the genetic sign of the mental image emerges the time-image as a completely new type of image. Subsequently, the book *L'Image-temps* tells the short history of the vanguard postwar cinema. For this cinema, the organic cut is not an option anymore for the sensorimotor tie between image and movement and the whole as unit was destroyed by the catastrophes in the twentieth century, especially the World War II and the Shoah. The cinema allows to still believe in the whole in a

not naïve way and on behalf of this belief it shows, since the Italian neorealism, the broken world and the consistently breaking sense. *Citizen Kane* (USA 1941) by Orson Welles can be seen as the first important time-image-movie. In this movie, layers of past follow each other, so there is not a whole anymore but still sense. In Alain Resnais' *L'Année dernière à Marienbad* (F/I 1961) peaks of present appear instead of layers of past. A third way to make time itself visible is proved by the Japanese director Yasujiro Ozu. He uses scenes in his movies with nearly no movement at all—and if so, the movement is very slow so the Bergsonian *durée* is tangible.

Movement-image and time-image relate to each other like the two sides of a Möbius strip that are one at the same time. Connection and difference enable to learn how to see better or more precisely. This would be preferable for phenomena like learning, education, and school, so they could be seen in a different light as well.

## Learning, Education, and School

Deleuze utters the concept of learning in *Différence et répétition* and earlier in *Proust et les signes* (1964).

In his book about Marcel Proust, Deleuze writes that learning has especially and substantially something to do with signs. With Proust, Deleuze recognizes signs as objects of a temporal lesson which he distinguishes from abstract knowledge. To learn presumes and means to observe a material, an object, or a being in a way as signs spread from the observed. These signs need to be interpreted and decoded. Who learns becomes an “Egyptologist” of a matter or a thing in the Deleuzian perspective. Only this process of education enables to learn. *Bildung* is not only learning on a higher stage or learning in a second order; it is at the same time the foundation of all processes of learning. Deleuze summarizes: Who or what ever teaches something sends out signs. Every act of learning is an interpretation of signs or hieroglyphs. To Deleuze, the work of Proust grounds in a quite structural way in the learning of signs and not in a performance of memory like the memory of cookies—the madeleines—tea, smells, and others. In *Différence et répétition*, Deleuze adds that learning is a subjective act in view of the objectivity of the problem. Learning always happens in the channel through the subliminal and accompanied by affects. Because Deleuze and Guattari think the subliminal collective, every subjective act outstrips the single subject toward culture. As part of the culture, learning becomes an adventure of the involuntary. During “l’aventure de l’involontaire” (Deleuze 1968: 215) something is happening: Because learning reacts to an event and is an event itself, the movement of learning can be recognized as a transformativ process of *Bildung*.

Concerning the concept of education, Deleuze and Guattari follow widely the understandings of Foucault’s theory of power. Deployments of power arrange points of subjectivation and order their transitions. The subject usually regarded as autonomous doubles itself as subordinated during this process of subjectivation. The

subordination shows itself as standardization. Through processes of standardization the always preconditioned ideal is improving.

The various forms of education or 'normalization' imposed on an individual consist in making him or her change points of subjectification, always moving toward higher, nobler one in closer conformity with a supposed ideal. (Deleuze and Guattari 1987: 129)

With Foucault, hierarchic control and standardized sanctions intensify into examinations that create new knowledge. This knowledge, however, is nothing but a knowledge of Being as created by the royal scientists. Becoming of all kinds eludes from this kind of knowledge. Only minor scientists possess knowledge about the becoming. For since becoming implicates variation, to become, as a norm directs it, has nothing to with becoming. Hence, one cannot becoming-man but only be a man. But, to be a man can certainly contain to become a man. Becoming performs through micro processes, through standardization with the help of segmentary lines that divide classes from each other. In this regard, Deleuze and Guattari write of 'molar' as an antonym to 'minoritary', they summarize and go one step ahead. In doing so, they shift the concept of subject once again:

There is no becoming-man because man is the molar entity par excellence, whereas becomings are molecular. The faciality function showed us the form under which man constitutes the majority, or rather the standard upon the majority is based: white, male, adult, 'rational' etc., in short the average European, subject of the enunciation. (Deleuze and Guattari 1987: 292)

Instead of intentional center of perception, thinking, and of acting, subject does also mean issue and subordinated. Finally, it functions as a grammatical function, as subject of declaring and statement. With the concept of *visagéité* (faciality), Deleuze and Guattari connect to Deleuze's consideration about learning and to the philosophy of Emmanuel Lévinas. In this philosophy, the face expresses and supports the imperative 'You shall not kill' for it is very vulnerable. On the contrary, for Deleuze and Guattari the face is a disciplinary and disciplinating protosign that still forms the cinema as white screen and black hole. Deleuze and Guattari oppose the norm of the 'white reasonable man' referring to processes of becoming raising in radicalness. The most moderate process they call becoming-woman what does not happen by itself even with women. One has, as the saying goes, to become what one is. It follows becoming-child or becoming-black, depending on molar preferences of reason or whiteness, becoming-animal, becoming-plant, and finally inorganic or becoming-crystal. To slowdown or even hinder such kind of processes of becoming for keeping the molar laws of arborescence in force is the purpose of faciality. The faciality claims for itself a focal position—in the rhizome everything is center:

The central point, or third eye, thus has the property of organizing binary distributions within the dualism machines, and of reproducing itself in the principal term of the opposition; the entire opposition at the same time resonates in the central point. (Deleuze and Guattari 1987: 292)

To dissolve opposition in organization, this tactic, also common in reforming educational institutions, works by redundancy. The Redundancy creates and supports a majority in an antidemocratic way, since this majority is not the majority of the population:

Man constitutes himself as a gigantic memory, through the position of the central point, its frequency (insofar as it is necessarily reproduced by a dominant point), and it is resonance (insofar all of the points tie in with it). (Deleuze and Guattari 1987: 293)

Man seems like the tree trunk or like the face; he centers up and fixes the points only in relation to himself. That shrinks at least the freedom of movement as elementary liberty, and it hurts one of the principles of Deleuze/Guattari, namely, the one that there are no points but only lines for points are moving and moving draws lines.

Partially, Deleuze and Guattari anticipate the notion of Jacques Rancière in *Le maître ignorant* (1987: 29 ff.) that lessons based on explanation are antiemancipatory and so is the use of the so-called Socratic method. Rancière often refers to Deleuze. Explanation and directed teaching conversations seem to me quite ineffective and of low performance. They *bilden* only rarely. As an extreme form of becoming, *Bildung* can be understood as a process of crystallization where structures repeat and yet diversify, as process where something is growing by developing layers that can as well dissolve again. Generally, lessons function in a different way. A teacher, so it says at the beginning of the 4th plateau, does not inform herself when she questions or examines a student as little as she informs when she gives grammar or mathematic lessons. Deleuze and Guattari do not only support Rancière's understanding that explaining lessons operate antiemancipatory but moreover they refer in recourse to the concrete use of language and its power effect:

she (the schoolmistress) informing them (her students), any more than she is informing herself when she questions a student. She does not so much instruct as 'insign', give orders or commands. (Deleuze and Guattari 1987: 75)

The wordplay of *enseigner* (teach) and *signer* (sign/subscribe) disappears in the American or German translation. Deleuze and Guattari point out that the commands of a teacher or professor are not external or accessory to that what he teaches: regulations are always based on regulations thus they are redundant. "The compulsory education machine (la machine enseignement obligatoire)" (Deleuze and Guattari 1987: 75) does not communicate information but imposes semiotic coordinates with all the dual grammar basics as male-female, singular-plural, noun-verb, subject of the statement or stating subject respectively of the predicating on the child, the adolescent, or the student. Orders—the word has two meanings in German and even three in English—base on and change existing regularities that can be read as sediment of regulations:

The elementary unit of language—the statement (énoncé)—is the order-word (le mot d'ordre). (Deleuze and Guattari 1987: 76)

This determination opposes another, the one of the tool.  
Deleuze and Guattari write:

Words are not tools, but we give children language, pens, and notebooks as we give workers shovels and pickaxes. (Deleuze and Guattari 1987: 76)

They describe rules for grammar as markers of power that guarantee the transmission of information. Information itself shields disfigurements and is effective

against the noise. The criticism of Deleuze/Guattari defends life against the torture of instruction and lessons.

Language is not life, it gives life orders. Life does not speak, it listens and waits. (Deleuze and Guattari 1987: 76)

Lacanian Big Others have always already been there and established the law. The language instead needs to be forced to stutter—also with images.

## Review and Discourse

The international—and in the case of Deleuze and Guattari mainly Anglophone—review takes course primarily through a range of journal focuses, anthologies, and books by Inna Semetsky, Diana Masny, and David R. Cole (cf. Semetsky 2004, 2006 and 2008, Masny/Cole 2009 and Semetsky/Masny 2011 and 2013) to which I contributed as well (cf. Sanders 2011). One article about the concept of a school without conditions, inspired by Deleuze, written for the volume *Deleuze and Guattari, Politics and Education* (2014), edited by Matthew Carlin and Jason Wallin, was finally released online in *Other Education* (cf. Sanders 2015). The discourse meanders mainly in the Deleuze community, which is cross-bounded through the Deleuze studies and the corresponding annual conferences. This results in many prominent not-educationists and not-*Bildungs-* and not-education philosophers participating in the discourse in a *bildungs-* and education philosophical way. Most contributions/articles remain conceptual or applied Deleuzism. This discourse includes the danger of school education that Deleuze always wanted to escape. Instead of doing something different than Deleuze did with his concepts, professors tend to do what professors mainly do. The canonization may become aporiatic. Only *Multiple Literacies Theory* by Masny and Cole (2009) dares to get really close to school. Considering this, the theory by Masny and Cole is an exception, but sometimes it appears quite un-Deleuzian for maybe not being experimental enough. Here, the risk threatens to pedagogize Deleuze and Deleuze/Guattari.

Reciprocal Influences of Deleuze studies and the Anglophone Philosophy of Education are rarely known. And there have been hardly any academic papers produced within the German Philosophy of education and Philosophy of *Bildung* concerning Deleuze and Guattari. In this context, the scientific work of Liane Mozère should be considered. Mozère who died in 2013 was working with Guattari and also a member of the Centre d'études, de recherches et de formation institutionnelles founded by Guattari. Mozère published a lot of papers concerning early childhood education long before it came into fashion (cf. f.i. Mozère 2003a, b).

Altogether, the educational philosophical or pedagogical review of the writings of Deleuze and Deleuze/Guattari is complicated in a literal sense as it seems to be difficult to access. They cannot be used as a brick within a building of theories because all the many little shifts that occur while reading their books change everything. Becoming-educationist always means becoming-revolutionary. Precisely that

enables the creation of new concepts, perspectives, and theories that allow us to work on the sketched problems. This is the input given by Deleuze and Guattari: They enable to differ and to wish what needs to be strengthened in these times of hyperstandardization and advanced wish-colonialization—and this without getting caught into the trap of self-reference.

**Acknowledgement** The article based on a translation by Pia Milker. I am very grateful for her work. For critical final revision and proofreading I have to thank Robert Hamm.

# Derrida's Archive and Legacy to Education: Between Past and Future

Denise Egéa

*The archive contains ... places or moments where ... an archive*

*Oriented by the past is turned toward the future and what remains to come.* (Naas 2015, p. 126)

*There is legacy only where assignments are multiple and contradictory, secret enough to defy interpretation, to carry the unlimited risk of active interpretation.* (Derrida 2002b, p. 111)

## Introduction

Derrida (1930–2004) has been referred to as “probably the most famous philosopher of our time” and “the first truly global philosopher,” “an enormously prolific writer and lecturer” (Kujundžić 2011, p. 1), “one of the most important philosophers of the twentieth century” (Glorieux and Hašimbegović 2007, p. 1), the “most inventive of a generation of inventive French thinkers” (Hartman, in White 2007, p. 407). He is one of the most productive philosophers, with “a truly remarkable and as yet *barely explored archive*” (added emphasis; Naas 2015, p. 15),<sup>1</sup> and one whose huge corpus has generated an enormous amount of follow-up events and studies: conferences, seminars, books, articles, theses, dissertations, films, art work, and so on. On the other hand, following his death on October 8, 2004, a shocking number of negative public obituaries were published,<sup>2</sup> “tainted by misunderstanding and ill-advised criticism, displaying a malignant wit and vicious satire ... condemning his thought as ‘obscurantism,’ or being ‘murky,’ ‘enigmatic’ or ‘self-contradictory’” (Fagan et al. 2007, p. 1). Since 2004, a large number of publications, conferences,

---

<sup>1</sup> More than 70 books published during his life time, four decades of seminars, all carefully written out (in the process of being published), and innumerable articles, chapters, essays, conference papers, etc., too numerous to count, and not all accounted for.

<sup>2</sup> For example, *The New York Times* (2004, October 10) and *The Economist* (Guerrero Mendez 2004, October 21) denigrated his work, declaring that “[h]e was a sincere and learned man, if a confused one” who “vehemently resisted any attempt to clarify his ideas” (para. 3 and 6).

D. Egéa (✉)  
Nazarbayev University, Astana, Kazakhstan  
e-mail: [denise.egea@nu.edu.kz](mailto:denise.egea@nu.edu.kz)

forums, and symposia<sup>3</sup> have addressed and explored the meaning of Derrida's legacy in a variety of disciplinary fields; however, none in the context of education. Yet the question of education is at the core of Derrida's work, and one can even affirm that, "in the strongest sense, the question of deconstruction *is* the question of education" (Cahen 2011, p. 5).

Among the many areas in which Derrida's archive represents an invaluable legacy, one is paramount, especially in the context of education: his unrelenting defense of philosophy, of access to philosophy, of the right to philosophy, the right to, and the necessity of, teaching philosophy, and, concomitant to that, the crucial role of Humanities departments in the university, especially as we continue to face the most 'dramatic program cuts' (Wilson 2012). It is the object of the second part of this chapter, after I examine Derrida's "constant preoccupation" (Naas 2015, p. 125), that is, his concern with the 'archive,'<sup>4</sup> heritage, and legacy. Then I discuss how reading Derrida helps understand the importance and necessity of our philosophical heritage in order to be aware of, and respond to, the most urgent problems posed by the current educational context under the pressure of the corporate and money market model. In the last section, I focus on two concepts which run through Derrida's thought and corpus, concepts which I find most helpful to identify, think through, and address some of the most critical current challenges in education.

## Learning from the Past with Derrida

### *Archive*

In his last two seminars at the *École des Hautes Études en Sciences Sociales*, Derrida engaged in "a radical rethinking of the trace and the archive" (Naas 2015, p. 12). 'Rethinking' indeed, because his last 2-year seminar, published posthumously in two volumes under the title *The Beast and the Sovereign* (2009, 2010), was not the first time Derrida explored the theme of the archive. Naas sees a 'long itinerary' in Derrida's reflection on the archive, which he points out is "clearly not just one question among others for Derrida ... but in some sense, the central question" (2015, p. 126). He even goes as far as asserting that it is "the central question of philosophy itself" (p. 126). I shall leave this last assessment to stand as is in Naas's words. Suffice it to stress that the theme of archive and of the related notions of heritage and

<sup>4</sup>Derrida consistently used the singular form.

legacy, but also of a string of attendant concepts (trace, memory, tradition, inheritance, writing, supplement, spectrality, gift, debt, and so on) can be found in most of Derrida's texts.<sup>5</sup> In *Archive Fever* (1996), he wrote:

I asked myself what is the moment *proper* to the archive, if there is such a thing, the instant of archivization strictly speaking, which is not ... so-called live or spontaneous memory (*mnēmē* or *anamnesis*), but rather a certain hypomnesis and prosthetic experience of the technical substrate. (original emphasis; pp. 25–26)

Naas sees two sources of the archive. One is in the “attempt to protect, save, or indemnify a unique text” (2015, p. 127), which means that it would be impossible to reproduce it, replace it, or reiterate it by any means. His assertion is supported by Derrida's affirmation that “each time in its original uniqueness, an archive ought to be idiomatic, and thus at once offered and unavailable for translation ... and shielded from technical iteration and reproduction” (1996, p. 90). However, as an archive, a text must also, *at the same time*, be reproduceable, made accessible for future readings. This is the second source identified by Naas: “an *affirmative* relation to that past or that text in the form of a promise or performative repetition” in the future (2015, p. 128). And there lies the *inherent paradox of the archive*: its potential to preserve and protect, and its threat to translate and transform, to alter, through iteration.

This is also where the archive finds itself situated *between past and future*: the ‘archiving event,’ archivization preserves a unique past event (of writing, recorded speech, or gesture), the ‘archived event,’ in the hope and with the promise that it will be made available in the future. For Derrida, the archive was always “at once beneficial and monstrous, *both at once* ... a chance and a threat.... To keep, precisely, one destroys, one lets many things be destroyed” (added emphasis; 2013, p. 26). In that sense, the archiving event is always marked with violence since, while it must preserve the ‘archived event,’ it must *at one and the same time* select, censure, erase, which means neglect, reject, discard, destroy, forget all that is not archived. “The archive begins by selection, and this selection is a violence” declared Derrida in a set of remarks made on June 25, 2002, at the *Institut National de l'Audiovisuel* (INA) in Paris,<sup>6</sup> and published in 2013 in a text titled “Trace and Archive.” In those remarks, he made a distinction between the trace and the archive, affirming that “there is no archive without a trace,” but “every trace is not an archive in so far as the archive presupposes ... that the trace be appropriated, controlled, organized” (2013, p. 23). It is this ‘evaluation,’ this selection, which shift the trace to the status

<sup>5</sup>For example, such obvious titles as: *Archive Fever*; *The Secrets of the Archive*; *Copy, Archive, Signature*; *The Next to Last Word: Archives of the Confession in Typewriter Ribbon*. In other works, the word does not appear in the title, but the concept is no less central: *Of Grammatology* (the trace); *Specters of Marx* and *Ulysses Gramophone* (hauntology); *Echographies*; *No Journalists*; *A taste for the Secret*; *Above All*; *No Apocalypse, Not Now*; *Choosing One's Heritage in For What Tomorrow... A Dialogue*; and Derrida's last interview with *Le Monde* (August 19, 2004, 2 months before his death on October 8): *I'm at War with Myself*.

<sup>6</sup>Created in 1975, the INA is a cultural public institution precisely responsible for the preservation and valorization of radio and television archives and for the transmission of our audiovisual heritage, in France and abroad.

of archive. As such, archivization attempts to preserve selected traces which, in that sense, are always finite.

In his 2002 remarks, Derrida made another distinction between the trace and the archive, based on their relation to power. By appropriating, controlling, and organizing traces, naming them, the archive exerts its power over the trace. Derrida insisted that “There are no archives without a power of capitalization or of monopoly ... of a gathering of statutory traces that are recognized as traces. In other words, there are no archives without political power” (2013, p. 23). Who or what authority decides on what will be archived? According to which and whose criteria?

In essence, a trace is erasable, can be lost. If selected to be preserved as an archive, it will be assigned to a support, “whether tablet or papyrus or paper or hard drive or, today, ‘tablet’ again” (Naas 2015, p. 128), all liable to be damaged or lost (a stark reality when in 2005 Katrina hit New Orleans, for example). The astounding advances in technology have greatly diminished those risks, multiplied the possibilities to increase the volume of the archive, and enhanced its secure safekeeping. The concern for ‘finite survival’ is still there though; but because of

the enormous and unprecedented advances ... in the technical possibilities of archivization, it is becoming today harder and harder not to indulge in the dream of an archive that would become so effective, so performative, that it would be more or less total or absolute. (Naas 2015, p. 133)

Not a position Derrida supported in his 2004 last interview (2004 and 2007). He did acknowledge the progress of our techno-cultural potential; however, he did not believe that it could guarantee the survival of the archive. He declared: whereas people from

previous generations ... thought that such and such a work would survive, owing to its qualities, for one, two – or in the case of Plato, 25 – centuries ... today the acceleration of modalities of storage but also the wear and the wearing out change the structure and the temporal parameters of our legacy. As regards thinking especially, the question of survival has become subject to too many unknowns. (2007, p. 9)

Shortly before his death, he confided, not for the first time, how this question of archive, inheritance, and legacy ‘preoccupied’ him, ‘constantly.’ He asked: “Who is going to inherit and how? ... we exert ourselves without knowing whom exactly the thing we leave behind is entrusted to” (2007, p. 9). What will be preserved, left out, what will be archived, by whom, how, and where?

## *Heritage and Legacy*

The archive is what the future will inherit, the legacy of the past to future generations. Derrida has emphasized the importance of our cultural and philosophical heritage and has often stressed the necessity of a ‘philosophical memory.’ He himself has repeatedly paid homage to, and ‘marked the alliance with,’ the philosophers

who preceded him,<sup>7</sup> acknowledging himself as their 'heir,' be it "a question of life or work or thought" (Derrida and Roudinesco 2004, p. 3).

In *The Freedom of Spirit* (1960/1962), using a metaphor of economy, Paul Valéry considered the becomings<sup>8</sup> of culture as an accumulation of capital: "For myself ... they are a kind of capital that grows and ... can be used and accumulated, can increase and diminish like all the imaginable kinds of capital" (Valéry, p. 1089/200).<sup>9</sup> This 'cultural capital' is the archive from the past. And as indicated earlier, this archive, this cultural capital is finite, precarious, fragile, and uncertain. Its survival, its "salvation ... resuscitation or reanimation" (Naas 2015, p. 132) depends on its being "read, interpreted, taught, saved, translated, reprinted, illustrated, filmed, kept alive by millions of inheritors" (Derrida 2010, p. 130). Valéry stressed that artifacts, "*things*, material objects – books, pictures, instruments, etc. – having the probable lifespan, the fragility, and the precariousness of *things*" (original emphasis; p. 1089/200), are not sufficient to ensure a cultural legacy. They require individuals "*who need them and know how to use them*" (original emphasis; Valéry, p. 1089/200). Derrida put it another way, arguing that the archive "resuscitates, each time a breath of living reading, each time a breath of the other or the other breath, each time an intentionality intends it and makes it live again by animating it" (2010, pp. 132–133). Valéry emphasized the need for individuals with "a thirst for knowledge and for the power of inner transformation" (p. 1090/201). The disappearance of those individuals who could keep the memory of a heritage, keep the archive alive, was for Valéry what constitutes the ultimate threat to our cultural heritage.

Commenting on Valéry's text, in *The Other Heading* (1992a), Derrida argued for the necessity of a 'responsible memory,' of both 'repetition and memory,' and of individuals who are capable of assuming the responsibility of this heritage, who are "prepared to respond, to respond *before*, to respond *of*, and to respond *to* what they had heard, seen, read, and known the first time"<sup>10</sup> (original emphasis; p. 70). It is this 'repetition,' this responsibility toward the cultural capital, toward the archive, which guarantee the growth of a 'universal capital.' But for Derrida, the acknowledgment of our heritage is anything but a passive repetition; it entails a willingness to assume this legacy, "as a heritage one calls upon to form new questions or new propositions" (2002a, npn). With a constant reflection fundamental to philosophy, one must put this heritage into question, challenge it, and re-think its assumed certainties. This deconstruction, Derrida understands it as "a tension between memory, fidelity, the preservation of something that has been given to us, and at the same time heterogeneity, something absolutely new" (in Derrida and Caputo 1997, p. 6).

<sup>7</sup>e.g., in no particular order: Plato, Descartes, Kant, Nietzsche, Hegel, Heidegger, Husserl, Rousseau, St. Augustine, Jabès, Ceylan, Levinas, Genet, Lacan, Levi-Strauss, Foucault, Althusser, Deleuze, Lyotard, Artaud, Austin, and others still.

<sup>8</sup>Plural form in Valéry's text.

<sup>9</sup>The first number refers to the French text, the second to the Folliot and Mathews's English translation.

<sup>10</sup>Translation slightly modified. Brault and Nass's original translation: "prepared to respond *to*, to respond *before*, to be responsible *for* and to respond *to*..." – "to respond *for*" means "to be responsible *for*" and respects the parallel structure of the sentence based on "to respond."

A recurring paradox underlies this tension in the necessity to neither accept everything, nor reject anything, to be both faithful and unfaithful to a legacy, that is, not to accept a heritage wholesale ‘passively,’ but to deconstruct it, understand it through its genealogy, its fractures, its gaps, its inconsistencies and contradictions. It is to know it well enough to be able to uncover its sedimentations, layer by layer – not to destroy the preceding systems of thought, but to try to analyze them, uncover their origin, their composition, and assumptions. The choice is then given and received through the experience of this reaffirmation and double injunction, experienced anew in each different context, through new steps of identification, selection, filtering, and interpretation of the archive. In “The Deconstruction of Actuality” (2002c), Derrida explained:

whoever inherits chooses one spirit rather than another. One makes selections, one filters, one sifts through the ghosts or through the injunctions of each spirit. There is legacy only where assignments are multiple and contradictory, secret enough to defy interpretation, to carry the unlimited risk of active interpretation.... A legacy must retain an undecidable reserve. (p. 111)

For example, when Derrida draws on philosophers who preceded him, he “makes [their] works speak from within,” extracting their innermost voices “through their fault lines, their blanks, their margins, their contradictions, but without trying to kill them” (Roudinesco, in Derrida and Roudinesco 2004, p. 2). For Derrida, this recognition carries the necessity of a response to “a sort of double injunction, a contradictory assignment” (in Derrida and Roudinesco 2004, p. 3).

First, we must learn what came ‘before us,’ then we must reaffirm it: “It is necessary first of all to know and to know how to *reaffirm* what comes before us” (in Derrida and Roudinesco 2004, 3). Since our heritage comes before us, it comes to us; it is received by us without our being given a chance to choose it. What is left to us is the power to reaffirm it, yet not without a critical step. The contradiction Derrida perceived is between the passivity of reception and the decision to say “yes”... or “no” (in Derrida and Roudinesco 2004, p. 4). With this decision, this acceptance, comes the necessity to “select, to filter, to interpret, and therefore to transform; to not leave intact, unharmed” (in Derrida and Roudinesco 2004, p. 4).

Secondly, in an approach similar to that required by the act of archivization, while one reaffirms one’s heritage, in order to do so, *at the same time*, one must question it, reinterpret it, critique and displace it. Derrida believed that one must take ‘the unlimited risk of active interpretation,’ one must resist conditioning, escape enlisting, and challenge conformity.

## Thinking Education Through Derrida

### *Reading Derrida*

Through Derrida’s texts, through an attentive and thoughtful reading, we may gain a better understanding of what educational issues we must face. Such reading may also help us articulate more clearly these problems, yet not find solutions which are

a closure, but 'solutions' which we shall see Derrida calls on us to question, relentlessly. Reading Derrida, we do not seek to reduce "the profound arguments which form in his work ... to trivial statements used to talk about implications for schooling" (personal communication, 2000). Indeed, any attempt to summarize complex concepts, to recall them more or less exactly, more or less precisely in order to be able to try and draw some specific 'implications' to be 'applied' to education would not carry much meaning, and would amount to misreading this author. It is not a matter of striving to relate his thoughts to issues of pedagogy or didactics either.

Rather, reading Derrida in the context of education "calls for *an engagement of his form of reasoning and analyzing* with educational issues" (Biesta and Egéa 2011, p.4). Reading Derrida's texts, the way he read other philosophers before him, needs an attentive and respectful reading "through work which actually requires time, discipline, and patience, work that requires several readings, new types of reading, too, in a variety of different fields" (Derrida 1995, p. 401). Furthermore "it is also, and at the least, the taking of a position, in work itself, toward the politico-institutional structures that constitute and regulate our practice, our competences, and our performances" (Derrida 1992b, p. 23).

It is worth noting that, in his own teaching, his own pedagogy, what I would call 'the art of reading' was paramount and constitutes a strong example. Not only were all his seminars prepared and written with great care, "with a very clear pedagogical purpose" Nass reminded us (2015, p. 3), but they were also, like the conferences he delivered, "meant to be understood by those hearing them for the first time" (p. 3). To anyone who ever attended any of Derrida's seminars where he taught his "students how to *read*" (p. 3) works of philosophy or literature, his 'pedagogy' was inspiring. Grounded in reading, he led his students "to read texts closely and patiently, in their letter," and then taught them "how to read them in relation to other texts, themes, and questions from the history of philosophy and literature" (p. 3). Beyond teaching his students about "various philosophical and literary themes, figures and problems," he taught them "how to read, how to question, and, thus, how to teach in turn" (Nass 2015, p. 1). And here, if any, lies a lesson for us, philosophers of education and educators.

In the limits of this chapter and in the context of reading Derrida and focusing on his legacy, as an example, we shall consider two of our most urgent current educational concerns: the closing of philosophy, philosophy of education, and humanities programs at all levels; and the commodification and corporatization of education and the necessity of philosophy education.<sup>11</sup>

---

<sup>11</sup>Longer studies on these topics were published earlier, e.g., Egéa-Kuehne (2003, 2012), Egéa (2016a, b)

## *Philosophy and the Mission of the University*

Earlier we saw how Valéry (1960/1962) stressed that, in order for a cultural legacy not only to be sustained but to grow, to flourish, it is essential for individuals to gain knowledge of their heritage, to “know how to acquire [and] exercise the necessary habits, the intellectual discipline, the conventions and methods” indispensable to make a wise use of the archive, of our accumulated capital, “to exploit the arsenal of documents and instruments accumulated over the centuries” (p. 1090/201). This is precisely where philosophy is indispensable. To cultivate the knowledge of one’s heritage, “philosophical teaching must continue to develop, one must continue to read, the relation to tradition must be as cultivated as possible” (Derrida 2002b, p. 15). But at the same time, while being true to the memory of a culture, to what one receives from the past, while continuing to faithfully preserve the archive and pass along a legacy to the future generations, we saw that one must also break from the tradition and strive to inaugurate something new. The pedagogy involved in the teaching of philosophy cannot be one of mere reproduction, which would soon lead to a closing upon itself of the field. It must include *putting into question* past certitudes and assumptions.

Consequently and paradoxically, we must reiterate and stress that one can be faithful to one’s heritage only in as much as one accepts to be unfaithful, to analyze it, to critique it, to interpret it, insistently. Philosophy of education and the teaching of philosophy carry a right, a duty, a responsibility to question philosophy itself and its heritage. Not only must philosophy be taught, it must also be questioned, relentlessly, and philosophy of education must endeavor to do so; it has always been important, and now even more than ever before, to “negotiate a relation ... to philosophy in a philosophical place but also a place where philosophy will be put into question” (Derrida 2002b, p. 18). Questioning was at the root of Derrida’s thought, which was most prominent when he addressed the mission of the university. In his May 2002 interview, he recalled that the concept of the university is

a place of absolute independence in the questioning and in the quest for truth, in the face of any power, political, economic, religious, etc. That is the concept of the university, the principle of the unconditional freedom of the university. (2002a, npn)

and within the university, of philosophy.

In the same interview, Derrida recalled that the founding principle of the university has a history, a heritage of several centuries, and that, if it is to be faithful to its principle, the university must not only allow questioning, even questioning itself, but it must in fact *foster it and nurture it*: “it must not interdict any question, any putting to question, any discourse” within its own borders. The most challenging questions should not be excluded from inside the university, especially not according to “criteria external to the university,” whether these criteria be issued from governmental, techno-scientific, ideological, religious, or economic concerns. Furthermore, within its borders, “the university can discuss, fight against, object,

contest,” these same questions and discourses.<sup>12</sup> Philosophy must question the question itself, its principle, as well as its content. In fact, in his various texts and lectures on the university without condition, Derrida insisted repeatedly that even questioning should not be beyond question, especially within philosophy. He claimed the university as the “ultimate place of critical resistance – and more than critical – to all the powers of dogmatic and unjust appropriation” (Derrida 2002d, p. 204).

This is where the question of the ‘unconditional university’ comes in (university as distinct from other research institutions serving, ‘sponsored by,’ commercial and economic interests), the ‘university without condition,’ where the new Humanities and philosophy should be capable of taking on the task of deconstruction, as a right,

as an unconditional right to ask critical questions ... about the history even of the notion of critique, about the form and the authority of the question, about the interrogative form of thought. For this implies the right to do it *affirmatively and performatively*. (original emphasis; Derrida 2002d, p. 204).

On the next page, Derrida added: “The university should thus also be the place in which *nothing is beyond the question* ... not even the traditional idea of critique, meaning theoretical critique, and not even the authority of the ‘question’ form, of thinking” (emphasis added; p. 205). Not only has the university a “principlial right to say everything,” to question everything, but, at the same time, it should also, again especially through philosophy, “reflect, invent and pose,” profess and teach the “principle of unconditional resistance” as a fundamental right, *questioning even the question* (Derrida 2002d, p. 204–205). And that, questioning, questioning even the question, is one of the most powerful aspects of Derrida’s legacy.

Another most serious current problem in education, intensified by the unprecedented swift development of technology and the money market, is the commodification of education supported by the corporate model. Here, many of Derrida’s texts offer the rationale to argue in favor of the necessity of philosophy education and for the right of access to philosophy programs and the right of teaching philosophy.

---

<sup>12</sup>The preceding quotes are from Derrida’s 2002 interview with France 3. However, he has spoken and published numerous times about ‘the university without condition.’ See for example the Stanford lecture written in response to an invitation for the Presidential Lecture Series in the Humanities and Arts hosted by President Gerhard Casper of Stanford University and organized by Hans Ulrich Gumbrecht in 1999. Originally titled “The Future of the Profession; or, The University Without Condition (Thanks to the ‘Humanities,’ What *Could Take Place* Tomorrow),” it was published under the title “The University Without Condition” in *Without Alibi* (2002d). With minor variations, the same lecture was delivered at the University of SUNY Albany on October 11, 1999, under the title “The Future of the Profession or the Unconditional University.” It was hosted by Tom Cohen, and David Wills. It was published in 2001 under the title “The future of the profession or the university without condition (thanks to the ‘Humanities,’ what *could take place* tomorrow)” (2001a).

## *Commodification and Corporatization of Education: The Necessity of Philosophy*

In 2000, Taylor already announced: “Education is the oil of the 21st century.” In the past decades, institutions across North America and Western Europe have had to suffer “dramatic program cuts” (Wilson 2012) or be closed altogether, mostly if not in priority in the humanities departments and philosophy programs. To someone who understands the nature of higher education in the USA, it should come as no surprise that this trend has only grown stronger over the years. Besides the fact that no other country is as well (Web-)connected as the USA, it is also where education has long been said to be ‘a business,’ in which ‘schools market’ and ‘students shop.’ The line between education and training is increasingly blurred, and a utilitarian approach to education more heavily promoted than ever. For example, besides the hegemony of the STEM model, education must comply with ‘school-to-work,’ accountability of teachers and school systems as well as students, mandatory ‘performance assessment,’ with the requirements of standards, outcomes, benchmarks, and so on. Ranking is ubiquitous from schools and school districts to journals (e.g., ‘impact factor’), to international or global ranking of universities. Almost two decades ago, in *Dancing with the Devil* (Katz 1999), James Duderstadt argued that the university was inadequate in its size and practices... even as it is now. He believed that higher education must be ‘scalable,’ which is made possible by Internet, which is perfectly suited to deliver the desired products. He also suggested that soon,

a small number of academic celebrities, a larger number of “content providers,” and a still larger number of “learning facilitators” [would] create “learningware products” and market “courseware” for “an array of for-profit service companies” who in turn [would] sell these products to students.

It is now a reality.<sup>13</sup>

A decade ago, in a December 2008 special issue from UNESCO’s Global Monitoring Report (GMR) Team titled *Education: The other global emergency*, Stéphane Hessel alerted us to what he saw as his greatest concerns. Four years later, in a November 12, 2012, interview, he reiterated his concern and emphasized that “it is through education that current shortcomings can be addressed,” and that

---

<sup>13</sup>For example, *Learningware* (<http://www.learningware.in/>) is a leader in developing digital education resources for higher education. They advertise: “Our digital library for engineering education contains 30,000+ learning objects across 56 courses and comes with a powerful set of pedagogic tools including animations, simulations, graphical slides and question banks.... These resources significantly enhance teaching-learning outcomes through structured, engaging and interactive content. Colleges and universities can sign up to access *Learningware* for all their students, teachers and administrators.” They offer: teaching-learning resources, pedagogic tools designed to enhance teaching-learning outcomes, including animations and simulations; access to question banks, large banks of multiple-choice and subjective exam questions across different taxonomy and difficulty levels; custom cloud deployment for college; content mapped to multiple global curricula including USA, India, UK, and many state university standards.

“whatever advancement ... it will be inextricably linked to progress made in the area of education” (p. 4–5). That same month, the 2012 Global Education for All (EFA) meeting was organized by UNESCO and hosted by the government of France in Paris. A Final Statement was issued, “reaffirm[ing] education as a fundamental human right, as enshrined in Article 26 of the Universal Declaration of Human Rights, and as reflected in the 1990 Jomtien Declaration and the 2000 Dakar Framework for Action” (2012, Item 5, p. 1).

Grounding this reflection in a reading of Derrida, we can see the role philosophers of education can and should play, and their responsibility in the face of the impossible task assigned to education in a time Shakespeare would deem ‘out of joint.’ Indeed, as indicated in his several addresses before UNESCO, Derrida emphasized the crucial importance of philosophy and philosophers. He expressed the same urgency on many other occasions. For example, in his 2002 interview, following up on the deep concern expressed in the media as to the politicians’ ability to analyze and respond to major socio-political developments, Charles Pépin asked Derrida whether “the mighty of this world, heads of states and corporations” should be educated in philosophy. Derrida responded not to entertain too many “illusions as to the organized, institutional, pedagogical form” such a teaching could take. But he recognized that “corporate executives, policy makers, and especially politicians” would benefit from it, in particular since “all the decisions ... so-called ethical, theo-ethical, which must be taken today, questions of sovereignty, questions of international law, have been the objects of philosophical research for a very long time, and in a renewed fashion now” (2002a: npn). In that interview, Derrida insisted that philosophy is more than ever necessary to respond to ‘the most urgent questions’ raised by today’s socio-political issues.

Never as much as today have I thought that philosophy was indispensable to respond to the most urgent questions of society.... Never has philosophy appeared to me as vitally indispensable as *today*. (original emphasis; 2002a, npn)

He underscored that those concerns require a questioning and a reflection guided by the philosophy model, and a sound knowledge of our epistemological heritage is indispensable to inform a responsible response.

Additionally, as seen earlier, not only must philosophy be taught, it must also be questioned, relentlessly, and philosophy of education must endeavor to do so; it has always been important, and now even more than ever before, to “negotiate a relation ... to philosophy in a philosophical place but also a place where philosophy will be put into question” (2002b, p. 18), such as the unconditional university. In the current global, socioeconomic, and educational context, Derrida’s questions, although posed 15 years ago, sound most urgent:

What are the concrete stakes of this situation today? Why must the important questions concerning philosophical teaching and research, why must the imperative of the right to philosophy be deployed in their international dimension today more than ever? Why are the responsibilities which need to be taken no longer, and even less today in the twenty-first century, simply national? What do “national,” “cosmopolitan,” “universal” mean here for, and with regard to, philosophy, philosophical research, philosophical education or training,

or even for a philosophical question or practice that would not be essentially linked to research or education? (2002b, p. 332)

In this context, Derrida had already pointed out, the necessity of philosophy and the teaching of philosophy, as well as the responsibilities at stake, must be considered beyond national borders, on a global and universal level.

Furthermore, I would argue with Derrida that, in the context of globalization, one of the responsibilities of today's philosopher is the necessity to move beyond the worn opposition Eurocentrism vs. anti-Eurocentrism. While upholding the memory of an epistemological heritage essentially Euro-Christian, it is a prime example of the necessity to both recognize its origins and go beyond its limits. It is also essential to be aware that philosophy has been and is being transformed and appropriated by non-European languages and cultures. According to Derrida, this is what a close, 'long and slow' study of its historical roots and development should reveal – a study he did not have time to pursue before 2004.

Following Derrida's thought, letting philosophy, even under the label of cosmopolitanism, be determined by "the old, tiresome, wearing, wearying opposition between Eurocentrism and anti-Eurocentrism" (2002d, p. 336) would be limiting any access to philosophy and to its teaching. In order to follow up and understand 'what is happening and can still happen under the name of philosophy,' I propose to carefully consider the three fields of reflection suggested by Derrida under three 'titles.' According to him, they "could be the concrete conditions for the respect and extension of the right to philosophy" (2002d, p. 337).

1. *First title.* Whoever thinks that the right to philosophy from a cosmopolitan point of view must be respected, granted, extended will have to take into account the competition that exists and has always existed between several models, styles, philosophical traditions.
2. *Second title.* The respect and extension of the right to philosophy to all people also presupposes ... the appropriation but also the overflowing of what are said to be ... the founding or originary languages of philosophy – the Greek, Latin, Germanic or Arabic languages.
3. *Third title.* Although philosophy does not simply amount to its institutional or pedagogical moments, nonetheless the many differences of tradition, style, language, and philosophical nationality are translated or embodied in the institutional or pedagogical models, at times even produced by those structures. (Derrida 2002d, p. 337–340)

The closing of philosophy programs and the commodification and corporatization of education are only two examples where reading Derrida can highlight the importance and the necessity of maintaining, cultivating, and questioning our epistemological heritage. More than ever philosophy and philosophy of education are necessary, for they are indispensable to understand our commitments and responsibilities in the face of those unprecedented challenges and to help us make responsible decisions. This is precisely where reading Derrida can be most powerful.

Two concepts in particular not only help appreciate Derrida's detailed analysis and interpretation of philosophical texts, from Plato to his contemporaries, but they

offer philosophers of education some powerful paradigms to move toward a sounder understanding of the issues at stake in education; for through reading Derrida's texts, we find new ways of thinking and new ways of assuming responsibility.

## Legacy of Two Major Concepts: Aporia, *À-venir*

### *Aporia and Responsibility*

Derrida has extensively analyzed double injunctions, contradictory imperatives, aporias, and ambiguities, and his writings can help us make sense of paradoxical events and situations frequently encountered in education. A most appropriate example here to understand the concept of aporia, essential in education, is precisely the context of heritage and legacy. Above, we discussed how Derrida maintains that “the heir must always respond to a sort of double injunction, a contradictory assignation” (Derrida and Roudinesco 2004, p. 3). Roudinesco understands that for Derrida “the best way to be faithful to a heritage is to be unfaithful” (p. 2), creating a tension between two imperatives. We must know our heritage, but *at the same time*, “this very heritage ... demands reinterpretation, critique, displacement ... a transformation” (original emphasis; pp. 3 and 4). Going one step further, Derrida asserts that it is precisely within our philosophical heritage that we can find the “conceptual tools” which will enable us to challenge the limits of this heritage, as traditionally defined and imposed.

To engage oneself as a philosopher, Derrida believes that one “must do otherwise than merely follow up (*faire du suivisme*) and obey given watchwords or instructions. One must disengage oneself [*se désengager*]” (Derrida 2002a, npn). The paradox and the danger, the dangerous paradox for a philosopher is that he or she must negotiate a balance between engagement and disengagement. Derrida believes that one “can engage politically, *as a philosopher*, only in so far as he or she maintains as much freedom as possible in regards to all that is imposed on him or her as hegemonic discourse, well-received axioms, etc.” (original emphasis; Derrida 2002a, npn). Derrida views his own engagement as concomitant with a necessary autonomy; for him, “[his] political duty as a philosopher” means “being engaged without alienating [his] freedom, [his] right to disengage” (Derrida 2002a, npn). This is closely linked to the aporia of responsible decision. However much Derrida can, and is willing to, account for the heterogeneity and complexity of a situation, ‘when it is necessary,’ he recognizes that there are times ‘when an urgent and binary choice’ is called for in a specific instance; he believes that it is then his “duty to respond in a simple [i.e., straightforward] fashion” (Derrida 2002a, npn), when it is necessary to take a definite stand. Derrida recognizes:

That is not easy. It is even impossible to conceive of a responsibility that consists in being responsible *for* two laws, or that consists in responding *to* two contradictory injunctions. No doubt. But there is no responsibility that is not the experience and experiment of the impossible. (original emphasis; Derrida 1992a, pp. 44–45)

These double injunctions, contradictions, aporias, are, according to Derrida, the very essence of responsibility. He has described and discussed extensively, and in most of his texts, how these dilemmas are inherent in the concept of responsibility, are in fact *the very condition* of its possibility. For “at a certain point, promise and decision, which is to say responsibility, owe their possibility to the ordeal of undecidability which will always remain their condition” (Derrida 1994, p. 75). He stresses repeatedly that, if there is an easy decision to make, and only a set of rules to follow, or a program to implement, there is, in fact, no decision to be made, therefore, no responsibility to be taken.

Our responsibility, as philosophers and as educators, entails being wary of “*both* repetitive memory *and* the completely other, the absolutely new” (original emphasis; Derrida 1992a, p. 19). Which is why we have to be careful, to be ‘vigilant,’ a term often used by Derrida, who prompts us to be wary of “*both* anamnestic capitalization *and* the amnesic exposure to what would no longer be identifiable at all” (original emphasis; p. 19). The difficulty is in assuming a responsibility which is double and contradictory. For while we must preserve and guard an ideal of culture, and an ideal of philosophy, we must also remain aware that a heritage of culture and philosophy (be it of Europe or any other culture) cannot enclose itself within the borders of the university; because the heritage of philosophy “consists precisely in *not* closing itself off in its own identity and in advancing itself in an exemplary way toward what it is not ... indeed ... perhaps something else altogether” (added emphasis; Derrida 1992a, p. 29). Derrida defines “the condition of possibility of this thing called responsibility” as “a certain *experience and experiment of the possibility of the impossible: the testing of the aporia* from which one may invent the only possible invention, the impossible invention” (original emphasis; Derrida 1992a, p. 41). He also shows how closely related aporia, responsibility, and ethics are, declaring: “ethics, politics and responsibility, *if there are any*, will only ever have begun with the experience and the experiment of the aporia” (original emphasis; Derrida 1992a, p. 41). Derrida’s analysis of aporias and antinomies can help us understand not only the complexity of double injunctions facing philosophers of education, but also the necessity to recognize and acknowledge them, and to see the true dilemma *not* as a choice, but as a responsibility to, *both and at the same time*, the multiple imperatives inherent in education and knowledge, and the concomitant issues of ethics and justice.

This touches upon two essential and tightly linked concepts, fundamental in Derrida’s texts and in education: ‘à venir/to come,’ and ‘promise.’

### **À-venir/To Come and Promise**

Derrida links the concept of aporia – this condition of possibility as being dependent on the simultaneous necessity of a condition of impossibility – to the experience of à-venir, to come, to the promise. It is by opening a space for the affirmation of this

promise, of the “messianic and emancipatory promise as promise” (Derrida 1994, p. 75), of the impossible event as a promise, that it will preserve its capital of possibilities, of dynamic ideal in-the-making, *à venir*, to-come. Derrida developed his concept of ‘to-come’ in particular when discussing democracy, then complexified it with the notions of ‘as if’ and ‘perhaps,’ analyzed at length in his various versions on the theme of the unconditional university.<sup>14</sup> This ideal of philosophy and education which would be characteristic of the unconditional, unconditionally free, autonomous university is an idea, an ideal toward which we must strive.

However, when Derrida talks about an ideal of philosophy or of the university *à-venir*, to-come, his reference is not to how we know them now, as determined by their history, their heritage. He makes it clear that the political, philosophical, and economic dimensions of our world have changed, are still changing (increasingly faster), and that philosophers the world over have to re-evaluate, re-think, re-conceptualize the meaning of ‘old’ paradigms and develop new ones. This does not mean, for example, some new brand of philosophy or education which will realize itself only in a future time, nor “a regulating idea, in the Kantian sense, or ... a utopia” (Derrida 1994, p. 65). What Derrida proposes here is some openness to the future and to the other, the different, the new, to renewal which he sees as enlarged and re-elaborated concepts, including but broader than the traditional and humanist project. By the concept of philosophy and education ‘to-come,’ Derrida refers to the very concepts of philosophy and education ‘as the concept of a promise,’ a concept he has further developed in *Specters of Marx* (1994) and his texts on the unconditional university.

The possibility, the eventuality of this promise, is absolutely dependent on preserving within itself a hope, but a hope which can never be expected, anticipated, or identified as such. For the moment it is, it loses its very possibility. Derrida writes: “If one could *count* on what is coming, hope would be but the calculation of a program” (original emphasis; Derrida 1994, p. 169). In fact, it can manifest itself only where there is disruption, where there exists a gap between the present state of philosophy and education, and the idea, the ideal of philosophy and education. It is in this very gap that the future of the profession can be shaped, “between an infinite promise ... and the determined, necessary, but also necessarily inadequate forms of what has to be measured against this promise” (Derrida 1994, p. 65). Derrida’s words about “democracy to-come” can aptly be applied to the promise of philosophy of education, which cannot be a promise unless it “always keeps within ... this absolutely undetermined messianic hope at its heart, this eschatological relation to the to-come of an event *and* of a singularity, of an alterity that cannot be anticipated” (original emphasis; 1994, p. 65), which *must not* be anticipated, lest it would simply not be.

---

<sup>14</sup>“What I would like to attempt with you is this apparently impossible thing: to link this ‘as if’ to the thinking of an event that, without necessarily coming about tomorrow, would remain perhaps – and I underscore *perhaps* – to come” (original emphasis; Derrida 2002d, p. 65).

In this gap must be preserved heterogeneity, “as the only chance of an affirmed or rather reaffirmed future” (Derrida 1994, p. 65). Without this gap, without this disruption, philosophy of education may simply believe, in all good conscience, that it has succeeded, and, as a consequence, it may miss its “chance for the future, of the promise or the appeal, or the desire also (that is, its own possibility)” (Derrida 1994, p. 65).

### *Derrida’s Legacy*

“If someone knew nothing about Derrida” (personal communication, 2017) and we could learn only one thing from him, it should be the importance and necessity of our philosophical heritage, and the importance not to simply keep its memory, but to question its teachings. From Derrida, we learn the importance of something found in all his writings: question, question, question again, and question the question. There are no experts. The moment we think we know something, we must look at it again, and question it, not in a nihilistic way, not to demolish it (the most misguided interpretation of deconstruction), but to either recognize its weaknesses, dismiss it (but should we, could we, ever totally dismiss anything we thought we knew?), revise it, shore it, or affirm it, build on it, and then question it again... and again.

The other aspect I find most useful in reading Derrida is his analysis and use of aporia and antinomies. In education, are we not always dealing with contradictory imperatives? For example, one situation of acute educational concern in most developed and developing countries, in particular as a consequence of sharply increased population movements and refugees, is: “How is it possible to reaffirm singularity, minority, specific idioms, natural languages, without giving rise to what we call nationalism in its violent and imperialistic form?” This dilemma, this double injunction, this paradox of universality is a challenge for all philosophers of education, all educators, to develop an ability to mediate differences and boundaries, exclusions and violence, hierarchies and borders, whether they be concerned with languages, rights, or democracy. So how can one respond *both to*, respond *for*, respond *to and for* two imperatives? How can one respond to both the necessity of respecting the voice of the other, the idiom of the other, the heterogeneity which welcomes the other, which is the necessary condition for the very presence of the other, *and at one and the same time*, to the necessity of a universal form of law? How can one satisfy to the conflicting imperatives of “neither monopoly nor dispersion”? How can one choose between two equally imperative injunctions? But again, while traditionally we were asked to make a choice, Derrida calls on us *not* to make a choice, but rather to face our dual responsibilities. As discussed above, that is not easy, but it is the very essence of responsibility.

As philosophers of education in an increasingly diverse and complex world, is it not our responsibility then *not* to simplify or to neutralize complex challenges and aporetic situations? Isn't it *not* to eliminate or exclude complex or controversial issues, but on the contrary, to make sure that they are part and parcel of our philosophy and our education, and that students are given a chance to develop the necessary skills to understand and analyze such problems? Isn't it our responsibility to re-evaluate, re-consider, and re-interpret our position along the continuum of double duties and responsibilities described by Derrida? Isn't it to engage ourselves and our students in a quest for knowledge which should take us all, way beyond the boundaries of our immediate sociocultural context in space and in time? Isn't it our responsibility to have the courage and to encourage our students to take risks, in learning and discovering the other, the unknown, while building up a greater sense of responsibility?

## Conclusion

Derrida's voice is now a 'voice from the past,' which can truly help us face education's most challenging problems. His archive is voluminous and still growing as more texts are made available, being translated, or published for the first time, as is the case of his 40 years-worth of seminars. In his last interview, Derrida declared "one has not yet begun to read me" (2007 p. 33). Indeed, no matter how many times one reads his texts, it is like reading them "for the first time" (Derrida 1992b, p. 70), each time finding more meanings, new layers. However, what this legacy means is definitely not a set of implications, much less rules one could apply to education. Rather, reading Derrida

*calls for an engagement of his forms of reasoning and analyzing with educational issues. It requires attentive and respectful reading "through work which actually requires time, discipline, and patience, work that requires several readings, new types of reading, too, in a variety of different fields" (Derrida 1995, p. 401). (in Biesta and Egéa-Kuehne 2011, p. 4).*

The power of Derrida's legacy for philosophy of education is evident on many levels, but especially in his defense of philosophy and of the 'unconditional university' in the present context of STEM hegemony, and the marketing of knowledge leading to yet more 'dramatic program cuts' (Wilson 2012). A questioning and a reflection guided by the philosophy of education model and a sound knowledge of our epistemological heritage are indispensable to inform a responsible response. There we see how a reading of Derrida helps understand how important and necessary our philosophical and Humanities heritage is, for us to be aware of, and respond to, the most urgent questions and dilemmas posed by the current socio-political context of education. Derrida's archive rich legacy can engage a thoughtful reader in some powerful rethinking of education, "analyzing all the assumptions, the hidden assumptions

which are implied in the philosophical, or the ethical, or the juridical, or the political” issues (Derrida 2011, p. 178). In Derrida’s corpus, we can find some powerful paradigms to develop a greater awareness and better understanding of the most critical educational challenges, their nature and their causes, and to move toward a more responsive and responsible approach to address them.

# John Dewey and Beautiful Knowledge

Naoko Saito

[T]he idea of asking philosophical positions, of attempted answers to the great philosophical questions, what difference they have made and can make in practice, what difference they make to our lives, is a necessary first step towards bringing philosophy back in contact with human concerns, a first step to doing what Dewey asked us to do when he wrote that “Philosophy recovers itself when it ceases to be a device for dealing with the problems of philosophers and becomes a method, cultivated by philosophers, for dealing with the problems of men.” (Putnam 2014)

We have heard of a Society for the Diffusion of Useful Knowledge. It is said that knowledge is power; and the like. Methinks there is equal need of a Society for the Diffusion of Useful Ignorance, what we will call Beautiful Knowledge, a knowledge useful in a higher sense. (Thoreau 1991, p. 112)

## Introduction: What Is Useful Knowledge in the Global Economy?

What is useful knowledge for human beings? What is the task of philosophy in service of life? In times of a global economy, these familiar questions have gained a new resurgence. Problem-solving is taken to be the task of education in the terms of a global economy. The call to bring philosophy back to life and to return knowledge to practical use is emphasized all the more, yet with a distinctive sense. In the so-called knowledge economy, higher education in Europe, Gert Biesta has claimed, is under “an economic spell” (Biesta 2010, p. 45). Current discourse in Japanese educational policy further illustrates this. A recent policy statement from the Council for the Implementation of Education Rebuilding is entitled ‘Education for Realizing the Learning Society, Full Participation and the Revitalization of Local Communities’ (2015). The vision and language of education here is redolent with good intentions for the creation of a society that can respond to the diverse needs of people who want to continue their education. For lifelong learning and citizenship education,

---

N. Saito (✉)

Graduate School of Education, Kyoto University, Kyoto, Japan

e-mail: [saito.naoko.6v@kyoto-u.ac.jp](mailto:saito.naoko.6v@kyoto-u.ac.jp)

the significance of the *Shutai-teki* (active and autonomous) power of finding and solving problems is emphasized. Japan is encouraged to be a “country well developed for the solving of problems” (p. 3). But while the language of education is oriented towards practical use and problem-solving, these ideas themselves – *use*, *practicality*, *activity*, and *life* – are subordinated to economic need: so is democracy. What it means to acquire knowledge, what education’s role is in cultivating democratic citizenship, is skewed and narrowed in the discourse of global economy. Though this apparently humane language of education echoes Deweyan ideas of ever-continuing growth and self-realization, what is in fact envisioned is an ideal of the human being in terms of human resources for economic growth.

In the current circulation of the global economy as a part of our daily lives, we cannot ignore the use of knowledge in what we teach and what we learn. Neither simple evasion nor superficial criticism of the global economy will suffice in the face of what constitutes the reality of our lives today: we cannot avoid the currency of the language of the global economy and useful knowledge. A deeper threat lies in the fact that the currency of the language of use, which has come to dictate, so it seems, the terms of any philosophy for life, makes it difficult to think beyond its surface value, as if language itself blocked the liberating power of thought, circumscribing its own possibilities of circulation. For a higher sense of practice, the humanities must work to a different economy: they must question what it means to bring our thinking back to life; they must keep thinking about the meaning of practicality, usefulness, and the point of knowledge and enquiry.

Hence there is a need to present an alternative sense of useful knowledge. What should be resisted is the assimilation of the idea of use into the dominant discourse of profit, efficiency, and transparency. At the same time, the isolation of the humanities, especially philosophy, from the global trend of the economy of thought should also be resisted: a pedantic, abstract, and decontextualized philosophy colludes with the global economy by retaining the dichotomy between the useful and the useless, mind and body, and theory and practice. Now is the time to reconsider an alternative *use* of philosophy and education, to rethink the meaning of thinking in life, and the role of higher education in terms of the humanities, towards education for a higher sense of practice.

In response to this challenge, this chapter explores the contemporary significance of Dewey’s pragmatism – a philosophy in service of practice and action and answering to the problems of common people: it reevaluates the *use* of Dewey’s American philosophy today, especially as lip-service to this is sometimes paid in the rhetoric of this new, alleged practicality. Dewey’s pragmatism can offer us an insight into the current issue – *if*, in the spirit of “reconstruction in philosophy” (1920), it is critically reconstructed such that it is not assimilated simply into ‘pragmatic’ use and hijacked by a superficial idea of problem-solving and instrumentality.

In the following, I shall first introduce some philosophical features of Dewey’s pragmatism as a philosophy for life, showing how they are relevant to the issue of useful knowledge today. Second, for the sake of making Dewey’s pragmatism more thoroughly and robustly resist the tide of global the economy, I shall explore a dimension of *thinking beyond problem-solving*. These matters are pursued in terms

of interrelated notions *the obscure* and *twilight*. Dewey's later writings on aesthetics shed light on an alternative sense of useful knowledge. What Thoreau calls Beautiful Knowledge here helps show that it is a way to make best use of the wisdom of Dewey's pragmatism, and more in general, of American philosophy in resistance to the tide of the global economy.

## The Use of Dewey's Pragmatism Today: Problem-Solving and Criticism

Inheriting Emerson's call for a "philosophy of life" (Emerson 2000, p. 58), Dewey developed the idea of democracy as a personal way of living (creating democracy from within), of philosophy for the common man, and most importantly, of philosophy as education. In particular among classical pragmatists it is Dewey who demonstrates most concretely the contemporary significance of the *praxis* of pragmatism for the reconsideration of useful knowledge and education. Thinking in life as a whole means going beyond the dichotomies of mind and body, means and ends, and fact and value. Dewey's pragmatism is known to be a kind of "instrumentalism" (Bernstein 2014, p. 11): thinking and knowledge are instruments to solve problems in our daily lives. *Praxis* and action are internal to the nature of American philosophy. The idea of useful knowledge is inseparable from this problem-solving as a mode of thinking. Against the opposition of "experience and true knowledge" (Dewey 1980, p. 271), Dewey reclaims "knowledge of *how to do*" (p. 192, my italics). With regard to informational knowledge, he says: "To be informed is to be posted; it is to have at command the subject matter needed for an effective dealing with a problem, and for giving added significance to the search for solution and to the solution itself" (p. 196). Such knowledge is a medium through which mind goes through a "passage from doubt to discovery" (p. 196): it is "experimental" (p. 197). Precisely because it is a philosophy for use, Dewey's pragmatism has the potential to resist dichotomous thinking and its consequent narrowing of the sense of useful knowledge.

Dewey's idea of thinking, however, cannot be simply contained in this stereotypical mode of problem-solving. This is best shown in his recount of critical thinking. Dewey says that a key to creative activity is criticism (Dewey 1984, p. 143). His idea of the "criticism of criticisms" (Dewey 1981, p. 298) is, on Hilary Putnam's account, a matter of "higher-level criticism," involving "'standing back' and criticizing even the ways in which we are accustomed to criticize ideas, the criticism of our ways of criticism" (Putnam 2004, p. 96). Criticism of criticisms is distinguished from analytical thinking for clarity. Rather it involves the robust power of thinking thoroughly in the uncertainty of life. It is also a key to creative democracy (Dewey 1984, p. 143).

Dewey's criticism of criticisms opens a horizon of thinking beyond problem-solving – requiring us to delve more subtly into ordinary life. It offers a key towards a higher sense of practice and useful knowledge. Critical thinking in this sense

involves an awakening to what has not been thought before, an adventure into the unknown by taking a chance. Critical thinking entails, as a precondition of problem-solving, the existential question of how human beings can convert crisis into a chance to be taken, and how we can transform the way we live our lives. It is risk-taking by nature, involving an awakening to what has not been thought before, an adventure into the realm of the unknown. In *Art as Experience* (1934), Dewey calls this comprehensive notion of thinking ‘creative intelligence’ – a kind of thinking that integrates reason with emotion and imagination (Dewey 1987, p. 351).

Furthermore, thinking beyond problem-solving requires a peculiar mode of thinking – thinking in “middle term” (Dewey 1983, p. 96): American philosophy entails the possibility of opening a third way of thinking – a form of antifoundationalism beyond the dichotomy between foundationalism and *anti*-foundationalism. In order to adventure into ‘genuine uncertainty’, Dewey takes *chance* to be the crucial element. Taking a chance, the moment of the leap, is at the heart of his experimentalism and philosophy for action. To think without fixed ground does not mean that anything goes. This is an idea of perfection without final perfectibility, without abrogating the quest for a better life. Thinking on the way, however, *is* difficult. Thinking on tiptoe is a key to sustaining a form of antifoundationalism that neither fully abrogates grounding nor fully relies on secure grounding. As Dewey expresses this poignantly, “Perfection means *perfecting*, fulfillment, fulfilling, and the good is now or never” (Dewey 1983, p. 200, my italics). This is what might be called perfectionist antifoundationalism – a kind of antifoundationalism that does not fall into relativism or anarchy and that retains a quest for a better life. Criteria for the betterment of life are constantly to be revised in an ongoing process of communication.

Still, American philosophy needs to show policy-makers the *merit* of choosing this risk-taking and unstable mode of living. The foundationalist drive is a part of the human condition. It can always lure us to the apparently secure and yet surface value of language in educational policy. This is a state in which each of us stops thinking for ourselves, relying instead on, and being assimilated into, the circulation of the existing economy of exchange. What would be the best possible use of the antifoundationalism of American philosophy for education? How can we shift the mode of our thinking?

## **The Obscure and the Twilight: Thinking Beyond Problem-Solving**

The discourse of problem-solving, however, is on the verge of falling into the hands of the global economy, one that one hundred years ago Dewey would strongly have opposed. Precisely because it is a philosophy that would not *avoid* use, Dewey’s pragmatism must resist being assimilated into this dominant use. His discourse and pragmatism in themselves must be reconstructed, beyond the terms of problem-solving. Dewey acknowledges the limits of scientific intelligence in his reference to

the obscure and the hidden (Dewey 1983, p. 200), the qualitative background of thinking (Dewey 1987, p. 197). These matters are pursued here then in relation to antifoundationalism as realized especially in the idea of betweenness, poignantly captured in notions of the obscure and twilight.

To think in an antifoundationalist way, by standing on tiptoe, one must venture into the precarious borderland between the known and the unknown, on the threshold of “a residuum unknown, unanalyzable” (Emerson 2000, p. 214). It is the notion of *obscurity* that is crucial to the sustaining of a thoroughly antifoundationalist mode of thinking and, hence, to the reconceiving of the idea of useful knowledge.

Behind problem-solving thinking, Dewey equally finds it important to note that for any object of primary experience there are always potentialities that are not explicit; any object that is overt is charged with possible consequences that are hidden (Dewey 1981, pp. 27–28, in Richardson 2014, p. 104). He expresses the sense of the obscure as the background of human intelligence – “the sense of our slight inability even in our best intelligence and efforts” (Dewey 1983, p. 200). In *Art as Experience*, he recognizes the significance of “obscurity” in Shakespeare and Coleridge, and “half-knowledge” in Keats (Dewey 1987, p. 39). The reality of the obscure requires us to exercise, in Keats’ phrase, “Negative Capability” – a kind of poetic insight after reason (*ibid.*). He expresses the sense of “a whole that stretches out indefinitely” as a background of the perception of objects (p. 197). Thinking in the strong present tense (in affirmation) is made possible in the midst of the obscure, the negative. Far from obscurantism, the realism of the obscure is an alternative way to see the reality of the world as always being translated. It expresses a proper respect for the darkness, and hence avoids the violence of language implicit in the clutching and grasping of comprehension. In order to say something, in order to see things, we need the background of the unsayable, the ungraspable. Our perception is fated to be partial. Dewey’s pragmatism as a philosophy for life, thinking beyond dualisms, is preconditioned by this sense of the obscure. To thoroughly resist the tide of a global economy geared towards transparency and accountability, and to live the life of perfectionist antifoundationalism, requires thinking in the obscure and living with what is beyond our grasp.

American philosophy retrieves the idea of light from the dichotomy between the clarity of enlightenment and darkness as a lack of knowledge. It realizes something different both from Plato’s light, which enlightens people in the cave and draws them upwards towards the sun, and from the light of clarity in analytical philosophy. Wittgenstein says, “nothing is hidden” (Wittgenstein 2009, #435). But this does not mean that we can see everything. Rather he indicates that the reality of the world and the truth of the matter cannot be fully elucidated in the light. If obscurity suggests non-presence (at least, what be made simply evident), light is non-mediated directness, casting light on something that is thereby revealed, while something else is thereby hidden. Similarly, to say something involves what is not said, what is hidden. To foreground something suggests another background. This rediscovery of the words is closely related to the idea of *aletheia* – the idea of revealing and of acknowledging the hidden as a background (Standish 2012, pp. 79, 176). The world under the explicit light of problem-solving thought sheds light only on a part of our lives.

When Dewey speaks of the “actual focusing of the world at one point in a focus of immediate shining apparency,” he is hinting at the vague and obscure background that must accompany the explicit (Dewey, *Essay in Experimental Logic*, p. 7). In his recognition of the limits of intelligence, he indicates the nature of partial light:

At most intelligence but throws a spotlight on that little part of the whole which marks out the axis of movement. Even if the light is flickering and the illuminated portion stands forth only dimly from the shadowy background, it suffices if we are shown the way to move. (Dewey 1983, p. 180)

Here he indicates that the revealing of the world is closely related to the gradual finding of the way – being provisional, non-permanent, like the work of the foresters.

The light that is flickering on an obscure border represents the transit from darkness to light, and a movement of evanescence. It is also a mixed state in which light and darkness exist side by side. If we think *clearly* about clarity, we realize that it must involve a proper (or appropriate) distribution of light and shade. We depend upon shade, the dark and *the half-light*. As Dewey says, “At twilight, dusk is a delightful quality of the whole world” (Dewey 1987, p. 198). In English, ‘twilight’ usually connotes the half-light of the evening. Etymologically speaking ‘twi-’ means between. ‘Twi-light’ refers to an indistinct border, between light and dark. It is, in a sense, the state in which light and darkness coexist. The state in which the light permeates the evening darkness evokes ending but is also an expectation of morning, of a new dawn. Twilight as flickering light against the background of darkness symbolizes the partiality of human intelligence.

If the experience of the obscure, standing on tiptoe, is a key to sustaining anti-foundationalism, with the sense of perfecting now or never, what kind of experience of knowing would come to us? What kind of knowledge would we acquire?

## Beautiful Knowledge: The Beautiful as the Functional

For the sake of making the best use of Dewey’s useful knowledge, the positive alternative vision of knowledge that should be presented is to be found in the contemporary wisdom of pragmatism. Its key lies in his aesthetic work. Dewey’s later writings on aesthetics shed light on what can be meant by ‘useful knowledge’: knowledge that cannot be simply assimilated into the practical or reduced to accountable and empirical evidence, and that is inseparable from the beautiful.

Such knowledge communicates illustratively and vividly, albeit in indirect ways, the nature of critical thinking beyond problem-solving. In *Art as Experience* (1934), Dewey presents the idea of art and aesthetic experience as being in continuity with “normal processes of living” (Dewey 1987, p. 16). Aesthetic experience is not a property of professional artists but at the heart of human experience. He also indicates that aesthetic experience has two phases: instrumental and the consummatory.

There are some distinctive characteristics in *Art as Experience* that guide the reader towards an alternative sense of useful knowledge. First, Dewey characterizes aesthetic experience as involving “happiness and delight”, related to a “fulfillment that reaches to the depth of our being” (p. 23) (which is the consummatory phase). Art has to do with the “intensity” and immediacy of the moment, of “what now is” (p. 24), and the experience of “direct seizure” (p. 150). Here Dewey highlights the role of a receptive dimension of experience typified in “esthetic surrender” (pp. 35, 51, 108). We find ourselves by “forgetting ourselves” (P. 110).

Second, we can find in Dewey’s aesthetic theory his idea of growth – growth without fixed ends. Aesthetic experience is “the ever-recurring cycles of growth” (p. 152). Creation without a preset goal does not mean the abrogation of an end: it is a reconfiguration of the idea of an end, as continuously reoriented and revised as we go. This evokes a process of “continuing perfecting” (p. 177). Dewey expresses the sense of being on the “growing edge of things” (p. 149), where the artist is a forerunner who carries forward a new vision. From time to time, Dewey describes the moment of what might be called being on a threshold in the “twilight” (p. 198), where “ordinary boundaries are transformed into invitations to proceed” (p. 213). When an aesthetic experience comes to a closure, this is not its final end but is an “inclusive and fulfilling close,” with the anticipation of a new horizon ahead (p. 62).

Third, in Dewey’s aesthetic theory, although an emphasis is put on “personal perception” (p. 157), aesthetic experience is understood not as limited to the individual experience of the artist but as extending into “a remaking of the experience of the community in the direction of greater order and unity” (p. 87). And again, this is not a closed whole but “an expanded whole” (p. 171). As is typical of pragmatism, Dewey’s whole is a unity with diversity (p. 184). In this whole, the term “egotism” has no place, and we are to be understood as “citizens of this vast world beyond ourselves” (p. 199).

This takes us to the fourth point: aesthetic perception as the precondition of social and cultural criticism. Discussing the significance of criticism from within tradition and convention, Dewey highlights the role of aesthetic judgment as social and cultural criticism. “Better criteria are to be set forth by an improved examination of the nature of works of art in general as a mode of human experience” (p. 313). Unlike his typical emphasis on social and scientific intelligence, Dewey reminds us in aesthetics of the significance of “a bias, a predilection” as the origin of social and cultural criticism, and encourages us not to surrender “the instinctive preference” (p. 327). And then he touches upon the necessity of the cultivation of aesthetic perception as follows:

The function of criticism is the reeducation of perception of works of art; it is an auxiliary in the process, a difficult process, of learning to see and hear. (p. 328)

Through the power of “imaginative projection” and as “the moral prophets of humanity”, poets become “the founders of civil society” (p. 350). The aesthetic is hence inseparable from, and indeed is a precondition to, the political. Dewey’s aesthetic work and other later writings help us see again the dynamism between

tradition and innovation, beyond freedom and control, and they point to the education of aesthetic perception as a key to cultural criticism.

Going beyond the dichotomy of the beautiful and the sublime, and between the aesthetic and the functional (the instrumental), Dewey's pragmatism can turn us towards the experience of transcendence in the ordinary, the moment of rebirth, by finding high intelligence in the low and the common.

Dewey's insight into an alternative sense of useful knowledge – an idea that the beautiful can be useful, the useful is what makes life beautiful – can be further developed in reference to Thoreau's idea of Beautiful Knowledge. Integrating more robustly body, mind and language than Dewey, Thoreau redeems the economy of living in what he calls "higher knowledge" – "the highest that we can attain to is not Knowledge, but Sympathy with Intelligence" (Thoreau 1991, p. 113). "Higher knowledge" is anything but the object of a direct perception under clear sunlight. Without negating the concept of use, knowledge is more than anything *aesthetic*. Thoreau calls this Beautiful Knowledge (p. 112). It is important to attend here to the note of satire evident in the quotation from Thoreau at the start of this chapter. This pokes fun at the pomposity and earnestness of the advocates for the "Society for the Diffusion of Useful Knowledge," the capitalization of which Thoreau ironically appropriates. This helps to show why the point that he is pressing and the phrase that he chooses to adopt do not amount to any simple gesture of romanticism. Knowledge said to be beautiful is tough, robust, and grounded on earth – being surrounded by daily objects, instruments, animals, plants, air, light, sound, etc.

Bob Davis has recently drawn attention to "the legacy of the Transcendentalist writers now so popular in the USA across many areas of philosophical enquiry" (Davis 2015), and in particular he has identified Dewey as an important influence on the idea of outdoor education. In Davis' delineation of outdoor education, Thoreau's *Walking* also can definitely be included as a book that encourages us to go outdoors. There is a danger here, however, of the self's losing itself within a version of the outdoor education caught up in the tide of the global economy. Against such a reading of Dewey and Thoreau, there is much in the account of Beautiful Knowledge that should lead us reconsider the meaning of the outdoors there (by it, through it). Beautiful Knowledge relates to a realm in which the functional and the aesthetic are united. Intellectual work should be integrated with what is commonly thought of as practical (or vocational) education.

Beautiful Knowledge points us neither to experiential education nor to a quasi-mystical realignment with nature – that is, it is not some kind of return to the woods. The beautiful, Thoreau says, is inseparable from the wild – the apparently unbeautiful – as expressed in the metaphor of the "most dismal swamp" in the darkest wood (p. 100). As "wild and dusky knowledge" (p. 112), Beautiful Knowledge can be experienced in the reading of classic texts (pp. 102–103). Beyond the dichotomy of the natural (the wild) and the human (the civilized), and far from anti-intellectualism, Thoreau proposes that we regain the untamed, self-reliant power of thinking and reading as a distinctive capacity of the human.

Associated with ignorance as "negative knowledge" (p. 112), Beautiful Knowledge involves the recognition that "the light which puts out our eyes is

darkness to us,” “a sudden revelation of the insufficiency of all that we called Knowledge before” (p. 113). Such experience of imperfection is a drive towards further perfection in continuing education. Education for Beautiful Knowledge drives teachers and students into the obscure. Knowing is to know what one does not know, and to know how one should know: it never allows us to loosen the power of our thinking.

Beautiful Knowledge is transformational rather than informative. In other words, it is the experience of *knowing*, undergoing the moment of self-transformation. More as a matter of reception rather than acquisition, it involves the experience of human transformation undergoing the phases of crisis. Such experience is consummated in the moment of what Emerson calls the “flying Perfect” (Emerson 2000, p. 252), a symbol of something that can never be fully grasped, never fully elucidated. It is this secular sense of transcendence that is missing from our obsession with useful knowledge today.

In *Art as Experience* Dewey quotes the famous aphorism of John Keats:

Beauty is truth, truth beauty – that is all  
Ye know on earth, and all y need to know.

– Keats quoted by Dewey (1987, p. 40)

The twilight of American philosophy prompts a reconsideration of the meaning of thinking (especially of *critical* thinking), of knowledge, and of the human subject. It reminds us that the language of policy documents (i.e., of self-realization, of diverse needs) cannot help but connote further implications that would touch upon the ungraspable dimension of human transformation. Still we can hear the voices of those whose eyes are only directed to the transparency of the knowledge economy. How can we persuade them of the *use* of “half-knowledge” – knowledge only known in half-light? Wouldn’t the twilight simply be metaphorical, without any substance and impact on educational practice?

## Outward Excursions

In *Democracy and Education* (1916), Dewey proposes the “place of active occupations in education” (Dewey 1980, p. 202). He says that play and active work in the curriculum are “intellectual and social, not matters of temporary expediency and momentary agreeableness” (ibid.). Here “knowledge-getting” is the result of actions and active occupations (p. 203, 207). “Outdoor excursions” are useful as well as social in their aims (p. 204). Dewey illustrates this by using the experiences of gardening, hunting and play (pp. 208, 210, 211). In his strong emphasis on the outside and the active, however, Dewey, on the one hand, leaves room for its being hijacked by the global economy. On the other hand, without fully persevering on the border between the inside and the outside, he lends support to the romantic opponents to the global economy who would seek spiritual salvation by going outdoors, to the woods. Outdoor excursions are not merely active but by nature receptive: they constitute a kind of withdrawal but, through this, a more fully fledged turning outward.

Turning inward into the territory of the vague, the uncertain dimensions of human life, Beautiful Knowledge envisions a more difficult path of education, more fully outward than outdoor education. Such education for Beautiful Knowledge should not be limited to extraordinary experience in the woods. Rather it relates to diverse contexts of intense experience, crossing their borders – ranging from daily occupations outside to the learning of a classic text inside. This is a vision of liberal education in resistance to freedom in the global economy – the kind of education Dewey envisioned in *Democracy and Education* one hundred years ago.

Dewey's emphasis on outdoor education has importance today, but it can also seem somewhat dated. How can it be received in a way appropriate for today – especially against the state of education foregrounded in the introduction of this paper? First and foremost, the insight of Dewey's pragmatism, his "criticism of criticisms," can elucidate the *problems* in what is there in the present curriculum – consider especially assessment and practices of a reductive kind – that eulogizes the significance of immediate experience and yet that in fact blocks what experience can afford us. Second, it reminds teachers, practitioners, and policy makers that the liberal/vocational dichotomization is a distraction and that it is not sound. Following Dewey's insight, vocational education, as might be seen in the experience of civil engineers, can be deeply stimulating and it can help develop the whole person. This is the implications of beautiful knowledge, in the combination of the functional and the aesthetic, knowledge in service to human transformation. Third, in view of Beautiful Knowledge, it is a mistake to be nostalgic about old methods of teaching – learning and teaching in the immediate encounter between teachers and students in a small classroom. New technology and distant learning can also provide occasions for rich learning experience of Beautiful Knowledge. Fourth, if *Democracy and Education* is read along the lines of his later work, *Art as Experience*, it is all the more clear that the cultivation of aesthetic judgment is crucial for the education of democratic citizens. Quoting Shelly, Dewey says that poets are "the founders of civil society" (Dewey 1987, p. 350). This is especially so in the light of the inadequacy of (or misplacement of) critical thinking in education. Dewey would say that aesthetic judgment is the condition of creative democracy, what is at the heart of the criticism of criticisms. For example, the incorporation of film education can be a promising way of cultivating aesthetic judgment and political emotions, and this, in an interdisciplinary way. These implications can constitute an alternative economy of beautiful knowledge today.

# Critical Reflections on Fārūqī's Islamization of Knowledge

Yasien Mohamed

## Introduction

The scholar Ismā'īl Rājī al-Fārūqī (1921–1986) was deeply troubled by the crisis of knowledge in Islam today. In an attempt to reconcile his faith with the intellectual challenges of the very varied and interconnected world we live in, he developed the concept of the 'Islamization of Knowledge': the synthesis of old and new within an Islamic epistemological framework.

Fārūqī's is not the only Islamic revivalist response to secular modernity. This chapter explores his idea of the Islamization of Knowledge, reviews the modifications and alternatives proposed by other Muslim scholars, and concludes with a new proposal.

## The Biography of Ismā'īl Fārūqī

The Palestinian Fārūqī is noted for his valuable contribution to comparative religion, his critique of Zionism, his theory of Arabism, and his exposition of *tawhīd*. He received his early Islamic education from his father, an Islamic judge, and his early secular and Christian religious education from French Dominicans. At the American University of Beirut, he took a B.A. in Philosophy and English. On his return to Palestine, he was appointed Governor of the Galilee district. With the creation of Israel in 1948, he was deprived of that office and exiled. The Israeli occupation of Palestine had a lasting effect on his thinking, highlighting the vulnerability of Muslims without a vocabulary true to their faith to engage with the modern

world. His most influential idea, the ‘Islamization of Knowledge’, was born in an attempt to resolve the religious-secular dichotomy of education in the interests of the social transformation of the *ummah* or Islamic nation (Hashim and Rossidy 2006). He promoted it through the International Institute of Islamic Thought (IIIT), which he founded, and the *American Journal of Islamic Social Sciences*.

After completing a doctorate in Western philosophy, Fārūqī entered the al-Azhar and committed to an intensive programme to gain a deeper appreciation of Islam. In Egypt he was inspired by Muslim reformers such as Muḥammad ‘Abdu. This gave him the impetus to attempt bridging the gap in thought between Islam and the West (Fletcher 2008: 52).

The Islamization of Knowledge was not Fārūqī’s only concern. Imtiyaz Yusuf, one of his former students, argues that it is unfortunate that he has been judged only in relation to this project. Fārūqī’s concerns were broader than Islamization. He was the Muslim trailblazer in the academic study of other faiths: “engaged in Islam’s dialogue with other religions, especially Christianity in the West.... He was not theologically exclusivist, rather a Muslim pluralist scholar of religion. This is evident from Fārūqī’s elaboration of the concept of metareligion as presented in his book, *Christian Ethics*” (Yusuf 2014: 112).

## The Crisis of Muslim Education

In the classical Muslim world, knowledge was integrated. There was no bifurcation of the kind evident today between revealed Islamic knowledge and acquired human knowledge. The two levels of knowledge were complementary, Islamic knowledge providing the general principles and human knowledge the particulars, based on observation and experience. However, in the modern Muslim world, there is a split: the universities are secular and the Islamic seminaries focus on traditional Islamic theology. There is generally no attempt from either side to integrate these two systems of knowledge, partly because the epistemologies that characterize them are in conflict: secularized knowledge relies on empirical observation, but what is referred to as Islamic knowledge is based on both divine revelation and reason. Muslim educationists have realized the need to resolve the contradictions and bring about a synthesis. Several attempts at that synthesis are explored in this chapter.

In *Truth and Method*, Hans Gadamer showed that bias is inevitable in the interpretation of a text. Thus bias is not wrong in itself, but unrecognized it can have negative consequences. Elmessiri’s *Epistemological Bias* provides examples of such consequences in Western social sciences. And, in *Orientalism*, Edward Said demonstrates an insidious European bias in treatment of the East in English literature and in the orientalist’s ‘othering’ of Eastern people as objects of study rather than knowing subjects. Such bias can have far-reaching implications. For example, German philosopher, Emmanuel Kant, gave currency to the notion of Africans as incapable of rationality. That notion was used as a justification for the European colonization of non-European people.

Egypt was the first Arab country to be conquered and colonized by the French. The secular system of school education the colonizers introduced ignored Islam as a factor in Egyptian society, promoted French but neglected Arabic, and taught learners about the greatness of French generals like Napoleon Bonaparte, but not about Arab and Muslim generals like Khālid ibn al-Walīd. Muḥammad 'Abdu, the late nineteenth-century religious scholar and liberal reformer, was critical of this kind of biased French education, which was indifferent to the local cultural heritage of the Egyptian people, cultivating a sense of inferiority in Egyptian children and leaving the main religious tradition of the country completely out of account.

Unfortunately, the Muslim world has increasingly adopted the Western system of education and its ideological bias on a binary basis, allowing no conceptual space for valuing the Islamic world's history and its living intellectual and religious tradition. This has had serious consequences. In Saudi Arabia, postgraduate students of Sociology know about Karl Marx, Durkheim, and Adam Smith, but know little, if anything, about Ibn Khāldūn, the fourteenth-century North African pioneer of sociology. Similarly, in the West, many valuable concepts in economics and sociology, such as the division of labour and the labour theory of value, were developed only in the nineteenth and twentieth centuries, without any sense that an Islamic scholar had articulated them five centuries earlier.

Recent Muslim social science graduates of American and European universities have tended to adopt Western versions of their own Islamic societies for want of an intellectually compelling alternative. The combination of ignorance of their Islamic intellectual legacy and the bias towards the West at these universities has left them vulnerable. At an academic level, Syed Farid Alatas refers to this phenomenon as *academic dependency*: “a condition in which the knowledge production of certain scholarly communities is conditioned by the development and growth of knowledge of other scholarly communities to which the former are subjected” (Alatas 2010:56).

Perhaps more profoundly, the bias in European and American universities and those which follow their curricula elsewhere is not only towards the West. It is also secular and materialist. This conflicts directly with the Islamic world view, creating an epistemological duality for Muslim students. Western secular knowledge is based on the triumph of the mind in interpreting the observable world and celebrates the human being as a physical and rational animal. From an Islamic point of view, this is not enough. The human intellect alone cannot guide man through life: divine revelation is also needed. Whereas Western secular knowledge sees man as a physical entity determined by the laws of physical nature, for Muslims, the human being is only partly a physical creature, and nature is both physical and spiritual: man is a microcosm of the universe and part of the creation of God. Without acknowledgment of the spiritual dimension of human nature, Western education cannot provide adequate knowledge for a person to know himself and so to know his Lord – the key to his true happiness in this world and the hereafter. For Alatas, this does not mean that secular knowledge from the West should be rejected. The epistemological duality can be overcome by identifying and countering the harmful assumptions which accompany Western secular knowledge before integrating it into the Islamic world view (Alatas 2010, 18–20).

Similarly, Elmessiri argues against blind submission to foreign ideas that are secular and materialistic. Western social scientists are concerned with how material progress can be achieved in society and measure the progress of Muslim societies only on those terms. But Muslims, according to Elmessiri, should measure progress within the framework of their own vision. They should not fear foreign ideas, but should weigh them according their own standards. “What they are really against is having their own concepts weighed for them by scales thrust into their hands by others” (Elmessiri 2006:10).

The twentieth century brought unprecedentedly rapid change, and the Muslim world has not been immune to it. The challenge is to change without losing the fundamentals of faith. Early responses by Muḥammad ‘Abdu in Egypt and Sayyid Aḥmad Khān in India rejected the changing morality of the west, but accepted its science and technology without awareness of the accompanying ideological bias. Ismā’il Fārūqī was critical of their assumption that “the modern subjects are harmless and can only lend strength to the Muslims”. “Little did they realize”, he says, “that the alien humanities, social sciences, and indeed the natural sciences as well, were facets of an integral view of reality, of life and the world, of history, that is equally alien to that of Islam” (Fārūqī 1982: v).

The first thinker to introduce the concept of Islamization was Syed Naquib Alatas (Wan Daud 1991: 35; Mohamed 1993a, b: 12), but it was Fārūqī’s version of the concept that became popular in the Islamic world. In his 1982 book, he proposed the Islamization of Knowledge to overcome the problem of a dichotomous education. In recent years the popularity of the concept has waned, and scholars of the International Institute of Islamic Thought (IIIT) are now talking instead of the integration of knowledge. The rest of this chapter will focus on an exposition of the Islamization of Knowledge, the modifications made to the concept by IIIT scholars, the address to the same problem by two other scholars, and a further possibility.

## **Fārūqī’s Islamization of Knowledge**

As we have seen, modern secular knowledge is not value-free. To bring about the Islamization of Knowledge, the epistemological paradigm of secular modernity, with its conceptions of the self and the world, has to be thoroughly understood. Elmessiri (2006:4) describes a paradigm as a mental abstract picture, which can accept some features of reality and reject others. It is usually hidden because it is taken for granted within a particular discourse. Fārūqī identified the source of the crisis of Muslim society in the paradigm of secular modernity which rejects the reality of faith, leading to the dichotomy of modern secular and Islamic knowledge, each then necessarily with its own system of education. For much of the Islamic world, this dichotomy was reinforced by the colonial experience. The colonizers established Western schools and universities and ignored local cultural and religious values. Islamic education tended to react in unfortunate ways. Increasingly, Western

education came to stand for freedom and enlightenment and Islamic education for control and conformism.

As Professor of Islamic studies at Temple University in Philadelphia, Fārūqī had direct contact with Muslim students and graduates in the social sciences. He noticed that their sentimental attachment to Islam was not enough to engage the philosophical assumptions of modern science. After 4 years, their Islamic consciousness was ravaged, and they felt inferior, with a keen sense of the value of Western knowledge but little idea of the vibrant intellectual heritage of their faith. The crisis they faced was both epistemological and ethical. It was not only about the nature of knowledge but about its informing value system. The secular sciences assume that all knowledge is based on observation, leaving no room for revelation. They also silently embody a value system alien to Islam. Fārūqī sought to resolve this crisis, as representative of the much larger challenge of modernity for Muslims everywhere, through what he called 'the Islamization of Knowledge'. The rejuvenation of the ummah requires that, "the present dualism in Muslim education, its bifurcation into an Islamic and secular system must be removed.... The two systems must be united and integrated" (Fārūqī 1982). This goes beyond a mixing or juxtaposition of Islamic and Western sciences to a total reorientation of knowledge in the light of five universal principles that form the foundation of an Islamic epistemology (Safi 1993:25). These are the unity of God, of creation, of truth, of life, and of humanity.

On the basis of these five principles, Fārūqī introduces a 12-step work plan as a general strategy to realize the Islamization project. The aim is to recast every discipline to be informed with the world view of *tawhīd* (Oneness of God). This orientation must be reflected in the textbooks of each discipline (Fārūqī 1982: 10–11). A creative synthesis is achieved through reinterpreting and adapting the components of secular knowledge in ways consistent with the world view of Islam to produce university textbooks in Islamic sociology, Islamic psychology, and Islamic political sciences. This requires cooperative input from both sides of the divide. The chief responsibility for it lies with modern Muslim scholars, well versed in the disciplines and trained in critical thinking. However, it also demands the input of traditional Islamic scholars with a knowledge of the depth of the Islamic intellectual tradition (Fārūqī 1982: 43).

The first edition of Fārūqī's *The Islamization of Knowledge* was received with great enthusiasm, and its thesis gained wide acceptance. He was concerned with the failure of the traditional Islamic seminaries which were unable to deal with the challenges of secular modernity, so he wanted to ensure that Muslim graduates would have a comprehensive understanding of Islamic culture and civilization while also being strongly grounded in their particular area of modern specialization. To achieve this, he proposed that all students at universities in Islamic countries take an Islamic Civilization course alongside their other subjects over the full undergraduate period (al-Fārūqī 1982).

Since Fārūqī had direct contact with Muslim students and social sciences graduates in America, his Islamization project was initially inspired by them, so he created the IIIT journal as a platform for research and sharing of ideas. Before he died,

Fārūqī founded the International Islamic University of Malaysia (IIUM), which became the main experimental site for the Islamization of Knowledge. At this university, every student has to do a double major: in Islamic studies and in one of the social sciences. They are also required to master both English and Arabic so that they are qualified to be employed in the civil service, the teaching profession, or private business (AbūSulaymān 2007:13–19).

## Critical Reflections of Scholars Connected to the International Institute of Islamic Thought (IIIT)

A project as wide-ranging as the Islamization of Knowledge requires ongoing monitoring and critique. I shall first discuss the work of two leading scholars inspired by Fārūqī, AbdulHamīd AbūSulaymān and Taha Jabir al-Alwani, both pioneering members of the International Institute of Islamic Thought (IIIT). They have progressively adapted the theory of the Islamization of Knowledge and its work plan. I shall then turn to the work of three other scholars, Elmessiri, Sardar and Henzell-Thomas. Although their views do not necessarily reflect its official position, their books are published by the IIIT, so they point to a general change of direction in critique of the social sciences and a search for a new paradigm.

AbdulHamīd AbūSulaymān, former president of the IIIT, and former Rector of the International Islamic University of Malaysia (IIUM), agreed with Fārūqī that the first step in Islamization should be mastery of the secular social sciences, but he emphasized that this was a temporary measure. In the classical period, the Muslims were at the forefront of philosophy and science, and the West borrowed from them; but today, it is Western scholars who are pioneering philosophy and science, and Muslims are borrowing from them. He emphasizes that there is no problem in borrowing from the West, provided modern knowledge is integrated with the Islamic intellectual legacy in a creative synthesis. This may restore the confidence of contemporary Muslim scholars. Such a synthesis depends on reformulating modern thought in accordance with the world view of *ṭawḥīd* (Oneness of God). AbūSulaymān notes that the IIIT has cooperated with Muslim elites throughout the world to this end and, through conferences and its *American Journal of Islamic Social Sciences*, has provided platforms for dialogue and significant scholarly contributions (AbūSulaymān 2007:13–19).

AbūSulaymān sees Islamization as an educational project, involving the integration of disciplines. He speaks of: “a remarkable intellectual integration of knowledge fusing the disciplines of revealed knowledge and those of human and technological sciences” (AbūSulaymān 2007, 13). The question is whether this kind of Islamization can be regarded as genuine intellectual integration or rather as a preliminary attempt at combining the Islamic and Western disciplines. There is nothing wrong with the latter. Students need to be exposed, as a first step, both to the knowledge that emanates from the modern secular university and to that from the Islamic revealed legacy. Such exposure does not produce full intellectual integra-

tion, but is perhaps a starting point towards attaining that goal. At the IIUM the undergraduate must first gain exposure to Islamic and Western disciplines, and only at the postgraduate level can they hope to work systematically on the much longer project of intellectual integration of disciplines. The IIIT has worked towards this goal and cooperated with Muslim academics and intellectuals throughout the world in joint efforts, providing platforms for dialogue and publication of research papers through the *American Journal of Islamic Social Sciences*. This peer-reviewed journal has appeared regularly since its inception and has even published articles critical of the Islamization of Knowledge project or its work plan. Generally, scholars have been in agreement about the crisis of a dichotomous education, but have differed as to how to bring about unification.

Fārūqī proposed the Islamization of Knowledge, to lead ultimately to creative synthesis of knowledge and the publication of textbooks for the Islamic university in Islamic economics, Islamic psychology, and Islamic sociology. This was his first priority at a time when the Muslim world was losing its best minds to the West. Not all the textbooks produced have achieved the envisaged goal of creative synthesis. They have, however, been important in a time when Muslim students in Western-style universities have felt threatened and even overwhelmed by modern higher education and desperately in need of alternative perspectives to enhance their self-worth and build their confidence in their Islamic intellectual heritage.

The second pioneering IIIT academic, Taha Jabir al-Alwani, an eminent Shari'ah scholar and president of IIIT for a decade, differed with AbūSulaymān on the sequence of the Islamization of Knowledge work plan. The first step for him was mastery of the Islamic sciences, as the main task of Islamization and creative synthesis had to come from traditional Islamic scholars (Ragab 2006, 76–77). Alwani appears to have had little faith in the modern educated graduate to bring about genuine Islamization. His scepticism is revealed when he says, "Islamization is not a cosmetic addition of religious terminology and sentiment to studies in the social sciences and humanities or the grafting of relevant Qur'anic verses onto the sciences or disciplines intended for Islamization" (al-Alwani 2005: 29). The first steps should be adopting the Islamic paradigm of knowledge and the Qur'anic methodology (al-Alwani 2005: 35–42). Then the Shari'ah sciences should be reformed, not only in terms of the Islamic epistemology and world view but also through adding some social sciences to the Islamic syllabus (al-Alwani 2005: 57). That would make integration of knowledge possible (al-Alwani 2005: 45).

We now turn to two other approaches within the ambit of the IIIT. Perhaps a good starting point for the synthesis of knowledge is not only a mastery of modern knowledge as Fārūqī suggested but a critique of the secular and Eurocentric bias embedded in it. Abdelwahab Elmessiri, editor of *Epistemological Bias in the Physical and Social Sciences*, focuses on the epistemological bias in Western disciplines. As they stand, he sees these Western disciplines as not always suitable for or applicable to Third World and Muslim countries because of their bias. The book contains concrete examples of this bias in almost all modern disciplines, including Psychology, Anthropology, Political Science, and Sociology. However, the aim is not to replace a Western paradigm with an Islamic one; that would amount to imposing an Islamic

paradigm on the study of Western societies, making the same mistake as “orientalists” did in relation to Islam when they interpreted it in accordance with their Europe-centred bias (Elmessiri 2006: 1–76). Scientific approaches to the study of religion are helpful, particularly in understanding the social dimensions of religion, but in other respects they tend to be reductionistic, giving an unhelpfully limited view of Islam and Muslims. They need to be complemented by Islamic understandings. Put differently, Western scholarship can look at the house of Islam from the outside only, but it is also necessary to look at the house of Islam from the inside. Both approaches are needed to arrive at an in-depth and comprehensive view of Islam. For Elmessiri it is an ongoing concern that Muslim and Arab intellectuals uncritically adopt Western approaches to the study of Islam and Muslim societies, resulting in their self-perception being defined by others, usually in a negative light. Elmessiri sees the primary need as identifying and countering the bias within modern education.

To this end, Elmessiri has edited a volume where the contributors have identified the main biases within their disciplines and pursued the implications. Hussein (2006: 77–104), for example, stresses that Muslim challenges are different from non-Muslim challenges; inevitably Muslim scholars will raise different questions from scholars from the West. From another perspective, Habib (2006, 126–144) sees the values of individualism and self-interest as alien to the collective Muslim psyche, which is more oriented towards altruism and cooperation than to selfishness and competitiveness. He says that Arabs have a collective psyche and do not see themselves in isolation from their tribe or society. But Western-developed sciences expose the Arab to a philosophy of the self-centred individual in competition with other individuals, as in Adam Smith’s *The Wealth of Nations*, where self-interest is the basis for his philosophy of economic development.

Ziauddin Sardar and Jeremy Henzell-Thomas are the authors of an important IIIT book, *Rethinking Reform in Higher Education: From Islamization to Integration of Knowledge*. Still inspired by the first principles from Fārūqī’s work plan for the Islamization of Knowledge, they explore a significant change from the path trodden by Fārūqī, AbūSulaymān, and Alwani. It is a change first signalled by Malkawi (2014), a fellow IIIT author. The new direction focuses on the integration of knowledge so that through a multi-disciplinary approach students are also prepared for the new challenges of technology, pluralism, and ecological sustainability. The IIIT, publishers of the work, make it clear that “the views and opinions expressed in this book are the authors’ and not necessarily those of the publisher”, but it seems that in recent IIIT workshops the focus has been on integration of knowledge rather than Islamization of Knowledge. In the opening chapter, Mapping the Terrain, Sardar (2017: 23) provides a thought-provoking analysis and critique of the modern university: although the world is becoming more complex than ever before, the discipline-specific curriculum only prepares the graduate for the economic market, not to deal with the complexity of the modern world. To counter this, education must be interdisciplinary and knowledge must be integrated, not fragmented. As modern knowledge is embedded within a Western paradigm, embodying a particular epistemology and world view, the university needs to be decolonized. This “does not mean the

exclusion of modern knowledge: the decolonizing process is not an attack on Europe – it is to point out that modern European knowledge is one amongst various forms of knowledge. However, decolonizing does require questioning the Eurocentricism of modern knowledge and its claims to be universal”.

This awareness of the epistemological bias in modern knowledge is relevant for the reform and transformation of universities all over the world. The Islamization project provides useful models for the critique of colonial education, emphasizing that syllabus change needs to be directed by critical thinking, if the epistemological bias in the modern university is to be countered. Sardar's (2017:96) critique of the modern university is important for all students, not only Muslims:

Each academic discipline has emerged within a particular cultural context; and each has its own specific history that defines its contours.... The desire to manage and control the natives Europe conquered gave rise to anthropology. While the function of anthropology was to study the exotic Other, with the aim of proving the inalienable superiority of Europe, the objective of sociology was to inquire into the underclass, the Other within Europe.... Whatever the discipline, the overall narrative was the same: to perpetuate the [dominant] worldview of the West

This awareness of bias in disciplines, however they have developed from their origins, is a first step towards the long and intellectually arduous process of integration of knowledge.

Is the integration of knowledge an alternative to the Islamization of Knowledge? Henzell-Thomas defines the word integration to include not only the integration of knowledge but also the integration of the human personality, where human desire is subservient to reason. This broader and deeper understanding of integration is welcome. However, with respect to knowledge, what integration basically comes down to is synthesis of the old and the new, the Western and the Islamic. This is precisely the goal that Fārūqī laid out for the Islamization of Knowledge. Integration and synthesis are synonyms. So we have to ask, what is really new about the integration of knowledge?

In a draft IIIT document, *Towards an Expanded Glossary of Key Terms: Introduction and Five Model Entries*, Henzell-Thomas refers to the Islamization of Knowledge as “extreme” because it is “setting itself apart from other traditions which it may see as contaminated by secular or other foreign concepts” [Henzell-Thomas, 42]. He concurs with Sardar who sees Islamization of Knowledge as a product of its time and context, but who notes that “it has left an enduring legacy, not least in articulating concerns about the dire state of Muslim thought and education, drawing attention to the Eurocentric nature of social sciences and enunciating the first principles. We move forward with Integration of Knowledge” [Sardar and Henzell-Thomas 2017: 136].

As we approach this new model, we need to examine critically the implications of ‘extreme’ in reference to the Islamization of Knowledge. First, is it Fārūqī's vision that is seen as narrow, or is it the way Islamization of knowledge has been implemented? As mentioned above, Imtiyaz Yusuf pointed out that Fārūqī proposed the Islamization of Knowledge as a man of broad and generous concerns. He did not set himself apart from other traditions, but took part in inter-religious

dialogue. As a Muslim scholar, he was a pioneer in the academic study of religion, and he engaged in Islam's dialogue with other religions in America. Clearly, he was not theologically exclusivist, but a Muslim pluralist scholar of religion. Secondly, dismissing knowledge because it is secular incorrectly reflects Fārūqī's vision. What is the point of Islamization if it does not respond to the problem of secularism embedded in the presuppositions of Western knowledge? Modern knowledge can only be reconciled with the world view of Islam when its inessential secular, anti-religious elements are removed. Once that has happened, knowledge can be enriched with an Islamic dimension. Fārūqī was not opposed to the integration of knowledge; he had a problem with the dichotomy in the educational system and wanted to correct that through Islamization as a means to creative synthesis. How innovative, then, is the new vision and model of Sardar and Henzell-Thomas? In many ways it is very much like Fārūqī's. The way the ideas are implemented is a different matter. There are serious shortcomings at the Islamic universities, where modern and Islamic disciplines have been combined or juxtaposed, but not actually integrated. As Henzell-Thomas points out in his *Glossary of Key Terms*, 'integration' has a primary sense of unification and fusion. This has been attempted under the Islamization of Knowledge project with varying degrees of success in fusing knowledge systems and producing Islamic textbooks. However, Henzell-Thomas distinguishes two other senses of the word 'integration'. Firstly, it can refer to the integrated personality, where wisdom predominates over the lower faculties of the soul. This is an important aspect. Integration starts with the integration of the mind and the human personality. Secondly, integration also means adapting to and co-existing with people of other cultures. This does not mean 'assimilation' where a minority culture is submerged in another culture, resulting in the loss of identity. Muslims should retain their distinct identity and nurture a healthy *asabiyyah* (social solidarity), to use Ibn Khaldun's term. However, this positive sense of community should not lead to an ethnocentric mentality, which looks down on the values of other communities. I shall be taking these two senses of integration further as I pursue my proposal for the integration of knowledge.

## **Critical Reflections of Muslim Scholars Not Connected to the IIIT**

We now turn to the views of two scholars, not associated with the IIIT, who accept Islamization in principle and are open to foreign knowledge and its integration into Islam. They too regard the bifurcation between Western secular knowledge and Islamic knowledge as problematic and propose ways to bridge this gap in responding as Muslims to secular modernity.

The most radical departure from Fārūqī's Islamization has come from Chicago-based Pakistani scholar, Fazlur Rahman. His call is for a critique of the Islamic intellectual legacy in the light of the Qur'an and a corresponding reconstruction of

the Islamic sciences, including law, philosophy, and theology (Mohamed 1993a, b: 31).

Rahman is not opposed to Islamization, but holds that the Islamic intellectual legacy is not absolute and should also be subject to critique. For him, Islamization's attempts to build bridges are problematic, because genuine integration can only take place if the traditional Islamic scholars take the initiative. He states: "It is futile to even raise the question of the Islamization of Knowledge: it is the upholders of Islamic learning, who have to bear the primary responsibility of Islamizing secular knowledge, by their creative intellectual efforts" (Rahman 1982: 134).

For Rahman, the specific rulings in the Qur'an are not objectives in themselves, but are contingent upon definite historical circumstances. They are meant to convey quintessential Islamic moral objectives of justice, mercy, and benevolence. Unlike al-Alwani, who proposes minor reform to Islamic education, Rahman calls for a complete reconstruction of the Islamic sciences, based on the teachings of justice as a predominant theme of the Qur'an, recognizing its affinity to the dominant international culture of human rights.

The other scholar outside the IIIT, who is not only in support of the Islamization of Knowledge but was actually the first to coin the phrase, is the Malaysian scholar Naquib Alatas. His *Preliminary Statement on a General Theory of the Islamization of the Malay-Indonesian Archipelago* was published in 1969 (Wan Daud 1991: 35). In it, he defines Islamization as "The liberation of man first from magical, mythological, animistic, national-cultural traditions opposed to Islam, and then from secular control over his reason and his language... It is also liberation from subservience to his physical demands which inclines towards the secular and injustice to his true self or soul" (Alatas 1985:44). Unlike the IIIT scholars, Alatas, being Sufi-inclined, gives more attention to the liberation of man from his lower self and its desires as part of the process of Islamization. The starting point for him is Islamic metaphysics focused on the reality of God. Knowledge of God goes beyond theory to experience, firmly grounded in revelation. In that context, he deals with the 'de-secularization' of knowledge, exploring it in *Islam and Secularism and the Philosophy of the Future* (Alatas 1985).

Alatas points out that he is not being acknowledged for pioneering the idea of Islamization and that he believes the idea has been wrongly applied at the International Islamic University of Malaysia (personal interview 2004). He founded the International Institute of Islamic Thought and Civilization (ISTAC) to correct matters. Daud, the deputy director of ISTAC, comments: "Professor Alatas ... has authoritatively defined the meaning of Islamization.... Without proper definitions, Islamization has often been reduced to legalization or to the establishment of some socio-political entities, and knowledge has been wrongly equated with mere facts, skills and technology" (Daud 1991: 36).

## The Integration of Knowledge in Islamic Context: An Alternative Approach

In the light of this valuable debate, I should like to propose a fresh approach with deep historical roots: *the integration of knowledge in Islamic context*. My proposal is partly inspired by the models used by classical Islamic scholars for the integration of knowledge. My article, ‘The Integration of Knowledge in Islamic Context: al-Rāghib al-Iṣfahānī’s Concept of Justice’ (Mohamed 2009), provided for the first time a concrete example of how integration of knowledge took place in the work of al-Iṣfahānī, the eleventh-century philosopher. I showed how al-Iṣfahānī appropriated the Aristotelian categories of justice, integrating them into an Islamic meta-physical framework to develop an authentic Islamic theory of justice, concerned with both individual and social justice as contributing to happiness in this world and in the Hereafter. Al-Iṣfahānī’s approach is what I refer to as the integration of knowledge in Islamic context.

In the classical Islamic period, Muslim scholars critically appropriated Greek ideas. They enthusiastically entertained foreign knowledge and fearlessly integrated what was positive from it into their Islamic world view. They had already established themselves in all branches of knowledge and had a strong Islamic epistemological framework into which foreign knowledge could readily be assimilated. By contrast, Islamization today starts from a position of weakness, because the established bodies of knowledge are Western, and they have no strong Islamic epistemological framework of adequate complexity. Muslim scholars setting out to make meaningful connections with their Islamic intellectual heritage often end up trying to infuse Islamic concepts into a Western knowledge that is not hospitable to them.

Integrating knowledge in an Islamic context must involve the following:

- Identifying certain elements of new knowledge disciplines and integrating them within an Islamic epistemological frame
- Drawing selected methods and techniques with utility and applicability in Islamic societies from new knowledges and integrating them
- Replacing the secular paradigm with an Islamic paradigm elaborated from the Islamic understanding of human nature and creation
- Replacing secular concepts and terms or expanding the vocabulary with faith-based conceptions and terms mediating Islamic values and concerns

Modern social scientific methods may usefully be employed to study Islamic societies, especially the social manifestations of Muslim institutions, governance, economies, and education. However, these methods are not useful in understanding transcendent phenomena (*al-ghayb* – the unseen). Muslim scholars have to be critically receptive to new ideas, methods, and techniques, using what they have to offer without compromising Islamic belief. Why should psychoanalysis as a therapeutic technique not be employed by Muslim psychologists if it proves to be effective? Thus, the Islamic critique of the ideological role of the social sciences need not negate the positive knowledge to be gained from them or from physical sciences and

technology. Once foreign knowledge is integrated into an Islamic context, it becomes naturalized in Islam.

My proposal for the integration of knowledge in Islamic context differs from the current Islamization project. It is more accommodating of epistemological pluralism in a multi-religious society. Islam may share with the other religions the critique of the secular bias within the social sciences, but would integrate the beneficial knowledge into its own social context and world view. Thus, the integration of knowledge in Islamic context is more open to the present global climate of religious pluralism. It is not opposed to the integration of knowledge of other religious contexts, whether they be Confucian, Buddhist, Christian, Hindu, or African.

This is not compromising religion, but allowing scholars from other religious traditions also to integrate knowledge in their own religious context. They should critically assess new knowledge, distinguishing the substantial from the ideologically value-laden, extracting what is beneficial for their needs, and filtering out what is harmful or incongruent. It also implies reforming the Islamic sciences so that they are open to new knowledge, showing their current relevance to the diversity and plurality of our communities, and taking the needs of the environment into consideration.

To sum up: Fārūqī sought a solution to the immediate problem facing Muslim social science students urgently in need of an Islamic perspective on their disciplines if they were not to become alienated from their Islamic identity and intellectual heritage. With this in mind, the notion of the Islamization of Knowledge struck a chord among Muslim academics and was enthusiastically received in Islamic schools in the West and in Islamic universities in the Muslim world. However, Fārūqī's concept of Islamization and its implementation have not gone uncriticized. Many scholars have warned of a cosmetic Islamization and urged that a comprehensive Islamic philosophical framework should be the foundation for any Islamization of the Western sciences. Others have felt that the starting point should be the reform of the Islamic sciences. I have proposed an alternative approach, the integration of knowledge in Islamic context, as a more open-minded response to Western intellectual modernity.

This alternative approach, faithful to the Islamic tradition, is of value in Islamic countries as well as in helping Muslim minorities in the West. It is also realistic about the new world we are living in. In Muslim minority countries where educational institutions are secular in orientation, there may be a functional need for non-Muslims to know more about the religion and intellectual perspectives of their Muslim friends or neighbours. Students may want to choose a module or more in intellectually integrated Islamic studies for their own enrichment or to supplement their areas of specialization. This is possible and manageable. A module on Islamic economics could be very valuable to people working locally or internationally with Islamic banks or with banks offering Islamic finance. A module in Islamic law could serve those well who may have to work with Muslim clients in the areas of marriage, divorce, and inheritance. A module in Islamic pastoral psychology could be helpful to psychotherapists dealing with Muslim clients who suffer from faith-related problems of guilt and depression. Then, as part of a fuller intellectual

history, Ibn Rushd's contribution to philosophy fills in the picture, and the pioneering contribution of the African sociologist, Ibn Khaldun, needs to be recognized in its own right.

In conclusion, while Fārūqī's proposals have valuably asserted the importance of the Islamic intellectual and social tradition, they have also raised a number of issues which have to be confronted in the modern world. Integration of world knowledge in an Islamic context is an immediate challenge. So is the kind of exposure of non-Muslims to various aspects of Islamic knowledge which they need in moving towards meeting the plural epistemological demands of the modern world.

# Michel Foucault: Educational Philosopher?

Maarten Simons

## Introduction

There are several ways to discuss how the work of Michel Foucault has been used in educational philosophy and theory. The most common way is to retrace references, to recall or reconstruct philosophical debates, and to evaluate his most enduring influence. There is no reason not to take this route and to start with a general overview of how Foucault's work has played, and continues to play a role, in philosophy of education. But there is a good reason to add another layer to such an overview. This additional layer of influence is not about clear-cut references, and is to be located at the level of a philosophical ethos rather than at the level of systems of thought and conceptual apparatuses. This influence is less mediated by debate, argument, and position, than by experience, concern, and style. Adding this layer, arguably, does better justice to how Foucault himself thought about philosophical work. In addition, then, this layer allows us to give Foucault a voice in how to think about philosophy, education, and the relationship between them.

## Foucault's Influence

It is not possible to present a complete overview of all educational research inspired by or based upon Foucault. To have an overall sense of the broad influence of his work, a short overview might suffice (see, for example, Simons and Masschelein 2007). Early on, Foucault's genealogies, and related concepts such as normalization and disciplinary power, played a major role in critical histories of education: the

history of the modern school and classroom, the normalizing role of the teacher, and the power-effects of the educational sciences (e.g., Pongratz 1989; Ball 1990; Hunter 1994; Popkewitz 1998; Depaeppe 1998). During the 1990s and at the beginning of the twenty-first century, the influence of Foucault can be situated on a continuum between two poles, ranging from theoretical and conceptual research to analytical and empirical studies in education. This overview is limited to the Anglophone context predominantly, and it is important to consider that this influence was partly shaped by the availability of his works in English.

In philosophy of education, the work of Foucault was introduced to question, for instance, the use and underpinnings of key concepts such as autonomy and liberal education (Marshall 1996). More generally, Foucault has been positioned as a key representative of postmodernism and poststructuralism, and his work has played a major role in debates on epistemological and ethical relativism, and in criticisms of the modern conception of the subject underlying educational theory (e.g., Smeyers 1995; Wain 1996; Blake et al. 1998; Biesta 1998). Foucault has also been mobilized in attempts to revitalize the historical materialistic approach in education studies (Olssen 1999), and became a key source of inspiration for the reformulation of the concept of the self (Marshall 2001). But his influence went far beyond that. He also left a clear mark on methodological reflections in educational research, and in sociology of education and educational policy studies in particular (Ball 1994; Popkewitz and Brennan 1997). Finally, Foucault's later work on 'technologies of the self' and 'truth telling' was introduced into the study of ethics in education and in discussions on the role of critique and truth(–telling) in philosophy of education and educational theory (Peters and Besley 2008).

In the study of concrete educational practices, the influence of a Foucauldian approach has been, and remains, very visible. A substantial number of authors make use of his analytical tools (discourse analysis, for instance) or adopt his genealogical analysis in the field of education (to analyze normalizing mechanisms in educational settings, for example). Foucault's lectures on governmentality during his courses at the *Collège de France* in 1977–1978 and 1978–1979 (Foucault 2004a, b; Burchell et al. 1991) have been particularly influential in this regard. One could rightly refer to studies of governmentality as having become a new subdiscipline within the humanities (Dean 1999). The term discipline, however, may not be fully appropriate, as it might mask the huge diversity within these studies, in terms of both research domain and method (Rose 1999). What they have in common, however, is an interest in forms of governmentality, minimally conceived of as the strategies of governing people and governing ourselves. This work on governmentality has also given a new impetus to critical education policy studies while confronting education reforms in the wake of neoliberal and neoconservative policies (see, for example, the edited collection, Peters et al. 2009). The following examples give an idea of the wide range of themes and topics being covered: governmentality, bus-nopower, and liberal education (Marshall 1995); classroom management (Tavares 1996); entrepreneurship and education (Peters 2000); teacher reflection and teacher identity (Fendler 2003; Zembylas 2003); mobilization, flexibility, and lifelong learning (Edwards 2002); neoliberalism, globalization, and democracy (Olssen

et al. 2004); Europeanization and new forms of power (Masschelein and Simons 2002; Hodgson 2016); the care of the self and confession in a knowledge economy (Drummond 2003; Fejes and Nicoll 2015); as well as several edited volumes (e.g., Baker and Heyning 2004; Pongratz et al. 2004; Ricken and Rieger-Ladich 2004).

## Foucault's Concern

Few will doubt that Foucault's influence has been and remains massive. But there are some observations to be made when compiling an overview of the remarkable impact of his work. First, the extent to which Foucault is promoted as a master-thinker in the field of educational research correlates with the 'risk' of creating a growing group of followers, if not a school of Foucault scholars. This risk has, arguably, become a reality, for it is striking to note that many usages of Foucault are, in one way or another, about isolating his method, approach, or conceptual apparatus and applying it to practices in the field of education not previously studied. An example of this is the number of studies that makes use of 'disciplinary power' as an analytical concept to reveal mechanisms of power in the most diverse practices. The widespread use of discourse analysis as a method is another example. The assumption is that Foucault's ideas, approaches, or concepts can be disconnected from the, often very specific, genealogical studies from which they emerged, and that they can be used without considering the research attitude, disposition, or ethos (Karskens 1986). This is not about arguing that many studies are mere copies of the original and that very few take our thinking any further. The relevance of these studies is not in question. There is reason to doubt, however, whether it is at the level of applying conceptual and methodological apparatus and tools that the full relevance of Foucault's work is located.

The second observation to be made is that, although Foucault became a key reference figure, this was not without strong criticism (see, for example, Flynn 1994). Historians (of education) often criticized his work for not being the work of a true historian and, for instance, for making a rather selective use of the archives. Philosophers (of education), for their part, formulated doubts about the relevance of a Foucauldian contribution to theoretical debates about, for instance, the human subject, freedom, and power. His work was considered to be too historical or empirically oriented, and too implicit in its philosophical stance to actually contribute to ongoing philosophical conversations. This kind of criticism was often about the difficulty of giving Foucault and his work a proper place. In one way or another, the work of Foucault provoked strong reactions and did not meet the expectations of the established research disciplines. Despite the temptation to blame the disciplinary gatekeepers for having the wrong expectations, it is perhaps more useful to ask what motivated Foucault's work and made him transgress disciplinary boundaries. This again leads to the question of what Foucault's concern actually was. The third observation here offers the beginning of an answer to this question.

Foucault was one of the protagonists in the modernism-postmodernism debate, as it was staged by Habermas, which also had clear echoes in philosophy of education. In his statements on modernity as being an “unfinished project”, Habermas (1985) strongly opposed Foucault’s ideas about the end of modernism and the death of the subject. He labeled Foucault “crypto-normative” in his ambition to criticize power-knowledge regimes without making explicit the criteria or norms for his critique. For Habermas, such a position not only leads to intellectual relativism but also is politically dangerous. Foucault was categorized as one of the French “young conservatives” who had given up belief in reason and, therefore, the Enlightenment. In his typical style, Foucault questioned this framing of his work in the famous appeal to refuse the “blackmail of the Enlightenment,” that “you either accept the Enlightenment and remain within the tradition of its rationalism [...] or else you criticize the Enlightenment and then try to escape from its principles of rationality” (Foucault 2007: 110). He commented on several occasions on Kant’s essay *What Is Enlightenment?*, not to radically question the project of Enlightenment and modernity, but to distinguish between the critical project to install reason as the supreme court of history on the one hand, and modernity as a concern with one’s present on the other hand:

No philosopher can go without examining his own participation in this *us* precisely it is this *us* which is becoming the object of the philosopher’s own reflection. All this, philosophy as the problematization of an actuality and the philosopher’s questioning of this actuality to which he belongs and in relation to which he has to position himself, may very well characterize philosophy as a discourse of and about modernity. (Foucault 2007: 85)

Foucault’s main philosophical concern was the modern act of questioning one’s actuality, including our actuality that proclaims reason to be the ultimate guide to emancipation and progress. To get a clearer picture of Foucault’s relevance for philosophy of education, it is worth exploring this concern in more detail.<sup>1</sup>

## Foucault’s Truth

Foucault is exceptionally clear about where to situate his own work:

It seems to me that the philosophical choice with which we are confronted at present is this: we can opt for a critical philosophy which will present itself as an analytic philosophy of truth in general, or we can opt for a form of critical thought which will be an ontology of ourselves, an ontology of the actuality. It is this form of philosophy that, from Hegel to the Frankfurt School, through Nietzsche and Max Weber, has founded the form of reflection within which I have attempted to work. (Foucault 2007: 95)

Instead of being engaged in intellectual work that seeks to discover or establish the grounds, rules, or procedures for knowledge and truth, he is concerned with what counts as truth in our actuality to which he himself belongs, and with finding out what made this count as truth. In later studies, which can to a certain extent also be

---

<sup>1</sup>The next sections are partly based on: Simons and Masschelein 2014.

read as an ontology of his own work, Foucault traced back this project of a critical philosophy to Greek and Roman antiquity. In the 1981–1982 courses at the *Collège de France*, under the title *The Hermeneutics of the Subject* (Foucault 2001), Foucault studies ancient practices of truth-telling and retraces two traditions in philosophy. The leading questions in this series of courses were: How can people have access to the truth? How can people become truth-tellers? What is the price of having access to the truth? Foucault distinguishes two traditions that each answers this set of questions in its own particular way.

The first tradition, which emerged in Greek antiquity and is dominant today, claims that it is knowledge that offers access to the truth. The point of departure is that in order to have true knowledge, specific (internal and external) conditions related to the act of knowing and the position of the knower have to be taken into account. Aristotle – “the philosopher” – represents for Foucault the incarnation of this tradition (Foucault 2001:18). Probably little clarification is needed to see how this tradition culminated in modern scientific research that relies for the discovery or production of true knowledge on the rigorous use of methods that open up a world of objects to be known and place someone in the position of a disinterested researcher. Philosophical enquiry in this tradition mainly tackles epistemological issues, or aims to answer questions about the foundations or limits of knowledge. Perhaps due to our familiarity with this tradition and its institutionalization in academic and university life, we have lost sight of the fact that it is but one, very particular, way of having access to the truth.

Foucault refers to a less common tradition that claims that access to the truth requires a transformation of the self. This second tradition, which could be called the existential-ethical, spiritual, or ascetic tradition, assumes there is no access to the truth without transforming one’s mode of being. Instead of postulating the subject as an underlying, stable entity that functions as the source or foundation of knowledge, this tradition is oriented toward exercises in thought and experience through which a particular relation of the self to the self, others, and the world – as a specifically shaped form of subjectivity – can be questioned, challenged, and shaped. This is linked to the idea that philosophy is, in the first instance, about a way of living and about the aspiration to live a true life. It is not about developing a system of knowledge or a set of rules that exists externally to the philosopher and can be passed to others. Rather, one becomes a ‘touchstone’ for others in their search for a true life.

In both traditions one has to meet certain conditions and to pay a price for having access to the truth, but the conditions and prices differ: in the first, one must fulfill conditions relating to knowledge; in the second, one undergoes a transformation of the self. On the basis of this distinction, it makes sense, first, to situate Foucault’s own intellectual work within the existential-ethical tradition, and second, to acknowledge that the importance of self-transformation in philosophy allows us to think in a very particular way about philosophy of education: it becomes philosophy as education. Here, a possible influence of Foucault can be seen and might be made possible.

## Foucault's Philosophy

Foucault states that his studies and books work as experiences, and that in his studying and writing he is transforming himself: "What I think is never quite the same [...] for me my books are experiences [...] And experience is something that one comes out of transformed" (Foucault 2000: 239). The term experience is related to practices of putting oneself and one's thinking to the test: "[...] I am an experimenter and not a theorist. I call a theorist someone who constructs a general system, either deductive or analytical, and applies it to different fields in a uniform way. That isn't my case. I'm an experimenter in the sense that I write in order to change myself and in order not to think the same thing as before" (Foucault 2000: 240). While the theorist – a figure clearly associated with the first tradition – puts an outside reality to the test of her theory, thereby immunizing herself, the experimenter always puts her own thinking, and so her very mode of existence, to the test. Notice that experience for Foucault does not refer to what someone has (as in "I have experience of..." or "This experience has enriched me"), but rather to what actually disrupts or destroys the 'I' and 'me': "[...] experience is trying to reach a certain point in life that is as close as possible to the 'unlivable,' to that which can't be lived through. [...] experience has the function of wrenching the subject from itself, of seeing to it that the subject is no longer itself. [...] This is a project of desubjectivation. [...] The idea of a limit-experience that wrenches the subject from itself" (Foucault 2000: 241–242).

Foucault is talking about very specific things; for instance, our common understanding of madness in terms of normality and abnormality, and our tendency to problematize sexuality in moral terms. He does not place himself outside this common understanding and the familiar practices in order to judge those who are part of it. His point of departure is exactly those understandings and practices from which he himself cannot escape, that make his own thinking possible, and that are actually part of his subjectivity. What is at stake is "to construct myself and to invite others to share an experience of what we are, not only our past but also our present, an experience of our modernity in such a way that we might come out of it transformed," and this means, he goes on, "that at the end of the book we would establish new relationships with the subject at issue; the I who wrote the book and those who have read it would have a different relationship with madness, with its contemporary status, and its history in the modern world" (Foucault 2000: 244). Being an experimenter and not a theorist, Foucault regards his books as books of experience and not as truth books or books of demonstration. Truth books aim to pass true knowledge to the readers by way of demonstration. They are focused on argumentation and proof, and they address readers as an audience that has to be convinced. In describing experience books, however, Foucault makes the following remark: "I don't accept the word 'teaching' [...], my books don't exactly have that value [method, demonstration, lessons]. They are more like invitations or public gestures" (Foucault 2000: 245). In view of this invitation and gesture, readers are not put in a position of ignorance, but rather they are invited to 'share' an experience. Foucault

sees his books working at the existential-ethical level, then, and not at the level of knowledge. This short depiction of Foucault's understanding of his own work brings several important aspects to the foreground.

First, what guides Foucault's work is a concern for the present. The aim is not to reveal the truth about what is going on and to demonstrate what is right or wrong, but instead to question the truths we live by and take for granted today. Foucault described this concern for the present as an (historical, critical) "ontology of the present" or an "ontology of ourselves" (Foucault 2007: 95 and 113). This kind of ontology starts from the things that *we* take for granted (or regard today as fundamental or ontological), and asks how *we* came to see these things as fundamental; which *we*, or which subject, came to see these things (e.g., the prison, the hospital, sexuality) as evident or essential. The present, however, is not merely what we see in front of us, nor is it what shows itself when looking through temporal or historical lenses. Rather, Foucault's present presents itself when we are attentive to or "present in the present" (Foucault 2007, p.86). It appears in a kind of "sagittal relationship", and this requires an effort. The present refers to that what is 'actual' or 'actualized' today, to things that matter. The notion of curiosity captures very well this attitude of care toward the present (Rajchman 1991: 141). Curiosity, as Foucault explains, is not to be situated at the level of knowledge and the ongoing assimilation of what we ought to know:

To me it suggests something altogether different: it evokes 'concern'; it evokes the care one takes for what exists and could exist; a readiness to find strange and singular what surrounds us; a certain relentlessness to break up our familiarities and to regard otherwise the same things; a fervor to grasp what is happening and what passes; a casualness in regard to the traditional hierarchies of the important and the essential (Foucault 1997: 325).

The term curiosity, then, relates to care. Care is derived from the Latin word *cura* that provides the root of 'curiosity' and the French *curiosité* (Foucault 1980: 108). An attitude of care encompasses a concentrated, accentuated gaze on what is happening today, what is happening to us in the world, and a willingness to become a stranger in the familiar present; that is, to regard who we are and what we do, and what we regard as our foundations, as no longer self-evident. As such, curiosity combines both distance from and vigilance or attention toward oneself in the present (Gros 2001: 512).

Second, critique for Foucault is first of all an attitude (and even 'akin to virtue'). More specifically, it is a task one takes up (Foucault 2007: 43; Butler 2004; Masschelein 2004). The critical task, according to Foucault, "requires work on our limits, that is, a patient labour giving form to our impatience for liberty" (Foucault 2007: 119). Driven by a curiosity for the present, critical philosophy embodies "an attitude, an ethos, a philosophical life in which the critique of what we are is at one and the same time the historical analysis of the limits that are imposed on us and an experiment with the possibility of going beyond them" (Foucault 2007: 118). Intricately related to the ideas of experience and desubjectivation introduced earlier, the critical attitude at stake combines a limit-attitude and an experimental attitude. These attitudes are different from what motivates a foundational critique that judges

the legitimacy of current practices and understandings based on given principles (limiting attitude) or that unmask particular strategies and tactics by recalling what is given in original experiences (experiential attitude). The limit-attitude is about the act of becoming sensitive to what presents itself as a necessity nowadays in order to explore a possible transgression of its limits. Critical work, then, refers to the work that is done at the limits of ourselves and our present: “[...] It will separate out, from the contingency that has made us what we are, the possibility of no longer being, doing, or thinking what we are, do, or think [...] it is seeking to give new impetus, as far and wide as possible, to the undefined work of freedom” (Foucault 2007: 114). But this limit-attitude should be combined with an experimental attitude, or an attitude that seeks to transform or modify one’s mode of being and how one lives the present. It involves an experimental work of the self on the self, and “this work done at the limits of ourselves must [...] put itself to the test of reality, of contemporary reality, both to grasp the points where change is possible and desirable, and to determine the precise form this change should take” (Foucault 2007: 114). This explains why Foucault refers to the critical ontology of the present as a kind of essay. An essay – as the French word *essayer* or ‘to try’ indicates – is a careful attempt to modify our mode of being in the present. It is a “transforming test of oneself in the play of truth,” or an “*askesis*, an exercise of the self, in thought” (Foucault 1984: 15). For Foucault, what is at stake is the challenge to take care of the self and the world. It is not at all a withdrawal from the world, but rather is an attempt to “live the present otherwise” (Foucault 1979: 790).

## Foucault’s Education

In his later work, Foucault recalls a tradition of philosophy that is primarily concerned with self-transformation, care, and exercise. It is remarkable how he tries to articulate his own philosophical ethos in a similar way. He does not argue that the other tradition – an analytic philosophy of truth – is wrong or mistaken. His concern is not to convince. At most, Foucault argues there is a possible danger in this tradition; it often leads to the installation of tribunals by self-proclaimed judges of truth, progress, reason, etc. who put humanity to the test. Philosophy, for Foucault, starts with the courage of putting oneself to the test, that is, with a deep concern with the present to which one belongs. Herein lies the unique contribution that Foucault makes to philosophy of education, one that is easily overlooked if we remain at the level of concepts, theories, epistemological positions, and methodologies. One could argue that a Foucauldian-inspired philosophy of education can be identified by the priority it gives to the concern or curiosity for education. Education is not approached as a field of application for ideas or concept developed elsewhere; it is not something to pass judgment on. Philosophy of education along Foucauldian lines expresses a relation of care and concern, not primarily a relation of knowledge

and judgment. This concern is not only about unmasking what is self-evident in, or taken as fundamental to, education by others, but also what we in our contemporary reality – to which the philosopher himself belongs – take for granted as the ontological ‘make-up’ of education. But there is more to a Foucauldian-inspired philosophy of education than this.

Foucault frequently writes about processes of self-transformation and (de)subjectivation, but he mainly uses an ethical, and partly political, vocabulary. This is remarkable because, traditionally, these or similar processes are described in educational or pedagogical terms. To the extent that philosophy is an act of self-transformation in thought, one could easily consider this to be an educational process and even argue that philosophy is a particular mode of (self-)education: philosophy as education (Simons and Masschelein 2014). Foucault probably has good reason to draw on ethical and political vocabularies to frame these processes of change. Ethics and politics, in one way or another, approach the issue of change with a particular aim or goal in mind that gives the change processes their orientation and urgency: “you *must* change your life” or “we *have to* change our lives” (see also Sloterdijk 2014). But ethical and political devices such as these assume, and for that reason also forget, that what comes first is the ability to change one’s life: “I *can* change my life.” This assumption is exactly what in (classic) philosophy of education is called the basic assumption or belief of education: human beings can be educated, that is, human beings are born without essence or destiny and thus are able to ‘give shape’ their own essence or destiny (clearly expressed in the German idea of *Bildung*, and perhaps foremost in the term *Bildsamkeit*; Peukert 1992).

Foucault’s studies always seem to circulate around this educational point without really being attentive to it. Or, in other words: while radically questioning essences, Foucault’s critical ontologies of the present seem to bring the reader to the point where it becomes possible to think again about ‘giving shape’ to one’s life. Experience books make it possible to relate in a different way to madness, to sexuality, to punishment, etc., and they create a space where the question about living the present otherwise starts to make sense again (Masschelein and Simons 2013). There is, without doubt, a strong tendency to give an urgency and direction to *how* to live the present otherwise by projecting a compelling ethical or political horizon. But this often seeks to mobilize or even tame education – and its potential for change – in the name of particular ethical or political projects. Instead of looking at education as the carefully designed place and time in which the coming generation can ‘give shape’ to itself, these projects use the transformational force unleashed through education to shape the coming generation into its own image. Foucault himself was, of course, always reluctant to articulate or defend such clear-cut ethical or political projects. And he was criticized for that. His criticism without giving an alternative led Habermas to call him crypto-normative. But what if Foucault’s work were approached as being crypto-educational? It could be an interesting exercise of thought in philosophy of education.

# Paulo Freire and Liberation Philosophy of Education

Eduardo Duarte

## Introduction: The Revolutionary Struggle

Freire's project of critical literacy, which he initiated in 1946 when he was appointed director of the Department of Education and Culture of the Social Service in the state of Pernambuco, Brazil, was an immediate overturning of the traditional classroom that, along with other vestiges of colonialism, has its roots in European authoritarian pedagogies that accentuate the dichotomy between the expertise of the master (instructor) and the ignorance of the novice (student). "By giving the student formulas to receive and store, we have not offered him the means for authentic thought" (Freire 1973, p. 38). In sum, Freire's is a decolonial project intent on dismantling antidemocratic, anti-dialogic, and authoritarian schooling by initiating an entirely new project of liberation education within agricultural *campesino* communities and beyond.

The critical literacy Freire developed and practiced aspired to be "an education which would lead [people] to take a new stance toward their problems – that of intimacy with those problems, one oriented toward research instead of repeating irrelevant principles. An education of 'I wonder,' instead of merely, 'I do'" (Freire 1973, p. 34). Here an education of wonder must be qualified as an education of wonder at the possibility of social and political transformation: How might the world be otherwise? How might the world be one of justice, peace? How might we build a world by way of egalitarian principles? These questions can only be taken up authentically when they are put to the test and practiced in a classroom where "the teacher has the right but also the duty to challenge the status quo, especially in the questions of domination by sex, race or class" (Freire and Shor 1987, p. 174).

We must read Freire's work as part of what West calls the critical pragmatic tradition that was initiated by Dewey, i.e., as a philosopher whose work is grounded in the lived realities of teachers and students who struggle daily with the limit situations that curtail their freedom:

First of all, we should be clear that our work, our activities as an educator, will not be enough to change the world. This for me is the first thing, not to idealize the educational task. But, at the same time, it is necessary to recognize that by doing something inside the space of the school we can make some good contributions. We need to have a more or less clear idea of the limits we have as educators. (Freire and Shor 1987, p. 180)

When we read the preceding excerpt, we must recognize the limits Freire is referring to are those very *limit situations* that liberatory education struggles with; limits that are, first and foremost, the hierarchical ordering of traditional schooling. Traditional approaches to teaching and learning, according to Freire, maintain the status quo and reproduce antidemocratic conditions (e.g., racism) insofar as the teaching methods are based upon asymmetrical relationships between teacher and student.

In one of his early and, he would say, formative essays, 'Education as the Practice of Freedom,' Freire articulates his criticism of traditional educational practices by noting the disconnected nature of the curriculum. He writes:

Our traditional curriculum, disconnected from life, centered on words, emptied of the reality they are meant to represent, lacking in concrete activity, could never create critical consciousness. Indeed, its own naïve dependence on high-sounding phrases, reliance on rote, and tendency toward abstractness actually intensifies our naivete. (Freire 1973, p. 37)

The disconnected nature of the curriculum is the tool of oppression that constructs what Freire describes as the "dominating" and "authoritarian" classroom, an environment of schooling that is cultivated by a monological dissemination of knowledge. Within such a setting there is an 'inadequacy of dialogue'. Moreover, the anti-dialogic nature of traditional education is supported by a disciplinary linguistic practice that functions to maintain the students powerless insofar as they do not adopt the language of schooling. Freire identifies this problem of 'classroom discourse' or the problem of 'abstract versus concrete speech' as one of the fundamental limit situations to be taken up by dialogic liberation pedagogy. Freire writes:

I have to think about the language I use and the language the students use when they first come to the university, above all in the students' first year in the university, I have to think again about the dichotomy of reading words and reading the world, between the dance of concepts, a conceptual ballet we learn in the university, and the concrete world that the concepts should be referring to. The distance of the concepts from the concreteness is that problem I come back to when thinking of the question of language in the classroom. The concepts should be associated with a concrete reality but they are not, creating a pedagogical problem. When students come to us in the university, their experience of language is much more the experience of defining the concreteness of their existence, not an experience of dancing with concepts by themselves. (Freire and Shor 1987, pp. 147–148)

Freire's critique of the disciplinary system does not entail the abandonment of theory but the recognition that it must be co-created with students, built with them so that 'little by little' students and teachers together articulate a new critical theory.

Here the point is to move away from the presumption that the teacher alone possesses and is thus alone capable of disseminating theory. Such is the way of monological and anti-dialogical pedagogies, where students are reduced to empty vessels, receptacles; objects to be moved rather than subjects who move. Disrupting this disciplinary system requires a shift toward productive and creative relation to language. Literacy within the Freirean model is emancipatory because it is a tool for the production of a new relation to the world. And this can only happen when the theory that emerges via literacy arises from the world that the students inhabit. Freire writes:

In diminishing the distance between concepts and reality, in starting from the student understanding of their concreteness as they express it, the issue of language is involved with the act of knowing, the act of gradually illuminating the conceptual meaning of experience. We must start from student perception...this means that we start from their language, not from our language. But starting from their levels of knowledge about reality, we try to go with them to more rigorous levels of knowing and expressing reality. (Freire and Shor 1987, p. 150)

## Freire's Philosophical Genealogy

It is safe to say that many who are drawn to critical theory were, like Marx, from a young age moved by their experiences with the stark economic inequalities and social injustices that prevail in the world, and called, vocation like, to expose the repugnant contradiction between the ideals of equality and freedom they had been taught to believe in and the actually existing material conditions they encountered in their everyday life. Critical theory, however, is the calling to expose the contradiction between the principle of equality and reality of inequality, and the authentic response to this calling is *praxis*.

The highly influential critical theory of Paulo Freire exemplifies what Martin Jay refers to when he describes the development of critical theory through dialogue. Freire's application of Marx is articulated in his *Pedagogy of the Oppressed*, which is a philosophical account of the grassroots adult literary project he undertook in Brazil that replicated the literacy campaigns of Cuban revolution. Freire identified his project the work of 'the radical, committed to human liberation,' and as such it is an unambiguous testing of Marx's 11th thesis: "the more radical a person is, the more fully he or she enters into reality so that, knowing it better, he or she can better transform it. This individual is not afraid to confront, to listen, to see the world unveiled. This person is not afraid to meet the other people or to enter into dialogue with them...The pedagogy of the oppressed...is a task for radicals...revolutionary cultural action" (PO 21). This is the philosophy of the street that Socrates defined, which happens via dialectics, or what Freire called dialogue, and which makes social transformation via educational *praxis*. With Freire, dialogue is *praxis* because it transforms the world: the speaking of the true word, which is to say *real* word, transforms the world. In other words, this educational *praxis* is a critical philosophical project: it does not simply interpret the world but changes it. All of this is based on

the realization of what Freire calls the ontological vocation of becoming fully human. Dialogue is the response to the call of humanization, the call to *be human*: “to exist, humanly, is to *name* the world, to change it” (69). And where does this call arrive from? Is it from the historical struggle of humankind to realize its ontological vocation, which is to say, from the world? Yes, indeed, especially when we understood ‘the world’ as the work of human hands that at one and the same time brings us together as humanity (a people) and separates us into humans (persons). At one and the same time we encounter the world as the history of humanity and the histories of each and every human person.

Critical consciousness awakens with expression of social discontents “precisely because these discontents are real components of an oppressive situation,” Freire writes in *Education as the Practice of Liberation*. And this awakening arises from the recognition that the oppressive situation is, at the base level, a manifestation of the disrupted harmony between humanity and life on earth. Critical consciousness is thus the form of thinking that not only perceives the ubiquity of gross inequality but at the same time negates the fundamental premise that humans have dominion over life on earth. The source of that claim is found in one of the oldest and lasting narratives of Western civilization, the Old Testament book of *Genesis*. Critical theorists tell this story by relentlessly showing how the exercise of dominion has unfolded as the history of domination and subjection of *all* life on earth: the exploitation and oppression of large segments of the human community by a small number who have placed themselves above the rest.

Theoretically, which is to say, philosophically, Freire’s Marxist critique exposes the colonial logic put to work in schooling. “Manipulation is another dimension of the theory of anti-dialogical action, and...is an instrument of conquest” (Freire 1994, p. 128). In classic Marxist fashion Freire shows how ‘education’ within the neocolonial school is nothing short of socialization into docility, and ‘teaching’ is domination:

Domination is when I say you must believe this because I say it. Manipulation is dominating the students. Manipulating culture makes myths about reality. It denies reality, falsifies reality. Manipulation is when I try to convince you that a table is a chair, when the curriculum makes reality opaque, when school and society present the system of monopoly capitalism as ‘free enterprise.’ In opposition, the liberating classroom illuminates reality. It unveils the *raison d’être* for any object of study. The liberating classroom does not accept the status quo and its myths in society. In that unveiling, we change our understanding of reality, our perception. (Freire and Shor 1987, p. 172)

In response to the foregoing, Ira Shor, one of Freire’s principal collaborators in the USA, explains that this phenomenon of manipulation and domination, notwithstanding the students’ socialization to this form of education, is most often subtle and reinforced by the ideology of the instructor as a ‘neutral’ disseminator and arbiter. A mask of neutrality is donned by the instructor who adopts an apolitical posture, by the teacher who enacts and demonstrates the ‘value’ of disinterested inquiry. Shor unmasks this posture of the teacher who “pretends that reality is not problematic, [and]...thus reduces the students’ own power to perceive and to act on social issues.” Exposed by Freirean critique is the connection between ‘scientific’

disinterested inquiry and domination. “An opaque reality disempowers people, by holding a screen in front of what they need to see to begin transformation. ‘Neutral’ teaching is another name for an opaque curriculum and an opaque curriculum is another name for a domesticating education” (Freire and Shor 1987, p. 174).

From a Habermasian point of view Freire’s conclusion argues that the market logic of a capitalist economic system has effectively colonized the sphere of education. Here then, relying on Habermas categories, we can describe the Freirean project as a struggle to decolonize the market logic from the lifeworld where authentic teaching and learning is rooted. In Habermasian terms the Freirean project is part of the struggle for “radical-democratic change...to erect a democratic dam against the colonizing encroachment of system imperatives on areas of the lifeworld...so that the social-integrative power of solidarity – the communicative force of production – can prevail over the powers of the other two control resources, i.e., money and administrative power, and therewith successfully assert the practically oriented demands of the lifeworld” (Habermas 1992, p. 444). Like Habermas, the Freirean project lays claim to an original or fundamental communicative ontology. The turn to dialogue is thus a return to what always remains prior to the colonizing logic of capitalism. For Freire this amounts to developing a dialogic pedagogy which, while aware of its limits as a lever for social transformation, is nevertheless uncompromising in its commitment to liberation from the ground up. Freire writes:

We must avoid being interpreted as if we were thinking that first, we should educate the people for being free, and after we could transform reality. No. We have to do the two simultaneously, as much as possible. Because of that, we must be engaged in political action against the dehumanizing structures of production. (Freire and Shor 1987, p. 127)

The Freirean liberation pedagogy understands itself to be the practice of politics within the classroom, or a praxis that is aimed at creating a radically democratic education setting, a polyphonic learning environment in which all voices can be heard and can interact with one another. It understands itself to be an avenue for democratization of the school as one sphere of civil society. For Freire, as I will show below, the challenge for educators is to thwart the colonization of the lifeworld by the market logic by making it the very content of learning, i.e., engaging with students in a critical dialogic examination of the dominant ideology and its relationship to education:

That is why...I have insisted with you on a radical pedagogy of asking questions. This pedagogy, experienced in education or in political struggle, is essentially democratic and for that very reason anti-authoritarian.... Its criticism of traditional education is not limited to technical and methodological issues, nor to student-teacher relations, which are important, but extends to criticism of the capitalist system itself. (Freire and Faundez 1989, p. 45)

For Freire the colonization of the educational sphere by the capitalist marketplace logic is exemplified in what he calls the “banking concept of education.” In *Pedagogy of the Oppressed* Freire exposes banking education as an instrument of oppression and articulates his own dialogic praxis as the only means of combatting this authoritarian pedagogy. In turn, it is necessary to understand his critique of banking education before moving forward with an examination of his emancipatory dialogic praxis.

## The Critique of Banking Education

The critique of banking education appears in the second chapter of *Pedagogy of the Oppressed*. “Freire’s analysis of banking education as destructive of human freedom is close to being the classic criticism of all didactic and teacher-centered forms of education” (Elias 1994, p. 114). At the core of banking education is what Freire names the ‘narrative character’ of authoritarian teaching. “This relationship involves a narrating Subject (the teacher) and patient, listening objects (the students)” (Freire 1994, p. 52). In the traditional education setting the relationship between instructor and student is asymmetrical, with the teacher desiring total control over the ‘learning’ process.

The teacher-student relation delineated above is predicated on a curriculum that Freire describes as ‘lifeless and petrified.’ Banking education is thus life-denying, and the banking educator described as a necrophiliac. Banking education “leads students to memorize mechanically the narrated content,” as opposed to creatively and critically posing questions and offering original interpretations. Banking education attempts “to minimize or annual the students’ creative power and to stimulate their credulity” (Freire 1994, p. 54). In banking education there is no recognition of thinking, no collective inquiry because the world is presented as ‘completed.’ Thus the banking educator is teaching at the proverbial ‘end of history,’ an epoch ushered in by the so-called triumph of capitalism. The practice has the goal of reinforcing this ideological claim by ‘teaching’ the students to be passive, and thereby “transforms students into receiving objects. It attempts to control thinking and action, leads women and men to adjust to the world, and inhibits their creative power” (Freire 1994, p. 86). The students in the banking model are reduced to ‘containers’ or ‘receptacles’ to be filled with ‘knowledge,’ the ‘facts’ of the world *as it is*.

Education thus becomes an act of deposition, in which the students are the depositories and the teacher is the depositor. Instead of communicating, the teacher issues communiques and makes deposits which the students patiently receive, memorize, and repeat. This is the ‘banking’ concept of education, in which the scope of action allowed to the students extends only as far as receiving, filing, and storing the deposits...But in the last analysis it is the people themselves who are filed away through the lack of creativity, transformation, and knowledge in this (at best) misguided system. For apart from inquiry, apart from the praxis, individuals cannot be truly human. Knowledge emerges only through invention and re-invention, through the restless, impatient, continuing, hopeful inquiry human beings pursue in the world, with the world, with each other. (Freire 1994, p. 53)

Like Dewey, Freire’s critique of the traditional pedant and authoritarian educator reveals the domesticating outcomes of a ‘teaching’ that is intent on pacifying students. Whereas Dewey and Freire demand a learning environment that allows students to experiment, to create, to invent knowledge, and to inquire through dialogic interaction, the domesticating system of schooling reinforces what Freire calls “the ideology of oppression...Projecting an absolute ignorance onto others,” this ideology “negates education and the process of inquiry” (Freire 1994, p. 53).

Freire turns to Hegel for assistance in elaborating his critique of banking education, which is an expression of what Hegel named the master-slave dialectic. Freire

writes that “the students, alienated like the slave in the Hegelian dialectic, accept their ignorance as justifying the teacher’s existence...” (Freire 1994, p. 53). To draw this analogy with sharper lines Freire might have added that insofar as banking education is organized by the master-slave dialectic it permits the teacher to burgle away the students’ capacity for critique and by doing so their faculty for identity formation. Banking education ‘naturalizes’ the authoritarian teacher’s position as ‘master’ and student as ‘slave,’ as object being formed, rather than subject who is forming herself. As Hegel describes it, the dialectic is organized by “a recognition that is one-sided and unequal” (Hegel 1977, p. 114). Hegel writes:

Since to begin with they are unequal and opposed, and their reflection into a unity has not yet been achieved, they exist as two opposed shapes of consciousness; one is the independent consciousness whose essential nature is to be for itself, the other is dependent consciousness whose essential nature is simply to live or to be for another. The former [the teacher] is lord, the other [the student] is slave. (Hegel 1977, p. 115)

For Hegel, self-consciousness – emancipated consciousness – is dependent upon intersubjective, mutual recognition, on symmetric reciprocity: “self-consciousness exists in-and-for-itself when, and by the fact that, it so exists for another; that is, it exists only in being acknowledged” (Hegel 1977, p. 111). Following Hegel, Freire recognized that any project of emancipation via education begins, philosophically, with the premise that self-consciousness (emancipated consciousness) is not an historical inevitability, but must emerge via struggle. For Hegel this struggle was, figuratively, a struggle to the death, the death of the asymmetric relationship, the death of the master-slave dialectic.

The logic of the master-slave dialectic unfolds as a politics of misrecognition. The students’ subjectivity is eclipsed by interpolation of them as receptacles, objects of control as opposed to subjects with freedom. The student is reduced to the status of ‘slave’ and (de)formed into a dependent “and not an independent consciousness...He is therefore, not certain of being-for-self as the truth of himself. On the contrary, his truth is in reality the unessential consciousness and its unessential action” (Hegel 1977, p. 115). In Freire’s terminology the banking educator renders the student dependent, while a dialogic pedagogy undertaken under conditions of mutual recognition emancipates the student’s independent consciousness. Hegel describes the process in this way: “Through this rediscover of himself by himself, the slave realizes that it is precisely in his work wherein he seemed to have only an alienated existence that he acquires a mind of his own” (Hegel 1977, pp. 118–119).

Freire’s liberation project is one of confronting, destructing the contradiction at the heart of the asymmetry and then reconstructing the teacher-student relationship. By reconciling the poles of the contradiction the liberatory educational context produces a democratized classroom where power is circulating dynamically, with no party capable of claiming control over the movement of learning that is propelled by freedom. Students are empowered, and so too the newly liberated teacher who also encounters himself anew. Together they recognize the production of knowledge as a joint effort, a collaborative and collective work. All members of the dialogic learning community “are simultaneously teachers and students” (Freire 1994, p. 56).

Freire warns that the implementation of liberatory pedagogy is one of struggle. This warning, which is often ignored by more liberal and reform minded educators, is captured well by Ivan Illich when he describes Freire's project as a "truly revolutionary pedagogy." In turn, while Hegel's influence is unquestionable, Freire is best understood as a Hegelian-Marxist, or Marxist humanist.

The resolution of the traditional teacher/student contradiction arrives when "the innumerable well intentioned bank-clerk teachers" (Freire 1994, p. 56) abandon the metaphysical view of the self and world as fixed and determined. An education for liberation, on the contrary, is put underway by a process metaphysics that works under the premise that "reality is really a process, undergoing constant transformation." In this case, a process metaphysics deployed within a critical and revolutionary praxis has an existential implication: liberation is the human expression of a primordial dynamic process.

## Freire and the Ontological Vocation to Be Free

The work of the liberation educator is thus first and foremost one of calling the students into what Freire calls their humanization. Teaching is vocational and vocative, a calling of students to their ontological vocation *to be free*:

Concern for humanization leads at once to the recognition of dehumanization, not only as an *ontological possibility*, but as an historical reality. And as an individual perceives the extent of dehumanization he or she may ask if humanization is a viable possibility. Within history, in concrete, objective contexts, both humanization and dehumanization are possibilities for a person as an uncompleted being conscious of their incompleteness.

But while humanization and dehumanization are real alternatives, only the first is the *people's vocation*. This vocation is constantly negated, yet it is affirmed by that very negation. (Freire 1994, p. 25)

When we examine the fragments where Freire rehearses the ontological vocation, we immediately recognize the ontological vocation is the central category for his project, and thus for the philosophy of liberation. Without properly thinking this category we fail, at a philosophical/theoretical level to understand what is happening with the *praxis* that is unfolding with philosophy of education.

Thinking the ontological vocation demands hearing the resonance of ancient words that are conveyed therein – *allí dentro*. Thus, when we take up the work of thinking the ontological vocation, we are compelled to shift into an auditory dimension, to *perceive* via *listening*, because the ontological vocation is an existential *calling*; specifically, a calling that gathers: a congregational gathering, a call to community via communion. This is precisely why the thinking of this category enables us to understand with Freire that the authentic outcome of thinking the ontological vocation is the praxis of dialogue: speaking and hearing the Word, and thereby exercising our primordial right, as Freire puts it.

Thinking the ontological vocation via Freire entails reconciling what appear to be contradictory discourses. For example, Ron Glass criticizes Freire for working

with what Glass calls “conflicting interpretive frameworks...in particular traditions of Marxism, existentialism, and Christianity.” These discursive conflicts produce “certain contradictions...that arise when trying to weave these roots together...” For Glass the major conflict arises with the category: ontological vocation. Glass insists that the discursive conflict “can be seen...in Freire’s conception of humanization as the ontological ‘vocation’ of human beings. The theological notion of vocation undermines the more historicist ontological interpretation required when analyzing oppression (which Freire labels dehumanization) since it is also a way that humans produce the history and culture that they live.”

Glass’ critique raises some important questions: does the “theological notion of vocation” undermine the historicist consciousness that is put to work by the liberation project? Does the ontological call for humanization, for a new humanity, undercut or diminish our capacity to perceive injustice and critique the institutions that produce it? Does the vocational thwart our struggle to mount a praxis and construct alternatives to the status quo?

Clarence Joldersma offers a signpost for a response to Ron Glass when he writes: “Although I do not argue this point, I would think it would be difficult to understand Freire without acknowledging his Christian faith...” Indeed, faith, as I come will back to later, is the dramatic backdrop to Freire’s project, and one that is emphasized by Henry Giroux who, in his introduction to Freire’s *Politics of Education* reminds us that Freire adopted the language of possibility that was worked out by Latin American liberation theologians. Giroux writes the “Language of possibility is rooted in what Freire calls ‘a permanent prophetic vision.’” Giroux continues, “Underlying this prophetic vision is a faith that, as theologian Dorethee Soelle argues in *Choogin Life*, ‘makes life present to us and so makes it possible...it is a great Yes to life...[one that] presupposes our power to struggle.’”

Freire’s thinking arises out of a movement, namely, liberation theology, that, in contrast to what Glass has claimed, presumes a symmetry between the Christian Gospel and critical social theory. As Giroux adds, Freire’s categories of faith and hope are in fact expressions of “his faith and sense of hope in the God of history and in the oppressed, whose teaching [i.e., the pedagogy of the oppressed] make it possible, in Freire’s words, to ‘reconcile Christian love with the exploitation of human beings.’” Reconciliation occurs whenever we perceive in the lived experience of oppression the redemptive passion of Christ’s salvific crucifixion: the liberation of the human spirit in the historical reality of oppression. The perception of this soteriological event in history is a reception of the prophetic call to struggle for justice through an unrelenting faith that is confirmed in the presence of the living Christ in the oppressed.

Thinking, Freire writes, “perceives reality as a process, as transformation” (Freire 1994, 73). This thinking ‘*el pensar verdadero*’ (true/authentic thinking) that is true/authentic because it is appearing through dialogue (the dialectic moving through the human gathering). Dialogue is the only proper response to the ontological vocation because the calling is calling us into the process of becoming. The call says, first and foremost, “All is Becoming.” In turn, dialogue is the only proper response to this call because it alone is capable of placing us (together) in the pro-

cess of becoming. Dialogue in this sense is not mimetic, because we are not imitating the process of becoming. Rather, through dialogue we are gathered *into* Being qua Becoming.

A vocation is a calling, a sonic or auditory disclosure, perceived via listening. The ancient word that we discover when we undertake an archeological exegesis of Freire's 'ontological vocation' is *ekklesia*, which is the word that the Attic Greeks used to designate the process through which individual private citizens were called out of their homes and gathered together into a public place. The Attic *ἐκκλησία* was lifted wholesale into the New Testament Greek and then appeared in Latin virtually unchanged as *ecclesia*, and then later in Spanish became *iglesia*. The original is the compound of *ek* ('out' – as in *exodus*: out on the road, path) and *klē* (to call). Vocation is a calling in the form of an unambiguous saying: an injunction (imperative). The *ἐκκλησία* *calls* out from the private and singular into the public and collective. The necessary presumption here is that there is a sound – traditionally made by a horn ('trumpet') – that is heard *by all in the same way* as an injunction to gather. What's more, it is presumed there is a place where the assembly is meant to gather. The Latins will translate that place as the *res publica*, the shared place.

*κοινός* is the common. *ἐκ κοινού*: of, from the common is what is shared in common – both as the place that is shared and the sharing of a place. Hence *κοινώς* – what is held in common or jointly – should always be joined with *κοινότες* – the act of sharing in common, community. Finally, *κοινός* unfolds as *koinonia* via *κοινῶ* – communicate. All of this can be summarized with the fragment where, in light of the assertions that "the essence of dialogue is the word," and "the true word is praxis," Freire adds, "*Los hombres se liberan en comunión*," which I translate as "the people liberate themselves in *communion*."

Here it is obvious that *reception* qua revelation of the ontological vocation for humanization happens by remaining in the calling in which one is called insofar as one perceives the call to enter into communion with others, i.e., called into the inter-subjective humanization experienced in the *sharing of life*.

The formation of the learning community occurs as an implication of the *conversion* to dialogue, to being-together through the word. And this is precisely how Freire himself puts the matter when he insists that "dialogue...requires an intense *faith* in humankind, *faith* in their power to make and remake, to create and recreate, *faith* in their vocation to be more fully human...[which is] the birthright of all. *Faith* in people is an *a priori* requirement for dialogue; the 'dialogic [person]' believes in others even before [they] meet them face-to-face" (71).

Here is another example of what Glass calls Freire's theological language, but my interest in these concluding remarks is not to revisit *that* critique. The greater challenge appears with showing via an archeological exegesis that Freire's invocation of faith is not a secular humanist euphemism, but, on the contrary, arising out of the discursive field in which liberation theology is rooted, i.e., the efforts in the late 1960s and early 1970s to midwife what Vatican II described as "the birth of a new humanism...defined first of all by [our] responsibility toward [our] brothers and sisters."

What's important here is to recognize that Freire's claim that *faith* in people is an *a priori* for dialogue is an assignment of the faith in the ontological vocation, the vocation to be more fully human, *SER MAS*, which is codified by the primordial to speak the Word.

## Freire's Legacy

Paulo Freire's influence on critical theory and practice in education is unparalleled. His work is read the world over, and has led to creation of institutes in Brazil, the USA, South Africa, Canada, and the UK, which are devoted to the study of his work and to the ongoing engagement with the liberation educational praxis he initiated. Internationally renowned philosopher and theologian Enrique Dussel has identified Freire as a singular figure in the articulation of liberation philosophy. Freire has been credited as the foundational thinker for Augusto Boal's radical theater of the oppressed. Critical educational such as bell hooks, Antonia Darder, Peter McLaren, Donald Macedo, and Henry Giroux are among the most prominent figures who have taken up Freire's work in the USA. In the USA, his work has been read through the lenses of an array of discourses such as neomarxism, postmodernism, feminism, decolonial, and critical race theory. In the two decades since his passing, Freire's legacy has continued to grow with each new generation's response to the vocation to be free and the struggle for human liberation.

# Maxine Greene's Concept of the Social Imagination

Wendy Kohli

## Introduction

Maxine Greene (1917–2014) was a philosopher of education who grounded her work in existential phenomenology, pragmatism, critical theory, and aesthetics. A prolific writer, public intellectual, and teacher, Greene offers contemporary educators, philosophers, and policy makers a valuable critique of education and schooling. In particular, her concept of the social imagination is a potent antidote to the negative forces of scientism, technicism, and instrumental rationality that have dominated educational thought and practice for several decades. It is also a generative idea that supports the viability of multicultural communities in our schools and in our democratic societies at large. This chapter will address Greene's resistance to the increasing standardization of teaching and learning, the corporatization of schooling, and the shrinking of the public sphere, through a critical understanding of the arts.

Since her earliest writings in the 1970s, Greene has provided a sustained critique of our bureaucratized schooling systems, systems that offer a reduced and packaged concept of education (Greene 1973, 1978). She laments the situation of many teachers and students who often experience a loss of their own subjectivity—their own agency and suggests “that [the teacher] struggle against unthinking submergence... If he wishes to present himself as a person actively engaged in critical thinking and authentic choosing, he cannot accept any ‘ready-made standardized scheme’ at face value” (Greene 1973, p. 269).

---

Portions of this chapter first appeared in a paper given for the 2015 Presidential Symposium of the John Dewey Society: The Legacy of Maxine Greene, and subsequently published in *Education and Culture* 32(1), 15–24, 2016.

In her later work, Greene makes a compelling case to transform this disempowering situation through critical aesthetic experiences. By invoking the imagination, particularly the *social* imagination, Greene seeks to move us beyond education as “simple transmission” (Greene 1995, p. 3) and also “the hollow formulations, the mystifications so characteristic of our times” (Greene 1988, p. 126). She maintains that “a concern for the critical and the imaginative, for the openings of new ways of ‘looking at things’, is wholly at odds with the technician and behaviorist emphases we still find in American schools” (Greene 1988, p. 126).

It is important to underscore Greene’s insistence on the *social dimensions* of the imagination—imagination that is transformative, that can produce a more humane and just world. Drawing on critical theory, existentialism and the arts to develop her critical concept, Greene deploys it to *provoke*, to provoke us into ‘wide-awakeness.’ As she tells it: “I am interested in trying to awaken educators to a realization that transformations are conceivable, that learning is stimulated by a sense of future possibility and by a sense of what might be” (Greene 1978, pp. 3–4).

This chapter will locate the social imagination in Greene’s existential commitment to provide openings, to create more possibilities, to move us to a more empowered stance in the world. For Greene, as it was for John Dewey, it is through encounters with a range of art forms that we *are* provoked, to “think of things as if they could be otherwise” (Greene 2001, p. 116). And like Dewey, Greene was engaged in applying her theories to real life problems. Through her long teaching and writing career, her 30-year role as Founder and Philosopher in Residence at the Lincoln Center Institute for the Arts in Education,<sup>1</sup> and as co-founder of a small New York City high school focused on the arts and social inquiry,<sup>2</sup> Greene inspired countless generations of teachers, artists, professors, and community activists. Ever the philosopher of education, Greene continually asked us to reflect on the perennial question—to what ends are we preparing the young in our schools? One response from her was to “educate for freedom”<sup>3</sup> through an engagement with the arts (Greene 1988, pp. 117–135). Her concept of the social imagination provides a fuller understanding of Greene’s philosophy of education and its impact on our field.

<sup>1</sup> The Lincoln Center Institute for the Arts in New York City, now Lincoln Center Education, was founded by Maxine Greene over 30 years ago. <http://www.aboutlincolncenter.org/education-community/lincoln-center-education/lincoln-center-education>

<sup>2</sup> <http://schools.nyc.gov/SchoolPortals/03/M299/default.htm>. From the website of the school: At the High School for Arts, Imagination and Inquiry we work to infuse our interdisciplinary curriculum with experience in, and reflective study of, the arts in accordance with the model created by the Lincoln Center Institute for the Arts in Education. We believe that encounters of this sort release imagination and open unexpected intellectual possibilities that provoke students to reach beyond themselves as they “look at things as if they could be otherwise” and, most significantly, encourage civic dialogue which empowers all of the members of our diverse school community to work towards a more just, humane and vibrant world.

<sup>3</sup> See Greene’s classic text 1988, *The Dialectic of Freedom*, for her historical and philosophical justification of “education for freedom.”

## Situating Greene's Philosophical Stance

Over the course of Greene's lifetime of scholarly work, she maintained that our received framework of critical rationality was not sufficient to understand and educate about the complexity of human experience within diverse societies. For a fuller account of our lived reality, one needed to see from many vantage points and through many disciplinary lenses. She insisted that no one discourse could grasp adequately the complexities and contradictions of human experience in our contemporary multicultural world.

In developing "the capacity to look critically at [the] world" (Greene 1973, p. 167), Greene argued that we must address what she often called "'the sedimentation' of meanings over time," starting from the vantage point of the individual (Greene 1973, p. 165). With her grounding in phenomenology and existentialism, Greene argued for education to start with a strong connection to the subjective experience, the biographical standpoint of the learner, in order to make connections with the subject knowledge at hand. Otherwise, these sedimented layers of meaning can become barriers to educating for democracy, for social justice, and for human liberation if not excavated first from this personal standpoint. She describes this phenomenological process as such:

...the individual is moved to constitute his world as meaningful within the stream of his consciousness...Wanting to *be* someone, he continually moves outward, seeking to transcend, to break through to a new future. He makes this break best of all in the context of his life history, perceiving from his vantage point and *then* from a multiplicity of other vantage points. (Greene 1973, p. 167)

Greene continues by reminding us that "every human being has the capacity to look critically at the world if he is freed to do so through dialogue. Equipped with the necessary skills, he can deal critically with his reality, once he has become conscious of how he perceives it" (Greene 1973, p. 167). Her focus on dialogue, on perception, on situated consciousness resonates with the critical pedagogy of Paulo Freire, another important inspiration for her educational philosophy. She cites his early work, *Pedagogy of the Oppressed*, when referring to those "who have to be aroused to a consciousness of how the real is constructed and who have to be challenged to 'name' their lived worlds, and through the naming, to transform those worlds" (Greene 1995, p. 24).

It is clear that Greene offers an expanded notion of critical reflection—one that incorporates not just the rational, but also the emotional, ethical, and aesthetic sensibilities—in order to come to a more complete understanding of reality. Echoing Merleau-Ponty, Greene embraced the "pre-reflective landscape" of each individual's situatedness as the foundation for understanding the world—however partial those perspectives would necessarily be (Greene 1988, p. 21). Similarly, Greene employed Bakhtin's concept of 'heteroglossia,' that is, the recognition of differences within languages and worldviews, to allow for open dialogue and to create spaces "where multiple voices and multiple discourses intersect and interact" (Greene 1988, p. 129).

## Social Imagination and the Transformative Potential of the Arts

Amid this array of perspectives, of multiple voices, Greene, like Dewey, asserted the “potency of the arts” (Greene 2001, pp. 196–197). It is worth quoting Dewey at length here—as Greene often does—to make vivid the influence of his work on her aesthetic-political thinking.

...The function of art has always been to break through the crust of conventionalized and routine consciousness. Common things, a flower, a gleam of moonlight...not things rare and remote, are means with which the deeper levels of life are touched...This process is art...Artists have always been the real purveyors of news, for it is not the outward happening itself which is new, but the kindling by it of emotion, perception, and appreciation.<sup>4</sup> (Dewey, as quoted in Greene 2001, p. 197)

Greene took seriously Dewey’s understanding of the power of art to deepen the lives of people. As evidenced by how she lived her life, she appreciated the aesthetic value of a work of art. However, she also saw that painting, literature, music, drama, dance, photography, and film had the potential for rationalizing the status quo just as much as it could lead to its transformation. Consequently, she resisted sentimentalizing the imagination by reminding us that acts of horror have been committed because someone was able to imagine them and implement them. That is why it was important for Greene to emphasize the development of a critical consciousness of the world through a *critical engagement* with the arts (Greene 2001, p. 197). It is in this extension of Dewey’s aesthetic experience that we see Greene’s political-philosophical roots in existentialism and critical theory/pedagogy.

Greene’s modernist grounding kept her focused on the critical, transformative possibilities of the arts. To support her position, she invoked Jean Paul Sartre who said: “it is on the day that we can conceive of a different state of affairs that a new light falls on our troubles and our suffering and that we *decide* that these are unbearable” (as cited in Greene 1995, p. 5). For Greene, it is our *social* imagination at work when we see as ‘unbearable’ something such as uncaring schools and that we are able to “think of humane and liberating classrooms for every learner” (p. 5). Greene readily admits that to attain this social imagination one must develop “a mode of utopian thinking: thinking that refuses mere compliance, that looks down roads not yet taken to the shapes of a more fulfilling social order, to more vibrant ways of being in the world” (p. 5). No easy task in a world ‘submerged’ in bureaucratic practices; yet she was determined to move us beyond education as “simple transmission” (p. 3).

Greene’s existential commitments forced her to wrestle with the possibilities of hope and despair; yet more often than not, the possibility for deciding, acting, changing, and creating kept the despair at bay. Her concept of the social imagination was intended to provide openings, to create more possibilities, to move us toward a

---

<sup>4</sup>This is drawn from Dewey’s *The Public and Its Problems*, Chapter Two “In Search for the Great Community.”

more empowered stance in the world. For Greene, it is through critical encounters with a range of art forms that we are provoked to think and act differently—to become 'wide awake'.

## Consciousness and Wide-Awakeness

In Greene's first major educational philosophy text, *Teacher as Stranger*, she challenges us to rethink our taken-for-granted assumptions through the critical lens of existential phenomenology. Specifically, she asks us "to become highly conscious of the phenomena and events in the world as it presents itself to consciousness" and like Sartre, "to go beyond the situations one confronts and refuse reality as given in the name of a reality to be produced" (Greene 1973, p. 7). As an existential phenomenologist, consciousness plays a central role in how Greene conceptualizes philosophy.

Drawing on Husserl, Greene spoke of the "consciousness of the living being and the life-world constituted by each subjectivity" (1973, p. 35). Applying this concept to her philosophy of education, Greene warns of the "ancient images, abstractions, and slogans [that] too often hang like veils between the teacher and the 'phenomenology of the situation'" (1973, p. 80). Yet, she argues, "if [the teacher] chooses consciousness, if he is alert to the veil, the teacher will realize that to talk about something, to name something is not to guarantee its existence...Existence, empirical reality must be demonstrated" (p. 81). Greene goes on to remind us of how easily it is to accept unquestioningly such commonplace assumptions such as "children are 'learners' when they go to school or that all are provided 'equal opportunity'..." (p. 81). It is here we grasp Greene's critical theory at work, deconstructing the educational slogans that constitute much of our educational landscape. She is nudging us into 'wide-awakeness', into challenging our taken-for-granted views, in order to move beyond such abstractions and slogans.

In her reliance on the phenomenologist's understanding of consciousness, Greene reminds us that it "is in no sense mere innerness or introspection. It thrusts *toward* the world, not away from it...that consciousness is characterized by intentionality: it is always *of* something" (p. 131). Greene implores teachers to be conscious of their lived realities, to examine the specific situations and subjectivities of their students, and to refuse the sedimented meanings they have inherited.

At the same time, Greene is quite aware that most of us, including teachers and students, are "not conscious of [our] standpoint or ... [our] consciousness. [We] live immersed in [our] daily life... tak[ing] for granted the commonsense reality of things" (pp. 131–132.).

This is where the notion of 'wide-awakeness' becomes so crucial to Greene's philosophy. She recounts that when 'wide-awake', our taken-for-grantedness "becomes questionable; there is an interference with the habitual...Ordinary ways of perceiving have to be suspended; questions have to be posed. The individual has

to be jolted into awareness of his own perceptions” (p. 132). ‘Jolted into awareness’: Greene employs Alfred Shutz’s definition of awareness as “a plane of consciousness of highest tension originating in an attitude of full attention to life...” (as quoted in Greene 1978, p. 169).

To arouse this awareness, this ‘full attention’, Greene turns to encounters with the arts, to aesthetic experience. In advocating for the artistic-aesthetic domain, especially in and for schools, Greene makes clear that her commitment to this domain is not simply a love for the arts. Rather, “it derives as well from a sense of the *anaesthetic* character of so many institutions in our culture, including schools” [emphasis added] (Greene 1978, p. 169). Echoing Dewey, Greene argues that this ‘anaesthetic’ character of schools is a product of bureaucratic practices and technicist thinking that contributes to humans becoming “passive gazers, not see-ers; hearers not listeners” (Greene 1978, p. 169). Greene’s life work has been to move us out of our complacency, our passivity, to be more active questioning beings.

Like Dewey and Freire, Greene promotes a philosophy of education built upon problem posing and questioning from an active stance. Citing Dewey, who promoted aesthetic experiences as “a challenge to the systematic thought called philosophy” Greene extends his critique to include “many kinds of linear, positive, thinking” in order to “break... with the mechanical, the sporadic, the routine” (Greene 1978, p. 171).

At the same time, Greene saw the limits of Dewey’s critique and looked to Sartre to bolster her understanding of aesthetic experience—especially his views on “the dangers of fixity” (Greene 1978, p. 172). As an existential phenomenologist, Greene feared the human tendency toward certainty, finishedness, and habituated behavior that was susceptible to reification. Furthermore, she appreciated “Sartre’s stress... on the reconstruction of the present in the light of future possibility...The going beyond...the identifications of lacks in present situations, with the struggle to surpass, with the transformation of the world” (p. 172).

It was Greene’s commitment to ‘going beyond’ that animated her commitment to social justice and educational change. And it was her embrace of the arts that became the vehicle to imagine the possibilities for a different, more humane, and just world.

## Imagining a Transformed World

Greene’s passion for the arts rivaled her commitment to educating for critical consciousness: educating for freedom, for equality, for democracy. Critical aesthetic encounters were for Greene, as indicated earlier, openings for new possibilities, for new visions of the world. They provided a nondogmatic, nondidactic pedagogical approach to educating and empowering young people. And they offered a way to make connections across cultural divides by increasing multicultural understanding and recognizing a multiplicity of voices. Yet Greene was not naïve about the enormity of this endeavor, of the barriers to liberation.

Here she implores us to recognize the task at hand:

Given the dangers of small-mindedness and privatism...I do not think it sufficient to develop even the most variegated, most critical, most imaginative, most 'liberal' approach to the education of the young. If we are seriously interested in educating for freedom...it is...important to find a way of developing a *praxis* of educational consequence that opens the spaces necessary for the remaking of a democratic community. (Greene 1988, p. 126)

Greene is calling for a radical rethinking of education. For her this “would mean fresh and sometimes startling winds blowing through the classrooms of the nation. It would mean the granting of audibility to numerous voices seldom heard before” (Greene 1988, pp. 126–127).

Greene took this passion for rethinking and remaking the world into her lectures at the Lincoln Center Institute for the Arts in Education. In one of her most cited lectures, “Thinking of Things as if They Could be Otherwise,” given in 1997, Greene spoke “about opening spaces in our classrooms, more and more spaces where people can appear as who they are and not *what* they are, spaces for action on the part of all of those involved” (Greene 2001, p. 118). Like Hannah Arendt, Greene insisted that “action, in contrast to behavior, means taking an initiative, embarking on a beginning, setting something in motion” (Greene 2001, p. 119). And she believed to the core of her being that “aesthetic discoveries and experiences...and the effect [they] can have on the spaces we open” encouraged “a sense of agency on the part of teachers and learners both” (p. 119). These aesthetic encounters were also openings to go “beyond the schoolroom space into larger spaces where we look for communities-in-the-making, for...democracy” (p. 119).

Through the Maxine Greene Center for Aesthetic Education and Social Imagination,<sup>5</sup> Greene supported new pockets of innovation, imagination, and transformation through grants to community based youth and arts groups. By making this effort she hoped that microcosms of democracy might flourish and nurture a more enlivened public sphere—especially in a *multicultural* democracy.

## Critical Multicultural Aesthetic Experiences to Enlarge the Public Sphere

Greene's focus on the arts as a powerful source for social transformation had, and continues to have, relevance for educators seeking pedagogies in and for multicultural contexts. Like Dewey, Greene had a dialectical understanding of freedom and democracy, where *individuality* could only be attained through *community*—“in which individuality is constituted by membership, by coming together” (Greene 1995, p. 197). Furthermore, the community she envisioned—these public spaces—are spheres of difference, of multiplicity. For Greene, “the challenge is...to make possible the interplay of multiple voices, of ‘not quite commensurable visions’” (Greene 1995, p. 198).

---

<sup>5</sup><https://maxinegreene.org>

Greene makes a compelling case for us critical teacher educators to develop the social imagination in our students when she says: “we who are teachers would have to accommodate ourselves to lives as clerks and functionaries if we did not have in mind a quest for a better state of things for those we teach and for the world we share. *It is simply not enough for us to reproduce the way things are*” (Greene 1995, p. 1) (Italics added). It is Greene’s deep philosophical connection to existentialism, phenomenology, and critical theory—as well as her pragmatic activism—that sustained her hope that people, in community, *can* think differently, *can* change their consciousness, *can* change schools, *can* change history. For Greene, it was an embedded, embodied consciousness that produced this transformative epistemology; this embodied way of knowing the world in which we live.

In *Releasing the Imagination*, Greene speaks of beginnings, and “of how much beginnings have to do with freedom”—freedom to act differently. And this acting differently requires a change of consciousness and an awareness of possibility. She goes on to claim “that if I and other teachers truly want to provoke students to break through the limits of the conventional and the taken for granted, we ourselves have to experience breaks with what has been established in our own lives; we have to keep arousing ourselves and to begin again” (Greene 1995, p. 109).

One significant way Maxine Greene helped teachers ‘begin again’ was through her work as Philosopher in Residence for over 30 years at the Lincoln Center Institute for the Arts in Education (LCI). Working with LCI teaching artists and university teacher education professors, Greene educated hundreds of New York City K-12 teachers about the theory and practice of aesthetic education. She was especially passionate about integrating the arts in ways that represented the diverse cultural experiences of the city’s students. We see again and again in Greene’s Lincoln Center lectures, her commitment to cultural diversity and community. The following passage is worth quoting at length:

Aesthetic encounters with works of art are situated encounters. That means that the perceivers of a given work of art apprehend that work in the light of their backgrounds, biographies and experiences. We have to presume a multiplicity of perspectives, a plurality of interpretations. Clearly, this opens aesthetic educators to the likelihood of more than one interpretation of a poem, a dance, a play, a musical piece. At once, the growing diversity in the New York, and other public, schools continues to remind us that we cannot, in the works of art we explore, confine ourselves to what is called the western “canon.” In consequence, we have tried to vary our offerings to include works from a range of other cultures... Including once unfamiliar musical works and dance performances, for example, we have opened new worlds, new perspectives to ourselves, as well as to the teachers who attend our institute... the community we keep forming by means of our Institute has opened richer and richer dialogues, and our increasingly diverse numbers have found as many notes of connection as they have new possibilities. “Multiculturalism,” therefore, has become more and more multifaceted, more and more open to new interpretations, new ways of viewing works of art, new ways of being in the world. (Greene 2001, p. 175)

One of the teacher educators who participated in Greene’s Lincoln Center Institute created a graduate course called “The Educational Imagination.”<sup>6</sup> The course has

---

<sup>6</sup>The instructor was not referring to the classic book by Elliot Eisner, *The Educational Imagination: On the Design and Evaluation of School Programs*, when naming the course.

been taught for a decade and remains a viable component of a Masters of Education program for pre and in-service teachers.

Inspired by Greene to make connections “between the aesthetic, the ethical, the intellectual, the existential, and the political” (Gur-Ze’ev 2005, p. 19), this teacher educator used the ‘potency of the arts’ to move her students to see things in fresh ways, to de-familiarize experience, to become more “wide-awake” (Greene 1973, p. 2). The course employs Greene’s concept of the social imagination to deepen and complicate teachers’ understandings of culture, identity, and curriculum. Through the integration of multicultural aesthetic experiences, and an amalgam of feminist and critical pedagogies, students in the course experience the transformative and transgressive power of the social imagination. Students learn from cultural and social histories of marginalized groups in the USA and around the globe. They encounter contemporary artists who disrupt and challenge taken-for-granted representations, and they see the critical role the arts and artists can play in inciting social and educational change.<sup>7</sup>

By connecting critical educational and cultural theory to their professional/practical and personal experiences, one key aim of the course is to help the students begin to see the world ‘as if it could be otherwise’. The assignments require them to draw on a range of talents and skills and move them increasingly out of their comfort zones—their theoretical, psychological, professional, and aesthetic comfort zones. The course description signals that the teacher’s role is one of empowering students to think critically about their identities, positionalities, and privilege. The course is also intended to do the same for them—as teachers and as citizens in a multicultural democracy.

Each time the course is offered, the instructor is reminded of how important *context* is with regard to the participating graduate students/teachers.<sup>8</sup> This includes taking into account who they are as gendered, classed, raced, beings and, consequently, what/whose cultural knowledge they bring to the class. Unfortunately, many of these graduate students/teachers were found to have relatively ‘thin’ experiences with art, literature, drama, film, and music, especially those from culturally different sources. This poses a pedagogical challenge in terms of how to help them make sense of these unfamiliar artistic works.

Greene offers assistance when she says:

Meaning *happens* in and by means of an encounter with a painting, with a text, with a dance performance. [And yet] the more informed our encounter—by some acquaintance with the medium at hand, some use of critical lenses, and some consciousness of the art world the more we are likely to notice and the more the work is likely to mean. If questions beat inside us about whether or not something is called good art or bad art, what context has to do with an artwork, and what constitutes good reasons, we are likely to perceive even more. (Greene 1995, p. 139)

---

<sup>7</sup>Teaching the course for 10 years, the instructor used a range of material. However, the core texts for the course remained stable: Dewey’s *Art as Experience* (1934), Greene’s *Releasing the Imagination* (1995), Greene’s *Variations on a Blue Guitar* (2001), Freire’s *Teachers as Cultural Workers* (1998), Cahan and Kocur’s *Contemporary Art and Multicultural Education* (1996), or Joo and Keehn’s *Rethinking Contemporary Art and Multicultural Education* (2011).

<sup>8</sup>As context, the graduate students getting their Masters degrees in Education are mostly white, female, middle class, suburban teachers.

Grappling with how to facilitate these aesthetic encounters, with this ‘release of the imagination’, keeps the instructor pedagogically engaged. Each year it is a creative, ‘educative experience’—in both planning the curriculum and engaging with the students.

Dewey is helpful here when he reminds us that learning and meaning-making occur when a current experience is connected to a prior one: “Imagination is the only gateway through which these meanings can find their way into a present interaction; or rather...the conscious adjustment of the new and the old *is* imagination” (Dewey 1934, p. 272). At the same time, he cautions us that “there is always a gap between the here and now of direct interaction and the past interactions [and] because of this gap, all conscious perception involves a risk; it is a venture into the unknown...” (Dewey p. 272). So the pedagogical challenge remains one of introducing new, unfamiliar, even transgressive aesthetic experiences to the students in a way they can connect to from their prior knowledge—which *is* a big risk because their prior experience with/knowledge of ‘the arts’ is so varied, and in some cases, so limited. A further issue is to insure that the aesthetic encounter is not, in Dewey’s terms, an “anesthetic,” or numbing experience—one that “prevents them from reaching out, from launching their own inquiries” (Greene 1988, p. 125). This can happen either by offering all-too-familiar works of art from the conventional canon, thereby *shutting off* their curiosity; or stretching them too far beyond with the consequence of *shutting them down* out of fear of looking ignorant or unsophisticated.

Greene’s own words, taken from her 1994 LCI lecture, “...We Have Found the Wonders of Difference...” provide a fitting ending to this piece. They have served to guide many teachers and teacher educators as they created critical aesthetic encounters to foster wide-awakeness across and within diverse communities.

I hope you think about the wonder of multiple perspectives in your own experience. I hope you think about what happens to you...when it becomes possible to abandon one-dimensional viewing, to look from many vantage points and, in doing so, construct meanings scarcely suspected before. (Greene 2001, p. 187)

None of this signifies that you are required to like these works or that you are bound to discover openings within them. I am pointing to, suggesting to you the possibilities opened by imagination—possibilities that something may happen in your experience, that something may open to a new way of seeing or feeling or coping with the world. (Greene 2001, p. 188)

Opening ourselves, putting one-dimensionality aside and shallow conventions, we can nurture a desire for *communitas* by means of art experiences while preserving differences. We need to affirm ourselves and touch our own horizons as we work to fuse with others, as we offer more and more pathways out of the fixed and the ordinary, pathways toward what might be (Greene 2001, p. 190)

# Amy Gutmann and Liberal, Deliberative Democracy: Implications for Schools

Barbara J. Thayer-Bacon

## Introduction

Amy Gutmann (1949–) is a political philosopher who brings a critical, feminist, and multicultural read to John Dewey’s concept of democratic education. She presents her concept of democracy as *liberal democracy*, focusing on principles of nonrepression and nondiscrimination in *Democratic Education* (1987) and later as *deliberative democracy* in *Democracy and Disagreement* (1996), written with Dennis Thompson. She is a good example of someone working today who is clearly influenced by Dewey’s work and has amended and extended his work to meet what she sees are today’s needs. Gutmann underscores classical liberal assumptions lingering within Dewey’s (1935) *renascent liberal democratic theory*.

Instead of further developing Dewey’s (1916) transactional theory of selves-in-relation-to-others, something that Myles Horton’s (1990) work at Highlander Folk School and my (2008, 2013) work represents, Gutmann emphasizes values such as *freedom* and *choice*, that depend on an assumption of individualism; *deliberation*, that depends on an assumption of rationalism; and *universal rights*, while publicly recognizing particular cultures, which ends up reassuming universality and neutrality. What makes her work critical is her recognition of the need to address material needs in striving for equality. What makes it feminist is her recognition of gender’s influence on inequality, including its influence on material needs in a sexist society such as the USA, where women still do not earn equal pay for their work. What makes her work multicultural is her recognition of the need to develop a concept of democracy that is inclusive of diverse cultural values and needs.

Today key underlying assumptions of liberal democratic theory are questioned and further critiqued. Enlightenment rationalism and the idea of a unitary subject

are seriously criticized by postmodernists, social feminists, and critical theorists. Rationalism is criticized for focusing on Reason as the ultimate source for finding Truth at the expense of other important tools we use such as emotions, intuition, and imagination (Boler 1999; Greene 1995; Thayer-Bacon 2000). Rationalism is also criticized for its assumption of absolute Truth and lack of attention to power issues (Foucault 1980; Lyotard 1984; Rorty 1979; Thayer-Bacon 2003). Individualism is criticized for its assumption of autonomy, that we develop into selves on our own, naturally (Noddings 1984; Ruddick 1989), and for not addressing the impact of social forces and the context within which we develop (Grimshaw 1986; Smith 1987). Individualism is also criticized for assuming that our selves are unified and whole, rather than multifarious and fractured, certainly not understood by ourselves completely let alone by others different from us (Flax 1990; Irigaray 1974; Levinas 1987).

Gutmann is a good example of a political theorist who presents a current liberal democratic theory and seeks to connect her theory to educational issues, and act upon them. She was a professor at Princeton University (1976–2004) and is now the eighth president of the University of Pennsylvania (Penn), and their first female president (2004–present). She is credited with raising record-breaking levels of funds for Penn’s capital campaigns and using some of these endowments to create more endowed chair positions and attract talented, diverse faculty, as well as admit a strong, diverse student population who receive financial support enabling them to attend. It is vital to the possibilities of democracies that we examine the issue of elite, private schools and good quality, public education paid for by the state and available to all future citizens. This is an issue Gutmann examines as a political theorist and seeks to address directly in her practice as a faculty member and leader of two elite, private universities.

I begin by turning to Gutmann’s (1987) *Democratic Education* to see how she amends and extends Dewey’s concept of democracy in relation to education. I then explore her further development of deliberative democracy as a political theory in *Democracy and Deliberation* (1996). We will learn about her basic principles for democratic education, nonrepression and nondiscrimination, developed in her earlier work and the addition of a third principle, deliberation, in *Democracy and Disagreement*, as she continues to aim to find ways for basic democratic values of liberty, opportunity, and mutual respect to thrive and for acceptable terms for social cooperation to further develop in a world where people disagree in significant ways. We will find that Gutmann relies on a separation between moral ideals and political ideals to maintain the case for the value of deliberative democracy as a political ideal and that there are problems such a separation creates from a transactional perspective of democracy-always-in-the-making. We will consider if Gutmann’s theory will help us improve conditions for democracy someday, or not.

## Amy Gutmann and Deliberative Democracy

Gutmann (1987) centers *Democratic Education* around the question: “Who should share the authority to influence the way democratic citizens are educated?” (p. 3). Her answer is that educational authority in a democracy should be allocated to the state, parents, *and* professional educators (teachers); it should not rest with any one of these alone. It is striking to realize that in 1987 Gutmann was arguing for a democratic society to trust their teachers and treat them as equals, involving them in the development of educational policy and curriculum design. Almost 30 years later teachers are under attack by society at large for not doing their jobs competently and state governors and legislatures are disbanding teacher unions. Things have actually gotten worse for teachers in the USA since 1987. Teachers shoulder the blame for problems in the country’s public school system and have lost ground in terms of having an equally valued and respected voice in school decisions.

Gutmann (1987) wrote during a time in American education when educational policy makers were taking a conservative turn toward worrying about students’ declining achievement test scores, and seeking to go ‘back-to-basics,’ while educational scholars were taking a more liberal turn toward critical pedagogy, focusing on social justice issues. In *Democratic Education*, Gutmann brings out disagreements on issues such as censorship (book banning, teaching creationism, sex education), the need to support teacher unions and teacher professionalization, and the privatization of public schools through voucher plans, in order to show that political controversies are an important source of social progress in a democracy. Gutmann demonstrates that disagreements over educational problems are inevitable, and in a democratic theory of education, a virtue. “The primary aim of a democratic theory of education is not to offer solutions to all the problems plaguing our educational institutions, but to consider ways of resolving those problems that are compatible with a commitment to democratic values” (p. 11). Thus, we find that Gutmann separates moral ideals (the values we embrace that represent the good life) from political ideals so that she can create a space where people can disagree about their views of the good, while agreeing on the value of democracy.

Gutmann (1987) explains that her democratic theory is inspired by Dewey’s, but it diverges in at least one way. “Dewey correctly emphasized the need to enlarge the range of our outlook on education beyond ‘an individualistic standpoint, as something between teacher and pupil, or between teacher and parent.’ But what should that broader, presumptively democratic standpoint be?” (p. 13, inside quote from ‘The School and Society,’ p. 7). For Dewey (1900/1990) the answer to that question is his often quoted guideline: “What the best and wisest parent wants for his own child, that must the community want for all its children” (p. 7).

Gutmann (1987) is troubled by the *must* in Dewey's guideline. She argues that Dewey's *must* contradicts the whole notion of democracy, that enforcing any moral ideal of education without the consent of citizens subverts democracy. Again, Gutmann points to the need to separate conservative and liberal moral ideals of education from the political ideal of democracy. According to Gutmann: "A democratic society must not be constrained to legislate what the wisest parents want for their child, yet it must be constrained *not* to legislate policies that render democracy repressive or discriminatory" (p. 14, her emphasis). While we don't want to dictate people's moral ideals in a democracy, or assume that we all agree what makes a parent wise and good, we do want to do what is needed to assure that we can democratically deliberate on our various views of the good. Citizens and public officials can use the democratic process to destroy democracy, and Gutmann wants to make sure that cannot happen. How does she propose to protect us from destroying democracy while at the same time still allowing us to disagree on what makes a parent 'best and wisest'? By introducing two principles she wants to add to Dewey's basic concept of democracy, the principles of nonrepression and nondiscrimination. Gutmann thinks that these two principles will place limits on parental and state educational authority and cede some educational authority to professional educators. The principle of nonrepression assures "the freedom to deliberate rationally among differing ways of life" (p. 44) and the principle of nondiscrimination assures that "all educable children must be educated" (p. 45). Gutmann claims: "A society that empowers citizens to make educational policy, moderated by these two principled constraints, realizes the democratic ideal of education" (p. 14).

For the remainder of *Democratic Education*, Gutmann (1987) shifts to considering educational policy issues as a way to demonstrate how nonrepression and nondiscrimination can be applied to help us out of tough educational dilemmas. Gutmann's (1987) form of analysis is dialectical in the Aristotelian sense of the term, not as a process that can establish scientific knowledge but as "a process of criticism wherein lies the path to the principles of all inquiries."<sup>1</sup> She begins by evaluating commonly held theories concerning her topic of discussion, in order to develop a better theory that learns from their strengths and avoids their weaknesses. For example, in her chapter "[Introduction: Section 1 – Voices from the Present and the Past](#)" she contrasts Plato's concept of the family state to Locke's theory of the state of families, to Mill's focus on the state of individuals. She shows the strengths and weaknesses of each theory to help her make the case that educational authority must be shared by parents, citizens, and professional educators. Gutmann relies on a strong assumption of rationalism to make her case.

We can see Gutmann's (1987) assumption of rationalism even more clearly when she makes the case that because we allow for competing conceptions of the good life and the good society in a democracy, "a democratic state must aid children in developing the capacity to understand and to evaluate competing conceptions of the

---

<sup>1</sup>Gutmann cites in her footnote 7 on p. 21: Aristotle (1928).

good life and the good society” (p. 44). We must teach our children the value of critical deliberation and offer them the opportunity to practice and develop the rational tools they need to help them critically deliberate. This aim leads Gutmann to discuss teacher unions and to make the case for the need to support teacher professionalization (chapter “[Giorgio Agamben](#)”). She recommends that we need to allow teachers to exercise intellectual independence in their classrooms, for if they cannot do this how can they teach their students to be intellectually independent? We, as citizens, can create impartial review boards to address concerns of teachers having too much independence. She points to Dewey as an example of how to treat teachers for in Dewey’s Lab School teachers were treated as partners in school policy; they were treated like colleagues, much like faculty are treated at universities.

In *Democracy and Disagreement*, Gutmann and Thompson (1996) address the subject of moral disagreement and the challenge it presents for democracies by developing a conception of democracy they call deliberative democracy.<sup>2</sup> They argue that scarce resources, limited generosity, incompatible moral values, and incomplete understanding cause moral disagreements. Their central idea in this text is: “When citizens or their representatives disagree morally, they should continue to reason together to reach mutually acceptable decisions” (p. 1). Notice again the very central role reason plays in deliberative democracy. Gutmann and Thompson seek to systematically examine the substance of deliberation through the use of everyday case examples that have occurred such as: moral disagreements about affirmative action, national health care, and a woman’s right to end an unwanted pregnancy to demonstrate how their three theoretical principles of deliberative democracy can be used to help guide moral arguments. These three principles are reciprocity, publicity, and accountability. “Reciprocity asks us to appeal to reasons that are shared or could come to be shared by our fellow citizens” (p. 14). Publicity argues that the reasons citizens and officials give should be public, partly to make sure they are reciprocal, but also to underscore the important value of openness in government. The principle of accountability states: “In a deliberative forum, each is accountable to all” (p. 128). Notice that they repeat the same move Gutmann makes in *Democratic Education* of seeking to separate the political from the moral, and to treat democracy as a universal that is neutral, while partiality rests in the realm of morality.

Let’s move on to consider an important educational issue for democracies someday: whether future citizens should attend the same, quality public schools paid for by the state to assure all students have access to a quality education and are exposed to diverse perspectives, or have a choice of differing high quality private schools that more directly reflect their diverse family and community values and help them develop shared identities with others like them. Maybe we can find an alternative that takes us out of this either/or logic.

---

<sup>2</sup>Examples of others who describe their theory as deliberative democracy, influenced by Habermas (1984), include: Benhabib (1996) and Young (2000).

## Educational Implications

In *Democratic Education*, Gutmann (1987) considers the debate between private schools vs. public schools for democratic societies. Is a democratic society dependent on the offering of a state-paid good quality education for all of its future citizens or is it more important to offer its citizens choices in where they send their children to school? Americans, as good representatives of classical liberalist values, consistently opt for what they think offers them the most freedom and choices for their education, so it should come as no surprise that they have historically fought for the option of privately educating or home schooling their children, and only begrudgingly, in the latter half of the 1800s, agreed to the utilitarian argument made by intellectuals such as Horace Mann that it benefits all of us to have our citizens educated and healthy and able to work and contribute to our society (Spring 1993/2011).

The case was made for government sponsored public education for those who could not afford to pay to educate their own children, but in the USA the citizens have never agreed that the government should ensure that all children should receive the same, high quality education (Kozol 1991). Those are values expressed in countries with collective values such as Japan and China (and other countries with more social democratic values such as Norway, Sweden, Finland, Denmark, and Canada), where the vast majority (>97%) of students attend state-run schools and the children are exposed to the same, state-run curriculum (for consistency and quality control, to help ensure equality, cooperation, and a sharing of resources). Americans have only agreed that it is important to ‘minimally educate’ children in the USA, that we have an obligation to supply an ‘adequate education,’ to ensure children are not ‘absolutely deprived.’ The private school business still thrives today in America for those who have the means to pay for their children’s education, as the USA continues to refuse to guarantee its economically poor children anything more than a ‘minimally sufficient education’ (Kozol 1991, 2005).

At the time of Gutmann’s writing, the voucher system was being proposed by conservative politicians such as George W. Bush, then governor of Texas. Voucher proposals return with each presidential election in the USA. The general argument made by advocates is based on classical liberal values, making the case for parents to be able to *choose* what school their child attends, and insisting that the way to solve the inadequacies of a public school system is to make them accountable through a capitalist approach of market *competition*. The general idea is that if public schools have to compete with private schools for student enrollment, they will have to improve the quality of their schools. As public schools are currently designed, the argument goes, there is no market incentive to encourage their improvement. Most seem to agree that the public schools are failing. Critical theorists seek to improve conditions in American public schools and make them more equal, so there is not such a strong class divide between the haves and the have-nots, or racial divide between White students and students of color. Conservative politicians make the case that because our public schools are failing we need to try something else.

Vouchers are a form of credit, that give people a way to take the money they pay through their taxes for public school education, and use it to pay for a private school tuition instead, if that is what they choose to do. It is an idea that threatens to do away with public schooling and privatize all schools. Critical theorists argue that a voucher system does not offer a real choice for lower income families, unless the government supplies people with the means of transportation to get their children to other schools, insists that schools open their doors to all who apply, and the government caps all school tuition rates so that schools cannot raise their tuition rates above what the voucher amount is, for parents who cannot pay more than the value of their vouchers. These safety measures would result in essentially making all schools public. No classical liberal will agree to such terms, as they mean the government becomes significantly involved in the running of schools and removes the incentive the vouchers were meant to create, market competition. However, without making the playing field level, lower income families and parents who have children with special needs, for example, cannot avail themselves of the choices the voucher system supposedly offers.

The general feeling in America today is a loss of faith in our public schools, and a general exodus from public schools for families that can afford to send their children to private schools or home school them. We do not have only lower income children left in the public schools, which was the prediction if a voucher system was adopted in the USA without the caps and protections, but we have close to that in parts of our country. In Kozol's (2005) *The Shame of the Nation*, he describes current conditions in urban school districts across America where the public schools are full of mainly working class children. What we have in the USA is not an education system that can lead to democracies someday; it is a system that continues to lead to greater discrepancies between the haves and the have-nots, who are predominantly people of color in a nation with a long history of racism. The issue of public schools versus private schools through the debate over a voucher system stands today as a vivid example of my (2008) argument that classical liberalism and the assumptions upon which it is based will not, cannot support democratic theory. Classical liberalism undermines the possibilities of a democracy for its logic is based on a view of individual needs in competition with each other, where others are positioned as a hindrance, taking away from and getting in the way of individual needs.

Gutmann (1987) argues in *Democratic Education* in favor of a constrained voucher system for primary education, using her two principles of nonrepression and nondiscrimination to protect parents' options and choices and at the same time address limits on choices due to lack of material resources. Included in her discussion about voucher plans is an argument for the need to redistribute income more equitably so that parents' choices can be real. She argues that the principle of nondiscrimination permits private schools but at the same time she recognizes the need to learn a common set of democratic values including the value of diversity. Her solution is to offer both public and private schools within a well-developed welfare state that federally guarantees students will be able to reach their thresholds, while leaving it up to states and parents to decide how to get students over their thresholds.

Gutmann wants to preserve American's right to choose what type of school they send their children to, and also make it possible for all parents and students to have this choice. I agree with what Gutmann wants to preserve, but since America is not a well-developed welfare state that does what she asks, her solution will not work. However, I must commend her for her extraordinary efforts to expand access for students from low-income, middle-income, and first-generation to college families, to attend the private university of which she is president. To date, she has raised over \$600 million for undergraduate financial aid.

## Evaluation

Gutmann's (1987, 1996) effort to separate moral ideals from political ideals so that people can embrace the universal value of democracy as a political ideal while still disagreeing on what the good life should be is troubling from a pluralistic perspective. Gutmann suggests that democracy is at its best when it protects *both* universal rights *and* it publicly recognizes particular cultures. However, she fails to recognize how the protection of universal rights is based on standards and criteria that are not neutral. Rationality (deliberation) is not politically neutral. It is based on a Euro-western definition of rationality that can be traced back to ancient Greece and values reason over other tools that we use as well to help us make decisions, such as our intuition and emotions (Thayer-Bacon 2000). Gutmann's liberal democracy cannot help but influence judgments made concerning various descriptions of the good life.

From a Native American perspective, for example, the White Man's liberal democratic theory is anything but neutral. It has acted as a poison to Indigenous cultural values and visions of the good life, and sought to destroy their ways of life. There is much evidence to support the claim that pre-contact First Nations such as the Iroquois and the Pueblo Lagunas already had tribal government systems in place that were democratic in structure.<sup>3</sup> Yet, due to Euro-western racist assumptions, many of the explorers and early colonists in America were unable to recognize and appreciate Indigenous highly developed ways of shared governance and instead saw Native Americans as primitive savages. Due to Euro-western sexist beliefs that rejected the idea of women being educated equally to men and able to assume roles of leadership, most of the explorers and early colonists were unable to appreciate the equal roles women shared in Indigenous tribal governance, but instead saw Native American women as 'wild and willful.' The very men who rebelled against tyranny in Europe acted as tyrants against Native Americans and sought to remove them from this 'newly discovered' land. Native Americans have experienced over 500 years of threats of extinction due to political views that Gutmann presents as neutral. They certainly stand as a strong example of the inability to separate political ideals from moral ideals, and as evidence that an assumption of universal rights

---

<sup>3</sup> See for example: Allen (1986), Deloria and Lytle (1984), Johansen (1996), Pratt (2002).

does not necessarily allow for the recognition of particular cultural values and ways of life. The personal is political, as feminists teach us, and neutral universal rights are based on hegemonic positions of power, as critical theorists and postmodernists teach us. An historical analysis, like Dewey's, and a material analysis, like Marx's, reveal the power that becomes masked as neutral and natural by the winner while the losers' cultural values become described as uncivilized, threatening, backwards, and part of the past.

While Gutmann (1987, 1996) does underscore the value of diversity and recognizes the challenge of moral disagreements, her split between political ideals and moral ideals and her assumed neutral universal tone in regards to political democracy ends up masking issues of power that are allowed to remain hidden and undisclosed. Her split is what allows her to cling to liberal democratic assumptions of individuality, rationality, and universality, and to argue that the solution to moral disagreements is to teach the values of free and open inquiry, the spirit of democratic citizenship, and individual freedom. Gutmann labels the kind of criticism I am offering as reductive, reducing everything to an exercise of political power. For her, 'the deconstructivist view' that common standards mask the will to power is an argument that is self-undermining, logically and practically. However, in my work I (2008, 2013) present the case that a pluralistic and relational view of democracy-always-in-the-making will help us find our way out of this either/or logic, healing the split between moral and political ideals she proposes, while at the same time keeping front and center issues of power so that they don't remain hidden and go unchallenged.

## Conclusion

I discussed Amy Gutmann's political philosophy of education in this chapter as an example of someone influenced by Dewey's democratic ideas who took those ideas in a liberal democratic direction, which she later described as deliberative democracy. We found that Gutmann's liberal democracy relies on principles of nonrepression, nondiscrimination, and deliberation that depend on classical liberal assumptions of individualism, rationalism, and universalism. Most troubling was the split Gutmann wants to insert between moral ideals and political ideals, so that people can agree on the value of democracy while not having to agree on what the good life should be. I offered Native Americans and the genocide they experienced in 'democratic' America as a vivid example to show what social feminists, pragmatists, and postmodernists have already argued soundly, that political ideals such as *democracy* are anything but neutral, and to treat them as universal and neutral masks the very real power they wield.

Through a closer look at educational policy examples such as the debate between public and private schooling and the proposal to use vouchers to open up more choices for families with limited resources and encourage more competition

between schools, I brought out problems liberal democratic assumptions create. My goal was to show how a transactional view of democracies-always-in-the-making helps us heal the split between moral and political ideals, by relying on a both/and logical approach that never loses sight of power issues that exist within our diverse societies. When we look at our social institutions through a transactional lens we realize how connected and part of one whole our families, churches, economies, governments, and schools are. If we try to address one social institution such as our schools, while ignoring other social institutions such as our economies, or our families, we are doomed to not make effective change. Only through addressing the transactional relationship between them all will we have a chance of addressing problems within particular social institutions effectively. The complexity of the situation cannot lead us to do nothing and give up, we are called to act in the name of social justice, but not recognizing the complexity of the situation will doom us to continual failure. Democracy is a moral *and* political ideal we must continually strive for. The shape of it comes in many forms. It is a beautiful goal of equality worth aiming for, and it can serve as our criteria that give us ways to measure our progress and recognize the work that is yet to be done.

# Heidegger and the Recovery of Education

SunInn Yun

## Introduction

Why Heidegger? Let us begin by asking who Heidegger is. Martin Heidegger (1889–1976), who spent most of his life in his native south-west Germany, was a philosopher whose work is associated especially with phenomenology and existentialism. His philosophy is influenced by Husserl, Dilthey, Kierkegaard, and Nietzsche, and by the German Poet, Hölderlin. In his wrestling with Western metaphysics, he refers extensively to Plato, Parmenides, Heraclitus, Anaximander, and Aristotle. His later work, however, relates also to such Eastern philosophy as the Kyoto school and Taoism (May 1996). He is, without doubt, one of the most influential philosophers of the twentieth century. But what does his work have to do with education?

Heidegger's work bears on education in multiple ways. Even, it might be said, pervasive ways. His project is one that questions the way we live and learn, the way that the world comes to light. Hence, his thinking gives reason to think again about human subjectivity and about the nature of knowledge, matters that have a bearing on the substance of the curriculum itself. It is sometimes said that Heidegger has no ethics. This is true if 'ethics' is understood to involve a systematic approach to an aspect of human lives, with the establishment of principles for action, for example. Yet if one dispenses with these expectations, it can be seen that Heidegger's philosophy is pervaded by questions of value; it is profoundly at odds with the fact/value divide. In this sense, then, the development of our moral lives cannot be understood as separate from the fabric of our experience as a whole and the ways in which we comport ourselves to this. This has a bearing not only on teacher-student relationships –

perhaps the most obvious way in which a conventional ethics of education might be thought to have purchase – but on the relation to what is studied and, by extension, to the world as a whole. Heidegger's later writings make clear the absolute importance of language in this – to the ways in which the world comes to light and the ways in which students and teachers are engaged with it. In this light learners can come to see themselves as answerable to things, such that things come to be seen in their own right and not just through imposed grids of understanding. Technology is a powerful element in those restrictions of understanding. Heidegger's critique of this, which is by no means a rejection of technology, breaks new ground in revealing the ways in which technology comes to construct us. The implications of this in an age of performativity with its characteristic new technologies should be clear.

In what follows, I propose to draw out these and other implications by selecting three aspects of Heidegger's work, for each of which I shall provide an explanation followed by some remarks about its educational import. I shall consider these aspects under the following headings: *Dasein*, *Being-in-the world*, and *Finitude*. In doing so, I will mainly consider Heidegger's magnum opus *Being and Time* (1927).<sup>1</sup> Upon its publication, this book attained a reputation for its critical and revolutionary approach in philosophy. The questions in *Being and Time* maintain the central theme in the Heidegger's entire work, while his philosophy moved on in his later works.

## Dasein, Being-in-the World, and Finitude

First, Dasein. The word comes from the German verb form *Dasein*. It means 'to be there' or 'to be here'; *Da* (there or here) and *Sein* (being). The term is not a particular invention by Heidegger. In traditional German philosophy, Dasein has been broadly used with regard to the existence of any entity (Inwood 1997, p. 22). In the everyday usage of the term, it refers more narrowly to persons. Heidegger's usage of the term Dasein follows the latter, everyday usage. Further, Heidegger uses the term in order to avoid speaking of the 'human being' or 'man' on the grounds that such terms are burdened with accumulated meanings and associations that he wishes to escape, precisely because these prevent the phenomenology he is elaborating from coming into view.

What matters by choosing the term Dasein rather than human being? By this, Heidegger attempts to show that the way that human has been understood or

---

<sup>1</sup> Strictly speaking, *Being and Time* is not the complete book. The book was originally in two parts with three themes each. The first part is the interpretation of *Dasein* (human being) in terms of temporality and the second part is a phenomenological destruction of the history of ontology. *Being and Time* only covers the two themes of the first part. The third theme of the first part is believed to be covered in *Introduction to Metaphysics*. Although Heidegger's thinking moved on from *Being and Time* in his later work, his other work cannot be understood independently from *Being and Time*. Regardless of Heidegger's original intention, this does not change the fact that the book has been so influential in twentieth-century philosophy.

constructed in the modern period as particularly problematic. It is an attempt to disturb thinking by disrupting habitual vocabularies and this is in a way indicative of the book's other lexical innovations. Dasein, according to Heidegger, is the entity "which each of us is himself and which includes inquiring as one of the possibilities of its Being" (Heidegger 1962, p. 27). To put it bluntly, Dasein is a person for whom its being is always in question. In the course of analysis of Dasein, Heidegger attempts to understand the meaning of Being as such.

Likewise, Heidegger's philosophy is fundamentally concerned with the question of being – that is, what is it for something to, say, be red, or be large, or be welcome, but simply *to be*. This is a question which he claims Western thought has lost sight of. Its particular pertinence has to do with the way human life itself is understood. For the human being, the question of what life amounts to, what it is to be, is always there. According to Heidegger, this is the question that has been forgotten since Plato and Aristotle. The question may sound trivial. What it is for something to be is self-evident: it is a universal category that cannot be further defined. For instance, if I see a rose and I say "This is a rose", is it not the case that by being there the rose's being is already evident? What is the whole point of even asking the question whether the rose *is* what it is for the rose *to be*? This is quite different from asking, for example, what colour the rose is. But this is one of the ways in which Heidegger's philosophical project attacks Western metaphysics. In particular, he draws attention to the problems attached to the epistemological categories, to the subject and object division, and to the way we understand ourselves and the world.

Consider the following statement: *This is a rose*. How do we know that this entity is a rose? Scientists, or botanists, in this example, would identify it under the genus of the species. Along with the fact that the entity is there, we want to know what this entity is, the substance. For this, philosophers worked on the category and the class of entities. According to Aristotle, the most fundamental part of being is substance (Aristotle 2012b, *Metaphysics* 1028a). Aristotle introduces the Categories in 10 classifications: substance, quantity, quality, relation, place, time, situation, condition, action, and passion (Aristotle 2012a, *Organon*). Based on the classification we can identify or know what the entity is in such and such way. It seems clear and evident. With a degree of variations, this way of understanding of things has been accepted in Western philosophy.

Heidegger questions this: how can we understand being as a whole, not as the collection of entities, but in terms of the ambiguous term 'being'? For Aristotle, there are different types of being: 'That being', the fact that something is or exists and 'What being', what the thing is. Mathematicians can work for 'that being' in numbers, and scientists can identify the whatness of the thing. Heidegger however is more interested in *how* being exists – so-called, How being, the mode, manner, or type of an entity's being. Dasein understands its being not as 'that being' or 'what being' but 'how being', the mode through which an entity is related to me. In this analysis, Heidegger points out the lack of problematisation of the epistemological category in consequence of which the question of being is naturally neglected.

Consider this: *This is the rose*. In the ordinary English the sentence does not look quite natural on its own. It might need further context, something like, "This is the

rose that I once mentioned to you before.” Such usage naturally presupposes particular contexts. What Heidegger is attempting to emphasise is this: the question of being is not a task of epistemology in terms of categorical definition. Heidegger relates the inquirer’s mode of the thought to the question of being. Let us hear Heidegger directly:

If the question about Being is to be explicitly formulated and carried through in such a manner as to be completely transparent to itself, then any treatment of it in line with the elucidations we have given requires us to explain how being is to be looked at, how its meaning is to be understood and conceptually grasped; it requires us to prepare the way for choosing the right entity for our example, and to work out the genuine way of access to it. Looking at something, understanding and conceiving it, choosing, access to it – all these ways of behaving are constitutive for our inquiry, and therefore are modes of being for those particular entities which we, the inquirers, are ourselves. Thus to work out the question of Being adequately, we must make an entity – the inquirer – transparent in his own Being. The very asking of this question is an entity’s mode of Being; and as such it gets its essential character from what is inquired about – namely, Being. (Heidegger 1962, pp. 26-27)

Heidegger claims that Dasein should be the first entity for our inquiry. We, the inquirer, inquire ourselves. This is not to establish a thorough object knowledge of study questioning on being but to understand the mode of Being in the analysis of human being. “This is the rose” indicates how human being experiences the existence of the rose in a specific place within each particular context. The question of being involves Dasein and its experience of being.

Second, Being-in-the world. The rose is not simply out there waiting for being observed by the subject, the knower. This is linked to the matter of subject and object. The what of being or that of being establishes the division between the knower (as subject) and the entity (as object). Heidegger describes the object understood in this way as ‘present-at-hand’. The entity is simply present in front of the knower. But this is not the only way to understand the entity. Another way to look at the entity is to see its context. The things have relational meaning to Dasein. The famous example that Heidegger provides for this is the hammer in the work shop. For the craftsman, the hammer is not to be examined by weight, colour, or strength. These are the aspects of the present-at-hand. For the craftsman, the hammer is to fix a nail on to the wood in order to craft a table that is made for the dining room in his house. The craftsman does not know the weight of the hammer or its exact colour. But he knows precisely when or how to use it. Dasein’s relation to the entities in the purpose of use is what Heidegger describes as ready-to-hand. The workshop looks messy for strangers but is perfectly well organised for the craftsman who knows where all his tools are. For Dasein, the ready-to-hand does not refer to the value of the thing in terms of utility. By this, Heidegger shows that Dasein and the world are not strictly separated, but related. In fact it may be that the example of the craftsman is slightly misleading insofar as it may be taken to suggest that this relationship is peculiar to the experience of the craftsman. On the contrary: the ready-to-hand is a dimension of existence for Dasein generally. The point is that the thing is encountered in use and without direct contemplation. This is emphasised by Heidegger’s characterisation of Dasein as ‘being-in-the-world’, with hyphens in the expression.

He hereby seeks to reveal the nature of human being as always engaged in activity, as embodied, as involved with others in projects, with a past of activities they have come from, and in anticipation of those goals they are moving towards. This is very different from the picture of the human being put forth by Descartes as a mind separated from a body and abstracted from experience.

This shows how Heidegger applies phenomenology in his inquiries. Phenomenology is defined as the study of structures of experience, or consciousness. This is a study of 'phenomena' of things as they appear in our experience, or the ways in which we experience things (intentions), thus the meanings things have in our experience. Heidegger, influenced by Husserl, approaches the analysis of Dasein by phenomenology, setting aside the epistemological categories, the slogan of phenomenology becomes "To the things themselves". For Husserl, phenomenology is via transcendent ego, abstracting from all significance or the meanings that we experience from things, 'retaining' the aspects of the table that I have seen, and synthesizing them to form a conception of the table as it is. Unlike Husserl, Heidegger takes phenomenology in quite an etymological sense of phenomenon and logos, as he puts it "letting things show themselves." Phenomenology is to make entities apparent, which usually go unnoticed in everyday life. This is not by abstract arguments but by the phenomenological (the way we experience things) descriptions of the everydayness of Dasein. Recall, this is the main question of being in Dasein. Dasein is the being who experiences being from its own existence. Heidegger's analysis of Dasein is therefore built along its ontological structure. By this, he does not use abstract arguments, but interprets Dasein's existence. It is what he calls the existential interpretation of Dasein.

Last, Finitude. For Heidegger, the existence of Dasein is shown in its temporal structure. This is quite a radical shift in the understanding of human being in Western metaphysics. Dasein is not a substance with essence to be discovered, but whose being is always experienced. Such experience is not captured intellectually, but appears to us first through different moods. And Dasein first experiences its modes of being as possibility. He finds that Dasein is not a definite actual being, but a possibility of various ways of being. His approach converts the common understanding of being between the actual and the potential. Aristotle puts actuality prior to potentiality, for the actual entity can be identified as to be the case or to be true. The entities based on the substance can be classified or identified by its genus. In contrast to Aristotle, Heidegger puts possibility prior to its actuality. Since Plato, being has been understood as something unchanging, eternally present, form, or ideas. Being is regarded as atemporal.

In Heidegger's analysis of time, it is always Dasein's time in its temporal structure, timeliness of human being. Heidegger takes issue with the commonly accepted understanding of time. Time is not the series of nows which are divided into past, present, and future. Dasein is only understood in terms of being thrown to the world, being ahead of its own being, and being already where it is. One dimension of this is that Heidegger places much emphasis on the fact of our mortality and on the way that our awareness of it, our 'being-towards-death', affects our lives in a pervasive and a priori way. This is something that is scarcely a focus of concern in schools,

and yet, given that human beings are mortal, it is always present. For Heidegger, Dasein exists as dying: “As soon as man comes to life, he is at once old enough to die” (Heidegger 1962, p. 289). In contrast to the atemporality of being in Western metaphysics, Heidegger describes the way Dasein experiences being through the mode of anxiety: through awareness of the fact of my mortality. This is temporal presence – becoming, arising, fading, dying. A further factor of the temporal structuring as Dasein lies in the fact that Dasein did not choose to be born. By existing, Dasein creates or is created in its own ways to be. Existence is standing forth. The existence of Dasein is nothing but standing forth: as *ex*-istence, Dasein stands outside itself. This questioning of being in the analysis of Dasein brings us to the question not of who I am but of how I become who I am.

Through Heidegger’s work in the tradition of phenomenology and hermeneutics it is possible to see education in a different way. Phenomenology is concerned with the way that the world comes to light *from the point of view of the human being*, as embodied and acting in the world. Hermeneutics concerns the way that the world comes to light in terms of interpretation: things are understood as thematised in some way and as available to new connotation and associations. We always see something *as* something and it is this respect that his phenomenology is hermeneutical. Understanding is fundamentally different from the cognition. Understanding is prior to cognition, presupposes a prior understanding of what we want to know. Meaning of being presupposes a prior understanding of being. Dasein is not constituted in a blank tablet of mind. In its existence, Dasein understands the world. Understanding, constitutes being in the world. Dasein interpret things not as a whole, but in a specific use and context: understanding something *as* something. This is how *Being and Time* is structured. It begins with preliminary analysis (understanding) of Dasein, and then interprets it as temporality and historicity.

## Time of Education in Hermeneutic Phenomenology

We have now tasted a bit of Heidegger in the way he wrestles with the Western metaphysics. But how is this relevant to education? It disrupts or reveals the problems in the basic metaphysical assumptions (consciously or unconsciously) rooted in educational theories and practices. It will help us see a different way to question educational issues. In particular, this chapter draws attention to the way modern discourse refers to time in education.

Time in education, in the neo-liberal framework, has come to be construed as a resource. In the context of a free market, with privatisation and deregulation, time is ‘used’ more or less ‘efficiently’. Indeed, the virtue of education has become efficiency, in an inflated vocabulary of excellence and performativity. Such time, the time of education, is manipulated in instalments, in grids of measurement, calculation, and exchange, and where the saving of time is the measure of success. Educational time has become something countable, plannable, and measurable. A certain number of teaching inputs is equivalent to the outcome of the lesson week

by week syllabi, course descriptions. Lesson plans are the prevailing idea of good teaching these days and have a typical association with the ideas of efficiency, goals, and outcomes. Time has become a criterion of efficiency; we should neatly invest our time and energy in education. Otherwise, time is wasted.

If only the values of education could be restored! If that were the case one might claim instead that ‘true’ education should equip children with autonomy and freedom. In so doing, there are roughly two different thoughts in educational practices: liberal education and progressive education. Liberal education aligns itself with the classic values of education: freedom, tradition, and cultural upbringing. Progressive education however has come to light roughly in the twentieth century, led by educators who questioned the practices and traditional values of liberal education.

In terms of practice, liberal education claims that children should be educated in a fairly disciplined way in order to be equipped with full autonomy at the end of education. Progressive education, however, emphasises the importance of the experience of freedom in childhood. Liberal education and progressive education may differ on what point the education should give what amount of freedom to the children, they both assume a chronological time frame of the educational project. This is the discourse of *not yet*, that something is not yet achieved, one to be achieved at the end of education. This lies on the chronological understanding of time in education.

The implication of such a bright day to come varies from economic success to other ideals of education such as freedom or autonomy. One may read, for example, the biblical promise of God that one who listens to the truth shall be free. Some individuals deliver the stories of how they came to be successful, perhaps they were diligent. Some stories typically rely on educational impact in a particular time frame. There is a before and after of education. It is something of a myth in education: If you do well in education, you will be better off in the future.

In Western metaphysics, time has been understood as “the measure of motion, the number of motion in respect to ‘before’ and ‘after’” (Aristotle 2008, *Physics*, 219b1–2). In the time of ‘before’ and ‘after’ one understands events in a chronological order. Time appears as follows: ideals (economic values or personal or abstract values) are to be achieved or exchanged sometime in the future, at the end of education. Educational practices are understood and valued in the order of chronological measurement of time.

The time has been characterised by datability as *chronos*. Heidegger criticises this common-sense conception of time. While such a concept of time is important to our lives (for example, the deadline of this paper is the 1st June), this relation exists only in relation to our experiencing what we are doing with different degrees of focus and intensity at different times. Today is 30th of May. This statement does not address anything to me – not, that is, until there is a context, as for example where I realise anxiously that the paper is still some distance from being finished. The 30th of May is then not a simple day: it becomes a day when there is something that burdens me, when something is at stake for me, perhaps with the trace of a thought also that some final judgement day is coming. After all I shall never face quite these circumstances again, and today I must act. Time involves the meaning,

the mode of being. In the previous section we briefly discussed being-in-the-world. The basic mode of being-in-the-world is understanding. This is not a cognitive process, but human being in relation to the things in practical situations. To understand the event, we need the chronological description of things, but as Heidegger emphasises, that it is only one mode of understanding. Human understanding is not constrained by the chronological and cuts across its sequential character in seeking to make sense of something. Heidegger emphasises Dasein's understanding in terms of possibility (Yun 2014).

In Western philosophy, possibility has been regarded as something not yet actualised. The possible, is a set that is complementary to the actual. It is also possible that some events that are not yet actualised may be actualised in the future. In a logical sense, the possible is only found in thinking such as “crossing the Rubicon to conquer Rome” or “picking the apple from the tree of paradise” (as Leibniz considers). The actual is here and now thereby can be proven while the possible lies in the future or is non-temporal, where nothing can be proven or guaranteed. For Heidegger, the possible is concerned with an existential possibility, or ability-to-be (Seinkönnen). Possibilities are ways of being as the ability to be. And this is not a dimension of my *existence*. Possibility, for Heidegger, indicates the mode of the world in which I am. The futural here, within the structure of freedom in finitude, is a dimension of the historicity of being-in-the-world.

Only an entity which, in its Being, is essentially futural so that it is free for its death and can let itself be thrown back upon its factual ‘there’ by shattering itself against death – that is to say, only an entity which, as futural, is equiprimordially in the process of having-been, can, by handing down to itself the possibility it has inherited, take over its own thrownness and be in the moment of vision for ‘its time’. Only authentic temporality which is at the same time finite, makes possible something like fate – that is to say, authentic historicity. (Heidegger 1962, p. 437)

The possibility of Dasein includes the possibility of death. Heidegger describes the fact of finite human being as being-towards-death. This does not mean that we are heading to die in the chronological time. Being-towards-death invites us to think about the world differently. This awareness of our mortality always somehow flickers beneath our everyday absorption in things, conditioning those practices, however much this may be concealed. For this Heidegger exploits different modes of temporality as ‘ecstasies’ between the past, the present, and the future. The sense of here and now is not from the series of now but from an ecstatic mode of temporality.

This understanding of time invites doubts about the time of education in the chronological sense of before and after. Education is placed in the linear progressive conception of time. And in this temporality, Heidegger warns us the possible forgetfulness of one's own being. We understand ourselves as possibility by existence. Education here is not devised to be realised at the end of this action. The action affects here and now of the ecstasies of temporality in our existence.

Elsewhere I discussed the time of education as follows: the aim of education cannot be reduced only for an unattainable future (Yun 2014). Educational actions are the secured gesture within which we initiate things without making any claim to, or

any necessary expectation of, becoming this or otherwise that. This possibility of being, this existence of being has been neglected in the neo-liberal take on education. Underneath it, the chronological understanding of time in education buttresses the myth of education for success. This should disturb the way we learn, the substance of the curriculum and the nature of knowledge.

## **New Possibility of Subjectivity in Education**

We have now come to the point that of identifying one of the metaphysical assumptions in educational discourse as a temporal issue. In this discourse, not only economic success but also ideals are expected to be achieved at the end of education in a chronological time set. This kind of belief can disappoint us when it is not actualised for obvious reasons. What is even more problematic is, as discussed earlier, that we fall into this way of thinking and forget the fact that we exist in our existential experience. What does this tell us in education? Is this reading of Heidegger merely negative criticism? What can Heidegger offer as positive or alternative possibilities? I would like to push the argument forward with a new possibility of subjectivity. Let us begin with Heidegger's criticism of modern technology.

Heidegger is typically accused of anti-modernism. He does not claim however that we should abandon modern technology. He warns, however, that there is a way of thinking bolstered into modern technology. The dichotomy in object/subject has been reflected in our understanding of the world. The world has become the resources of present-at-hand for human being. The object is itemised and categorised to be known and be used by the subject. This way of thinking is affected in the modern technology. That the world becomes the resources to be atomised, stored, distributed at human being's will. At the end, the human being has become one of the resources at its use. This is, what Heidegger calls, the destructive or nihilistic nature of modern technology.

According to Heidegger, the essence of technology is Enframing. Heidegger claims that we should have a better relationship with this. For this we need a new way of thinking forward, or to rethink what is commonly accepted in our thinking. This is to rethink thought on technology, not only to critique but to find a better way of living with technology. If one understands the ready-to-hand of things, this can be different. Ready-to-hand does not mean that the things are instrumentally used by human being. It is more to address the relationship with the things. We relate ourselves with the world or the things in a richer relationship. According to Heidegger, the world is not to be possessed by Dasein. We only participate in the events of the world. The relationship between the human being and the world is rather reciprocal because human being is affected by the world and affects the world. Heidegger elaborates further on this:

We let technical devices enter our daily life, and at the same time leave them outside, that is, let them alone, as things which are nothing absolute but remain dependent upon something higher. I would call this comportment toward technology which expresses 'yes' and at the same time 'no,' by an old word, *releasement toward things*...

There is then in all technical processes a meaning, not invented or made by us, which lays claim to what man does and leaves undone. We do not know the significance of the uncanny increasing dominance of atomic technology. *The meaning pervading technology hides itself*. But if we explicitly and continuously heed the fact that such hidden meaning touches us everywhere in the world of technology, we stand at once within the realm of that which hides itself from us, and hides itself just in approaching us. That which shows itself and at the same time withdraws is the essential trait of what we call the mystery. I call the comportment which enables us to keep open to the meaning hidden in technology, *openness to the mystery*. (Heidegger 1966, p. 55)

For Heidegger, the authentic relationship with technology is expressed in a releasement towards things (*Gelassenheit*), towards which we say yes and no. Because it is not entirely human will that occasions this, there is mystery in this releasement; it is not purely or primarily a matter of human mastery. In line with this, Heidegger speaks of a non-willing, beyond the division of subject and object. It is a matter of something "outside any kind of will", of a willingness to renounce willing (Heidegger 1966, pp. 59–60). Lewis points out "beyond the metaphysics of willing to a mode of being that is more willing to be responsive, sensitive, and thankful for what is offered up by the world" (Lewis 2013, p. 29). On Heidegger's account of this, the force of the idea of releasement is such as to enable us to understand freedom in terms of the mystery of letting be.

What *Gelassenheit* might amount to in relation to education can be seen by considering the way that the idea of freedom has figured in defences of different conceptions of education. In the idea of a liberal education freedom is understood as involving the initiation into worthwhile pursuits and into those habits of thought that develop rational autonomy. In child-centred education, it is understood as involving the growth of the child from within, where freedom is from the start a condition for the best growth and development of the child. In contemporary practice education is understood as providing the skills and abilities to enable freedom of choice in free market conditions. All of these, however, presuppose that freedom is something that human beings have, as a property. But, according to Heidegger, this loses sight of a deeper sense in which freedom is the pre-condition not only of human beings but of things as they appear in the world. Children by their existence are free. In poetic thinking, as Michael Bonnet argues, children experience and express their own being. This is beyond the measurement of the values inherent to achievement or possession. Heidegger here claims the opposite in *Gelassenheit*, which can be loosely translated as 'letting-be'. This orientation, which is so strongly present in Heidegger's later writings, can be understood in terms of the contrast between a thinking that is calculative and seeks to control, on the one hand, and one that is meditative and receptive on the other. If there is a new subjectivity to be considered in education, one should start from a different orientation. The subjectivity is not the possessor of freedom. This is the subject that is receptively responsible for their own being in the world.

In this sense, then, the development of morality lies in the fabric of our experience as a whole and the ways in which we comport ourselves to this. Such a sense of morality varies by situations beyond the possible categorisation or a set of values. The value of action requires my spontaneous receptive responsibility to the event. In this regard, the following might be said: it is true that Heidegger has no ‘ethics’ if this is taken to refer to a systematic approach to ethics. Yet in another sense it should be clear that ethics pervades Heidegger’s thought. Education in the Heideggerian sense calls for ever for more importance in the teacher’s judgement in the classroom. The teacher’s attentiveness to the situation and timely and thoughtful judgement affects the possible event of learning at any moment that is beyond our calculable time measurement. This has a bearing on the teacher-student relationship, but also on the relation to what is studied and, by extension, to the world as a whole. Educational events, therefore, should have bearing on the existential events. This is existential insofar as the teacher and learner are understood as the existential being of possibility with authentic relationship to things in the world. Heidegger’s notion of language reminds us of this – the ways in which the world comes to light to us and the ways in which students and teachers are engaged with it. The educational experience must involve to see ourselves as answerable to things, such that things come to be seen in their own right. Education as an existential event emphasises here not the recovery of the educational values but of educational experience of the world, the studies, and the relationship.

## Conclusion

This chapter started by emphasising the broad range of Heidegger’s significance for education. In more detail, it showed the philosopher’s wrestling with Western metaphysics and his attempts to deconstruct it via hermeneutic phenomenology. I attempted to show that the assumptions in educational discourses share the assumptions of traditional Western metaphysics, temporality in particular. This has served the neo-liberal framework as well as a set of classic values in education. The values can serve as the currency of education. In order to achieve autonomy, students must be restrained. The logic here is in the same framework of thinking of temporality. Education is serving for the sake of something. I exchange my time of education with the values like earning higher salary. Such values can easily be translated to the economic value of autonomous choice. As Paul Standish argues:

For all their undoubted importance, however, the ideals of autonomy and authenticity are subject to a degeneration with broad cultural and educational manifestations. Autonomy becomes allied to consumerist conceptions of free choice while authenticity is subject to a sentimentalized idealization of the self and a theatricalization of the real: media images enframe us with hyperbolic images of ‘the real thing.’ The kind of mastery celebrated in autonomy correlates with an expectation of explicitness and transparency (and with self-management and presentation). (Standish 2000, p. 159)

Rather than attempt to rehabilitate such values of education, we should attempt to retrieve education itself. This involves overcoming the metaphysical assumptions embedded in current educational discourse, as were illustrated above in connection with the chronological time and the values it exacts. In response to the question of what it is that constitutes education as such, let me say that educational practice should be able to address possibilities of human being in a richer sense. In this respect, Heidegger's influence in educational thinking lies in various areas of practices and studies. In his hermeneutic phenomenology, we have revisited our understanding of temporality in terms of our own existence. Second, we have revisited the subject-object dichotomy by which the way we understand the world has been deeply rooted. Heidegger has influenced educational thinking in various areas. His work has been taken up in education – to children's thinking, environmental education, and technology. Heidegger's philosophy leads us to see the world not as resources to be achieved or possessed but us to respect and communicate at an existential level. Educational practices in children's thinking are not a technical focus on rational thinking. It respects the poetic aspects of thinking. It also allows us to think of technology more carefully, with the new possibility of subjectivity.

There are some commentators, who have insightfully discussed Heidegger ideas in philosophy of education. In light of the problem of freedom in education, for example, the work of Michael Bonnett (1994, 2004) and Paul Standish (1992, 1997, 2000) attempt to sketch Heideggerian approaches, while later publications by Ilan Gur-Ze'ev (2002), Thomson (2005), Duarte (2012) and Gibbs (2012) extend interesting lines of thought. Gur-Ze'ev, for instance, describes the possibility of a counter education which is in opposition to the nominalising doxa of education, follows the path of Heidegger's philosophy.

Some limitations to his work should also not be neglected. Heidegger's account of Dasein, in particular, and his treatment of human subjectivity as a whole, has little serious consideration of childhood. This is puzzling. For without this notion one still wonders how we come into these practices that constitute Dasein. It is even more problematic especially when Heidegger has to say profound things about teaching and learning. For Heidegger, however, perhaps childhood is naturally included in temporality of Dasein, and not particularly necessary to set a certain period of time as childhood. He does not put any particular concerns in the nature of childhood. Another limitation is with his ontological conception of human relationships. Heidegger has compelling thoughts on being with others. This is something to do with the relationship to others as a being-alongside. But this does not address the deeper sense of alterity, as Immanuel Levinas emphasises, that one is addressed by the other, always already addressed. Being-alongside neglects the very beginning of the subject, the one who is being addressed by the other. For Levinas, Heidegger's concept of being-with (*Mitsein*), a relation of 'marching together', implies a militant imagery in Heidegger's thought.<sup>2</sup>

---

<sup>2</sup>The expression from Levinas reminds the readers of Heidegger's unapologetic misjudgement in 1933. And the fact should never be neglected or excused in reading Heidegger. Although Heidegger has the radical and highly influential nature of his thought in twentieth century, one should never

Bearing this point in mind, this chapter tries to read or write questions attached to the current educational issues in a different way via Heidegger. At a fundamental level, the way of thinking, one may call the metaphysics of education should be carefully deconstructed. Such thinking gives us a positive approach on education with a new subjectivity, *Gelassenheit* of Dasein. Heidegger pushes us to question what we have lost in thinking education and its practice, and what should be pursued as initiatives in thinking. This is not a nostalgia for the past, however. It is an attempt to problematize instrumental ways of thinking in education and to recover it in thinking education within itself. The recovery of education is a gesture to move on to those educational questions that invite us to think beyond.

neglect the disastrous fact of his political involvements. No matter how long or short, his affiliation with Nazism, as Rector of the University of Freiburg, was an irreversible taint upon his career. It may still be controversial how much his philosophy influenced his political judgement, but there is no doubt about his involvement in Nazism. This is the disruptive historical nature for us to approach Heidegger. Thereby, reading Heidegger always has a double edge. One cannot simply ignore his political misjudgement when reading the philosopher's great thinking. There is a painful reminder one should always bear in mind. Richard Rorty (1998) expresses this point that Heidegger will be read "for centuries to come, but the smell of smoke from the crematories – 'the grave in the air' – will linger on these pages."

# Unifying Ourselves As Efficacious, Autonomous and Creative Beings – Kant on Moral Education As a Process Without Fixed Ends

Klas Roth

## Introduction

Immanuel Kant was born in 1724 and died in 1804 in Königsberg (now Kaliningrad, Russia; it was earlier a part of East Prussia). He was the fourth of nine children. Kant's parents were followers of Pietism, a branch of the Lutheran Church. A friend of the family – a pastor – made it possible for Kant to enter a Pietist school. Kant later enrolled at the University in Königsberg as a student of theology. He also studied mathematics and physics. However, Kant did not complete his degree at the University partly due to the death of his father. He continued instead as a private tutor in three families for about 6 years before, with the help of a friend, he took his degree and took up a position as a Privatdozent (lecturer) at the University of Königsberg at the age of 31. Kant lectured on topics such as anthropology, geography, mathematics, metaphysics, the natural sciences and pedagogy. It was not until later, at the age of 57, that he published his famous work *Critique of Pure Reason* (1998a), which he rewrote and published in a new version 6 years later. Kant published two more critiques – *Critique of Practical Reason* (1997) and *Critique of the Power of Judgment* (2000). He also published a number of works on other subjects such as religion, history and anthropology. He wrote little, however, on education. He only published the *Essays Concerning the Philanthropinum* and the “Doctrine of the Methods of Ethics” in his *Metaphysics of Morals* (1996a, 6: 477–484). The other published work on education – *Lectures on Pedagogy* (2007) – was put together and edited by his former student Friedrich Theodor Rink.

The philosophy of Immanuel Kant still has enormous influence in philosophy and other fields. Little, however, has been written on his work on education, but this literature is growing. Paul Guyer (2014b), Barbara Herman (2007), James Scott

Johnston (2013), Robert Louden (2011), Kate A. Moran (2012), G. Felicitas Munzel (2012), Klas Roth and Chris W. Surprenant (2012) and Chris W. Surprenant (2014), amongst others, have published works on Kant on education. These authors have shown in various ways that it is important to consider Kant's philosophy of education in the light of his other work, *inter alia* on practical reason, anthropology and aesthetics, and not merely the published work on education.

This chapter outlines three themes, which Kant develops throughout his work. He argues that as human beings we can be characterised by our capacities to make ourselves efficacious, autonomous and creative, and that these capacities ought to be cultivated in education when we want to moralize ourselves, that is, cultivate our moral dignity in practice. These characteristics do not therefore merely indicate what can be made of us, but what we can make of ourselves in education and elsewhere. The moralization of us is not, however, something that can be pursued by an individual or specific groups of people in isolation, nor is it something that can be pursued only once; it is an open-ended and never-ending process<sup>1</sup> that can be taken up and pursued in the world by the human species.

It seems, however, that recent interpretations and reconstructions of Kant's work do not consider the above-mentioned characteristics together in the process of moralization. It seems instead that they emphasise either his practical philosophy in terms of efficacy and autonomy<sup>2</sup> or his views on creativity, in particular his thoughts on genius<sup>3</sup>. It seems too, that we, according to Kant, wilfully deviate from unifying us in the terms mentioned above due to our innate propensity to evil (see part two). It does not, however, suggest that we should not strive to unify ourselves in the terms suggested. On the contrary, the efforts to cultivate ourselves in the above-mentioned terms should remain. It seems, however, that education in present times does not necessarily make it possible for children and young people to render themselves efficacious, autonomous and creative (see Part 3). Education can, then, be criticised for not making it possible for them to cultivate themselves in the sense mentioned, and for not being an open-ended and never-ending process in moral terms.

## Rendering Ourselves Efficacious, Autonomous and Creative

How, then, can we cultivate our moral dignity in practice? We do this not merely by rendering ourselves efficacious, but in particular autonomous. We render ourselves efficacious by being initiated into already known ways of understanding concerning ourselves, others and the world, and by being trained, that is, disciplined and civilized to behave in the same or similar ways as others do in similar situations; we can

<sup>1</sup> See Guyer 2014b, for a discussion on this.

<sup>2</sup> See, for example, Korsgaard 2008 and 2009.

<sup>3</sup> See, for example, Allison 2001, Chapter 12, Bruno 2010, Chapter 4, Crowther 2010, pp. 147–152, Guyer 1997, pp. 355–361, and 2014a, Chapter 9, for discussions on Kant's notion of creativity, in particular genius.

also do so by cultivating our capacities so that we are capable of pursuing the ends set.

We render ourselves autonomous by conferring value on our capacity to set and pursue our own freely chosen ends and determining ourselves to be the cause of such ends (see Kant 1998b, 4: 429, and 4: 440). We cannot therefore just use each other as mere means for some further end, nor just understand who we are in relation to narratives, practices and traditions; we can also transform and transcend how we take things as they stand, and think anew. Rendering ourselves autonomous means, then, that we should not merely determine ourselves to be the cause of some particular end, accepted and legitimised within a specific community and/or nation-state; we can and should also determine ourselves to be the cause of morally permissible ends or in Kant's words – the highest good in the world.<sup>4</sup>

When pursuing the highest good in the world, we do not hinder or prevent each other from setting and pursuing particular ends, nor each other's rights to determine ourselves to be the cause of the ends we have chosen. We engage in making it possible for not just a few but in principle all concerned to pursue their own freely chosen ends if, and only if, those ends and the pursuit of them do not violate the capacity of any other persons to set and pursue their own freely chosen ends. If, however, a group of people, within, for example, a nation-state, only have their own specific and subjective ends as the determining grounds, not merely of their own will but also of the will of others, then they do not necessarily make it possible for others to set and pursue their own freely chosen ends and engage in the moral pursuit of finding out which ends are morally permissible.

A human being who forces any other person to submit to his own ends does not respect the dignity either of the other or of himself as a human being endowed with freedom to make his own laws and obey "no law other than that which" (Kant 1998b, 4: 434) he gives himself; such a being does *not* render himself autonomous. On the contrary, he renders himself heteronomous, namely dependent on the will of others or a slave of his passions (or both), and hence does not "allow [someone else] to set [his] own ends ... [or] work toward the systematic satisfaction of the ends that they set, that is, toward the satisfaction of a system of particular ends that is consistent with the free choice of each agent as an end in itself" (Guyer 2014a, p. 409). Thus, a heteronomous being limits his choices to the pursuit of specific external and agreeable ends and renders himself efficacious with regard to such ends. He does not exercise his freedom to transcend and transform his beliefs, or the values or norms he holds, or the ones held by any other. Such a being does not "strive for the attainment of this perfection in himself, and to do what he can to promote it in others as well" (Wood 1970, p. 226); he merely take things as they stand and strives to maintain them as they are.

We as human beings who, on the other hand, want to perfect ourselves morally, that is, cultivate our moral dignity, have to confer value on the rational capacity of ourselves, in particular the moral law, specifically the principle of autonomy, the

---

<sup>4</sup>See Kant 1997, in particular Chapters II–IX, and Kant 2000, § 84, 86, 87 and 91 for discussions on the notion of the highest good.

supreme principle of morality, namely “the property of the will by which it is a law to itself” (Kant 1998b, 4: 440) and not merely a particular incentive, that is, a “motivationally loaded representation of an object” (Korsgaard 2004, p. 83); we also have to engage in the free play between imagination and understanding.<sup>5</sup> When we do this, we exercise our freedom to free ourselves from the domination of the other and from being the slave of our passions; we then determine ourselves to be the cause of our own actions and cultivate the power of our judgement continuously, in practice.

By cultivating the power of judgment, we do not merely exercise the determining power of judgment to classify objects, compare and/or evaluate them, or compare and/or evaluate the classifications in agreement with others; nor are we just encouraged to do so; nor do we just think for ourselves, from the standpoint of the other and continuously.<sup>6</sup> We also exercise the reflective power to transcend and transform how things stand and search for new ways of thinking about the other, the world and ourselves. When exercising this power, we do not address or hold on to any particular interest in the object given, maintain a specific use of a particular concept or subsume a particular under an already given concept, even though we may be influenced more or less strongly to do so. We contemplate objects “without regard to any purposes that can be fulfilled or interests that can be served by their existence” (Guyer 2000a, p. xxviii) and seek “to discover a concept for a particular object that is given to it” (Guyer 2014a, p. 356). When exercising the reflective power of judgment, we do not just allow ourselves to be determined by how others use specific concepts or utterances in practice in every single case. We somehow give “the mind room for play in some aspect that goes beyond the mere application of determinate

---

<sup>5</sup> See also Guyer, (2006) for a discussion on three different interpretations of the free play between imagination and understanding, namely the precognitive, the multicognitive and the metacognitive approach, which Guyer defends. The precognitive approach suggests that ‘free play’ means playing around with images which would not be constrained by any determinate concepts, and the multicognitive approach suggests that ‘free play’ means playing around with concepts which would not be determined or constrained by any determinate concepts, which Guyer argues are dubious (see 2006, p. 178). He argues instead that “the only way we can understand Kant’s account of the free play of the cognitive powers consistently with our own and his assumptions about the determinacy of the objects of aesthetic judgment, as well as with his assumption about the judgmental and therefore object-referring structure of consciousness itself, is by replacing the precognitive and multicognitive approaches with what I will now call a ‘metacognitive’ approach. [And Guyer continues:] On such an approach, the free and harmonious play of imagination and understanding should be understood as a state of mind in which the manifold of intuition induced by the perception of an object and presented by the imagination to the understanding is recognized to satisfy the rules for the organization of that manifold dictated by the determinate concept or concepts on which our recognition and identification of the object of this experience depends. It is also a state of mind in which it is felt that – or as if – the understanding’s underlying objective or interest in unity is being satisfied in a way that *goes beyond* anything required for or dictated by satisfaction of the determinate concept or concepts on which mere identification of the object depends.” (Guyer 2006, pp. 182–183)

<sup>6</sup> See Kant 2000, 5: 295 and 2006, §43 for discussions on three maxims of human understanding; see also Deligiorgi 2002, Merritt 2009, Roth 2011 and 2015, for discussions on this and similar issues.

concepts to them” (ibid., 2014a, p. 367) and transforms how others or we take things as they stand, which can be hard work.<sup>7</sup>

The reflective power of our judgment is, for Kant, particularly noteworthy in relation to objects we find beautiful, but not only such objects. Paul Guyer says: “the real basis for Kant’s interest in aesthetic phenomena is precisely his view that the freedom of the imagination that we *experience* in our encounter with beautiful objects can give us a feeling of the reality of the freedom of the will that we can only *postulate* within purely moral reasoning, and the natural *existence* of beauty can give us a feeling that nature is hospitable to the achievement of our moral goals as well” (ibid., 2014a, p. 360).

It seems, then, that we can have an experience of the power of “the freedom of the will” not merely when we go against and transform already known ways of understanding objects and events in the world and think anew, but also in aesthetic experience. We can, during such an experience, come to realize that it is not without difficulty to surpass more or less determinate ways of understanding or going about in the world; we can also come to realize that it is detrimental in certain situations to go against what are considered to be accepted and supposedly legitimised ways of thinking and acting by others.

Hence, the freedom of the will and the experience of the power of it require that we exercise our freedom to confer value on ourselves as beings capable of conferring value not merely on particular external ends but also on others and ourselves as beings capable of conferring value on our capacity to set and pursue new ends (see Korsgaard 1996 for a discussion on this). It also requires, as seen, that we engage in a disinterested contemplation of the object, “not by a practical concern for utility or advantage in the possession of the object, but by the free and harmonious play of the cognitive faculties of imagination and understanding” (Guyer 2000a, xvii). Such an exercise reflects, for Kant, the valuable relation between our mental powers, whose union constitutes genius, and is ultimately a sign of our human freedom. Kant says:

The mental powers, then, whose union (in a certain relation) constitutes **genius**, are imagination and understanding. Only in the use of the imagination for cognition, the imagination is under the constraint of the understanding and is subject to the limitation of being adequate to its concept; in an aesthetic respect, however, the imagination is free to provide, beyond that concord with the concept, unsought extensive undeveloped material for the understanding, of which the latter took no regard in its concept, but which it applies, not so much objectively, for cognition, as subjectively, for the animation of the cognitive powers, and thus also indirectly to cognitions; thus genius really consists in the happy relation, which no science can teach and no diligence learn... (Kant 2000, 5: 317)

We see, then, that it is through the free play between our cognitive capacities that we can go beyond more or less specific ways of understanding how things stand and create new ends. Here is where this chapter goes beyond Christine Korsgaard’s interpretation and reconstruction of Kant, in which she focuses on rendering ourselves efficacious *and* autonomous in the world by complying with the principles of

---

<sup>7</sup> See also Munzel 1999 for a discussion on the value of cultivating reflective judgment in education and elsewhere.

practical reason.<sup>8</sup> It does so by also emphasising the value and importance of exercising and cultivating the reflective power of our judgment. This is because we should not only cultivate our capacity to set and pursue particular ends or just determine ourselves as the cause of particular ends in the world, nor just confer value on ourselves as value-conferring beings, capable of setting and pursuing morally permissible ends; we should also promote and preserve our freedom to engage the free play between imagination and understanding. We cannot therefore merely act in agreement with and be motivated by the principles of practical reason in order to perfect ourselves as moral beings. We also have to cultivate the full power of our judgment in practice, in communication with others. This is not, however, something that happens just once; it has to be cultivated continuously when we want to perfect ourselves morally and pursue the highest good in the world.

We see, then, that we express our unique moral dignity, according to Kant (1998b, 4: 437), when we determine our ends through reason, namely when we render ourselves efficacious, autonomous and creative, but not when we submit to the ends set by someone else or become the slaves of our passions.<sup>9</sup> We render ourselves efficacious by exercising our freedom to cultivate the rational capacity to set and pursue ends with the means available. We render ourselves autonomous by being the cause of our own ends and by pursuing morally permissible ones.<sup>10</sup> And we cultivate our creative capacity by exercising the free play between our imagination and understanding. Such an engagement can give us an experience of “the reality of the freedom of the will” and is a symbol of a morally good soul.<sup>11</sup> We cannot, however, experience just “the reality of the freedom of the will” but also its power when we exercise our freedom “to play with features beyond what are necessary just for the object to satisfy its concept” (Guyer 2014a, p. 367). Hence, we value our moral dignity in education and elsewhere, the extent to which we render ourselves in the above-mentioned terms. There is, nonetheless, no guarantee that we perfect ourselves in terms of efficacy, autonomy and creativity, or that we make it possible for us to do so; we wilfully deviate from doing the above, from time to time.

## **Wilful Deviations from the Duty to Cultivate Ourselves As Efficacious, Autonomous and Creative Beings**

We see that we have good reasons, according to Kant, to unify ourselves as efficacious, autonomous and creative beings, and that we should make it possible for us to do so. We could not, however, be sure that each and every one strives to do so in

---

<sup>8</sup> See Korsgaard 2008, 2009, where she develops a view of agency in terms of efficacy and autonomy, but not creativity, with regard to Kant’s principles of practical reason, namely the hypothetical and categorical imperative; see Kant 1998b, in particular Section II for a discussion on these principles.

<sup>9</sup> See also Roth 2014 for a discussion on this and similar issues.

<sup>10</sup> See Guyer 2000b for a discussion on morally permissible ends.

<sup>11</sup> See Kant 2000, §42, §59; see also Baxley 2005 and Guyer 2005 for discussions on this.

every single case even when they are enabled to do so; some will wilfully turn away from doing so from time to time due to their desire to do what is unlawful. He says:

... in him [the human being] there is a tendency actively to desire what is unlawful, even though he knows that it is unlawful; that is, a tendency to *evil*, which stirs as inevitably and as soon as he begins to make use of his freedom, and which can therefore be considered innate (Kant 2006, p. 229)

Kant argues that we as human beings are capable of making a choice between acting lawfully or not. He also argues that the desire to do what is unlawful is “not to be sought in the natural inclinations, which merely lack discipline and openly display themselves unconcealed to everyone’s consciousness, but is rather as it were an invisible enemy, one who hides behind reason and hence all the more dangerous” (Kant 1998b, 6: 58); namely our free will, in particular our tendency to reverse the order of the moral law and the principle of self-love as an incentive for our will so that we make the latter the condition for the former rather than the other way round. Our free will is therefore a “condition for the possibility of being good or evil” (Wood 1970, p. 212), and we corrupt the human heart when we reverse “the ethical order as regards the incentives of a *free* power of choice” (Kant 1998c, 6: 30); that is, when we make the principle of self-love the condition for the moral law. Allen W. Wood says:

The good man makes it a rule to do his duty, and to pursue the satisfaction of inclination only when this is compatible with the performance of duty [to wilfully act upon the moral law]. The evil man, on the contrary, seeks first his own happiness [or the personal ends of a few]. ... But the good man does not cease to have natural needs and inclinations, nor does the evil man cease to understand his moral obligation and to recognize it as an incentive for action. (Wood 1970, p. 213)

We cannot, then, understand ourselves without viewing ourselves as rational beings endowed or condemned with free choice and action. Hence, the cause of whether we render ourselves – in particular our character – good or evil is to be found in whether we choose to have the moral law or the principle of self-love as the incentive of our action.

Kant says that this propensity to evil “must reside in the subjective ground of the possibility of the deviation of the maxims from the moral law ... [and that it] can only attach to the moral faculty of choice” (Kant 1998c, 6: 29 and 6: 31). He argues that there cannot “be any further cognition of the subjective ground or the cause of this adoption (although we cannot avoid asking about it) [and he continues:] [W]e are just as incapable of assigning a further cause for why evil has corrupted the very highest maxim in us, though this is our own deed....” (ibid., 1998c, 6: 25 and 6: 32). There is, therefore, no further cause of evil or goodness other than our free choice.

This choice, whether to let either one of the above-mentioned principles determine one’s will, is not just innate and radical;<sup>12</sup> it also seems to be influenced by the antagonism in society. It is something we need to be on our guard against and we do

---

<sup>12</sup> See Kant 1998c, 6: 21, 38, 43, and Kant 2006, p. 229 for discussions on evil being innate.

this when we “[h]ave courage to make use of [our] own understanding” (Kant 1996b, 8: 35), that is, think for ourselves, etc. Kant continues:

Here I understand by ‘antagonism’ the *unsociable sociability* of human beings, i.e. their propensity to enter into society, which, however, is combined with a thoroughgoing resistance that constantly threatens to break up this society. ... [Kant, continues:] Now it is this resistance that awakens all the powers of the human being, brings him to overcome his propensity to indolence, and, driven by ambition, tyranny and greed, to obtain for himself a rank among his fellows, whom he cannot *stand*, but also cannot *leave alone*. (Kant 2009, p. 13)

We see, then, that one of the reasons why human beings are inclined to act upon the principle of self-love rather than the moral law is that they have a tendency [Hang] to evil, that is, is a “tendency to prefer the incentives of inclination to those of moral reason” (Wood 1970, p. 219), and this tendency “can be brought under the general title of a self-love which is physical and yet *involves comparison* (for which reason is required); that is, only in comparison with others does one judge oneself happy or unhappy. [And Kant continues:] Out of this self-love originates the inclination *to gain worth in the opinion of others*, originally, of course, merely *equal worth*: not allowing anyone superiority over oneself, bound up with the constant anxiety that others might be striving for ascendancy; but from this arises gradually an unjust desire to acquire superiority for oneself over others” (Kant 1998c, 6: 27). It is our craving to obtain “a rank among” our fellows which seems to be reinforced in education (see Part 3), and perhaps in society at large, that makes us override the moral law and become the victims of vices of different kinds, namely envy, ingratitude, arrogance on the one hand, and defaming others and rejoicing in their misfortune on the other. It can even be the case that we do not just fail to do what is right; we act straightforwardly on an inclination and use the other as a mere means for the fulfilment of our own ends, or the ends set within a specific society. It may even suggest that we do away with the other if for some reason we find the other as a treat for us in the pursuit of our own ends. It is here that the evil character shows itself most clearly for Kant (see Kant 1998c, 6: 30).

The evil character shows itself less clearly, for him, at the first and second level of evil; the first level is the frailty of our nature or weakness of will – here we still want to do what is right, but we “succumb to temptation” (Wood 1970, p. 218), and the second is “the propensity to adulterate moral incentives with immoral ones” (Kant 1998c, 6: 30), namely when we pretend that we comply with the moral law, when in fact we are motivated by the principle of self-love and just want to use the other as a mere means to some further end. Hence, it is when “we come to value ourselves in the wrong way, preferring the worth of our condition – which can be compared favorably to that of others – over the worth of our person” (Wood 2010, p. 167), in particular the worth of ourselves as value-conferring beings, that we corrupt ourselves, our hearts. It is then we are influenced and perhaps even reinforced to become evil, instead of taking our responsibility to engage in “a kind of rebirth, as it were a new creation” (Kant 1998c, 6: 47) and perfect ourselves as moral beings, in education and elsewhere.

It is, however, not enough that we realize that we cannot avoid making a choice; we need to make the right one, namely to comply with the moral law. As moral persons, we can go against the inclination to override the moral law, and this we do when we render ourselves as a whole, and not merely efficacious with regard to specific desired ends. If instead we subordinate the moral law to the mere satisfaction of an inclination or to making ourselves efficacious with regard to specific desired ends, then we reduce ourselves to beings who are more or less identified with our inclinations or functions used for some specific purpose(s) within specific communities and/or nation-states, which suggests that we submit to the will of someone else or become the slave of our passions, or both, and this we cannot do if we want to become moral persons.

Thus in order to decide which persons we want to be or become, we have to decide which principle we want to act in agreement with and be motivated by, namely whether we want to act upon and be motivated by the principle of self-love or the moral law, and be enabled to do so. If we comply with the principle of self-love, we first seek our own happiness. If we instead comply with the moral law, we cultivate our character as moral beings, that is, we make it your duty to perfect ourselves morally and seek “*the happiness of others*” (see Kant 1996a, 6: 386). If we refuse our moral restrictions, we reduce ourselves as human beings and identify ourselves either with a specific function or with our sensuous inclinations (or both), which we cannot do if we want to raise ourselves up from our crude state of nature (see below). Henry Allison, for example, says that we “cannot conceive of [ourselves] as such [agents, that is, as moral persons] without assuming that [we] have a certain control over [our] inclinations, that [we are] capable of deciding which of them are to be acted upon (and how)”, and which to resist (Allison 1995, p. 41),<sup>13</sup> and we do this when we make the moral law the condition of the principle of self-love rather than the other way around. Kant says:

The human being must make or have made *himself* into whatever he is or should become in a moral sense, good or evil. These two [characters] must be an effect of his free power of choice, for otherwise they could not be imputed to him and, consequently, he could be neither *morally* good nor evil. If it is said, The human being is created good, this can only mean nothing more than: He has been created for the *good* and the original *predisposition* in him is good; the human being is not thereby good as such, but he brings it about that he becomes either good or evil, according as he either incorporates or does not incorporate into his maxims the incentives contained in that predisposition (and this must be left entirely to his free choice). (Kant 1998c, 6: 44)

Kant continues:

Hence the difference, whether the human being is good or evil, must not lie in the difference between the incentives that he incorporates into his maxim (not in the material of the maxim) but in their *subordination* (in the form of the maxim): *which of the two he makes the condition of the other*. It follows that the human being (even the best) is evil only because he reverses the moral order of his incentives in incorporating them into his maxims. He indeed incorporates the moral law into those maxims, together with the law of self-love; since, however, he realizes that the two cannot stand on an equal footing, but one

<sup>13</sup> See also Korsgaard 2009, in particular Chapter 4.4, for a similar argument.

must be subordinated to the other as its supreme condition, he makes the incentives of self-love and their inclinations the condition of compliance with the moral law – whereas it is this latter that, as *the supreme condition* of the satisfaction of the former, should have been incorporated into the universal maxim of the power of choice as the sole incentive. (Kant 1998c, 6: 36)

The good person therefore wilfully acts upon the moral law, and the evil one “reverses the moral order of his incentives”, making the principle of self-love the condition for the moral law; the latter does not treat humanity “*whether in your own person or in the person of any other, always at the same time as an end, never merely as a means*” (Kant 1998b, 4: 429); neither does he let the other or himself cultivate the capacity to freely set and pursue morally permissible ends but just the required ends in a specific community and/or nation-state; nor does he let himself or the other be the cause of his or her actions, nor engage in the free play between the imagination and understanding, and think anew. Such a person treats humanity “*in [his] own person or in the person of any other*” merely as a means for some further end; he therefore wants to affect the beliefs, values and norms of action of the other so that they are formed and in agreement with the accepted ones.

Kant says, however, that you can “indeed be constrained by others to perform actions that are directed as means to an end, but [you] can never be constrained by others to have an end”, and Kant continues: “only [you yourself] can make something [your] end” (Kant 1996a, 6: 381). That is, even though you are constrained by others or believe yourself to be so in ways mentioned above and that, as an effect of this, you are or think you are prevented from cultivating the predisposition to personality, namely your “awareness of [your] obligations and [your] accountability before the moral law” (Wood 1970, p. 210), you are not necessarily constrained or prevented from doing so; it is not possible in principle, according to Kant, to prevent yourself from exercising your freedom to comply with the moral law. He says:

[S]ince the human being is still a *free* (moral) being, when the concept of duty concerns the internal determination of his will (the incentive) the constraint that the concept of duty contains can be only self-constraint (through the representation of the law alone); for only so can that *necessitation* (even if it is external) be united with the freedom of his choice. (Kant 1996a, 6: 380)

This suggests that it is always possible in principle to make the moral law the condition for the principle of self-love and have it determine our will. It is, however, hard work to cultivate the humanity in our own person and that of any other, as well as the predisposition to personality, that is, “the susceptibility to respect for the moral law *as of itself a sufficient incentive to the power of choice*” (Kant 1998c, 6: 28) so that we take the responsibility to strive to render ourselves efficacious, autonomous and creative, instead of corrupting our mind’s attitude “at its root (so far as the moral disposition is concerned)” (*ibid.*, 1998c, 6: 30), in education and elsewhere in society. It seems, however, that we do not live in an age when children and young people are rendered efficacious, autonomous and creative, which when realized in practice is an open-ended and never-ending process; it seems rather that they are enabled and influenced to render themselves efficacious with regard to desired ends, and at best autonomous, but not necessarily creative.

## Education: Perfecting Moral Beings, in an Open-Ended Process with No Fixed Ends?

Kant says, in *Lectures on pedagogy*, that education should not only make children and young people “fit in with the present world” (Kant 2007, 9: 448), it ought also “to educate them better, so that a future, better condition may thereby be brought forth” (ibid., 9: 448). He continues: “The final destiny of the human race is moral perfection ... How, then, are we to seek this perfection, and from whence is it to be hoped for? From nowhere else but education.” (Collins 1997, 27: 470–471) In this chapter, it is argued, as seen, that Kant emphasises the value of making us efficacious, autonomous and creative, which suggests that those who are enabled and do render themselves in the above-mentioned way exercise their freedom to set and pursue morally permissible ends, be the cause of their own ends, engage in a continuous transformation of their own beliefs, values and norms of action and think anew; they also engage in responding to anything that prevents them from perfecting themselves morally.<sup>14</sup>

It seems, however, that children and young people as well as teachers are cultivated and civilized but are not necessarily moralized in education and elsewhere,<sup>15</sup> that is, rendered efficacious with regard to specific desired ends and affected to become loyal and morally committed to the values of the nation-state, but not necessarily autonomous and creative “so that a future, better condition may thereby be brought forth”. First, children and young people as well as teachers are nowadays expected, at the policy level, to be cultivated in education in order to become employable, competitive, movable and flexible on the market, that is, rendered efficacious with regard to specific desired end(s),<sup>16</sup> or to put it in the words of Kant: they are influenced in education to cultivate their capacities in order “to perform actions that are directed as means to an end” (Kant 1996a, 6: 381). Moreover, it has also become more common to evaluate the outcomes of education to generate knowledge with regard to the extent to which the desired ends have been achieved and use this knowledge to make it more possible to achieve the desired ends.<sup>17</sup> This too may lead teachers and students to confer value on the desired ends and not on themselves as value-conferring beings.

---

<sup>14</sup> See Dewey’s *German Philosophy and Politics*, 1915/1979 in which he strangely argues that Kant defends the idea that those who do their duty submit themselves to the will of others and follow their orders. It seems that Dewey mistakenly associated duty with heteronomy instead of autonomy, and that he therefore thinks that Kant defends the absurd idea that doing one’s duty consists in following orders, and hence not thinking for oneself, from the standpoint of the other, and consistently; see also Campbell 2004 and Johnston 2006 for critical discussions on Dewey’s reception of German philosophy in general and Kant’s in particular in his *German Philosophy and Politics*.

<sup>15</sup> See Kant 2006, 324 and 2007, 9: 450 for the value of cultivating, civilizing, and moralizing ourselves in education and elsewhere.

<sup>16</sup> See Rönström 2012, 2015 and Wahlström 2015 for discussions on this and similar issues.

<sup>17</sup> See, for example, Biesta 2010; Lingard, Martino and Rezai-Rashti (Eds.) (2015) and Smith (Ed.) (2016) for critical discussions on this and similar issues.

Second, there is also an emphasis on influencing children and young people through education in nation-states to become civilized by shaping their loyalty and moral commitment to the nation-state and its members; “This shift was accomplished in many ways: through language policies, through the development of standard curriculums, through the construction of a national history and symbols and through the development of a common identity, often identified with the majority-culture within the nation” (Roth and Selander 2008, p. 207). This civilizing of them in the above-mentioned sense does not, however, necessarily enable children and young people or teachers to think for themselves or enlarge their thinking outside the interest of the nation-state and maintain their freedom to do so.<sup>18</sup>

The above suggests that children and young people (and others) are led to learn to confer value on particular desired ends, specific methods and means available for achieving them and to render themselves efficacious with regard to certain desired ends and expected outcomes; it does not necessarily mean that they are enabled to confer value on themselves as value-conferring beings, nor that they take their responsibility to confer value on themselves as such beings so that they are capable of pursuing the highest good in the world, and not just particular valued ends in specific societies and/or nation-states, which today is or seems to be the case.<sup>19</sup> Moreover, even though we would want to make it our own end to perfect children and young people morally, that is, to render them autonomous, or by influencing them to become morally committed and loyal to the nation-state and its members, it is not possible to do so; it is a contradiction in terms. That is, “it is self-contradictory to require that I do (make it my duty to do) something that only the other himself can do” (Kant 1996a, 6: 386),<sup>20</sup> namely that he distances himself from particular ends, ways in which he thinks about them or themselves, others and the world, reflects upon and possibly also challenges and changes them when needed; we can, however, enable them to do so even though we cannot make it our duty to do “something that only the other can do”. However, even though children and young people are enabled to render themselves efficacious, autonomous and creative, they still have to take their responsibility to do so, that is, to struggle against their inclination to submit to the principle of self-love and override the moral law. They then also have to struggle against the frailty or weakness of their will and their propensity to perform actions which seem to conform to duty but which are “not done purely from duty” (Kant 1998c, 6: 30) but motivated by the principle of self-love. Moreover, they would also have to go against their propensity to corrupt their hearts by its roots, by directly reversing “the ethical order as regards the incentives of a *free* power of choice” (ibid., 1998c, 6: 30) and designate themselves as evil. By taking their responsibility, however, to do their duty, they can become aware of and acknowledge their free choice with regard to the above, which is hard work – it is even harder if they are prevented from doing so.

---

<sup>18</sup> See Roth 2012b and 2015 for discussion on this and similar issues.

<sup>19</sup> See Roth 2012a, 2014 and 2015 for discussions on this.

<sup>20</sup> See also Surprenant 2014 for a discussion on the value of cultivating virtue in education and elsewhere in Kantian terms.

Third, it is not uncommon to argue that critical thinking is or ought to be an overall aim of education, particularly in liberal-democratic societies. Harvey Siegel, for example, argues that critical thinking ought to be *the* educational aim of education (see Siegel 1988), so that children and young people come to cultivate a ‘critical spirit’ and can think critically about knowledge, norms and values whenever needed. It can be disputed, however, that critical thinking and not moral perfection ought to be the ultimate end of education; it can be argued that the latter and not the former ought to be its ultimate end. One reason is that critical thinking concerns what is known, while moral perfection also focuses on the value of engaging in the free play between imagination and understanding. Thus it seems that we, as rational beings endowed with freedom, should not merely cultivate and civilize but also moralize ourselves. The process of moral education is therefore not merely challenging, open-ended and never-ending, but hard work as well. Kant says:

A human being has a duty to raise himself from the crude state of his nature, from his animality (*quoad actum*), more and more toward humanity, by which he alone is capable of setting himself ends; he has a duty to diminish his ignorance by instruction and to correct his errors. And it is not merely that technically practical reason *counsels* him to do this as a means to his further purposes (or art); morally practical reason *commands* it absolutely and makes this end his duty, so that he may be worthy of the humanity that dwells within him. A human being has a duty to carry the cultivation of his *will* up to the purest virtuous disposition, in which the [moral] *law* becomes also the incentive to his actions that conform with duty and he obeys the law from duty. This disposition is inner morally practical perfection. (Kant 1996a, 6: 387)

Thus we should operate as a whole and determine ourselves as rational beings that do not just set and pursue particular ends but aim to pursue the highest good in the world. We cannot, then, just place a higher value on particular desired ends in a specific society and/or nation-state, or in the satisfaction of particular enjoyments for which we ourselves have aroused a particular inclination; this applies also when the satisfaction of particular enjoyments or the pursuit of specific desired ends goes against or just happens to be in line with the pursuit of the highest good as an object of morality. We should instead, according to Kant, place a higher value on making the moral law the supreme condition of the satisfaction of particular enjoyments and specific desired ends rather than the opposite.

When we render ourselves efficacious, autonomous and creative, that is, when we operate as a whole and are enabled to do so, we confer value on ourselves as rational, value-conferring beings, namely as beings capable of setting ends and making ourselves the cause of our own ends, in particular morally permissible, including the free play between the imagination and understanding. Thus, we do not just submit to the ends of others and render ourselves efficacious with regard to them; we do not make the satisfaction of our own end(s) the only reasonable and legitimate aims for ourselves; and as an effect thereof, we do not place a value on each other as value-conferring beings, nor do we prevent each other from having particular ends as objects for reflection, nor challenge and change them when needed, and – once again – hinder each other from thinking anew.

It seems, however, from what has been said above, that education influences children and young people to confer value on specific desired ends, but not necessarily on themselves as value-conferring beings, nor as beings who can exercise their freedom to engage in the free play between imagination and understanding. Hence, it seems that they are expected to cultivate themselves and their capacities in order to become efficacious on the market, but not necessarily autonomous or creative, which in turn suggests that the moral dignity of children and young people is not valued in education, nor the moral dignity of those who educate them. This suggests that children and young people are led to submit to the principle of self-love and override the moral law and that they are not being respecting for their “duty to carry the cultivation of [their] *will* up to the purest virtuous disposition”, that is, exercise their freedom to take their responsibility to unify themselves as efficacious, autonomous and creative beings.

However, even though we should take our responsibility to unify ourselves as a whole, and make it possible for us to do so, there is no guarantee that we will strive to unify ourselves in terms of efficacy, autonomy and creativity, nor make it possible for each other to engage in such a pursuit. On the contrary, those concerned may choose to comply with the principle of self-love, and as an effect thereof override the moral law. They may then submit to the ends of someone else or others in order to “*gain worth in the opinion of*” them. They may also prevent each other from setting and pursuing their own ends, in particular morally permissible, and as an effect of this, not allow each other to exercise their freedom to reflect upon and critically assess the ends set, to engage in a continuous transformation of them and to think anew. Hence, they may be used, or use each other as a means for some further end, more or less aggressively and violently.

In order to go against our innate propensity to evil and perfect ourselves morally, we have to actively cultivate our moral character, and this we do when we comply with the moral law and pursue the highest good in the world, and make it possible for us to do so continuously, in education, and elsewhere; education is therefore an open-ended and never-ending process, in moral terms.

## Summary

It is argued with Kant that we have a duty to moralize ourselves, and that we should not merely render ourselves efficacious in education with regard to specific desired ends within a specific society and/or nation-state, or that we just should accept things as they stand. It is also argued that we should unify ourselves, that is, render ourselves efficacious, autonomous and creative, and this we do when, *inter alia*, we exercise our freedom to transcend and transform the ways things stand and create new ends. Moreover, it is argued that we are influenced to deviate from doing so and that we even wilfully deviate from doing so from time to time due to our imperfect rational nature. We can, however, choose to sustain our unique moral dignity by promoting morally permissible ends and make it possible for us to do so. We can

also experience this through the power of the freedom of our will when we comply with the moral law and engage our mental powers, even though there is no guarantee that this will occur.

Hence, we are consequently confronted with a continuous challenge to moralize ourselves and to combat our propensity to evil, that is, our tendency to act upon and be motivated by the principle of self-love, and the fact that we are influenced, *inter alia*, to merely render ourselves efficacious with regard to desired ends in education and society at large, or so it seems. We struggle, therefore, with others and ourselves when deciding whether we should let our will be determined by the moral law or by the principle of self-love. The unification of us in the above-mentioned terms in education and elsewhere is therefore hard work and a process without fixed ends.

# Invisible Teaching: Søren Kierkegaard

Herner Saeverot

This contribution analyses Søren Kierkegaard's pedagogical principles within the framework of four significant questions that are part of modern pedagogical thinking. First, it analyses the 'why' of education. In addition to legitimating the pedagogical praxis, this question gets to the purpose of education. Any pedagogy must have a justification and a purpose; if it does not, it will lack direction and arbitrariness will ensue. Secondly, it analyses the 'who' of education. Who is the student who is to be the subject of the pedagogical praxis? Thirdly, it analyses the 'how' of education. How is the pedagogy to be carried out in practice? Fourthly, it analyses the 'what' of education. What should be the content of pedagogy?

How does Kierkegaard, through his pedagogical perspectives, answer these questions convincingly? We know that he was not first and foremost a pedagogue. Therefore, he never presented any systematic pedagogical ideas. However, by looking at his works more closely, we can nevertheless see that he regularly tried to solve complicated pedagogical issues, including the four questions this contribution analyses. Kierkegaard provides an original contribution to pedagogy, in part because he relies on ideas about irony and deception, and this contribution argues that his pedagogy can be highly relevant to modern pedagogy, at least in some areas.

Before elaborating on the 'why', 'who', 'how' and 'what' of education, I wish to offer some insight into key aspects of Kierkegaard or his theory of indirect communication and how this theory might be referred to or used nowadays.

## Visible Learning and Direct Instruction Versus Indirect Communication

Although modern education is extensive and consists of many different perspectives, there are certain trends. One such trend is the so-called visible-learning paradigm (Nielsen & Klitmøller, 2017, p. 3). Since the release of the book *Visible learning – A Synthesis of Over 800 Meta-Analyses Relating to Achievement* in 2009, the New Zealand researcher John Hattie has had a huge impact on Western education. Hattie's book on visible learning consists of a synthesis of over 800 meta-analyses, of which more than 52,637 individual studies are integrated.

Although Hattie's book consists of an impressive empirical material, he also finds support from certain theoretical assumptions on what learning and teaching signify. One of Hattie's projects is, therefore, to develop a theory of what good teaching might be. Central to his teaching model we find direct instruction. Furthermore, he includes three phases of learning: surface learning, deep learning and transfer learning. While surface learning covers learning in the form of understanding of facts and knowledge, deep learning involves a deeper and more thorough learning process. The third dimension in Hattie's understanding of the learning process focuses on acquiring knowledge or constructing new approaches to the ways in which the students engage in deep learning and surface learning (Hattie, 2009, p. 29). Hattie criticizes much of today's teaching for not going beyond the level of surface learning. He does not reject surface learning as unimportant; rather, he seeks to integrate surface learning in his overall model of learning.

Nevertheless, Hattie's understanding of learning is rather narrow, first and foremost because his concept of learning is reduced to information processing and knowledge acquisition from a very teacher-led perspective.<sup>1</sup> With this perspective, there are obviously a number of aspects that are not thematized, for example, ethical aspects, creativity, autonomy and critical dimensions. Kierkegaard, on the other hand, argued that communication, which is ethical, existential, religious or similar, does require an indirect approach. For Kierkegaard, the ethical, existential and religious are subjective categories in which there are no general or objective truths. Given this, educators cannot tell children directly how they should live their life; rather, educators can only do so by indirect communication methods (Kierkegaard, 1846a/1978, volume 9, pp. 64-65). As for Hattie's *Visible learning*, one do not find such subjective categories. Learning for Hattie (2009) is, therefore, a matter of direct instruction. Such an understanding of learning also excludes passion which, according to Kierkegaard, must be part of existence ((Kierkegaard, 1846b/1978, volume 10, p. 18). Having said that, educators or teachers cannot teach in such a way that the receiver simply incorporates the passion of the teacher. The recipient must rather develop a form of passion that means something to his or her life, a personalized passion, which must be communicated indirectly so as to create space for developing an emotional relationship to that which is communicated or disclosed

---

<sup>1</sup>Hattie himself is aware that his concept of learning is quite limited (Hattie 2009, p. 209).

without any form of coercion. Both learning and teaching in a Kierkegaardian perspective are therefore invisible, unlike Hattie's visible learning and teaching.

But what does it mean that the ethical, existential and religious are subjective categories? The answer is that one can know a lot about existential, ethical and religious matters, without converting this knowledge to one's own life. Therefore, factual knowledge is not the same as existential knowledge where ethical and religious matters come into existence, according to Kierkegaard. Where the latter is a subjective concern of the ethical and the religious, the former is an objective understanding. The hallmark of objective knowledge is that it can be communicated directly, but only to a certain extent. The reason being that objective knowledge also requires a form of reflection and because of that educators cannot communicate absolute directly. Hattie (2009) seems to ignore that objective knowledge also requires indirect approaches. The difference between subjective and objective knowledge is that the latter form of knowledge only requires one reflection, as opposed to subjective knowledge that requires a double-reflection (Kierkegaard, 1846a/1978, volume 9, p. 64). While the first reflection in the process of a double-reflection is concerned with understanding the relevant concepts being communicated, the second reflection tries to figure out what it actually means to apply these concepts with regard to one's own existence. This backdrop tells us that communication must be indirect, even in the paradigm of visible learning, to make sure that the recipient not only engages intellectually, but also in terms of how the newly acquired knowledge can be part of life itself. In this sense, educators must make room for the recipients to think on their own, on a deeper level of human existence. Although the knowledge is objective, some sort of effort in the form of reflection is required from the part of the receiver. This means that both subjective and objective knowledge do require reflection from the receiver, which also means that the communication must be indirect. The difference is that subjective knowledge requires a deeper kind of reflection than objective knowledge.

Against this background, the following hypothesis emerges: education is indirect by nature. Of course, there are various forms and levels of indirect kinds of communication. Once we are commanding, we are fairly direct. However, a command addresses a non-free will with no choices. For example, we may command someone to 'sit down!' or 'shut up!'. Such precepts are virtually impossible not to understand, as there are no intermediaries that complicate and hamper the interpretation. This is also the reason why commands do not belong to the kind of education that is concerned with freedom, morality, existence or the like. In order to provide space for freedom, some form of indirect communication is required.

In the following, I shall attempt to systematize Kierkegaard's theory of indirect communication by looking at the 'why', 'who', 'how' and 'what' of education.

## The Why of Education

In 1968, Theodor W. Adorno published *Erziehung zur Entbarbarisierung* (“Education for debarbarization”), which assumes as a point of departure that we adapt to the dominant system without further thought or reflection. For Adorno, this is a form of barbarity, which in short is about hatred, aggression and similar destructive primitive conditions (Adorno, 1970, pp. 120–121). It should be noted that Adorno wrote the essay in the aftermath of Nazi Germany, where barbarism flourished. People adapted to the barbarian system without resistance. This is not only blind obedience, but also a form of cultivation, and, not least, a dangerous condition. It is true that cultivation is an important factor in becoming human, which one becomes in part by knowing culture, history and the like. By getting to know one’s origins in this way, there is less danger of being alienated. Furthermore, it is important to incorporate children into existing norms and rules so that the democratic and pluralistic society does not collapse. Another important element is that the child must be led into a world that will later be part of their adult life. Nevertheless, these views of cultivation imply a pedagogy that is direct and that can lead the individual into barbarity. The main reason for this is that the pedagogy has not emphasised that the individual also must have a critical distance to whatever he or she is incorporated into.

So how are students to be cultivated, without ending up as barbarians? The question, which is highly relevant to pedagogy, assumes that everything is in perfect order and that the teacher can start from a blank slate. Yet the problem, which Adorno (1970) also underlines, is that individuals are already more or less barbarian *before* they are to go through the pedagogical processes. This is precisely why he focuses on a form of de-barbarisation, which is also a form of de-cultivation and is linked to the idea that it is society and culture that are to blame for the individual having acquired barbarian aspects. This is how the Existential Self is suppressed. To explain what is meant by the ‘Existential Self’, we can imagine looking at ourselves in the mirror. When we do, we are often focused on what we look like. Perhaps we want others to think that we look good. This is completely normal and not unimportant, but also not generally existential. However, in the mirror it is also possible to see something in one’s own face that touches us. This may of course be any number of things, from a situation we have recently experienced to a childhood memory that has impacted our lives, etc. When we then confront this vision and in a way respond to our self – perhaps we are even about to make a decision that will affect our life in the short or long term – then we have entered an existential area.

Like Adorno (who was actually awarded his Habilitation based on a dissertation about Kierkegaard), Søren Kierkegaard, who is considered the father of existentialism, believed that cultivation could be a form of deception. For example, he believed that the Cultured,<sup>2</sup> who belonged to the upper classes, thought they knew what fine art, literature and the like was. However, this individual has difficulty becoming

---

<sup>2</sup>For Kierkegaard, the Cultured were Hegel and his Danish followers.

anything other than what the culture forms them into. A similar form of cultural determinism can be found in the current educational situation, where becoming cultured is often about incorporating the student into the dominant culture. Another term for this is ‘half-education’, which Adorno describes in the essay *Theory of Half Education (Theorie der Halbbildung)*. Half-education is about absorbing values, thoughts, ideologies, etc. without further thought or reflection. In short, half-education is a taken-for-granted state (Adorno, 2012, p. 209).

In this background, we can find both the legitimisation and purpose of education. Specifically, the socialised, cultured, barbarian and half-educated person must, according to Kierkegaard, be de-cultured in order to achieve a pre-cultural state in which the individual is at first placed ahead of general principles (Kierkegaard, 1843/1978, p. 54). The point is that the general – social norms or what is generally accepted and applicable in a society – must not become the middle term, or in other words the governing principle, of ethical (and, for Kierkegaard, religious) matters. That would lead to a conforming and normative society in which individuals respond within the framework of something predetermined; what we might call a third-person perspective. Instead, we must strive for a first-person perspective, as Kierkegaard and Adorno do, in which individuals respond on an individual basis and are thus independent of predetermined principles, rules and norms. This way, the individual appears as a subject, instead of as a barbarian and half-educated individual.

Of course, we can ask whether this does not bring us beyond the framework of pedagogy, for is it not the case that what relates to the subject is outside this framework? Surely, becoming a subject cannot be determined pedagogically, but must be determined at the individual level? It is true that it is the subject who must make the existential decision. But it is also the case that pedagogy can give the individual the existential options. In other words, pedagogy can provide individuals different choices they would not have had without pedagogy.

To sum up: The contribution started with Adorno’s theory of de-barbarisation, because it suggests that the individual can be frozen in destructive feelings and attitudes. Like the half-educated person, this individual is something half and inauthentic. The barbarian person is only unilaterally and negatively involved in themselves and their surroundings. Pedagogy must therefore bring this individual out of the barbarian half-state, so as to enable them to relate to themselves and thereby acquire a form of state that is not destructive but meets the world with positive engagement, integrity and responsibility. This is the modern purpose of education; a purpose that fits well with Kierkegaard’s pedagogical perspective.

## The Who of Education

Where does education start? The teacher who aims to cultivate students starts with something that is pre-determined, whether it be ideas about behaviour, socio-cultural norms, democracy, morals, etc. However, a more existential form of

pedagogical teaching starts by finding out where the student stands, existentially speaking. Kierkegaard underlines that the teacher “must be sure to find him [the student] where he is and start there” (Kierkegaard 1859/1978, p. 96). This form of teaching does not just ask for a what, how and why, but also asks who. In other words: who is the student? The art in this lies in understanding what the students themselves understand, but also something more. The teacher who does not understand more than the students is fairly helpless in terms of teaching for a first-person perspective.

What is necessary to practise this art? The teacher must be both humble and patient and be willing “for the time being to be in the wrong and not perceiving what the other perceives” (ibid., p. 97). In a modern perspective, can we say that the teacher shall appear as the leader of the class who, in a humble and patient manner, leads the students’ learning? The answer is no, because this is about existential teaching. It is therefore not learning that is in focus, at least not as we know the concept from psychology. The teacher does not relate to the student as if he or she is ignorant, as if the student needs to be taught through explanations and explications. “Being a teacher is not to say: it is so, nor is it to lecture or the like; no, being a teacher is truly to be the learned one” (ibid., p. 98). Do not misunderstand: this is not about letting go of the authority of the teacher by learning from the students. This is about bringing the student into a form of existence that is relevant to each student. To do so, the teacher must find out where the student is, existentially speaking.

But who is the student? What characterises the student the teacher is trying to teach? Kierkegaard discusses two types of students. One type is ignorant, and that is the type of student the modern curriculum tends to relate to. The other student is in an imaginary existence. Here, the teacher must base the teaching on the student’s existential existence being a delusion. For Adorno, this might be about stronger or milder forms of barbarism, while Kierkegaard perhaps would have concluded that the student was deceived by authorities (for Kierkegaard, the church leadership was particularly responsible for the deception of Christendom). In both cases, the student has become a dependent individual who responds to the world based on how the society and culture has formed them as a human being – in other words, based on a predetermined mindset.

Against this background, the first part of the teaching will consist of getting the individual out of the deception, which is caused by the society and culture. Teaching would have to consist of a de-cultivation or de-barbarisation process, in which the student is brought out of their barbarian state. This would allow the student to come into an existence in which they are present in their own life and the lives of others rather than letting themselves be governed by culture, tradition, history and the like (Kierkegaard 1843/1978, p. 46). Clearly, another form of teaching than the traditional one is needed. Imagine that the individual was not deluded but merely ignorant – what then? It would not provide much of a challenge for the teacher, beyond bringing this person to knowledge “so that he is like the empty vessel that shall be filled” (Kierkegaard, 1859/1978, p. 105). The difference between the two types of students emerges in the latter type, which does not have anything that needs to be

removed. Here the teacher can simply pour forth knowledge, which in turn will result in the student gaining greater knowledge. Where the traditional teacher simply assumes that all students are receptive to knowledge, the Kierkegaardian teacher allows for the possibility that the student may be deceived. Thus, the teaching gets a task that is about how the teacher can remove the deception that the society and culture causes. But, how is this possible? The question brings us to what this form of teaching might look like.

## The How of Education

Kierkegaard's answer is fairly unorthodox:

One can deceive a human being out of what is true and – to recall old Socrates – one can deceive a human being into what is true. Yes, only in this way it is possible to lead a deluded person into what is true – by deceiving him (ibid., pp. 104-105).

In other words, the deceived person can only be brought out of their deception through a counter-deception. Kierkegaard stresses that there is in fact no other option. There is no doubt that deception has a negative tone, and one might wonder how fruitful it is in the context of teaching. Nonetheless, it may be argued that the teacher cannot avoid deceiving their students. If there is any truth in such a claim, would it then not be highly relevant to take a concept such as deception seriously? Would it not be the case that the more awareness and knowledge the teacher has about the destructiveness and pedagogical opportunities of the deception, the less risk there is of ending up on the wrong side of the line between justifiable and unjustifiable action? Deception is not as bad as it sounds.

Furthermore, it may be argued that we cannot get around deception, whether it be in childrearing or teaching. Deception seems to be a 'natural' part of modern Western childrearing. For example, one of the first deceptions in childrearing is the dummy. Parents deceive the baby by putting the dummy in the baby's mouth, though no milk comes from it. Deception can also be used with a view to protecting small children. In many contexts, parents have good reasons to not tell their children the whole and complete truth. There may even be a need to distort the truth a bit. For example, we may imagine that a 4-year-old has watched something frightening on television. The child of course becomes frightened, a feeling that is often heightened at bedtime. In such cases, it may be appropriate to make what the child has seen seem less frightening, which adults often do by distorting the entire thing. Another example is when adults say to a child: "It is great that you help me!" The adult had likely managed just fine without the child's help. It would likely be easier to complete the task without the child's involvement. Nevertheless, we often say such things to children. Why? Apart from protecting children, adults often say such things to enhance the child's self-confidence, which is an important element of childrearing. We can therefore speak of a form of pedagogical deception that is used to build children up, not to break them down.

It is also possible to interpret Socrates' deception in this light. He deceived his interlocutors, but he actually did two things at once. First of all, he tricked his interlocutors. He simply deceived them. Secondly – and this took place through the deception – he got the interlocutors to feel smarter than they did from the outset. If he had simply deceived, the interlocutor would feel cheated, violated and perhaps stupid, but by using deception pedagogically, he was able to lift his interlocutors up. Through the deception, he helped them see that they were more skilled and talented than they first believed. Socrates' interlocutors were thus not tricked so that they would feel stupid. To the contrary, they were deceived in order to see that they were smarter than they first thought. That said, one may of course be critical of Socrates' belief that truth can be found within us.

Kierkegaard takes Socrates' ways of deception one step further, where he implies that the teacher must deceive the student with the purpose of de-deceiving the deceived. Kierkegaard explains this in the following quote:

Suppose that one is deluded, and thus truly understood that the first communication is to remove the delusion, – when I do not start by deceiving, I start with direct communication. But direct communication presupposes that the recipient concerned is fully capable of receiving; but this is not the case here, wherein the delusion is an obstacle. That is to say, a corrosive means must first be used; but this corrosive is the negative, but the negative regarding the communication is precisely to deceive (*ibid.*, p. 105).

The quote can be explained in more detail using Adorno. When the student does not have any barbarian tendencies, there is no reason to go through deception. In such cases, the teacher can use the most direct methods possible. But, things are different with the student who shows signs of a barbarian state. In those cases, the teacher must use indirect and discrete methods, in the form of a deception, an incognito or aesthetic method.

To clarify what the teacher may have to remove, we can imagine that the class is discussing a case consisting of two parents who each have a son.<sup>3</sup> Both sons are accused of a crime. They must meet in court, with the parents as witnesses. The teacher then asks the students what they would have said on the witness stand if they were the parent of one of these sons. (This is also a good way of finding out where the student stands, existentially speaking.) Like most mothers, one of the students in the class – let us call her Monica – wants her son to be found innocent, but she is willing to let facts stand. She is not willing to overlook her son's guilt, should that turn out to be the case. Thus, Monica is a witness on the basis of innocence, until facts declare the one option or the other. Even if it should turn out that her son is guilty, her love for her son would remain as strong as before. In a Kierkegaardian perspective, her attitude to truth is therefore 'up-building'. In other words, we can say that everything is in perfect order in this example, and the teacher does not need to use indirect methods. In contrast, the other student – here called Christine – is willing to deny facts, or look another way, for the sole purpose of maintaining her

<sup>3</sup>The example is from Perkins, R. L. 2002. Kierkegaard, a kind of epistemologist. In: Daniel W. Conway (ed.). *Søren Kierkegaard: critical assessments of leading philosophers*. London: Routledge, p. 233.

son's innocence. Thus, she is willing to deceive herself. Her attitude to truth is therefore not up-building. To the contrary, it is destructive and barbarian.

Like most mothers, both students want to believe that their child is innocent, but they differ completely in attitude. Where Monica will be built up by her respect for truth, Christine will be broken down by her lack of respect for truth. In other words, Monica will be built up even if her son is guilty, while Christine will have the opposite experience, even if her son should be innocent. From this, we can deduce the following: in cases where the individual is at a remove from what is up-building – which can happen when the individual is cultivated through language, cultivation, tradition etc. – there will be a need for de-cultivation. In other words, the teacher must reach Christine indirectly.

Why not go straight to the issue? Why not call a spade a spade? Certainly, the teacher can choose to address the issue directly, but must then be aware of at least two dangers. Of course the teacher can challenge Christine directly, through an alternative viewpoint that says she is in the wrong. According to Kierkegaard, nothing is likely to be achieved if the teacher impatiently rushes forward in a direct manner. Instead, direct confrontations can strengthen the other party's conviction and perhaps also cause bitterness or similar feelings (Kierkegaard, 1859/1978, p. 95). Furthermore, we must keep in mind that the teacher is speaking to a free will, which will likely oppose you if it feels that it is being told something, or feels it is about to be bound rather than freed. Therefore, teaching must be done in a way that lets the free will feel free. But, does the teacher not then steer the free will through the deception? Not necessarily. It is also possible to give the free will opportunities to be freer tomorrow than it is today. This is what we have deception for. There is nothing evil or cunning in this; it is a form of pedagogy. But, might it not be possible for the teacher to succeed by using direct methods? Perhaps, but we should not overlook the other danger in addressing Christine directly. It might be that the teacher succeeds in convincing Christine, but then the danger would be that Christine ends up assuming the teacher's standpoint.

This implies that this form of teaching is not about moving the student from one place to another. The Kierkegaardian form of teaching thus diverges from modern approaches to curricula, which amongst other things aim to lead the student to specific values. Students are thus raised to exist within a specific pattern – in other words, cultivated. In contrast, Kierkegaard's pedagogical goal is to move the students in relation to themselves. This is a very challenging task, and – as I have already noted – it is necessary for the teacher to assume the role of the learner; necessary for the teacher to know the student and thereby be able to create or find the opportunity – the right moment – when the student is ready to receive the message that opens for the student to respond for and based on herself, rather than based on what she has learned from the curriculum or from how the culture has formed her.

In other words, the teacher must first find the place where Christine stands, and start teaching there, and then teach so that she moves herself. The curious and almost magical aspect here is that there are powers in the deception that can get

Christine to move herself, without her being aware that this could not have happened without the teacher's indirect and veiled help.

But, why must the teacher use indirect methods in Christine's case? Because the relationship between the teacher and Christine is not equal; rather, it is an indirect relationship from the start. The reason for this is that Christine shows signs of a barbarian state as she is willing to hide the truth by lying. At the same time, this indirect relationship is the reason the teacher cannot use direct methods. The teacher must try to remove Christine's convictions through a counter-deception before she can be moved in relation to herself and her unique existence. But, does the relationship between the teacher and Christine not have to be equalised? That would be 'pedagogically' typical. Discussions of pedagogy appear to love to talk about the equal relationship, dialogic learning etc. However, in the Kierkegaardian perspective, this relationship is to be turned upside down. That means that the teacher in a deceptive and ironic manner pretends to not know much, while at the same time claiming that Christine knows so much more. In short, the teacher makes herself smaller while making the other larger. Kierkegaard, who was a Christian thinker, says it like this: "Thus one does not start [...] like this: I am a Christian, you are not a Christian; but like this: You are a Christian, I am no Christian" (ibid., p. 105). The quote can be rewritten in many ways, depending on the perspective. For example, it may be written thus: "One does not start by saying: I am right, you are wrong, but thus: you are right, I am wrong." The point is that this is neither an equal relationship between teacher and student nor a traditional pedagogical relationship in which the teacher, based on her authority and power, is above the student. Rather, it is a non-likeminded relationship in which the teacher places herself below the student, but as this is done ironically, we might say that the teacher is simultaneously and indirectly placing herself above the student.

The idea of making oneself smaller than one perhaps is while also making the other larger is directly tied to the Greek word for irony: *eironeia* means to conceal something while pretending to be ignorant. Thus, deception is part of the concept of irony. Some might argue that this form of irony is unethical, but it can also be viewed in a more positive light. It can be argued that the teacher is humiliating herself, as Kierkegaard did by disguising himself as, or embodying the role of, a pseudonym. The point is that one sacrifices one's reputation and good name, but this is done so that the other (in our case Christine) can be given the opportunity to be pulled away from the lie and self-deception to then move themselves in relation to their own existential standpoint. The indirect method can also be legitimated through this reasoning: by humiliating herself by entering the role as an aesthete, it is possible for the teacher to speak Christine's language, because she acts like an aesthete in the sense that she lets her ego lead her in life. Thus, metaphorically speaking, the teacher appears as a mirror in which Christine can see herself. And, is it not the case that we can only move ourselves once we have seen ourselves?

To strengthen the legitimacy of irony in teaching, it is important to underline that irony is not a tool for the exercise of coercion, in contrast to the form of pedagogy that aims to cultivate students. This form of pedagogical cultivation can be considered a form of coercion because the students are led into a predetermined thought

pattern in which they must place their trust in their subsequent actions. But, why argue that irony is not a form of coercion? Is irony not precisely about getting the receiver in one way or another to absorb the opposite of what the speaker appears to think? The answer is yes, if we only look at irony in its simple, vulgar form. In contrast, Kierkegaardian irony is a more ‘effective’ form of conversation about existential issues compared to directives, instructions, lessons, admonitions, criticism and the like. This form of existential irony is everything but lecturing. This means that it never forces the students into specific choices. If we are to speak of coercion, we might say that the seductive powers of irony forces attention and decisions about existential issues. In short, irony opens for an existential or subjective truth that is true for the individual and only for the individual. In other words, the purpose is not to trick or deceive the student into believing in a disguised secret of some kind. It is therefore also not a form of disguised coercion, which is arguably more unethical than forms of coercion that are out in the open. Instead, irony is to open up room for students to move in relation to themselves.

To sum up, the teacher helps the student on the existential path, but this help is offered through a gentle and tender form of irony, as the late theatre and film director Ingmar Bergman says so well in his autobiography *The Magic Lantern*, where he talks about his grandmother:

She wanted to know what I was thinking, listened carefully, and cut through my little lies or pushed them aside with friendly irony. She let me speak as my own, completely real human being, with no mask (Bergman, 2008, p. 55; my translation).

This quote alone nearly summarises what has been said thus far. His grandmother first gets to know Bergman by listening – by being the learner, as we spoke of earlier. Once she has developed her knowledge of the ‘student’, she can use gentle irony to push aside Bergman’s little lies, which in Adorno’s view can be referred to as a barbarian half-state. In other words, she removed something to let him come to himself, become himself, a whole human being. There is much pedagogy in these two short sentences from Bergman.

## The What of Education

The ‘what’ of education is most prominent in Kierkegaard’s writing. But, can teaching really take place with no specified content? If teaching lacks both deliberation and assessments related to questions of content, what then? We would be left with teaching consisting of lots of irony, but no content to relate to. Such a form of teaching would be both meaningless and un-pedagogical. Any teaching must therefore relate to both goals and content, as one cannot close the door on the more important and pedagogical questions about content – questions that are constantly subject to pedagogical assessment. On closer inspection, we can see that Kierkegaard too was ready to assume responsibility for the content of pedagogy, for, as he said, though the tactic is to use the aesthetic incognito – deception – the goal is nevertheless to

“bring forth the religious” (Kierkegaard 1859/1978, p. 96). In bringing teaching over to the religious dimension, Kierkegaard’s teaching is not just about how, but also emphasises content: a ‘what’.

In a more modern pedagogical sense, the religious or Christianity also cannot be the main content of the teaching. Instead, we must think of existence as a whole, as there are no objective truths associated with existing in the world. Each and every student must choose their unique way of existing, which means that for Kierkegaard too, existence is associated with subjective truth. For the teacher, this is therefore about selecting content that is associated with each individual student in the class. In contrast to more traditional teaching that tends to relate to epistemological knowledge, Kierkegaardian teaching places more weight on existential knowledge in which students are to acquire knowledge related to their existence.

What does this form of teaching look like? The Christine example can again help us explain. This example showed that Christine wanted to give testimony in court that was not up-building, but rather destructive.<sup>4</sup> To get Christine out of the destructive, as a teacher one can add a *what* and a *how*. In the first instance, this means that Christine is given an opportunity to get some understanding of *what* is meant by different ethical concepts, such as justice. It is then a question of *how* she relates existentially to the different ethical concepts, such as the concept of justice (Kierkegaard 1846a, b/1978). Concretely, we get a teaching that is direct-indirect in its form, an approach that Kierkegaard too settled on. By combining direct and indirect methods in the teaching, the teacher reaches the receiver not just at the cognitive and intellectual level, but also at the emotional and spiritual levels. On the one hand, teaching must ensure that students get some ‘tools’ that can help in their existential struggles. In other words, the teaching must open room for the students to understand *what* certain concepts mean, in order that they be able to incorporate them and, not least, make them suitable to their own lives. On the other hand, the teaching must allow room for the acquired and incorporated concept to be put into action: the *how* of students’ incorporations of the concepts. In both cases, a direct-indirect form of teaching takes place.

To provide a concrete example of teaching that provides room for *what*, the teacher may for instance use Emmanuel Levinas’s view of justice as a point of departure that can function as a ‘tool’ for each student. The teacher can for instance in a direct manner show the difference between the concepts of responsibility and justice. The teacher would thus emphasise that justice is a far more complicated concept than responsibility, as justice is directed to the one plus all others (Levinas, 2009). However, if the teacher only conveys this in a direct manner, the level of abstraction will likely be too high for many students. Therefore, it can be beneficial to use an indirect approach in addition to the direct approach, to clarify for the

---

<sup>4</sup>For Kierkegaard, what is up-building legitimates the subjective truth, for the subjective truth can in itself be everything (cf. the postmodern creed ‘anything goes’), but the up-building cannot, as it relates to the ethical dimension (or for Kierkegaard, the religious dimension). Kierkegaard’s conceptualisation of subjective truth is therefore not at all self-centred; rather it is tied to the responsibility of the individual.

students what justice may entail. For example, the teacher may use an indirect method by drawing an image for the students (which Kierkegaard often does in his writing). Here is an example of how such an image can be drawn: a car drives towards the city centre. There is quite a lot of traffic. Just ahead on the right, the driver sees several cars that have difficulty exiting an intersection due to the amount of traffic. The driver wants to be considerate and chooses to stop to let some of the cars at the intersection pass. But then, the driver is hit from the rear. The whole thing ends up as a chain collision. The teacher's point is that the driver only looked ahead. The driver wanted to be responsible or considerate to the drivers stuck at the intersection, but forgot to consider those who came behind. After having been indirect in this manner, the teacher can be direct again, by pointing out that justice can have a similar issue: one cannot always just take the one person that one is closest to into consideration. One must also consider whether one's actions are just in relation to others. One must consider the ripple effect of one's actions. Many people must be considered. The example provides one way of giving the students 'tools' in which they are given the opportunity to gain knowledge about justice being about the one plus all others.

Further, the teaching must provide room for *how* students can utilise concepts such as justice etc. in practical actions, so that the concepts can be part of their existential acts. This part of the teaching will minimize the normative aspect that was relatively strongly present during the first section of the teaching. In *Works of Love* (1847), Kierkegaard opens for what I will refer to as 'the teaching of the dash' by presenting two sentences. The first sentence is as follows: "This person is standing by himself through my help" (Kierkegaard, 1847/1978, p. 263). The sentence equals the so-called visible teaching as I referred to in the introduction; however, Kierkegaard indicates that the students cannot stand on their own through this visible form of help. In other words, the teacher is too direct, and simultaneously too normative, in the 'teaching', and thus the student has been coerced into an objective truth. This is not how the teacher should teach Christine. In the unlikely event that the teacher nevertheless manages to get Christine out of an imagined and barbarian existence by being visible and direct, Christine has not become free and autonomous. For Kierkegaard, Christine has not come to herself in this way, as the teacher, through direct and clear directives, has taught in a manner that will leave Christine feeling indebted and as if she needs to thank or otherwise give recognition to the teacher for the 'gift' she received. In such cases, the gift is destroyed. The main reason for this is that the teacher brings in a disruptive element – the indebtedness – that prevents the students from getting in touch with themselves and their surroundings. The further consequence of this form of visible teaching is that the students will be led to a sort of existential existence governed by the teacher. Instead of standing on their own feet, the students must seek the support of the teacher, as if the latter was a crutch. According to Kierkegaard, helping in this manner is "really to deceive him" (ibid., p. 273). The point is that one cannot live someone else's truth about existence. Therefore, the teacher must in an ironic manner hold back words and actions that require recognition and gratitude in return.

This leads us to the second sentence, which reads thus: “This person is standing by himself – through my help” (ibid., p. 264). The two sentences are almost identical, with the exception of one small detail. In contrast to the first sentence, the second sentence has a dash. This may appear unimportant, but the small dash represents a significant difference in terms of existential teaching. How might that be so? The dash is a sign. When we encounter such signs, we may not reflect on their meaning beyond that of being simple signs. Thus, the dash hides something, much like irony hides its contents, often where the content is most obvious. The teacher who understands the teaching of the dash may also know how to give a gift. The art is in helping the student, who must not discover that she has been helped. The help must be hidden, the way the dash hides something, and must remain hidden – otherwise the student will not become free, autonomous, her own. For Kierkegaard teaching is thus invisible, unlike Hattie’s visible form of teaching.

The dash, which indicates that the teaching is invisible, opens for the entry of free will into the existential, where the subject can freely and autonomously move in proximity to herself and the world, so that the subject is internally connected to herself and the world. In other words, the students shall not be pulled into the teacher’s truth, but into their own, subjective truth. As previously mentioned, the teacher pretends that she has done nothing, but according to Kierkegaard she has really done everything for the students. This means that the teacher has helped the students stand on their own feet, be free and autonomous with regard to existential decisions and acts. This also means that the teacher takes no credit for what happened, for the moment the teacher does, it will open for the possibility of it being the teacher’s doing that the student took the leap into a specific form of existence. But, this existential leap must be taken completely alone. This is about an invisible and a selfless act on the part of the teacher, much like working without pay, to make it possible to give “in such a way that the gift looks as if it was the recipient’s property” (ibid., p. 263). In contrast, to be too visible or too direct, and perhaps even impatient, in teaching can be very problematic, especially in terms of existential questions. The reason being that there are no objective truths about existence. There is only a subjective or existential truth, which is only true for each individual.

## Emmanuel Levinas, Autonomy, and Education

Ann Chinnery

### Introduction

This chapter explores the ways in which Emmanuel Levinas's account of heteronomous subjectivity contributes to ongoing debates on autonomy as an educational aim. While Levinas did not write much specifically about education (a notable exception being his essays on Jewish education in *Difficult Freedom* 1963/1990), he spent most of his life as an educator—as teacher and director of the *École Normale Israélite Orientale* and as a professor of philosophy at the Universities of Poitiers, Nanterre, and the Sorbonne. When one looks at how Levinas's work has been taken up by philosophers of education (e.g., Biesta 1999, 2003; Egéa-Kuehne 2008; Eppert 2000; Joldersma 2014; Papastephanou 2005; Standish 2001, 2008; Strhan 2012; Todd 2003a, b, and others), it becomes clear that his most significant contribution to our field can be traced to his critique and inversion of the modernist conception of subjectivity that has long underpinned the educational project. Levinas rejected the Enlightenment ideal of the sovereign, rational subject in favor of an account of subjectivity as emerging only in an encounter with the other. Levinas's description of subjectivity as fundamentally heteronomous thus calls us, as educators and philosophers of education, to rethink some of our deeply held, even taken for granted, assumptions about education and the educated subject.

In what follows, I first highlight some key points in Levinas's scholarly life. I then sketch his account of heteronomous subjectivity and provide a brief overview of arguments for and against autonomy as an educational aim. In the last section I explore how Levinas's work helps us see that while autonomy may be important for mitigating the risks of indoctrination and ethical servility, the emphasis on cultivating

autonomy as the hallmark of a liberal education risks fostering a kind of ethical blindness to the other, which, on a Levinasian view, marks an impoverished rather than flourishing human life.

Levinas was born in Lithuania in 1906, studied phenomenology in Strasbourg in the early 1920s, and moved to Freiburg in the late 1920s, where he met Martin Heidegger and Edmund Husserl. Levinas's doctoral dissertation, *Théorie de l'intuition dans la phénoménologie de Husserl*, is noted for having introduced phenomenology to Jean-Paul Sartre and other French philosophers of the postwar period. From 1930 to 1960, Levinas divided his writing between Talmudic exegesis and phenomenology, and he was recognized during that time more for his Jewish scholarship than for his philosophical work. However, he continued to work on Husserlian and Heideggerian phenomenology and eventually came to be seen as a specialist in that field as well. Two publications during this period marked the emergence of Levinas's own philosophy. In his 1951 essay, 'Is Ontology Fundamental?', he critiques Heidegger and ultimately rejects the privilege traditionally accorded to ontology in Western thought. Levinas argued that Western ontology, and Heidegger's ontology in particular, is ultimately and inescapably egoistic in that it assumes a conception of the subject as a being whose main concern is its own being. Levinas countered with a claim to ethics as first philosophy and an account of subjectivity as fundamentally heteronomous—as 'pre-ontological intersubjectivity'—a position that grounded all of his work from that point on.

In 1961 Levinas published his first major work, *Totality and Infinity*, originally written for his Doctorat d'État. *Totality and Infinity* was considered a revolutionary text in that it critiqued the whole of Western philosophy and civilization as being dominated by a totalizing drive for unity—for a reduction of otherness to the same (to what is or can be known). After 1961, Levinas wrote several shorter pieces that culminated in his 1974 *Otherwise than Being or Beyond Essence* (first published in English in 1981). Whereas *Totality and Infinity* focused on the epiphany of the other's face, *Otherwise than Being* offered a fuller treatment of his account of the subject as coming into being only in response to the other, and therefore as always already subject to and responsible for the other.

Levinas's work has long been considered influential in Continental philosophy, and one finds frequent reference to Levinas in the writings of Jacques Derrida, Paul Ricoeur, Jean-Luc Marion, and Jean-Luc Nancy, especially in their work toward a post-Husserlian and post-Heideggerian philosophy. However, it is only in the past 25 years or so that there has been much interest in Levinas's work in the English-speaking world, and even more recently in philosophy of education. When considering the impact of Levinas's thought on education, it is important to note that his ethics is not one that can simply be applied to education in the typical sense of that word. As I have put it elsewhere, "one of the biggest stumbling blocks in trying to get to grips with Levinas is that he offers no practical advice, no straightforward answers or prescriptions for practice. There is no recourse to moral principle, no appeal to codes of conduct, nor is there any comfort to be had in adhering to particular norms or virtues or values" (Chinnery 2003, p. 5). Sharon Todd makes an even stronger case, saying that, "it is only through a gross distortion of, or infidelity to,

the concepts themselves that a direct application of his philosophy can be considered” (2008, p. 170). Rather, “approaching education from a Levinasian perspective becomes a question of implication”, not application (Todd 2003a, b, p. 3).

Another challenge in taking up Levinas’s thought in philosophy of education—especially secular education—is that, as we will see below, many of his ideas are more easily read through a religious lens. However, while Levinas had no objection to being characterized as a Jewish philosopher, he insisted that his confessional work was separate from his philosophical work and, for that reason, chose to work with different publishers for the different branches of his scholarship. When pressed on this point in an interview with François Poirié, Levinas acknowledged that he often chose to illustrate philosophical claims with biblical examples, but he maintained that those examples were not intended as philosophical proof:

Of course, I try to enter first into the language of the nonphilosophical tradition which is attached to the religious understanding of Jewish writings; I adopt it, but this adoption is not the philosophical moment of my effort. There I am simply a believer. ...A philosophical truth cannot be based on the authority of a verse. The verse must be phenomenologically justified. ...It irritates me when one insinuates that I prove by means of the verse, when sometimes I search by way of the old ancient wisdom. I illustrate by the verse, yes, but I do not prove by means of the verse. (2001, pp. 61–62)

However, not all Levinas scholars are convinced by his claim, arguing that his ethics is inextricably tied to his metaphysics. For the purposes of this chapter, I will simply acknowledge this tension and set it aside for the moment so we can focus on his contribution to the debate on autonomy as an educational aim.

## Education and the Educated Subject

In *Postmodernism and Education*, Robin Usher and Richard Edwards claim that education is “very much the dutiful child of the Enlightenment” and “the vehicle by which the Enlightenment ideals of critical reason, humanistic individual freedom and benevolent progress are substantiated and realised” (1994, p. 24):

The very rationale of the educational process and the role of the educator is founded on the humanist idea of a certain kind of subject who has the inherent potential to become self-motivated and self-directing, a rational subject capable of exercising individual agency. The task of education has therefore been understood as one of “bringing out”, of helping to realise this potential, so that subjects become fully autonomous and capable of exercising their individual and intentional agency. (pp. 24–25)

This modernist educational project of creating rational, autonomous subjects is the backdrop against which Levinas’s work is read by educators and philosophers of education and thus why his ethics often seems so radical and counterintuitive.

Central to Levinas’s work is a rejection of the modernist assumption that human beings are first and foremost self-governing and self-regarding individuals who only incidentally and out of necessity encounter and engage with the other. He contends instead that individual subjectivity emerges out of a relationship “older than the ego,

prior to principles” (1981, p. 117). In other words, for Levinas, one comes into being as a subject already in relation with another whose irreducible alterity (exemplified in the face) means that she or he cannot be assimilated or reduced to some version of oneself. So, rather than being connected to the other by way of essential similarity or a common humanity, we are called to a different kind of kinship. In grammatical terms, heteronomous subjectivity means being a subject in the accusative. One is subject *to* the other: it is not a matter of I think (I will, I want, I can), but *me voici*, Here I am (Levinas 1981, p. 142; Peperzak 1997, p. 199).

Levinas illustrates this by way of the biblical account of Moses’s response to the appeal of God (the absolute Other): “God called to him out of the bush, ‘Moses, Moses!’ and he said, ‘Here I am’” (Exodus 3:4). He thus inverts the commonplace conception of “no other-than-self without a self” to “no self without another who summons it to responsibility” (Ricoeur, cited in Kemp 1996, p. 46). And it is precisely in one’s response to the face, to the appeal of the other, that one finds oneself awakened to an inescapable indebtedness to and responsibility prior to any decision or choice. This condition of what Levinas calls ‘pre-ontological intersubjectivity’ thus renders subjectivity as being-for-the-other prior to being-for-oneself.

Now, at first blush, it might seem that Levinas is not talking about subjectivity at all, that he is arguing instead for a forfeiture of subjectivity and agency, or slave morality. However, for Levinas, heteronomous subjectivity is not about the other person exercising his power over me as one who can demand that I subject myself to his will. Rather, one is called to be-for-the-other in response to the face of the other in all its vulnerability, suffering, and destitution. I am called into being as an ‘I’ not by the force of a powerful counter-ego, but by the somewhat paradoxical ‘force’ of vulnerability and fragility—by the command of what Levinas calls the “beggar’s request” (1961/1969, 232–3).

It is important to note that Levinas writes in descriptive rather than prescriptive language. As he made clear in several interviews over the years (e.g., Levinas 1985; Levinas and Kearney 1986), his project was not to map out a normative ethics that tells us what one ought to do or not do in any given situation, nor to provide a guiding framework for making moral decisions. Rather, he claimed that his phenomenological analysis was intended to awaken us to what our human condition really is and always has been. “My task”, he said, “does not consist in constructing ethics; I only try to find its meaning” (1985, p. 90). However, the descriptive language he employs does nothing to soften his claim about the demand the other makes on me. In fact, if I truly recognize or awaken to the fact of being indebted to the other as the one who calls me into being, my life is always already inscribed with a responsibility that is at once inescapable and impossible to fulfill. In Levinas’s oft-repeated phrase, “I am I in the sole measure that I am responsible” (1985, p. 101). As I mentioned above, Levinas’s work came onto a scene dominated by modernist ideals and liberal education. So let us turn now to a brief discussion of the role of autonomy in education and the ways in which Levinas’s emphasis on heteronomous subjectivity contests that discourse.

As Usher and Edwards explain in the passage quoted above, autonomy is at the very heart of the modernist project and thus of liberalism and liberal education.

However, there are different views on the precise definition of autonomy and how best to cultivate it in education (e.g., Brighouse 2006; Deardon 1972; White 1982; Callan 1997). I will limit this discussion mainly to Harry Brighouse and Eamonn Callan as representatives of contemporary philosophers of education writing on autonomy. In general, autonomy refers to the freedom to determine one's own thoughts and actions and the inclination to exercise that freedom. But since we are not born with the capacity for independent thought and action, we must learn it, and this is why education for autonomy has come to play such a central role in liberal democracies.

Brighouse argues that the capacity for autonomy is "important enough to justify a requirement that all children be subject to an education designed to facilitate it", but he stops short of declaring autonomy necessary for a flourishing life (2006, p. 15). Both Callan (1997) and John White (1982), on the other hand, argue that education must not only be autonomy-facilitating—that is, it must not only enable students to develop the capacity for independent thought and action—it must actively promote autonomy as a necessary condition for a flourishing life. For Callan, drawing on John Rawls, autonomy is both personal and political. It is personal in that the autonomous subject is self-governing and able to critically assess various truth claims, theories, etc. that come her way without being coerced or unduly influenced by outside authorities. And it is political in that the capacity to exercise such independent judgment is a precondition for participating in and contributing to a just democratic society (1997, pp. 227–228, n. 8; 2014, p. 71).

For both Callan and Brighouse, one of the main risks of not cultivating autonomy is indoctrination and (especially for Callan) the vice of ethical servility. In their view, for a life to be truly fulfilling, the kind of life one chooses to pursue ought not to be determined or constrained by luck of the particular family, culture, religion, etc. into which one is born. So, if education is concerned with providing students with the knowledge, skills, and attitudes necessary to lead a flourishing life, it must foster autonomy so that whatever life one ultimately leads is both freely chosen and consistent with objectively valuable goods. Educating for autonomy obviously does not preclude the possibility that children may eventually choose the same way of life, and come to hold the same values, as their parents and community. But, for advocates of liberal education, it is of utmost importance that those children, now adults, will have arrived at their conception of the good life through a process of independent reflection after exposure to a wide range of conceptions of the good life, rather than through indoctrination or authoritarian socialization. In Callan's words, "human beings have a right to order the diverse possible constituents of the good life in their own way, to choose a life in which autonomy is pursued at the expense, say, of secure religious conviction or to reverse those priorities" (1997, p. 156).

While Callan and Brighouse may disagree about whether autonomy ought to be actively promoted in education or only facilitated, and about other more technical aspects of autonomy, both are committed to the view that it is an essential quality in an educated person. Therefore, teachers who teach in such a way as to foster subservience to authority and the uncritical acceptance of ideas have neglected their responsibilities as educators.

There are, however, a number of philosophers of education, both within and outside the liberal tradition, who reject autonomy as an educational aim. Michael Hand (2006), for instance, critiques various aspects of Brighouse, Callan, Deardon, and White's arguments as conceptually flawed and incoherent. Hand is not against autonomy per se, but he rejects it as an appropriate aim of education. Taking on two aspects of the commonsense conception of autonomy, Hand argues that while the freedom to exercise autonomy is desirable, it is not something that can be learned. We either are in circumstances in which we can exercise that freedom or we are not; and, for the most part, educators do not determine those circumstances. He also cautions that a broadly construed disposition to think and act autonomously, while something that can be learned, is not necessarily desirable, since there are many situations in which it is far better to defer to others' knowledge or experience than to rely on one's own (pp. 537–539). Hand goes on to critique various other technical aspects of arguments for autonomy as an aim of education, but the details of that discussion go beyond the scope of this chapter.

Another critic of autonomy as an educational aim is Nel Noddings, best known for her ethics of care (1984). In contrast to Hand, Noddings's concern is not with conceptual coherence, but rather with the liberal ideal of the rational individual subject. Noddings's work rests instead on an ontological claim that human beings are essentially relational creatures, so to educate for autonomy is to educate away from, not toward, human flourishing. In her words:

I am not naturally alone. I am naturally in a relation from which I derive nourishment and guidance. When I am alone, either because I have detached myself or because circumstances have wrenched me free, I seek first and most naturally to re-establish my relatedness. My very individuality is defined in a set of relations. This is my basic reality. (1984, p. 51)

More recently, Noddings has argued for a conception of relational autonomy, as a kind of middle ground between autonomous and heteronomous subjectivity. "The liberal notion that distinct individuals precede the formation of relationships is contrary to what is easily observed in human life" (2011, p. 7). For instance, she says, "It is clear that we are not autonomous...in many of the categories governing our lives. We do not choose our parents, the cultural groups into which we are born, our first language, our economic status, the genomic patterns that predict our physical characteristics and talents, or our first religion" (p. 8). But rather than educating in a way that denies the importance of such attachments, or sees them as potential impediments to a flourishing life, Noddings's relational autonomy emphasizes the self as a subject always in relation—as parent, spouse, teacher, citizen, or friend.

It is interesting to note that Noddings refers to the same biblical story of God calling to Moses that Levinas cites. But Noddings rejects the heteronomous subjectivity implied in Moses's response, 'Here I am', as an undesirable relation of subservience and obedience to a higher power, favoring instead the responsive posture 'I am here', which she describes as an expression of love flowing from the one with more power to the one with less (Noddings 2002, p. 129). The difference between the two is significant because Levinas's account of heteronomous subjectivity as 'Here I am' is based on a claim that the ability to say 'I' only emerges in the

encounter with the other, whereas Noddings's 'I am here' highlights the relation between self and other, but retains a conception of substantial subjectivity. The commonality I want to highlight, though, is that for both Noddings and Levinas an education that focuses on cultivating autonomy reflects a misunderstanding of what it means to be human. So, in the final section, let us explore the kind of human flourishing that is made possible by autonomy and heteronomy, respectively, with a particular focus on Levinas's contribution to that debate.

## Autonomy, Flourishing, and the Other

Proposing human flourishing as the primary aim of education is unlikely to meet with much objection. However, agreeing on what a flourishing human life looks like is where things get tricky. One of the main differences between a liberal education and a Levinasian-inspired education is their respective conceptions of the kind of freedom that characterizes or underpins a fully flourishing life.

For Callan and other advocates of a liberal education, the freedom to choose the kind of life one wants to pursue is a necessary precondition for flourishing, and surrendering one's judgments to the will of others or living in "fearful or unthinking conformity to the will of others" is the very antithesis of a flourishing life (Callan 2014, p. 69). For Levinas, on the other hand, freedom is connected to the somewhat paradoxical Hebraic idea that to be free is to be bound; it is the freedom that comes in the act of answering the call of the other and investing our freedom in the freedom and rights of the other (1993, p. 125).

Both Callan and Brighouse argue that an autonomous life need not be purely or narrowly self-centered, and they acknowledge that being part of cultural or religious communities that depend on the transmission of traditional beliefs and values may be central to some people's autonomously chosen conceptions of a good life. But the key question for Callan is "how far autonomy can be rejected without spoiling our lives" (1997, p. 152). However, from a Levinasian perspective, the question would be asked from the opposite end—something like, to what extent is the capacity and desire to disentangle oneself from unchosen relationships and responsibilities a fully human life? In *Outside the Subject*, Levinas wrote, "It might astonish some that—with so many unleashed forces, so many violent and voracious acts that fill our history, our societies and our souls—I should turn to the I-Thou or the responsibility-of-one-person-for-the-other to find the categories of the Human" (1993, p. 43). But this is precisely what he did; and, as Catherine Chalier put it, "he wagered on an education that does not separate human beings" (in Chalier and Bouganim 2008, p. 16). For Levinas, a flourishing life (although he typically does not use that term) is a life lived in recognition of one's inescapable indebtedness to and responsibility for the other. It is not about forming and acting on one's own conception of the good life, with the attendant goods accruing to the self, but about a radically other-centered life—a life that begins from and returns to the other. Viewed through a Levinasian lens, then, one of the risks of promoting (especially a

robust conception of) autonomy as the main aim of education is a moral blindness in which relationships and obligations to the other come to be seen as encroachments or, as Zygmunt Bauman puts it, “stumbling blocks on the self’s march to fulfillment” (1993, p. 84). Paul Standish describes it well when he says:

Levinas is not defending heteronomous practices, such as indoctrination or slavery, which amount to blatant and thoroughgoing denials of autonomy. The point is rather to contest the kind of freedom that is realized where, within the totalized conceptions of thinking he envisages, too singular a faith in autonomy and mastery develops. Freedom arises, in his view, only on the strength of the realization of one’s responsibility, out of prior obligation. Blindness to this—in other words, the presupposition of an initial neutrality as the basis of obligations freely entered into—results in an illusory freedom, for all the apparent choices it may confer. (2008, p. 58)

Levinas’s conception of heteronomous subjectivity thus does not require a complete rejection of autonomy, but it casts it in a very different light from the rational autonomous subject at the heart of liberal education. A Levinasian kind of autonomy is an autonomy that comes into view only after we recognize, or awaken to, our prior condition of heteronomy and existential indebtedness to the other. As heteronomous subjects we are always both acting and being acted on, forming and being formed by others. Therefore, as Anna Strhan argues, “if we want to encourage students to recognize their autonomy, it is also necessary to encourage awareness that autonomy is only possible through the condition of existing in community, a community that makes demands on us, impresses on us and forms us in ways we cannot always control” (2012, p. 91).

In closing, I need to acknowledge that while there has been increasing interest in Levinas, and an admirable body of Levinasian scholarship in philosophy of education published over the last 15–20 years, this work has largely been limited to scholarly audiences; it has not, as yet, had much discernible impact on policy and practice. As I said at the outset, this may be in part due to the fact that Levinas’s ethics cannot be simply applied to practice, but I also think the fact that Levinas calls into question the very assumptions on which modern education has been built means that speaking of education after Levinas (i.e., on Levinasian terms) requires both a new educational language and new frameworks for practice. This, then, is the next challenge for those of us who find his work compelling.

## Introduction

Even beyond the borders of Germany, Klaus Mollenhauer (1928–1998) is considered a classical author of twentieth century social pedagogy (Niemeyer 1998). In addition to having worked as a social welfare worker, he also wrote a number of social-pedagogical studies as well as the highly influential *Introduction to Social Education* (Mollenhauer 1964). In the current academic debates surrounding social work, however, his arguments are rarely referenced or utilised; instead, he is considered more as a historical, critical voice, above all within the context of teaching. In a sense, Mollenhauer himself provoked this form of reception. Ten years after the publication of his *Introduction*, he wrote in the preface to a new edition: “This book bears the marks of the context in which it was written to such an extent that it only makes sense as an object of a critical engagement in the context of teaching and learning” (Mollenhauer 1976, 6). The obligation he places on the reader – to deal critically with existing ideas – is present throughout Mollenhauer’s entire thought and demonstrates his role as a strong proponent of critical pedagogy (*Kritische Erziehungswissenschaft*). He advised the coming generation to make use of his educational works for the purpose of study, and that they should emancipate themselves from his position, precisely because it is inextricably connected to its context and time. In doing so, Mollenhauer performatively demonstrates his own position within the educational sciences.

Due to the generational crisis and conflict with the younger generation, Mollenhauer distanced himself from the traditional humanistic position of the “*geisteswissenschaftliche Pädagogik*”, which was primarily oriented towards principles, thereby neglected the societal, political and social situations. Consequently,

he turned away from a humanities-oriented approach to education and towards a social science approach with its corresponding empirical methods of investigation. Nevertheless, he was aware of the fact that a purely empirical form of researching social contexts was not going to change anything regarding the actual situation confronting the youth. It had been forgotten that the emancipation from existing cultural practices is only possible if people confront them. In this way, Mollenhauer reminds us that the older generation's responsibility to the younger involves not only presenting their ways of life, but also representing them in such a way as to allow the younger generation the opportunity to engage with them, yet without closing off the possibility of critique.

However, after having uncovered these and other 'forgotten connections' (Mollenhauer 1983, English translation: Mollenhauer 2014), he found a new research field between aesthetics/culture and education, thereby taking a second turn towards a perspective of cultural studies and cultural practices. His anthropological and methodological contributions mean that he is still an important figure in the current debate: on the one hand, when it comes to the discourse concerning the measurement of 'cultural education', and on the other, in the development of a cultural studies perspective in the educational sciences. In other words, Mollenhauer's voice is still heard today when elaborating the transformation of educational science – thereby preserving its relevance – because he is viewed as a pivotal figure in the transformation of the discipline into a cultural science (see Brumlik 2006, Meyer-Drawe 2004). In contrast to rigid empirical studies and humanistic approaches to pedagogical phenomenon, Mollenhauer developed a cultural approach. The current relevance of his thought within the education discourse was achieved with his work *Detours (Umwege)* (Mollenhauer 1986), where he made use of artworks and other artistic materials in order to make them productive for educational science.

These endeavours demonstrate the connection between research focusing on theories of action and systematic approaches to educational scholarship. He confronts pedagogy with the limits or boundaries of its endeavour due to the unavailability of aesthetic experience. Mollenhauer provokes educational research to transgress boundaries by claiming: In aesthetic objectivations – especially in literature and images – educational phenomenon are “more precisely grasped than in texts that seek to clarify the questions in the name of science” (Mollenhauer 1986, 12). Mollenhauer claimed that art, as a specific form of cultural articulation, was more suitable for dealing with the cultural practices of pedagogy, and this held true both for researchers as well as actors involved in pedagogical interactions.

In his reflections, Mollenhauer struggles with the possibilities and limitations of aesthetic education. His controversial term 'aesthetic literacy' (*ästhetische Alphabetisierung*) conceptualises the dilemma of any pedagogical interaction that grasps *Bildung* or education, following Humboldt, as an interaction of subject and world. Mollenhauer problematises the side of individuals via the difficulties tied to the concept of “identity” and the discernment of aesthetic. He explains the side of the world in terms aesthetic objectivations, which as cultural artefacts, challenge

*Bildsamkeit*<sup>1</sup> and self-activation to such an extent that appropriation and disassociation occur concurrently.

The thesis of this chapter claims that Mollenhauer's voice still resonates within educational philosophy today, above all because he pursued questions intimately tied to aesthetic and cultural education. His current relevance is not only due to the innovation of referring to works of art for educationally relevant theoretical interpretation, but more generally because Mollenhauer provides connections between aesthetics/cultural and anthropological thinking regarding *Bildung* and upbringing.

## The Connection of Pedagogy, Aesthetics and Culture: Forgotten in Order to Be Remembered

In 1983, Mollenhauer published his book *Vergessene Zusammenhänge* (Forgotten Connections, 2015), which made him an internationally renowned educationalist. Brumlik considers this book a “paradigmatic, almost revolutionary development within educational science, anticipating decades in advance the cultural-scientific turn of the social sciences” (Brumlik 2009, 291; see Biesta 2014). Often this book is considered innovative only in so far as Mollenhauer made use not only of texts but also of images for his interpretations. However, behind this approach lies a much greater transformation of educationally relevant theoretical considerations both at the action- and the science-theoretical level. The general education is thematised by means of art and aesthetics in order to provoke a renewal within educational philosophy.

Even Brumlik's view that Mollenhauer's “essence of educational science is a theory of initiation into a culture” doesn't go far enough. Mollenhauer was not only interested in how the subject enters a culture but also in how it leaves it again in order itself to become culturally formative. This is a point also ignored by those who accuse Mollenhauer of having returned to a humanities-oriented pedagogy in his later period (see ABmann 2015, 257). Such accusations are based on his argument that education cannot be critical or emancipatory from the outset. But this overlooks an important aspect of Mollenhauer's argument: one cannot free oneself from culture without already being in that culture. In other words, emancipation is only possible when one is situated within something to emancipate from. If adults do not take on their responsibility for representing their own way of life, then the coming generation will not have an opportunity to critically deal with the constructions of existing reality.

In a double sense, one might call this Rousseau's misunderstanding, even though Rousseau was only viewed very one-sidedly. Indeed, his book on education starts by explaining how man makes the nature of man degenerate; however, at once he

---

<sup>1</sup>The German concept of '*Bildsamkeit*' draws directly on Rousseau's notion of 'perfectability' (*perfectibilité*), and it is misleading translated into English as 'plasticity', therefore rendering it passive.

adds that without this intervention things would be much worse, and that, by today's standards, a human left to him/herself would be completely miseducated (see Rousseau 1993, 9). After all, the conditions of our time no longer have to do with nature; instead, they are in culture, and *this is* where education must take place. "Education would be powerless and ideological if it ignored the aim of adaptation and did not prepare people to find their way in the world. However, it is just as dubious if it stops there and produces nothing more than 'well-adjusted people', as a result of which the present state, and precisely its bad sides, really asserts itself" (Adorno 1971, 109). Herein lies the criticism of critical theory and the science of education as formulated by its own proponents: criticism and emancipation require confrontation with the representation of reality. "Just as the artist depends on the historically produced material of the media he/she uses in order to 'assemble' something new, so too the child depends on those components enabling its participation as a member of society. At the same time – according to the postulates of critical theory – it would have to learn how to distance itself from this cultural material to be able to deal productively with its present time, to look to something new in the future" (Mollenhauer et al. Kursbuch 81/82, quoted after Winkler, 43).

Mollenhauer practices this process of appropriation to adaptation, while at the same time calling for self-activity, also at the level of science. The style in which he presented his thoughts in essays, commentaries, sketches and polemics performatively demonstrates that the way in which science finds expression demands its appropriation while, at the same time, allowing for a distancing from it. The proclaimed preliminary nature and transience of his thought goes so far that he hardly believes in the possibility of any systematic concept of general pedagogy (see Winkler 2002, 12). General pedagogy, he states, has become 'diffused'. "It is no longer possible, it seems to me, to bring together the scattered elements in a way which may rightly so be labelled 'systematic'" (Mollenhauer 1996, 281). Thus, Mollenhauer presents his theses by way of fragments, which are systematising, however, do not stabilise any standardised system (see Schütte/Weiß 2017).

Five years after *Forgotten Connections* was published, Dietrich Benner attempted to develop a systematic form or notion of "*Allgemeine Pädagogik*" (1987). Benner's constitutive principles of pedagogy (*Bildsamkeit* and the call for self-activity) were also present in Mollenhauer's *Forgotten Connections*. Benner's conception of general pedagogy unhinges Mollenhauer by way of a 'footnote' referring to the practice of art. The specific nature of art fits neither into Benner's praxeology nor into any general pedagogy, for it goes beyond the constraints of any system. In this incredibly dense and complicated essay from 1990, "Aesthetic Education between Criticism and Self-Certainty" captures the entire problem of the innovative, yet also problematic, connection between aesthetics and pedagogy.

This thought goes far beyond reconceiving art in the form of literature and images as 'pedagogical documents' in terms of educational theory. "In terms of methods and methodology, [Mollenhauer] broke new ground when using text and image sources from the field of art" (Brumlik 2009, 291), and he even went farther, i.e., back to the classics, albeit taking up a different perspective. The classic figures of pedagogy, namely, Herbart, Comenius, Pestalozzi, Rousseau, Schleiermacher

and Humboldt, are treated in *Forgotten Connections*, where they are confronted with the aesthetic material. If autobiographical and aesthetic objectifications by Kafka, Bernhard, Kleist, Velasquez, Dürer and Rembrandt are interpreted with a view to educational theory, then educational theory must, indeed, be ready to be irritated by them. What are these aesthetic objectifications capable of expressing that neither the texts of the pedagogical thinkers nor praxis-related experiential reports cannot? They speak a language that the sciences cannot. In so far as it is language, even if a language of art, eventually the issue of aesthetic literacy will come up. The *Forgotten Connections* are primarily about making scientists capable of understanding and interpreting the way in which artists express themselves, for the sake of their own epistemic interest. He was “certain that artistic objectifications provide better empirical material than any quantitative study” (Brumlik 2009, 293).

Mollenhauer hints to the reason why this artistic way is more appropriate when it comes to the reception, interpretation and presentation of pedagogical phenomena in the book’s motto. “The entirety of pedagogy, upbringing, has a meaning which cannot be scientifically grasped” (Blankertz 1982, quoted after Mollenhauer 2008, 7). Educational and pedagogical processes, he states, are such complex phenomena that “...if one wanted to present them separately – they would lose their specific meaning; a meaning which remains the same only by the parallel presence of all the components” (Mollenhauer 1986, 13). Scientific methods dissect and analyse, and the subject dissected into its parts is less than the whole. Mollenhauer dealt with the entire range of educational research methods. Together with Christian Rittelmeyer, he published a book in 1977 on this topic. In this text, the common methods are portrayed as conservative if they are “believed to be the only possible tools and to be valid also for the future” (Mollenhauer/Rittelmeyer 1977, 7). The critical, emancipatory question arises: “Could it perhaps be that alternatives in the research are made more difficult or impossible of which we cannot as of yet know if they are much more likely to produce new insights?” (ibid. 27). Humanities-oriented pedagogy hermeneutically generated its knowledge of education from classical texts. Socio-scientific research analytically examines by way of facts empirical data. Mollenhauer, being both sympathetic and critical of both approaches, takes cultural artefacts of art, and thus possesses fragments that contain more than the individual parts of a whole, yet which must be read not only scientifically but also aesthetically.

Mollenhauer uses Kafka’s letter to his father to grasp the failure of the entirety of *Erziehung*. In this letter, Kafka not only describes the failure of his own upbringing but, at the same time, also addresses his inability to adequately speak about this. For Mollenhauer, this self-reflection seems to be the added value of artistic products, and these products describe not just pedagogical matters of fact but also addresses the limitations of their own descriptions. In the opening quotation, Kafka announces the problem of his descriptions: “because the volume of the matter goes far beyond my memory and reason” (Kafka quoted according to Mollenhauer 2008, 9). This limitation is due to the “rational means of conceptually grasping the matter” (ibid. 11) and to the powers of recollection, which never grasps the whole of education. However, that which is fragmentary *can* be addressed and done so in

a particular way. The artistic style provides the balance between overly specific “experiential kitsch” (ibid. 12) and sweeping generalities. Resulting from the liberties of the aesthetic genre, there is no need to care about the stringency and consistency of arguments, and their obviousness need not be scientifically proven. Thus, such artistic descriptions are much closer to the impossible and paradoxical nature of education and, in a Socratic sense, take both the reader and the scientist into a “pedagogical aporia, a pathlessness” (ibid. 14), from where a new way of thinking the other may start.

Kafka, Bernhard and Sartre are the authors quoted in the autobiographic fragments to whom Mollenhauer attributes pedagogical significance, because they speak about education without a “progressive pathos” (ibid. 9). These are by no means success stories, but rather subtle descriptions of inner strife and failed identity. What Mollenhauer wants to make clear when he speaks of the failure of education is that the concept of identity is not appropriate when it comes to the aims of development and education. The concept of identity, he says, wipes out the nature of the self, making it torn, uncertain, fragmentary and not permissive of any form of contradiction. One’s self-image is not one of identity but must in principle be imagined as being an unstable and a risky sketch (ibid. 158) whose stability must be doubted. Mollenhauer didn’t consider identity to be an attainable feature or capacity but rather understood it in terms of a problem (Mollenhauer 1986, 59). For the educationalist, this means that “...identity exists only as a fiction and not as an empirically secured matter of fact” (Mollenhauer 2008, 158). The concept of identity does not stand the test of a pluralised society.

According to Mollenhauer, the failure of these educational situations is inherent in any educational process, because it is “extension and enrichment, but also restriction and devaluation of what would have been possible” (ibid. 10). Educational processes are enablement and hindrance at the same time. By allowing for one, they block other possibilities that could have been.

And aesthetic material, by way of artistic presentation, makes this clear, and it permanently demands that attention be paid not only to its content but also to its form. The “sentence, which is the linchpin of the aesthetic and argumentative structure of a section” (ibid. 30), deserves particular attention. Thus, by means of its aesthetic character and quality, we see how the material challenges the interpretation and makes it aesthetic. This way it gains in virtuosity and liberates the stringent scientific ways of observation from their methodical tunnel vision.

What is not particularly striking in textual material becomes spectacular when presented as images. The “image presents, so to speak, in a moment, what the text can only communicate spread out in time” (Mollenhauer 1986, 38). In this sense, the ability of hermeneutics is challenged anew and vitalized in a different way. This can only be accomplished via images, more precisely, stylised images, that is, aesthetic figurations. Scenes with children filmed by the scientist as fixated material can also be interpreted aesthetically and ambivalently; and yet, they lack something if they are only subjected to an analytic and not an artistic claim. They only show what the child shows us or what is immediately accessible. An image painted by an

artist (as well as a novel or a film) shows us something else – the artist’s view of the things – and, if we are lucky, it shows us how we see.

In the methodological remark on his education-oriented theoretical interpretation of an image document (see Mollenhauer 2008, 42), Mollenhauer anticipates an accusation: images are, of course, not the thing itself but rather the painter’s conception of what is painted or depicted. For Mollenhauer, it’s not the real thing that is interesting but rather its conception, i.e., not its presentation but its *representation*. For the conception simultaneously presents the “particular perspective of the producer” (ibid. 41) and a stylised generalisation in which reality is not depicted one-to-one but rather the “historically valid rules for the social construction of reality” (ibid.) appear as well. From images one can infer not only how education is conceived but also “the rules according to which ‘educational reality’ was socially constructed” (ibid.). “However, this requires the interpreter to deal not only with the contents (in the case of the image its iconographic elements), but also, and above all, that he/she directs his/her attention to the formal structures, for it is above all in these that the ‘habitus’ reveals itself – another expression for ‘rules concerning the social construction of reality’” (ibid.). Thus, the added value of an aesthetic, that is, stylised representation of reality is not only in showing but in presenting the showing.

For Mollenhauer, images harbour an educational message, which is at once a stylised depiction of the world, its reflection and its construction. An aesthetic figuration is a reflection, because, for the purpose of understanding, it must remain in the symbolic order of the world. It is a construction, because there are aesthetic shifts that deviate from this order. These two sides, which emerge at the same time, despite in a sense excluding one another, are the pivot and linchpin of Mollenhauer’s thought.

Understanding images, he says, has a double meaning for the educationalist and the practical pedagogue: “to understand the ways of life of past ages, the culture communicated by education – and as an exercise for a practical task we owe the children of today” (Mollenhauer 1986, 39). The practical task we owe the children, again, has two sides: firstly, we owe it to the children to not let our conceptions bereave them of their individual possibilities. Following Plessner, Mollenhauer formulates this as follows: “For always the child is much more than that what understanding and explaining makes immediately accessible to us” (Mollenhauer 2008, 89). To give leeway to this ‘more’ of the child, according to Schleiermacher, a good pedagogue requires a so-called ‘divinatory capability’ – a competence of foresight. Looking at images and attempting to interpret them trains our ‘divinatory capability’, making us able to “extract some of the non-conventionalised aspects of the child into the field of our attention” (ibid.). In this way, he says, we come closer to an understanding of education that “is not imagined according to the model of processing, shaping, changing of a material, but as supporting a developing potential as a dialogic relation, as call and answer, or with whatever metaphors this view has been clad with over the course of our history” (ibid. 90).

The second practical task we owe the children is the representation of culture and cultural practices in order to enable their participation. Mollenhauer elucidates this by means of Comenius’s *Orbis pictus* from 1658. This book marks the starting-

point for the representation of the world. “For 300 years pedagogy, one could say, has mirrored the world, namely in stylised depictions, a powerful aesthetic, symbolic enterprise, a gigantic collage” (ibid. 53). The modern constitution of pedagogy starts with a picture book. Why a picture book? “The image can, namely, made in the right way, simultaneously point in two directions” (ibid. 59). On the one hand, it works in the service of empiricism by providing reason with sense data, and, on the other, the image presents a structured order of the world. Both sides point to the aesthetic dimension of all forms of education: that which is perceived can be perceived in two respects – namely, as an aesthetic bodily sensual perception and as a meaningful sign within an aesthetic-symbolic order. Still today we owe it to the children to teach them how to read the signs.

### **Aesthetic Literacy: Enabling for or Hindering Aesthetic Experience**

Aesthetic education as both productive and receptive relations of individual and aesthetic objectivation/works of art splits into two sides, which, like a chiasm, are nevertheless connected: one’s own evident, sensual experience of oneself, on the one hand, and understanding or expressing a symbolic representation, on the other. The first side, under the concept of ‘aesthetic experience’, will be the cause of a furore in the philosophical as well as the educational discourse. For the second aspect, Mollenhauer invented a prominent term: aesthetic literacy.

If participation in aesthetic objectivations of culture, he says, is the goal of aesthetic education, then aesthetic products must be readable, and the young generation must be taught this capability to read (see Mollenhauer 1990b, 8). The ability to decode images, to interpret its signs and thus to read their expression can be learned and practiced. “The readability of a sign is something other than bringing together the many associations or projections that occur during the process of observing. Thus, while perhaps not the most appropriate term, aesthetic literacy is, nevertheless, a possible term for understanding the learning process, in which non-linguistic, culturally produced figurations can be localised within a historically determined field of meaning, that is, become readable as meaningful signs” (ibid. 11).

Aesthetic objects belong to cultural contexts and use these symbols, which are still recognisable, but which also – due to being aesthetically alienated – allows for other interpretations. However, before aesthetically virtuosic alienations can be liberating, the younger generation must be made familiar with the readability of the aesthetic objectivations of the existing culture. The readability of images is associated with an iconographic method that, however, always only grasps what can be compared to other things, what is divisible and generalisable – not in terms of universality but regarding the members of one cultural community.

However, what could readability mean after the arts have become autonomous if the arts speak a language that is not ‘homologous’ with the symbolisations of the

culture? Regardless of whether with a classical alphabet or an understanding of language, in the sense of body language or artistic language, “in both cases readability is tied to cognitive operations referring a signifier to a signified, and according to culturally valid rules” (ibid. 11). Talk of literacy only works metaphorically, and we will come closer to it if we understand readability also concerning “pre-literary pictographic writings” (ibid.). Those who “misunderstand the figuration in an image by Cy Twombly as childish scribbles behaves like somebody who considers hieroglyphs to be nice little pictures: he/she is illiterate” (ibid.).

The reading of images presupposes comprehensibility, a meaning and a statement that is found with any cultural product. The artist must be assumed to always want to tell something, no matter how abstract the aesthetic figuration is. One accusation might be that this is only possible with art meant to express something; contemporary art is suspected of refusing any meaning. Art that refuses any statement no longer means anything. However, even the artist’s intention to not want to say anything is, nevertheless, a statement the moment the work is presented to others. This escalation of the problem demonstrates the interwovenness of the pedagogical with linguistic philosophy, communications theory, hermeneutics and theories of art and aesthetics.

Mollenhauer himself draws the limits of aesthetic literacy, and this is not always recognised. At best, aesthetic literacy is one half of aesthetic education; however, it is what fits into the “pedagogical” (see Mollenhauer 1990a, 484), i.e., to put it into a pedagogical framework. The much larger and important part of aesthetic education – aesthetic experience – is unavailable to the pedagogue. The crucial question is if aesthetic literacy enables or hinders aesthetic experience. Literacy seems to make works of art available and is in danger of making immediate (i.e., not culturally preformed) aesthetic experience more difficult. Susan Sontag already expressed just such a criticism in her well-known essay “Against Interpretation” published in 1933. For her, “interpretation is the revenge of intellect upon art” (Sontag 2006, 13). By way of interpretation, she states, one gets a grip on the work of art intellectually speaking; however, at the same time, this capability poisons sensitivity. To this extent, aesthetic literacy would be an obstacle to aesthetic experience.

Mollenhauer sees both sides: Aesthetic figurations “can indeed always be the bearers of culturally established semantic fields, that is, cultural signs, that is, cognitively readable. Yet, at the same time, they are perceived, by means of our sensory organs, which are never completely, and above all never from the outset, trapped within the dominant cultural codes, the given formations of signs” (Mollenhauer 1990b, 13). Cognitively accessible readability stands in opposition to experiencing or feeling it, which semantically speaking does not comply with the orders. However, to keep from drifting towards the kitsch of stimulation and emotion, Mollenhauer never speaks of the emotional; instead, he speaks of self-certainty and experiences of certainty that evade verbal expression. The problem of communication is the difficulty of transforming individual aesthetic experience into an always reductive communicable language. The starting point for discussing aesthetic literacy was the fact that, on the one hand, a language is visible in art, that we recognize and interpret signs, and, on the other, it is art that also withdraws from readability, addressing us

as observers without making us understand or allowing comment. It is this latter aspect of art that rips us from an interpreting self-evidence we use to read signs. Aesthetic experience bears the potential of evoking a “fundamental disturbance of routinised social outlines of normality” (Mollenhauer 1988, 457). From Schiller’s “aesthetic state while playing” to Foucault’s “aesthetic existence”, here most of all the extraordinary position of aesthetic experience is emphasised – the “social state of suspense of aesthetic existence” (Mollenhauer 1990a, 491). It is this ‘dropping out’ that makes up both its particularity and unavailability. “The I at the moment of aesthetic experience is different from that which must survive the struggles of everyday existence” (ibid.). All pedagogical matters, whether concerning development, grasping of the world, integration into society and orientation, even including the search for identity, seems doubtful here. However, ‘dropping out’ requires having been ‘inside’. It presupposes that we are already equipped with cultural patterns of interpretation, from which we are liberated by such aesthetic experiences. “The appearance of freedom, in the aesthetic event, shines only for those already familiar with the epistemic impositions of the concepts of understanding and who are familiar with the utility expectations of social practice. This is not a task for children” (Mollenhauer 1990b, 6),<sup>2</sup> nor is it one for pedagogy. First, children need to be familiarised with cultural signs and practices before being able to liberate and emancipate themselves from them. Thus, here we are back at the starting point of the argument, without having come full circle; on the contrary, this starting point should always be taken up anew in a different way.

## Current Education-Philosophical Issues

“If they are good, aesthetic products are characterised by two things: they provoke not only the use of reason in the observer/reader/listener, but, at the same time, the use of their senses; and they are, so to speak, seismographs for the state of a culture” (Mollenhauer 1986, 10). Thus, in one sentence we find three points that demonstrate Mollenhauer’s relevance with regard to the current educational-philosophical discourse: (1.) questions of aesthetic education; (2.) aesthetic experience as a threshold experience; and (3.) pedagogy as a cultural science.

1. If *aesthetic products provoke our use of reason*, then it is about interpreting and reading them, i.e., understanding their expression. This readability is a skill that may be learned and practised and thus can become a possible task of aesthetic education. Helpful for understanding art is what Mollenhauer refers to as ‘aesthetic literacy’; a concept that is very much associated with him in the numerous reflections within the German discourse on aesthetic education. The most recent contribution to this discussion “*Einführung in die Ästhetische Bildung*” (Introduction into

---

<sup>2</sup>This idea is developed further by Michael Parmentier in his provocative essay “*Protoästhetik oder der Mangel an Ironie. Eine etwas umständliche Erläuterung der These, dass Kinder zu ästhetischen Erfahrungen im strengen Sinne nicht fähig sind*”, 2004.

Aesthetic Education) (Dietrich/Krinninger/Schubert 2012) serves to emphasise this point. Drawing on Mollenhauer, the authors point out that, while aesthetic experience is inaccessible to pedagogy, aesthetic upbringing may nevertheless make sense in order to allow for aesthetic education by way of pedagogical interaction. Literacy belongs to the four dimensions of aesthetic education. It is possible, they state, to communicate knowledge via inventories of aesthetic symbols and their historical contexts. Participation in the cultural practice of aesthetics requires the cognitive competence of being able to distinguish meanings from aesthetic signs (see *ibid.* 29). Whereas Dietrich et al. emphasise education, Klepacki and Zirfas ask about learning: “Aesthetic education: what one learns and what one does not learn” (2009). The first of the four dimensions of learning discussed is Mollenhauer’s aesthetic literacy. All of these authors, however, are aware of the limited possibilities of aesthetic literacy, and, at the same time, point to the unavailability of aesthetic experience. Often the strange ambivalence that aesthetic literacy may be simultaneously enabling and hindering remains untouched.

2. If aesthetic products provoke not only the use of reason but, at the same time, *the use of the senses*, then reference isn’t merely being made to sensual (aesthetic) perception, but rather to the crucial potential of aesthetic experience brought forth in their simultaneity. For the latter, of course, arrives at self-certainty when the recipients’ search, in their attempt to understand, does not come to an end. They continue to be impressed by the work of art: it holds a certain appeal or attraction. It is this connection of stimulating *aesthesis* and the failure of reason that tears us from the world’s self-evidence, invalidates previous orders and rules, as well as starts the game of reflecting judgement. Influenced by Foucault’s later writings on the aesthetics of existence, a wave of reinterpretations of Kant’s *Critique of Judgement* and a turn towards researching ‘aesthetic experience’ was triggered in philosophy. From an anthropological perspective, Hans-Rüdiger Müller asks about an “aesthesiology of education” (*Ästhesiologie der Bildung* 1997) and an anthropology of the senses. At the same time, via the reception of Foucault, the topic of aesthetic existence has been expanded to include the art of life and self-care. The initial studies on this topic carried out by Markus Rieger, *Ästhetik der Existenz* (Aesthetics of Existence 1997), and Thomas Coelen, *Pädagogik als Geständniswissenschaft?* (Pedagogy as a Science of Confessing? 1996), exemplify both aesthetic and social-scientific approaches. The overarching topic of Malte Brinkmann’s latest compilation *Pädagogische Erfahrung* (Pedagogical Experience 2015) as well as the idea of ‘exercises’ (*Übungen*) as a forgotten pedagogical component were also inspired by Foucault. Furthermore, in his contribution to the volume just mentioned, Norm Friesen explicitly addresses Mollenhauer’s work (see Friesen 2015).

Moreover, Christiane Thompson draws on Foucault and Adorno in her educational-philosophical study on *Bildung und die Grenzen der Erfahrung* (Education and the Limits of Experience, 2009). For Mollenhauer, authors such as Adorno, Bourdieu and Foucault are interesting for pedagogues because in their works “... the irresolvable connection between educational problems and cultural products comes to the fore” (Mollenhauer 1986, 40) – a connection that pedagogy must never forget.

3. If *aesthetic products are indicators of the state of a culture*, then the educational scholars are entitled to make use of them as material for their theoretical and empirical research on education. Micha Brumlik (2006) makes it clear that in *Forgotten Connections* Mollenhauer has recovered ‘the forgotten’ of the social scientific perspective, and thereby has renewed it via a cultural scientific perspective. The difference between the social scientific and the cultural scientific views, he says, has to do with the fact that the former is interested in the functions social actions have for institutions and the latter in the significance of public actions in different frames of meaning and their transformation (see Brumlik 2006, 62). “The modest contribution of pedagogy might consist in making its issues more a part of our cultural context again.” (Mollenhauer 2008, 19). And by this he meant not only art-historical interpretations of images, but he also demonstrates that he had arrived in the age of pop culture by asking: “How must a punk hairstyle be read, and under what conditions would that be at all possible?” (Mollenhauer 1990b, 8). This, too, is a question of aesthetic literacy – and not only a question to be dealt with by children but also by adults.

The current educational-philosophical discourse struggles to obtain a cultural scientific perspective focused on aesthetic and cultural education, not to mention the limits of its research. And within this discourse, it is clear that Mollenhauer’s voice will continue to accompany the debate into the future.

## Introduction

One of the voices that have contributed in recent decades to discussions of political education is that of the Belgian political theorist Chantal Mouffe. After some brief biographical notes, this chapter discusses Mouffe's distinctive contributions to political theory, the relevance of her work to the contemporary context, and its uptake in philosophy of education. We begin by casting Mouffe as a post-Marxist scholar, tracing both the Marxist lineage and departure from Marxism in her work. We argue that Mouffe's work is political through and through and cannot be understood outside of her persistent political concern with domination, inequality, and democratic contestation.

We focus on the concept of agonistic pluralism, which has been one of Mouffe's central contributions to political theory. Mouffe positions agonistic pluralism as an alternative to other models—most prominently the deliberative model—of democracy. One key feature of agonistic pluralism is that it sees conflict as not an undesirable phenomenon to be overcome by democratic consensus, but rather as constitutive of politics. A second key feature of agonistic pluralism is that it recognizes the affective nature of political conflict, that is, the role of collective passions in politics.

Mouffe's model of liberal democracy is particularly salient for political contexts in which concerns have been raised about political disengagement. While some have argued that youth are not, in fact, disengaged from politics and that "political engagement" may take place outside of party politics and other formal channels of liberal democracy (e.g., O'Toole et al. 2003), more traditional party-based politics

is not yet obsolete and continues to shape local, regional, national, and international landscapes of legislation and other policy directions.

In education, Mouffe's work has been taken up to argue for forms of citizenship and political education that do not suppress conflict but recognize its value for vibrant democracy, without abandoning the liberal democratic framework completely (e.g., Ruitenberg 2009; Biesta 2011; Todd 2011). We propose more work can and should be done in this area as state governments at all levels (municipal, provincial, national, etc.) continue to propose curriculum frameworks that stress "personal responsibility" and "community-mindedness" rather than genuinely *political* citizenship (see Westheimer and Kahne 2004; Ruitenberg 2015). Moreover, Mouffe (2014) insists that it is not sufficient merely to leave room for questioning and contestation; agonistic pluralism seeks also to put in place new "institutions and configurations of power" (p. 153), recognizing that these, in turn, will be contested.

Finally, recent years have seen increased attention to the affective aspects of both politics and education. Work on political emotions can be rethought in light of Mouffe's caution not to confuse emotions, which are often associated with *individuals*, with the *collective* affect required for politics. Mouffe's emphasis on the ways in which power relations and antagonism constitute political identities, rather than taking place between preexisting identities, offers a way out of unproductive identity politics while acknowledging the need for political identification. Mouffe (2014) identifies as a key question for politics today: "how are collective forms of identification created and what is the part played by affects in this process?" (p. 155). From this perspective, one of the key questions for political education today is what educational processes may play a role in the fostering of collective, political identifications, and how such educational processes can accommodate affect.

## Mouffe and Marxisms

Chantal Mouffe was born in Charleroi, in the south of Belgium, in 1943. She studied philosophy at the Catholic University of Louvain, graduating in Philosophy and Humanities (*Philosophie et Lettres*) in 1965. She moved to Paris, where she attended Louis Althusser's seminars. According to James Martin (2013), Althusser's "anti-humanist reconstruction of Marxism dominated the intellectual scene and strongly influenced her intellectual formation" (p. 2). In 1975, she graduated with an MA in Politics at the University of Essex (Alpbach n.d.). While at Essex, she met the Argentine political theorist Ernesto Laclau (1935–2014), whom she married in 1975. Since 2000, Mouffe has worked at the University of Westminster in London (UK).

Mouffe's earliest published work was the edited volume *Gramsci and Marxist Theory* (1979), which included her chapter 'Hegemony and Ideology in Gramsci.' As Martin (2013) also observes, the concept of hegemony has remained important in Mouffe's reading of contingent political arrangements and tensions. One of Mouffe's most influential works, and key to understanding her later work on agonistic pluralism, was *Hegemony and Socialist Strategy: Towards a Radical*

*Democratic Politics* (1985), which she co-authored with Laclau. The work grapples with the possibility of politics and ‘the Left’ after Marxism or, more precisely, after the Marxist insistence on class and economic position had been shown to be only one of a range of relevant identities and positions—alongside, most significantly, race and gender—involved in understanding and overcoming systemic domination and inequality. As Martin puts it:

The break made by Mouffe and Laclau from the conceptual framework of Marxism was, without a doubt, profound.... But what remained of Marxism was also significant. The authors retained a focus on relations of power and domination as the driving undercurrent of radical politics and social change. But hegemony now designated the ongoing assemblage of all social identities without privilege, and no longer merely indicated the connecting of economic classes to non-class groups and ideas. (p. 3)

Mouffe is mainly known as a ‘post-Marxist’ philosopher (as is Laclau), an adjective indicating that while she does not adhere to central Marxist tenets, her work can also not be considered as anti-Marxist or separate from its Marxist lineage.

*Hegemony and Socialist Strategy* (1985) has become a fixture in scholarship on radical democracy. Laclau and Mouffe’s main concern in this text, as well as in subsequent writings, is that the ideals of liberal socialism have been hijacked by capitalist discourses. Liberal democracy as we know it, they argue, is a manifestation of economic aims rather than a vehicle for justice and equality. As Mouffe has argued in her later writing (2005), a retrieval of the foundations of socialism “can give us an insight into ways of overcoming the obstacles to democracy constituted by the two main forms of autocratic power, large corporations and centralized big governments, and show us how to enhance the pluralism of modern societies” (p. 99). This radical democratic approach to justice connects a Marxist with a post-foundationalist perspective on identity. Departing from traditional Marxism, Laclau and Mouffe (1985/2014) outline a model that reconvenes, identifies, and reassembles political identities as asymmetrical and yet bounded. They argue that “it is impossible to fix the literal sense of each isolated struggle because each struggle overflows its own literality and comes to represent, in the consciousness of the masses, a simple moment of a more global struggle against the system” (p. 8). Mouffe’s (2005) project has been that of rewriting democracy in a way that deepens how we experience the political, without destroying liberal institutions. As she explains, her aim has been to “reinscribe socialist goals within the framework of a pluralist democracy and to insist on the necessity of their articulation with the institutions of political liberalism” (p. 90).

## Agonistic Pluralism

As noted, Mouffe has referred to her perspective as ‘radical democracy.’ ‘Radical’ can be understood in two ways. The first, and most commonly alluded to in ‘leftist’ political circles, signifies an extreme departure from tradition and traditional norms. ‘Radical’ refers to a rethinking or even abandoning of oppressive, historically

engrained, norms. However, ‘radical’ can also be understood in a second sense: as a root or an original form. In the introductory paragraph to her text *Dimensions of Radical Democracy: Pluralism, Citizenship, Community* (1992) Mouffe states: “the objective of the Left should be the extension and deepening of the democratic revolution initiated two hundred years ago” (p. 1). This idea is fleshed out in the next paragraph when she expresses her dissatisfaction with the ways in which democracy is being manifested in a contemporary context: “The problem therefore is not the ideals of modern democracy, but the fact that its political principles are a long way from being implemented, even in those societies that lay claim to them” (p. 1). Highly critical of how the founding principles of liberal democracy have been manipulated and misused, Mouffe calls for their reconsideration and for a return to the founding principles of democracy. She has labeled this framework ‘agonistic politics.’

Central to agonistic politics is the conviction that working towards equitable relations in political life is premised on the acknowledgment of how hegemony and antagonism function in political spheres. Based on her earlier work with Laclau, Mouffe reconfigures politics as always entrenched in power struggles that manifest in hegemonic relations. Citizens are constructed through hegemonic discourses and conflict. Mouffe advocates for a model of political life that does not presuppose the stable identity categories of traditional social theory. As Laclau and Mouffe (1985) argue in *Hegemony and Socialist Strategy*, “it is necessary to analyze the plurality of diverse and frequently contradictory positions, and to discard the idea of a perfectly unified and homogeneous agent, such as ‘the working class’ of classical discourse” (p. 74). Agonistic politics attempts to break down constructions of totality, particularly as these subjugate minority identities and produce fictions of what it means to be a political subject.

For Mouffe, antagonistic politics brings to the forefront what is political about political life: conflict and political passion. Liberal theory has thus far been inadequate in articulating how the realities of conflict and passion shape how the realities of politics are played out. Mouffe (2013) expressly critiques liberal theory’s incapacity to deal with either emotion or conflict when she states that

the political in its antagonistic dimension cannot be made to disappear by simply denying it or wishing it away. This is the typical liberal gesture, and such negation only leads to the impotence that characterizes liberal thought when confronted with the emergence of antagonisms and forms of violence that, according to its theory, belong to a bygone age when reason had not yet managed to control the supposedly archaic passions. (p. 4)

Conflict, then, is inevitable in democracy and constitutive of the political, but it must be underscored that Mouffe is not talking about any and all conflict. While Mouffe does continue to use the term ‘conflict’ also in later work, Paulina Tambakaki (2014), who works with Mouffe at the Centre for the Study of Democracy, prefers to use more specific terms to refer to this particular type of conflict: she refers to “agonistic contestations” and stresses that these are “*agons*, not conflicts” (p. 3). The risk with the term ‘conflict’ is that it is understood to refer to violence, and that would be a misunderstanding: “Precisely because adversaries share something in

common, the ‘grammar of democratic life’, their struggle and confrontation does not take on an extreme, violent form. The very commonality they share serves as the limiting and moderating element in their confrontation” (p. 3). The mitigating potential of ‘agonistic contestations’ is perhaps most clearly exposed when considered in post-conflict contexts. In situations of reconstruction, nation-building, and reconciliation, the misconception that conflict should be avoided not only contradicts Mouffe’s view of productive democratic engagement but stifles possibilities of political transformation. Scholars such as Briony Jones (2014) and Sarah Maddison (2015) have argued that Mouffe’s conception of the political, which embraces conflict as natural and productive, provides particular benefits for societies that remain divided due to their histories of war and violence. For example, in her discussion of how Mouffe’s work applies to post-war reconstruction and development policy, Maddison argues that Mouffe’s view of the role of conflict contributes to an inclusive vision of democratic life: by bringing ‘back in’ the voices of those who are most marginalized and offering “an opportunity to provide an alternative that enables us both to deconstruct post-war interventions and to reconstruct an alternative” (p. 253). Similarly, in his discussion of ethnic conflict in Cyprus, Michalinos Zembylas (2011) makes the case that conflict between politically opposing identities provides an important foregrounding for reconciliation. Drawing from Schaap (2006), Zembylas (2011) argues that “what is distinctive about agonistic democracy, then, is not that it seeks to resolve conflict on the basis of competing identities [but that] it aims to mediate the conflict in such a way that the other is not perceived as an ethnic other-enemy to be destroyed” (p. 62). Wishing conflict away or denying its existence is particularly fraught in contexts where citizens are working to reconcile historical and ongoing tensions. Mouffe’s work offers a reconceptualization of the democratic *agon*, allowing it to be recognized as a mediating agent. Concerns about the appropriateness of an agonistic conception of democracy for post-conflict settings may be misdirected by the translation of *agon* as conflict; if *agon* is understood as ‘battle’ or ‘struggle,’ it may be clearer that there is no post-*agon* democratic society because there is no democracy without *agon*, even in ‘post-conflict’ contexts where communities seek to overcome legacies of violence.

The Greek *agon* commonly referred to a struggle or contest, for example, in sports or cultural and religious festivals. As is the case in these contexts, political agonists accept certain limits to the contest or struggle they engage in, such as a focus on the distribution of power that exists at a given time and about which disagreement is bound to persist. Political agonists do not deny each other the right to engage in the agonistic contestation, but they treat each other as (political) adversaries rather than (moral) enemies (Mouffe 2005). However, while there are limits to agonistic contestation that prevent it from devolving into violent conflict, these limits are more capacious than in the stricter set of rules that guide, for instance, democratic contestation guided by Habermasian discourse ethics or a Rawlsian understanding of the limitations of rational, public deliberation. As we will explain later in this chapter, a key distinction is the role Mouffe ascribes to *passion* in agonistic contestation.

Mouffe's distinction between politics and the political offers crucial insight into not only how her thinking deviates from traditional liberal theory but also how her definition of antagonism is built into the framework of democracy itself. Politics, by her account, are procedural, disciplinary. These are the laws, policies, and practices such as voting, running as a member of parliament, or participating in an explicitly activist organization. For Mouffe, democracy cannot be reduced to 'politics'; rather, she uses the concept of 'the political' to signal how power and conflict are implicated in every facet of our lives. The political extends the definition of politics and encompasses all interactions that involve hegemonic power relations. The political constructs the conditions in which politics are carried out. Antagonism is an unavoidable reality in this construct; when power is acknowledged as an explicit force in decision-making and social life, conflict is inevitable. For Mouffe (2014), the recognition of this inevitability is necessary for tracing a political conduct aligned with the tenets of democracy. "It is only when the ineradicable character of division and antagonism is recognized that it is possible to think in a properly political manner and to face the challenge confronting democratic politics" (p. 150).

## Political Passion

For radical democrats such as Mouffe, political passion, like struggle, is integral to the political. Liberal theorists have not ignored the need to theorize emotion as integral to the political experience, but there are important differences between how political emotions and political passions are understood in the different frameworks.

Aristotelian philosopher Martha Nussbaum has recently argued for the recognition of emotion, and particularly love, as a political virtue. In *Political Emotions: Why Love Matters for Justice* (2013), Nussbaum asserts that public emotion is polymorphous and heterogeneous: there are ways that public emotion, specifically love, is demonstrated. Ideally, she argues, while there would be constraints on how people are encouraged to feel, there is also significant space to maneuver different iterations of political love. This space permits and encourages "different citizens to inhabit the public sphere differently, as best suits each person's age, gender, goals, values, and personality" (p. 382). The ways in which love is expressed and the objects of love are determined, at least in part, by individuals' social, political, economic positioning. Political love is polymorphous because it is rooted in the individual whose expression of love is shaped in and through constructed categories of identity. Nussbaum's conception of political emotion "leaves spaces for citizens to have particular relationships with people and causes they love, in the part of their lives that is carried out apart from politics" (p. 386).

In more recent work, Mouffe (2014) provides a clear distinction between the concept of emotion, especially if understood as virtue, i.e., individual quality or character trait, and the concept of political passion. In response to several commentaries on her work in a special issue of the journal *parallax*, she writes that, in the

political domain, “we are always dealing with collective identities, something that the term ‘emotions’ does not adequately convey because emotions are usually attached to individuals” (p. 149). Later in the article, she reiterates:

by using the term ‘passions’, I want to distinguish my reflection from the issue of individual ‘emotions’. More precisely, by ‘passions’ I designate a certain type of common affects, those that are mobilized in the political domain in the formation of the *we/they* forms of identification. (p. 155)

We return to this distinction between emotion and passion in a moment, when we discuss how Mouffe’s work has been, or is yet to be, taken up in philosophy of education.

It is important to underscore that passion in the political sphere, for Mouffe, ought to maintain a clearly political target. Disagreement with the vision for the political order that has been proposed by one’s political opponent can and should be passionate, but this passion should focus on the way in which the opponent’s political ideas and proposals violate one’s idea of a just order, not on the person of the opponent. ‘Passion’ for a cause would, in Mouffe’s view, not justify physically attacking or threatening others, or destroying private property. Passionate political acts target the practices, discourses, and institutions of politics in a hegemonic social order, not individuals who hold values different from one’s own. Recent political campaigns underscore the relevance of Mouffe’s caution against the disintegration of what ought to be *political* disagreement and debate into *moral* accusations and innuendo. The 2016 US Presidential campaigns, in particular, were dominated by attempts to undermine the moral character of the other candidate rather than to express disagreement with the content of the other’s political vision. One example was Donald Trump’s comment during the October 9, 2016, debate that he was surprised to see Bernie Sanders ‘sign on with the devil,’ referring to Sanders’ endorsement of Hillary Clinton; another was Trump’s disparagement of Clinton as a ‘nasty woman.’ The point of political conflict understood as agonistic contestation is that it does not play out on this personal moral register:

When politics is played out in the register of morality, antagonisms cannot take an agonistic form. Indeed, when opponents are defined not in political but in moral terms, they cannot be envisaged as an ‘adversary’ but only as an ‘enemy’. With the ‘evil them’ no agonistic debate is possible, they must be eradicated. (Mouffe 2005, p. 76)

The repeated ‘lock her up!’ chants during the Trump campaign are a vivid illustration of such desire for eradication.

## Radical Democratic Education

Youth civic engagement is of broad and current interest. Scholars, governmental organizations, and education policy-makers continue to respond to what has been referred to as ‘crisis’ of disengagement among youth. This crisis has been measured based on indicators including voter turnout, participation in electoral campaigns,

and volunteering (Putnam 2001). Disengagement is measured by non-participation in formal political structures. O'Toole et al. (2003), however, have denied that top-down indicators provide an accurate picture of the rate of political participation among young people or, more importantly, of the nature of politics themselves. They argue, in line with Mouffe, that the political ought to be conceived as "a lived experience" (p. 53). Further, they contend that by framing politics as located only in specific spaces, we reinforce the active/passive or engaged/disengaged binary. They argue that suggesting individuals "who do not participate in [formal political arenas] are politically apathetic is too simplistic and sweeping a statement" (p. 53). This analysis provides important insights into why current assessments of youth disengagement as a crisis may be flawed, by pointing to the limitations of the dominant framing of politics.

Drawing from Mouffe's framework of agonistic politics, philosophers of education have offered an overlapping but divergent analysis: that youth disengagement is better explained as a failure of deliberative democracy to incorporate and validate diversity in its political landscape. Mandating more of the same kind of citizenship education will not tackle the underlying issues that may drive disengagement. If the dominant curriculum discourse remains that of a deliberative democracy, this limits possibilities for enlivened democratic engagement (see van den Berg 2016). Mouffe's insights have been taken up in recent literature in philosophy of education to analyze how education might forge a different analysis of political identity, one that acknowledges the significance of identity, but that also gets us out of unpromising identity politics.

While some scholarship and curricula promoting citizenship education stress that deliberative forms of education are necessary for all citizens, Biesta (2011) raises the possibility that dominant forms of citizenship education aim to regulate new citizens, constituting a narrow form of democratic enculturation. Biesta describes "the particular role of education in the liberal view of democratic politics—and perhaps we might even say the *need* for education in the liberal democratic view of politics" as "making 'newcomers' ready for participation in democratic deliberation and decision-making" (p. 149). Biesta's view of the purpose of liberal civic education points to the exclusions of a deliberative model of citizenship. Pedagogical projects that seek to create a particular kind of citizen also seek to mold a particular form of political identity. Drawing on Mouffe, Biesta (2011) reinvents education as a process of subjectification that "generates new political subjectivities and identities" (p. 152).

### ***Agonistic Contestation in Radical Political Education***

Mouffe's work focuses on societies that are not facing violent conflict, and in which 'conflict' can be understood as agonistic contestation, as explained earlier. While education on political conflict means something different in societies in the midst of violent conflict (see, for example, Ben-Porath 2009), we believe that education on

agonistic contestation is important in any democratic context. In deliberative approaches to political education, political conflict might be presented in a 'current events' context, as information necessary for well-informed citizenship. Students may be asked to understand and discuss multiple sides and contributing factors to a particular conflict, where conflict is presented as external to the classroom. As a means of quelling conflict, deliberation or dialogue is presented as a productive way to immerse students in the art of discussion by encouraging tolerance and acceptance. In this narrative, conflict is treated as a reality that lives outside the classroom and that is preferably avoided or resolved. In a radical democratic conception of conflict, the main concern raised is "how a conception of democracy that treats disagreement as necessary and fundamental to democracy, rather than as a problem to be overcome, would change political education" (Ruitenber [2010a](#), p. 41). Consequently, examinations of how political education might become more focused on agonistic contestation have given rise to new discussions of the nature of political identity.

In Todd's ([2011](#)) critique of deliberative approaches to intercultural education that focus largely on dialogue as a means of managing cultural diversity, she offers, instead, a deepened conception of plurality with the intent of framing difference as an ontological reality rather than an issue to be dealt with. As she points out, Mouffe considers ontology and the political "as having a necessary relation" (p. 108). Todd goes on to explain: "if, in other words, an ontology of plurality sets the condition for political agonism, what is political about this agonism is that it reveals itself through action and speech" (p. 108). Focusing on the narrative self, the selves that one articulates outside of narrowly conscripted political discussions, Todd takes up the work of Hannah Arendt and Adriana Cavarero to propose political education that is not scripted but rather that works from Mouffe's basic premise, that politics (and the political) are imbued with conflict. This conflict cannot be contained or explained by the clear-cut lines of identity politics. "Conflicts are not so much about positions, perspectives and worldviews, but are articulations that are contested at the very level of who I am" (Todd [2011](#), p. 111). Todd argues for a radical conception of plurality as necessary "in order both to re-imagine the boundaries of democratic education and to address more fully the political aspects of conflict that plurality gives rise to" (p. 102).

Ruitenber ([2009](#)) has proposed several interventions aimed at instilling a radical democratic ethos within political education. Her first proposal is an education of political adversaries, "in which we educate students to disagree and to regard their opponents in political conflicts as adversaries rather than moral enemies" (p. 275). This call for a reframing of how political disagreement is construed suggests that education is an important channel for cultivating the dispositions necessary to be political adversaries. Ruitenber outlines how political education might incorporate Mouffe's conception of political conflict. For political education to be properly political, there needs to be a focus on 'political emotion' as a necessary and productive affect, understanding the role of power in reinforcing social order, and being aware of contemporary political divides through historical analysis. Political adversaries must be immersed in broader discourses of affect, power, and history to be

able to situate their perspectives and direct their emotions. These interventions, as do Todd's, situate the student as a political actor. They call for identity shifts on the part of students—from passive observers of politics (with the option to engage) to actors who are already political because they are already part of and affected by a contingent and contested hegemonic social order.

### *Political Passion in Radical Democratic Education*

There are opportunities for philosophers of education to think through the educational manifestations and uptakes of political passion as distinct from individual emotion. Ruitenberg (2009) has drawn from Mouffe's work to argue for the education of political adversaries and the education of political emotions in which "students learn to distinguish between emotions on behalf of themselves and emotions on behalf of a political collective" (p. 276). However, this argument did not specifically address the conceptual distinction between emotion and passion. Moreover, questions remain about whether particular collective affects have greater political potential than others. Nussbaum (2013) has emphasized love, Stitzlein (2012) hope, and Ruitenberg (2010a) and White (2012) have focused on anger.

Mouffe's analysis of passion provides an especially significant insight into how her framework of agonistic politics has the potential to shape political identities through education. Her framing of political passion informs her post-foundationalist approach to politics and political identity. As she explains, her concept of passion allows her "to underline the dimension of conflict and to suggest a confrontation between collective political identities" (Mouffe 2014, p. 149). Ruitenberg (2010b) has suggested classrooms as spaces in which students may learn to articulate their anger. "Political reengagement requires not just that people can get sufficiently angry about injustices, but also that they have a sense of how to channel that anger politically" (p. 377). Biesta and Todd's analyses above propose methods of subjectification that place cultural plurality and hegemonic power relations front and center. Political education has the capacity to incite and harness passion and, in doing so, formalize discourses that promote identities more deeply engrained in democratic ideals.

### **Final Thoughts**

Mouffe's work, while it emphasizes the antagonistic dimension of the political, clearly takes a stand for engagement with the institutions of politics. In doing so, it is less anarchistic in orientation than the work of other scholars associated with the 'radical democracy' label, such as Jacques Rancière. Mouffe (2013) has explicitly opposed the views of Michael Hardt and Antonio Negri as well as of Paolo Virno, who have argued against engagement with political institutions and for withdrawal

or ‘exodus.’ We call attention to Mouffe’s commitment to continued—albeit contestatory—engagement with political institutions because it has important implications for political education. Education has a substantive role to play in a robust democracy if it provides a place where young people experience an unsanitized encounter with the dominant social order. Such an encounter may provoke passionate disagreement when this social order is perceived to entail injustices. From the perspective of Mouffe’s work, the role of political education is not to squelch passionate disagreement, or to relegate these passions to the private sphere. Instead, it is to play a role in “provid[ing] democratic channels for the expression of collective affects” by helping students see how and where they may take action to demand change to the injustice that moves them. Sarah Stitzlein’s (2012) *Teaching for Dissent* takes up this challenge in the US context. While some educators may hesitate to give room to political passions in educational settings, lest they get ‘out of control,’ we are inclined to agree with Mouffe (2014) that the greater risk is of suppressing these political passions, as they are likely to find expressions other than nonviolent agonistic contestation:

Emphasizing the role of passions is no doubt open to the objection that those passions can be mobilized in ways that will undermine democratic institutions. This is clearly the fear that leads many theorists to exclude them from democratic politics. But ... this is a very perilous viewpoint because refusing to provide democratic channels for the expression of collective affects lays the terrain for antagonistic forms of their mobilization. (p. 156)

Violence is therefore more likely to erupt when political passions are dismissed, or repressed. The task is to frame conflict and passion as productive and necessary, rather than destructive. As we have argued above, this is the case not only in societies that have not seen violent conflict in recent history but also in so-called post-conflict settings. Thankfully there are educational scholars who do not shy away from political passions in educational spaces, nor from the perception that agonistic contestation is a ‘negative’ practice in its criticality. Matthew Clarke and Anne Phelan (2017) show how Mouffe’s views can reinvigorate democratic debate about “what constitutes a good education or the good of education.” They argue that this debate should be part of teacher education itself, as teachers are initiated into a profession that is entwined with the contingency and thus the inevitable democratic contestation of a given social order.

# Nietzsche on Inequality, Education, and Human Flourishing

Mark E. Jonas

## Introduction

Are inequalities of talent and achievement necessarily bad for the least talented and lowest achievers? Judging by the tenor of recent policy debates concerning educational equality the answer is, ‘Yes.’ Harry Brighouse, for example, claims that “the diversion of resources away from children who are likely to do very well and towards students who are more marginal is to be welcomed from the egalitarian point of view” (2010, p. 63–64). He goes on to say that the “undermin[ing] of the productiveness of the higher-achieving children is not a serious worry” (p. 64). On the other hand, diverting resources from the lowest-achieving students would be “objectionable” (ibid). It is important to note that Brighouse’s assessment is not extreme—it is moderate compared to the “radical conception of educational equality” proposed by more aggressive egalitarians (p. 33). What is implicit in Brighouse’s view is the belief that the existence of higher achieving students has no bearing on the improvement of the lowest achieving students, or if it has a bearing, it is negative. It is assumed that the lowest achieving students need ‘resources’ in order to improve their achievement, not relationships with higher achieving students. But what if this assumption is wrong? What if lower achieving students need relationships with higher achieving students in order to succeed? If this were the case then it would be, *pace* Brighouse, unjustifiable to undermine the higher achieving students; indeed, it would not only be unjustifiable—it would be anti-egalitarian because it would also undermine the potential achievement of the lower achieving students. In other words, if the existence of higher achieving students would support the flourishing of lower-achieving students, then it is incumbent upon policy makers to do what they can to support higher achieving students. Failure to do so would hurt the very students they are supposedly trying to help.

---

M. E. Jonas (✉)  
Wheaton College, Wheaton, IL, USA

On first glance, the supposition that lower achieving students might actually be benefitted by relationships with higher achieving students seems doubtful. The assumption is that the lower achieving students would feel inferior and would lose motivation as they compared themselves to their higher achieving peers. But is this assumption justified? On one way of conceptualizing education—where education is seen as exclusively private, individual, and competitive—then it probably is justified. But what about on other conceptions of education? Is it possible to imagine an educational community that is communal and mutually supportive, where all students see their own flourishing as intimately connected with the flourishing of others? This chapter attempts to imagine such a community by looking to Friedrich Nietzsche's *Schopenhauer as Educator*. In *Schopenhauer as Educator*, Nietzsche describes an educational community in which not only are all members challenged to become their highest selves, they are similarly challenged to assist others in their pursuit of their highest selves. Counterintuitively, Nietzsche argues that the individuals most benefitted by this pursuit are the least talented and lowest-achievers—and the way these low-achievers go about their own improvement is to first seek the improvement of the most talented and highest achievers. This surprising suggestion has led to years of misinterpretation of *Schopenhauer as Educator* as radically elitist and anti-egalitarian. These interpretations argue that *Schopenhauer as Educator* only supports the well-being of the most talented and is indifferent at best, and hostile at worst, to the well-being of the masses. This is a misinterpretation of the text, however. In *Schopenhauer as Educator*, Nietzsche articulates a vision of community that supports the well-being of the most talented and least talented, and all individuals in between.<sup>1</sup>

---

<sup>1</sup> Most Anglo-American educational theorists contend that while Nietzsche's philosophy of education may be beneficial for personal flourishing, it is not effective for societal flourishing. From this stance, Nietzsche's philosophy could be relevant to the improvement of individuals but would be irrelevant to the improvement of society as a whole. Rosenow (1989) and Johnston (1998) focus on Nietzsche's radical individualism and Nietzsche's insistence that each individual separates him- or herself from the conventions that govern the public good. However, Jenkins (1982), Hillesheim (1986), Aviram (1991), and Fennell (2005) argue further that Nietzsche is not only individualistic but elitist by advocating for an educational system that consigns the greater whole of the populace to mediocrity, drudgery, and slavery, while enabling a few elite persons to become their masters. Among political theorists, Nietzsche's reputation does not fare much better. MacIntyre (1981), Rawls (1971), Detwiler (1990), Hurka (1992), and Theile (1990), for instance, maintain that Nietzsche's philosophy is contrary to the advancement of the public good. Some argue that Nietzsche supports a radical egoism that rejects any typical moral framework that discussion of the public good could be based upon (MacIntyre 1981; Theile 1990). Others still assert that Nietzsche's ideals are elitist in that they deny the public good by advocating for the unequal distribution of capital (Rawls 1971; Hurka 1992; Detwiler 1990). This said, the multitude of elitist readings among Nietzsche scholars does not mean that there have been no interpretations of Nietzsche that are more sympathetic to his capacity to aid the public good. While considerably fewer, some theorists argue that Nietzsche's philosophy—particularly as represented in his early and middle work—is less hostile to democracy and the public good than it might seem on its face (Jonas 2009; Hargis 2010). Beyond Jonas and Hargis, there are other interpretations of Nietzsche's philosophy that are also sympathetic to democratic ideals: Owen (1995), Connolly (1981), Warren (1988), Schrifft (2000), Sassone (1996), and Bingham (2001).

The goal of this chapter is not merely to interpret Nietzsche correctly but to challenge the assumption that the best way to assist the lowest achieving students is to divert educational resources away from higher achieving students. The assumption may be the correct one, but it needs to be carefully interrogated in order to guard against a false egalitarianism that might unwittingly undermine a true egalitarianism. Nietzsche's ideas are too radical to implement wholesale, but they challenge us to think carefully about our assumptions about educational equality.

Before examining Nietzsche's ideas in *Schopenhauer as Educator*, it is important to note that many of Nietzsche's most famous and influential ideas are not found in the text. *Schopenhauer as Educator* was written in what commentators often refer to as the 'early period' of Nietzsche's development. The early period does not contain ideas like the *Overman*, the *Eternal Recurrence*, the *Will to Power*, the *revaluation of all values*, *perspectivism*, and so on. These ideas have been tremendously influential and merit serious consideration for the importance they might have for the philosophy of education. Unfortunately, a separate chapter (at least) would be needed to analyze these ideas and their relationship to the philosophy of education, and therefore I will not discuss them here. For readers who are interested in the ways philosophers of education have taken up some of these ideas, please see Yacek (2014a, b), Jonas (2009, 2013), Jonas and Nakazawa (2008), Fennell (2005), Ramaekers (2001), Smeyers (2001), Bingham (2001), Johnston (1998), Aviram (1991), Hillesheim (1986), and Rosenow (1989).

## The Received View of Nietzsche's Political Philosophy

In *A Theory of Justice*, Rawls summarizes the essence of the received view that Nietzsche is a 'perfectionist' of the elitist sort who believes that for a society to become great, the masses must sacrifice their happiness and well-being and work slavishly for the production of individual great men. For his interpretation, Rawls relies on a single passage from *Schopenhauer as Educator*: "Mankind must work continually to produce individual great human beings—this and nothing else is the task...for the question is this: how can your life, the individual life, retain the highest value, the deepest significance: Only by your living for the good of the rarest and most valuable specimens" (p. 325). Rawls summarizes this passage by claiming that Nietzsche argues that "We give value to our lives only by working for the good of the highest specimens" (p. 325). During the decades following *A Theory of Justice*, the passage Rawls quotes has been quoted time and again as an example of Nietzsche's disregard for the well-being of the masses in favor of the few.<sup>2</sup> Considering the received view's frequent reliance on the above passage to demonstrate Nietzsche's radical elitism, and considering that *prima facie* the passage

---

<sup>2</sup>The exact same passage is used in Ansell-Pearson (2001), Appel (1991), Thiele (1990), Fennell (2005), Detwiler (1990), and although he does not use the exact same passage, Conway (1997) uses nearby passages in *Schopenhauer as Educator* to make the same point.

seems clearly to support the interpretation, it may be helpful to begin with an analysis of the passage.

As mentioned, Rawls summarizes the passage by claiming that “we give value to our lives only by working for the good of the highest specimens” (p. 325). This summary is misleading, because it suggests that the average individual must work sacrificially, slavishly perhaps, for the good of the few. This is far from what Nietzsche intends. To see this, one need only read a few lines beyond the above passage where Nietzsche claims that living for the good of the few is accomplished when one has learned to “love” and has “attached his heart to some great man” (SE, 163). Attaching one’s heart to a great man is a far cry from working slavishly for him. When one attaches his heart to another, the individual is devoted to the other, but the devotion is not necessarily self-sacrificial. It may be self-enriching. It is this sort of relationship that Nietzsche has in mind.

For Nietzsche, the average individual is inspired by his exemplar to find his highest self. “It is incontestable that we are all related and allied to the saint, just as we are to the philosopher and artist; there are moments and as it were bright sparks of the fire of love in whose light we cease to understand the word ‘I’, there lies something beyond our being which at these moments moves across into it, and we are thus possessed of a heartfelt longing for bridges between here and there” (SE, 161). The ‘bridges’ referred to here are the redemptive men. The individual *wants* to help produce great men, because these great men provide him with ‘bright sparks’ of inspiration. Thus, the individual is not acting self-sacrificially by working to produce the philosophers, artists, and saints, but in fact, working for his own elevation. The reason an individual’s life “receives its highest value [and] deepest significance” from its participation in the production of great men is that the great men helped him “distinguish between those things that really promote human happiness and those that only appear to do so” (SE, 142).

From this brief analysis we see that the passage Rawls and others offer to support Nietzsche’s supposed disregard of the well-being of the many and obsession with the well-being of the few cannot be maintained. The question then becomes: does the rest of *Schopenhauer as Educator* bear out the reading of the above passage that I have offered here? The answer is yes. In fact, an examination of the rest of *Schopenhauer* strengthens the interpretation offered above.

## Conformity, Genius and a Flourishing Culture

Nietzsche begins *Schopenhauer as Educator* by explaining the chief difficulty in educating individuals to overcome and transform their initial identities: their own *laziness*. When he condemns laziness in the masses, Nietzsche can easily be misinterpreted as elitist by claiming that members of the masses are fundamentally inferior and cannot rise above their laziness. In a rather dramatic sentence, he says: “When a great thinker despises mankind, he despises its laziness: for it is on account of their laziness that men seem like factory products, things of no consequence and

unworthy to be associated with or instructed” (SE, 127). From this statement it might seem as if Nietzsche considers himself one of the ‘great thinkers’ and despises the masses himself. But this is to take the passage out of context. Rather than despising the masses for their factory product-like status, Nietzsche despises the educational and political culture that created the masses. He refers to the greed of the state and how it “desires the greatest possible dissemination and universalization of [false] culture and...the dissemination of education among its citizens can only be to its advantage in its competition with other states” (SE, 165). Furthermore, when the masses *remain* lazy they perpetuate the cycle that made them lazy in the first place. According to Nietzsche, as laziness allows individuals to be turned into factory products, teachers in the schools are implicitly relieved of the responsibility of offering individuals an education that would teach them to overcome their laziness. If students are fundamentally factory products, there is no hope of giving them any other education than a factory-like version of mass education. Indeed, while teachers may decry laziness and pretend to fight against it, the system in which those teachers work finds the laziness useful because it produces conformity. For Nietzsche, this is exactly what the so-called democratic education of his time meant: a state-run institution that had no intention of elevating people through culture, but worked merely to continue the existence of the state:

However loudly the state may proclaim its service to Culture it furthers Culture in order to further itself and cannot conceive of a goal higher than its own welfare and continued existence. What the money-makers really want when they ceaselessly demand instruction and education is in the last resort precisely money.... And this is why the conditions for the production of genius have *not improved* in modern times, and why antipathy for original men has increased to such an extent that Socrates could not have lived among us and would in any event not have attained seventy. (SE, 174)

Nietzsche wants to overthrow the state’s educational project by illuminating its machinations and calling individuals to reject the factory product status which they have accepted. Nietzsche argues that every individual is unique and irreplaceable, not a factory product without individuality. “In his heart *every* man knows quite well that, being unique, he will be in the world only once and that no imaginable chance will for a second time gather together into a unity so strangely variegated as he is: he knows it but he hides it like a bad conscience” (SE, 127, italics added). If every individual knows deep within that they are unique, Nietzsche hopes that they might be inspired to discover a means by which to raise themselves above their factory-like status. But this will require “true educators” who can “serve as an examples,” which leads to the need for the same individuals to work for “the production of the philosopher, the artists and the saints within [them] and without [them]” (SE, 160). For individuals to stop being factory products is to cease taking themselves easily. They know in their hearts that they are unique and they can, if they so choose, leave their factory product-like status behind, but to do that they must be willing to quell laziness and to work for the production of their ‘true educators’—artists, geniuses, and saints who provide a vision of human cultural flourishing that educates as it also draws aloft.

The view that individuals can overcome their tendency to laziness and become their highest, truest self continues when Nietzsche says, for instance, that “*Every human being is accustomed to discovering in himself some limitation, of his talent or his moral will, which fills him with melancholy and longing, and just as his feeling of sinfulness makes him long for the saint in him, so as an intellectual being he harbours a profound desire for the genius in him*” (SE, 142, italics added). This longing is resident in the genius and the non-genius, for all people have an ideal that they are striving for but which can never be fully obtained. “Even the greatest of men cannot attain to his own ideal. That Schopenhauer can offer us a model is certain, all the scars and blemishes notwithstanding” (SE, 143). All individuals suffer the same kind of struggle, even if the ideas towards which people struggle are unique. With this in mind, let us examine the ways that Nietzsche employs Schopenhauer as a guidepost.

For Nietzsche, the way to escape our laziness and tendency to follow the herd is to discover exemplars who can guide all people—whether the few or the many—to their highest selves. “Then one finally asks oneself: where are we, scholars and unscholarly, high placed or low, to find the moral exemplars and models among our contemporaries, the visible epitome of morality for our time?” (SE, 132–133). Exemplars are individuals who have cultivated the harmony of their emotional, physical, intellectual, and spiritual selves. Nietzsche argues that only individuals of this kind can serve as guideposts to the ideal. “I profit from a philosopher only insofar as he can be an example...But this example must be supplied by his outward life and not merely in his books—in the way, that is, in which the philosophers of Greece taught, through their bearing, what they wore and ate, and their morals, rather than by what they said, let alone what they wrote” (SE, 136–137). The problem is that, as we have seen, Nietzsche believes that such examples are almost completely absent in contemporary culture. “Never have moral educators been more needed, and never has it seemed less likely they would be found” (SE, 133). What is to be done in this case? The answer is to find examples of redemptive men from the past. For Nietzsche, Schopenhauer is such an example. He goes on to explain the ways in which Schopenhauer demonstrates the ideal. Indeed, Nietzsche takes non-Greek examples like Schopenhauer to be distressingly rare in contemporary society; he even indicates that he considered it a ‘miracle’ that Schopenhauer had the strength to overcome the cultural decay that threatened him. “It is, however, nothing less than a miracle that [Schopenhauer] was able to become this human example: for he was pressed upon, from within and without, by the most tremendous dangers which would have crushed or shattered any weaker being” (SE, 137). It was only Schopenhauer’s courageous self-command and “truly antique attitude towards philosophy” (SE, 139) that protected him from failure. What he can teach us is to “distinguish between those things that really promote human happiness and those that only appear to do so” (SE, 142). He can teach us these things by helping us to envision and approach our own ideal self.

Schopenhauer assists the geniuses as well as average individuals in becoming their highest selves. For the geniuses, he offers direction with respect to uncovering their own genius, which will have been obscured by the elements in themselves that

are products of their own age. This includes both an appreciation of the creative genius of their works and also the struggle they had to endure to achieve those works. Schopenhauer teaches the genius how to embrace the difficulties of living as a genius. Nietzsche illuminates the tribulations the geniuses will have to endure by outlining the tribulations of Schopenhauer. In the end, the geniuses are not given instruction on how to create culture-defining works but how to live in a way *that makes possible* the creation of culture-defining works.

Schopenhauer also serves as a guide to the non-genius. In the case of the average individual, Nietzsche uses Schopenhauer to reveal ‘a new circle of duties.’ Unlike the geniuses who discover their own genius, the masses learn to identify genius in others when it is lacking in themselves. Their new ‘duty’ is to strive for greatness within the pedagogy—which is exactly what the geniuses do—but when they discover in themselves limitations that separate them from the geniuses, they also discover their new goal: to promote the development of true culture. According to Nietzsche, the masses, like the geniuses, must strive “to acquire power so as to aid the evolution of the *physis* and to be for a while a corrector of its follies and ineptitudes. At first only for yourself, to be sure; but through yourself for everyone” (SE, 142). Both the genius and the average individual are meant to assist in the improvement of the world (*physis*) through the elevation of culture. The genius provides this by developing new artistic, ethical, physical, and intellectual expressions; the average individual does this by “a struggle on behalf of Culture and hostility towards those influences, habits, laws, institutions in which he fails to recognize his goal: which is the production of the genius” (SE, 163).

How does Schopenhauer teach the masses this new circle of duties? He does so in the same manner as with the geniuses. “But even the greatest of men cannot live up to their ideal. That Schopenhauer can offer us a model is certain, all these scars and blemishes notwithstanding. One might say, indeed, that in his nature which was imperfect and all too human brings us closer to him in a human sense, for it lets us see him as a fellow sufferer and not only in the remote heights of a genius” (SE, 143). This is an extremely important aspect of Nietzsche’s conception of the redemptive men, the geniuses who are to be models for both the few and the many.

The geniuses contribute to the uplift of true culture in two ways. The first way is that they produce great works of art, philosophy, and morality that are awe-inspiring and ennobling. Agreeing with Goethe, Nietzsche claims that “nature’s experiments are of value only when the artist finally comes to comprehend its stammerings, goes out to meet it halfway, and gives expression to what all these experiments are really about... ‘that the *causa finalis* of the activities of men and the world is dramatic poetry” (SE, 160). Nietzsche extends Goethe’s assertions about poetry to the rest of art, as well as philosophy and morality. Thus, what makes the geniuses great is their artistic, philosophic, or ethical genius, which produces what he calls in *On the Future of our Educational Institutions* “great and lasting works” (FEI, 66). Importantly, these works are not meant to be mere self-expressions of the genius created without regard for others. On the contrary, Nietzsche is explicit that the ultimate goal of the great and lasting works is the elevation of the few *and* the many. He claims that “the artist creates his work according to the will of nature *for the*

*good of other men*” (SE, 178; emphasis added). That Nietzsche means to include the masses in this statement is clearly seen a few lines above when he claims under current cultural conditions the great and lasting works “strike home only at the few, while they ought to strike home at everybody” (SE, 178).

But there is a second way in which the geniuses contribute to a flourishing culture, which does not depend on their singular genius. As we see in the quotation above, the importance of exemplars like Schopenhauer is not only that they produce great and lasting works, but that they provide *spiritual* (*geistig*) inspiration to *all* individuals who are seeking to become their highest selves. While second- and third-rate talents who are striving to be their highest selves are separated from the geniuses by a massive gulf with respect to their artistic, philosophical, or ethical abilities, and as such are their inferiors, they are their equals with respect to their shared struggle ‘live up to their own ideal.’ In other words, if third-rate talents, for example, attempt to overcome their “scars and blemishes” in an effort to achieve their highest self, they become, in an important sense, an equal to the genius insofar as they are fellow sufferers with him, trying to attain an ideal that is forever out of reach because it is “immeasurably high” (SE, 129) above their respective selves. It is true that the ideal to which they strive is different insofar as the genius’ is a more lofty ideal on an absolute scale, but their desire to achieve their respective ideals, and their willingness to strive to overcome their personal shortcomings that prevent them from that idea, is the same. When figures like Schopenhauer provide such an inspiration to the second- and third-rate talents, culture is elevated as the second- and third-rate talents can then become similar inspirations to lesser talents. According to Nietzsche, when all people in a society are all seeking to elevate themselves by pursuing the production of the ‘philosophers, artists, and saints,’ the culture will necessarily achieve the highest level possible. When culture reaches this level even more redemptive men will be developed which will further inspire average individuals to pursue their highest selves, and thus a continual cycle of elevation exists where all are working “at first only for [themselves], to be sure; but through [themselves] for everyone” (SE, 142).

## **Democracy, Equality and the Maximization of Student Potential**

Having established Nietzsche’s cultural vision, we can now return to the question at hand: how can contemporary democracies reconcile the goals of equality with giving all individuals the opportunity to maximize their talents? Obviously, implementing the entirety of Nietzsche’s vision will not work but nevertheless there are aspects of Nietzsche’s model that are applicable to contemporary democracies. Nietzsche’s philosophy illuminates how egalitarianism can backfire on both an individual and societal level. First, to totally eliminate indicators of achievement undercuts a

primary source of inspiration for individuals. Allowing inequality in achievement ought to be desirable for its capacity to inspire others to their own, separate greatness. As inspiration springs, the goal is not to best the person that inspired us but to simply improve our own selves, which is demonstrably beneficial for democracy.

Second, society itself also suffers because (1) intellectual, artistic, or moral achievements will be less common as individuals are less likely to strive for their highest selves, and (2) individuals will not see inequalities of talent and achievement as a personal and cultural benefit. In the case of (2), it is possible that individuals will feel envious or resentful because they have been made to believe they were as potentially talented as everyone else, when in truth they were not. In these cases, the identity of the individual will be founded on the false belief that they are equal in respect to talent and achievement rather than an accurate identity based on wanting to pursue one's highest self and encouraging others to improve their highest self.

The issue is whether it is possible that individuals can learn to be inspired by others who are more talented than they are. If the ability to be inspired by others who are superior seems natural, isn't it possible that something more could be achieved if individuals could be encouraged to appreciate and celebrate the fact that some people possess unique talents and achievements? If individuals learned to appreciate excellence in their peers, they might be inspired to improve themselves. If this were their aim, they would start to become, according to Nietzsche, equals in a vastly more important respect—they would all be seeking their highest selves, refusing to settle for their lower selves. If he is right we should seek ways of facilitating this reality in our classrooms as a means of personal and societal flourishing.

## Conclusion

According to Nietzsche, every individual *must* be given the opportunity to affect cultural change, but each individual's particular role will be different. It is true that Nietzsche believes that the cultural role of the many is to make possible the existence and flourishing of the few. But this does not mean that the many are to be sacrificed on the altar of the few. On the contrary, talk of sacrifice makes no sense here. Nietzsche does not ask the many to live for the good of the few and to sacrifice their interests but to fulfill them. According to Nietzsche, when they live for the good of the few, they are living for their own good. The few inspire the many to pursue "those things that really promote human happiness and those that only appear to do so" (SE, 142). When the many seek to improve the few, they are simultaneously and irreducibly seeking to improve themselves. Nietzsche does not believe it is possible to separate the good of the many from the good of the few—they are both necessary for a culture to flourish and for each individual to be maximally happy.

# Noddings: A Voice from the Present and Past

Susan Verducci

## Introduction

Nel Noddings is best known for her pioneering work in feminist ethics and philosophy of education. She came to national and international attention in 1984 with her book, *Caring: A Feminine Approach to Ethics and Education* (2013a). In this book, Noddings replaced the traditional Western framing of ethics in terms of an autonomous moral agent seeking objective moral action with an ethics of care, an ethics based in relation. The book grew out of consideration of women's moral experience, in particular women's experience as mothers. Noddings is an award-winning author and editor of over 20 books and 200 articles across fields as varied as ethics, philosophy of education, religious studies, peace studies, and social policy. Her books have been translated into eight languages, and her ideas applied in fields such as nursing and the health sciences. Prior to her position as the Lee L. Jacks Endowed Chair at Stanford University, Noddings taught middle and high school, and worked in administration at all levels of K-19 schooling.

## Ethics of Care

### Overview

Noddings' ethics of care replaces the notion of moral agents seeking to maximize utility or perform obligations for their own sake with situated social beings in face-to-face everyday relations with others. She argues that relationships, and not individuals, are ontologically basic (2013a, p. xxi). Human encounter and affective

response form the foundation of ethics, and moral relationships are organized in terms of connections, rather than traditional conceptions of freedom. Responding to others, providing care, preventing harm, and maintaining connection (by refusing detachment and depersonalization) characterize caring relationships.

Although the ethics of care arises from consideration of women's experience and is generally situated in feminist ethics, Noddings consistently asserts that caring is not limited to women. In the 2013 edition of *Caring*, she replaces the word 'feminine' in the title with 'relational'; *Caring: A Relational Approach to Ethics and Education* makes clear that the ethics of care is a human ethics.

### *The Phenomenology of Caring*

Caring relationships require both a one-caring and a cared-for. Noddings (2002b) highlights the necessary contributions of both parties to the caring relationship in the following:

1. A cares for B.
2. A acts in accordance with this care.
3. B recognizes that A cares for B (p. 19).

In this interdependent relationship, receptive attention and motivational displacement characterize the consciousness of the one-caring (Ibid.). Caring attends to the particular features of the moral context and the subjects involved, not their general implications. "When my caring is directed to living things, I must consider their natures, ways of life, needs, and desires. And, although I can never accomplish it entirely, I try to apprehend the reality of the other" (2013a, p. 14). Noddings names this apprehension of the reality of others 'engrossment,' and describes it as requiring receptive attention. "I receive the other into myself, and I see and feel with the other. I become a duality....The seeing and feeling are mine, but only partly and temporarily mine, as on loan to me" (2013a, p. 30). Through receptive attention and engrossment, the one-caring comes to a felt understanding of the other's reality.

This felt understanding generates motivational displacement; "[f]or if I take on the other's reality as possibility and begin to feel its reality, I feel, also, that I must act accordingly; that is, I am impelled to act as though in my own behalf, but in behalf of the other" (2013a, p. 16). In other words, the motivations of the one-caring "are put at the service of the other" (2013a, p. 33). The one-caring acts in accordance with the conditions and understandings derived from the experience of engrossment and its resulting motivational shift.

The cared-for also plays a necessary role in the caring relationship. Whereas for the one-caring, "caring is always characterized by a moving away from self," the cared-for must move toward the one-caring to "meet" her (2013a, p. 16). The cared-for must, in some way, receive and respond to the care; she must perceive that the one-caring is doing so out of regard for her, and that she is not being treated automatically or routinely (2013a, p. 19). If the one-caring does not come across to

the cared-for in this way, then caring is not present. Noddings' writes, "[h]ow good *I* can be is partly a function of how *you* – the other – receive and respond to me" (2013a, p. 6, emphasis in the original). Both the one-caring and the cared-for are necessary and valued in the ethical relation. The relationship, although not an equal one, is reciprocal.

### *Natural and Ethical Caring*

Noddings makes two important distinctions within the ethics of care. The first is between natural and ethical caring. Unlike traditional Western moral theories, caring values emotional response. In fact, Noddings locates "the very wellspring of ethical behavior in the human affective response" (2013a, p. 3). In natural caring we respond to the other "out of love or natural inclination" (2013a, p. 5). Our moral motivation arises from wanting to be moral to remain in the caring relation and to enhance the ideal of ourselves as one-caring (Ibid.). When natural caring fails, we turn to ethical caring, in which the memory of caring and being cared for shapes the ideal of ourselves as one-caring. The ethical ideal motivates caring and guides our actions in meeting the other morally, especially when natural caring is not present. For Noddings, the ethical self is an active relation between the actual self and a vision of the ideal caring self. Feelings arise from both natural and ethical caring and provide the motivation to act on behalf of the other.

### *Caring-for and Caring-About*

The second distinction Noddings makes is between caring-for (described above) and caring-about. We care 'for' others that we come in direct contact with. We do not care for things (e.g., ideas and objects) or distant others; rather, we care 'about' them. She writes that whereas caring-for requires engrossment, displacement of motivation and commitment to particular others, caring-about moves us into the public realm of caring about ideas or distant others (2013a, p. 112). Caring-about serves as a foundation for our sense of justice and acts as a force that extends caring beyond face-to-face human encounters to material, public, international, and environmental domains. Noddings, however, warns us not to "brush aside" caring-for; justice "is dependent on caring-about and caring-about is in turn dependent on caring for" (2002b, p. 6). Caring about "must be seen as instrumental in establishing the conditions under which caring-for can flourish....Caring about is empty if it does not culminate in caring relations" (2002b, pp. 23–4). For Noddings, caring interpersonal relationships are both the foundation and consequence of moral response.

The ethics of care is not a moral theory, rather it is a moral orientation or an approach to morality. Unlike traditional Western moral theories, which typically

center on justice and the determination of principles of ‘right’ action, caring places relations at the center of moral consideration. It attends to specific contexts and specific subjects. Interpersonal to its core, caring requires receptive attention, motivational displacement, reciprocity, and interdependence. The affective aspects of both natural and ethical caring entail moral response and motivate moral action. We care ‘for’ human others that we encounter, and we care ‘about’ ideas, objects, and distant others. Caring exists in the relation itself, not in the individuals involved.

## **Caring and School Reform**

Since her original work in *Caring*, Noddings has been articulating caring alternatives for school curriculum, policies, and practices. At their most basic level, these reforms derive from the relational ontology of care and advocate for attending to students’ needs and aspirations, for wanting the best for each student for each student’s sake, and for developing school structures, policies, and practices in accordance with these ideas. She draws upon John Dewey’s progressive vision of education and Walt Whitman’s dream of a democracy that “respects every form of honest work, includes people from every economic and social class, and cultivates a deep understanding of interdependence” (Noddings 2011, p. 1). Noddings’ ethics of care can be viewed as the soil from which her extensive work on school reform grows. She writes “the primary aim of every educational institution and of every educational effort must be the maintenance and enhancement of caring....It functions as end, means, and criterion for judging suggested means” (2013a, p. 172).

## ***Cultivating Caring Adults***

*Caring* (2013a) concludes with a chapter titled ‘Moral Education.’ This chapter articulates four means for establishing the conditions for caring and the nurturance of students’ ethical ideals in classrooms and schools. The first is ‘modeling.’ Noddings warns that all members of a school community – teachers, school staff, and administrators – cannot simply talk about or ‘teach’ caring as content; they must model it in their actions. Second, students and teachers must engage in ‘dialogue.’ Noddings conceives of dialogue not simply as the sharing of ideas, but rather as inquiry itself. Dialogue is not a form of indoctrination; it is a process in which teachers *and* students are learners. ‘True’ dialogue takes place when conclusions are not known and all parties openly and mutually explore, search for meaning, or attempt to solve a problem (2002a, b, p. 287). Third, schools must provide opportunities for students to ‘practice’ caring. They can do this through service activities, through work opportunities, and through the care of plants, animals, the environment, and so on. Of course, practice also requires caring for human others in their own community. It is not enough for students to intellectually understand what

it means to care; students must practice it to continuously nurture and develop their ethical ideal. Finally, schools and teachers can establish conditions for caring through ‘confirmation’ – attributing the best possible motive consonant with reality for less-than-respectable action. “Instead of blaming, shaming, and punishing...we point a student toward his or her best self, toward a developing ethical ideal” (2013a, p. xix). Modeling, dialogue, practice, and confirmation provide the basic conditions in which teachers and schools can establish conditions that cultivate caring.

### *Educational Aims*

Noddings challenges prevailing assumptions that the aims of schooling are limited to preparing students for the workforce and to preparing the nation for prosperity (2003a, b, p. 4). She adds to this short list of aims a long list of others including: the cultivation of active and engaged citizens of a democracy (2011, 2013b); moral education (2002a); membership in home-life (2006); and happiness (2003a, b). Additionally, she argues that all school reform requires reflective and ongoing discussion of the aims and purposes of education, which she calls “aims talk” (2003a, b). Aims talk suggests that educators and reformers ought not only expand the scope of their aims but also engage in continuous recursive reference and review of their practices and policies in the light of them.

### *Standards and Curriculum*

It is not surprising that Noddings severely criticizes the ‘standards’ and ‘accountability’ movements in education (2007). Reforms grounded in a relational ontology pay attention to context and to students as individuals. Attention to the particular flies in the face of standardized curriculum and high-stakes testing. In their place, Noddings recommends differentiated curriculum on a number of levels. First, she supports the existence of varied curricular paths for students. Challenging the ‘college for all’ mentality, Noddings recommends that schools develop robust and intellectually engaging vocational paths for students whose interests, talents, and aspirations lie outside of academics as currently defined in schools (2011, 2015). Not only should there be multiple paths within schools, she also advocates multiple pathways within disciplines and classes. As an example, she draws from her experience teaching a self-paced high school algebra course in which students chose to complete a minimum course, a standard high school course or an enriched course of study. Students worked through units at their own pace under the guidance of teachers. Noddings argues that this scenario, although better than the “one size fits all” pattern, does not go far enough; she notes that the students who struggled to complete the minimum course would be “better served by a course consonant with their interests” (2013b, loc 251). The seed of this idea can be found in the original *Caring*,

where she writes, “[t]he student is infinitely more important than the subject” (2013a, p. 20). To meet the needs of such students, vocational education ought to be a valued and vibrant option. Instead of moving toward standardizing curriculum and assessment, schools should provide students with multiple pathways and opportunities to identify and develop their specific aptitudes, interests, and aspirations.

Noddings also suggests including subjects in schools that historically have been excluded. “If dialogue is to occur in schools, it must be legitimate to discuss whatever is of intellectual interest to the students who are invited into dialogue. God, sex, killing, loving, fear, hope and hate must all be open to discussion” (2013a, b, p. 183). Other subjects students should explore in schools include self-understanding, parenting, the psychology of war, house and home, gender, making a living, advertising, and propaganda (2006). These curricular reforms move topics historically considered part of the private sphere to a more central position in public schooling. They also bring students into direct engagement with their own values as well as the values of others.

Noddings argues that not only do these subjects matter for cultivating flourishing adults, they also matter for creating healthy democracies. She suggests that attending to controversy and existential issues and engaging in dialogue across difference are central to cultivating moral and democratic citizens. She puts trust in Dewey’s ‘method of intelligence;’ “through dialogue, responsible experimentation, and the evaluation of current experience, students should come to the conclusions embraced by social revisionists or to well-argued alternatives” (2013b, p. 19). To learn to productively participate in complex political processes requires developing the ability to deliberate and engage in critical thinking and civil dialogue across difference, particularly differences in values.

Noddings’ vision of school reform can be seen as connected to the ideas outlined in her ethics of care. Her reforms prioritize attending to the individual development of students’ interests and aspirations through offering and valuing multiple school pathways, including vocational opportunities. They prioritize caring for students over disciplinary content and divisions, and they prioritize interpersonal connection through dialogue, particularly in the context of difference. The caring foundation of Noddings’ ideas for school reform prepares students to become not just successful workers but also flourishing adults and moral citizens of a democracy.

## Challenges to an Ethics of Care

The ethics of care has been extended and challenged by others working in ethics and philosophy of education. One extension comes from Michael Slote from the field of virtue ethics. Slote foregrounds caring as a virtue of the highest order and an ethic of care as capable of providing a comprehensive account of morality that surpasses traditional theories (Slote 2007). He proposes that an ethic of care is better suited to influence right action than traditional western rationality. Although Noddings’ moral approach is shaped by recognition of the moral limitations of rationality, she

does not claim to replace moral reasoning with caring. Again, she asserts that an ethic of care is an approach to morality that complements other approaches. Furthermore, Noddings resists the idea that care is a virtue or characteristic of individual persons. She sees it as a characteristic of a relation.

A second distinct challenge relates to care's (in)compatibility with the ends of justice. As noted above, Noddings' ethics of care was shaped by her recognition of the inadequacy of prevailing justice perspectives to articulate women's moral experience. However, critics charge that caring as a moral approach may be unable to address issues of social justice, fairness, right action, and so on. Their worry is that an unwavering focus on face-to-face relations cannot extend beyond the relation itself. In response, Noddings expanded her concept of the ethical ideal to show that the spirit of justice arises from (and is grounded in) caring. In 2002, she wrote *Starting at Home*, which articulated the implications of caring for social policy. Other feminists, notably Virginia Held (2006) and Joan Tronto (1994, 2013), also began articulating powerful connections between caring and political, economic and social issues. Again, Noddings does not consider the ethics of care to be a comprehensive moral theory, but rather a moral approach compatible with other moral approaches, including a justice perspective.

A third related challenge aims not at the theoretical aspects of caring as a moral approach, but rather to its application in education. It challenges Noddings' faith in deliberative democracy – faith in the power of understanding and dialogue as a means toward education for social justice. Noddings' clearly believes in the power of humans to care – to care about each other, to care about the earth and its inhabitants, and to care about justice. However, she has been criticized for a homogenous and essentializing view of the realities of women from feminists, and of students from those working in critical theory (Glass and Nygreen 2011). The latter argue that Noddings' reforms do not take seriously enough the segregated landscape of schooling and the differences in the social, political, and material realities of students. To the cause of social justice education, Noddings brings Dewey's method of 'intelligence' and moral commitment. Glass and Nygreen argue that these reforms are no match for structures of schooling that serve to construct, reinforce, and perpetuate social injustice for historically disadvantaged groups. They argue that not only do Noddings' reforms leave class structures intact, but they also reinforce the very inequalities embedded in these structures. Whereas Noddings (2015) recommends students study and *discuss* civil disobedience in their history classes with those who hold different views (p. 112), critical theorists recommend that moral and democratic citizenship requires that students learn to *engage* in collective action toward social justice. Without the knowledge and skills necessary for collective action, unequal social, political, and economic structures will remain undisturbed. This critique articulates a weakness of placing interpersonal relationships as the beginning and end of moral response.

## Conclusion

Despite these challenges, Noddings' voice continues to be forceful and distinctive in feminist ethics and education. It joined developmental psychologist Carol Gilligan in opening new lines of thinking in ethics in the 1980s. It profoundly influenced work in philosophy of education and in school reform. Like Dewey, Noddings advocates for "a curriculum rich enough, flexible enough, to help each child find what he or she needs to build a satisfying and satisfactory life" (2013b, p. 17). And like Whitman, she sees the public aims of education as the development of students into democratic citizens and caring adults.

At the time of this writing in 2016, although in her 80s, Noddings continues to write, to travel, and to advocate for improvements in education.

## Martha Nussbaum and the Fragility of Good Education

Lynne Wolbert

### Introduction

Educational philosopher Richard Smith observes that parents are required to become “ever more efficient and effective,” and should be better controlled and monitored (2010, pp. 357–358). The notion of ‘parenting’, which represents a way of speaking about childrearing as a ‘job’ that requires skills that can be improved, and the term ‘expert-parent’, which refers to the idea (and ideal) of the parent as a professional, are gaining popularity, claims Smith (see also Lambeir and Ramaekers 2007). The article titled “A Neuroscientist on How to Really Read to Kids” from the website ‘psychology today’ gives a good taste of what Smith is worried about:

Most parents read to their children. We’re steeped in studies about the benefits of reading to kids, so it’s become rather like a box we have to check as responsible guardians—the bare minimum a parent must do to ensure success. But most parents don’t intentionally read to their child to improve their language skills. No, instead we read to them to make them sleepy, or so they can have something to write down on their school reading logs. We pull out a nightly book to have a bedtime routine (as prescribed by child-rearing experts), to calm down our ADHD child, or maybe to get in some cuddle time before bed. (..) This is perhaps a start, but books can be far more useful tools. We just have to learn to stop simply reading to our children, and start engaging them. (..) From a neuroscientific perspective, each night most parents are losing an incredible opportunity to use artificial conflict as

real-life practice. (..)As parents, we are in control of what our children practice in an intimate and powerful way. We all want kids to be proficient readers. But on a deeper level, what do we really want our children to be good at?<sup>1</sup>

Educational philosopher Gert Biesta observes how a call for a “double transformation of both educational research and educational practice” paved the way for the idea of ‘evidence-based’ education (2007, p. 2). Evidence-based education stands for a model of (scientific) research that wants to find out ‘what works’, and an educational practice that implements that which has proven to be effective. An intervention is effective when there is a secure, measurable relation between the intervention (cause) and its result (effect) (Biesta 2007, p. 7). This implies that what the intervention is supposed to bring about is clear and a given, while to the most, if not all those involved in education, the question of ‘what school is for’, and what good education is, (still) is subject of a heated debate and ongoing (empirical and theoretical) investigation. On the website [www.neuroparent.org](http://www.neuroparent.org), the website’s mission reads: “neuroparent’s mission is to educate parents about normal brain development. This is a resource to

1. Get the facts
2. Parent with intent
3. Use parenting time wisely”.<sup>2</sup>

Smith and Biesta, as well as others, object to the tendency to think about education in ways that are predominantly informed by science (‘get the facts’), risk-management (‘what a parent must do to *ensure* success’), and ‘economic’ thinking (‘using parenting time wisely’). The aim of this chapter is first to give a clear account of this current issue in philosophy in education. What is it that these scholars precisely object to and why? Second, I propose that Martha Nussbaum’s 1986 book *The Fragility of Goodness* offers fruitful insights in this issue.<sup>3</sup> I suggest that Nussbaum’s interpretation of the Greek discussion of how much ‘luck’ a good human life needs offers a possibility to counter the assumption implicit in the use of the ‘languages’ of science, risk, and economy, namely that it is both necessary and possible to *control* education.

In the section ‘[Current Issue in Philosophy of Education](#)’ of this chapter I will elaborate on the current issue, in the section ‘[Martha Nussbaum and \*The Fragility of Goodness\*](#)’ I will lay out the position Nussbaum offers in her book. In the section ‘[The Fragility of Good Education](#)’ then, the value of her argument for the current issue will be explored and in the section ‘[Implications for Education](#)’ I will evaluate what might be the implications of an idea of fragility for good education.

<sup>3</sup> Martha Craven Nussbaum is an American philosopher and the Ernst Freud Distinguished Service Professor of Law and Ethics at the University of Chicago. Her main areas of interest are ancient Greek philosophy, political philosophy, and ethics. Important topics in her work have been and are the emotions, the status of women worldwide, and the capability approach which she further developed working with economist Amartya Sen. See her webpage at <http://www.law.uchicago.edu/faculty/nussbaum/>

## Current Issue in Philosophy of Education

### *The Need and Possibility to Control Education*

In the introduction I gave two examples of non-academic texts that reflect a tendency of educational media, as well as educational policy, (educational) science, and educators themselves (teachers and parents) to think and write about education (both formal schooling and childrearing) as if it were something that needs to be ‘controlled’, and which it is possible to control. It is the perception of several philosophers of education that these texts make use of a scientific discourse (‘research has shown that’), a discourse of risk (‘families at risk’), and/or a terminology that originally stems from economics. All three discourses assume that education is a practice that is best kept under control by educators and that it is possible to do so (in the example in the introduction it literally says that ‘parents are *in control* of what their children practice in an intimate and powerful way’). Educational sciences, as well as (developmental and neuro-)psychology are permeated with a striving for control; threats to a good development (of the child) are preferably *prevented*, or else *contained*. Situations or things that threaten all that we have under control are called *risks*. Third, a language of economics also implies the need for control, for a lack of control is a possible reduction of ‘efficiency and effectivity’.

In the following I will give some examples of scholars who object to the ‘scientization’ of education and some who object to the discourse of risk. For purposes of clarity I have distinguished between discourses of science, risk, and economy, because different scholars emphasize different phenomena to which they object, but in actual texts they are very much interrelated and interwoven (as the above examples show). For example, science is used to calculate risks and research is done with the purpose of finding ways to prevent or diminish risks. In turn, science often expresses the value of its findings in economic terms such as profit, valorization, and so on.

### Scientization

The main reason for Smith to object to ‘parenting’ is that it implies that parents are to be fully informed and skilled when they arrive at parenthood, which is highly unrealistic, or maybe even principally impossible. Moreover, it excludes how parents can learn from their children as well (2010, p. 361). ‘Parenting’ expresses a conception of childrearing as one-sided input into the development of the child, whereas many philosophers of education emphasize the importance (and many-sidedness) of the parent-child relationship (e.g., Spiecker 1984; Suissa 2006). Stefan Ramaekers and Judith Suissa also argue that the common modern way of speaking about childrearing and parents is (a) strongly informed by the language of (developmental) psychology and related to this that (b) somehow parents should be educated to be able to do a proper job (2012, p. 3). They call this the “scientization of the

parent-child relationship,” which they claim impoverishes the ways in which we can address the rich, complex, normative, and personal dimensions of parenthood and the parent-child relationship (see also Suissa 2006). In her 2016 book *Neuroparenting, the Expert Invasion of Family Life*, sociologist Jan Macvarish states that “neuroparenting is a way of thinking which claims that ‘we now know’ (by implication, once and for all) how children ought to be raised,” hence that we now, because we ‘know’ how the human brain functions, can fully control childrearing, and thus, in principle, can ensure a good education (2016, p. 1).

## A Discourse of Risk

Several philosophers of education (e.g., Smeyers 2005, 2010; Smith 2005, 2006; Papastephanou 2006; Biesta 2013) have used the concepts of ‘risk’ and ‘risk society’ to describe the desire to make education as risk-free as possible. The term ‘risk society’ was first coined by the German sociologist Ulrich Beck, who wrote his academic bestseller *Risk Society: Towards a New Modernity* (also) in 1986. Beck writes that the “paradigm of risk society” is the search for an answer to the question how we can handle the risks that are systematically produced in the process of modernization (1986, p. 2).

Paul Smeyers argues that the tendency to speak of children and families as being ‘at risk’ seems to lead in many cases to a “climate in which the legitimacy of government intervention comes to be broadly accepted” (2010, p. 272). Also, the discourse of risk might lead to “a redefinition of what it [childrearing or education in general] is supposed to be about” (ibid). Finally, referring to both Papastephanou (2006) and Smith (2005), Smeyers argues “that trying to minimize chance and uncertainty in the interests of making the world more predictable, more controllable, and safer is self-deceptive” (ibid, p. 281). Biesta takes the discussion a step further by claiming that we should even ‘embrace’ the risk of education and see it as something positive. He argues that we should not think of education in what he calls “strong terms,” as the production of something (which can be controlled), but in “weak existential terms,” that is “in terms of encounters and events” (2013, pp. 11–12). If we think about education in such terms, the thought that we in fact cannot control the outcome of the event becomes more admissible, as well as that the ‘outcome’ itself becomes a less important part of the endeavor.

Both scholars argue that ‘risk’ is an inherent part of education, of human life, and to frame risk as something that should be eliminated ignores an inherent aspect of what education *is* (see also Wolbert et al. 2018 for an analysis of different kinds of risk-taking in child rearing). Risk and uncertainty being part and parcel of what education is, it is not always worthwhile, nor feasible (but rather ‘self-deceptive’) to strive for complete control. Neither is therefore the reduction or elimination of risk a legitimate argument, on its own, to justify educational policy or practices.

## Martha Nussbaum and *The Fragility of Goodness*

### *The Fragility of Goodness*

The central theme of Nussbaum's book is the question of luck versus self-sufficiency. Luck is defined as what happens to people as opposed to what they do or make (p. 3, related to the Greek word *tuchē*), i.e., that which is not under our control (and can be good or bad for us, i.e., good or bad luck). How much of our human lives are we able to control and plan, and how much is up to luck? And how much of a good human life *should* be up to luck? This question occupied most early Greek philosophy and literature (tragedy). Nussbaum derives three themes from this general question: (1) "the role in the human good life of activities and relationships that are, in their nature, especially vulnerable to reversal" (p. 6); (2) "the relationships among these components [of an excellent life, such as friendship, love political activity, attachment to property or possessions]" (p. 6); and (3) "the ethical value of the so-called 'irrational parts of the soul': appetites, feelings, emotions" (p. 7).

No summary can do justice to the depth and broadness of the topics discussed in *The fragility of Goodness* (FG). It would be impossible to reduce all of the various ways in which the topics are interconnected into a short summary like this one, i.e., to succinctly set out all the different storylines available in this small book chapter. Therefore, I have chosen to follow one storyline, set out in Nussbaum's first chapter, that when asking the question about luck in a good human life, four other questions have to be answered as well: (1) why has this question moved to the background of ethics?; (2) what was the position and impact of Greek tragedy on the discussion on luck?; (3) how should Plato's attempt to free the human being from luck be understood?; and (4) what was Aristotle's reaction to the Platonic position? In this section, I will give a brief overview of points 1–3, and then I will discuss Aristotle separately.

Nussbaum writes that the question of how much luck a good human life needs is both strange and not strange. It is not strange, because it is a very human and intuitive question about the good life that we all ask ourselves. How much luck do I need to bear in my life? How much can I actively plan and control? And moreover, how can I secure a good life for my children? It has become a strange question in moral philosophy though, because since Kant's philosophy the idea that a good life is a *morally* good life has taken hold, in combination with the idea that moral value is immune to luck. According to Nussbaum, it is since this paradigm shift that luck is no longer a central theme in ethics (p. 5).<sup>4</sup> In a sense, it has been one of Nussbaum's aims in this book to restore the importance of this question, and make us understand that it would be good to address it (again).

In Chaps. 2 and 3, Nussbaum shows the broadness and depth of Greek tragedy. The function of tragedy is to force people to think about the inevitability of having to cope with things that happen to them without their choosing, and to explore what

---

<sup>4</sup>Until the subject was reintroduced by Williams and Nagel, among others.

human beings value. Human goods are diverse and can conflict. Moreover, because Greek tragedies tend not to offer (satisfying) solutions to the problems presented, people are forced to recognize that some problems aren't easy to 'fix' or not at all, or that the available solution doesn't necessarily solve the problem (p. 49).

This brings Nussbaum to make two points; first, she will not make a distinction between moral and non-moral claims, because the tragedies show us that all that is moral does not neatly fit in these two categories. There rather is a "messier continuum of claims judged to have various degrees of force and inevitability" (p. 30). Above that, the distinction is not self-explanatory, for different moral accounts make for different divisions between moral and non-moral. Second, Nussbaum explains that for the Greeks there was no clear division between writers of philosophy, tragedy, or poetry. All disciplines took part in the same ethical discussion of what makes a human life good, none of them any less serious than the other. This is unthinkable in modern philosophy, but Nussbaum argues that although tragedies "may be repellent to practical logic; they are also familiar from the experience of life" (p. 34). She therefore advocates a return to the use of literary texts in philosophy, a thesis she elaborates on in *Love's Knowledge* (1990).

Part II of FG analyzes the work of Plato. In the *Protagoras*, Socrates and Protagoras are eager to 'solve' the 'problems' of human vulnerability, they are in search of a *technē* (a science) of measurement that will save the human being from being vulnerable to luck. In the *Republic*, Plato defends a much more extreme conception of the best human life, namely "the life of the philosopher, whose soul the *Phaedo* describes as akin to the forms it contemplates: pure, hard, single, unchanging, unchangeable. A life then, of goodness without fragility" (p. 138).

Such a conception of the best human life implies a radically different set of values – a reduction of the plurality of values we saw in tragedies. In a sense, Plato says that reason prescribes that human beings shouldn't value things that are, or make us, vulnerable. A flourishing human being cannot be vulnerable, on the contrary, she is 'unchanging and unchangeable'. A logical consequence of the *Phaedo's* conception of the best life is for example that human beings cannot get so attached to other human beings that they can be hurt by them (i.e., be vulnerable). Note: this is something else than suggesting to tolerate goods that can make us vulnerable, but try to control this vulnerability (which was the conclusion of the *Protagoras*).

No 'ordinary' human being can ever lead the life of a Platonic philosopher. Moreover, 'ordinary' human beings wouldn't even want to; they are not willing to give up goods such as intimate relationships. According to Nussbaum, Plato nevertheless shows us two important points: (1) that human beings can be distracted or deceived by their desires, feelings, and needs, i.e., that our feelings do not necessarily always tell us the right thing to do; and (2) he reminds us that human beings *do* long to become something better than they are; it is not true that humans are happy and satisfied with their vulnerabilities and do not wish to be more in control of our lives (p. 163). Human beings would certainly wish to have worthwhile intimate relationships and never get hurt.

### *Aristotle: The Fragility of a Good Human Life*

In part III of the book (Chaps. 8, 9, 10, 11 and 12), Nussbaum discusses Aristotle's ethical position, both as an objection to Plato and as an affirmation of the wisdom of Greek tragedy. In short, Plato's *Protagoras* defended the elimination of luck by developing a science to unequivocally master our lives, and the *Phaedo* concluded that a good life necessarily has to exclude things that could render us vulnerable, while Aristotle claims that practical deliberation can never be scientific nor invulnerable. Plato needs an extra-human perspective to determine the unchangeable best life, while Aristotle demands an anthropocentric view of this best life for human beings (the person of practical wisdom, p. 290). According to Nussbaum, Aristotle's anthropocentricity implies that (a) values can be incommensurable, i.e., that there are (possibly unsolvable) dilemmas and conflicts in human lives, and (b) that priority lies with capturing the "fine detail of the concrete particular, which is the subject matter of ethical choice" (p. 301).

This conception of a flourishing life does allow for human vulnerability. There is nothing to do but to accept and value (not in itself, but for what it brings us, for example intimate relationships) this fragility. A good human life "stands in need of good things from outside" (Aristotle 2009, 1099a31–1). But, a human life is not completely at the mercy of luck: "we believe that human life is worth living, only if a good life can be secured by effort. (...) Our deep beliefs about voluntary action make it highly unlikely that we would ever discover that there was no such thing" (Nussbaum 1986, p. 321). However, Aristotle insists that a Platonic conception of the invulnerable good life is untenable, because it is forced to leave out important human values (p. 322).

The consequences of an Aristotelian conception of the good life is that uncontrolled circumstances may interfere with excellent activity (p. 327) and *eudaimonia* itself may be disrupted by the absence of certain external goods (p. 331).<sup>5</sup> This will not happen very often or very swiftly, because *eudaimonia* is, when reached, stable. But if the misfortune is great or happens frequently enough, eventually it will (p. 333).

### **The Fragility of Good Education**

In juxtaposing ancient Greek ethics with the current discontent with how education is being framed, I assume one central thing: that education is "thoroughly moral" (Biesta 2007, p. 6). Because comparing conceptions of human flourishing to ideas about education assumes that we can speak about education within the same (ethical) discourse. The question then is how the objections to the framing of education

---

<sup>5</sup>*Eudaimonia* is the Greek word commonly used in ancient Greek philosophy to describe the ultimate aim, the highest good for human beings. It is often translated as 'human flourishing'.

as striving for control can be understood in light of this assumption. Is it that the proponents of such a discourse fail to grasp the thoroughly ethical nature of education (as for example Biesta 2007, and Ramaekers and Suissa 2012 imply), or *are* the proponents and opponents having a thoroughly ethical discussion about education, and do they disagree in their ethical stances on what constitutes a good life/a good education?

The first part of the question can be linked to Nussbaum's rejection of a moral/non-moral dichotomy (1986, p. 30). The languages of risk, economy, or science are generally not *explicitly* moral. However, we can ask whether this is of crucial importance for the discussion. Whether or not both sides are conscious of or explicate that the discussion is ethical, both sides do take a stand, and they disagree. I have interpreted Nussbaum's suggestion of a messier moral continuum as saying we can still, and perhaps even better, have a discussion about which claims have which importance in education without pinpointing what is a moral claim and which not. In other words, the perceived failure to recognize the ethical dimension of education is not the core of the current issue described in this chapter. Then what do they precisely disagree about?

If we compare how Nussbaum opposes Plato and Aristotle with my opposition between a discourse of control and the objections raised by philosophers of education, at first glance it seems that we can equate 'control' with Plato and the discussed scholars with Aristotle. A good education in a Platonic sense would then not be, nor have the potential to make us fragile.

However, there is one essential difference between Plato and the current desire for control. As discussed in the section '[Current Issue in Philosophy of Education](#)', according to Nussbaum, Plato's *Phaedo* rejected the possibility of 'stabilizing' a good human life with a *technē*, and argued that the consequence of a good human life that is invulnerable has to be that certain goods that are vulnerable (or can make us vulnerable) thus cannot be incorporated in a conception of the flourishing life. The modern idea of control on the other hand, made visible in the use of the languages of science, risk, and economy, does have an underlying conception of the best life that includes vulnerability, but does not accept its consequences at the same time. It strives for control to eliminate our fragility. As in the example of intimate relationships, this idea of the best life wants to have intimate relationships without the risk of getting hurt.

Nussbaum shows us with her interpretation of Plato and Aristotle that the *desire* (to have full control) is understandable but the *belief* that it is possible to have full control, e.g., have the relationship without the risk of getting hurt, is untenable. Put differently, if someone has the perfect relationship(s) and never gets hurt, that person has been (very) lucky, but it is not something that can be enforced. The scholars discussed in this chapter object, justly, to the flaw in the conception of a good human life that underlies the desire to control that permeates the discourses I have discussed.

I think that approaching the current issue from the angle that Nussbaum provides (the question of how much luck a good human life should bear/needs) sheds light on the conceptions of the good life underlying this discussion. Whereas educational

philosophers object to seemingly different trends in education (why one should be careful with the translation of science to a broader audience; why the fact that some families are ‘at risk’ does not automatically legitimize an intervention; why evidence-based education is problematic; etc.), I think Nussbaum’s interpretation of the ancient Greeks shows us what these objections have in common, namely a shared idea about how much luck a good human life needs, i.e., what the limits are of human control.

The consequences Nussbaum sketches are that if human beings do not wish to give up these fragile goods (and I think that it is safe to assume that they do not), they must accept that there is unavoidable fragility involved in pursuing these goods. What would the acceptance of the idea of human beings as fragile mean for education?

## Implications for Education

What could be the implications of Nussbaum’s interpretation of fragility for educational theory and/or practice? Firstly, it offers an argument against the unbridled pursuit of control in education. If we value goods that contribute to or are constitutive of good education that render us fragile, such as for example the parent-child relationship or the teacher-pupil relationship, then we cannot, at the same time, claim that controllable education is a real possibility. It is not only not yet within human reach but not attainable in principle. This is not to say that we do not have the desire to be invulnerable/in control, nor that we should not have this desire, as Nussbaum has Plato remind us. Nussbaum writes in the preface of the revised edition of *FG* that the fact “that a completely invulnerable life is likely to prove impoverished by no means entails that we should prefer risky lives to more stable lives, or seek to maximize our own vulnerability, as if it were a good in itself. Up to a point, vulnerability is a necessary background condition of certain genuine human goods” (2001, p. xxx).

I think this philosophical point of the fundamental impossibility of invulnerability should receive more attention in philosophy of education. My hope is that this will make clearer what kind of ‘thing’ education is, and as such will promote the use of ‘different languages’ than the discourses of science and risk, or offer a different perspective on what science and risk *are*. This is mainly a theoretical point, but it leads to a second, more practical point.

We can explore what an Aristotelian anthropocentric ethical approach has to offer for the language that one has available to think and speak about education. Nussbaum explains what Aristotelian ethical deliberation is by looking at the tragedy of Hecuba (by Euripides). Hecuba mourns for her dead grandson who died for his city, and demands a fitting burial, although this is against the will of the gods. She deliberates about what is the proper thing to do in this particular situation, and she takes into consideration the perspective of the Greek gods, the demands of the city, but also her own grief. Hecuba displays “a flexible movement back and forth between particular and general. (...) This deliberation is itself fragile, easily influ-

enced and swayed by external happenings. Aristotelian deliberation, furthermore, is well suited to the high evaluation of fragile constituents of human life. For in allowing herself to use perception, rather than conformity to rule, as her standard, Hecuba opens herself to the value and special wonder of a particular city, a particular child; therefore to the deep grief she here expresses” (1986, pp. 316–317).

I think it important to promote the use of a language for education that takes the form of an Aristotelian deliberation. Aristotelian deliberation as a method of talking about, and doing research in education implies what one might call a ‘discourse of flexibility and fragility’. ‘Flexibility’ requires moving between the particular and the general, always reflecting on general guidelines from the position of the “fine detail of the concrete particular” (Nussbaum 1986, p. 301). ‘Fragility’ implies a certain instability of discussion, influenced by desires, feelings, and incommensurable values. In other words, under the influence of the complexity of real life. A proper educational discourse requires a deep understanding of the fragility of things that are constitutive of or contribute to good education.

## Concluding Remarks

Surprisingly, very few scholars I have discussed refer to FG. For instance, Biesta’s 2013 book about the beauty of risk is reminiscent of Nussbaum’s work, for she writes that the Greek poet Pindar’s work suggests that “part of the peculiar beauty of *human* excellence just *is* its vulnerability” (Nussbaum 1986, p. 2).

Most philosophers of education discussed here give direct or indirect account of their indebtedness to Aristotle. The fact that Nussbaum’s interpretation of the fragile human life is not mentioned is remarkable, because the particular way in which she interprets Plato and Aristotle does, in my opinion, contribute to grasping what can be said in defense of the existence of human vulnerability, as well as to clarifying how conceptions of ‘risk’ and ‘effectivity’ are colored by their underlying conception of a good human life.

# The Educational Legacy of Michael Oakeshott

Kevin Williams and Pádraig Hogan

## Introduction

This chapter addresses and evaluates two key aspects of Michael Oakeshott's theory of education. The first is his affirmation of the traditional conception of liberal education that draws on the metaphor of conversation, a metaphor that has been used by other scholars to illuminate the activities of teaching and learning. The second main feature of Oakeshott's contribution to education is his prescience regarding the rise of the culture of control in social policy. This culture was part of what in the late 1940s and 1950s he labelled 'rationalism'. It engendered a strand of profound pessimism in his thought and it continues to prompt concern in the minds of many educators in the twenty-first century.

Education for Oakeshott is an initiation via conversation into a world of personal and cultural enrichment and is of necessity liberal. It is liberal in that it is conducted in an arena which is "a place apart" (Oakeshott 1989a, pp. 69, 71–2, 76) from the business of everyday life and it also liberates us from the concerns that dominate normal living. Oakeshott's commitment to the educational potential of conversation is clear in the title of the essay 'The Voice of Conversation in the Education of Mankind' written circa 1948 (2004, pp. 187–199). In another major essay 'The Voice of Poetry in the Conversation of Mankind', written in 1959, he presents a

memorable account of what happens in human experience when genuine conversation takes place:

Thoughts of different species take wing and play round one another, responding to each other's movements and provoking one another to fresh exertions.... Conversation is not an enterprise designed to yield an extrinsic profit, a contest where a winner gets a prize, nor is it an activity of exegesis; it is an unrehearsed intellectual adventure. (Oakeshott 1981, p. 198)

He then gives explicit and eloquent expression to the relationship between conversation and education:

Education, properly speaking, is an initiation into the skill and partnership of ... conversation in which we learn to recognize the voices, to distinguish the proper occasions of utterance, and in which we acquire the intellectual and moral habits appropriate to conversation. (Ibid., p. 199)

It is indeed true that conversation is a central activity in much teaching and learning in both senses of the origin of the term. One is the sense of simply associating with different people and the second turning around thoughts and ideas in their company. As a form of association with others, conversation can refer to adults and young people mixing together in the context of organised learning and this in itself could be said to be educative. In its second sense as a shared exploration of ideas, conversation features not only in much moral education but also in the teaching of many subjects across the curriculum. It can be fruitful in promoting understanding within the major school subjects and is an essential aspect in the teaching of religion, literature, history, geography, economics and social studies. Indeed the relationship between education and conversation is captured by the term 'conversant' used to describe someone who is very much at home in a particular field. Yet in affirming the fertility of the conversation metaphor, an aspect of education that it neglects should also be noted. The focus solely on theoretical or intellectual pursuits makes Oakeshott insufficiently alert to possibilities involved in overt interaction between beings and their material environment and to the joy and great playfulness that can be a feature of this interaction. Identity creation or *Bildung*, that is, making "the most or the best" (Oakeshott 1989a, p. 47) of oneself can also assume an embodied quality. In brief, conversation as a metaphor does not yield a comprehensive view of all the education involves (see Williams 2007, 2012).

That said, how should conversation be understood in the educational context so that it becomes a genuine initiation into the world of learning?

## The Fertility of Conversation as a Metaphor in Education

Several philosophers have affirmed the potential and fertility of the metaphor of conversation to our understanding of educational endeavour. Indeed, the metaphor has recently been the subject of an entire collection of essays devoted to this theme

in Oakeshott's writings (Bakhurst and Fairfield 2016). In his most well-known work, *Philosophy and the Mirror of Nature* (1980), Richard Rorty draws on Oakeshott's conversation metaphor and on H-G. Gadamer's notion of the enduring effects of history (*Wirkungsgeschichte*). He puts both to work in dismantling traditional conceptions of metaphysics and epistemology and replacing them with a conception of philosophy itself as conversational, as distinct from truth-establishing (Chaps. 7 and 8). Highlighting the "educational" benefits of such a conception of philosophy, Rorty describes it as "edifying" philosophy, in contrast to "systematic" or foundational philosophy (p. 360ff). In a more specific sense of 'educational' there are many philosophers who have explored how Oakeshott's metaphor can enhance our understanding of the activities of teaching and learning. According to Nicholas Rengger (2001), for example, the need for initiation into the activity of conversation explains "why education is of such enormous importance to Oakeshott" (p. 259). Trent Davis (2009) believes that the metaphor has "genuine implications for the lived 'conversations' that people can and do have" (p. 398). Pádraig Hogan (2010, pp. 108–121) notes the parallel with Gadamer in the latter's notable description of human beings as being constituted by "the conversation that we are" (p. 119). Elaborating on Oakeshott's work in analysing the activity and influence of the teacher, Terry McLaughlin (2008) also refers to the notion of conversation.

The wide ranging sorts of influence over pupils that the teacher has to exert in the 'conversation between the generations' that constitutes education means that the teacher must be a *certain sort of person* who communicates not only knowledge and skill but also (parts of) him or herself. (Italics in original) (ibid., p. 225)

Tasos Kazepides (2010) makes helpful reference to the metaphor in *Education as Dialogue: Its Prerequisites and Its Enemies*, but he finds conversation less appropriate in the educational context than 'dialogue'. The precise pedagogic value of the metaphor, however, is foregrounded by K. A. Bruffee in a chapter entitled 'Peer Tutoring and the "Conversation of Mankind"' (1995, pp. 87–98). In the words of Paul Standish, we have scarcely begun

to realise the rich significance of the idea of conversation as this runs through Oakeshott's thought. The 'conversation of mankind' reconvenes the words of the dead, in reading and writing, and in so doing draws a kind of vitality from what cannot be made present. (2000, p. 168)

Of course the conversation metaphor, which Oakeshott takes from Hobbes and Montaigne, is not a new one. It also appears in the work of John Henry Newman (1901) and Matthew Arnold, two important theorists of the concept of a liberal education in the nineteenth century. The metaphor of voices is to be found in Arnold's characterisation of culture as made up of multifaceted "voices of human experience" represented by "art, science, poetry, philosophy, history, as well as of religion" (Arnold 1966, p. 47; see also Podoksik 2003, pp. 214–5). So how exactly does Oakeshott conceptualise conversation?

## Oakeshott's Conception of Conversation

Conversation, writes Oakeshott, appears “whenever talk is indulged in for its own sake, without ulterior motive” (Oakeshott 2004, p. 187) and must be distinguished from transactional or instrumental discourse, that is, discourse where our concern is with the expeditious satisfaction of wants. With genuine conversation, as he has written elsewhere, “we do not ask what it is ‘for’” (Oakeshott 1989b, p. 98) because the point of conversation lies within the activity of conversing itself, that is, in the pleasure, stimulation and enlightenment that it provides. This is why we can speak of conversation as valuable in itself, or for its own sake. Elizabeth Corey (2006) explains the spirit of conversation in its general sense in Oakeshott’s thought very well. It embraces “a focus on living in the present, a rejection of purpose and achievement in favour of enjoyment, a reading of the human condition that is both limited and expansive...” (ibid, p. 229). Many conversations are also open-ended in the sense that they have no definable end point and they can be suspended and taken up again on future occasions. This open-ended character marks a relationship between conversation and education because the principal activities with which education is concerned, in particular science and history, are also open-ended and have no terminus prescribed or prescriptible in advance (see Williams 2007, pp. 27–44).

Conversation is also to be firmly distinguished “from enquiry, from argument, from debate and from a symposium” (ibid.). It is not undertaken as a “search for ‘truth’ nor the propagation of a belief” (Oakeshott 2004, p. 188) but rather “a partnership in intellectual pleasure” (ibid.) where those who participate “must have everything in common except their opinions” (ibid.). Conversation requires a “readiness of sympathy” and a “naïve pleasure in the exchange of ideas” and a “generosity in giving and taking” (p. 193). Oakeshott takes particular pains to deny the adversarial character of conversation. According to him, the greatest enemies of conversation are the “disputatious”, “those who talk to win” (p. 189) and who suffer from “the lust to dominate” (p. 190). These are the individuals who are either unwilling or unable to listen to and hear what others have to say. To apply two terms coined by Gilbert Ryle (1973), listening is the task that is incumbent on any participant in a conversation and hearing is the achievement.

Oakeshott commends Plato for distinguishing between conversational discussion and eristic discussion. In eristic discourse “the participants are opponents; each is trying to establish his own point and to convict the other of error” (2004, p. 193). By contrast, conversational discourse is dialectical where “participants are united in a common purpose” and where the “aim of each is to show that his own view is the one which the others really believe; or conversely, that it was himself, and not the others, who began by denying a view upon which all are really agreed” (ibid.). “At once an exercise in politeness and in tactical humility”, an episode of such a conversation concludes “not when one triumphs over the other, or when each agree to differ, but when all simultaneously discover that each has been right all the time” (ibid., pp. 193–4).

There is one aspect of Oakeshott's conversational theory that needs to be noted and challenged, that is its sexist character. He condemns the potential contribution of women to conversation despite what he believes are the possession of two qualities appropriate to conversation: "they are gaily inconsequent and have little attachment to truth" (ibid.188). But "what disqualifies them is the feminine passion for management and for wanting to know where they are being taken before they get there" (p. 188). In 'The Voice of Poetry in the Conversation of Mankind' he refers to a girl who "in order to escape a conclusion, may utter what appears to be an outrageously irrelevant remark" with the aim of "turning an argument that she finds irksome into a conversation she is more at home in" (1981, p.198).

## The Value of Conversation in Teaching and Learning

An important benefit of conversation in education relates to the element of intellectual versatility that it both demands and fosters. As Oakeshott conceives the activity of conversation, its participants are challenged to practise *argumentum in utramque partem*, that is, the activity in Renaissance education whereby participants learn to attempt to appropriate and defend persuasively either side of a contentious question. Conversing involves, what he describes in the words of Eton teacher, William Corey,

the art of assuming at a moment's notice, a new intellectual position, . . . the art of entering quickly into another person's thoughts, . . . the habit of submitting to censure and refutation, . . . the art of indicating assent or dissent in graduate terms, . . . the habit of regarding minute points of accuracy, . . . the art of working out what is possible in a given time, . . . taste, discrimination, . . . mental courage and mental soberness. (Oakeshott 1981, p. 200, note 1)

It is this versatility that will enable participants in a conversation "simultaneously" to "discover that each has been right all the time" (Oakeshott 2004, pp. 193–4). Conversation both gives expression to intellectual versatility and also the opportunity to enhance further one's intellectual capacities. Yet the danger with too much versatility in conversation is that its exercise may appear to prompt a sceptical relativism and even a disregard for truth. This versatility has the potential to engender scepticism and relativism, a possibility that has been skilfully explored by Leslie Marsh (2005, pp. 252). Marsh reminds readers that in terms of Oakeshott's epistemology and of his theory of the modes of understanding (science, history, practice or practical life and art), claims to truth are modal, that is, they are embedded in distinct spheres of knowledge. Being modal, truth is plurivocal rather than univocal.

Yet the status of truth in Oakeshott's theory of conversation remains a concern among philosophers. The role of truth in teaching and learning in Oakeshott's work is addressed directly in the collection mentioned at the start of this chapter (Bakhurst and Fairfield 2016). Both David Bakhurst and Cheryl Misak express concern at Oakeshott's apparently cavalier attitude in his dismissal of truth as an aim of

conversation (see Williams 2017). In the less well-known essay ‘The Voice of Conversation in the Education of Mankind’ Oakeshott’s tone is very flippant and must give pause to educators. He goes as far as to take to task those who conceive of conversation in terms of the “search for ‘truth’” (2004, p. 188). In conversation where claims to truth are contested, he finds that agreement “to differ” is not a satisfactory outcome (p. 194). In the objectionable comment mentioned earlier he celebrates women for having “little attachment to truth” (p. 188) on the grounds that this is the right attitude in conversation. This leads us to wonder whether Oakeshott is serious or whether he is merely being characteristically provocative about those who bring too solemn an attitude to a conversation. Perhaps he should be understood as making a psychological rather than an epistemological point, namely, that the primary motivation of those who engage in conversation should be a desire for conviviality and enjoyment rather than a concern to seek truth. He could also be understood as poking fun at certain conceptions of what counts as ‘universal truth’ as in the manner of Jane Austen in the famous first line of *Pride and Prejudice*. “It is a truth universally acknowledged, that a single man in possession of a good fortune must be in want of a wife.” The truth is that, in reality, single women of modest means are often desperate to find rich husbands.

Still the criticisms of his attitude to truth by Bakhurst (2016) and Misak (2016) are telling. As Bakhurst argues, the aim of participants in conversation is normally to gain insight and insight is rooted in conceptions of truth and falsehood. He suggests that Oakeshott can appear to embrace “too aesthetic” a view of conversation that precludes the possibility of evaluating truth claims (2016, p. 14). Despite some of his provocative remarks, in her chapter on pragmatism, Misak offers a persuasive and subtle account of the profile of truth in the Oakeshottian conversation that is probably consistent with his considered view concerning its status. She attributes to Oakeshott what she describes as a “low-profile conception of truth” (p. 59), which allows us to envisage the Oakeshott’s conversation as being, in a “thin sense” (ibid.) an inquiry aimed at the pursuit of truth. The claims to truth that result from conversational encounters do not yield absolute and definitive conclusions but rather defensible and plausible argument that are open to rebuttal or indeed refutation in the light of evidence. Considered and persuasive accounts of the natural and human worlds can be offered as what Williams (2014) describes in a metaphor of Denis Donoghue’s as ‘viable’ versions of truth, in the sense that they are not contrary to reason.

The endorsement of conversation as an educational activity is consistent with the recognition of opposing views that, although perhaps incompatible, reflect a reading of some aspects of the human condition that can legitimately be affirmed by what Denis Donoghue (2002) describes as “sane and honorable” (p. 177) seekers after truth. In a different context, Williams (2014) gives an apt illustration of conversation that is conducted both in a convivial manner and prompted by a concern to discover the truth from an incident in one of Georges Simenon’s novels entitled *Maigret Tend un Piège*. After a long and sociable evening discussing over dinner the psychology of a serial killer on the loose, Maigret and a famous psychiatrist discover that they have come to a shared view of the individual’s character. The reader learns that their

insights match the psychological profile of the killer who is finally arrested. This is an example of conversation yielding truth in the mode of practical life.

Oakeshott's conception of conversation in education can be contrasted with that of Alasdair MacIntyre's. In fact it can be seen as a valuable corrective to the latter. In the final chapters of *Whose Justice? Which Rationality* (1988) and of *Three Rival Versions of Moral Enquiry* (1990), MacIntyre strongly recommends conversation in education. But he envisages conversation in both chapters as the combative presentation and defence of one's own tradition, where "we have to begin speaking as protagonists of one contending party or fall silent" (1988, p. 401). The danger with a combative or antagonistic conception is that conversation becomes what Oakeshott indicts as the exchange of points of view rather than clearly formulated ideas. To be critical "it is not good enough to have a 'point of view'... what we need is *thoughts*" (Oakeshott 1989b, p. 102). In this reference to 'thoughts' Oakeshott is identifying a requirement for something more than and other than "the possession of an armoury of arguments to prove the truth of what [one] believes" (*ibid.*).

Oakeshott's attitude towards adversarial discussion is well judged because an eristic attitude can frustrate fruitful communication. To be educationally productive, conversation must be open. Many of the features of the conversational disposition – attentiveness, tact, responsiveness, openness and availability to another person – are captured in the Italian word *disponibilità*. A full account of the conversational disposition would need to address the obstacles that ingrained sentiments can place in the path of a genuine sympathy with others. There are obvious implications of this undertaking for teachers who wish to expand the boundaries of human sympathies of their students in order and to enable them, in the words of Fred Dallmayr (2001), to take others seriously "in their lifeworlds" or "lived contexts" (p. 346). 'In genuine conversation', as Chris Lawn (1996) argues in his article on Gadamer and Oakeshott, we "learn something about ourselves as we enter sympathetically the horizon of the other" (p. 272). One task of the educator is to encourage the sympathetic imagination required to enter into conversation. The need for a conversational disposition, including willingness to listen to others and to hear what they have to say, is also very acute where religion is concerned, especially as religious and political disagreement can go together. The conversation enterprise that is education is, however, susceptible to being subverted and to the potential of such subversion attention must next be turned.

## The Culture of Control and Its Consequences

Oakeshott's insights provide a rich evaluative perspective on some dominant trends in international educational policy in the early decades of the twenty-first century, not least a culture of control that continues to gain ground as a body of managerial expertise. Such trends, already discerned by Oakeshott in the middle and later decades of the twentieth century, are inimical to the notion of education as a conversation that is open-ended and that involves interactions that may be unpredictable.

Oakeshott feared that education would become an instrument of manipulative social engineering, supported by the science of behaviourism, designed to realise the purposes of the state. He even considered that this project presaged the future “abolition of man” (1989a, p. 77). And this was before the rise of forms of state control that have become even more pervasive in the last two decades. It is a curious irony that the culture of control that Oakeshott so perceptively diagnosed and indicted in the 1950s has come to dominate education in the twenty-first century. The positivism that had its genesis at the time of the Enlightenment was designed to control nature. The positivism that developed in the 1950s, and became a pillar of educational policy in the 1980s, had a different purpose, namely, to bring social institutions under the control of government and employers. It is significant that one of Oakeshott’s most celebrated essays, ‘Rationalism in Politics’, is more about the folly of rationalism or the culture of control in education than in politics, a point perceptively noted by Efraim Podoksik (2003).

It is not surprising that Oakeshott’s work has served as a point of departure in criticising the dominance of this culture in our times. Desmond Ryan invokes Oakeshott’s essay ‘Political Education’ in his account of the “collateral damage” that was done to “the delicate eco-system” of university culture (Ryan 2002, pp. 134–5). Oakeshott’s essay explores the ecology of civil life and his insights also apply to university culture. The human interactions that occur between individuals at university can only be damaged and subverted by systems designed to measure, monitor and control them. Against the managerialism promoted by the post-1988 educational reforms in the United Kingdom, Michael Smith (1999) bases a persuasive account of the school as an educational community on Oakeshott’s work. Paul Standish (2000, p. 226) salutes Oakeshott’s ‘remarkable prescience’ in his sceptical appraisal of the way the “talk of the mission statement of the university was spreading” (ibid.). Standish endorses Oakeshott’s point about the derivative nature of ‘missions’ as shorthand for how to behave rather than programmes for action. To adapt Oakeshott’s memorable metaphor concerning the nature of ideology, a so-called mission statement is less the “quasi-divine parent” of an educational institution than “its earthly step child” (Oakeshott 1989c, p. 142). Elsewhere Standish draws upon Oakeshott’s metaphor of education as initiation into a conversation to show how university studies should be conceived (2005, p. 61). This conception is quite at odds with the “closed economy” (ibid., p. 54) of the current ideology of “proceduralism, coding and performativity” (ibid., p. 63) in higher education.

### *Controlling the Educational Conversation*

Much of what occurs in teaching and learning cannot be accommodated in terms of prescribed outcomes because “so much depends on the teacher’s judgement” especially “in responding to the rhythms of the occasion”, all of which relates more to Aristotle’s notion of practical reason – “doing the right thing, at the right time, in the right circumstances” (Standish 2005, p. 65). Standish gives an account of the teacher

in this situation that is very much consistent with the notion of the Oakeshottian conversation. The “good teacher”, he writes, “is in part the orchestrator” of propitious circumstances but she or he is “also something less centred, more exposed and perhaps more vulnerable, more open to the event” (ibid., pp. 65/66). Though there is, “no recipe”, writes Standish, “this does not mean that, for the aspiring or practising teacher, nothing can be learned: such abilities are gained by attending to examples of good practice and through readiness to learn from these” (ibid., p. 66).

The same point is made by retired primary school principal, Margaret Sutcliffe (2002). Indicting the over-prescriptive nature of the National Curriculum in the United Kingdom, she explains that every experienced teacher knows that “some of the most valuable teaching is done on the spur of the moment” (ibid., p. 156). When an appropriate teaching moment comes up in the classroom a “good teacher does not waste the opportunity but springs into action to give an instant lesson ... instead of the planned lesson” (ibid.). Unfortunately, the regime of prescribed outcomes does not accommodate this kind of spontaneity.

## *The University*

The spirit of Oakeshott’s conception of a university is far from the current reductionist view of policy-makers. The current regime of monitoring and measuring exhibits little sense that universities are first and foremost human communities. As Stephen Prickett explains, universities are “*collegial*” rather than “commercial” or “bureaucratic” institutions (2002, p. 185). Staff members in universities and schools are most of all “*colleagues*” and as colleagues “are collectively responsible for the development of their pupils, and for the advancement of their discipline” (ibid.). Richard Smith rightly argues that universities have a responsibility to respond to student concerns. This “ongoing dialogue, open and sensitive at its best” should not be “an add-on” to teaching but rather an integral part of it (Smith 2005, p. 141). The drive for efficiency that “threatens to eliminate contingency from the university” also threatens to destroy “forms of human relating, intimacy, intellectual passion, and much else” that have traditionally characterised university life (Smith 2005, p. 148). In other words, this misguided search for ‘efficiency’ is corrosive of the very notion of the university as a human community engaged in a conversational search for truth.

To endorse this critique of the culture of control in education is not to deny that there must be accountability on the part of those who are in receipt of public funds, but over-accountability and over-prescriptiveness are inimical to the conception of education as an initiation into a conversation. Nor is there anything reprehensible in expecting that educators must sometimes undertake administrative or organisational tasks. Stephen Prickett draws attention to the confusion between organisation and management. It is perfectly reasonable to expect academics to take responsibility for organising aspects of their department’s activities, but this is different from expecting them to possess management expertise in the sense of “skills in control

and motivation of people, a knowledge of the principles of economics, accountancy and bookkeeping” (Prickett 2002, p. 182). Still, the negative aspects of the culture of control recall an important lesson that Oakeshott taught for many decades. When human judgement takes second place to the rigid systems of control, what is good for human beings is overlooked. The lesson is an important part of his legacy.

And where education is publicly funded, it is not unreasonable to insist that it gives value to the taxpayer. It is possible to ensure appropriate accountability in a manner that respects the conversational nature of education and without recourse to destructive, mechanistic regimes of auditing. This can be undertaken sanely while respecting the true purposes of the conversation that is education.

# Meaningful Access for Students: A Petersian Account of Educational Inclusion

Christopher Martin

## Educational Inclusion as a Conceptual Issue

Discussions about educational inclusion are inclined to lead to disagreement in part because, behind the appearance of moral consensus, lies uncertainty over what constitutes a meaningful education at which inclusivity should be aimed. To begin with, much of the debate about classroom inclusion is the product of *conceptual confusion* about the use of the terms 'special' and 'inclusive'. For example, there is more than one meaning to the claim that a student is in need of a special education. Is one drawing a distinction between different *kinds* of educational aims, with some aims for the majority of students and special aims for others? Or is one simply talking about making 'special efforts', of a kind above and beyond what would normally be undertaken in the majority of cases and where we are still trying to achieve common educational aims?

When educational policy-makers and leaders rely on ambiguous conceptual frameworks, they can cause real moral harm. Take, for example, the recent British Columbia Supreme Court of Canada's *Moore vs. British Columbia* (2012). The case involved a school district that has closed down a diagnostic centre for students with learning disabilities. Parents were left to use their own resources to cover the shortfall in educational support. However, the parents of one of the affected students (called J) argued that the school district was discriminating against special needs students and should cover the costs of special educational provisions paid for privately. The school district argued that the centre closure was justified on the grounds that special education resources were withdrawn from *all* special education students, and so there was no discrimination. The court ruled in favour of the parents:

e-mail: [christopher.martin@ubc.ca](mailto:christopher.martin@ubc.ca)

[T]he reason children are entitled to an education is that a healthy democracy and economy require their educated contribution. Adequate special education, therefore, is not a dispensable luxury. For those with severe learning disabilities, it is the ramp that provides access to the statutory commitment to education made to *all* children in British Columbia. The ‘service’ to which J is entitled under s. 8 of the B.C. *Human Rights Code* is education generally. To define special education as the service at issue risks descending into a kind of ‘separate but equal’ approach. Comparing J only with other special needs students would mean that the District could cut *all* special needs programs and yet be immune from a claim of discrimination. If J is compared only to other special needs students, full consideration cannot be given to whether he had meaningful access to the education to which *all* students in British Columbia are entitled. This risks perpetuating the very disadvantage and exclusion the *Code* is intended to remedy. (2012, p. 362)

The ruling offers some initial clarification around the conceptual question I posed above. It is now understood as a matter of law, in some jurisdictions, that a policy distinction between ‘special’ and ‘general’ education is neither appropriate nor just.<sup>1</sup> When I say I am offering a special education I should mean that I am *enabling access*, not offering a different service or dealing with a ‘distinct and separate’ case.

So, what conceptual problem remains? There is a sense in which one can be committed to the view that education is a good to which all students are entitled, and that such an education ought not be taxonomised into different types, and still remain ‘conceptually confused’ about the moral demands of special and inclusive education. In fact, so long as this confusion remains implicit, a discriminatory distinction between ‘special’ and ‘general’ education is tacitly in force even if the distinction is not explicit.

Here is why: consider a district similar to the one described above. Instead of closing a diagnostic centre, however, the district decides that the needs of students with learning disabilities are best served when diagnostic tools and interventions are focused on functional literacy and other skills related to employability. The service is streamlined. In other words, less time struggling with Shakespeare and more time decoding job ads. The district could justify this move on the grounds that, according to provincial policy, the basic purpose of education is “the optimal development of individuals as skilful, free and purposeful persons, able to plan and manage life and to realize highest potential as individuals and as members of society” (cited in *Moore vs. British Columbia*, p. 379). Some students are going to realise their ‘highest potential’ with greater ease and to a greater degree than others. The interpretation of ‘optimal development’ is therefore key. For some students a comprehensive understanding and appreciation of Shakespeare just isn’t in the cards. Better to place our bets for the future flourishing of such students on their ability to work and be productive members of society.

On this view, streamlining a service in this way – denying some special education students certain kinds of educational *activities* normally accorded to other students – entails no discrimination of the kind found in *Moore vs. British Columbia*. This is because access is driven by the developmental needs of the individual, and

---

<sup>1</sup>For a discussion of some of the possible unjust consequences arising from the decision see Charney and Kraicer (2012).

individual development can take many and various forms depending on the student's particular needs and interests. We could call this a *constructivist* concept of educational inclusion – the view that what is being *accessed* through education is subjective well-being, broadly construed, and what counts as *meaningful* access is relative to each student as determined by their efforts and the efforts of the professionals, parents and others responsible for their care.

Counter to this kind of approach is what one could call a *perfectionist* concept of educational inclusion – the view that what is being *accessed* through education is related to some objective conception of well-being, and what counts as *meaningful* access is independent of the student. All children regardless of ability should have the opportunity to have certain kinds of educational experiences – experiences that speak to a particular ideal about what it means to be educated.<sup>2</sup>

On the perfectionist view children who are denied such experiences, regardless of ability, are simply worse off. The district would therefore be wrong to streamline its educational efforts away from Shakespeare<sup>3</sup> for the reason that the enjoyment of literature for its own sake is something that all students should have an opportunity to experience because such an experience puts students into contact with the 'best things in life'. On this view, inclusion means that the *aspirational* nature of educational values and aims should be maintained across all students and variations in ability is not a sufficient reason for compromising or qualifying this aspirational nature.

The disagreement here is no longer strictly about the justification of 'special' versus 'general' education. We can readily agree that this distinction is unhelpful, at least with respect to having intelligible debates about just access to a meaningful education. But the normative question remains: are there some kinds of educational activities or experiences to which all children are entitled regardless of ability? Or ought children receive whatever kind of support they need in order to attain a loosely defined educational goal, one that may vary considerably between different students? Should meaningful educational inclusion be understood along constructivist or perfectionist lines? What concept of education best explains the inclusive ideal?

Educational controversy about inclusion is driven, *at least in part*, by this unresolved conceptual question. Teachers and parents can each be steadfastly committed to inclusion in the abstract but nonetheless diverge with respect to what counts as meaningful inclusion. Defenders of full classroom inclusion, I suspect, are more likely to be constructivists about meaningful access, as they are wont to believe that education is about meeting the particular needs of individual students. There is no principled reason why regular classroom teachers cannot meet such needs. To claim otherwise is to arbitrarily value the needs of some children over others.

Critics of full classroom inclusion, I suspect, are more likely to be perfectionists about meaningful access, as they are wont to believe that education is about ensuring

---

<sup>2</sup>For one perfectionist account of distributive justice see Kupperman (1987).

<sup>3</sup>Shakespeare, or whatever culturally significant achievements are relevant to the community in question. My point is not to outline a *particular* perfectionist curriculum but to show how a perfectionist concept of education has implications for what counts as meaningful access to education.

that students have educational experiences of a certain quality – access is about inclusion in some common educational enterprise – and providing such educational experiences to students with severe learning disabilities requires a degree of pedagogical expertise and skill that goes beyond the remit of the traditional classroom teacher. To claim otherwise is to place the abstract ideal of inclusion above the flourishing of students.

Two different concepts of education, each advancing different notions of what is educationally worthwhile and each offering a different picture of what meaningful access looks like. How can the debate move forward? In this chapter I offer an interpretation of R.S. Peters' account of educationally worthwhile activities that might help navigate between the excesses of both constructivist and perfectionist accounts. I then point the limitations of a Petersian account of educational inclusion.

## R.S. Peters on Educationally Worthwhile Activities

R.S. Peters aims to clarify the values that purportedly distinguish education from social practices such as childrearing, socialisation or training. He takes the view that education is a normative enterprise – one that involves selecting out those traditions, forms of experience, and activities that have distinctive value for learners. More specifically, Peters argues that education is necessarily about the promotion of a desirable or worthwhile *state of mind*. The educational value of a particular activity should therefore be assessed in terms of its merits with respect to the development of mind. The educated person, then, should be the product of careful value judgements regarding what is educationally worthwhile.

Peters therefore rejects the view that education is a mere means to economically productive workers or obedient citizens. As he puts it,

[T]hese economic and sociological descriptions of education can be misleading, if taken out of context [because] they are made from the point of view of a spectator pointing to the 'function' or effects of education in a social or economic system. They are not descriptions of it from the point of view of someone engaged in that enterprise. (Peters 1963, p. 89)

On the one hand, education should involve activities that are worthwhile or beneficial *from the point of view of the individual learner*. While an activity may be beneficial in the objective sense that, say, it increases the student's human capital, it may not necessarily be educational.

On the other hand, when Peters argues that education is good for the learner, he does not mean this in a strictly subjective sense, either. Just because an activity is enjoyable for the student does not necessarily make that activity educationally worthwhile.

An activity is not educational unless one can account for why that activity contributes to the quality of mind resulting from the activity. And for Peters, some qualities of mind are worth leading out over others and deserve emphasis.

Accordingly, socialising children to function in society, while certainly important, is not sufficient for education:

The teacher who hears that he is an agent of socialization may come to think of himself as a sort of social worker striving in a very *general* sort of way to help children fit into society. He may get the impression that the teacher's task is not to educate children, in the sense in which I will later define it, but to concentrate on helping them to get on with others and to settle down contentedly to a simply job, healthy hobbies, and a happy home life. (Peters 1963, p. 90)

But what qualities of mind *are* children entitled to? Peters argues that for an activity to be educationally worthwhile it must satisfy three criteria:

First, for an activity to be educational something of value must be passed onto the learner (Peters 1963, p. 92).

Second, it must be possible to engage with valued activities in such a way that the learner can (a) understand and (b) intrinsically value those activities.

- (a) Educationally worthwhile activities must involve *reasoned comprehension and understanding*. The learner understands the “reason why” of what he or she is taught (Peters 1973a, p. 18).
- (b) The learner should also come to *value* that understanding in an instrumental *as well as intrinsic sense*. As he puts it, “[w]e would not call a man ‘educated’ who knew about science but cared nothing for truth or who regarded it merely as a means to getting hot water and hot dogs” (1963, p. 96). In other words, the learner is capable of adopting what Peters sometimes calls a “non-instrumental attitude” toward knowledge and understanding (Peters 1973b, p. 245).

Third, education requires multiple worthwhile activities that, taken together, transform and broaden the student's cognitive perspective (1963, pp. 98–100). In other words, to be educated involves having a certain breadth of understanding. Being restricted to a narrow intellectual perspective is here seen as undesirable.

Only activities that can satisfy *all three* criteria are educationally worthwhile. But which specific activities pass the test? Peters claims that theoretical activities or disciplinary “modes of experience” such as science, philosophy and history are especially suited to education. Peters makes the case by way of contrast: “There is very little to know about riding bicycles, swimming or golf. It is largely a matter of ‘knowing how’ rather than of ‘knowing that’. Furthermore what there is to know throws very little light on much else” (Peters 1963, p. 100). Compare this with bodies of knowledge such as history, science, and literature where “there is an immense amount to know, and, if it is properly assimilated, it constantly throws light on, widens, and deepens one's view of countless other things” (p. 100). For example, the progressive acquisition of scientific understanding opens a new perspective on the natural world. Not only does that person learn many scientific facts about nature, they understand what makes a fact ‘scientific’ and how such facts are different from other kinds of facts. Similarly, acquiring an aesthetic point of view allows one to know and experience one's surroundings in a manner that is mindful of its beauty. Both forms, science and art, together contribute to a fuller picture of the world and it is this expanded perspective, argues Peters, that characterises the educated mind.

## A Petersian Account of Educational Inclusion

Peters' concept of education understands 'the educated person' as someone who has been *empowered* to engage intelligently from a variety of epistemic perspectives: scientific, aesthetic, ethical, philosophical and so on. His account of educationally worthwhile activities, if coherent and justifiable, may go some way to addressing the question of meaningful access to education.

Recall that disagreement about educational inclusion turns on the question of access, where the criteria of *meaningful* access are informed by two rival concepts of education. My proposal is that Peters' concept of education can reconcile these two concepts.

In order to see how, let's examine what a Petersian point of view might have to say about each conception. It should not be hard to see how Peters' account would find fault in the constructivist conception of meaningful access. Classroom experiences that prepare students for a productive life in modern society, while surely important, are insufficient from an educational point of view. There is no principled reason why students of diverse ability should not be initiated into transformative forms of knowledge and understanding. As Mary Warnock puts it, "inclusion should mean being involved in a common enterprise of learning" (2010, p. 32). I am inclined to think that a Petersian position points to the same general conclusion. For Peters, education is more than mere socialisation, rather it is an initiation into modes of experience through which humanity has come to understand the world. If Peters is right, and yet we continue to assume that socialisation were sufficient for special education students, we would be implicitly embracing the kind of conceptual distinction that the BC Supreme Court argued was discriminatory, for we would be endorsing 'function' as adequate for some students while reserving an education in forms of knowledge for others. There is a sense, then, that the constructivist conception could be seen to be over-emphasising the 'value' criterion at the expense of the other two criteria. Of course the learning experience should be beneficial to the individual learner, and this requires engaging with the needs and interests of particular students. However, while these needs and interests should serve as a *basis* for the development of qualities of mind, their satisfaction alone is not sufficient for such development.

To be sure, the extent to which children of diverse ability can be initiated into transformative modes of thought and experience will differ. But this is no reason to deny such an initiation. Many students, regardless of cognitive ability, should have the opportunity to take intrinsic enjoyment in whatever advances in knowledge and understanding they achieve however unremarkable and incremental they may appear to others, for on a Petersian view they *are* remarkable and worth celebrating. In short, the constructivist concept of education is a poor framework for understanding meaningful access to education because, while understandably aiming to frame access as that which is *accessible*, it underestimates the capacity of students of diverse ability to experience an educational transformation of the kind articulated by Peters.

However, this does not mean that a perfectionist conception of inclusion will do, either. Educational perfectionists, as I have said, believe that education should expose learners to the best humanity has to offer in terms of knowledge and understanding. Anything less isn't a 'real' education but a pale imitation: if I haven't experienced Shakespeare or similarly revered cultural goods I am worse off because this puts me at a serious disadvantage in achieving an objective standard of well-being.

However, a Petersian conception of meaningful access would likely see this as too austere. This is because the perfectionist conception neglects *the reason why* forms of knowledge and understanding promote a desirable state of mind. Modes of thought an initiation into modes of thought isn't about putting the learner into contact with some objective standard of the good *a la* the Greeks.<sup>4</sup> A *meaningfully* inclusive conception of education is one that is attainable for a child regardless of where they are on the continuum of ability (Warnock 2010, p. 16).

First, recall that for Peters activities are worthwhile just because they have the potential to transform the perspective of the learner. The point isn't that an understanding of *Shakespeare qua Shakespeare* is transformative, rather the agreed norms and standards that define great art are seen to line up *with* Shakespeare. The public standards and criteria that define an intellectual tradition are what should guide pedagogy, not the particular cultural activities that just happen to align with those public standards. There are a variety of narrative and story forms that do much the same job and that can be appropriately linked to the capacities and abilities of learners. We understand this intuitively when it comes to educating children of different ages, gradually increasing the challenge and difficulty of the learning process in step with the learner's developing capacities, and I see no reason why the same pedagogical considerations cannot be made for many students with even severe learning disabilities.

Second, Peters' educationally worthwhile activities are not directed at an elitist 'educated person' conceived as some kind of developmental endpoint, rather his concept of education should be understood by the inclusive educator as a regulative ideal.<sup>5</sup> The transformative effects of a Petersian education opens the learner to greater possibilities in their lives *relative to the kinds of choices and distinctions that their cognitive abilities will allow them to make*, i.e. the significance of such a transformation is relative to their individual potential. And so while a Petersian inclusive educator might be perfectionist about the *kind* of transformations a worthwhile education should engender in the student, they should remain *constructivist* about the value of such transformations in the lives of the particular students under their care. For the student with severe cognitive delay, achieving an understanding of the relationship between plot and character in story, or developing literacy skills, is just as worthwhile and transformative as the scholarly student who grasps the

---

<sup>4</sup>See also Hirst (1965).

<sup>5</sup>When Peters talks about the 'educated person' it is better to read him as trying to develop an ideal conception of the person in order to draw out those criteria that define an educationally worthwhile process, not to establish what *counts* as an educated person.

distinctions between different literary theories. Note also that on this view, the development of literacy skills for the student with cognitive delay is not to be celebrated merely because it will help the student ‘get on in life’. It should *also* be celebrated because the acquisition of this skill potentially opens up the student’s capacity to value knowledge and understanding in a ‘non-instrumental’ way.

Educational policy-makers and leaders are likely to draw the conclusion that the achievements of the scholarly student has greater educational merit than other students when they confuse the place of knowledge and understanding in the lives of learners with the (often fickle) standards of disciplinary rigour and excellence that those forms take on in specialist contexts, such as the university. Peters, as far as I can tell and despite his critics, did not engage in such conflation, and I see no reason why one cannot credibly read him as advancing an inclusive conception of education. Initiating children into worthwhile and transformative modes of experience – to the furthest extent that we can and to the greatest degree that their abilities and talents will allow – is a necessary foundation for the well-lived life of any and all students and as such is an entitlement owed to all.

## Assessing the Petersian Account of Meaningful Access

I have offered an interpretation of R.S. Peters’ that may go some way in addressing confusion about what counts as meaningful educational inclusion. The stakes of such analysis are high because, as we have seen, some frameworks of inclusion lead to more just outcomes than others. Peters’ account offers criteria through which competing claims about meaningful inclusion could be assessed, serving as a correction to the excesses of what I have termed constructivist and perfectionist views. For example, on a Petersian account restricting special educational supports to functional literacy would be unjust. All children of diverse ability should be set on the path to greater knowledge and understanding, a path informed by the independent standards that define the various forms of knowledge. Such standards are important because they point the learner in the right *direction*. However, educational achievement should be valued in terms of the distance the student’s *individual* abilities and talents will allow them to go.

In what follows I want to address two potential objections to this Petersian account. I choose these in particular because they point to areas where a sympathetic reading of Peters’ concept of education isn’t enough, rather one may need to propose more serious revisions.

First, one might argue that Peters’ *justification* of educationally worthwhile activities reveals a far more exclusionary position than the friendly face I present above. I cannot go into too great exegetical detail here. In short, Peters’ answer to the question of *why* theoretical forms of knowledge are worthwhile is to point out that anyone who asks the question “why is activity X or Y educationally worthwhile” presupposes the knowledge and understanding necessary in order to *answer* questions about what is worthwhile (1973b). In other words, making decisions

about the good life requires sufficient understanding of theoretical forms of knowledge such as philosophy, science, history and so on (Peters 1966, pp. 151–156). Education, then, lays the foundation for the learner to be able to make rationally motivated decisions about what is worthwhile in their own lives.

This transcendental justification has been criticised on the grounds that it assumes a ‘life of reason’ is essential to any life worth living good. So there is a sense in which, underneath a Petersian account of educational inclusion, is a deeper form of exclusion. For many students, a life devoted to virtuosity about reason just isn’t possible or desirable.

How to respond? To begin with, Peters himself was less than satisfied with his proposed justification, and this suggests that a better (and perhaps more inclusive) justification of education is warranted. I believe that a deliberative democratic reconstruction of Peters’ concept of education and his transcendental argument is one plausible direction (Martin 2014, 2016). In my view, Peters’ educational theory should inform rules of public argumentation by which deliberants can arrive at agreement regarding what is educationally worthwhile in a diverse society. Going in the other direction, Stefaan Cuypers has rejected the transcendental argument altogether and argued for a perfectionist justification, though the extent to which such a justification can accommodate the inclusionary principle, alongside other normative questions pertaining to justice, diversity and education, requires further work (2012, pp. 15–16).

Second, one might argue that there is an individualism presupposed in the Petersian analysis that arbitrarily favours classroom exclusion. For example, my analysis has not addressed one of the most contentious issues about inclusion, which is the extent to which full classroom inclusion should be pursued as an ideal. What is the Petersian answer? One possibility is that classroom inclusion should take whatever form will be most likely to promote meaningful educational experiences in all learners. In some cases full classroom inclusion will best serve this educational goal, but in others it may not. Classroom inclusion is an empirical question about what is effective, not an ideal to be debated.

The likely objection to this view is that Peters’ criteria focus on the educational value of an activity for the development of individual minds, without fully considering the educational value of activities undertaken in a community. Having undervalued the place of community in education, it is therefore easier to rationalize removing children from the classroom. We can better understand this charge by looking at Ladenson’s account of the inclusive ethic of inclusionary care. As he puts it:

Despite their immense importance as human values, independence and productive ability are not the sole elements in a fully flourishing human life. Such a life can take place only within a caring community that values the flourishing of all, without qualifications based upon whatever an individual “live on his own”...those who support the ethics of inclusionary care would thus say that when a non-disabled student comes to understand, and to internalize, the above outlook, he benefits in the critical respect of becoming a morally better person. (2003, p. 531)

On this view, the ‘educational enterprise’ is woefully incomplete insofar as the *institutional* inclusion of all is left unfulfilled. Educationally worthwhile activities, it

could be said, can only happen in an educational community with others who are invested, for moral reasons, in one another's success. Such investment cannot happen at a distance. Peters' educational criteria miss this entirely.

Clearly, there are much neglected issues to be raised here with respect to education, self-esteem and moral recognition. However, it would be unfair to claim that these neglected issues can straightforwardly be attributed to a latent individualism in Peters' philosophy. First, modes of experience such as science and art are the result of humanity's public project of knowing and understanding. Students are initiated into these enduring communities of inquiry in order to bring about a person who is in possession of a *public* mind, i.e. a mind that can inquire and reason with others. Second, the educated person is by no means free from moral commitments and attachments. One can see from his writings on fraternity and moral community, for example, that educated persons must learn to live together peaceably through a shared moral understanding achieved through reason-giving *with others* (1966, p. 226).

Yet, one might still wish to revise a Petersian account of meaningful access in a manner more appropriately sensitive to the institutional dimension of inclusion. Perhaps such a revision would involve an explanation of how sociality requires forms of recognition other than reason-giving which, in turn, generate reasons why policy-makers should be more insistent on full classroom inclusion where possible. Another approach might be to supplement Peters' educational theory with a theory of educational institutions. I concede that this does not answer the institutional question, but that is not my intention. My point is that there are some plausible lines through which one could modify or further develop Peters' position in order to productively address problems of inclusion and educational community.

## Conclusion

A Petersian concept of meaningful access can play a helpful role in the debate over the nature and scope of educational inclusion, reminding us that *how* we conceptualise education is going to have serious implications for what *counts* as meaningful access. While Peters' own account is not without its own shortcomings,<sup>6</sup> it can nonetheless help prevent educators from drifting into a *de facto* distinction between 'special' and 'general' education, on the one hand, or a hierarchical conception of educational achievement, on the other.

---

<sup>6</sup>Anyone with a further interest in Peters' account of education should treat Jane Roland Martin's critique (1981) as essential reading.

# Plato and Aristotle

Jörg Ruhloff

## Use of the Words *Philosophy* and *Education*

The Greek equivalents for the words *philosophize*, *philosophical*, and *philosophy* first appeared in the colloquial language of Athens during the fifth and fourth centuries before Christ. They mean more or less friendship with and desire (*philein*) for knowledge and wisdom (*sophia*). It was first in Plato's writings of the fourth century that *philosophy* also acquired a terminological significance for an area of questioning strictly demarcated according to object and method. Plato (427–347) connected it with a way of life as well as the fate of Socrates (470–399). The later so-called *pre-Socratic thinkers* did not characterize their investigations as *philosophia* (cf. Kranz 1989), but rather as *historie* (research, reports). The aim of these investigations was “first and foremost the explanation of the external world” and “only incidentally” also referred to “man/people” (Kirk et al. 1994, p. 492). In contrast, the word *philosophy* from the very beginning emphasizes a human-oriented interest of this project: Becoming wise improves people. To philosophize signifies a caring about oneself (*epimeleia heautou*), that is, about one's own excellence (*areté*) in the intellectual competition with others. Even the word itself, *philosophy*, implies insofar an educational meaning and significance. The earliest forms of philosophizing were carried out as discussions among adults as well as between adults and adolescents.

At about the same time as the word *philosophy* entered into the Greek language, the word characterizing the tasks of *education* and *Bildung* (cultivation) starting from childhood onward, *paideia*, was first documented in a drama by Aischylos, which was performed in 467. There were already designations for specialized

learning and training activities as well as learning processes, for example, with regard to instruction of reading and writing or for learning a musical instrument and sport. However, the emergence of a word extending beyond toward an overall excellence orientation of the adolescent signaled a new matter of concern: Education and instruction were elevated “to a for-itself conceptually formulated problem of theoretical reflection” (Fischer 1998, p. 5).

This reflection as well as the (at first quite general) striving for knowledge also displays a loss of recognition: The integration in a social texture shaped by status by means of customs and habits (ethos) and their legitimation via the myths passed on by poets has lost its previous self-evidence. Among the factors contributing to the erosion of the common grounds of conviction, the democratic participation of the freeborn men in the governing and administration of the city has played a role. In order to succeed within the conditions of democratic participation in the city, beyond the status of those freeborn and the male gender, a broad range of knowledge and, above all, the ability to speak in a convincing fashion were necessary.

Given the need to be able to convince by means of speech and argument in public as well as to acquire a wide-ranging knowledge stemming from various fields brought about, starting in the fifth century, a new kind of teacher. These teachers referred to themselves as *sophists*, the wise or the knowers. They wandered between the Greek cities as traveling instructors and offered courses for (male) adults and adolescents in exchange for what were sometimes very high honorariums. Plato permitted the most famous among them, Protagoras of Abdera (ca. 485–415), in a dialogue bearing his name, to inform us that the object of his teachings is wisdom (*euboulia*, literally: being in a state of and giving good advice). For everyone who participated in his course, he would make them “from day to day” more skillful in domestic and private as well as in public-political engagement and speech (Plato, Prot. 318e/319a). The house (*oikos*) and city (*polis*) were the two largest spheres that occupied the life of the free man. Priority was given to exerting influence in the city. Later, Aristotle (384–322) was urged, as it were, to define people as political beings by nature (*zoon politikon*: Politics 1, 5., 1253 a). For Aristotle, this includes that humans are the only beings that can not only produce sounds but also possess language (*logos*). Accordingly, the rationally grounded claim of the sophists was to offer a comprehensive higher education.

## **Plato’s View of Education from the Early Dialogues to the Philosophy King**

Plato developed his conception of philosophy and human cultivation (*Bildung* and education) in stark contrast to the sophists. He portrayed Socrates, who himself never wrote anything, as the true teacher and friend of wisdom as well as the superior opponent to the sophists. In almost all of his dialogues Plato made Socrates the spokesman of the dialogues. Here, philosophy and *paideia* (education and *Bildung*)

are connected with each other in a double sense. One can differentiate between a performative (a) and a thematizing connection (b). The performative form dominates Plato's earlier writings, the so-called Socratic dialogues. The thematizing form is most prominent in the second and third groups of the 26 real dialogues, which are usually considered as belonging to Plato's complete works.

- (a) Socrates' practices consist, as Plato demonstrates in his early writings, of questioning, testing, and refuting, which can be summed up by the concept of *Socratic method* (*elenchos*). Socrates tests the ideas and convictions of his adult and adolescent fellow citizens, and specifically their ideas regarding issues of the 'highest' significance. These are the "very general ideas" (Fischer 1997, p. 107f.) that guide people through life, for example, ideas concerning right and wrong, bravery and piety, friendship and love, the best possible ordering of the city-state, the proper kind of education, as well as that death is an evil. The examinations begin with others appearing to have knowledge about the issues just mentioned, a knowledge that Socrates lacks. The form of questioning Socrates carries out, which at times seems like an interrogation, proves, however, that the preconceived general notions and knowledge claims are untenable. Socrates insists on consistent conceptual clarity regarding the life-guiding ideas. In the course of his initial examination, however, all attempts to ascertain a clear conception of the initial opinions fail. Plato's Socratic dialogues end in an *aporia*, that is, in a dead-end. The dialogues end with the admission that no sufficient knowledge about that which was inquired was achieved, without however rendering the questions discussed trivial. The Socratic examination sets free a form of thinking that leads from unreflected operative convictions as well as unchallenged beliefs toward the insight into one's own ignorance. Socrates urges a skeptical consideration of the self-evident convictions that have until now guided one's life in an unreflected manner. This process can, if one's attention is directed to Socrates' actions, be characterized as 'education' and as '*Bildung*', when the attention is steered toward the transformation, which the person being examined also engages in.

The performative coincidence of philosophizing with the process of education and *Bildung* should not be confused with instruction along the lines of a transfer of knowledge, for example, regarding geographic relations. Nor is the Socratic method an exercising practice for the correct use of language. Socrates denies ever having been anyone's teacher (Plato, Apology 33 a). He only claims, in contrast to his fellow citizens, to be aware of his own ignorance. That is why he questions those who seem to have knowledge about the important issues, for example, the artisans, the poets, the politicians. In Plato's stylized portrayal of Socrates' life practice, the love of wisdom arises from the awareness of a deficit; one that motivates the search for justified convictions that are secured according to general rational grounds. For the success of one's own life as well as that of the cohabitation in the city-state is at stake. The unveiling of ignorance bears relevance for the habitual collective cohesion, that is, the political and not just personal life. The illusion of knowledge about what really matters in life inevitably brings about an

authoritative attitude. This attitude impedes common deliberation. It blocks the capability of restraining oneself, the shame (*aidos*) which complements the compliance of right (cf. Plato, Protagoras 223, Sophists 229 f.). Plato's Socratic philosophy and education can be understood insofar as a 'negative' practice of destructing hubris and legal incapacity.

In the present day, the basic ideas of the Socrates method live on in educational concepts, which see the central task of education as preventing people from becoming trapped in fundamentalist systems of conviction that are, for instance, political-ideological, worldview, or religious in nature. Today, such systems also quite often include the hidden orientations of pedagogical activities and institutions harboring economic aims. The fundamental idea underlying the Socratic-Platonic integration of philosophy and education has been taken up in a variety of ways by the current discourse. In contrast to *positive* concepts of education, which presuppose unquestioned aims, values, and norms, the Socratic way emphasizes that education and *Bildung* have the task to raise a reflective and problematizing attitude (cf. Ruhloff 1979; Schönherr 2003; Fischer 2004). Regarding the educational studies as a scientific research discipline, the Socratic inheritance was brought into contact with Kant's critique of reason, for example, in Fischer's "transcendental-critical-skeptical" way of investigation (Fischer 1989). It analyzes the presuppositions upon which the validity of scientific and everyday pedagogical statements and practices depend. Fischer criticized the empirical and hermeneutic explorations of pedagogical matters for being uncritical toward the claims to truth and the research findings. Referring to the Socratic-Platonic impulse, Fischer critically reviews this insufficiency. Educational studies are dependent on a form of reflection that examines the (unreflected) presuppositions of educational knowledge (cf. Fischer 1989).

(b) While the early Socratic dialogue is directly involved with philosophizing, Plato later pronounces, in an explicatory fashion, a philosophy as *doctrine*. Education and *Bildung* take up a central role in this doctrine. The important source for this is his text concerning the essence of the state, the Republic, stemming from his middle period. Derived from the leading question concerning the search for an appropriate concept of justice, he develops a concept of the just city-state, where philosophy can exert itself without, like in the case of Socrates, being put to death. Such a city-state must, as Plato developed the notion, be guided by philosophers. The way to philosophy, in the strict sense, involves a long path of education. Even if it turns out that only very few men and women are suitable, from childhood onward, all citizens must be educated. This education has to be based on philosophical thinking and involve legitimate rational argumentation. The postulate that a philosophically guided city-state assigns status on the basis of education holds for at least two of the three different groups that Plato mentions. Plato only goes into detail when it comes to the education of the guardians and the further education of the philosopher king. The future responsible persons for material subsistence within the republic do not receive any special attention. An education that is controlled by philosophy and tailored to the becoming of philosophers should ensure that all citizens enjoy the greatest possible happiness

as well as the longest possible existence of the state. From this perspective, Plato submits the arts, as the source of the traditional linguistic-literary and musical education as well as the overestimated gymnastic training, to a radical critique. Educational aims and activities are judged according to whether they strive toward attitudes and capabilities that are suitable to a rationally organized city-state. In order to fulfill their guardian function, whose task it is to ensure the inner order and protect against outside enemies, this means men and women must live together without private income, without family, and without personally identifiable progeny. From the ranks of the guardian, the most capable individuals are raised, in preparation for the role of ruler or philosophy king, according to an even longer process of education and *Bildung*. Proficiency in this task is only in a much later state of adulthood. Plato rejects expressly gender-specific characteristics as educationally irrelevant and, in so doing, alienated his contemporaries as well as the vast majority of the educational tradition of the ensuing two-and-a-half-thousand years. The education of philosophers is not exclusively directed to the practice of government. According to Plato's political fantasy, the governing class should, at least temporarily, be relieved of their practical duties in order to dedicate themselves exclusively to the task of philosophy. As such, the risky Socratic practice of philosophizing is changed into an independent theory – a preliminary sketch of the battlefield between 'theory' and 'praxis', which remains present in the European tradition.

Due to its interrelationship with the project of designing a just republic, education receives a social selective function. Plato attributes the difference in aptitude to a great degree to nature while using them to determine the qualitative differences and duration of the educational requirements. However, these natural differences cannot be ascertained independent from educational tasks; for only through instruction, trials, and tests do they come to light. Because, however, the educational process is, from the very beginning, tailored to the class order, with unequally distributed rights, and because the proportion of the natural endowments cannot be unequivocally determined, the occasional correction of class assignments is permitted. For that matter, those governing are allowed to tell a lie when it comes to the assignment of the classes in order to secure satisfaction when it comes to the respective social status and unity of the republic. This problem remains virulent in modern societies.

Just as the sophists, Plato frees the question of education from the integrative prejudice of social patterns. However, he in no way questions all of the traditional conceptions of order, especially not that of slavery, even if he at least does not want anything to do with the enslavement of Greeks by other Greeks. The sophists' concepts, according to Plato's polemic representation, result in a training aimed at ego-centric self-assertion; something that several Sophists propagate as the right of the stronger. Against the abandonment of the sober and political order by the individual striving for advantage, Plato assumes an indispensable order of beings for the world of knowledge and for the good life. Only philosophy is capable of clarifying about this order, even though it cannot claim definitive knowledge. Basically, the percep-

tibility and being of this connection of order appears to be guaranteed via the general idea of the good, which ties everything together. It expresses “the perceptible truth” and lends the necessary strength to those who know (Poleiteia, 6 B., 508e). The knowledge of this is what education should be oriented toward.

Education has to overcome a fundamental difficulty; for access to knowledge of the true and good order is initially disguised from mankind. In contrast to the optimism of modernity, which since the European Renaissance assumes the orientation of mankind toward *Bildung*, Plato’s educational philosophy begins from a more pessimistic position. Its point of departure is the reality of *Unbildung* or lack of education. *Unbildung* (*apaideusia*) is a force of resistance. Initially, it stands in opposition to pedagogical efforts. It is introduced as the destiny of mankind and not as just an age-related deficit. That is implied in the allegory of the cave, the image-oriented representation of education. The allegory describes “the human nature in relation to *paideia* and *apaideusia*” (Politeia, 7th book, 513a ff.). The primary human condition is determined via the lacking awareness of one’s unknowing. In the condition of unknowing, people are impressed upon – without any resistance – by the perception of shadows on the cave wall in front of them, as if they had been from the very beginning chained and were forced to look in only one direction. The shadow images that they see originate from an event occurring behind their backs. On their own, they are unable, however, to turn around. They do not even feel the need to do so, because they are comfortable and safe, and they have never known a different state. They appear to be lacking in nothing. Already the perception of shadow images is dependent on an intellectual capacity that has nothing to do with education, but rather only steers us in the right direction. Here the painful act of freeing from the chains and the *turn* (*periagoge*) of the intellectual capacity against the light begins. Reluctantly guided by the educator in the beginning, an individual is eventually led up the steep and long path out of the cave. In the allegory, this path finally leads to freedom and the sight of the sun, the symbol of the idea of the good. It is identified as the cause of being, life, and knowledge. Three stages of the educational path are differentiated. After the initial state of belief (*pistis*) of images comes a stage of belief (*doxa*) supported by sensory perception, exemplified via the perception of the causes of what the chained people see, and as the symbol for an understanding of the relationships within the everyday lifeworld tied to the senses. The real world is only accessible to a kind of thinking essentially detached from sensory perception. The allegory represents this thinking in terms of exiting the cave, which in Plato’s explication means via the curriculum of higher education (*Bildung*). This education is divided into two sections. The introductory threshold is the ability to perform mathematical operations without appeal to sensory perceptions. The first phase of higher education takes up the mathematical disciplines arithmetic, geometry, the not yet developed, yet postulated stereometry, astronomy, and music theory or theory of harmony. The common features of these research areas are that they have to do with objects and relations that can only be explored via thinking and not perception, even if they can be applied to that which can be perceived. These disciplines also have practical value and uses, for example, when it comes to war strategy. However, its state of knowledge does not depend on this. A

criterion of *Bildung* is that it can refrain from purposes of utility. The mathematical disciplines liberate from the entanglement with perceptual desire. The highest aim of education is not met by them, however. They all operate on the grounds of the intellect (*dianoia*) with its theoretical assumptions and ‘hypotheses’ that are not called into question. Reason (*nous*) in the form of philosophy, in contrast, transcends thinking that is grounded on assumptions. Philosophy is the special discipline of unconditional thinking. Plato conceives of it as a methodologically driven ‘art of differentiation’ in the handling of concepts under the designation ‘dialectic’. The dialectic “neutralizes the assumptions” (Republic 533c f.). From the viewpoint of education, the dialectic forces ‘the eye of the soul’ from the ‘barbarous morass’ in which it was buried. After this escalation, a philosophizing oriented toward the idea of the good alone fulfills the whole purpose of education and *Bildung*.

In a city-state not ruled by philosophers it is extremely unlikely that philosophers come to be. They will be at best a rare exception as Plato makes plausible referring to his rich experience (Republic, Book 6). The realization of a just polis via proper education, Plato explains, is nonetheless fundamentally possible. It can succeed if the polis corresponds to a just mental constitution of the citizens, so that the reasonable judgment (*sophrosyne*) guides the courageous striving (*thymos*) and prevails in the face of opposing appetites (*epithymia*). Although in this ideal general tendency the educational and politically desirable goals would be more or less achievable, Plato does not assign any unlimited duration to his educational-philosophical city-state, for “everything that has come into being must perish” (Republic, Book 8, 546a). He specifically speaks about probable inexactitudes of the mathematically correct investigation of the matching relations which are sketched out by nature and must be attended to in the siring of offspring. From this follows improper assignments to the social classes as well as disagreement among the guardians and ruler.

In Plato’s later writing *Nomoi* (The Laws), the skeptical openness of the Socratic beginning (that is also still recognizable in his Republic) is abandoned in favor of a tendency toward rigid regulations in the form of law-like provisions. The trust in the unifying force of reasonable argumentation appears, for the most part, to have been lost. With the establishment of the Academy, Plato created the institutional support for a social community that dedicated itself to higher *Bildung*, scientific achievement, and philosophy. It endured for around 900 years before it eventually succumbed to “the politically successful Christendom” (Szlezák 1996, Sp. 386). As an organized community of those striving for wisdom, under the guidance of philosopher, the Academy was a kind of analogue to the biologically regenerative city. In the handed-down tradition and regeneration of the striving for knowledge over the generations, something that Plato attributed to Eros had remained alive. Eros, in the form described by Plato, is a yearning for immortality, which can only be achieved by mortal beings via the ‘reproduction and procreation in the beautiful’ and good. It is not exhausted in the bodily appetites, which however are not rejected, as suggested by the expression “Platonic love” (cf. in contrast, e.g., Plato, Charmides 155 d/e). For mortal beings, the erotic yearning for perfection can only be fulfilled in the pedagogical regeneration of the striving toward knowledge of the good, that is, in a shared philosophizing. This connection relativizes the pairing of Plato’s educational philosophy to the conception of making philosophers state leaders.

## Aristotle and the Question of Areté

Aristotle, Plato's most notable student, attended the Academy for many years, from adolescence onward. Unlike Plato, education was not one of the central themes of his universal works. Aristotle's interests included the whole spectrum of knowledge fields of his time, to which he added the exploration of the living and living beings. The ancient tradition attributes 106 writings to Aristotle, some of which possess the quality of lecture notes. We do not have any of the texts he released within his lifetime. The style of his treatment of pedagogical topics differs strongly from that of the Platonic dialogues. Aristotle discusses such issues from the position of an uninvolved, a describing observer and explorer, whereas Plato is himself noticeably involved in the educational-philosophical questions he discusses. Aristotle writes about educational questions in connection with his theories of ethics and politics. For him, these subject areas, unlike for Plato, became relatively independent philosophical fields of knowledge. The differentiation between *theoretical* and *practical* reason, which has shaped the entire tradition, goes back to him. This distinction has been taken shape in the later Plato, not in the earlier Socratic dialogues. Plato's speculative sketch of a city-state, whose organization is oriented toward the highest aim of the philosophical *Bildung* of mankind, is subjected by Aristotle to an analysis of reality. There is no room for bold postulates like gender equality or the abolishment of private property for the public officials. In other words, Plato's sketch of a republic is scathingly criticized by Aristotle (Aristotle, *Politics*, 2, 2–6.).

The guiding question, from the viewpoint of education, however remains: how can people become excellent (to get *areté*)? And how is this *areté* connected to the question of appropriate political constitution? In contrast to the Socratic-Platonic approach, Aristotle does not attribute the main problem to a lack of knowledge. He proceeds from the general assumption that *areté* is based on three factors: natural endowment, habituation, and instruction (Nicomachean Ethics X., 10.). Natural endowment is beyond the sphere of education. Instruction, thus knowledge, certainly belongs to good action but cannot bring it forth by itself. They can only become active in connection with a corresponding habitus (*hexis*), which must already be acquired through the practice of good habits as well as which in the political coexistence, if need be, brought about or maintained through the force of law. "Whoever does not broadly pursue the goals in life found in ethics [...] will not recognize the truth in the setting up of these goals" or "as practical truth pertaining to oneself" (Müller 1982, p 286).

Decisive for the specific determination of both the best political constitution as well as the functionality belonging to this way of educating is the question concerning the desirable form of life (*bios*) (cf. Aristotle, *Politics*, 7th Book). A good life is unequivocally desired by all people. Happiness (*eudaimonia*) is in and of itself worth striving toward (cf. N.E., 1st Book). Happiness or a "successful life" (A.W. Müller) can be searched for in various life forms, which have different levels of value. Its realization or failure to obtain is a matter of the praxis. Praxis, in the strict sense, is to distinguish between making (*techne*) and producing (*poiesis*).

Theoretical, scientific knowledge deals with objects and relations that are immutable and the knowledge of which can be proven with logical necessity. However, when it comes to practical knowledge, we are confronted with contingent relations. Political constitutions and forms of education, for example, unlike falling bodies, act one way or another. Objects of practical knowledge are the issues related to human existence. Happiness, *eudaimonia*, and good action (*eupragia*) are one and the same. In the everyday sense, praxis is understood as standing in opposition to theory. Aristotle reinterprets this view. Contrary to the widespread public aristocratic ideal of man, whose “superiority” in activities of politics and war is manifest (Bien 1989, Sp. 1284), he argues:

But the active life is not necessarily active in relation to other men, as some people think, nor are only those processes of thought active that are pursued for the sake of the objects that result from action, but far more those speculations and thoughts that have their end in themselves and are pursued for their own sake. (Politics, Book 7, 1325 b)

As such, the “philosophical way of life [...] becomes the highest human possibility” and the “practical-political life moves down to the second rung” (Bien 1989, Sp. 1283). The notion of a nobility acquirable via *Bildung*, which circulated in the Renaissance and again in the pedagogical concepts of the eighteenth and nineteenth centuries, helped keep this connection alive. Theory as a form of life, and thus as praxis, implies, according to Aristotle, that education of the free persons, who alone can claim it, are oriented toward contemplative leisure (*schole*). Education intends the “proper use of contemplative leisure” (Politics, 7, 14., 1333 b). Contemplative leisure is relieved from the necessary work, and the space reserved, not for the artisans, nor the slaves, but for the free persons for the active and pleasurable ‘unfolding of human powers and capabilities’. Contemplative leisure coincides with the experience of happiness and is dependent on peace (Welskopf 1962, p. 276). Productive activities like the handcrafts have no purpose in and of themselves, but rather produce a good separate from the acting person. The pleasure of a satisfying life-fulfillment in contemplative leisure also does not characterize learning in childhood and adolescence. Learning is unavoidably tied to displeasure. As a result, it is also not a game (Politics, 8, 5.). Playing is connected with the recovery from work. A praxis of contemplative leisure would be the contemplation as to what meaning work and play have for a good human life and who is entitled to it (cf. Arendt 2002).

Aristotle did not present a systematic educational doctrine. His statements about the education of the youth follow in awareness that pedagogical questions are controversially discussed. Neither about the objects of education nor about whether the training of the intellect or rather the formation of character is emphasized, is there, as he notes, any agreement. His own considerations look for the meaning between preexisting contrary views and extreme values. Basically, education guarantees the conformity with the respective constitution of the *polis*, without having to judge the actual constitutions as equally good. Education is conceived as relevant to the constitution. It is understood “as a ruling activity,” which introduces the coming generation to the question regarding the handling of the purposive overall order of the polis (Benner 2001, p. 125). The idea of a hierarchic, practical world and praxis order

contrasts sharply with the foundational tendencies of the modernity. It is specifically incompatible with an educational problem tied to Rousseau. To assume the needs and rights of the individual is basically a reversal of the Aristotelian concepts. Wilhelm von Humboldt demands “Bildung” to be as little as possible oriented toward the bourgeois relations, so that rather “the constitution of the State, so to speak” can test itself on the educated persons.

Other Aristotelian concepts remain present in the contemporary discourse. This also holds for his theory of learning. Contrary to the current reductions, for example, from education to the processing of information, it has been argued that learning takes place as process of experience on the grounds of a prior understanding or knowledge. Learning cannot, therefore, be conceived in terms of writing on a tabula rasa. Conveyed by the Anglo-Saxon philosophy, more recently Aristotle’s praxis-philosophical differentiations are receiving renewed attention. The orientation “on the categories of *poiesis* and *praxis*” are reclaimed for an appropriate discussion of pedagogical questions (Müller 2008, p 12). This orients itself away from an understanding of education in terms of production, as it has presently become dominant in educational policy. The question “what is education” cannot, according to this concept, be answered prior to and independent of the clarification of “what is good education” (ebd., p 8).

Like the reflections stimulated by the works of G.E.M. Anscombe, the German-speaking philosophy of education has over the past several decades brought a scientific-theoretical accentuated discourse involving Aristotle into contact with Wittgenstein’s theory of language-games. This discourse refers to the claims to the truth of educational statements. On the one hand, education cannot be meaningfully discussed without the inclusion of normative issues. However, it seems equally impossible to arrive at evidential claims as well as to abandon the realm of reasoning altogether (cf. Ruhloff 1979). Given this dilemma, the connection to a theory of justification of practical sentences is offered by Aristotle in his *Rhetoric*. In connection with Wittgenstein’s conceptions regarding the function of language-games and “certainty,” argumentational-theoretical concepts of education have been developed (cf. Helmer 1996; Dörpinghaus 2002; Koch 2004). There exist parallels between these rhetoric approaches and the earlier mentioned continuation of the Socratic-Platonic skepticism (Schönherr 2003). Referring to Aristotle, it is argued that educational knowledge about contingent pedagogical matters can be constituted. The Socratic-Platonic reference focuses, in contrast, its attention on the critical analysis and on ignorance – both are equally important for educational practices and educational studies or research.

## Conclusion

In the philosophy of education, initiated by Plato, a distancing of thought takes place in contrast to the socialized habitual life patterns that bring about prejudice. Saving the questions of truth from corruption via circulating opinions is a leitmotiv

in the fifth and fourth centuries emerging educational philosophy and philosophy of *Bildung* in Greece. Their questions and theorems do not overcome the “connection of guilt tied to privilege” (T.W. Adorno). The dependency of a more humane cultivation of ‘unfree work’ was, at the time of the emergence of philosophy, more or less thematized, and Socrates executed the orientation of the question toward conceptual generality of claims to truth. The theorems and postulates connected with early educational philosophy, however, were not referred to a general humanitarian perspective. In no way did it imply something along the lines of a universal human right of an education of high quality. To this extent, we cannot speak of ‘humanism’. On the basis of new research concerning the political economy of the era, the discrepancy between general truth claims and social privileging cannot be explained with simple models, such as the reflex of a “slaveholder society” (Marx). Belonging to the heritage of the early educational philosophy is an acceptance of inequality, which according to Aristotle also permits a reduction of ‘education’ to the training of ‘living instruments’ (slaves) to be used by those citizens born free and well-to-do. With a view to the global relations, this is today still the dominant reality. However, it is from the early philosophical enlightenment that the critique from historical reality arises.

# Fazlur Rahman, Islamic Philosophy of Education and the Islamisation of Knowledge

Yusef Waghid and Nuraan Davids

## Rahman's Thesis on Islamic Philosophy of Education

Both Wan Daud (1997) and Ahmed (1989) consider Rahman's thesis on the Islamisation of knowledge as a "promising intellectual agenda of Islamic resurgence and one of the most controversial issues that has captured the imagination and elicited strong reaction of Muslim intellectuals and activists across the globe since the late 1970s" (Wan Daud 1997: 2). It is within the ambit of Islamic revivalism that Rahman postulated his thesis on the Islamisation of knowledge. Of course, the Islamisation of knowledge idea was most poignantly pursued by scholars like Syed Muhammad Naquib al-Attas and Ismail al-Faruqi.

The reference to Islamisation was first made by al-Attas and al-Faruqi at the World Congress on Islamic Education in 1977. To al-Faruqi (1982: 18), Islamisation represents an integration of "new knowledge into the corpus of the Islamic legacy". Al-Faruqi's (1982) proposal of Islamisation involves a detailed 12-step work-plan, which incorporates the mastery of modern disciplines, the mastery of Islamic legacy, a survey of the *ummah's* (community's) major problems, to recasting the disciplines under the framework of Islam and the dissemination of Islamised knowledge. The objective of his understanding of Islamisation is to reapproach the disciplines – such as sociology, economics and anthropology – so as to foreground Islam. Al-Faruqi (1982) defines Islamisation as an actionable theory through which the reform of education should be the Islamisation of modern knowledge itself. To him, Islamisation means the recasting of every discipline on the principles of Islam in its methodology, in its strategy, in what it regards as its data, its problems, its objectives, and its aspirations.

e-mail: [yw@sun.ac.za](mailto:yw@sun.ac.za)

Unlike al-Faruqi (1982), however, Wan Daud (2009) maintains that the theory of Islamisation has little to do with the reworking of textbooks, or the restructuring of academic disciplines, but fundamentally to do with the reconstituting of the right kind of human being – that is, a human being who exhibits just action – an idea borrowed from the Malaysian scholar, Syed Muhammad Naquib al-Attas, which we will discuss later in this chapter. According to Wan Daud (2009: 8), Islamic epistemology recognises that knowledge – “stripped of the faulty opinions, doubts, and conjectures, as well as negative influence of the various human interests generally termed as *hawa*, is indeed universal”. Others like Halstead (2004: 521–522) describe Islamisation as a key process in countering the influence of western secularism on Islamic institutions. In turn, Abushouk (2008: 39) explains that Islamisation stems from the premise that because contemporary knowledge has been designed by western scholars who have their own cultural, historical and secular worldview, it is neither value-free nor universal. In this sense, therefore, Abushouk continues, Islamisation can be described as a revivalist response to modernity and its secular impact on Muslim society.

Yet, Fazlur Rahman’s involvement in the *Islamisation of knowledge* agenda cannot be denied as an impetus to his notion of Islamic revivalism. While al-Faruqi (1982) considers Islamisation as a direct response to what he considered as the malaise of the *umma* (community), Rahman’s (2011: 450) argument for an Islamisation of knowledge is motivated by “a feeling that the modern world has been developed and structured upon knowledge which cannot be considered Islamic”. Instead, Rahman (2011: 450) is of the view that the modern world has misused knowledge; “that there is nothing wrong with knowledge, but that it has simply been misused”. Al-Faruqi and Rahman are in agreement, however, that an Islamisation of knowledge provides a resurgent alternative to modern society and its impact on Islamic society. Rahman was critical of Muslim orthodoxy, most notably the influences of authoritarianism, and a general conservatism and uncriticality in relation to the interpretation of Islamic foundational sources. This criticism culminated in his phenomenal book, *Islam and Modernity* (Rahman 1982), in which he enunciates his understanding of Islamisation in relation to the re-education of Muslims. For him, firstly, Muslims have erroneously distinguished between religious or traditional sciences and the rational or secular sciences (Rahman 1982: 33). Rahman (1982) posits that if such a separation were to be defended, rationality would be disassociated from intuition. That is, to accept such a bifurcation is tantamount to arguing that religious sciences are not rational, and rational sciences are not religious. For Rahman (1982: 148) such a bifurcation of knowledge view is incommensurate with the unity of knowledge idea propounded by Muslim scientists who attached a high positive value to their intellectual pursuits such as the study of the universe and creation in relation to the Qur’an. In his words,

... the Quran, has a special point of view on the ultimate nature of studies of the universe (as it has on the studies of [wo]man and history), but the fact that it encourages these studies is important. As such, they are to be regarded in general as an integral part of Islamic intellectualism. (Rahman 1982: 148)

In other words, for Rahman, rational thought impinges heavily on religious thought and vice versa. Thus, for him Islamic philosophy of education is synonymous with a notion of “Islamic intellectualism” constituted by an analysis of the Quran and its responsiveness to moral, religious, social, historical, judicial and theological concerns and/or problems (Rahman 1982: 5). Put differently, for Rahman (1982: 7) an analysis of Qur’anic meanings – what he refers to as intellectual *jihad* (literally, striving) – is an effort to understand its implications for societal and historical practices, concomitantly with an examination of the latter (i.e. socio-historical situations) and its influence on Qur’anic interpretation. To Rahman (2011: 449–450), the fact that human beings have been granted the capacity to use their ‘*aql*’ (intellect, reason) means not only that they can discover knowledge, but that they have a responsibility to continually discover knowledge.

Inasmuch as an analysis of Qur’anic meanings impact socio-historical conditions, so does an interpretation of such conditions influence an understanding of Qur’anic texts. What this means is that an Islamic philosophy of education is at once concerned with connecting Qur’anic analyses (hermeneutics) with socio-historical situations and vice versa. In sum, Rahman’s (1982) philosophy of education is constituted by at least three dimensions: first, (Islamic) education is enframed by intellectual efforts to analyse Qur’anic meanings and its relevance to socio-historical conditions; second, an examination of the socio-historical contexts in which Muslims find themselves ought to be constantly re-examined so as to rethink the guiding rules of the Qur’an vis-à-vis such situations; and third, any attempt at finding meanings responsive to particular situations should be looked at without erroneously separating what is considered as religious or traditional from what is rational or secular. In the next section we examine as to how such a Rahmanian understanding of Islamic philosophy of education has framed the Islamisation of knowledge debate.

## **Islamisation of Knowledge as Enframed by Rahman’s Islamic Philosophy of Education**

Elsewhere, we have argued that Islamisation of knowledge offers a paradigm of knowledge construction in terms of which knowledge is conceived within an Islamic worldview (Waghid and Davids 2016: 220). Now, although Islamisation had been articulated in opposition to the secular, Rahman (1982) argues for a contrary position whereby all forms of knowledge are considered as integrated, including the secular, which in his view should remain subjected to Qur’an (re)interpretation and an Islamic metaphysics (Waghid and Davids 2016: 221). Put differently, all forms of knowledge should be regarded as Islamised if subjected to both Qur’an (re)interpretation and a metaphysical perspective of Islam. When conceived through the lenses of Rahman’s notion of Islamic philosophy of education, Islamised knowledge (including secular knowledge) is open-ended in the sense that knowledge does not have to attain the level of finality or certainty (Wan Daud 1997: 15). Although

Wan Daud (1997: 15), drawing on the ideas of Islamisation of Syed Muhammad Naquib al-Attas, argues against Rahman's open-ended view of knowledge, namely that "[k]nowledge of the fundamental credal matters such as the nature of God, revelation, religion, [wo]man and his destiny, of ethical and legal matters, are not open for further revision and correction ...", he posits that knowledge is subjected to "further elaboration and application" (Wan Daud 1997: 15). In other words, Islamised knowledge, following Wan Daud, is certain and final but its elaboration and application remain open to intellectual scrutiny. We surmise that Rahman himself would take issue with such a criticism in the sense that an interpretation of religion itself (which includes elaboration and application) cannot be closed on the basis that socio-historical situations vary as new meanings are construed. By implication, interpretations of religion cannot remain absolute, Rahman posits (1982: 145): "It is obviously not necessary that a certain interpretation once accepted must continue to be accepted; there is always room and necessity for new interpretations, for this is, in truth, an ongoing process".

Rahman (1979a, b: 186–187) couches Islamic philosophy of education as a discourse that should not privilege religious sciences over rational sciences. In other words, following Rahman, there is no justification to consider theological or religious sciences as more important than philosophical or rational sciences and vice versa. Rather, all forms of knowledge are organically related and any claims to exclusive self-sufficiency or absolutism, and "blind imitation" undermine the possibility of thinking and creativity (Rahman 1979a, b: 187). In other words, any defensible notion of an Islamic philosophy of education cannot be subjected to a fractured understanding of tradition as it has nothing to do with reason (Rahman 1979a, b: 191). Hence, for Rahman, a philosophy of Islamic education remains subjected to a non-separationist view of knowledge and that religious sciences or traditional sciences and rational or philosophical sciences are intertwined. More poignantly, a philosophy of Islamic education is aimed at counteracting "blind adherence" to "the basic ideas of Islam in such a way as to open the door for the influence of new ideas and for the acquisition of modern knowledge in general" (Rahman 1979a, b: 217). Instead, he avers that a philosophy of Islamic education ought to encourage Muslims "to accept the intellectualism and the humanism of the modern West as a genuine development from the apogee of Islamic civilization itself ..." (Rahman 1979a, b: 220). By implication, a philosophy of Islamic education, following Rahman (1979a, b: 215) draws on multiple strands of education with the intent to rethink Muslim intellectualism progressively according to the demands of what it means to achieve justice in societies. Put differently, a philosophy of Islamic education involves a rethinking of knowledge in an integrated way that can be responsive to the just concerns of any given society.

## Islamisation of Knowledge in Practice

Understandings of an Islamisation of knowledge have taken different forms in different contexts. As noted by Shaw (2006: 48), curriculum reform integrating the Islamic epistemic traditions within the disciplines of the social sciences and humanities, for example, has yet to be devised imaginatively in the Gulf States and Saudi Arabia. In Iran, the Ayatollah Khomeini introduced the Islamisation of the curriculum in schools and universities after the Cultural Revolution in Iran (post-1980), on the basis that Western curricula alienated students from their Islamic roots (Levers 2006: 159). In this instance, an Islamisation of knowledge was interpreted and implemented through a renewed focus on Islamic identity, and concepts such as, “justice, equality, morality, devotion to family, absence of malice and avarice, and cooperation with the state ... advocated as attributes of an Islamic society” (Levers 2006: 166). Yet, although Islamic texts on themes such as the family in Islam, psychology from an Islamic viewpoint, Islamic economics, Islamic law and Islamic political thought were introduced in specific faculties in universities to supplement the existing curriculum in the social sciences, university textbooks for scientific and technical subjects remained unaltered (Levers 2006: 161). By implication, the envisaged Islamisation in the aftermath of the revolution has not had the desired consequences, more specifically at the levels of fusion between the traditional and “modern” curriculum (Waghid and Davids 2016).

While the example of the Islamisation of knowledge in Iran might be best described as a supplementary position, a more maximally integrated approach is encountered in Malaysia. The Islamisation agenda in Malaysia, pioneered by the Muslim Youth Movement (*ABIM*) in the 1970s and 1980s, was influenced primarily by Syed Muhammad Naquib al-Attas’s intellectual, academic and historical aspirations to transform the lives and thoughts of the majority-Muslim Malay community and had a strong sociocultural impetus. During this phase of Islamisation, *ABIM* strongly advocated a discourse of Islamic universalism and its significance for a pluralistic Malaysia, which involved adhering to the democratic teachings of Islam, promoting equal and complementary roles for men and women and promoting social justice for all, irrespective of ethnic and religious affiliation (Bakar 2009: 38). The main focus of *ABIM*’s Islamisation programmes was education through their nationwide network of kindergartens and schools (and later Islamic teacher training colleges and universities) through which they advanced the idea of the Islamisation of modern knowledge (Waghid and Davids 2016). For the majority-Muslim Malays, Islamisation meant that the curriculum in secondary schools and universities was organised to produce citizens who were intellectually, spiritually, emotionally and physically balanced and harmonious, with a strong belief in God (Hashim 1996: 8).

Zain et al. (2016: 20) explain that an Islamised curriculum at the International Islamic University Malaysia (IIUM) follows two concurrent processes: ‘omitting’ the western-based curriculum and ‘infusing’ with Islamic inputs – as shown in the example below:

Omitting process	Infusing process
Eliminate the philosophy from western view	Remember the Islamic history and civilisation
Eliminate non-Islamic values, e.g. Darwinism, nature	Instil Islamic values and good ethics
Eliminate destructive knowledge (e.g. the making of nuclear bombs)	Infuse knowledge that will increase <i>Tawhid</i> (Oneness) and bring human beings closer to Islam
	Infuse constructive knowledge (for the sake of being beneficial to mankind)

Zain et al. (2016): 20

The Islamisation agenda has not been limited to Muslim-majority countries; it has also been attempted in Muslim-minority countries, such as South Africa, specifically in privately managed, Muslim-based schools. As Waghid and Davids (2016: 232) observe, the idea of Islamisation has been familiar to Muslim schools since the 1970s and took root at a number of schools when a Cape Town-based school hosted the Sixth International Education Conference on Islamisation of Knowledge in 1996. Discussions and ideas from this conference led to a number of schools agreeing, in principle, to implement an Islamised curriculum. The Islamised curriculum, however, needed to be integrated with the South African national curriculum, which at that time was grounded on an outcomes-based approach to education, leading to various interpretations and adaptations of an ‘Islamised’ curriculum. While certain schools changed their names to reflect a more pronounced Islamic identity and ethos, and introduced Islamic subjects, others changed the routine and structure of their school day to incorporate daily prayers and the recitation of the Qur’an. Waghid and Davids (2016: 234) maintain that although private Muslim schools in South Africa advocate an allegiance to an integrated Islamised curriculum, in reality, their curricular changes are commensurate with that of a supplementary approach to Islamisation. There are a number of possible reasons for the lack of consensus on an ‘Islamised’ curriculum or the implementation thereof. On the one hand, teachers have not been trained in teaching an ‘Islamised’ curriculum. On the other hand, the educational qualifications of teachers are varying and, at times, non-existent. While some might have a formal qualification in education, others might have a qualification as a *madrassah* teacher or a certificate in Arabic or *fiqh*, or others may be teachers by virtue of being *hafiz* (one who has memorised the Qur’an) (Waghid and Davids 2016).

Of course, as hinted at earlier in this chapter, Rahman had his critics, and one of his most vehement opponents in advancing a philosophy of Islamic education vis-à-vis the practice of Islamisation of knowledge was the Malaysian scholar, Syed

Muhammad Naquib al-Attas. We now turn to a discussion of al-Attas's notion of the Islamisation of knowledge concept and his alternative view of Islamic philosophy of education.

## **Towards a Critique of Rahman's Islamisation Approach: An Analysis of al-Attas's Islamisation Agenda**

Western civilisation, according to al-Attas (1991: 43–44) “has recast the knowledge and rational and scientific spirit to fit the crucible of Western culture”, and as a result, have become fused and amalgamated with all the other elements that form the character and the personality of Western civilisation. This fusion or amalgamation states al-Attas (1991) has produced a dualism that has, in turn, produced a disunity. In other words, because there exists conflicting cultures, values, beliefs and philosophies, harmonious unity within Western culture is not possible. By contrast, from an Islamic worldview, where there is no separation between the social, intellectual and the physical, there is therefore, as al-Attas (2005: 33) contends, “no conflict between societal and individual aims because there is unity of purpose”. And unity, according to al-Attas (2005: 33) has two facets – external unity, which discerns itself in the form of community and cohesion, and internal unity, which reveals itself in the form of spiritual lucidity, way beyond the confines of communal or national identities.

Hence, following on the above, and contrary to Rahman's recognition of secular knowledge as an integrated aspect of Islamic knowledge, al-Attas (1991: 45–46) couches Islamisation as

... the liberation of [wo]man first from magical, mythological, animistic, national-cultural tradition, and then from secular control over his [her] reason and his [her] language.

Whereas Rahman recognises secular knowledge as rational knowledge and hence important to Islamisation, al-Attas is fundamentally critical of secularism which he considers as alien to Islam in the sense that it belongs and is “natural only to the intellectual history of Western-Christian religious experience and consciousness” (al-Attas 1993: 25). Although al-Attas does not misrecognise the integration of rational and religious sciences, for him, Islamisation of knowledge “means the deliverance of knowledge from its interpretations based on secular ideology; and from meanings and expressions of the secular” (al-Attas 1991: 43). Consequently, he calls for an extension of knowledge that includes comparative religion from an Islamic perspective; an understanding of other religions, cultures and civilisations in relation to Islam; Islamic languages; and Islamic history, such as to desecularise knowledge and by implication enacting its Islamisation (al-Attas 1991: 43). To al-Attas, explains Hashim and Rossidy (2000: 25), knowledge is not totally and purely the product of the human mind and experience but is also based on revealed truth. For this reason, continues Hashim and Rossidy (2000: 25), knowledge continuously

requires direction, supervision and confirmation from the revealed truth – “This is so because the metaphysics of Islam is not only based upon reason and experience but also firmly grounded upon Revelation” (Hashim and Rossidy 2000: 28).

Moreover, whereas a Rahmanian conception of an Islamic philosophy of education advocates for a rethinking of knowledge in response to societal injustice, al-Attas (1991: 34) makes a case for *adab* as the “the capacity for discernment of the right and proper places of things”. Unlike Rahman, al-Attas (1991: 34) blames injustice in societies on a loss of *adab* that resulted in “confusion and error in knowledge of Islam and the Islamic vision of reality and truth ...”. Rahman, on the other hand, attributes societal injustice to the impotence of traditional Muslim education and its failure to recognise the secular (Wan Daud 1997: 18). Both Rahman (1982) and al-Attas (1991) seem to concur that the problem in societies involves a lack of a plausible conception of knowledge, although al-Attas’s (1991) position is to deny the secular and Rahman’s (1982) thesis is to invoke secular knowledge and understandings. Of course, Rahman was not uncritical towards secular knowledge on the basis that such knowledge can inhibit the modernisation of a philosophy of Islamic education (Rahman 1982: 134). His claim that such knowledge should be integrated into a comprehensive understanding of knowledge suggests that he is remiss of its potential to corrupt an Islamic conception of knowledge.

## Implications for Contemporary Debates in Philosophy of Education

As Waghid and Davids (2016: 220–221) argue, Islamisation, as both an ideological and epistemological construct, has undoubtedly assumed its forms in relation to the (de)secularisation of knowledge. One of the key concerns that the propagation of the Islamisation of knowledge raises is whether the modernisation of Islamic knowledge necessarily needs to be couched within the debate of a secular/religious dichotomy. And following on this, an extended concern might be to ascertain what exactly is understood by a secularisation and desecularisation of knowledge, and indeed whether an Islamisation of knowledge might yield the intended Rahmanian results of providing a resurgent alternative to modern society and its impact on Islamic society. In this regard, we echo the concern of al-Attas (1991), that an Islamisation of knowledge cannot simply mean the transplantation or extrapolation of secular knowledge into Islamic sciences and principle. Practices such as these, argue Hashim and Rossidy (2000: 30), “will only yield perpetual conflicting results and meaningless efforts because the essence of foreign elements or disease remains in the body of knowledge that makes it impossible to recast it in the crucible of Islam. Moreover, they contend, that transplanting between two distinct and contradictory elements and key concepts will produce neither secular knowledge nor Islamic one” (Hashim and Rossidy 2000: 30).

On the one hand, therefore, we would agree with Hashim and Rossidy (2000: 22) in their contention that the phrase “Islamisation of knowledge” is to a certain extent misleading “because it gives the connotation that all knowledge, including Islamic traditional knowledge based on the Qur’an and the Sunnah, which were developed by Muslim scholars over the millennium are not Islamic and therefore, needs to be Islamized” (Hashim and Rossidy 2000: 22).

If one considers societies in which attempts have been made to implement an Islamisation of knowledge, then often what one sees is a supplementary curriculum, rather than an integrated curriculum, which takes into account an embedded Islamisation of knowledge. Levers (2006: 159) reports that with the cultural revolution in Iran (post-1980), instigated by the Ayatollah Khomeini, the emphasis on Iranian nationalism and identity in school textbooks was minimised. Instead, explains Levers (2006: 166), attention was focused on “concepts such as justice, equality, morality, devotion to family, absence of malice and avarice, and cooperation with the state ... advocated as attributes of an Islamic society”. Despite the Islamic Republic of Iran support of an Islamisation of knowledge, Levers (2006: 172) maintains that the education system continues to offer a lack of space for individuality, self-expression and critical thinking in the school curriculum, coupled with an overemphasis on overtly ideologically driven curricular content that undermines creative thought.

Despite concerns being raised by non-Muslims regarding their own religious rights and cultural values, as discussed by Bakar (2009: 41), the Islamisation of knowledge in Malaysian educational centres seems to have enjoyed the greatest impact. The Malaysian example according to Hwang (2008: 159) represents a maximal form of Islamisation. In this regard, sufficient emphasis has been placed on an integrated Islamised curriculum in schools and universities under the auspices of a government intent on promoting the idea of Islamisation of knowledge. In the 1990s, the government initiated curricular reforms and launched an integrated curriculum for secondary schools in order to inculcate universal religious values in all young people (Hwang 2008: 159). Through the educational efforts of the Muslim Youth Movement (*ABIM*), continues Hwang (2008: 160), the state’s curriculum for Malay Muslims became integrated with an Islamic philosophy of education in schools. (Hwang 2008: 160). Likewise, at the higher education level, members of the Muslim Youth Movement (*ABIM*) became influential in the development of the International Islamic University of Malaysia (IIUM), which largely influenced by the Islamisation agenda of Ismail al-Faruqi, as well as the International Institute of Islamic Thought and Civilisation (ISTAC) under the then directorship of Syed Muhammad Naquib al-Attas (Waghid and Davids 2016: 230).

While the aforementioned examples are located in Muslim-majority countries, attempts at an Islamisation of knowledge have also been made in Muslim-minority countries, such as South Africa – specifically in private Muslim-based schools. These attempts have taken the form of sporadic supplementary programmes, to changes in the daily routine of learners, which might offer more spaces for prayers

and devotional activities. At this stage, there seems to be little consensus among schools and teachers what an Islamised curriculum might look like, or might achieve (Waghid and Davids 2016).

What interests us, and might hold particular implications for contemporary debates in philosophy of education, is Rahman's open-ended approach to knowledge construction, as encapsulated in his statement that an individual can "discover knowledge and can go on discovering knowledge" (Rahman 2011: 450). Such a view of knowledge presents particular spaces and opportunities not only for the pursuit of knowledge but the interpretation and reinterpretation thereof. And if knowledge is continually being discovered and rediscovered, then it means that knowledge is perpetually open to critical engagement, deliberation and dissent. Such an understanding of knowledge might be better placed to address issues of social injustice, marginalisation, discrimination and humiliation, not only in relation to Muslims but to all people. To this end, if the discovery and rediscovery knowledge does not lead to renewed forms of meaning-making, then it would seem that not only are human beings guilty of misusing knowledge but of neglecting the knowledge that ought to lead to and cultivate humane forms of thinking, being and coexisting.

## Conclusion

In this chapter we have mainly been concerned with Fazlur Rahman's exposition of an Islamic philosophy of education that accentuates the significance of rethinking knowledge for the purpose of being responsive to societal injustices. Similarly, we have shown that his Islamisation of knowledge idea primarily revolves around establishing an integrated conception of knowledge. Yet, seems to be remiss of the potential harm secular knowledge can cause to a comprehensive Islamic conception in the sense that secular knowledge per se misconstrues knowledge of Islam itself. Finally, a Rahmanian philosophy of education can address issues of societal injustice around the modernisation of knowledge idea. However, it seems to have fallen short from addressing issues of desecularisation and corruption of knowledge in Muslim societies in particular. However, we cannot deny his tremendous contribution to a theory of knowledge vis-à-vis a philosophy of Islamic education.

# Jacques Rancière

Charles Bingham

Jacques Rancière (b. 1940) brings disparate strands of critique together—aesthetics, politics, literature, and importantly, education. He has been prominent among Anglo cultural theorists since the late 1990s, and has since the early 2000s also become influential among educational theorists. In this chapter, three major tasks will be carried out. First, Rancière’s philosophical trajectory and major contributions will be outlined. Included will be major themes that appear in his work. Next, specific attention will be paid to Rancière’s educational contributions. His work will be situated in relation to other educational theorists. Subsequently, Rancière’s primary and unique educational ideas will be discussed. Finally, an interpretation of Rancière’s work will be offered in its current context, in an era when teaching has been under assault. It will be argued that Rancière’s major work, *The Ignorant Schoolmaster*, must be understood as embracing, rather than refuting, teaching.

## Rancière’s Philosophical Trajectory

Rancière studied philosophy under his mentor, the structuralist/Marxist Louis Althusser, at the École Normal Supérieure in Paris. After publishing *Lire le Capital* with Althusser, however, Rancière turned to denounce Althusser with the publication of *Althusser’s Lesson* (1996; Rancière 1974). This latter work reflects on the milieu of student uprisings in 1968 Paris and rejects the pretense of a theorist who guides the masses. In 1999, he joined the philosophy department at the Centre Universitaire de Vincennes, subsequently the University of Paris. He retired from there in 2000, professor emeritus.

e-mail: [cwb@sfu.ca](mailto:cwb@sfu.ca)

Among the major continental theorists of the post-structuralist, post-Marxist era, Rancière is the first to open up the literary/political/aesthetic trinity with an extensive educational component. Thus one need not translate his theory *into* education, rather one can grapple in the mother tongue with the work of a superb theorist who also theorizes education. Rancière's major works include the following. *The Philosopher and His Poor*, wherein he argues that Western philosophy has, since Plato, defined itself as at odds with laborers (2003). *The Nights of Labour* documents workers' manifestations in the context of coming to voice, rather than in the context of following some sort of theoretical orthodoxy (1991b). *The Politics of Aesthetics* describes the aesthetic dimension to reconfiguring human sensibility in order to bring about political acts (2004). And importantly, Rancière's book on education, *The Ignorant Schoolmaster*, chronicles the pedagogical adventure, and the educational theory, of Joseph Jacotot (1991a).

In *The Ignorant Schoolmaster*, published in 1987 and translated into English in 1991, Rancière uses the historical figure of nineteenth-century schoolmaster, Joseph Jacotot, to theorize education and its relation to truth, emancipation, and equality. In this work, the story is told of Jacotot, an exiled French schoolteacher who discovered in 1818 an unconventional teaching platform that spread across Europe. Many considered Jacotot's deviation from instructional norms, as his radically egalitarian pedagogy, dangerous to the social fabric. Jacotot, knowing no Flemish, found himself teaching students whose language he did not know. Finding success with this 'ignorant' method, Jacotot went on to formulate a philosophy of 'universal education', the foundation of which was both a linguistic radicality and an epistemological break. 'Universal education' was founded on (1) the arbitrariness of language and (2) the separation of will from intelligence.

Jacotot's was a philosophy of 'intellectual emancipation' finding great currency among a wide set of educators. As Jacotot professed, one need not teach that which one knows, and one should refrain from knowing what one teaches. Indeed, one must *not* teach what one knows. When one teaches what one knows, there is a "particular inequality that normal pedagogical logic operates" (Bingham and Biesta, 4). However, when one teaches that which is unknown to the teacher, "the teacher is first of all a person who speaks to another, who tells stories and returns the authority of knowledge to the poetic condition of all spoken interaction" (Bingham and Biesta, 6). Such a pedagogy would enable even illiterate parents to teach their children how to read and write. It should be noted that *The Ignorant Schoolmaster* is written with a vacillating voice that blurs the boundaries between Rancière's thought, on the one hand, and the subject matter of Jacotot's teachings and philosophy, on the other. Educational scholars as well as general cultural theorists tend to treat the work as a statement of Rancière's theoretical perspective in spite of this vacillating voice.

## Key Rancièrian Concepts

Before outlining some of Rancière's major educational contributions, attention to key Rancièrian concepts—ones that inform his overall oeuvre—is warranted. Rancière is an extremely consistent thinker, with the exception, perhaps, of his turn-around with regard to Althusser's thought. Thus, each of Rancière's key concepts serves to elucidate various elements even in works where these concepts are not specifically mentioned. 'Police' is Rancière's name for the management of human modes of life, society, and human passions. Rancièrian policing has nothing to do with human beings who are employed by the state, but rather the ordering of what gets to count as discourse and purposeful action. Rancière's "police", writes Eric Méchoulan, "as power practices and social life styles, builds inequalities, but such a construction has to appear natural" (Méchoulan 2004, 4). The 'distribution of the sensible' is a phrase of Rancière's that further clarifies the police order. This distribution "refers to the implicit law governing the sensible order that parcels out places and forms of participation in a common world... [it] produces a system of self-evident fact of perception based on the set horizons and modalities of what is visible and audible as well as what can be said, thought, made, or done" (Rancière 2004, 85). Whereas the distribution of the sensible offers up modalities of perception, the police order represents an organization of bodies based upon this distribution.

As Rancière writes,

This is what a distribution of the sensible means: a relation between occupations and equipment, between being in a specific space and time, performing specific activities, and being endowed with capacities of seeing, saying, and doing that 'fit' those activities. (Rockhill and Watts 2009, 275)

'Dissensus' is Rancière's term for the creation of a fissure within the distribution of the sensible and within the police order. A critical artistic work, for example, can lead to dissensus when it produces a new perception of the world, and creates a commitment to its transformation. "Dissensus", writes Rancière, "is the demonstration (*manifestation*) of a gap in the sensible itself... [It] makes visible that which had no reason to be seen; it places one world in another..." (2010, 38). Dissensus consists of three parts: the production of sensory inconsistencies, the development of an awareness of these inconsistencies, then a mobilization of individuals based on these inconsistencies. Central to both Rancière's educational theory and his political understanding of the police and dissensus is his notion of 'subjectification'. "Subjectification" "...is the process by which a political subject extracts itself from the dominant categories of identification and classification. By treating a wrong and attempting to implement equality, political subjectification creates a common locus of dispute over those who have no part in the established order" (Rancière 2004, 92). Subjectification is the coming into subjectivity of one who has participated in dissensus.

Rancière's 'presumption of equality', as well as the 'arbitrariness of language', are themes of Rancière's work that have special resonances with education. With regard to the presumption of equality, it is not that all people *are* equal. That is, Rancière does not offer some philosophical, psychological, or political justification for the sameness of all people. Nor does the presumption of equality mean that all people need to be allotted resources in a similar fashion. Thus the presumption of equality is not an ontological or political claim. It is rather a subjunctive claim, one that sets up a presupposition by which subjects might formulate language and actions by which they participate in politics and prove, through verification, that equality is a fact. The presumption of equality provides a means for a verification of equality. And as Rancière notes,

A verification of equality is an operation which grabs hold of the knot that ties equality to inequality. It handles the knot so as to tip the balance, to enforce the presupposition of equality tied up with the presupposition of inequality and increase its power (Rockhill and Watts 2009, 280).

In constructing an intervention on language, Rancière follows what has become an inevitable path in French theory after the "linguistic turn" (Rorty 2004). Namely, it now seems incumbent on French theorists to offer a unique commentary on, or a usage of, language theory. While Rancière has refused the notion that his work has a theoretical anchor in language theory, he has stated that his thinking grew when, after studying Joseph Jacotot, "I became more sensitive to the fact that words are never definitions of things or states of things but are like weapons exchanged in combat, in dialogue" (Rancière 2013). Thus language is arbitrary. There are no words that are more privileged than others to tell a given story. The philosopher's words are not any more important than the joiner's. The sociologist's words are no more important than the poet's. The teacher's words are not any more important than the student's.

All of the above concepts are discernable, if not explicitly mentioned, in Rancière's major educational work, *The Ignorant Schoolmaster*. However, this educational work also brings various of its own themes to the fore. Each of these themes constitutes a major educational contribution by a theorist whose work has a uniquely educational dimension.

## Rancière Among Educational Theorists

Jacques Rancière, with the publication of *The Ignorant Schoolmaster*, positioned himself as an unprecedented educational theorist. He established an iconoclastic approach to education through his recuperation of Joseph Jacotot. Rancière's work can be seen in contrast to three prevalent educational perspectives that dominated the twentieth century into the beginning of the twenty-first century. Education has commonly been described in one of three ways. These ways roughly correspond to the traditional, progressive, and critical models of education. As a traditional

project, education is conceived as a platform for disseminating a common set of learnings. These learnings will, in turn, enable citizens to share a common language for use in the public sphere. Such learnings may or may not derive from the experiences of the students since traditional education is not concerned with the private lives that students have had in the past, but with the common knowledge that needs to be fostered so that they can speak with others in the public sphere.

Progressive education shares the same liberalist tendencies of traditional theory, but progressives are more concerned about the bridge to be constructed between private experience and public life. So while the progressive orientation shares the desire to create a common body of knowledge that will enable citizens to communicate in the public sphere, progressives insist that a common body of knowledge can only be understood from the particular experience of each particular person. Thus one must link private experience to public discourse. Critical education, in turn, considers traditional and progressive models to be lacking. For criticalists, education itself is identified as a tool that has been used by various oppressive interests to foster inequality. Education must be changed so that it no longer serves hegemony. Education must be re-fashioned so that it no longer impedes democracy, emancipation, and enlightenment.

In contrast to these three views, Rancière offers a divergent alternative. First, Rancière's recuperation of Jacotot is at odds with the traditional figure of a knowledgeable teacher whose role it is to disseminate his or her knowledge. Instead, Rancière's teacher is 'ignorant', willingly unknowledgeable about subject matter. Further—and here is where numerous readers of Rancière go astray—Rancière's account has little to do with progressive pedagogy. As Rancière puts it, "The distinction between 'stultification' and 'emancipation' is not a distinction between methods of instruction. It is not a distinction between traditional or authoritarian methods, on one hand, and new or active methods on the other: stultification can and does happen in all kinds of active and modern ways" (Bingham and Biesta, 6). And finally, Rancière's contribution is not to be confused with the work of unveiling carried out by critical pedagogy. Rancière is explicitly critical of Pierre Bourdieu's theory of reproduction, "a discourse deriving its authority from the presumed naivete or ignorance of its objects of study" (Rancière 1991a, xi). Insofar as criticalist education is largely indebted to such notions of reproduction, and to programs by which educators might combat reproduction, Rancière's pedagogical logic is different still from critical pedagogy.

In contrast, Rancière offers an assault on the very notion of educational epistemology. While other paradigms have worked within such an epistemology, Rancière claims that any schooled epistemology is a matter of inequality. He wants to break with "the particular inequality that normal pedagogical logic orchestrates..." where instruction normally serves to "split the intellect in two, to consign to the everyday life of students the procedures by which their minds have heretofore learned everything they know" (Bingham and Biesta, 4). Rancière insists that knowledge of the teacher must not correspond with knowledge of the student. Instead, the will of the teacher must be matched to the will of the student without their knowledges being commensurated. It is the commensuration of knowledges that leads to knowledge

comparisons and student stultification. Only through a de-tethering of knowledge-knowledge comparison can intellectual emancipation obtain.

Having stated above that Rancière offers an assault on ‘educational epistemology’, it is appropriate here to comment upon such an assault and mention its significance within the contemporary educational scene. At present, the very idea of how legitimate knowledge is supposed to be accessed in contemporary society is dominated by the educational institutions. That is to say, schools and universities promote an ideology about the way knowledge should rightly be accessed. This ‘schooled’ way of accessing knowledge might be termed as ‘educational epistemology’, an epistemology that favors prioritizes educational institutions as the primary means for knowledge acquisition. Rancière rightly comments upon this educational epistemology in the way quoted previous paragraph, as an epistemology that relegates nonschool knowledge to a position somehow different from schooled knowledge, and schooled knowledge as preferable and procedurally distinct from what people have ‘learned heretofore’. His assault on educational epistemology is thus a confirmation that there is in fact no ‘split of the intellect’. The knowledge of a schooled mind is not different from that of an unschooled mind.

One can summarize in a straightforward way the importance of this contribution—this assault on educational epistemology—to current educational debates by contrasting it to the three dominant approaches outlined earlier: the traditional, progressive, and critical. Each of these educational approaches is concerned with *employing* educational epistemology to various ends, but these mainstream approaches are in no sense eager to assault such an epistemology head on. In the case of traditionalists, the educational epistemology is seen as a way to improve the unrefined state of those who are not educated. In the case of progressives, the educational epistemology is seen as a way to ameliorate the rift between natural experience and the static inheritance of culture. And in the case of criticalists, the educational epistemology is seen as a means to combat hegemonic ideology that otherwise subverts the unschooled mind. But in none of these dominant approaches is educational epistemology itself questioned. Rancière’s educational contribution to modern debates includes this unique epistemological assault on the school.

## Unique Educational Themes

Having briefly outlined Rancière’s key contributions and the distinction between his work and the work of other educational theories, two distinct themes of Rancière’s educational work will be detailed: educational emancipation and educational truth. At least since Immanuel Kant’s essays ‘What Is Enlightenment?’ and ‘On Education’, emancipation has been construed as an Enlightenment goal of education. Schools have been construed as places fostering “man’s release from his self-incurred tutelage” and a release from “man’s inability to make use of his understanding without the direction of another” (Kant 1982, 1992, p. 90). The Enlightenment project of the school has been an effort to bring students to a

place of autonomy and rational thinking. However, Rancière's work demonstrates that this Enlightenment project of emancipation is problematic. Emancipation, so construed, is "something that is *done to* somebody" (Bingham and Biesta, 30). So while emancipation "is oriented towards equality, independence and freedom, it actually installs *dependency* at the very heart of the 'act' of emancipation" (Bingham and Biesta, 31).

In contrast, Rancière proposes a form of emancipation that is done actively. Rancière notes that "nobody escapes from the social minority save by their own efforts" (1995, 48). This form is proposed both in politics and in education. In politics, Rancière documents the emancipation of French workers *by* French workers, "who, in the nineteenth century, created newspapers or associations, wrote poems, or joined utopian groups were claiming the status of fully speaking and thinking beings" (Rancière 2003, 219). This sort of political emancipation does not happen with the help of others; it happens at the hands of French workers themselves. Likewise in education, the students of Jacotot do not achieve intellectual emancipation with the help of someone else. Rather, they read, speak, and write French through repetition and verification *on their own*. Intellectual emancipation in education is thus a practice wherein explication no longer takes place. It is a practice where students take up a position as speakers, speakers who have as much right to make sense of the world as any other person, any other explicator who might pretend that students are somehow not equal to the task.

Another significant contribution is Rancière's educational conception of truth. Once again, Rancière departs from traditional, progressive, and critical models. Each of these dominant models partakes in an Enlightenment orientation toward truth. Each considers truth to be a desirable, attainable goal, one that can be arrived by perfecting the insight of humans through the enlightening process of education. For these dominant models, education is a vehicle by which one arrives at truth. Rancière demonstrates that this Enlightenment model of truth is shored up by the notion that truth needs to be explained in schools. Thus, the Enlightenment model of truth—embraced by dominant educational theory—actually reinforces the notion that education should be explanatory.

Rancière uses language theory and anti-explanatory pedagogy in tandem to posit an educational alternative to Enlightenment truth. That is to say, Rancière demonstrates how truth takes on a new role when Jacotot's universal teaching and Jacotot's thesis on arbitrary language are combined. With regard to language, truth, and Jacotot's pedagogy, Rancière writes,

Truth is not told. It is whole, and language fragments it; it is necessary, and languages are arbitrary. It was this thesis on the arbitrariness of languages—even more than the proclamation of universal teaching—that made Jacotot's teaching scandalous. (1991a, 60)

Rancière uses Jacotot's example to demonstrate the fact that truth does not depend on the particular language of a particular expert. No one has a monopoly on explicating truth because truth is not amenable to explication. Whereas explanatory pedagogy assumes that language can be a vehicle toward truth, Rancière reminds us that such a perspective depends on a rather simple, language-as-clear-window paradigm.

Significantly, Rancière demonstrates that the school has become a symbol for the Enlightenment orientation toward truth. The school, as an institution, is positioned as a place where people speak with words that are more knowledgeable than the words spoken outside of school. Those knowledgeable words, in turn, are supposed to bring students to truth. This model informs schools, and it also informs society at large. Rancière argues that we now have a ‘society pedagogicized’, where society itself takes cues from the school as to the availability of truth. Truth is, in general, assumed to be attainable through language because in an era of compulsory schooling, each person learns—in school, early on—that truth can be explained through language in a classroom. Thus, when Rancier and Jacotot insist on the arbitrariness of language, he insists that the school is not a primary place for attaining truth because the language of the teacher is no more privileged than the language of any other person.

## Rancière and the Assault on Teaching

Rancière’s primary educational work, *The Ignorant Schoolmaster*, is often interpreted as a text that promotes independent student learning without the aid of teachers. That is, readers of the text often assume that Joseph Jacotot does not teach his students anything because he does not speak Flemish and they do not speak French. It is important, however, *not* to insert Rancière’s text directly the current educational milieu of what Gert Biesta has called “learnification” (2005, 2011, 2012). Coining the term “learnification”, Biesta has documented a particular “language of learning”, “...including the tendency to refer to teachers as facilitators of learning, to teaching as the creation of learning opportunities, to schools as learning environments, to students as learners and adults as adult learners, to the field of adult education as that of lifelong learning” (2012, p. 37). Indeed, learning has become a preferred term in education as a number of powerful discourses have recently coalesced, without necessarily having conspired, to promote the learner while simultaneously demoting the teacher. As Biesta points out, the new language of learning has been bolstered by discourses of constructivism, critical pedagogy, informal learning, lifelong learning, and of neoliberalism (2012). With an omnipresent preference for learning, teaching appears to be fading in importance. If students can learn on their own, or learn online, it would seem that teachers are not necessary.

Some interpreters of Rancière’s work claim that *The Ignorant Schoolmaster* is primarily about discarding teachers, that Joseph Jacotot’s students were empowered because they became solitary learners in need of no teacher. Chambers notes the following for example:

When a student picks up a book and reads it for herself (even, as in the case of Jacotot’s teaching experiments, a book written in a language other than her mother tongue), then she is using the method of equality. This capacity for anyone to read the book without having someone else telling them what it means—this is the power of equality, and this is all there is to equality. (Chambers 2013, p. 644)

However, as Biesta correctly points out, one should not interpret *The Ignorant Schoolmaster* as a treatise on some different sort of education (in press). The work of Rancière should rather be understood as a project of intellectual emancipation, a political work rather than pedagogical statement. Nevertheless, educators continue to see in *The Ignorant Schoolmaster* some sort of educational model that coincides with the current trend toward learning and away from teaching. Especially if one heeds the comments that Rancière has himself made regarding his own interest in this text and his lack of interest in studying education per se, one must conclude that *The Ignorant Schoolmaster* is a work of political philosophy that just happens to use universal education as an emancipatory platform.

Not only can it be said that Rancière's work is more about intellectual emancipation than it is about education. It can also be said that lining Rancière up with the push toward learning gets Rancière's education platform wrong. To show this, the remainder of this chapter will detail what has elsewhere been called the 'logic of learning' in order to show that Rancière's work is actually antithetical to such a logic. Below five elements of the logic of learning will be detailed. It will be shown at each element how Rancière's work breaks from such a logic.

**Element 1** That learning *has* a logic. This element is perhaps the most essential aspect of the logic of learning. That learning has a logic might be said to derive from a long-standing tradition of theorizing *how people learn*. From Plato, to Rousseau, to John Dewey, to Maria Montessori, to Howard Gardner, educational thinkers have been offering up various figures-of-the-child in order to make the teacher better equipped to do his or her job (Bingham and Biesta 2010). Current discourses on learning have not given up this idea that learning *has a logic*. Indeed, as teaching is assailed and learning is championed, such assailing and championing is often done in the name of this or that figure-of-the-child, a child who, assumedly, does not need a teacher in order to learn. That learning has a logic is not to say that learning has *one* particular logic. Many educational thinkers opine differently about what the logic of learning is. But it is to say that learning is observable enough, or theorizable enough, or at least figure-izable enough, that we can talk about its logic—whatever the particular logic might be.

Rancière, in contrast, offers no logic of learning. Indeed his famous statement in *The Ignorant Schoolmaster* indicates the extent to which Rancière does anything but detail a new logic of learning. As Rancière notes, the intellectual adventurer learns not by some rule, but by no rule at all, "from proximity to proximity" (Bingham and Biesta, p.4).

**Element 2** Learning is instrumental. The logic of learning conceptualizes the learner as one who will acquire skills and knowledge to serve specific purposes. This instrumental aspect of learning can be seen in numerous practices in educational institutions of all levels. From elementary schools to universities, the use of learning outcomes is a prime example of the instrumental nature of learning. Learning outcomes indicate demonstrable behaviors that students will obtain by the end of a certain period in their education. A typical learning outcome, this one from

the University of Illinois Urbana-Champaign Library's 'Tips on Writing Learning Outcomes', states the following: "Students will be able to develop topic-relevant vocabulary in order to search databases with maximum flexibility and effectiveness" (Outcomes). While learning outcomes vary from subject to subject, and while learning outcomes are articulated in numerous ways at various levels of education, the central premise of any learning outcome is that students will gain a specific skill or disposition after they have finished their learning. Learning itself is thus posited as instrumental to specific, observable outcomes.

Rancière's perspective once again diverges distinctly. For Rancière, the act of intellectual emancipation derives from what he calls the 'presumption of equality'. A Rancièrian educational project rejects the idea that students will use learning to get to a more 'advanced' or more 'proficient' state. Rancière is insistent that equality is not arrived at because when equality is arrived at, then stultification is the inevitable result. Instead, Rancière formulates equality in the presumptive thus rejecting the very notion of instrumental learning.

**Element 3** Normation. Normation refers to the tendency to talk about learning as either on or off track, either right or wrong, either successful or unsuccessful. Discourses on learning, be they school-based, clinically based, or entrepreneurial, commonly entail the normative message that learning has a certain trajectory—and deviance from this trajectory means learning does not happen as effectively as it might otherwise happen. Thus in schools, one encounters the labels of 'slow learner', or 'exceptional learner', implying that the rate of learning has some 'natural' speed, and that any speed not commensurate with the natural one needs special attention. As another example, this time in psychological discourse, one finds entries in the DSM of attention deficit hyperactive disorder that are clearly aimed at learners: "...often avoids, dislikes, or is reluctant to engage in tasks that require sustained mental effort (e.g., schoolwork or homework...)" (American Psychiatric Association 2013). There are also the ubiquitous, if costly, seminars that barrage teachers' emails daily, such as this one I received lately: "Strategies to reach students in poverty". The implication of this particular seminar is that students in poverty learn differently than other students.

Also in this case, Rancière's presumptive statement of equality demonstrates a refusal of learning's logic, this time a refusal of normalized goals or paradigmatic ends. As in his other political works, the presumption of equality creates a political bond between social actors that does not explain who or what is the most 'normal'.

**Element 4** *That Teaching is the Same as Instruction*. Following the logic of learning, teaching is defined narrowly as instruction. This aspect of the logic of learning can be witnessed by looking to the beginnings of learnification in higher education, in particular, it is helpful to look to the widely cited article of 1995 by Robert Barr and John Tagg, published in *Change: The Magazine of Higher Education* (1995). Entitled, 'From Teaching to Learning: A New Paradigm for Higher Education', this

essay offered an argument as to why educators in post-secondary institutions should focus on learning rather than teaching. Barr and Tagg posit a binary of learning/teaching. Then they argue that there must be a shift from teaching to learning. In doing so, Barr and Tagg create a stereotype of teaching by assimilating teaching to *direct instruction*. Thus while any reasonable consideration of teaching would not assume that teaching consists completely, nor even primarily, of direct instruction, the 'new paradigm' of learning premises its own necessity on a rather thin misrepresentation of teaching-as-instruction.

That teaching is not the same as instruction in Rancière's work is most obviously demonstrated in the opening premise of Jacotot's teaching. Clearly, the French speaking teacher has no means to instruct the Flemish students whose language he cannot speak. Thus insofar as there is in Rancière a sort of teaching without instruction, the fourth element of learning's logic does not ring true.

**Element 5** Authority resides, or at least should reside, as the possession of the learner. This aspect of learning's logic derives both from the Cartesian model of the self's autonomy and from the constructivist image the acquiring mind. It is also related to the belief that authority is a substance rather than a relation. The self-authorized learner finds his or her place in practices of self-regulated learning, online learning, as well as the continuous progress model of learning I experienced as a child. Following this logic of authority-as-substance, authority presents a zero-sum game: If the teacher 'has' more authority, then the student 'has' less.

Once again, the learnification trend uses a logic that has nothing to do with Rancière's. Rancière's work breaks the either/or dyad that either students have authority or teachers do. He does this by positing will to will under the condition of the ignorant master. For Rancière, it is not that the authority of knowledge is given over to students at the expense of the teacher's authority. It is rather that both student and master meet in an alternative relation of authority, will to will, absent the typical arguments about knowledge authority.

## Conclusion

Jacques Rancière has made significant contributions to educational thought through his educational writings as well as through his wide-ranging philosophy. His writings will continue to inform educational philosophy because the themes he raises in the areas of philosophy, social theory, aesthetics, politics, literature, and education remain consistent. As has been shown, Rancière's work has garnered attention both from those who wish to hear in his writing an echo of previous educational trends as well as those who more correctly consider Rancière's educational philosophy as a distinctly political endeavor. His new writings will no doubt continue to inform his older ones, and his educational import will continue to grow as a result.

# John Rawls

Brian Coyne and Rob Reich

## Introduction

John Rawls's magisterial *A Theory of Justice* (1971) and its follow-up *Political Liberalism* (1993) constitute the most important defense of contemporary liberal political philosophy. Rawls, it is often said, revived the very field of political philosophy in the twentieth century. Though he wrote surprisingly few words about education, his model of a just society has powerful implications for important contemporary issues in education policy and the philosophy of education.

Rawls's project begins from an assumption that modern societies are characterized by deep disagreement about ultimate aims, about religious and moral doctrines that inform citizens about how they live as individuals. This pluralism of values gives rise to a fundamental political problem: how might citizens divided over religious and moral issues of the deepest importance nevertheless affirm a shared and stable political order that delivers justice for all?

This same disagreement on ultimate ends is also what gives rise to many of the most pressing questions in education policy and philosophy. In this chapter, we consider how Rawls's philosophy can inform debates in education policy and philosophy such as what justifies the public provision of education; what constitutes a fair distribution of educational opportunity; what space a democratic society should make for particularistic, including religious, schooling; and how tensions between educational choice and aspirations for common schooling can be resolved.

To put Rawls's project in perspective, start by considering that in a theocratic state, or even in a procedurally democratic state where a single set of values was the agreed-upon basis of the social order, answering these questions would be relatively

---

e-mail: [bkcoyne@stanford.edu](mailto:bkcoyne@stanford.edu)

easy. Public education would be justified by, and focused on, the need to instruct children in the state's official values. A Christian nation, for example, would systematically privilege a Christian education. Education would be distributed fairly if all children got a relatively equal instruction in the society's official creed, and particularistic schooling would be acceptable only to the extent that it did not contradict that creed. In a democratic state where not only is there no universally agreed-upon set of values but this pluralism of values must be respected, not just grudgingly tolerated, these questions become far more difficult. The same point holds true with other questions of fairness and justice: they are deeply challenging precisely because we must find answers that work in a condition of diversity of beliefs and ultimate values.

Rawls's work provides an answer to how a stable and just political order might be affirmed by citizens who are profoundly divided on religious and moral questions. He calls his answer 'justice as fairness'. The blandness of this label belies the sophistication of the argument. As developed in *A Theory of Justice* (1971) and *Political Liberalism* (1993), justice as fairness demands a key role for education. More specifically, Rawls writes that "Society's concern with [children's] education lies in their role as future citizens, and so in such essential things as their acquiring the capacity to understand the public culture and to participate in its institutions, in their being economically independent and self-supporting members of society over a complete life, and in their developing the political virtues" (Rawls 1993, p. 200). This chapter first discusses three aspects of Rawls's justice as fairness and its relationship to educational policy: fair equality of opportunity, liberal neutrality, and political virtues of citizens. The following sections explain how these concepts can be used to make contributions to debates on questions of education policy and philosophy and conclude with an evaluation of these contributions.

## **Rawls's Idea of a Just and Liberal Society**

### ***Fair Equality of Opportunity***

The fundamental question that animates Rawls's work is what kind of state we could expect a reasonable person, understood as a free and equal citizen, to affirm and accept, rather than merely submit to. A just political order is, for Rawls, one that could win the affirmation of any reasonable person despite background pluralism of religious and moral doctrines. The question then becomes how society must be organized for this criterion to be met.

In *A Theory of Justice*, Rawls defends two principles of justice, which together he calls "justice as fairness", and he argues that a society whose core social, political, and economic systems, what he refers to as the "basic structure of society", are based on these principles will best meet his proposed definition of justice (Rawls 1993, p. 11).

First Principle: "Each person is to have an equal right to the most extensive basic liberty compatible with a similar liberty for others."

Second Principle: "Social and economic inequalities are to be arranged so that they are both (a) reasonably expected to be to everyone's advantage, and (b) attached to positions and offices open to all". (Rawls 1971, p. 60)

Rawls does not claim that all inequalities—inequality of income, for example—are automatically unfair or unjust. What must be equal is the opportunity structure. Rawls defends what he calls 'fair equality of opportunity', which stipulates that, in order to be acceptable, inequalities must be 'attached to positions and offices open to all'. Consider two positions in society of unequal pay and social prestige: the CEO of General Motors and a janitor at a GM factory. To be consistent with justice, both positions must be equally open to all and the existence of this inequality must in some way advantage the less advantaged person, in this case the janitor. The idea of the positions being "open to all" is crucial, but Rawls recognizes that the phrase has two possible interpretations (Rawls 1993, p. 65). One interpretation is what describes most democratic societies today: both positions are formally open to all, in that there are no restrictions based on characteristics like race, gender, and class. However, facts about society make it the case that, if two infants with equal native intelligence are born in the same year but to families at opposite ends of the socio-economic spectrum, the infant born at the high end has a vastly greater relative chance of ending up as CEO, and the infant born at the low end has a vastly greater relative chance of ending up as janitor. Even if those tasked with choosing the next CEO chose solely based on merit, the infant born into the higher end of the socio-economic spectrum (in terms of class, race, gender, etc.) has, because of other inequalities in the social system, a much greater chance of converting this native intelligence into the skills needed to become CEO. Rawls calls this situation "careers open to talents", meaning that positions are assigned fairly based on talent, but there is in this scenario no guarantee that talents (Rawls uses the word "talent" to mean skills and knowledge developed during life, as opposed to naturally endowed intelligence) are distributed independently of the social position into which a person is born (Rawls 1971, p. 73). In short, Rawls recognizes what any educational policy expert knows: circumstances outside the schoolhouse (family and neighborhood characteristics) create predictable inequalities in school performance and opportunity, even if the schoolhouse is formally open to any child.

Rawls argues that, in a system like this, we should not expect a person born into social disadvantage to accept her low social position as an adult. A caste system that automatically assigned adults social positions based on circumstances of birth is obviously unacceptable to those on the losing end, and Rawls argues that inequalities in a system in which all positions are formally open to all but in practice the overwhelming majority of high-status positions go to people born into high positions is similarly unacceptable. To expect people who lose out in such a system, who have lost out merely because of their circumstances of birth, to accept their poor and unequal outcomes is to ask them to accept something less than equal citizenship in their society (Rawls 1971, pp. 102–103). It is to allow morally arbitrary circumstances of birth to shape life chances and outcomes.

Inequalities of social and economic position are acceptable, Rawls argues, when all positions are not just formally open to all but when there is ‘fair equality of opportunity’. Fair equality of opportunity can be explained statistically: it exists if the two infants discussed above, born into opposite ends of the social spectrum but with equal native intelligence, have roughly equal chances of ending up with high or low status positions as adults. It is impossible to measure native intelligence, but since we assume that native intelligence is not distributed unevenly across race, class, or sex, fair equality of opportunity requires that educational opportunity be distributed equally, or at least without regard to social position at birth. Family income or social status ought not determine educational prospects.

Education is, of course, one of the most significant ways in which native intelligence is developed into the kinds of skills, experiences, and capacities that in fact determine one’s eventual standing within society, and so, as Section ‘[Contributions of Rawls’s philosophy to questions in education policy](#)’ discusses in detail, the idea of fair equality of opportunity provides an important way to understand and evaluate educational systems.

### *Liberal Neutrality*

Pluralism is a standing condition of modern society. We should expect citizens to be divided on fundamental religious and moral values. Rawls calls a person’s set of values her “comprehensive doctrine”, a term he means to include religions but also encompass any system of beliefs by which a person makes her life choices (Rawls 1993, p. 13). In light of this pluralism, Rawls argues that political institutions must remain ‘neutral’ among these competing doctrines; to base fundamental political doctrines on any one comprehensive doctrine would be to privilege that group of citizens in the very architecture of the state. This principle is broadly consistent with idea of separation of church and state familiar from the practices of modern democratic states. Rawls’s core idea here is that no citizen, understood as free and equal, could be expected to accept any law or policy based exclusively on a comprehensive doctrine that she does not share.

Rawls of course recognizes that all laws and policies are based on some value or another: a prohibition on murder, for example, is based on the belief that people have a right not to be murdered. The idea of liberal neutrality thus depends on a contestable line between, on the one hand, values unique to a particular comprehensive doctrine and, on the other hand, values that any reasonable person could be expected to accept, what Rawls calls “political values” (Rawls 1993, p. 138). The belief that people have a right not to be murdered is a canonical example of the second kind of value, as are beliefs that things like hunger, poverty, and illiteracy ought to be eradicated. In contrast, a belief like the Hindu belief that cows are sacred is a value unique to a particular comprehensive doctrine, and it therefore cannot ground a law prohibiting the eating of beef, even if the majority of citizens of the country are Hindus. A state can be said to have achieved the goal of liberal neutrality

if all of its laws and policies are supported by political values (which Rawls also calls ‘public reasons’) and all of its reasonable citizens can therefore be equally expected to affirm these laws.

### *Political Virtues of Citizens*

The basic structure of a liberal democratic society must be just in order for it to be legitimate to its citizens. But how might that society remain *stable* over time, continuing to receive the affirmation of every new generation of citizens? Rawls’s answer here is that citizens must develop political virtues in their dealings with one another and that these virtues must be cultivated in the youngest citizens.

According to Rawls, “the political virtues [are] necessary for [citizens] to cooperate in maintaining a just political society” (Rawls 1993, p. xlvi) and he underscores their importance, noting that they are “very great virtues” which “constitute a very great public good, part of society’s political capital” (Rawls 1993, pp. 157, 171). The core political virtues are reasonableness, a sense of fairness, civility and tolerance, and mutual respect. Taken together, the political virtues make it possible for citizens not merely to affirm a belief in equality but actually to treat their fellow citizens as equals, even those who hold comprehensive doctrines radically different from their own. Citizens must be willing to listen to other arguments and points of view and articulate defenses of their own and must believe that political differences can and should be settled through debate, voting, and, compromise (including, sometimes, losing) rather than violence (Rawls 1993, 448ff.).

The idea of political virtues also puts a limit on the principle of liberal neutrality. The state is only required to be neutral among *reasonable* comprehensive doctrines. For Rawls, a doctrine is “reasonable” if it is broadly compatible with a liberal society and the political virtues just discussed (Rawls 1993, pp. 58–61). A doctrine that required political institutions to promote one’s religious views, for example, would be an unreasonable doctrine in a liberal society. A liberal state, according to Rawls, must simultaneously inculcate in young people the qualities that make an adult a reasonable citizen of a pluralistic democracy while at the same time not doing anything that violates neutrality among reasonable comprehensive doctrines.

As will be discussed in the next section, liberal neutrality and the political virtues both impose obligations on the state with regard to education. The idea of liberal neutrality imposes a negative requirement on education: the state must avoid privileging one doctrine over another in its educational systems. The idea of the political virtues imposes a positive requirement: the state must ensure that its educational system reliably cultivates the political virtues in its citizens and contains or prevents the spread of unreasonable doctrines. There is, inevitably, a tension between these two requirements, one that is at the heart of many of the most difficult contemporary questions of education policy and philosophy.

Overall, these three features, the idea of fair equality of opportunity, the idea of liberal neutrality, and the idea of the political virtues of democratic citizenship, form

important parts of Rawls's answer to the key question from which we started: what kind of state can a reasonable citizen be expected to endorse? Education is crucial to both sides of the question: education policies are part of what makes the state endorsable by the citizens, but education is also what makes the citizens able to endorse the just state. The next section looks at how these schematic demands can be used to gain traction on contemporary questions of education policy and philosophy.

## **Contributions of Rawls's Philosophy to Questions in Education Policy**

In the introduction, we identified some key questions in the philosophy and policy of education for which Rawls's theory can potentially provide useful insight:

- What justifies the public provision of education?
- What constitutes fair distribution of educational opportunity?
- How can tensions between educational choice and aspirations of common schooling be resolved?
- What space is there, if any, for particularistic schooling alongside common or secular schools?

In this section, we use Rawls's theory—in particular the three key ideas discussed in the previous section—as a lens through which to examine these questions.

### ***What Justifies the Public Provision of Education, and What Constitutes Fair Distribution of Educational Opportunity?***

It is taken for granted that modern societies should provide education to their citizens, but Rawls's philosophy helps give a sense of why the provision of this particular public good is so important, which in turn can inform debates about how much education (in terms of quantity, quality, and equality) the state needs to provide.

First, a state must provide education because, without universal and roughly equal access to education, justice cannot be achieved. In particular, fair equality of opportunity requires that access to education not depend on the arbitrary circumstances of the socioeconomic position of one's birth. The role of education in achieving fair equality of opportunity is to ensure that talents as an adult are cultivated without regard for socioeconomic position at birth.

The idea of fair equality of opportunity can inform debates about whether public provision of education should be sufficientarian (requiring a minimum threshold for all but permitting inequalities above this minimum) or egalitarian (focused on ensur-

ing some degree of equality of educational outcome). The idea of fair equality of opportunity means that fair distribution of educational opportunity will necessarily require some degree of focus on both. If the state provided no education to anyone (a form of equality, after all), the outcome would surely be that privately funded educational opportunities, and therefore adult levels of cultivated talent, would be strongly correlated with socioeconomic position at birth. Assuming that the state does provide public education but also does not prohibit high-quality, expensive private schooling, the general level of public schooling in a just society must be sufficiently high that public school students (including, presumably, students from poor backgrounds) are not at a disadvantage later in life when competing for high-status positions against people who had expensive, high-quality private educations. Fair equality of opportunity does not require that all children receive an absolutely equal education—even in a fully just society, factors such as teacher talent can likely never be fully equalized. What the ideal of fair equality of opportunity does require is that the quantity and quality of education not be shaped by socioeconomic position at birth. It does not take any special sociological knowledge to know that this requirement is not met in any real society. It does, however, provide a useful goal that can help orient and evaluate potential reforms to public education systems.

Public education must also be oriented toward children's future roles as citizens. In addition to ensuring that all students gain proficiency in standard academic subjects, education is, along with the family, the crucial way that children acquire the political virtues necessary both for their own success within a just, liberal society and for the long-term success of society itself as stable and just. Children must grow up to see themselves as free and equal citizens of their society who possess and exercise basic freedoms of conscience, speech, and association, develop a sense of justice, and cultivate the talents that allow them to compete on fair terms for social advantage. And they must also grow up to see others—all others, regardless of characteristics like race, gender, class origin, and comprehensive doctrine—as free and equal in the same way. Cultivating these beliefs requires more than a focus on sufficiency. As has been recognized in the United States at least since *Brown v. Board of Education*, if one school gives its students a solid education but the neighboring school gives its students an education twice as good, it will be difficult for the students at either place to grow up with a sense of equal citizenship and self-worth (Rawls 1971, p. 107). That inequality is, of course, especially problematic when students are separated according to other characteristics that track social status, like race, but the same concern would hold with unequal schools divided only by a characteristic like place of residence (see Koski and Reich 2006 and Allen and Reich 2013).

### ***What Role Is There for Particularistic Schooling?***

Are private schools incompatible with justice? Rawls's justice as fairness shows why private education is potentially problematic, namely that it permits socioeconomic status to influence educational opportunity. But Rawls's theory also shows

why a complete ban on private education would be impermissible. The first principle of justice's requirement that all people "have a right to the most extensive basic liberty compatible with a similar liberty for others" would seem to permit parents to transmit their religious and moral convictions to their children (Rawls 1971, p. 60). Honoring this liberty will very likely include the permission to educate one's own children in a way at least somewhat different from the standard public model.

For many people, the choice to give their children a particularistic education is based on their own (often religious) comprehensive doctrine. The idea of liberal neutrality clearly means that the state should make a good faith attempt to preserve room for families to educate their children in their own traditions provided this education prepares the children to support themselves in the larger society and does not conflict with the core political virtues. More difficult questions arise about comprehensive doctrines that do conflict with the political values, what Rawls refers to as unreasonable comprehensive doctrines. Consider, for example, a white supremacist group that wants to establish its own private schools. Should the liberal state tolerate those who are intolerant? Cases like this are where the tension between liberal neutrality and the importance of the political values come most strongly into focus. Liberal neutrality means of course that the state cannot ban parents from passing their beliefs onto their children simply because the majority of citizens find those beliefs deviant or immoral. But some beliefs, such as racism, are repugnant precisely because they contradict and threaten the state's just and liberal character. Navigating this tension would require an inquiry into exactly what kind of racist education the children would be getting. If they were taught that their own heritage is superior but that they nevertheless ought to treat all people with equal respect, then the principle of liberal neutrality might require the state to allow the school to exist. However, the importance of the political virtues means that the state could prohibit a school that teaches children that members of other groups are not free and equal citizens. To take another example, a religious school that teaches that women cannot be priests is acceptable, but a school that teaches that women cannot be President would be unacceptable. While both teachings contradict the political virtues of belief in full equality of all people, the inequality in the former is exclusive to the religious sphere, while the latter teaching threatens to undermine equality in the society as a whole (see Callan 1997, pp. 28–39).

## Conclusion and Evaluation of Rawls's Contribution

In the previous section, we discussed several broad ways in which Rawls's idea of justice as fairness can contribute to a debate on questions in education policy. To summarize:

- Fair equality of opportunity is only realized when the socioeconomic position an adult occupies is not determined by that person's socioeconomic position at

birth. While other factors such as discrimination can prevent this goal from being achieved, education plays a preponderant role, and the liberal state must ensure that inequalities in its public education system do not contribute to a lack of fair equality of opportunity.

- Liberal neutrality requires that the state avoid privileging any comprehensive doctrine in public schooling. Assuming that private schooling is allowed, the state must ensure that the education children receive in private schools, especially private schools based on parents' comprehensive doctrines, does not prevent them from developing the political virtues they will need to become reasonable citizens as adults.
- The public education system must inculcate the political values in all children in public school, both through the content of lessons and through equality between schools.

As should be clear, these contributions are highly schematic and would need significant empirical and theoretical work to be translated into specific policy recommendations, both because of the inevitable messiness of real-world situations and the fairly high level of abstraction of Rawls's theory. What exactly is the best way to inculcate the political virtue of openness to debate? Is a particular private school's curriculum genuinely in conflict with the political virtues? How much inequality between public schools would undermine citizens' belief in equal citizenship? The contributions of Rawls' philosophy in general, and his concepts of fair equality of opportunity, liberal neutrality, and political virtues in particular, to questions of educational policy and philosophy are best understood as establishing the goals of an educational system in a modern democratic society. It thus offers a language with which citizens and policymakers can debate key questions of education policy and philosophy without claiming to settle any of these questions for good. Rawls's claim is that these goals, and this language of debate, are 'political' in the sense that they are accessible to any reasonable person in society and do not depend on any prior consensus about values, a consensus that, in a diverse modern society, we can never assume or expect. Evaluating the contributions of Rawls's theory to education thus means asking whether the theory can successfully serve this bridging function between people who disagree deeply about ultimate values.

This is, after all, one of the major goals of Rawls's theory overall: to establish a language through which people who have fundamental disagreements about the ultimate questions of life can debate, disagree, and still function politically. Education, especially of one's own children, is an issue on which this deep disagreement is to be expected as much as any other. Thus education is one of the greatest tests of Rawls's claim that a liberal society is possible in the long term. If progress despite deep disagreement is possible on education, it should be possible on almost any issue.

# Jean-Jacques Rousseau (1712–1778)

Kerstin Jergus

## Introduction

Jean-Jacques Rousseau is regarded as one of the most important figures of educational theory. Mainly, this is to be traced back to his work *Émile ou de l'Éducation* (1762b), which had a huge impact already in his lifetime. In Paris, it was immediately banned shortly after publication and in Geneva it was burned. The same happened to *Du Contrat Social*, which had been published the same year. The close connection of politics and pedagogics is central to the understanding of this voice from the past of philosophy of education. To this day, the ongoing discussion about Rousseau's work is inexhaustible, already fuelled in his lifetime by both the radicalness and contrariness of his writings. Rousseau's sharp criticism of the foundations of the Enlightenment movement, presuppositions he at the same time shared, contributed as much to the controversiality of his work as his unsteady life – amongst others as a music copier, private secretary, tutor and writer – as well as his many discords with friends, supporters like Diderot or Hume.

Rousseau was born the son of a clockmaker (his mother died shortly after his birth) in the Republic of Geneva, which he turned his back on very young after two quit apprenticeships. Through the acquaintance with his motherly friend as well as lover Mme de Warens, he converted to Catholicism (and returned to Calvinism in 1754). He long lived in Paris (since 1742) where he initially kept company with the Encyclopaedists Diderot and d'Alembert. He styled a theory of notation of his own and composed pieces of music. However, he soon fell out with Diderot and the other Enlighteners, who he contemptuously called *Philosophes*. For 23 years, he lived with Thérèse LeVasseur in cohabitation before marrying her civilly in 1768; they gave their five children to a foundling hospital. In later years, Rousseau dressed and lived

in a simple manner, e.g. in Armenian costume and spent his last years after his expatriation from Paris and Geneva at various places. He died in 1778 shortly after having moved to Ermenonville. Acclaimed by Robespierre and the French Revolution as a paragon and authority, his remains were transferred to the *Panthéon* in 1784. The distribution and process of reception of his writings began – also because of the conflicts around his writings – already in his lifetime and has been continuing since.<sup>1</sup>

## Rousseau and the Enlightenment Movement: Society, Anthropology, Alienation

In the Paris of his time, Rousseau became famous overnight by answering the question of the Académie de Dijon, whether the progress in science and arts had contributed to moral betterment. In his *Discours sur les sciences et les arts* (Discours 1, Rousseau 1750), Rousseau rejects the belief which was then held as common sense of the flourishing Enlightenment movement, namely to achieve improvement in the human affairs by science and arts. The academy awarded him the prize. Rousseau criticises – in Enlightenment manner – the depravity of society of which he recognises as pretence and vanity – refined by science and arts. But Rousseau does not stop with this cultural criticism of his contemporary society. Out of his ‘*Non*’, he develops a radical criticism of society as such. For, Rousseau regards the set out decay not as a momentary state which could be overcome by the advance of reason-based insights. He rather assumes that society always alienates humans from themselves. Social relationships cause humans to see themselves in the light of other people’s assessments, leading them to stage, pretend and compete. In Rousseau’s view human misery is not to be enhanced by means of social civilisation but conversely results from it. All struggles about subjection and domination, all inequality between humans originate in social relationships which withdraw the humans from their self-identity (cf. Oelkers 2008).

Against this background Rousseau relates to an abstract ideal of the human being, which he describes as ‘state of nature’ and is elaborated in his second *Discours* ‘*Discours sur l’Origine et les Fondements de l’Inégalité parmi les hommes*’ (1755). As opposed to the understanding of his already then existing deriders, Rousseau with this figure of the ‘noble savage’ did not echo the ‘back to nature’ call. On the contrary, neither did Rousseau take the possibility of a historic state of nature for granted nor did he consider its future existence to be empirically probable. The ‘noble savage’ is as a constructed ideal figure in the strict sense a

---

<sup>1</sup> Whereas some examinations of Rousseau connect his unsteady, partly pathological character with the disputable systematics of his teachings, Cassirer (1954) assumes that the radicalness of his life rather corresponds with his writings. The following thoughts will focus on the architecture of Rousseau’s work with a view on pedagogical systematics and leave the discussion about Rousseau’s character and conduct of life aside.

non-social being that is closer to the animal, because he does not require the other. His existence is not determined by the wishes of others. Even though Rousseau's approach is similar to a Platonic position, as it shows the social conditions as aberrancies, Rousseau does in contrast not aim at the reference point of the eternal or divine good order, which is withdrawn from the human existence. Whereas for overcoming the 'wrong' social conditions a Platonic point of view will seek for realisation and internalisation of the eternal or divine order, Rousseau goes ahead in a radically modern way. He sets the human being – the non-socialised human being (*l'homme naturel*) – as the transcendent point of reference for judging and criticising social conditions.<sup>2</sup>

Rousseau's criticism of science and arts in the first *Discours* is primarily also a problematisation of Enlightenment's optimism. In the second *Discours* Rousseau develops this problem further by identifying the appearance of private property as the origin of all inequality between humans and of the resulting dependencies. Rousseau sees the origin of dependence and superiority already laid out in the first acts of property and barter. However, Rousseau does not criticise this against the background of an egalitarian concept of human rights or from the point of view of a just form of social conditions. Rousseau's criticism is related to the imbalance of needs and abilities that is imminent in barter and dependence.<sup>3</sup> Rousseau's criticism of civilised society is not related to a specific form but to the social in general – as a danger for human's self-identity, for human's humanity as such: "Man is born free and everywhere he is in chains" (Du Contrat Social P, III, p.352: "*L'homme est né libre, et par-tout (sic) il est dans les fers*").

Rousseau's anthropology is in a way an abstract anthropology, since it has an ideal point of reference: Only if there is an equilibrium of desires and abilities the human being can be truly human and free: "The truly free man wants only what he can do and does what he pleases. That is my fundamental maxim" (*Émile*: 84). In the light of this figure of identity – correspondence of volition and ability – rational agreements as well as imagination can be problematised: Mere 'rationalizing', as Rousseau calls it sarcastically, cannot guarantee, that the gained understanding will achieve obligingness. Against the background of an equilibrium of desires and abilities as a reference point Rousseau adds the role of the sentiment to Enlightenment's orientation on rationality and reasonable understanding, whereby Rousseau helps to prepare the ground for the romantic counter-movement against Enlightenment: Not only argument but also sentiment – in particular conscience respectively – can distance the human being from the social struggles about subjection and domination. To Rousseau, with imagination there is ambivalence,

---

<sup>2</sup>On the traces of religious Christian figures of argumentation in Rousseau's work, particularly on replacing the role of the divine order by the figure of the human educator in *Émile* as well as on the privileged relationship of human beings in educational processes resulting thereof: cf. Osterwalder 2012; Oelkers 2008.

<sup>3</sup>Cf. Tröhler 2008 for a discussion of the close ties between early capitalism and Rousseau's criticism of social relationships as well as Rousseau's specific manner of educationalisation of political and social problems.

too: Through imagination wishes and needs may arise which exceed human abilities and thus lead to his misery.<sup>4</sup>

The correspondence of desires and abilities is at the same time the point of reference for Rousseau's concept of freedom: Freedom means independence from social relationships. Therefore, Rousseau neither sketches an alternative or utopian society in a narrower sense nor does he refer to a 'lost paradise'. His concept of freedom pre-eminently works as a measure of criticism of civilisation and social relations as such. This measure can effectively be laid out as independent of the respective concrete form of society. From there, Rousseau opens the discussion, how the human being can achieve identity with himself under social conditions and how, thus, human alienation from himself can be avoided.<sup>5</sup> Rousseau radicalises the modern question about the shaping of a good society by the human being (as opposed to divine order or also to Platonic orientation on truth) by binding the question about justice to a human measure. Rousseau's work is focussed on human inner independence, which is permanently endangered by social ties. To maintain inner freedom under the conditions of the civilised social is, therefore, the core as actually the cause of educational influence.

## Rousseau on Education

This background of a fundamental criticism of social relationships, which corrupt true humanity instead of encouraging it, is radically continued in his work *Émile* (1762b). Right at the beginning one can read: "Everything is good as it comes from the hands of the author of things: everything degenerates in the hands of man" (*Émile*: P, IV, 245; "*Tout est bien, sortant des mains de l'auteur des choses, tout dégénère entre les mains de l'homme*"). With this sentence Rousseau breaks with the doctrine of original sin precisely by not ascribing moral decay, the possibility of human lapses and the – in Rousseau's eyes – inevitable tendency to misery to human sinfulness but to the social conditions under which humans are obliged to interact. It is against this background that Rousseau sketches out an educational course that rests on the premises of *Perfectibilité* and *Éducation naturelle* entailing four phases of education.

---

<sup>4</sup>On the role of imagination in Rousseau's *Émile* cf. Shuffelton 2012. The ambiguity of imagination lies in its double role: Imagination may lead to envy or compassion. To form the latter, educational arrangements such as *Émile's* education are needed; cf. White 2008.

<sup>5</sup>Rousseau's anthropology as well as his educational thinking is clearly androcentric and more or less tacitly endorsing patriarchal gender roles, which was objected by early feminist criticisms like Mary Wollstonecraft as well as it is subject of contemporary debates between Rousseau scholars and feminist readers of Rousseau (cf. Lange 2002).

## Perfécibilité: *The Ability of Becoming Human*

In his second *Discours*, Rousseau introduces a figure which is decisive for modern philosophy of education: *Perfécibilité*. The point of reference for perfecting – in contrast to perfection – does not lie in a concrete anthropology nor in social values and norms or in a religiously orientated salvation. *Perfécibilité* refers to the accordance of volition and ability, which is always on the verge of being upset, but which is the prerequisite of human inner independence and self-identity. Thus, Rousseau forgoes any kind of content-related measure or norm, which could serve as an educational goal. Rather, education is to ensure human's development which is orientated on the formal criterion of achieving identity with himself.

Thus, the element of uncertainty is introduced into educational thinking, in fact in two ways: Firstly, there is the openness of human development stated by *Perfécibilité*, which does not stake the educational core in a certainty about future necessities that precedes the educational process. The educational course is, therefore, not guided by the rehearsal of social norms and necessities but, instead, is open – it aligns itself with the inner freedom of the individual from all social expectations. Rousseau does precisely not aim at a different future society as an utopian projection of true human existence. He concedes that societies will change, which is why they can be no reference point for current education. Rousseau has indeed developed the concept of a truly human form of society mainly in his contemporaneously published *Du Contrat Social* (1762a), which has its point of reference in the *volonté generale*. But this can – in sharp contrast to the will of all, *volonté de tous* – only come about inasmuch as it rests on the identity of volition and ability of every individual. *Volonté generale* is, therefore – Rousseau saw its enabling only realisable in smaller, and especially not in his contemporary forms of government – in itself 'good' and 'right', because it does not represent the majority of particular interests (as in democracy) nor a general good as against particular volition (as in the *polis*). Instead Rousseau puts forward the entity of law, which – if orientated towards the *volonté generale* – is a truly human and more just form of government, because it does not produce social dependencies through representation and obedience. Inasmuch as the *volonté generale* only comes about by authentic accord on the basis of the self-identity of every individual, there can be – theoretically – no conflict of particular interests. It would be inappropriate to accuse Rousseau at this point of, in an utopian way, negating the empirical existence of particular wishes. In Rousseau's outline, *volonté generale* is a consequential possibility, if one takes its foundation into account: The self-identical human being cannot develop individual interest which would cheat or disregard others, because after all the development of self-identity is – according to the author's concept – carried out through the education process.

Secondly, Rousseau introduces with *perfécibilité* a dimension of uncertainty into educational theory, because it marks a potentiality. Self-identity does not – especially not under the conditions of social civilisation – come by necessity. It is permanently in danger of being failed. To avoid this failing of self-identity and to

ensure inner independence of the human education comes at stake. Although education is embedded in the political dimension of another society, it is not staked about the alignment of education along the necessities of civic society – unlike for the later reception of Rousseau’s work especially by Pestalozzi and the German Enlightenment pedagogy. Rousseau rejects this education to the *bourgeois* and juxtaposes education to the *citoyen*. In Rousseau’s view the core as well as the measure of educational processes is to be humanity under the conditions of civilised society, the inner independence of social norms and relationships. This independence can only be achieved if the human being is self-identical and does not follow social expectations, which means desires and abilities must be brought into accordance.

Rousseau therefore vehemently opposes the educational concepts of the Enlightenment movement about the reason-based conveyance of rational understandings and judgements, as he finds it in Locke’s *Some Thoughts concerning Education* (1693). Rousseau problematises rationalisation and argument as the basis for reasonable judgement on two levels with regard to education: Firstly, Rousseau doubts that reasonable *ratio* can carry out the obliging of judgements. Explanations and arguments always open up the space for dissent and dispute as they only will occur if there is a different view of things possible. Explanations and arguments always might lose bindingness by counter-arguments. Reasonable arguing, therefore, can hardly be the orientation and method of educational practices. In contrast Rousseau emphasises the role of emotional insight. Understanding facts and arguments requires direct experience of their truth. Thus, Rousseau introduces an individual-centred and holistic view into educational thinking – which was taken up by the later nineteenth-century reform pedagogy – comprising the senses, body and mind.

Secondly however, it is according to Rousseau’s view – and he thereby prepares the ground for a fundamental shift in modern pedagogical thinking – useless to reason with children. Children are not able to follow the logic of an argument. They are no ‘little adults’. Their thinking, their feeling and consequently their understanding proceeds in a completely different way than that of adults. Rousseau, therefore, limits in a way the mightiness of knowledge and social norms: The adult perspective is fundamentally different from that one of children. Reasons do not reach them, for children think, recognise and comprehend in a way that is unique to them and radical different to adults. In Rousseau’s educational theory children are not an end on the way to good civic society, yet, they have an end in themselves. With this argument educational theory is entrusted with a completely new task and starts in a way as epistemological project: The mere foreign or unknown childhood initiated the still continuing issue of gaining knowledge about childhood and educational addressees.

## Éducation Naturelle: *Negative Education*

Inasmuch as social relationships and social norms are to be put at a distance, the educational relationship must not be in shape of a social condition. The character of *Émile* grows up in the countryside and in more or less social isolation. *Émile* is removed from parental care and encounters only a few people of the rural household who are selected by the fictive educator whose role is taken in his treatise by Rousseau himself. Though, the ‘natural’ of education does not refer to the supposedly untouched nature. Rather it depends on the medium and style of education. In order to avoid the social influence of obedience, power and cheat, all chances for experience must be learned as natural and out of human control. For this reason, Rousseau opposes mere instruction and impartation of knowledge. This mode of ‘positive education’, as Rousseau sees it advocated by his Enlightenment contemporaries, is to be rejected as instruction adds something to children’s comprehension, which does not come from within themselves and must inevitably be beyond their understanding. Instead, Rousseau figures with his ‘natural’ education a negative education method, which can also be described as indirect education. “The first education then ought to be purely negative. It consists not at all in teaching virtue or truth but in shielding the heart from error and the mind from vice” (*Émile* (P, IV, 245; “*La première (sic) éducation doit donc être purement négative. Elle consiste, non point à enseigner la vertu ni la vérité, mai à garantir le Cœur du vice et l’esprit de l’erreur*”).

One would misinterpret *éducation naturelle* by understanding it as a form of teleological self-unfoldment which would proceed without educational activity – as later advocated by Montessori and other reform pedagogues. In fact, Rousseau sketches out educational influence – in opposition to the knowing position of ‘positive education’ – rather to be orientated towards the vital support of *perfectibilité* and preventing the failure of self-identity. The educator does not impart knowledge he has found right and valid regardless of whether and in what way it can be of meaning to the child. He refrains himself and his educational practices are guided by the task to enable his educatee’s inner freedom. Any convenience for domination and submission must be avoided. In this manner, the true and authentic speech is of an important role. *Émile* has to be taught the meaning of things without any ambiguity or ambivalence: The human being speaks in clear, unmistakable and unambiguous language. He is authentic in his words and does not disguise, because he by virtue of his education is incapable of doing so (cf. Starobinski 1988). The human being – this is the central point of criticism of Derrida’s reading of Rousseau (1977) – *is* his language, language presents him.<sup>6</sup> The educational relationship, therefore, must not be experienced as part of social relations. The educator’s appearance and performance have to be as immutable as things are. Learning and experience are mediated through things and environment, which are as well as human

---

<sup>6</sup>On the relevance of the pedagogical induction of an unambiguous language and ‘right’ hearing with Rousseau cf. Lavery 2011.

encounters arranged in an absolutely pedagogical ‘learning environment’ around *Émile*. The power of educational influence completely disappears in this arrangement, which *Émile* is to experience as natural and not as socially conveyed. “Do you see what a new empire you are going to acquire over him? How many chains have you put around his heart before he notices them!” (*Émile*: 233).

### *The Development of Childhood and the Education of Émile*

It is against this background that Rousseau drafts a course of development which is orientated towards the premise of human inner independence. His phase model is, however, not based – unlike present-day developmental psychology – on empirical research on children’s development levels. In *Émile*, human self-identity marks the differentiation criterion between different levels (cf. Schäfer 2002). Insofar as in each phase, which Rousseau divides in four – infancy, childhood, prepubescence, adolescence – the relation of desires and abilities is changing, new balancing is needed every time: “Each age, each condition of life, has its suitable perfection, a sort of maturity proper to it” (*Emile*: 158). The developmental stages are, thereby, not aimed with a deficit-orientated perspective at the not-yet-existence of a future final state like the completed adult. Rather, the fundamentality of the ‘unknown child’ notably comes to the fore: Each phase has its own value in regard to the respective achievement of self-identity as equilibrium of desires and abilities.

Rousseau assumes that education begins with birth. Infancy is the first phase of human development. The crying and babbling of the infant are to him already pre-language forms of communicative expression – thus, the stark contrast to Enlightenment’s reasoning education comes into view. In this phase, desires and needs predominate, without there being an adequate repertoire for their satisfaction. That is why the educator is an extension of the infant’s body; he must enter into interaction with, and understand his or her needs in lieu of, the infant. Doing so is not about fulfilling all needs. This would, according to Rousseau, only signal to the infant the option of dominating others. The educator’s task is to distinguish representative for the infant between needs that must be satisfied and needs that merely serve for subjection or manipulation of the environment. The educator is inasmuch a ‘tool’ for the infant’s needs as he puts them into accord with the adequate form of satisfaction and, thus, makes it possible for the infant to experience a feeling for the harmony of desires and abilities. It is against this background that Rousseau vigorously pleads for an extension of the infant’s movement space by turning against the in his time common wrapping-up of babies and by advocating both more infant’s mobility and breastfeeding, which was also rather frowned upon.<sup>7</sup>

---

<sup>7</sup>Tosato-Rigo (2012) argues that the importance of corporal education played a decisive role in the uprising physical education of Rousseau’s time where the evolving of childcare studies – mainly aiming at avoiding child mortality – more and more came into objective of physical doctors whereas Rousseau’s *Émile* transformed the medicalisation of pedagogy to a pedagogues’ object.

With 3 years of age phase two begins, the phase of childhood. Caused by the speaking of the child there is a change in the relation of desires and abilities. Although in this phase, too, desires outweigh the possibilities of their fulfilment, there is also a developing stronger independence and a form of self-awareness as an individual being through the disposability of language. Rousseau assumes that in this phase actual education begins and with language the child gains cognitive faculty. The educator in his influence must, therefore, especially be concerned to the child's wishes remaining correspondent to the conditions of their fulfilment. According to Rousseau, all situations and *Émile's* experiences must, therefore, be characterised by the experience of necessity, instead of letting the social character of the pedagogical relationship in the form of command and obedience become focal. The situations arranged by the educator must appear to *Émile's* experience as opposition of the world limiting the child's volition. Thus, *Émile* is to learn to adjust his desires to the possible.

Phase three – prepubescence – begins between the ages of 12 and 15 and is characterised by a prevalence of powers over desires. To Rousseau, this is a decisive time because in this phase knowledge can be imparted to the child. However, this knowledge is related to a new criterion, which occurs in this phase for the first time – utility. Knowledge can only be introduced in this phase in order to compensate for the imbalance between abilities and desires. The abundance of powers is canalised by learning crafts, which *Émile* and the educator perform simultaneously. For the purpose of directing the increased abilities Rousseau recommends reading, especially Plato's *Politeia* and *Robinson Crusoe*. Knowledge acquisition is, thus, always orientated towards necessary utility.

The fourth phase of adolescence is characterised by a fundamental change, in which the social dimension of *Émile's* relationship to the world emerges. Especially sexuality and bodily desire, which develop at about the age of 15, again alter the balance between desires and abilities. Since sexual passion is to a great extent related to others, Rousseau therein sees the founding stone of moral insight. Due to his previous education *Émile* now is able to understand that others also feel and that he is part of a social context. This allows him to gain insight into his social connection to others. Now, everything in education depends on guiding the feelings to the right path: Compassion is to be evoked instead of envy, pity is to be cultivated instead of presumptuous pride, friendship instead of strategic calculation, self-love (*amour de soi*) instead of selfishness (*amour-propre*).<sup>8</sup> This needs carefully planned encounters, in which *Émile's* orientation towards other people leads to the appropriate attitudes.<sup>9</sup>

At this point the educational relationship changes in a decisive way: Whereas so far experienced by *Émile* as natural or non-social respectively, since the words,

---

<sup>8</sup>The difference between *amour-propre*, which is the dangerous part of sentiments leading to selfishness and self-superiority amongst others and *amour de soi* plays a decisive role in Rousseau's concept of education. The latter is the true and striven for mode of inner independence.

<sup>9</sup>In this phase, religious education occurs, too, which Rousseau describes in the digression 'The Profession of Faith of a Savoyard Vicar'. It is especially this part of *Émile* which contributed the ostracism of Rousseau by parliament and church.

actions and encounters were laid out by the educator as immutable like mere things or laws of nature, the educator now discloses the social character of this relationship to *Émile*. The educator changes the mode of his address and reveals himself as *Émile*'s lifelong companion so far, he discloses his duty with *Émile*'s education and, thus, speaks to *Émile*'s heart. In Rousseau's hypothetical experiment, *Émile* is touched by the insight into the educator's sacrifice and recognises the necessity of this relationship. Following this, *Émile* asks for a contract in order to ensure further education by the educator. On this new basis the educational relationship between the two is continued, they travel various countries in order to acquaint *Émile* with politics, language and culture.

*Émile* marries *Sophie*, who is chosen by *Émile* on the basis of the clear conception of a wife prepared by the educator. Although Rousseau anticipates the sprouting romantic ideal of love as a precondition of conjugal union, he, however, depends on the difference of the sexes between the public and the private entailing the anthropological argument of female inferiority. *Sophie*'s course of education is outlined in the fifth book of *Émile*, and it is thoroughly guided by the notion that women are not able to achieve inner independence. *Sophie*'s education is directed at preparing her for being a wife and mother. In Rousseau's view women will never be able to take an independent position towards the expectations and judgements of others. With that, Rousseau's anthropology figures out to be cleft concerning the possibility of being human which was characterised by self-identity, autonomy and inner independence.

That the educational relationship – and, thus, the indirect, all the more effective power of the educator over the educatee – is indispensable is shown by the lifelong lasting relationship between them (cf. Cooper 2004). *Émile* will permanently stay in contact with the educator and ask for his advice.

## Conclusion: Rousseau's Voice in Philosophy of Education

Listening to Rousseau's voice in philosophy of education means literally to listen to a voice from the past, though no voice could be less present than his one. Rousseau's pedagogy is radically modern insofar it seeks for an appropriately human existence and education, which stakes a radical difference between the individual self and social conditions. With it, the ongoing debate arises, how an adequate pedagogical answer can be found in the light of human openness to the future on the one hand and social contingency on the other hand. Yet, Rousseau's answer is, considering its radical orientation towards individual happiness in a mere *eudaimonian* sense, a rather a pre-modern answer. Despite transforming the Platonic good into plain humanhood the religious traces oriented towards the transcendental are evident in Rousseau's criticism of society.

Rousseau's work is, however, radically modern, insofar as his criticism of society positions the human being as the absolute reference point for truth, freedom and

justice.<sup>10</sup> Particularly, Rousseau's thinking can be regarded as a crucial point in the history of modern educational thinking: By introducing the concept of *perfectibilité* as the human condition Rousseau alters the foundations of pedagogical perspectives. Educational principles and practices are now to be proven and regarded in the light of their social and powerful conditions which are contrary to the individual. Further, by the notion of human *Perfectibilité*, which by Herbart has been introduced into pedagogical terminology as *Bildsamkeit*, the central role of uncertainty in educational processes is highlighted. By his conviction that educational influence – in particular under the auspices of Enlightenment-style impartation of knowledge – can certainly cause harm to the goodness of the human being Rousseau as one of the first has limited educational optimism.

The impact of these shifts entailed a different view on intergenerational relationships. Certainties and knowledge are untied from their unquestioned validity and must be orientated towards their adequacy with regard to the abilities and desires of the educatee instead of those of the educator. The introduction of the difference between children and adults, the resulting ongoing effort for insight and understanding of educational addressees as well as the distancing of a deficit-striven perspective on the child became fundamentals of educational theory (cf. Wain 2011). The notion of a gradual human development has influenced modern developmental theory, romanticism and the child-centred concepts of reform pedagogy at the end of the nineteenth century with its biologicistic view on the self-evolvement of the child as well as progressivism (cf. Oelkers 2008).

In the lens of this the role of power came to view within the educational relationship, which with Rousseau takes the shape of an exclusive dyad of a privileged relationship between humans. In Rousseau's *Émile* the problem of the intersubjective relation in educational processes comes to the fore: Whereas the child is no longer limited in his or her purely receptive role but treated as an independently acting being provided with his or her own dignity, the power of the educator as well as within educational relationships is nowhere shown and at the same time deproblematized more clearly than in the fictive course of education like *Émile's*. The manipulative role of the educational influence and *Émile's* lifelong indispensability of guidance and supervision by the educator contradict the premise of independence which Rousseau claimed to be the core and measure of human being and education. Rousseau's impact in philosophy of education might not at least arouse from the contradictions within his work which radical elaborate the consequences of fundamental issues of modern educational theory and practice.

---

<sup>10</sup> Kant admired Rousseau for this approach and described it as a decisive turning point for his own thinking (cf. Cassirer 1945). Cassirer lines out the links between Rousseau and Kant, especially that this critique of theory-based reason stretches forward to Kant's '*Praktischer Vernunft*'.

## Israel Scheffler's Antireductionism and Today's Narrowing Scope of Education

During the past decades, many political philosophers and philosophers of education have expressed their concern with respect to the narrowing scope of education in today's democratic societies. Martha Nussbaum expresses this concern as follows:

Radical changes are occurring in what democratic societies teach the young, and these changes have not been well thought through. Thirsty for national profit, nations, and their systems of education, are heedlessly discarding skills that are needed to keep democracies alive. If this trend continues, nations all over the world will soon be producing generations of useful machines, rather than complete citizens who can think for themselves, criticize tradition, and understand the significance of another person's sufferings and achievements. The future of the world's democracies hangs in the balance. (Nussbaum 2010, p. 2)

In this chapter, my aim is to reconstruct a Schefflerian approach to this question. Israel Scheffler (1923–2014) was one of the leading figures of Anglo-American philosophy of education during the second half of the twentieth century.<sup>1</sup> Scheffler has made remarkable contributions in many different fields of academic philosophy, such as epistemology, the philosophy of science, the philosophy of language, the philosophy of religion, and of course, the philosophy of education. His philosophy

---

<sup>1</sup> Scheffler was Victor S. Thomas Professor of Education and Philosophy at Harvard University. He was appointed to Harvard in 1952, serving there until his retirement in 1992. Scheffler holds M.A. and B.A. degrees from Brooklyn College, an M.H.L. and a D.H.L. (hon.) from the Jewish Theological Seminary of America, and a Ph.D. from the University of Pennsylvania. He was the author of 17 books including *The Language of Education* (1960), *Reason and Teaching* (1973), *Four Pragmatists* (1974), *Of Human Potential* (1985), *In Praise of the Cognitive Emotions* (1991), and *Symbolic Worlds* (1997).

of education draws from his insight into these other fields of philosophy. The roots of his thinking lie in the philosophical traditions of pragmatism and analytic philosophy. Characteristic of all his work is that he does not compromise either the wide and pluralist focus or the analytical rigor of philosophy.<sup>2</sup>

In 1950s and 1960s Scheffler – with such scholars as Paul H. Hirst and R.S. Peters – was one of the pioneers in analytic philosophy of education. Scheffler promoted the idea of bringing the methods from general philosophy to the philosophy of education (Scheffler 1966, p. 4; 1960, pp. 4–10; 1973, p. 9; Siegel 2001, p.142). He stressed a particular challenge in the philosophy of education: educational discourse involves various contexts with different vocabularies and conceptual systems (Scheffler 1960, pp. 8–9). For him, one of the fundamental tasks of the philosophical analysis of educational discourse was “the disentangling of different contexts in which education is discussed and argued, and the consideration of basic ideas and appropriate logical criteria relevant to each” (Scheffler 1960, pp. 8–9). However, his idea of the relevance of linguistic analysis was not reduced to this, but he saw the analysis of language as a vital tool for gaining deeper understanding of our educational thought and practice. For him (1966, p.7), the analysis of language was actually “to ‘look through’ language at the whole range of traditional issues, issues concerning fundamental notions such as truth, belief, and judgment, value and obligation, intuition and verification”.

Along these methodological lines, Scheffler’s famous *The Language of Education* (1960) provided an influential analysis of educational definitions, slogans, metaphors, and proposals for relevant principles for their critical evaluation. In this book, he also argued for the idea of teaching as conceptually separated from such psychological notions as “setting up conditions under which learning will most effectively take place”, or such social-scientific notions as “transmission of the content of a culture” (1960, pp. 104–105). Instead, his emphasis was on the moral concerns crucial for the adequate idea of teaching (1960, pp. 98–99).

In relation to the current concern on the narrowing scope of education, Scheffler’s philosophy is rewarding at least in three respects. Firstly, Scheffler (1973, pp. 126–135) develops further the Deweyan idea of schools as “standing apart from current social conceptions and serving autonomous ideals of inquiry and truth” and should thus be autonomous from any short-term ends of current society. On this basis, Scheffler elaborates the idea of education, which has the responsibility “to criticize, enlighten, and create” and which, thus, “has its own dignity and its own direction to follow”. In Scheffler’s view, education in a democratic society can never be used merely as a tool for achieving, say, national or global economic goals.

Secondly, Scheffler’s conception of human nature, related to his theory of symbolism as well as his understanding of the intertwined nature of reason and emotion, provides a view of human nature that points to wide-ranging possibilities – and requirements – for education. We humans approach phenomena with an embodied apparatus involving reason, emotion, and bodily skills and reactions, all of which, in combination, affect knowing and understanding (Holma [in press](#); Scheffler 1991,

<sup>2</sup>On Scheffler as a philosopher of education, see also Holma (2014) and Siegel (2001).

pp. 3–17). Scheffler's (1985, 1997) theory of symbolic representation follows the same lines, and he emphasizes that the symbolic systems we create are not only linguistic but also, for example, pictorial, kinetic, or ritual. Again, we may witness Scheffler's strong tendency against reductionism in this instance in relation to human nature and its potential.

Thirdly, Scheffler's epistemological and ontological insights provide a philosophically coherent basis for his educational philosophy. Scheffler (1973, p. 60) argues that the scope of education must be interpreted as widely as civilization itself. And civilization for Scheffler is a wide notion indeed, as he argues against reductionism – both within the realm of science and outside it as well. It is also important to note that Schefflerian pluralism and fallibilism do not imply relativism. On the contrary, his reformulations of the notions of rationality and objectivity preserve the possibility of critical inquiry in all fields of human understanding without connecting either of these notions to the possibility of certainty or fixed starting points of human knowledge. Therefore, his antireductionism, deep fallibilism, and his interpretation of the interconnected notions of rationality and objectivity provide important arguments for resisting any short-term educational aims that narrow the focus of our understanding.

In what follows, I will concentrate in more detail on three aforementioned dimensions in Scheffler's philosophy: his conception of the autonomous role of education in a democratic society, his conception of human nature, and his pluralist and fallibilist – yet not relativist – epistemology and philosophy of science. Scheffler's broad conception of education rooted in his wider philosophical framework provides the needed conceptual tools for opposing the current neoliberalist tendency toward reducing the value of education to that of economic discourse.

## Education in Scheffler's Antireductionist Framework

[T]he notion that education is an instrument for the realization of social goals, no matter how worthy they are thought to be, harbors the greatest conceivable danger to the ideal of a free and rational society. (Scheffler 1973, p. 134)

For Scheffler, a democratic society needs various autonomous spheres of activity. One crucial reason for this seems to be that it helps society in resisting the threat of totalitarianism, which looms when one sphere with its specific ends and vocabularies takes over one or many of the other spheres. For example, in the 1970s Scheffler (1973, pp. 18–30) was concerned about an increasing “tendency to reconstrue intellectual work as political ideology, continuous with political action”. He compares the demands of political activism of those times in the USA with the situation where philosophy is under the domination of state or church. On the surface, these two threats to the autonomy of philosophy may seem different from each other particularly in terms of their relationship to democracy. The aims of political activism in the USA during those times were mostly connected to democratic values. This is often contrary to political systems where state or church dictates the contents of philosophy,

as they are not usually committed to the democratic values in the first place. However, within the Schefflerian framework the democratic form of life is in danger in both cases, because – for it to flourish – the autonomous spheres of activity in society are necessary.

It is important to note that autonomous does not mean isolated. The adequate relationship between the spheres is dialogical and creative. As Scheffler describes the relationship between philosophy and education, his own two fields of interest:

The philosophers's job is not to deduce purported educational implications from his general doctrines any more than it is to derive purported legal, historical, or scientific implications. His task is to bring to bear philosophical methods, conceptions and traditions in seeking to understand the independent concerns of his object realm. Education, in particular, must be taken as seriously in its own right as science is taken by the philosophy of science. This does not mean that education must also be taken as fixed and unalterable, any more than science is so taken by philosophers of science. The relationship sought is a creative one – in learning from a genuine inquiry into education, philosophy's scope is extended and enriched; in striving for philosophical critique and perspective, education may attain a deeper and wider self-consciousness with inevitable bearings on practice. (Scheffler 1973, p. 19)

In the same spirit, Scheffler (1973, pp. 134–135) criticizes the interpretations of Dewey that claim that the role of education in a Deweyan philosophy should be understood as instrumental in relation to the wider aims of society. Scheffler argues that for Dewey, education can be understood as an instrument for the realization of social goals, only if the notion of society is “not society as it happens to be, but a reformed society, illuminated by an ideal imagination and a critical intelligence that it is the school's office to foster”. There he emphasizes that in a democratic society, the task of education “is not only to serve but also to criticize, enlighten, and create”.

Of course, the role and responsibility of education in a genuine democracy is enormous. In many of his writings, Scheffler stresses that education, which focuses merely on techniques or skills, is fundamentally misguided. As he writes:

[W]e talk of ‘citizenship’ as if it were a set of skills, whereas our educational aim is, in fact, not merely to teach people *how* to be good citizens but, in particular, to *be* good citizens, not merely *how* to go about voting, but *to* vote. We talk about giving them “the skills required for democratic living,” when actually we are concerned that they acquire democratic habits, norms, propensities. To take another example, we talk of giving pupils the “ability to think critically” when what we really want is for them to acquire the habits and norms of critical thought. (Scheffler 1960, pp. 98–99, emphases in original)

In other words, the task of education is not only “to provide persons with techniques but, more importantly, to provide techniques with critical, informed, and humane persons” (Scheffler 1973, p. 135). Of course, this is easier said than done, and one can reasonably ask, what resources can we find from Scheffler's philosophy that would help us in understanding the conditions of educating humane persons? In my view, two lines of his thinking would be worth further development here: his arguments on the intertwined nature of cognition and emotion, and his theory of symbolism as the primary characteristic of the human mind.

In following the path of many earlier pragmatists, especially William James, Scheffler (1991, pp. 3–17) emphasizes the fundamental interdependence of reason

and emotion<sup>3</sup> in our thinking, feeling, and acting. The rejection of the dichotomy is based on pragmatist epistemology in turn grounded on evolutionary theory, where reason, emotion, and bodily sensation and skills are seen as adaptive instruments for getting useful information about the circumstances in which we live. Pragmatism sees perception, reason, and emotion as interrelated parts of the apparatus developed for surviving and succeeding in the surrounding world. From the pragmatist perspective, emotions have an important function in our system for achieving new knowledge (epistemic and moral), but they are fallible, as are both reason and perception as well.

In his contribution concerning the intertwined nature of reason and emotion, Scheffler (1991) demonstrates, for example, how the emotional stance of surprise indicates that we have realized something that we have not known before, and how the emotional stance of joy is connected to the scientist's success in verifying her hypotheses. These emotions keep us motivated in cognitively demanding activities, such as scientific or philosophical work, or critical thinking. Even though Scheffler himself does not develop this idea further, the intertwined nature of reason and emotion can be seen as crucial also in developing the theory of how to educate persons who are motivated and capable of using their techniques and skills in a critical and democratic spirit.<sup>4</sup>

Scheffler's (1985, p. 18) theory of symbolism, for its part, is closely related to his antireductionist philosophy in general, as he develops the theory of our symbolic systems not only as linguistic, but as including "also non-linguistic vehicles of representation, comprehending the graphical or diagrammatical, the pictorial and the plastic, the kinetic and the ritual". For Scheffler (1997, p. 3) symbolism is "a primary characteristic of mind, displayed in every variety of thought and department of culture". He (1985, 18) rejects any suggestion that these symbolic systems could possibly be reduced to one system, as "the symbolic systems constructed by human beings are not simply changes rung upon some universal matrix, itself sprung from the givens of physics".

This brings us to the third point, Scheffler's antireductionist and pluralist philosophy of science and epistemology. His philosophy of science has been antireductionist and pluralist from the start, but in 'A Plea for Pluralism' (2000), 'My Quarrels with Nelson Goodman' (2001), and 'Worlds of Truth' (2009) he further develops this position and terms it 'plurealism'.<sup>5</sup> To put the point of plurealism roughly, it combines Goodmanian pluralism with Peircean fallibilist realism. Scheffler agrees with Nelson Goodman that by using different and incommensurable symbol systems, equally true descriptions of the world may be presented. Nevertheless, he disagrees with Goodman's statement that we should, in conclusion, reject the notion of an independently existing reality.

---

<sup>3</sup>Some current theories of psychology define the notion of cognition as involving emotion. However, Scheffler uses the term cognition as referring to thinking.

<sup>4</sup>I have further elaborated this idea in Holma (2012) and Holma (2015). About the type of personality a genuine democracy requires, see also Winnicott (1950).

<sup>5</sup>On Scheffler's plurealism and its educational implications, see also Holma (2004).

Scheffler seems to think that Goodman would not have refuted realism, if he had not mistakenly assumed that a realist must always be a ‘monist’. By monism Scheffler refers to one who believes that science will converge to one symbol system which can, at some point in the future, explain everything. As he (2009, p. 64) describes the monist assumption that he takes as false: “The prospect of wholesale reductions that would reduce the total number of scientific specialties at a given time to any appreciable degree, much less to one, is a fantasy of science fiction”.

According to Scheffler, this kind of monism can be rejected without rejecting the ultimate assumption of ontological realism. As he (2000, pp. 165–166) writes about his plurealist position, it “agrees with [Goodman] in rejecting the notion of one world, but disagrees with him in that it holds whatever worlds there are to be independent of their corresponding versions. We have then to reckon with a variety of unreduced domains of entities, for each of which there are credible versions short of certainty but commanding a greater or lesser degree of confidence”.

In Scheffler’s view, not only is science pluralistic, but philosophy is pluralistic, too. He (1997, p. 5) entirely rejects “the restrictions of philosophy to logic, science, or language as objects of study”, as the realm of philosophy reaches any human interest. In addition (2009, p. 3), the concepts of philosophy are plural, too, as they must “be chosen out of an infinite array of alternatives”. And, finally (2009, p. 3), its solutions are plural, as “for any systematic interpretation preserving the preferred truths of some object domain, there will be incompatible others that do the same”. Within the field of the philosophy of education, Scheffler (1973, p. 19) stresses “the need and opportunity for a variety of programs and styles to flourish, all embraced within the continuous neighborhood relating philosophy and education”.

It is important to note, however, that Scheffler’s pluralism either in philosophy or in science does not imply relativism, not to mention nihilism. As he (2009, p. 3) states in relation to pluralism in philosophy: “An adequate interpretation is a triumph of insight and order available to all – hence an instance of intellectual process”. This possibility of avoiding relativism is based on his (1982) famous reinterpretation of the notion of objectivity.

Scheffler makes a distinction between the notions of certainty and objectivity. The objectivity of the statement or theory can be evaluated in light of such criteria as impartiality, evidence, and good reasons, without any demand of certainty or its derivation from the fixed starting points of knowledge. Rationality, for its part, can be defined as a human capacity to evaluate these criteria. For a belief to be counted as rational, it must be objectively assessed, and for a judgment to be counted as objective, it must be supported by reasons. In rejecting – along Peircean lines – the possibility of certainty, as well as the conception that knowledge can be derived from any fixed starting points, and without rejecting the possibility for objectivity and rationality, Scheffler’s pluralist and antireductionist view avoids the danger of slipping into any nihilist version of relativism.

In short, Scheffler’s conception of the human, as well as his conception of the world in which we live, takes quite seriously the multifacetedness and multidimensionality of the human condition. Only within this framework does the significance of

Scheffler's (1973, p. 60) statement emerge, insofar as "the proper scope of education is as large as civilization itself". As he states:

If we narrow the scope of education, we narrow our operative conception of civilization and we impoverish the meaning of participation in civilized community... A limitation to the cognitive and the academic, not to say the hard core of science, mathematics, and technology, would, in my view, be a disaster. (Scheffler 1973, p. 60)

In the following section, I will discuss the potential of Scheffler's philosophical view in resisting the current tendencies of narrowing the focus of education in more detail. In my view, Scheffler's philosophical approach on the whole provides us not only with compelling arguments for resisting too narrow a scope of education, but a wide and coherent philosophical framework in which one can understand the potential of education for a democratic society on the one hand, and the danger of narrowing our understanding of education on the other.

## **Schefflerian Tools for Resisting the Narrowing Scope of Education**

The Schefflerian understanding of humans as symbolic meaning makers in a rich and manifold reality provides us with a conception of education that is fundamentally different from contemporary neoliberalist discourse stressing the mostly economic values as being crucial for the realization of any other values. If we consider this essential characteristic of neoliberalism in the light of the Schefflerian framework, the first and most obvious problem is that it bypasses the importance of various autonomous spheres of society. These spheres should be in a dialogical and creative relationship with each other in order to maintain and develop the democratic form of life.

Within the field of education, a too narrow conception of human nature and potential may lead to educational designs that do not provide a rich enough medium for growth into the traditions of various symbol systems of science, art, morality, and religion, *and* for developing these systems as well as creating new ones. Another important reason for keeping all these fields within the field of public education is that, in the Schefflerian framework, all these fields are subjects of free and rational inquiry and development. Therefore, to keep these fields within the public sphere of education may have another crucial benefit for democracy: it may prevent democracies from segregation, radicalization, and irrationality, especially within the field of religion and morality.

Furthermore, Scheffler states that democracy needs persons who have not only internalized the ideal of democracy and their duty in maintaining it, but, in addition, persons who have such a rich conception of human life that they can find ways for creating the conditions of meaningful life, for example, when the environmental crisis forces us to give up our lifestyles based on the idea of economic growth. Scheffler's (1960, pp. 98–99, 1973, p. 135) warning about education, which focuses

mostly or merely on techniques and skills and abandons the wider conception of educating “critical, informed, and humane persons”, is thus more than topical today. An adequate understanding of the intertwined nature of reason and emotion is crucial here, as the opposition between these two “distorts everything it touches”. In Scheffler’s words:

Mechanizing science, it [the opposition of cognition and emotion] sentimentalizes arts, while portraying ethics and religion as twin swamps of feeling and unreasoned commitment. Education, meanwhile – that is to say, the development of mind and attitudes in the young – is split into two grotesque parts – unfeeling knowledge and mindless arousal. (Scheffler 2009, 125)

In my previous work, I have developed the idea of the harmfulness of the opposition of reason and emotion in education and have argued that the philosophy and practice of education should be more aware of the ways that reason and emotion work together (Holma 2012, 2015). For example, the tendency to avoid emotional discomfort can lead to ‘rationalization’, the process by which the reasons one gives for one’s actions are not real, but instead are based on self-deception. That is to say, one’s own rationalizations in response to difficulties in accepting or interpreting emotions can distort one’s interpretations. This, as well as many other shortcomings deriving from inappropriate interplay between reason and emotion, is crucial in the education of democratic citizens.

Contemporary reductionist tendencies have yet another implication, which can be addressed by Schefflerian tools. By this I refer to the empiricist inclination that aims to reduce educational research to the narrowly understood research on learning, based on empirical psychology or even the neurosciences. From the viewpoint of Scheffler’s philosophy, educational research could never be justifiably reduced to these realms of science. This is both due to his plural notion of philosophy and science, and because empirical sciences do not have conceptual tools for addressing normative questions always embedded in the practice of education.<sup>6</sup> As a democratic society necessitates the autonomous sphere of education; it also necessitates autonomous science with its various fields of study. The autonomous fields may, in addition to their other benefits, protect us from errors that may arise from a distorted perspective of some of these spheres.

A unifying feature in all these Schefflerian concerns is his deep fallibilism. For Scheffler, we are always in danger of reducing reality to what we happen to know

---

<sup>6</sup>A basic reason for this irreducibility is that empirical sciences can provide us only descriptive knowledge, whereas the main aim of philosophical, or pedagogical, knowledge, is normative understanding. From this perspective, philosophical and empirical perspectives can, and actually must, interact with each other, but they can never replace each other. As an example from the birth of pragmatist philosophy: the very starting point of the Peircean epistemology – on which the tradition of pragmatism is based – was Peirce’s inspiration from the new theory of Charles Darwin. From the perspective of evolutionary theory, Peirce rejected both rationalism and empiricism, and formulated the epistemological position of fallibilism. As can be easily seen, there is no danger that Peircean epistemology could be reduced to the evolutionary theory or replace it, simply because the former is normative and the latter is descriptive. About this irreducibility in educational research, see Holma and Hyytinen (2015).

and think about it now. Due to this common distortion of our thinking, we are inclined to delimit human potential to what humans have already found out about themselves, education to what we now happen to think as fundamental for the survival of our societies (e.g., economic growth), and reality to our current understanding of it, at worst, to the current results of science (Holma 2011, pp. 544–547).

## Conclusion

Current neoliberalist trends throughout the world tend to frame educational aims in the vocabulary of economic growth and productivity. Without denying the importance of the role of economics in human welfare, one can reasonably ask, whether the focus is too narrow for preserving democracy and elaborating the conditions for a good human life. Contemporary democracies are struggling with ecological crises, shrinking budgets, floods of refugees, and without education that is wide-ranging, preserving and developing what is best in human civilization to foster both criticality and creativity in all these realms, we may soon be facing a disaster that Scheffler (1973, p. 60) predicted long ago.

One can of course ask, why and how might education rescue us from the enormous problems that the human race is now facing. The question can, however, be turned the other way around. If we want to adhere to the hope that it would be possible for humans to live together in peace and harmony (or at least relatively so), can we bypass the resources and potentials that education offers? What other means do we have? And if we believe that education matters, is it not extremely important to try to achieve a profound understanding about the relationship of education to democracy and the meaningful life of its members?

Israel Scheffler's philosophy of education stresses the autonomous sphere of education – as independent of any short-term political ends – as a fundamental part of a democratic society. He defends the scope of education which is as wide as civilization itself, including science, humanities, art, ethics, and religion. Within the Schefflerian framework, all these realms of human understanding should be approached in a critical and fallibilist spirit. Furthermore, he emphasizes that education cannot focus merely on skills, that is, without aiming to contribute to the development of mature personalities of the subjects of education. Indeed, such a short-sighted focus on skills alone can never be sufficient for a genuine democracy.

Scheffler's antireductionist philosophy provides us with perspectives of human nature and the world in which we live that reach beyond our current limited understanding. In this framework, education is an important medium not only for transmitting to the younger generations the various traditions and symbol systems past generations have created, but also to enquire into and create new understanding of ourselves as humans and the world within which we live. In the current world crises, we need the creative ways of renewing what is best in the traditions of human civilization more than ever, as well as new insights in how to live harmoniously together in a world of decreasing ecological and economic resources.

# Stiegler and the Future of Education in a Digitized World

Joris Vlieghe

Bernard Stiegler (born 1952) is one of those philosophers for whom life and thought are very closely related, if not intertwined. When incarcerated in the 1970s for an armed robbery, he commenced a philosophy study by correspondence. The transformation he went through forms an important backbone to his thought (he has commented on this experience in his book *Acting Out* (2009)). Finding himself there in utter solitude and deprived of all life comfort, it is no surprise that his first philosophical work precisely dealt with the way in which material and technological circumstances shape our experience of time (Stiegler 1998). Since then, Stiegler has become one of the most influential thinkers France knows today.

As much as he is an academic philosopher (holding, among other positions, a prestigious post as visiting professor at Goldsmith College London), Stiegler is first and foremost a public intellectual and activist. He appears in many films and documentaries, he regularly casts his voice in the French media and he interferes in major political debates. In order to deal adequately with today's societal challenges (the growing problem of consumerism, marketization and the impact of digital technologies), Stiegler has founded in 2005 the movement *Ars Industrialis*. This think-tank has an explicitly political goal, viz. an 'industrial politics of the spirit'.<sup>1</sup> The main objective is to defend human civilization against the evils of industrial capitalism (Stiegler 2014). Stiegler also created his own philosophy school in 2010 in the small town of Epineul-le-Fleurriel, where he teaches local secondary school students, as well as PhD students (on-line).

This testifies to his ongoing concern with the fate of education in the contemporary world. Stiegler has taken a particular interest in how we raise the next generation, in view of the ubiquity of new media technologies in the life-world of the

young. However, rather than holding these technologies themselves responsible for what is going wrong in the world, it is his firm conviction that the elder generation has a responsibility for using these technologies wisely, and in such a way that a good future for the new generation can be guaranteed. Stiegler founded the *Institut de Recherche et d'Innovation* (IRI, Institute for Research and Innovation) at the Centre Georges Pompidou in Paris, which is aimed at experimenting with various new forms of learning and teaching. As a philosopher, Stiegler has by now gained international recognition (also within the field of philosophy of education, as evidenced by an interview with Stiegler which opens a recent special issue on digital pedagogies (Kouppanou 2015)). Unfortunately, the scope of his educational initiatives remains limited to the French speaking world only.

Stiegler's oeuvre is a large and complex one. A first reason for this complexity is the enormously varied range of schools of thought he draws from. Stiegler is an eclectic thinker *par excellence*. Second, he has a predilection for constantly inventing neologisms, and has created his own highly sophisticated jargon, which might frighten off readers not familiar with his work. In the following I will introduce the main influences on Stiegler's thought, and the key ideas and terminologies to be found in his work. After that, I will zoom in on one particular educational issue which, as I just mentioned, is of central importance to him: the consequences of the introduction of digital technologies on education. In the last section I critically evaluate the relevance of his work for the field of philosophy of education.

## Stiegler's Technocentric Account of Subjectivity

As already indicated, Stiegler's first philosophical writings dealt with technology and time. Here, Stiegler is clearly influenced by traditional *phenomenological* thinkers, and notably by Husserl and Heidegger. These authors argue that time as human beings experience it is something altogether different from time as defined in a physical sense (clock-time). For instance, the first time we spend a whole hour in a waiting room attending a visit to a physician, we might find this an extremely boring experience that seems never to come to an end. After frequently going through the same experience, however, it might seem time flies by – even if physically speaking it concerns the same amount of minutes and seconds. This implies that every experience we have 'now', is always colored by past and future experiences (memories and expectations): the time spent in the waiting room has a different feel because we can relate it to past experience, and because we know the tedious experience will (soon) come to an end. As Husserl would say, every experience in the now is structured on the basis of *retentions* and *protentions*. Moreover, time is not just a milieu in which we happen to find ourselves. It constitutes us from the inside as human subjects. For instance, as Heidegger has shown, the fact that we know that we will die, and that our time will come to an end, makes our existence into a properly humane life: we must take life seriously and take utmost responsibility for all the decisions we make.

Although Stiegler fully agrees with Husserl and Heidegger on this point, he also criticizes these authors for not having paid enough attention to the extent to which *technologies* shape human subjectivity. Traditional phenomenologists, Stiegler (1998) claims, have a limited view of technology: it is just a matter of objects and tools at our disposal. However, as he goes on showing, the very possibility of relating to the past and the future in the now is predicated upon the use of material memory supports. Next to primary retentions (e.g., my experience of reading this sentence is structured by my experience of reading the sentence I have *just* read) and secondary retentions (e.g., my experience of reading this text is structured by my experience with all the academic texts I have read in my life), there is a third form of retention which Husserl has left out of the picture, but which is far more important: the artificial supports of memory that are *external* to our consciousness. Stiegler most provocatively claims that the invention of, say, calendars and monuments is not merely an extension of an internal memory capacity humans have always had. It is the other way around: it is only thanks to writing down stuff in order to remember the past and to plan the future that humans were able to develop memory in the first place. Often we tend to regard our memory as something private and pure – an internal realm we alone have access to. For Stiegler, ‘our’ memory only comes about as the result of relying on already existing technologies, concrete material stuff out there which Stiegler also calls *hypomnemata* (in reference to Plato’s discussion of the invention of script technology).

More generally, Stiegler argues that technology is not a creation of humankind, so much as humankind is actually created, or at least co-constituted, through the coming into being of technologies. To be more exact on this point, Stiegler (1998) defends the view that the main factor deciding on human evolution is not so much genetic selection, as it is the development of ever new technologies (*epiphylogenesis*): internal factors such as our genetic code are of less importance than the changes in the technological milieu we live in. A good example, which is key to Stiegler’s thought, is the invention of script technology. The fact that the brains of people capable of reading are substantially different from non-reading brains (Dehaene 2010) has nothing to do with genetic mutations. We are not biologically programmed or predisposed to read. But, ever since script was invented and started to play a crucial role in human culture, humans born in literate societies have been trained in such a way that they literally became different creatures than their ancestors.

Script technology, and more precisely alphabetic writing (invented by the Phoenicians and fine-tuned by the Ancient Greeks), is a unique invention, the importance of which is often overlooked. It is no coincidence that two other important phenomena saw the light of day at exactly the same place and time: democracy and philosophy (scientific thought). Alphabetic writing is a superior memory technology that allows for remembering things past and anticipating the future: the alphabet, in contradistinction to for instance ideographic writing systems, permits us to fix exactly mathematic formulas, the steps in a complex argument, the precise content of an agreement or a law, etc. This has enormous consequences. For instance, instead of just expressing our thoughts and feelings in speech, we can now take a distance to what we and others say. This comes with a deepening, if not with the

creation of reflective capacities – necessary for philosophical and critical thought, as well as for democratic discussion and decision-making. Therefore, the particular shape subjectivity and culture has taken is strongly influenced by the unique characteristics of alphabetic script technologies. One of Stiegler's main concerns is that today script technologies are increasingly substituted with digital ones. As such, we are witness to another *epiphylogenetic shift* which potentially has far-reaching implications for what it means to be a human creature.

It is important to note here, that the word 'technology' doesn't refer only to the newest (mechanical, electrical or digital) tools, but to *all* tools humans use to make their way in life: a stone-axe is as much technological as a computer is. Moreover, the word 'tool' might be misleading here as it seems to imply an instrumental relation. At this point Stiegler is (without referencing to it) very close to the so-called *post-phenomenological* school of thought, of which Don Ihde (2016) is perhaps the most well-known advocate. For post-phenomenologists the body comes to replace conscious subjectivity, and hence the main focus of analysis should not be so much our knowledge about the world, as it is our interactions with the world supported by technologies. In this regard, connections between Stiegler and *posthumanism* (a recent school of thought discussed in the second section of this handbook) can also easily be made.

## Proletarianization, Grammatization, Transindividuation

Stiegler himself, however, would likely define his departure from traditional phenomenology in terms of *deconstructivism* and *poststructuralism*. Deconstruction is all about showing that binary oppositions which structure our worldview cannot be upheld upon closer scrutiny (Cf. Derrida 1989). Ever since the dawn of civilization human beings have defined themselves in terms of a self-sufficient and pure consciousness that positioned itself as distinct from the body and from the material world, and that moreover saw its highest calling as becoming master over this world. This binary opposition is a false one, Stiegler holds. Unique human qualities such as memory, but also consciousness, reason and agency are dependent upon the invention and interiorization of particular technologies, i.e., upon the creation and appropriation of possibilities that *first* need to be materially realized in the world outside.

Stiegler's step beyond phenomenology is also inspired by the poststructuralist insights of Michel Foucault. With Foucault Stiegler holds that what we can say, think and do is not something fixed – i.e., determined by an invariable human nature. Instead, our subjectivity (i.e., who we are) is dependent (or *contingent*) upon conditions which change throughout the course of history. When these conditions alter, forms of *subjectification* change. To this Foucauldian position Stiegler adds the importance of modifications in technological conditions for processes of subjectification. Furthermore, Stiegler takes Foucault's (1978) ideas regarding the invention of educational technologies, and more exactly the *school*, in a surprisingly new

direction. Over and against a popular reading of Foucault which one-dimensionally identifies the school as an apparatus that is devised to seize power over the lives of the young and to turn them into well-disciplined and productive subjects (Cf. chapter on the body in the third section of this handbook), Stiegler gives a far more positive account. Disciplinary regimes are not only repressive. They are also productive in that through the prolonged and repetitive introduction to dominant technologies our subjectivities are shaped in a particular way. The example of learning how to read and write at school is, again, a most illustrative case. For Stiegler (2006, 2010a), the school is a most important milieu, as it is here that, thanks to intense training and exercising, the prevailing societal and cultural technologies become our own.

In order to understand this argument in favor of the school correctly, it is necessary to refer here to yet another intellectual tradition Stiegler draws from: *Marxism*. More exactly, Stiegler reads Marx's ideas regarding the *proletarianization* of the producer in his own, idiosyncratic, way. Analyzing the lamentable situation of the oppressed nineteenth-century working class, Marx maintains that exploitation is (partly) caused by the fact that the working class is alienated from its own labor force. For instance, it matters nothing whatsoever that one actually knows that one is producing spare parts for trains or steel bridges. And therefore, workers no longer recognize themselves in the fruits of their labor. Today, Stiegler claims, we witness an analogous *proletarianization of the consumer* (Stiegler 2010b, 2015). We constantly rely on technologies, but without having any notion whatsoever of why they operate in the way they do. For instance, we use calculators to do a division, but we no longer know or understand the rules behind arithmetic operations, let alone that we would have any insight into how a machine can perform these operations for us. The know-how is delegated to a machine that remains a black-box, and so this know-how is completely *exteriorized*.

In view of this analysis, it should be clear that the school is indeed of vital importance, not so much because it instills discipline, as because it offers students the opportunity to get acquainted with the logic that commands the technologies we constantly count on. Consider once more script technology, and more specifically the most basic level of reading and writing instruction. Repetitive reading and writing exercises are meant to literally *inscribe* the rules constituting literacy into our bodies and minds. They become part of our second nature. Referring here to the original meaning of the word grammar (from the Greek verb *graphein*, which means to graft something on a writable surface), Stiegler (2006, 2010a) argues that schooling *grammatizes* certain abilities into our bodies and minds. Preventing us from becoming mere consumers of a technology, and therefore from not being ourselves in control, schooling brings about a deep-seated understanding of how particular technologies operate: we get a first-hand sense of their intrinsic possibilities and limitations (Cf. Vlieghe 2015). This is not only the case for script technologies, but for *all* technologies.

However, getting acquainted with the grammar behind the societally and culturally dominant technologies is crucial for yet another reason. In line with the idea that there is no eternally fixed essence which defines us as human beings, it is more accurate to speak about *ever-ongoing processes of subjectivation*, instead of about

subjectivity. Drawing from the work of Gilbert Simondon, Stiegler (1998) uses the term *psychic individuation* to refer to our never finished identity. Now, individuation at the level of the individual subject should always entail a social, cultural and temporal dimension: individuation should in principle involve *transindividuation*. This means that in our subject-constitution we relate to the whole history, which lies the groundwork for the technologies that define us as subjects in the present. Transindividuation is a question of becoming part of what Stiegler calls *long circuits* – transgenerational chains that transcend the merely individual level.

In order to see the importance hereof, consider again the proletarianization of the consumer taking place today. This process could be described in terms of closing off long circuits. For instance, one is able to use a calculator, but without understanding how to multiply or divide numbers. Or one is able to apply Pythagoras' theorem, but without really understanding why this theorem holds true. In order to really understand, one always has to go back to the beginnings, and – through a long and possibly painstaking process of initiation – connect to the whole history behind the technologies we rely on. A sound individuation as a subject capable of performing arithmetic and geometric operations requires long-circuits of transindividuation within and in dialogue with the whole history of mathematics.

All this might seem utterly fogyish, and yet Stiegler claims that long-circuits of (trans)individuation are actually the very precondition for *societal and cultural rejuvenation*. If our use of technologies is short-circuited, we become total slaves to these technologies, as we have no ability to relate to them with critical distance. This is especially the case because from eternity there have been forces present in society which seek to take control over our productive capacities. In the Ancient Greek world, sophists played this role (Stiegler 2010a). Today, mass-media are responsible for trying to control our minds, to rob us from the capacity of knowing how to do things (*savoir faire*) and knowing how to live (*savoir vivre*), and to turn us into passive consumers who mindlessly do whatever it is commercial enterprises profit from. As such the possibility of critically taking distance from given ways of giving shape to our lives and thus of the coming into being of *new* forms of life, individually and collectively, withers away. Instead, we all become *synchronized* to the dictates of a market-driven society, and we can't even begin making a representation of what an alternative could look like.

To prevent this from happening, we need a profound understanding of the principles that make our technologies operate, and to make these principles our own. Long-circuited connections with what the past generations have bequeathed us, as well as practices that lead to grammatization, are necessary for the process of individuation and (trans)individuation to go on. Therefore, it is education, and more exactly school education, which has a crucial role to play today: to conserve the past in order to make the coming of the new possible. Hence, as the title of one of Stiegler's major books (2010a) goes, our task today is: *Taking Care of Youth and the Generations*.

## The Digital Pharmakon and the Role of Education in the Contemporary World

One of the main concerns the elder generation is facing today is the far-reaching impact of the newest, i.e., computer or *digital* technologies. In line with his view that technologies are not solely instruments at our disposal, but that they have the power to (de)form us in profound ways, it is of the utmost importance to come to grips with how exactly new technologies operate. And this implies, for Stiegler, understanding how they are different from the technology that was dominant beforehand, i.e., *script*. Therefore, I have to turn a last time to Stiegler's account of reading and writing.

As previously explained, alphabetic script has given rise to the subject form we know today. Another unique characteristic of script that has not been discussed so far is that there is potentially a perfect symmetry between writing and reading, i.e., between the productive and consumptive side of script (Cf. Vlieghe 2015). To see this, one must consider that writing consists of the following two operations. On the one hand, it converts time into space: thoughts and feelings, which typically evolve in time (e.g., conclusions come after premises), get solidified in a static spatial object (e.g., on a single piece of paper). Time gets *spatialized*. On the other hand, writing converts the analogous (i.e., the infinite complexity of thought and speech) into something discrete (a finite construct based on a code consisting of about 26 signs) (Stiegler 2010c). Reading consists of the reverse operations: the reader must re-convert discrete signs into the thoughts and feelings analogous to the ones the author had. Likewise, in the act of reading, space gets *retemporalized*. In that sense there is a deep reciprocity between producing script and consuming script. And, therefore, one can only be said to be a genuine reader if one is also able to write – in the same sense that people who know how to read the music score of a Beethoven symphony (and who know how to play an instrument) will have a completely different and much fuller experience compared with what the mere amateur has. Therefore, the lack of musical literacy in our times, so Stiegler argues, constitutes a regrettable impoverishment (Stiegler and Rogoff 2010).

As is the case with all technologies, the risk of proletarianization is lurking around the corner. There is always the risk of merely consuming script (or music) without having any sense of what it means to produce it. This is, when one reads without deeper understanding of what, for instance, writing a book or a poem is really about (or listens to a symphony without any knowledge of how this music is composed). In order to really appreciate and understand texts, one must (at least potentially) be able to write these texts oneself. An example Stiegler (2010a) is keen on referring to is the *Enlightenment* idea(l) of a “republic of literate people” (*République des lettres*): for him a modern democracy is dependent upon the willingness by the whole of the populace not only to read *but also* to write. Being able to read is not sufficient in order to foster minds that are as critical and enlightened as the authors one studies.

When the digital becomes the new prevailing medium we are faced with a similar risk of proletarianization. In a digitized society one can perfectly function without having any insight into how computers operate – i.e., without knowledge of the software (algorithms) and hardware (electric circuits) that underlie the programs we use. With the invention of ever new consumer-friendly apps, things get worse, as ever more intuitive interfaces hide the programs that are running. In that sense the digital isn't different from script (or music for that matter). On a deeper level, however, digital technologies have *particular* disadvantages compared to script. First, digital technologies short-circuit the process of retemporalization (Stiegler 2010a). Recall that the ideal reader is also a writer who performs *herself* the reverse operations which constitute a text (i.e., an author materializing analogous thoughts into digital space), and that this is thanks to embodying the grammar regulating the translation of thoughts into visible signs (and vice versa). When relying on black-boxed digital technologies, we delegate retemporalization to a machine, and become mere users. A very simple illustration of this is that we can immediately read and understand the meaning of the *written* word 'cat', whereas it is highly unlikely that one ever will be able to immediately understand 011000110110000101111000 (the binary equivalent for cat) without the aid of a computer translation program. Differently put, where script ideally requires that reader-writers literally embody the grammar behind this technology (one can read c, a and t because one can form these signs oneself), it is impossible to grammatize binary code. Encoding and decoding get short-circuited (cf. Vlieghe 2015).

Second, the use of digital media goes together with a new attention regime (Stiegler 2010a). One of the consequences of learning to read and write in a traditional way is that it also fostered the capacities of *caring* and *paying attention*. At school students must engage in a long, repetitive, and strenuous process of learning *to get things right*. This applies both to forming the letters of the alphabet the way they should look, or to writing a well-constructed essay. Now, in order to read and write well, we must learn to be concerned for the quality of what we do, and we must learn to have patience and to concentrate on one task over a long period of time. With the ubiquity of digital media, we no longer need to care to the same degree (the letters we type are uniform and always right, spell-checkers, templates and copy-paste functionalities can do a lot of work for us, etc.). The direct satisfaction of our needs provided by digital media (immediately looking up every piece of knowledge one lacks with the help of Wikipedia, ordering online every commodity we crave for, etc.) destroys the capacity of relating to our own lives in terms of longer periods of time. We are no longer able to wait – i.e., *attendre*, from which the word *attention* stems (Ibid.). And so, the whole nature of attention itself changes completely: the *deep attention* required for reading a difficult text is counterproductive for users of digital technologies. They rely on *hyper attention* (a terminology Stiegler draws from Katherine Hayles (2007)): a constant vigilance and sensibility for new stimuli (and related to this, a willingness to give up, immediately, the thing one was working on). The problem is, of course, that hyper attention and deep attention are mutually exclusive modes of consciousness.

In view of this, Stiegler might seem to be fully opposed to the use of digital technologies. As explained in the introduction, the opposite is true. Like all technologies, digital technologies are *pharmaka* (Stiegler 1998). This Greek term should be taken in its literal, ambiguous meaning: like the word ‘drugs’ in English, *pharmakon* refers to something which both poisons and heals. If we take too much of a medicine, we might get even more sick or might die. For instance, script technology is a *pharmakon* and thus potentially a risk. As Plato, who introduced this term, already indicated: script *might* make us lazy and *might* have detrimental effects on human memory. Or, it *might* instill in us a passive and uncritical attitude, just parroting opinions written down by others without truly understanding or caring for them.

Analogously, we should be very careful about the digital *pharmakon*, but at the same time we should not demonize it. It is the responsibility of the existing generation to teach the next generation using digital technologies in such a way that the above described dangers are circumvented. After all, if we like it or not, the digital has become the new prevailing technology, and when used properly, it has a lot to offer which script-based technologies never could. What is needed is to form the next generation in a similar way we – the generation of digital immigrants – were formed ourselves when being introduced into a script-based culture. The newcomers need to understand and become familiar with the grammar behind the technologies they rely on, from a first-hand perspective (Cf. Vlieghe 2015). This entails more than just being introduced into a practical and thus superficial knowledge about how to use stuff (mere consumption). Rather, the young need an education which offers them a sense of how this technology works, so that they get inscribed in long-circuits of transindividuation, and so that they develop the capacity for taking a critical distance. Only then, the new generation can begin anew, and in unforeseen ways, with the dominant technologies that support our subjectivity. Moreover, this education should also generate care and attention. This is, we should look for concrete educational practices that foster deep attention and sustained interest and love for things – or, in sum, *savoir vivre*.

## Originality and Limitations of Stiegler’s Work

Stiegler’s analysis has a lot to offer to contemporary philosophy and theory of education. The debate regarding the meaning of digital technologies tends very often to either denouncing them as profoundly anti-educational (e.g., Carr 2011) or as the solution to all our problems (e.g., Gee 2007). Stiegler holds an original position in that he fully appreciates the importance of technologies for our subject-constitution *without* giving in to an unwarranted optimism or pessimism: how the future will evolve all comes down to the responsibility the adult generation takes for using the new prevailing societal and cultural technology wisely. As such Stiegler is, in spite of his belief in the formative (and potentially deforming) power of technology, not a technodeterminist. He is truly convinced that education can make all the difference. An innovative and important contribution of Stiegler consists of regarding

*attention* not as psychological but as a fundamentally educational category. Very often attention is considered as a capacity with invariable characteristics (e.g., one assumes that children have a maximum attention span of 15 min). Stiegler, on the contrary, argues that attention is a matter of formation and therefore a main task for education. In this regard, Stiegler is also most original in highlighting the importance of the school. As he shows, it is a *unique* place which allows for the new generation to take a critical and potentially emancipatory perspective on the main societal and cultural technologies. This point has recently been developed in Masschelein and Simons's (2013) work on the school. His analysis has also contributed to a materialist turn in educational theory (cf. Fenwick et al. 2015), which emphasizes the importance of bodily and technological dimensions of education over and against a purely cognitive account of education.

Much of Stiegler's criticisms of modern western culture might not sound new or original, as critical theorists have been fulminating time and again against 'cultural industries' (e.g., Adorno and Horkheimer 2011) for destroying our humanity and making us slaves to capitalist society. Nonetheless, Stiegler has made an original contribution to this line of thought by showing that there is *nothing inherent bad or oppressive* to prevailing cultural technologies: they are *pharmaka* and as such *one and the same* technology can be a source of enlightenment and real human progress, as well as the vehicle of individual and collective stupefaction, and cultural and societal impoverishment. As a last original contribution to educational philosophy, it should be noted that Stiegler shows how philosophy is not an activity apart and aside from education (i.e., a discipline which merely should be *applied* to education), but intricately concerned with the phenomenon – and the fate – of education. When he addresses the most fundamental philosophical questions, such as *what does it mean to be human?*, or *what does it mean to be a subject?*, his answer involves very concrete educational processes, as should be clear from the analysis of literacy initiation discussed in this chapter. Moreover, philosophy is not merely an exercise in abstract thought: for Stiegler, it is essentially about understanding our contemporary condition and about responding to the challenges of the present – especially to the issue of the need for schooling in digital times.

These things said, it should also be remarked that Stiegler is not fully true to his own principles. To take a simple example, in his mind, television seems to be *always and without exception* a source of alienation (cf. Stiegler 2010a). Because television, in contradistinction to digital devices, doesn't offer opportunities for an active engagement with the content it offers, it can only turn us into passive consumers and permanently deform us. It should be added that at times Stiegler's analyses are also imprecise (many youngsters use digital devices in the same way many people use televisions) and inaccurate (if we can never retemporalize binary coded information without the aid of machines, how then can digital literacy ever become equivalent to script literacy?).

Returning to the example of the television, my point is not to disagree with his claims, but to show that according to Stiegler's thought this technology, and maybe many others, should not classify as *pharmaka* (i.e., poison and cure). They are inherently bad, and this constitutes a major problem for Stiegler's whole account of

technology and education. On the one hand, Stiegler argues that there is no outside to our technological conditions: we become but who we are through the repeated use and appropriation of historically contingent technologies. On the other hand, it seems that the philosopher can take a position outside of the technological conditions that define us and that, starting from this position, technologies can – and should – be judged as educationally desirable or corrupt. So it seems Stiegler adheres to a clearly normative perspective, and this perspective is downright conservative, if not reactionary.

More exactly, it seems like script and book technologies are in the end superior, and that an intensive use of the internet must lead to a deformation of attention. In that regards it is telling that Stiegler keeps referring to Hayles' (2007) concept of hyper attention – without ever considering the potentially positive potential of hyper attention Hayles describes. Furthermore, his emphasis on transindividuation often comes down to the claim that the preservation of the ways of life of the existing generation is more important than the possibility of renewal and rejuvenation. However, in spite of these criticisms, Stiegler remains one of the few philosophers who has engaged in such a profound way with our contemporary, digital, condition, and its impact on the education of the new generation, and who has drawn attention to the great responsibility the existing generation has in regards with safeguarding a truly human culture.

# Taylor

## On the Educational Project of Overcoming Modern Epistemology

Hanno Su

### Introduction

As outspoken philosopher of modernity, Charles Taylor is one of the most influential contemporary philosophers and intellectuals of our time—known not only for his originality but also for the copiousness of covered topics ranging from cultural diversity to intellectual history and from religion to language. In his arguments on social and political life, Taylor is not just debating fundamental questions of various philosophical traditions, but he is also reaching for topics of interest to a broader public. Accordingly, in philosophy of education, although not exclusively, the relevancy of his work is seen in the unique take on moral and political philosophy.

This chapter contrasts this predominant interest in Taylor's practical philosophy by focusing a less common educational discussion of his theoretical philosophy. Consequently, it reads Taylor's seminal work on the modern self (Taylor 1989) from an epistemological angle, emphasizing the narrative of the epistemic self rather than the moral self. Further, it picks up Taylor's crucial involvement in debates on realism and the role of epistemology in philosophy, for which Taylor's reaction to Rorty's critique of traditional epistemology is pivotal (Taylor 1987/1995). As matters between these two sharp critics of Cartesian dualism seem to have rapidly reached an impasse and new positions are to be sought and created (Dreyfus and Taylor 2015), I set out to extract from that discussion an integrated view of epistemology and education in terms of social knowledge practices.

This sets the tone for an educational philosophizing that is explicitly generative and that helps both to redescribe the philosophical project of epistemology as well as articulating an understanding of a specific educational philosophy. Critically

assessing the educational relevance of Taylor's overcoming of modern epistemology opens an intricate way to look at educational philosophy as a certain hindsight, a *special way to look at things* in order to articulate educational structures. It thereby goes up against the presumably straightforward ways of characterizing philosophy of education by means of a kind of 'folk realism'; in other words, it goes up against attaining the demarcations of philosophy of education by singling out education as determinate subject matter, by then mapping a subdivision of philosophy to this section of the world, and by eventually using philosophy to work on the represented problems.

In leaving those mapping and application strategies behind and in establishing the perspective of educational philosophy, we do not just ask any questions about education, but we specifically "ask *educational* questions about education" (Biesta 2011, p. 190). However, this does not have to stop there, as the same focus also encourages asking educational questions about basically anything. Such a move toward the question of an educational philosophy will place educational problems already in the middle of the core problems of modern epistemology—how to talk about reality and the possibility of knowledge through internal representations of the outside world. Thus, by redescribing the Taylorian overcoming of epistemology as *educational epistemology*, I will pick up these interconnections and explore what it means to *expressively build up an educational stance* in the sense of an educational philosophy that is finding its own style of problematizing.

## Taylor's Philosophy of Modernity in an Educational View

Covering numerous fields of contemporary philosophy, Taylor's philosophy of modernity is never just a disjointed bulk of philosophical deliberations. Rather, he is diligently elaborating interconnections between his thorough observations of modern philosophical ideas and their history. Among the broad range of Taylor's philosophy of modernity, two interconnected topoi stand out: his work on theorizing multiculturalism as prominently displayed in the "canon-establishing essay" (Blum 2001, p. 555) on *The Politics of Recognition* (Taylor 1992/1994) and his historical analysis of the formation of the modern self in his "landmark work" (Smith 2009, 3) on the *Sources of the Self* (Taylor 1989). However, in both cases, his efforts to theorize modernity as an "Age of Pluralism" (Tully and Weinstock 1994) do not stand alone. In view of his other writings, rather, the historically oriented systematicity of Taylor's ongoing work is at display.

In his exploration of the ethics of authenticity based on the three "malaises of modernity" (Taylor 1991)—individualism, disenchantment through instrumental reason, and consequentially the industrial-technological society—Taylor is embedding his explicitly Canadian stance on multiculturalism (Taylor 2012) into the broader ethical debate of modern philosophy, especially as involvement in the liberalism-communitarianism debate (Keeney 2016). In his later writings, his politically interested diagnoses of the times takes a turn toward religion and Taylor

reconfirms his influential voice on current sociopolitical issues. Culminating in *A Secular Age* (Taylor 2007) he elaborates his critical account on the place of religion in the public sphere. Accompanied by his readings of Hegel, Taylor's analysis of the self is unfolded to be the broader project of the "number one problem of modern social sciences" (Taylor 2004, p. 1): the observation of modernity. In his recent *The Language Animal* (Taylor 2016), he systematizes his ongoing concern with philosophical anthropology which orients his readings of the philosophical discourse on language. Once again, he offers an encompassing and historically versed view on the human condition and its modern predicaments.

Continuously working in the intersection of these two modern strands—diversity and identity—Taylor is one of now many philosophers (like Nancy Fraser, Axel Honneth, Jessica Benjamin, or Judith Butler), who build on the Hegelian concept of recognition to issue social inequality and injustice from the perspective of the development of selfhood. For Taylor, speaking about multicultural societies, especially cultural recognition, is prerequisite for equality and to the same extent a crucial factor in the formation of the self. In our identities, he claims, we are "partly shaped by recognition or its absence" (Taylor 1992/1994, p. 27). This means that the formation our "identity crucially depends on [...] dialogical relations with others" (p. 34). This "*dialogical* character" (p. 32) of recognizing and being recognized could elegantly frame both the recognition of diversity and the recognition in processes of subjectification. In encountering the other, one is "allowing oneself to be interrogated by the other" (Graaf 2008, p. 759), while seeing "identity formation as a narrative achievement" (Higgins 2003, p. 141) in face of diverse preexisting cultural narratives.

The educational connection to Taylor's work reflects these two aspects to a large degree and appears to work out rather seamless and almost frictionless. Early on, Taylor's critical account of individualism and modern subjectivist philosophies gained some traction in discussions of the role of authenticity or equality in education. Since in his take on multiculturalism from the angle of mutual recognition Taylor is "arguing for the significance of culture to individual identity" (Houston 1996, p. 190), especially regarding minority cultures, his work offers a conceptual tissue connecting both the politics of difference and diversity and the "theory of the dialogical formation of identity" (Blum 2001, p. 546). To a social and moral perspective on education, such a notion prepares not only for a profound take on authenticity in an dialogical perspective (Splitter 2009), but also for articulating the formation of the self throughout the course of life (Zhao and Biesta 2012) in a globalized world (Golomohamad 2004).

On first sight, this might seem like a direct path to moral and political education, as general philosophy informs democracy and citizenship education by declaring topoi like tolerance and openness to dialogue the aim of education or implementing curricula truly fitted to a multicultural and diverse society. However, combining Taylor's stance on recognition and selfhood from an educational perspective (Bingham 2006; Balzer 2014) rather means to focus less on the content or the aims, but on the process or the practice of education (Smeyers and Burbules 2006).

Nevertheless, this might be more of an observation of the educational discourse than an observation of the relevance of Taylor's work for philosophy of education and call for a broader discussion of Taylorian perspectives on educational and social philosophy (Balzer et al. 2018). Insofar as education is, in the most general perspective, dealing with two frames, it is, first, traditionally regarded in the context of sociopolitical prerequisites and goals. And at least since Comenius' *omnes omnia omnino excoli* or Rousseau's second discourse, this is pursued with a special sensitivity to matters of social inequality. Taylor's plead for a *Politics of Recognition* fits right into this debate. Second, education is in its presuppositions and its consequences conditioned to individuals as learners in processes of becoming. Here, Taylor's narrative of the subject in *Sources of the Self* fits right into that.

## Overcoming Modern Epistemology

Although drawing educational arguments from the more political and anthropological branches of Taylor's philosophy is rather straight forward, there is another viable connection to education: Taylor's epistemological stance. Arguing about whether Taylor's *Overcoming Epistemology* does indeed overcome epistemology, Siegel (1998, 2017) and Williams (2015) proceed from an educational interest in Taylor that is grounded in questions of rational and critical thinking. On a general level, critical reasoning seems to be in accord with an account that favors the reflexivity of the modern subject and brings about a specific understanding of education. In a sense, we can relate this to an autonomous, self-sufficient, and critical reasoning against "trusting the opinions you have acquired through your upbringing" (Taylor 1987/1995, p. 4). Along these lines, it is assumed that the "relevance of epistemology to (philosophy of) education" (Siegel 1998, p. 19) roots in asking what sort of knowing should or could be favored in education and how "students gain [this] knowledge, and the ability to engage in rational inquiry" (p. 20). Conceptions like these are connecting epistemology to the educational debate by *reflecting the role of knowledge in education*. Being embedded in a critical account of modernity, however, Taylor's epistemological deliberations could also open a debate on linking epistemology and education in the sense of *epistemological deliberations on educational philosophy*.

For Taylor, the critique of epistemology might arguably have been an important undercurrent of his philosophy of modernity all along. At the core of the modern self lies the epistemological problem of the Cartesian quest for certainty in the dualistic setting of inner mental states representing the outside world. And this view is conversely anchored in "the depths of our modern culture" (Taylor 1987/1995, p. 6). The modern subject, which is in its "reflexive turn [...] indissolubly linked to modern representational epistemology" (p. 5), can fulfill the "modern ideal of freedom as self-autonomy" (p. 7) only after having "fully distinguished himself from the natural and social worlds" (p. 7).

As thereby “ideally disengaged” (p. 7) subject, it cuts the epistemic ties to the world in which epistemic certainty was sought previously. By turning inward, “[n]ow certainty is something the mind has to generate for itself” (p. 4). Since “the modern ideal of disengagement requires a reflexive stance” (Taylor 1989, p. 174), consequently (but paradoxically) the modern epistemological model bases its “strength [...] not just on its affinity to mechanistic science but also on its congruence to the powerful ideal of reflexive, self-given certainty” (Taylor 1987/1995, p. 6). Reflections like this connect Taylor—via the shared reference to the greats of twentieth-century philosophy Heidegger, Wittgenstein, and Merleau-Ponty—to other North American contemporaries like Richard Rorty and Hubert Dreyfus. Overall concern of this debate seems to be the mutual interest in reevaluating the “old epistemology” (p. 2) which established the notion of “knowledge [...] as correct representation of an independent reality” (p. 3).

In their joint publication *Retrieving Realism*, Dreyfus and Taylor recently revisited this issue that once actuated a tricky discussion between them and Rorty. In this debate of “who has really confuted classical epistemology” (Dreyfus and Taylor 2015, p. 40), the issue is not *that* one has to “break with the representational epistemology” (p. 55) but *how* this could be achieved. So both parties passionately distance themselves from the (Cartesian) “old mediational epistemology” (p. 66) of gaining knowledge of outer reality “through some inner states” (p. 2). Both sides claim they have done so, but despite seeing their common interest they do not see the other side following through. On the one side, there is Rorty who is “just walking away” (Dreyfus and Taylor 2015, p. 67) from the “philosophical distinction between the in-itself and the for-us” (Rorty 1994, p. 30) that so pervades classical epistemology. He might, however, still be a “prisoner of a new inner-outer picture” (Dreyfus and Taylor 2015, p. 132). On the other side, there are Taylor and Dreyfus who argue that we must philosophically work through “these deep, pervasive, half-articulated, taken-for-granted pictures which are embedded in our culture” (p. 41). But they might hold on to the “notion of truth about reality under some privileged description” (Rorty 1979, p. 378) and that those descriptions work better than others “because they represent reality more adequately” (Rorty 1994, p. 22).

However, Dreyfus and Taylor see the intractability and ask “[h]ow to pursue this debate further” (Dreyfus and Taylor 2015: 41) and introduce a third position. While for Rorty “the only way to escape the imperialism of modern science” (p. 154) is to reject the category of truth, Dreyfus and Taylor opt for a position they call “plural realism” (p. 130) in an attempt to mediate between classical scientism and Rorty. By stating that “the valid claims of modern science to grasp things as they are in themselves do not conflict with the plurality of revealing perspectives” (p. 154), they are clearly mapping the core idea of Taylor’s engagement in multiculturalism or anti-imperialism.

This means to shift the epistemological argument to a social justice argument. Allegedly, “[o]ther cultures do not ask about the universe as it is in itself” (p. 150) and “have no notion of a view from nowhere” (p. 150). Therefore, Dreyfus and Taylor put not only the scientific way of coping with life but also modern (Western) culture in a privileged position. Irrespective of Taylor’s orientation toward

anti-imperialism, this implicitly strengthens Western epistemic hegemony in pointing out its exclusivity. Claiming an epistemic superiority of the scientific view from nowhere holds modern western science to be *the* provider of truthful insights based on the western preference for unity over diversity. Thus, reflecting on “what we impose in order to cope” (p. 155), the question arises whether a “preference for unity is just another prejudice we should overcome” (p. 155). Privileging one vocabulary over another on the grounds of corresponding to the world is undermining the epistemic gains and the social desirability of “epistemological diversity” (Ruitenbergh and Phillips 2012).

## Toward a Generative Account of Epistemology

In what follows, I will join the general plea for a way out of this gridlocked situation. However, I will emphasize the bridge to epistemic pluralism differently. Instead of simply applying concepts of plurality regarding cultural identities and their knowledge constructs, i.e., instead of running on pluralist ideas that invite the problem of self-privileging mechanisms through the backdoor, I will discuss how articulating a generative understanding of philosophizing could divert the focus of this debate from the status of truth and reality to an *educational account of epistemology*.

This crucially shifts the focus away from talking about *constructs* or worldviews that might or might not represent reality toward talking about philosophizing as *process* of creating new ways to look at things. I will push away a little the compelling societal question whether philosophy should refrain from its immense interest in *the* truth and the subsequent self-image of having a privileged perspective that is imposing “the right” view (from nowhere) on “local knowledge” (Geertz 1983). Setting aside the differences, what the Rorty-Taylor debate as a whole has to offer is that it underlines the urgency of questioning the roots of our adopted epistemic habits in order to assess its relation to educational philosophy.

For educational philosophy, thinking about knowledge should (almost naturally) take a different form than the formula of the justified true belief. Educational philosophy’s interest in knowledge is not about systematizing our ways of making convictions true or not. Maybe it is not even about how to figure out what should be considered true, how to differentiate true statements from false ones, or how to distinguish knowledge from mere beliefs, opinions, and sentiments. Rather, educational philosophy challenges the standard figure of justified true belief by being prone to a more *generative* account of knowledge, as it is interested in knowledge-related *practices* or practices that go along with the process of *becoming* knowledgeable.

Approaching this distinction, we might take our clue from discussing sociology and its concept of society. Most often, sociology builds its central concept (implicitly) around the image of grown persons coming together and forming a kind of cohesion or solidarity. But this view of society falls short. In connecting the concepts

of the self and society, Taylor points out that (early modern) understandings of society work with a “picture of society [...] of individuals who come together to form a political entity [...] with certain ends in view” (Taylor 2004, p. 3). He marks such “an atomistic construal of society as constituted by, or ultimately to be explained in terms of individual purposes” (Taylor 1987/1995, p. 7) as a direct consequence of the image of inwardness and disengagement as it merged early modern liberalism and epistemology.

Moreover, this social atomism reduces the concept of society along the line to an oversimplified image of a compound of preexisting, somehow ready-made elements arguing their relations on the ground of preformed beliefs. If we follow Elias’ compelling argument, such a (standard) sociological account fails to acknowledge to the full extent that humans are becoming beings (Elias 1987/2001, pp. 20–22.). It fails to provide an understanding of society that starts out from educational processes, instead of just recognizing an educational dimension at some point (as maybe interesting detail, important functional aspect of society, or later add-ons to an already functioning theory). Thus, analogously, we might say that the conceptual framework of educational philosophy seems to favor a *generative epistemology* that is deviant to standard epistemology. Such an enlargement approach to knowledge lies besides the traditional “JTB epistemic tripod” (Brandom 2000, p. 97), as it is inherently nonfoundational and not about the conditions of *justification* and *truth*, or not even about *beliefs* at all. So thinking of this (post-epistemic) type of epistemology as *educational* is not without initial appeal to it.

## Articulating Educational Philosophy

This type of coupling of epistemology and educational philosophy could be examined even further, as the argument in the Rorty-Taylor debate might (implicitly) be reaching for an educational problematization of knowledge, already. I want to address two aspects of an engagement in such a constructive reading of all the critical effort against Cartesian dualism. *First*, I want to point out how in epistemological terms the modern subject stands for both the engaged first-person perspective in which sensations are recollected *on the inside* and, at the same time, the disengaged view from nowhere that oversees the world *from the outside*. *Second*, this two-faced epistemology of the modern subject corresponds to two forms of naturalism and expressivism: one about expressing the vastness of nature as *surrounding* universe and the other as expressing one’s nature as *inner* depth.

*First*, Taylor’s tale of the modern disengaged subject articulates a crucial contribution to the project of overcoming traditional epistemology. Modern inwardness and disengagement as distilled by Descartes means just “becom[ing] aware of our own activity and of the processes which form us” (Taylor 1989, p. 174). As subjects, we are separating ourselves from the world and generating an observatory stance toward the external world. In disengaging from the world, we turn inward and we “disengage from them and objectify them” (p. 175). Thereby, since presupposing a

“being *to* whom it appears, *for* whom it is an object” (Taylor 1987/1995, p. 9), we eventually “establish [our] identity” (Taylor 1989, p. 178).

However, taking an even firmer grip on this issue than Taylor, the epistemology of disenchantment of the world gets disenchanting itself for building on paradoxical grounds. The subject appears to be the *inside* and, miraculously, also the *outside*. Turning inward it takes “*inner* appearance[s]” (Dreyfus and Taylor 2015, p. 15; emph. H.S.) as the underlying basis for all knowledge. Thus, “the whole point of the reflexive turn is to achieve a quite self-sufficient certainty” (Taylor 1989, p. 156) as a safe ground for all the modern epistemic acrobatics. However, posing as the center of undoubtable certainty it takes on the “view from nowhere” (Nagel 1986) toward the world which is “grasped from *outside*” (Dreyfus and Taylor 2015, p. 14; emph. H.S.).

We might rephrase Descartes’ half way skepticism as follows. Turning inward is double sided. In separating itself from the world around it, the subject disengages from the world around it as it turns inward to itself. By establishing its identity, it becomes an observer with a first-person standpoint. From there, it gains that small grain of certainty through introspection which serves as the starting point for becoming the disengaged and objectifying third-person onlooker from the outside. The epistemic subject is at the same time *the* perspective for any knowledge and *no* perspective at all.

*Second*, this double-sidedness of modern epistemology is mirrored by two understandings of naturalism and, respectively, expressivism. Taylor reminds us that the establishment of a scientific world view goes hand in hand with a “split-screen vision of nature” (Taylor 1989, p. 416). On the one hand, we get to know nature as vastness of an independent universe on the outside, “which scientific discovery continually reveals [...] stretching far beyond our imaginative powers in both the gigantic and the miniscule” (p. 416). On the other hand, there is a tendency to think of “human nature as intrinsic source” (p. 374) whose “impulse we feel within” (p. 416). Whereas we might term the former *scientific naturalism* of outer nature, the latter is that *humanistic naturalism* of inner nature which is firmly connected to the hermeneutic counter program against the early modern upcoming of scientific epistemology.

Analogously, the respective establishment of an “expressive view of human life” (p. 374), in general, splits up into an *outer expressivism* and an *inner expressivism*. Turning to the outside, such a view would come close to a philosophy of our scientific practices of “*articulating the world*” (Rouse 2015; emph. H.S.). But to think of our epistemic practices of talking (and writing) about the world as just a matter of linguistic representation of the world would come short. Scientific expressions are “never just a matter of ‘mental’ representation” (p. 25), but about “extending and refining the inferential entanglements of scientific concepts and other discursive elements with other domains of discursive practice” (p. 25). And even much more than working on academic prose, e.g., in laboratory approaches “[s]cientific practices rearrange our surroundings so that novel aspects of the world show them-

selves” (p. 215). Turning to the inside expressive practices would be practices of *articulating ourselves*. In this self-referential process, the “sense of depth in inner space is bound up with the sense that we can move into it and bring things to the fore” (Taylor 1989, p. 390). This results in the “expressivist idea of articulating our inner nature” (p. 389), which as “inexhaustible inner domain” (p. 390) is the ground of our “expressive self-articulation” (p. 390).

The question, though, is whether in both readings this surmounts to ascribing a “creative role to expression” (Taylor 1992/1995, p. 107), which brings it closer to a Neopragmatist account of an expressive epistemology. In the case of articulating myself, it seems clear that “[b]ringing things to speech can’t mean just making *externally* available what is already there” (p. 107; *emph. H.S.*). Expressively reworking former descriptions of ourselves, we do not use “present redescrptions to make true statements about [our] earlier sel[ves]” (Rorty 1994, p. 25), but we engage in “practices of *disengaged* self-remaking” (Taylor 1989: 389) that make “our traditions and habits [...] objects for us [and] subject them to radical scrutiny and remaking” (Taylor 1989, p. 175). In other words, *in* articulating ourselves we are “finding new and more interesting ways of expressing ourselves” (Rorty 1979, p. 359). Frequently, we become different in the process of such a “‘Sartrean’ redescription which changes the redescrber” (Rorty 1994, p. 25).

In the case of articulating the world, however, Rorty claims “there are no scientifically interesting ‘Sartrean’ redescrptions” (Rorty 1994, p. 25) that change the redescrber, since scientifically we use “redescrptions to make true statements about the state of [e.g.] the solar system antecedent to my redescrptions” (Rorty 1994, p. 25). This, surprisingly, brings Rorty closer to an exceptionalism of the scientific worldview, to which Taylor (and Dreyfus) seem to adhere. But there are scientific redescrptions that “redescrbe the familiar in unfamiliar terms” (Rorty 1994/1999, p. 87) and change the redescrber (i.e., the scientific observer) along the way. Just think about how redescrbing the solar system as heliocentric challenged the cultural narrative of humans-as-center-of-the-world narrative or how Darwin’s redescrptions of the outer world could not leave the self-image of the redescrbing humans unaffected.

Thus, for Taylor (and Dreyfus) as well as for Rorty, the project of overcoming epistemology might be running into yet another inner-outer structure. This means, in pursuing a generative epistemology we have to be even more diligent in making the important semantic transition away from gaining knowledge about the world toward carrying out knowledge practices in the world. Redescrptive philosophizing, surely, might still have knowledge or becoming knowledgeable or promoting societal change as motivational starting points. But it proceeds just by refraining from being preoccupied with how theory accurately portrays reality. Instead of working on closing the gap to reality, the generative account of redescrptive philosophizing is ever increasing the distance to the present philosophical problematic whose descriptions it is letting become strange.

## Educational Epistemology

In my argument, I picked up the question how to ask educational questions about education and asked in what way Taylor's philosophy or, strictly speaking, his critique of modern epistemology helps us to gain a new perspective on the relation of epistemology and education. Especially enterprises of explicitly nonscientific epistemology could open an important conversation about the special connection educational philosophy has (or could have) with epistemology. The developed figure could be taken to frame the role of Taylor's epistemology regarding "language and educational research" (Frowe 2001). Redescribing Taylor's attempt to overcome epistemology shows that this debate does not have to be a project of analytic philosophy alone, but can also be explored further by drawing from the twentieth-century continental philosophy or Neopragmatism. Accordingly, articulating philosophy is not only nonfoundational but also nonrepresentational by thoroughly questioning the inside-outside structure.

Moreover, questioning the epistemological fabric of modernity by overcoming epistemology can be conceived as a project of an educational philosophy all along. From such a focus on redescriptive theorizing, overcoming epistemology is not the attempt to disestablish epistemology altogether. Rather, it is about organically exceeding tradition by shifting the weight to a "(neopragmatist) social epistemology" (Derry 2013) that can be articulated as generative account of epistemology. In general, this enables us to talk about knowledge practices instead of evaluating relations of correspondence. Commonly, one might characterize educational philosophy by employing a high specificity regarding its object and pair it with a high generality regarding its findings, i.e., as philosophy of education it produces universally valid assertions on a specific set of educational issues. Refraining from any metaphors of imaging the world, however, induces a high generality regarding possible observable objects. In a nonrepresentational view, the question what makes educational philosophy a distinguishable enterprise instead of dissipating into scatters of research could not be derived from its object, i.e., from the demarcations of education out there. We could not simply assume that we already know where to look for education and how to distinguish it from that what is not education (e.g., using toothbrushes). In contrast, a generative account of educational philosophy retains the high generality regarding possible objects by redescriptively developing a high (educational) specificity in its way of looking at things. This way, we can not only ask educational questions about education but basically about everything. For example, we can articulate that in the practice of using bamboo toothbrushes we find an understanding of ourselves as having become educated or cultured subjects that are caring about their health in terms of hygiene, long-term effects, or even as something we can influence in the first place, and at the same time are caring about the environment for example in terms of plastic reduction.

The extending question put forward here is: in what way such redescriptions themselves can be paralleled to educational processes. Taking an even broader stance, nonrepresentationalist epistemology in either form serves as a reminder for modern philosophy to constantly work through its '*forgotten connections*'—to bor-

row an image Mollenhauer (1983/2013) uses to impressively recollect the submerged historic and systematic connections of education. Analogously, a recollection regarding the epistemological framework of educational philosophy could be seen as both revitalizing those historic reconstructions as well as carving out reconstructions in the nowadays fractured field of research styles to give new meaning to a universal theory of education (Bellmann and Su 2017). In a direct evaluation, such an educational approach to philosophizing could be understood as invitation to find new ways to carefully and confidently place educational philosophy into the academic system, which it almost traditionally struggles to fit into (Biesta 2011).

Shifting our talk from a generic talk about philosophy of education to a specific *educational philosophizing* as a particular mode of philosophizing enables us to ask in what ways redescribing epistemology is itself an educational endeavor. Redescriptions enlarge our internal and external expressive range and, regarding their dialogical structure, open the social and cultural realm to us and others in new and interesting ways. Giving this project an even stronger educational ground and maybe articulating a little too confidently, this redescriptive project could be continued as *educational epistemology*.

# Wittgenstein, Science and the Social Sciences

Richard Smith

## Introduction

The social sciences – perhaps even the very idea of social science – are experiencing something of a crisis. On the one hand, there is a considerable degree of scepticism, bordering on outright hostility, towards them on the part of governments and governmental funding bodies. In the USA, for example, the National Science Foundation is now prevented by the House of Representatives, following a vote in May 2012, from funding research in political science. In the USA, again, the establishment of the ‘What Works Clearinghouse’ and the idea that education research in particular must be ‘evidence-based’ marginalises theoretical research, especially that with a sociological or philosophical basis, since ‘what works’ and what counts as ‘evidence’ are construed on the model of medical research, with randomised control trials as the ‘gold standard’ and the supremacy of purely or predominantly empirical research taken for granted (Cartwright and Hardie 2012). In the UK, it is now over 30 years since the Social Science Research Council became the Economic and Social Science Research Council when the Secretary of State for Education at the time, Sir Keith Joseph, decreed that the word ‘science’ was ‘misleading for a subject that cannot provide testable answers’. This appears to have masked his view that the social sciences were “packed with people committed to the left in British politics” who disagreed with his own ideas on, for example, the cycle of deprivation (Denham and Garnett 2001, 379–80).

Perhaps this hostility to the social sciences is partly caused by what some identify as the increasing unwillingness of social scientists – still so called, naturally – to be compared with the model of the natural scientists. (Of course it might be the other way round: perhaps it is the hostility which their discipline encounters that

---

e-mail: [r.d.smith@durham.ac.uk](mailto:r.d.smith@durham.ac.uk)

induces social scientists to repudiate the comparison with natural science.) Fay (1996 p. 1), in rejecting the comparison, writes that the question of how far social science is or should be like natural science has become less interesting today, partly because for many people

natural science no longer induces the kind of reverence it once did. Implicit in much previous philosophizing about social inquiry was the presupposition that natural science is the benchmark against which all cognitive endeavors must be measured. But in the current intellectual climate natural science has lost this privileged position.

It has lost that position, Fay thinks, because we live in an age of growing repugnance towards the military-industrial complex and the degradation of the environment and of scepticism concerning the benefits of technology, and accordingly increasing wariness of the science that underpins them.

At the same time, and perhaps at least partly as a further response to the kind of pressure noted above, many researchers and writers who identify themselves as social scientists still appear more than happy to see social science model itself on the approaches and procedures of the physical sciences. Thus there is much interest in ‘big data’, that is massive data sets that can be analysed by computer to expose patterns, trends and correlations, for instance, between social disadvantage and low education attainment, in ‘learning analytics’, the application of data (which may well be ‘big’) in order to maximise learning, in randomised control trials (RCTs) along the lines of their successful use in medicine and in neuroscience. This is not the place to offer detailed critique of these trends: for randomised control trials see Cartwright and Hardie (2012) whilst for neuroscience see Schrag (2011) and Smeyers (2016).

In this chapter, I note some of the ways in which Wittgenstein in his later and arguably more influential writing is astute (albeit sometimes cryptically) about the fundamental confusions at the heart of many elements of the ‘scientific turn’ that had captivated him in his earlier work and offers us well-judged ways of dissolving the pseudo-scientific myths that enthral and mislead many who regard themselves as members of the social science community. He is exceptionally and, it is sometimes tempting to say, uniquely helpful to us as we resist scientism, that is *faith* in science and excessive respect for science – particularly the expectation that every question is susceptible to scientific solutions and that scientific knowledge should be taken as the model for all knowledge. This of course is not to reject or even to denigrate science itself, though Wittgenstein, who was knowledgeable about science, having trained as an engineer and having worked as an aeronautical scientist in Manchester and elsewhere, often expresses extreme hostility to science in his later writings:

It isn’t absurd, eg, to believe that the age of science and technology is the beginning of the end for humanity; that the idea of great progress is a delusion, along with the idea that the truth will ultimately be known; that there is nothing good or desirable about scientific knowledge and mankind, in seeking it, is falling into a trap. (*Culture and Value*, p. 56)

It is usual to connect this with Wittgenstein’s feelings about the way science and technology had contributed to the horrors of two world wars (he had witnessed these

with his own eyes as a front-line soldier from 1914 to 1918), especially through the development of the atomic bomb, and with his apocalyptic phrase ‘the darkness of this time’ in his Preface to the *Philosophical Investigations*. A deeper scepticism however is evident in such remarks as the following, also from *Culture and Value* (p. 40):

What a curious attitude scientists have –: ‘We still don’t know that; but it is knowable and it is only a matter of time before we get to know it!’ As if that went without saying. –

This is a telling example of the naïve scientism that Wittgenstein would have us guard against.

It is important to note that both the scientism against which Wittgenstein reacts in his later work and what we might call scientism now have long roots. The word ‘science’ to designate the kind of unified field of knowledge and research that we are familiar with today was not widely used until well into the nineteenth century. Until then it was called ‘natural philosophy’, and Wittgenstein’s philosophical predecessors, as we would now think of them, were absorbed by mathematics and geometry more than by the empirical approaches that come to mind when we think of science in our own time. Descartes, for instance, records in his *Discourse on Method* that geometry strikes him as the most rigorous form of ‘obtaining clarity in any subject’, and published an appendix to the *Discourse* in 1637 called *La Géométrie*. His invention of a systematic way of linking Euclidean geometry with algebra still bears his name as the system of Cartesian co-ordinates. Spinoza resolved to write his own philosophical treatise *more geometrico*, in the manner of geometry. Gottlieb (2016, p. 138) writes that “falling in love with geometry seems almost to have been an occupational hazard of seventeenth-century philosophy”: that love affair, as we shall see, continued well into the twentieth century.

## Scientism in Educational Research

Here is an extended example of how educational researchers often assume that their work must conform to scientific criteria for truth and accuracy. Many studies appear to show a correlation between parental involvement in their child’s schooling and the educational standards that the child achieves. Parental involvement is, in short, a good thing. But correlation is one thing and causation another. Can we say that parental involvement *causes* better results – which will naturally have to be in the quantifiable form of higher marks in tests and exams? One problem here is that the various studies do not enable us to say just what kind of parental involvement is effective. Is it, for instance, a matter of the parent or parents ensuring that the child does her homework? Is it instead a matter of the parent(s) listening to the child read aloud, or of the parent(s) reading to her? If so, at what stage in the child’s development? Furthermore might there be a difference between on the one hand reading aloud somewhat mechanically, stabbing the finger at successive words in the text, so that the child knows she is supposed to be learning something here, and on the

other reading with a sense that the book – including its pictures – is meant to be relished and enjoyed? (We moved our older son to a different school when we discovered that the teacher required him to cover up the pictures on the left-hand page: using these as clues to the text opposite was, she said, ‘cheating’.) Is it important that the involved parent asks ‘What did you do at school today?’ or is it more important to be punctilious in attending parents’ evenings at the school? Or do we want to say in the end that it all comes down to the general truth that children need to see that their parents think education is valuable and to be taken seriously (but not necessarily solemnly)? Even asking a child what she did at school today can surely be counter-productive if it feels to the child like an inquisition to which they will be bound not to have the correct answer. (Children often reply to this question by saying what they had for lunch: perhaps because it is at least a definite and incontrovertible answer.)

The existence of all these variables and complexities means that we are a long way from being able to assert that parental involvement *causes* better results, in the form of better grades or anything else. To repeat: correlation, however regular, even if we can find it, does not demonstrate causation. There is a pleasingly old-fashioned example of this point often used by philosophers of science. A factory hooter sounds at 5.00 every evening at a factory in Glasgow, and all round the country workers promptly leave their factories at the same moment. This happens, let us suppose, from Monday to Friday every week apart from national holidays. Still the Glasgow hooter has not *caused* workers to clock off in Birmingham, Bristol and Newcastle.

To search for causes in the social sciences is problematic, then, if a properly causal connection is taken to mean, at least, that an intervention  $x$  will always be followed by an outcome  $y$ , and *as a result* of  $x$ . Yet, some researchers find it a matter of regret that social science has not come up with causal connections of this sort (not yet, perhaps they will say, it is only a matter of time before we get to know it!), and so they continue their search for the chimaera. Even the physical sciences, we should note, do not always work with the kind of idea of causation these social scientists are hoping to discover. Dissolving magnesium in sulphuric acid certainly causes, in the sense required, the production of hydrogen gas, but the same is not always true in medical science. Your doctor may be confident that your insomnia is caused by stress, but she does not suppose that stress always causes insomnia. The same is true of smoking and lung cancer. Not all smokers, not even those who smoke heavily for many years, contract lung cancer. But we hardly want to stop claiming that smoking causes lung cancer – that is, unless we work for the tobacco industry, which has for a long time fallen back on the fact that smoking does not fit the magnesium in sulphuric acid model of causation. Yet we hardly want to make a concession here – to the tobacco industry or the determined smoker – and say merely that there is a significant connection between smoking and contracting lung cancer. That does not seem sufficient here. Cigarette packets in the UK are now required by law to carry the unequivocal message: Smoking Kills. Similarly, there are signs on UK motorways that say Tiredness Kills. As with the case of smoking, the implicit causal connection between driving when you are tired and being involved in a fatal accident is not disconfirmed by the fact that large numbers of

people drive when they are tired without disastrous results. Only ‘the bewitchment of our intelligence by means of language’ (*Philosophical Investigations* §109), here the language of science, persuades us to stop thinking in causal terms in this case or in the case of smoking and lung cancer. The messages on the cigarette packets and the motorways are well conceived, implying causation in an ordinary, everyday sense of the word.

To emphasise this point, putting it in slightly different way: we can and do talk about causation when it does not conform to any supposedly scientific paradigm. As Nancy Cartwright (1997 p. 104) writes: “About causation I argue...there is a great variety of different kinds of causes and even causes of the same kind can operate in different ways”. She goes on to note that:

The term ‘cause’ is highly unspecific. It commits us to nothing about the kind of causality involved nor about how the causes operate. Recognizing this should make us more cautious about investing in the quest for universal methods for causal inference. (ibid. p. 105).

The prime candidate for such a ‘universal’ method of causal inference would naturally be a putatively ‘scientific’ one. It is worth noting that Cartwright’s criticism applies even to what has become a very popular such candidate: the INUS account of causation, associated particularly with J. L. Mackie, according to which an event C is perceived to be the cause of event E if C is “an insufficient but necessary (or non-redundant) part of a condition which is itself unnecessary but sufficient for the result” (Mackie 1974 p. 62). There is no space here to do justice to the problems that have been found with the INUS account. For a clear overview, which is particularly insightful about the importance of “the background of knowledge that is taken for granted” and the crucial role of blame in attributing causality, see Meyer 2000 (pp. 13 ff.). Cartwright (2007 pp. 34–35) simply notes “INUS conditions are not causes. The INUS formula represents an association of features, a correlation, and we know that correlations may well be spurious”.

## The ‘Scientific’ Wittgenstein

It is important to note that Wittgenstein’s attitude to science, which can be characterised as a growing sense of how science is prominent amongst the pictures that hold us captive (*Philosophical Investigations* §115), is connected to many of his central concerns in his philosophical writing throughout his life. In the early *Tractatus Logico-Philosophicus* (1922), it is fair to say that Wittgenstein himself was ‘captured’ by scientific models and ideas that were making a major impact at the time. Albert Einstein did important work in atomic theory in the early years of the twentieth century, culminating in the publication of his ‘General Theory of Relativity’ in 1916. J.J Thomson was awarded the Nobel Prize in 1906 for his work in identifying subatomic particles in cathode rays. Ernest Rutherford, Niels Bohr and Gilbert Lewis made important discoveries about the structure of atoms between 1909 and 1916; Rutherford famously ‘split the atom’ in 1919. It should not be too

surprising that a trained scientist and engineer such as Wittgenstein, who had been fascinated by the philosophy of mathematics and corresponded with Gottlob Frege, perhaps the most eminent thinker in this field at the time, should be influenced by scientific and mathematical ‘pictures’. Essentially, the *Tractatus* is a work of logical analysis dedicated to discovering elementary propositions, understood as the basic building blocks of language. This is usually called his ‘picture theory’ of meaning since it conceives propositions as meaningful insofar as they picture states of affairs or empirical facts. Because those elementary propositions are analogous to the place of atoms in the world that the physical sciences investigate, Wittgenstein’s theory in the *Tractatus* is often described as logical atomism. Wittgenstein did not use this phrase himself but the word *Sachverhalte* which he uses in the *Tractatus* and is usually translated as ‘states of affairs’ is translated by some as ‘atomic facts’ (Hunnings 1988). Furthermore, Bertrand Russell, who was a major influence on Wittgenstein and acknowledged the influence Wittgenstein had on him in turn, was happy to call himself a logical atomist (Klement 2004).

Wittgenstein’s own title for the *Tractatus* was *Logisch-philosophische Abhandlung* (literally *Logical-Philosophical Treatise*). He adopted the Latin title for the English translation on the suggestion of the philosopher G.E. Moore. It is sometimes said that Moore was struck by the Spinozian flavour of the last part of the *Tractatus*, and Spinoza’s great work of moral philosophy had been titled *Tractatus Theologico-Politicus* (Moore had published his own work on moral philosophy in 1903 as *Principia Ethica*). It is significant too that Spinoza had conceived his philosophy as proceeding *more geometrico*, in the manner of geometry, just as Descartes had taken mathematics and geometry as the model for how to deal with the ambiguities and uncertainties of philosophy. Perhaps in the Latin title of the *Tractatus*, there is also an allusion to Whitehead’s and Russell’s *Principia Mathematica*, published in 1910, which itself pays homage to Isaac Newton’s *Philosophiæ Naturalis Principia Mathematica* (‘The mathematical principles of natural science’, what we now call ‘science’ being known as ‘natural philosophy’ in Newton’s time.). At any rate, the early Wittgenstein was not the only philosopher to be held captive by the ‘picture’ of science. And when he writes later in the *Philosophical Investigations* that “a picture held us captive” (§115), then, it is the ‘scientific’ picture – science here including geometry and mathematics – that he has in mind, and it is he himself, he confesses, that was held captive by it.

The picture that captivates Wittgenstein in the *Tractatus* extends beyond its title and beyond the nature of the theory that he expounds there to the way in which he presents it (if indeed these two sides of a text can ever be entirely separate). Commenting on the literary style of the work, Muñoz-Suárez (2016) notes that Wittgenstein had trained as an engineer and comments that.

Perhaps this explains why the *Tractatus* looks like the work of a sort of conceptual engineer. In it, Wittgenstein describes reality as an immense device whose pieces perform together, giving rise at different levels to different configurations and abstractions, among them language and thought. Like cogs in a machine, all the aphorisms in the *Tractatus* serve an overall aim.

The *Tractatus* has a literary style that is variously described as austere, succinct, extremely concise, “formidably compressed” (Monk 1991, p. 156), cryptic and highly abstract. There is an “almost total absence of arguments proper, in the usual sense of the word, not to mention the absence of examples which would be useful in coming to the aid of the reader” (Frascolla 1994). Instead of arguments, there are statements that are intended to be axiomatic or self-evident. As is familiar to anyone who has opened the book, the statements are numbered (e.g. 1, 1.1, 1.11, 1.12 and 4.1272, 4.12721, 4.1273) in a hierarchy such that every lower level proposition expands on or comments on the proposition directly above it in the hierarchy. Wittgenstein makes copious use of logical notation and truth-tables, which unfortunately I cannot reproduce here. The style of the book is less reminiscent of Spinoza’s *Tractatus Theologico-Politicus* than of Euclid’s *Elements of Geometry*. Here, just as Wittgenstein sets out in his *Tractatus* basic axioms whose truth is intended to be self-evident, so Euclid sets out at the beginning of Book 1 of the *Elements* what he calls ‘Definitions’, ‘Postulates’ and ‘Common Notions’. Here are a few of the ‘Definitions’:

7. A plane surface is (any) one which lies evenly with the straight-lines on itself.
8. And a plane angle is the inclination of the lines to one another, when two lines in a plane meet one another, and are not lying in a straight-line.
9. And when the lines containing the angle are straight then the angle is called rectilinear.
10. And when a straight-line stood upon (another) straight-line makes adjacent angles (which are) equal to one another, each of the equal angles is a right-angle, and the former straight-line is called a perpendicular to that upon which it stands.

The reader, whatever her understanding or lack of it of the technicalities in the *Tractatus* – and it must be said that the fact that few readers will be able to follow all of the logical technicalities is no criticism of Wittgenstein – is left in no doubt that something dauntingly and compellingly rigorous – ‘scientific’ in the popular sense of the word – is going on in the *book*.

## Wittgenstein’s Turn Away from Science

Wittgenstein’s later repudiation of the scientific ‘picture’ is accompanied, as that earlier ‘picture’ was, by a theory of language and meaning, but now a very different one. In the *Philosophical Investigations*, he writes that it is a mistake to look for a perfect language, pure and crystalline like the language of logic and science. Now he abandons his aspiration to find one, ideal kind of language to which all language should conform. He is more impressed by what he calls “the multiplicity of language-games ... the multiplicity of the tools in language and of the ways they are used, the multiplicity of kinds of word and sentence” (*Philosophical Investigations* §23). The early pages of the *PI* have much to say about this. Wittgenstein offers a

list, including ‘Singing catches—Guessing riddles—Making a joke; telling it—Solving a problem in practical arithmetic—Translating from one language into another—Asking, thanking, cursing, greeting, praying’. In the next paragraph, he warns us that if we do not keep the multiplicity of language-games in view, we will perhaps ‘be inclined to ask questions like: “What is a question?”’ or, we might say, questions like ‘what is a cause?’, in expectation that there is a paradigm to be discovered, no doubt derived from what is currently a high-status language-game, that of science.

In a well-known summary of his new view of language, Wittgenstein writes:

every sentence in our language is in order as it is. That is to say, we are not *striving after* an ideal, as if our ordinary vague sentences had not yet got a quite unexceptionable sense, and a perfect language awaited construction by us. (*Philosophical Investigations* §98)

It is an idea that is repeated elsewhere in the *Philosophical Investigations*, for example, at §§123–124 where we read “A philosophical problem has the form: ‘I don’t know my way about’... It [ie philosophy] leaves everything as it is”. This needs some clarification, not least because it appears to limit the role of philosophy so severely as to make it effectively useless. What then are we to make of Wittgenstein’s insistence that ‘every sentence in our language is in order as it is’? Surely, we come across sentences from time to time which strike us as not being in order. Here are some: ‘Social science, as the word “science” implies, is a precise discipline’. ‘Learning phonics skills is the first important step in learning to read’. ‘Depression is an illness like any other’. ‘Education should stream children on the basis of their natural ability’. Wittgenstein’s apparent endorsement of ‘every sentence in our language’ is unfortunate, suggesting that each of the four sentences above is beyond reproach. Indeed, each of them might seem to some people at least to express simple common sense: to the lecturer in a Social Science Research Methods module, whose students reported her words to me with glee; to the writer of a UK Department for Education (2013) leaflet, *Learning to read through phonics: Information for parents*; to the doctor who spoke these words to a colleague of mine as he typed the prescription for anti-depressants; to the student who recorded her faith in the idea of ‘natural ability’ in an undergraduate essay.

Yet each of these statements can be challenged. The important point here is that the challenge is essentially on the grounds that the writer is in the grip of a *theory*. The first sentence shows the speaker holds a remarkably naïve theory about science as well as about social science: in particular one that shows no awareness of the way that the term ‘social science’ came into being as theorists and researchers sought in the nineteenth century to dignify the new discipline with the aura of the physical sciences (see Smeyers and Smith 2014). The second is questionable. Phonics as a reading ‘method’ is contentious (you would not know this from the Department for Education leaflet). Depression may often at least be a response to difficult circumstances in a person’s life, and to call it an illness immediately assumes that a medical doctor is the appropriate person to ‘treat’ it as she would tonsillitis or gout, that is through medication. The idea that there is such a thing as ‘natural ability’, a kind of stable attribute of the individual, perhaps expressed in terms of IQ, ignores the

possibility that ability may be acquired, for instance, through practice or good teaching. It is linked with the discredited theories of psychologists such as Cyril Burt.

The idea that ‘our language is in order as it is’, then, is one more warning that we are not to go looking for an ideal or perfect language: particularly one strongly coloured by theories, scientific or otherwise. *For the most part*, our ordinary language does not need to be replaced by something more ‘scientific’. We can talk of the sun rising and setting when ‘in fact’, as we might be tempted to put it, the sun is stationary and it is the earth that is moving. We can enjoy the distinctive smell of what we call the good sea air even if a biologist correctly informs us that much of that smell comes from dimethyl sulphide released by bacteria eating dying photoplankton. We can say we are standing on solid floor even if “we have been told by popular scientists that the floor on which we stand is not solid, as it appears to common sense, as it has been discovered that the wood consists of particles filling space so thinly that it can almost be called empty” (*The Blue Book* p. 45). It is worth quoting this passage further. Wittgenstein continues:

This is liable to perplex us, for in a way of course we know that the floor is solid, or that, if it isn’t solid, this may be due to the floor being rotten but not to its being composed of electrons. To say, on this latter ground, that the floor is not solid is to misuse language. For even if the particles were as big as grains of sand, and as close together as these are in a sandheap, the floor would not be solid if it were composed of them in the sense in which a sandheap is composed of grains. Our perplexity was based on a misunderstanding; the picture of the thinly filled space had been wrongly *applied*. For this picture of the structure of matter was meant to explain the very phenomenon of solidity.

## Some Implications for Social Science

It is usual, and by no means wrong, to say that the central feature of Wittgenstein’s later work is his new way of thinking about language: his move from conceiving of propositions being connected ‘atomistically’ to states of affairs to his conception of ‘language games’, as noted above, and to his insistence that “For a large class of cases – though not for all – in which we employ the word ‘meaning’ it can be defined thus: the meaning of a word is its use in the language” (*Philosophical Investigations* §43). Now this is certainly helpful to the social scientist or educational researcher: it gives them a way of understanding how we play different ‘language games’ with the notion of causality, for example. Thus the language game played by physical scientists when they identify a catalyst’s part in a chemical reaction is rather different from the language game we play when we talk of smoking causing lung cancer, and different again when we talk of how the football team’s run of bad results caused the sacking of their manager. This we have seen in § III above; and it is worth repeating the further, crucial point: none of these ways of talking or thinking about causation has any claim to be the primary or essential sense of causation, as if the other ways were secondary, derivative or inferior.

It is equally true, however, and certainly it is especially helpful to the social scientist and those in cognate disciplines, to register the force and significance not just of Wittgenstein's changing views of how language has meaning but of his growing dissatisfaction, so marked in his later work, with science as the paradigm of all knowledge and his identification of it as prominent amongst the 'pictures' that had held him captive. There is space here to note only three such aspects of his dissatisfaction with science. The first is what Wittgenstein calls "our craving for generality" (*Blue Book*, p. 18). We might think here of the widespread tendency these days to suppose that explanations will be found 'in the genes' for a wide range of aspects of human behaviour, from Attention Deficit Hyperactive Disorder (ADHD) to criminality. Or we might think of the way that some people are excited by the expectation that neuroscience will supply the key to our understanding of human learning – and thus answer the question of the purpose of education. The discussion of causality above is another instance of the assumption of generality, here the idea that there must be one true account of causality to which all talk of causality will have to conform. Wittgenstein writes that by 'our craving for generality' he means

The method of reducing the explanation of natural phenomena to the smallest possible number of primitive natural laws ... Philosophers constantly see the method of science before their eyes, and are irresistibly tempted to ask and answer questions in the way science does. This tendency is the real source of metaphysics, and leads the philosopher into complete darkness. I want to say here that it can never be our job to reduce anything to anything, or to explain anything (*ibid.*).

The idea that it is not our job (as philosophers) to explain anything may sound strange, but this is a second aspect of Wittgenstein's escape from the capture of science. It is a matter of doing justice to the fact that not all understanding and knowing comes down to explaining. In science it often does. We explain someone's slurred speech: he suffers from a particular condition (perhaps he has had a stroke) of which this is a symptom. We explain the distinctive flora and fauna of Australasia: it became separated from the great land-mass we call Pangaea at an early stage when that land-mass began to divide, and so Australasia had a long time over which its particular flora and fauna could evolve. But in social science, our understanding and knowledge typically take a different form. When we seek to understand puzzling behaviour in a strange culture (the way children dress up on the last day of October and go round houses demanding treats and threatening 'tricks', say), we are not asking what caused the behaviour: we are asking what it *means*. The rituals of marriage, of university graduation ceremonies (why are these young people wearing strange clothes in which fur figures predominantly?) or of the game of cricket are not to be understood in terms of what brought them about. It is not much help to the bewildered foreigner watching her first game of cricket to start by saying "Well, in 1702...and the 'wicket', if you think about it, looks a bit like a wicket gate...". The modern game of cricket is governed by various rules and conventions, for instance, that if the ball hits the wicket (broadly speaking) this is not good for the batsman, and the person who has thrown (or 'bowled') the ball has secured an advantage for his or her side. Just as to understand the word is now, for Wittgenstein, in most cases to understand its use, so to make sense of human behaviour is to grasp that it is for

much of the time constituted by ‘rule-governed behaviour’. Thus making sense of it consists of understanding those rules or, to use a term that is perhaps more helpful, those conventions.

This is to say – the third aspect of Wittgenstein’s escape from the capture of science – that this later Wittgenstein has a more generous conception of knowledge than the author of the *Tractatus*. In *On Certainty* (260), he writes “I would like to reserve the expression ‘I know’ for the cases in which it is used in normal linguistic interchange”: that is to say, scientific discourse or ‘interchange’ is no longer to be taken as the model or paradigm. Let me give a vivid and, I think, rather moving example of this from the twenty-first century UK (and if some in this increasingly disunited kingdom would specify that it is an English – rather than Scottish, Welsh or Northern Irish – example then I concede the point to them).

A sportswear retailer called Sports Direct has been the subject of government investigation following complaints that it paid the workers at its warehouse less than the minimum wage; that staff there were penalised for matters such as taking a short break to drink water, and for taking time off work when they were ill. The investigation was conducted by the Select Committee of the UK Government’s relevant department, which is called Business, Innovation and Skills (BIS), following earlier revelations by BBC journalists. The Chair of the Select Committee, Iain Wright MP, appeared on the BBC programme *Inside Out* on 10 October 2016. He spoke about how workers at the warehouse complained that they were ‘treated like cattle’ and talked about the distress their working conditions had forced them to endure. He described them as ‘incredibly brave’ for coming forward to give evidence to the journalists who first uncovered the story. There is a possible question here concerning how much credence should be attached to the stories the workers told. Might they for instance have exaggerated their distress, perhaps in order to win compensation? Mr. Wright said: “When someone’s looking at you in the face, and crying, and saying ‘nobody’s listening to me’ ... we knew from looking in their eyes that they were telling the truth”.

How can we *know* the truth in cases like this? Shouldn’t there be more *scientific* ways of establishing the veracity of the workers’ testimony, such as lie detector tests, footage from CCTV in the warehouse, or at least the cross-examination of witnesses, and corroboration of their accounts by other witnesses? Against such demands for greater certainty – indeed for what we might call hyperbolic certainty – we have Mr. Wright’s calm assurance: “*We knew from looking in their eyes that they were telling the truth*”. In similar vein, Wittgenstein writes that there is such a thing as “imponderable evidence” (*Philosophical Investigations* p. 228): that is, evidence that cannot be precisely calculated, weighed and measured, but which is good evidence nonetheless.

Imponderable evidence includes subtleties of glance, of gesture, of tone ... I may recognize a genuine loving look, distinguish it from a pretended one (and here there can, of course, be a ‘ponderable’ confirmation of my judgment). But I may be quite incapable of describing the difference. (ibid.)

This is no more than what the social science researcher understands perfectly well. She talks with 9 year-olds about their experiences of the culture of assessment

and testing at school. How does she know whether she is hearing the truth, or what they think they are supposed to say? The anthropologist records what the natives say about the traditions of the cock-fight, but what is there to prove that this isn't just the story they always tell visitors (it fits with Europeans' prejudices and makes them happy, and the islanders are kindly people who do not want to disappoint the tourists)? She knows from looking in their eyes, and whilst she may not, on this occasion or that, see enough to form a sensible judgement, if she does not look into their eyes she does not see at all.

## Conclusion

Thus Wittgenstein invites us to follow his journey, to shake off the bewitchment of science and scientific language and to return to searching for the meaning of what we find rather than its cause. Ordinary human understanding, such as the Chair of the Select Committee was satisfied with, will not give us the certainty that science promises, but it is the search for scientific certainty that is causing the problems rather than leading us in the direction of the answer.

Here, in the form of little more than a coda, or perhaps an extended end-note, is something rather odd. Many of the standard textbooks on the philosophy of social science – and here I am referring only to those for which I have great respect and which my undergraduate students find helpful – have little or nothing to say about Wittgenstein. Vernon Pratt's *The Philosophy of the Social Sciences* (1978) mentions Wittgenstein in two endnotes only. One is to the effect that the *Philosophical Investigations* 'may also be read as offering a defence of logical positivism'. The other notes that 'Concepts are given their sense by their role in a way of living, and, since ways of living differ, so do concepts', with the suggestion that a kind of conceptual relativism is thus implied. Martin Hollis's *The Philosophy of Social Science: An Introduction* (1994) tells the reader that the *Philosophical Investigations* "makes fertile use of the notion of a 'game' in discussing human action" (p. 18) and helpfully connects this with the idea of rule-governed activity, which is expanded upon later in the book (pp. 152–7). Brian Fay's *Contemporary Philosophy of Social Science* (1996) has just two references, one explaining that those being interpreted and those interpreting them must both be persons, and citing Wittgenstein's well-known remark that if a lion could talk we would not be able to understand what it said (p. 26). The other employs an analogy from the *Tractatus*: an eye looking out at the world will not see itself (p. 42). Michael Root's *Philosophy of Social Science* (1993) makes no mention of and no reference to Wittgenstein at all. The only introductory textbook on the philosophy of social science I know that draws substantially on the work of Wittgenstein is Roger Trigg's *Understanding Social Science* (1993), but although there are over a dozen references to Wittgenstein they nearly all relate only his discussions of rule-governed activities and forms of life.

If Wittgenstein is deeply helpful to us as social scientists in liberating us from the 'capture' of science, as I have argued in this chapter and for showing us how such

liberation may be effected, it is surprising that this is barely represented in the standard introductions to the philosophy of social science; and perhaps the fact that it is so little represented there goes some way to explain why our liberation from the language and fantasies of science is still far from being complete.

## Introduction

The Slovenian philosopher and psychoanalyst Slavoj Žižek currently captures media attention mainly by his physical presence, a think-fast-talk-fast communication performance and his versatile interpretations of heterogeneous common phenomena. In his references, he mixes theoretical and political considerations with popular culture in a challenging way. In this regard, he is a media phenomenon, not only starring in several documentaries about him,<sup>1</sup> but at the same time speaking at Occupy Wall Street protests and being interviewed for the release of a 1000 pages Hegel interpretation in newspapers or for the relevance of communist ideas nowadays (see Žižek 2012). But since his first widely noticed book *The Sublime Object of Ideology* in 1989, he is probably recognized as both, one of the most provocative and productive political philosophers these days. Therefore, Pfaller states “Nothing is too stupid or too trivial in order to teach him something – [...] nothing is too high or too low in order to be excluded from the scope of his philosophy. This creates an extremely egalitarian atmosphere in Žižek’s approach” (Pfaller 2007: 42.44). Žižek however rarely talks about subjects of educational theory or disciplinary issues. While his thinking is not at all being considered to be genuine ‘philosophy of education’, it still contributes to very relevant aspects of educational theory.

First of all, Žižek’s re-readings – just to mention Hegel’s idealism or Lacan’s psychoanalysis – are capable of bringing new insights into the theoretical framing

of educational processes. His highlighting of a different concept of negativity hints at a re-considering of crucial concepts like subjectivity. The way Žižek uses new interpretations of past voices can be seen as another ‘deconstruction’ method, offering a different option for the way we rely on the ‘historical past’ of educational thinking to analyse our present situation. Secondly, the roots of current discussions about the economization of knowledge, educational systems, lifelong learning, culture etc. (see Simons and Masschelein 2008; Wall and Perrin 2015) can be located in a materialistic tradition of theorizing the changes of (pedagogical) ideas in close relation to changes in the political, social and economic background of society. With a view to this, a Žižekian perspective can bring back a critical macro perspective of a changing order of global capitalism into the analysis of its broad effects on everyday life. Thus, the changing structure of desires and of consumer attitudes are seen as having their impact on the way of satisfying intellectual needs or on the form of political articulations. Thirdly, Žižek’s dedication to popular culture, particularly to the film, has the potential to open the contemporary educational discourses up to a not yet exhaustively debated but seemingly very relevant issue. From his psychoanalytical point of view emerges the idea that this type of media provides access to ideology as the always problematic designations of society and of subjectivity. Therefore, the relevance of Žižek’s work for educational questions and issues has to be read in terms of uncomfortable irritations and interventions with regard to actual ideas of the subject and the subjectivation process in the midst of social contexts. So, he shakes clear-cut pedagogical attributions, especially in terms of autonomy, rationality and emancipation, which neglect the inconsistency and conditionality of every theoretical and practical access.

### **“Do You Lack Something?” – Theoretical Intersections of Mind and Materiality**

Žižek especially combines a Hegelian concept of negativity and a Lacanian approach to the constitution of subjectivity (see Parker 2004: 36ff). Therefore, he is able to re-read and vindicate even the Cartesian Cogito. In the contemporary poststructural influenced philosophical thinking, it seemed to be a foregone conclusion that a new starting point has to be found. Though, Žižek rather works out the unseen and unthought aspects of past voices that come along with a different notion of how we find and attach meaning to the world around us. In the following, we will address three topics to briefly render the key ideas to describe the relationship that we establish with ourselves, with others and with the world: lack and desire (section “**Lack and desire**”), the mirror stage (section “**The mirror stage**”) and cogito and negativity (section “**Cogito and negativity**”). Those key ideas still deal with the connection of mind and materiality, but rather shed a different light on what in Educational Philosophy is called ‘education’ or ‘Bildung’.

## *Lack and Desire*

One of the main aspects in Žižek's use of the category of 'subject' can be illustrated by referring to a children's book, written and illustrated by Shel Silverstein. In *The Missing Piece* Silverstein (1976) tells the adventures of 'It': "a circle with a point for an eye and a triangular gap for a mouth, a subject in search of a missing piece that would fill in the gap" (Žižek 2001: xviii). As 'It' feels incomplete and therefore is not happy, 'It' decides to go rolling, looking for its missing piece. Being forced to roll slowly by its imperfect conditions, 'It' has all the time to meet other life forms (worms, beetles, butterflies), face the different elements (heat, rain, snow, oceans) and hurdles on its way (holes, walls, swamps, mountains). Keeping singing that it is looking for its missing piece, 'It' meanwhile experiences attentiveness, ignorance and rejection. When 'It' finally finds a perfect fitting piece to become a whole circle with, they further on are rolling together much faster than before. So 'It' cannot stop for encounters and is no longer able to sing. After all, 'It' slows down and carefully sets its missing piece free again to roll on alone singing his old song – "Oh I'm lookin' for my missin' piece" (Silverstein 1976).

As Pierlott (2011) in accordance with Žižek (2001) says, Silverstein's story is dealing with the concept of Platonic love that can be found in Plato's dialogue "Symposium" when Aristophanes holds his speech. He tells a myth of the origin of human desire that is explaining why love makes partners feel 'whole'. The image of two lovers being the other half of each other is an allegory for the idea of unity.

Silverstein's story about 'The Missing Piece' points out a different view on the subject here: The subject is constituted by a fundamental lack and therefore is driven by desire, which is always organized in interaction with the Other, as Lacan (1998: 235) phrases it. Yet the ideal of love, happiness and strength could not be achieved by the idea of becoming one perfect circle (as an image for the ideal form). Although 'It' finds just its perfect 'missing piece', 'It' still is experiencing a rupture: the memory of how it was when something had been missing. Consequently, at the origin of the subject there never has been a 'whole' which now is lost and has to be restored – Or more precisely: There is no origin; for it is the irreducible function of the 'missing piece' to make 'It' move. This eventually means that for the desire-driven subject the objects of desire are itself dynamical and contingent. Lacan calls these objects 'object small a' while the symbolic order that is providing orientating patterns for desire is called the 'Big Other' (similar to Hegel's 'objective spirit'). For Žižek, this is the paradox insight into the structure of subjectivity: that the desired object will enable a kind of fulfilment or pleasure *insofar as it keeps open* the experience of a lacuna between desire and its fulfilling (see Heil 2010).

## *The Mirror Stage*

Jacques Lacan (1901–1981) puts the answer to the question how the ‘missing piece’ serves as a stimulating source of subjectivity in his concept of the ‘mirror stage’. This term describes the genesis of subjectivity in an irreducible dependence from the Other. Thus, the subject does not emerge with the fact that it is able to refer to itself as an ‘Ego’. For Lacan ‘everything’ begins with the bodily exposure to a lack: The (6–18 month-old) infant experiences a vexatious incapacity of regulating its physical processes on its own (see Lacan 1973: 63ff.). McMillan (2015: 553) notes: “Consequently, from the very beginning of subjectivation, the demands of the body cannot but be expressed in language, and it is this separation of the body from itself that creates the subject: the subject exists as the effect of our particular failure to re-establish the fantasy of bodily coherence.” So, by visually identifying itself, the infant establishes an imaginary relation to the image reflected. Lacan’s point here is that this consolidation is a crucial effect of imagination: The ‘Ego’ is situated on a fictional line, which cannot be extinguished by the individual (see Lacan 1973: 64). In the mirror, there is not ‘the real me’ but an image looking at me from a point that ‘I’ cannot be at – an “unoccupiable point” (Copjec 2015: 34). So, Žižek (2008b: 116) emphasizes in general: “[T]o achieve self-identity, the subject must identify himself with the imaginary other, he must alienate himself – put his identity outside himself, so to speak, into the image of his double”.

In the progression of this model, the confrontation with symbolic regimes achieves importance. The symbolic regimes refer in a broad sense to social interaction, respectively to discursive orders implying hegemonic cultural norms or common articulations that arrange the controversies about naming ‘myself’ and the ‘world’. In summary, the mirror stage stresses a constitutive – although powerful and fragile – intertwined process: The imaginary identifications of the subject, its meanings and desires, are always situated in social practices or symbolic regimes, in demands and dramaturgies. This is the reason why Žižek (2008a: 245ff.) accentuates that our enunciations are always emerging from the outside, from a constantly controversial ‘point’ that is representing the Other’s desire ‘for us’. Consequently, this means that the subjective point of view never can be clearly identified by ‘positive’ knowledge. It is always structured by signifying processes which cannot close the lacuna of imaginary identifications and the symbolic matrix. To phrase this crucial incompleteness, Žižek uses the concept of the ‘real’. This is a metaphor for a non-identical, failing dynamic that is inherent in every signifier we use to describe our reality. It expresses the experience that there is always something withstanding the full identification – as ‘my knowledge’ or ‘my desire’ as a clear cultural or social identity etc. (see Žižek 1999: 54ff.; 2008c: 127). The ‘real’ is indicating that we do not *have* reality, but *signify* it – in relevance to all three registers: the imaginary, the symbolic and the real – and therefore always miss it. Thus, for Žižek, Psychoanalysis is “never simply about the individuals and their (more or less intimate) problems – these are inscribed, from the very outset, into the socio-symbolic field that Lacan calls the ‘the Other’” (Zupančič 2008: 3).

The crucial point for educational philosophy may be seen here, e.g., in the fact that terms like autonomy, individuality, learning, participation, competencies etc. are not at all immaculate or superior concepts which can easily be implemented in pedagogical settings or research. Similar to what Laclau and Mouffe (1999) indicate, there is no necessary connection between the concept and the signified or what ‘really’ happens. Every identification just fixes the contingency of signifying processes at a particular point: “providing a ‘quilt’ or fixing effect to grasp the reality we are seeking to portray” (Žižek 2008b: 95). As a result, pedagogical reflection in these terms is not about building on concepts to figure out matters and means for a project of a better world. It is rather about critically reflecting the precarious demands and legitimations we are dealing with in our everyday life and in our professional settings. In relation to this context and in the light of Žižek’s ideas, Cooley (2009: 383) for example tries “to rethink how we view, analyse, and confront educational problems” and Taubman (2010: 196) works on “an ethics of teaching”, which deals with the ambiguous experience of quotidian routines – especially in institutional settings like in schools and universities.

### *Cogito and Negativity*

To put it short, Žižek highlights the impossibility of using or producing an evident or definite knowledge base of subjectivity and of the world around us. From this perspective, it should be supposed that he would reject a concept like René Descartes’ (1596–1650) idea of a *res cogitans* that is asking for a foundation of the self. With the upcoming of ‘postmodern’ and ‘poststructural’ theories the Cartesian Cogito was used as a foil for critical demarcations against the illusion of the modern supremacy of the rational self (see McMillan 2015: 549). Žižek, on the contrary, frames this concept for rendering some aspects of the Hegelian negativity. He focuses precisely on the consequences of the sceptical dynamic of the Cartesian subjectivity and “bring[s] to light its forgotten obverse, the excessive, unacknowledged kernel of the cogito, which is far from the pacifying image of the transparent Self” (Žižek 1999: 2). This reading is directly linked to what Georg W. F. Hegel (1770–1831) calls the “night of the world”.<sup>2</sup> The implications of this excessive level accentuate again a disruptive dimension, on which every idea of absolute knowledge is collapsing (see Žižek 2006a: 14, 2008a: 16). This does neither mean that subjectivity is just the effect of a heteronomous subordination to social demands nor does it point to a sovereign self-confident and non-compliant actor. Instead, the concept ‘subject’ strains the always problematic status of making decisions in the light of the impossibility to close the gap between the signifying process and the signified object (see section “A Žižekian guide to ideology”). Due to this

---

<sup>2</sup>“The human being is this night, this empty nothing, that contains everything in its simplicity – an unending wealth of many representations, images, of which none belongs to him – or which are not present”.(Hegel, cit. Žižek 1999: 29).

constitutive moment of emptiness, the cogito fails to finally overcome the ‘night of the world’ in the name of the ‘light of reason’. But this is not a conclusion; it is just the condition of subjectivation: The sceptical Cogito fails fundamentally in separating reason and rationality from phantasmagorical representations and madness – but its reality is to proceed (with) the difference. As Michael Wimmer (2014: 308) remarks, the act of decision is nothing but regulating imaginations and delusions. Consequentially, there cannot be an absolute opposite between ‘Bildung’ – for Hegel: “[t]he life of formative discipline” (Žižek 1999: 106) – and the abyssal moment, here termed madness. In the process of forming subjectivity, in which we are irreducibly engaged and confronted with ‘the Other’, there is no neutral base (like nature, God or our intellect) for a comparison between the ‘truth of reality’ and the volatile and passionate parameters of our perceptions and reflections.

### **“Emancipation or Expertise? Yes, Please!” – Contributions to Pedagogy and Philosophy of Education**

The pedagogical value of Žižek’s approach, as we outlined it, can be seen in reflecting the constitutive function of the “lack within subjectivity” (McMillan 2015: 545). In this regard, the elementary problem is to concentrate on subjectivation meaning the transit from the ‘night of the world’ into our everyday universe of socio-symbolic orders or forces (see Žižek 1999: 35). Žižek argues on the one hand that our thinking, speaking and acting cannot simply be understood as an interaction with others. The way we discipline our desires, acknowledge norms and meanings, attitudes or requirements etc. – on account of that what we are not fully aware of – “is grounded on our accepting and relying on a complex network of rules and other kinds of pre-suppositions” (Žižek 2006b: 9). On the other hand, this is also the threshold for his materialistic diagnosis, that our present universe of reason is elementary embedded in the excessive and antagonistic dynamics of the contemporary capitalist society (see Wall and Perrin 2015: 18). This brings back the question of the relationship between education and madness (section “[Education and madness](#)”) and comes along with the question of ideology (section “[A Žižekian guide to ideology](#)”).

### ***Education and Madness***

Tony Wall and David Perrin (2015) provide the first pedagogical introduction to a variety of Žižek’s theoretical viewpoints in book form.<sup>3</sup> They use his arguments in confronting the critique of hegemonic neo-liberal claims in education inspired by

---

<sup>3</sup>We also want to mention the Anthology “Žižek and Education”, edited by Antonio Garcia, which is already announced as forthcoming in two volumes (see: <https://www.facebook.com/ZizekAndEducation/>; Accessed: 11 Sep 2016).

Marx with a paradox double-bind: ‘we’ as lecturers and scholars agree to the critique on actual tendencies to structure the educational sector like business companies, and we deprecate a look at pedagogical issues (e.g. learning, autonomy, courses) primarily under aspects like efficiency, investment and profit. We are complaining about considering pupils, students or even researchers as customers, stakeholders and so forth. But we also accept the criticized implemented educational policies (like the modular design of knowledge or its representation in credit points) – and act like this stated socio-symbolic matrix is self-evident. We doubt that ‘Bildung’ can be unitized in educational systems which are reproducing inequality on the one hand, but on the other hand we still have to deal with complaints from different actors if the failing of students indicates that we did not deliver the promised learning competencies. To this ambiguous situation “Žižek exclaims ‘we do know what we do, but still do it!’” (Wall and Perrin 2015: 2). This statement aims at the concept of subjectivation: There is no ‘pure’ educational domain being unambiguous and rational, and so our decisions are performing the difference between reason and ‘madness’ (as a philosophical notion). Consequently, our articulations and aspirations are at the outset entangled in the socio-symbolic order: that what we want to overcome also organizes our desire.

In here we find the reason why this theoretical frame does not pose a sovereign or a resigned position: it is because the socio-symbolic order itself is not an ‘absolute’ realm. It works through the processing of its incompleteness and contradictions; it prevails through our speaking and acting while we *claim* it to be effective, disciplined, individual, critical, subversive etc. Žižek urges us here to realize that our stances and interventions are still an imaginary identification entangled in the socio-symbolic order. But as the identification of ourselves and the world is marked by a disruptive gap, this indicates even to radicalize our analytical perspectives in reference to the variety of antagonisms in different social spheres. Therefore, we will point out a few exemplary analytical references in the following, before we draw attention to Žižek’s concept of ideology with regard to the way he discusses movies (see section “A Žižekian guide to ideology”).

To particularly exemplify our previous statements about the link between education and madness we will shortly refer to Aaron Cooley’s examination of Žižek’s ‘In Defense of Lost Causes’ (2008c). To relate this work to educational issues, Cooley mentions three examples that all seem to describe a ‘mad’ situation. His first example is quite in accordance with McMillans intro (see McMillan 2015: 545). Both evoke the picture of educational situations as a ‘struggle’ for an educational relationship between teachers and learners, as Cooley puts it. In taking over Žižek’s concept of the ‘desire’, he locates the struggle where teachers attempt to regulate the desires of their students and students resist to this by “slipshod writing” (Cooley 2009: 385) – and reformulates this as a matter of “civility in the classroom” (ibid.: 386). In his second example, where Cooley takes Žižek’s suggestions to the realm of education, he examines the “educational connection” (ibid.: 386) between the US government’s whitewash of torture and its impact on the development of the moral and political identities of young people. Finally, Cooley brings up the consequences of the specific knowledge economy that political common sense has led to in the

past decades by sparing out the worldwide growing inequalities because they would not affect 'us'. In seizing a contemporary educational debate here, Cooley resumes: "The predictable strategies of resistance from the educational left that are offered to defend against the commercialization of schools, the ills of teaching to the test, and the abominable lack of public investment in education, all fall short" (Cooley 2009: 391). He suggests that it might just be the flipping inverting Žižekian view that could be sensitive enough for analysing the complex fragments and contradictions in those geopolitical events and drifts. It could make us change our focus to the predicaments that underlay those that may look like the obvious ones on first sight. In order to work towards a transformation, he therefore proposes the educational philosophers to take over Žižek's method, to change the choreography of political urges and to "enter the policymaking arena as if it were a mixed martial arts cage with the method of combat open and the outcome unknown" (ibid.).

The contemporary predicament of the educational economy of knowledge and its political impact, Cooley draws on, is expanded by Christiane Thompson (not in reference to Žižek), by taking a closer look at the American 'What Works Clearing-House' (WWC) within the American Department of Education. The WWC "is responsible for producing reviews concerning scientific studies" (Thompson 2015: 658) and therefore rates the quality of those reviews especially as a service for the practical or applied fields of education. Thompson, among other things, shows the functioning of this program of efficiency that we would take for Žižek's description of the functioning of ideology: "The neutrality feigned by that kind of scientific objectivism is fueled by the promise of efficiency, which has given the WWC its name" (ibid.: 659). The seemingly obvious evidence of that 'what works' does not prove the idea is right or true. It just proves that the political frame is determining what 'a good idea' to solve problems is and thus legitimises to go on the same way.

In an interview with Paul Holdengräber 2014 in Denmark,<sup>4</sup> Žižek links this critique to Kant's idea of the 'public use of reason'. He poses that the basic idea of Bologna reform of schools and universities would be to get rid of this public use of reason. Instead of a free debate we have a certain frame determined in advance and let experts decide. Maybe, it is this diagnosis that also led Cooley to contend that "the drift and pull towards a policy of de-politicization in education is the worst of common sense in action" (Cooley 2009: 385). Žižek's objection is that intellectuals would not in this sense be experts and provide answers to questions formulated by others but on the contrary question the very way a problem is described. In this sense also, Thompson outlines the '*ecology* of pedagogical knowledge' in opposition to the '*economy* of pedagogical knowledge': "An ecology of pedagogical knowledge expands upon the analysis performed under the focus of economy and models or condenses them to problems, and in doing so it opens them up to shared reflection and deliberation." (Thompson 2015: 661).

## *A Žižekian Guide to Ideology*

In the documentary ‘The Pervert’s Guide to Ideology’ (2011), Žižek leads us through several movies and shows the crucial moments that condense their stories. His interpretations do not explain the narrative lines of the film but demonstrate the implicit knowledge working in our perception and portraying ourselves, others and social conditions. While the means of analysis may be taken from Lacan, the method Žižek practises here reminds of the Hegelian Dialectics as he sees it. This shall be illustrated by an incident taken from the mentioned documentary.

In the starting scene from the movie *They Live* by John Carpenter (1988), John Nada, a homeless worker in Los Angeles, finds sunglasses that make him see ‘the real messages’ behind the advertisements, that basically are orders to perceive oneself as a consumer, as a subject of pleasures. Žižek now does not follow the classic tradition of critique of ideology that assumes cleared up minds would result in a change of behaviour. According to him, it is important to see that ideology is not a false representation of reality but in a way is determining the structure of material and social processes as it is itself determined by the structure of the desire (see Heil 2010: 108). Ideology is not imposed on us but is ‘our spontaneous relationship to our social world’. It is our way to perceive meaning – and enjoy our illusions. Ideology thus is not what is thought to confuse the otherwise straight view on the world but is precisely the idea that we could step out of ideology and then see how things really are: This idea is itself ideological – and would be ‘the ultimate illusion’, as Žižek asserts. His comment, that ideology is functioning just where it is supposed to be overcome, is an inversion. Taken from the Hegelian dialectic thinking, the claimed fact is united with its opposite (see Gamm 1997).

To put it in a nutshell, there is no position outside the symbolic order. Therefore, there is no outside of the ideology as well. The subject is constituted by organising his or her desire midst of ideological invocations – as McMillan puts it: by “anxiety that drives identifications and thus acts as the catalyst of belief and behaviour” (McMillan 2015:546). The claim for a pedagogical or political concept of emancipation therefore is ambivalent because the idea of a liberation potential has to be mobilized always from within ideological positions. In contrast to the popular reception of Foucault’s concept of ‘De-Subjectivation’ within educational philosophy, which intends an experimental attitude and “the art of not being governed like that and at that cost” (Foucault 2007: 45), Žižek points out the ineluctably controversial behaviour when one is relating to ones own self and to the world in always ideologically shaped representations, contexts and situations. So for him, a subversive moment can also reside in an ‘over-identification’ with the ruling ideology, where ideology can collapse with different results. Žižek explains with reference to Stanley Kubrick’s movie *Full Metal Jacket* (1987), that taking an order word by word – like the ‘good Soldier Švejk’ – leads to chaos rather than accomplishment (see Heil 2010: 77f; see also Žižek 1997). Another example from this movie shows how the ‘overconformist’ Private Leonard Lawrence (called ‘Paula’) ends up in

self-destruction. The decisive point for Žižek is that within every kind of *affirmation* of the desired ideological objects, there is at the same time a *distance* to the ideological appeal. This distance or lack neither promotes emancipatory aspects in a literal sense nor does it mean that our affective attachment to the world could be fully rationalised (see Butler 2007: 4f.; Vogt 2008: 154). We may know about the harmful consequences of smoking – and still we like it. So what Žižek’s concept of ideology ultimately puts at stake here is the limitations of the prevailing paradigms that go along with the contemporary economy of knowledge in education.

## “Less Than Nothing” – The Contribution of a Žižekian Perspective

McMillan condenses the specific Žižekian contribution to educational issues, “that any critical pedagogical practice that seeks to evoke radical transformation should not merely engage with the discursive frameworks through which the learner interprets the world, but should facilitate exploration of both the affective dimensions of these narratives and the potentially ‘traumatic’ elements that threaten to disrupt them” (McMillan 2015: 547). This point aims at the persistence and power of the complex socio-symbolic networks within our stubbornness, which causes massive problems if we have to change the fixing points that sustain our (private or professional) habits, thoughts and desires. But if we take it serious, this subjectivation implies an irreducible process of alienation. Then, every perspective on radical transformation cannot be expressed just as an act of enlightenment that comes along with emancipatory learning opportunities as a pedagogical strategy. We are faced with an antagonistic situation: Subjectivity is from the very outset a conflictual process of formation – and therefore an elementary socio-symbolic transformation, because there is no somehow formed substance at the beginning of the process or at the end. Simultaneously, the essence of global capitalism, which is deeply inscribed in our everyday lives, claims multiple transformations of identifications and subject positions (see Žižek 1999: 127ff.). So it seems that contemporary capitalism always is able to incorporate new dynamics, even critical or revolutionary attitudes, in its logics of competition, consumption and commodities (see Wall and Perrin 2015: 26).<sup>5</sup>

What can make a difference? – The answer, according to Žižek, can only be paradoxical: The stubbornness of antagonism itself. In the process of relating oneself to the world, there will be a persisting mismatch between desire and its ‘object small a’ that keeps the antagonistic process going (see section “[Lack and desire](#)”). The structuring idea of an inconsistency that concerns us and ‘makes us move’ – with

---

<sup>5</sup> Boltanski and Chiapello (2007), for example, are explaining how ideas like autonomy and creativity have switched their meaning in the twentieth century: from the articulation of subversive interventions against the process of alienation in contemporary fordism to the point of promotion of the postfordist conditions of production.

reference to the subject, but also to society<sup>6</sup> – acquires a powerful configuration in the current economic and political conditions. Consequently, Žižek claims that a transforming and therefore always political act is just situated as a moment in the midst of reason and madness (see sections “[Cogito and negativity](#)” and “[Education and madness](#)”). As a gesture of interruption it cannot be derived from the existing socio-symbolic orders. The act is “always an interregnum of virtuality and possibility” (Finkelde 2009: 179; Vogt 2008: 160f.). Here is also the point for critical remarks, as Heil (2010: 143) stresses it: The entanglements and fuzziness of Žižek’s concepts itself complicates not only the reception of his works<sup>7</sup> but also their – theoretical *and* practical – application. It is often not quite clear on which level we can adjust our analysis when we talk about ideology, transformation, subjectivation etc. as distinct matters. But it is precisely the obstinate refusal to the idea of unambiguous references that indicates Žižek’s productive systematic theoretical interventions.

## Conclusion

The resistance of Žižek’s theoretical contributions to clearly defined conjunctions with contemporary pedagogical programs is indicated also in his works in other (disciplinary) fields. The (individual, social, political) effects of lack and desire, of a generating absence, seem to be part of his own writings, too. Apparent insensitivity or even discrepancies in his talks and writings resist any affirmative attempt to easily collect his ideas. Notwithstanding made and meant for ‘practical reasons’, his philosophy still eludes pragmatic approaches: He does not deliver conclusions, that easily can be inserted in actual topics of philosophy and practice of education. Žižek’s provocative writings are “rather a series of theoretical interventions which shed mutual light on each other, not in terms of the *progression* of an argument, but in terms of what we could call the *reiteration* of the latter in different discursive contexts” (Laclau 1989: xii).

In his unusual re-reading of past voices, he also brings disavowed authors back into a serious theoretical reflection (e.g. Lenin: see Budgen et al. 2007). This is thwarting the recourse of “set or prescribed answers” (Wall and Perrin 2015: 5), precisely to open up the contingent symbolic areas of our analytical and daily struggles. By this, Žižek deconstructs the hegemonic theoretical and political strategies to bring to light what stays unsaid, unheard or outrageous with reference to past and present voices and issues. With this approach he tries to free their possible but unrealized options from readings that themselves have become ideological mainstream. This uncomfortable challenge of common perspectives, the inability or reluctance

---

<sup>6</sup>Žižek (2008c) never gets tired of emphasising the permanence of ongoing social divisions and contradictions as society in principle.

<sup>7</sup>Another issue is Žižek’s struggle to cultivate anti-capitalist positions, which brings him into quarrels with Laclau and many other thinkers (see Heil 2010: 139ff.).

to identify completely with a specific theoretical or social position, does not only point at the very inception of philosophical thinking in the interstices of socio-symbolic orders (see Žižek 2006a: 7f.). It is the crucial and opening political feature that offers a critical perspective within and on educational philosophy. Nonetheless, a broad international reception is still to come.

**Section II**  
**Schools of Thought**  
Contributing Editors:  
Christiane Thompson and Joris Vlieghe

# Introduction: Section 2 – Philosophy of Education: Schools of Thought

Christiane Thompson and Joris Vlieghe

It has been argued that we live in a post-theoretical and post-paradigmatic era (Reichenbach 2014). The argument says that theories and paradigms no longer structure the current academic discourse. The central debates between major schools of thought that once steered the discussion, such as the encounter between Gadamer and Derrida in 1981 (Michelfelder and Palmer 1989), are not as prominent as before. Rather, one might feel exhausted with the ever-repeating critical charges that are brought forth against certain schools of thought, e.g., the charge of idealism against phenomenology or of relativism against postmodernism. Another observation is that the differentiation within thought traditions makes it difficult to view these schools in terms of a programmatic identity. Moreover, it seems that the significance of philosophical reflection has diminished given the prominent role of empirical research methods that dominate the educational studies. Eventually, in times where modern democracy is challenged by political and economical crises, it might feel pointless to center one's knowledge interest around different philosophical approaches and trends.

Nevertheless, there are still good reasons to include a section on traditions and schools of thought in this handbook. One reason is to present the current state of the educational-philosophical discourse in such a way that new developments and challenges become observable and debatable in the first place. The aim is not to reignite wars of attrition that have haunted the landscape of educational-philosophical studies but to map this highly diversified field. This requires moving beyond quasi-paradigmatic labelings, such as the “continental” versus the “analytic” tradition (cf. Standish 2007).

Even though it is impossible to fully recover the current state of the art – and every selection of schools and traditions remains disputable – the editors of this handbook have decided to include chapters that go beyond the occidental tradition of the philosophy of education. The aim is to widen the scope of systematic thought on education – toward traditions that have developed in particular religious, cultural, and regional contexts. This section comprises chapters on Jewish and Islamic philosophies of education, on Eastern and African educational-philosophical perspectives, as well as on indigenous philosophy of education. These chapters call for the continued and extended reflection of central educational-philosophical issues, such as the mind-body relationship, the relationship of human beings to nature, as well as the relationship between philosophy and religion.

The demand to abandon Western-Centrism is important to an academic field that has undergone a considerable global expansion. In the current discourse of the philosophy of education, there is a growing consciousness for the fact that ‘international’ cannot just mean ‘English speaking’. What is required, instead, is to bring together and to translate the respective language traditions. In this regard, the reference to schools of thought and traditions serves a very important function in the discourse: it is hoped to engender dialogue.

Dialogue is a communicative exchange on a shared concern – even if this concern is interpreted in very different ways and leads to controversy and fierce debate. In our view, dialogue depends on ‘reference points’ that clarify where the dialogue partners stand. This section provides these reference points from different schools of thought. Furthermore, it presents the pluralization and differentiation that have occurred within the respective paradigms. Take, for example, the concept of ‘reification’ that has undergone changes from the first to the second and third generation of critical theory. As of consequence, the chapters of this section move beyond the idea of ‘representative master thinkers’ within different paradigms (for this we refer to the first section of the handbook). Rather, schools of thought are considered as loosely coupled contexts of dialogue and debate. As such, the chapters on phenomenology, critical theory, Marxism, and pragmatism commit themselves to the plurality of developments within these traditions.

When working on this section, it became obvious how dependent the educational-philosophical exchange is on *the reading and interpreting of texts*. In other words, schools of thought are constituted by a group of readers. This emphasizes the importance of ongoing translations (see, e.g., Standish and Saito 2017) – between languages as well as between different approaches and perspectives (Thompson 2016). Translation, then, is an important topic in order to secure the ground of dialogue and exchange. The chapter on ‘Modernity and Education’, for example, provides access to the German tradition of *Bildung* by focusing on three figures (Humboldt, Schiller, and Hegel) that deserve more attention in the international educational-philosophical forum. The chapter on ‘Feminism’, in turn, provides a comprehensive overview of the different developments and issues with an extensive and nearly exhaustive survey of the literature from different national discourses.

Yet, some chapters of this section are not limited to recapitulating the *traditions* of educational-philosophical thought. Rather, they demonstrate how schools of thought have developed as a *critical confrontation with and turn against* present societal and cultural conditions, and more exactly the inequalities that come with modern societies: The phallogentrism and the logocentrism of Western philosophy have subduced in unjust social and political structures, such as in different pay scales for men and women or the limited access to education for particular groups. Hence, the chapters on postmodernism/poststructuralism, feminism, and posthumanism problematize the oppositions we have held dear for a very long time, for example, humanity versus animality, the properly humane as opposed to technological supports, as well as sex and gender differences. The chapters on Marxism and critical theory present the processes of reification within modern capitalist societies and the shortcomings of philosophical idealism for addressing contemporary educational issues.

One of the challenges of this section has been to adequately reflect the relationship of philosophy and education. To be sure, educational-philosophical traditions are bound to philosophical paradigms – from a conceptual but also a historical point of view. However, as the chapter on ‘Analytic Philosophy’ demonstrates in a very clear and vibrant way, philosophy – with its task of self-enlightenment – is essentially an educational matter. All of the central philosophical issues – epistemological, ethical, anthropological, etc. – are directly connected to educational questions: questions on the forms and ways of knowing, questions about how to lead one’s life, questions regarding what it means to be human and to live together with non-human animals and things, etc. However, it is also important to bring into view the differences between philosophy and education: regarding the treatment of concepts or the relation to educational practice. Recently there has been a discussion concerning the importance to form a stronger disciplinary core surrounding education and pedagogy (Hodgson et al. 2017).

In this context, it is important to note the different policy and practice backgrounds of the schools and traditions presented in this section of the handbook. Take, for example, the tradition of pragmatism and its strong intertwinement with policy and practice in the United States in contrast to the analytic tradition in the UK that unfolded in the context of a professional reform and academization of teacher training. Or consider the relationship to traditions of self-mastery that are typical for Eastern cultures of education. For that matter, see also the disciplinary development of the Germanophone ‘Pädagogik’ and ‘Geisteswissenschaft’ (see, e.g., Biesta 2015). From here, we come to see very diverse or even opposing constellations of philosophy *and* education.

For Marxist and critical approaches, for instance, the *connection between philosophy and education or educational practice* is a very tight one, as the task of emancipation, which is key to both schools, is profoundly educational: structural oppression can only be overcome and real autonomy and justice realized, if people somehow become conscious of what it is that holds them back from claiming and

achieving a better life both for themselves and others. Even if such ideas are criticized, for instance, by poststructuralist approaches, autonomy and justice remain important: not as idea(l)s beyond discussion, but rather in terms of contingent discursive constructs, which themselves become an educational issue. In other words, educational practices become a site where these terms can be renegotiated and reshaped.

Other chapters have sought to look for a unifying strategy in order to draw a comprehensive picture concerning the relation of philosophy and education. For example, ‘ubuntu’ has been put forward as a key concept to understand African philosophies of education. In the chapter on Jewish philosophy of education, the concept of ‘modernity’ serves as an analytic tool to describe a contested field of knowledge claims. The chapter on Islamic philosophies of education crystallizes around the legitimacy of different sources of knowledge. Alternatively, a trope borrowed from a well-known tradition is used to give a synthetic account of another ‘school’: Plato’s image of the philosopher as being freed from the cave is used to provide an outlook of the complex manifold called Eastern philosophies of education.

From another angle, the chapters on indigenous and non-Western philosophies of education problematize the idea that there is an ‘obvious’ link between philosophy *and* education – or at least not in the terms as we are accustomed to from a modern Western perspective. These chapters call for a reevaluation of preferences deeply embedded in the educational discourse, such as the dominance of reflection and theory. To be sure, a further task of the philosophy of education will be to critically reflect and re-constitute itself in the light of this criticism: What are the appropriate instruments and forms of educational theory and practice? The chapters of this section touch upon this question when presenting further possible developments of the respective schools of thought.

Altogether, the section on schools and traditions is not oriented toward unity and identity. Instead of presenting a well-ordered field of generally recognized scholarship, it attempts to provide an insight into a contested terrain that questions unequivocal classifications. The section is indebted to what has been described as an antifoundationalist perspective (Heyting 2001). In the end, this ‘messiness’ of incompatible and shifting positions – of different traditions but also within them – is related to the inherent openness of philosophy and of education, and it testifies to the impossibility of having a final say about the field that they constitute.

In this context, the editors of the handbook are very much aware of the limitations of this project. The section on schools of thought is structured in exchange with the other sections, especially with the part on ‘voices of the past and the present’. The aim was to cover as many fields and debates as possible, but also to limit repetitions.

We thank the authors of this section for having taken up this challenging task. As described above, the contributions form a multifarious landscape of perspectives and schools that (re-)shape the educational-philosophical field.

# Eastern Philosophies of Education: Buddhist, Hindu, Daoist, and Confucian Readings of Plato's Cave

David Lewin and Oren Ergas

It is not possible to provide a comprehensive account of the educational philosophies and theories that fall within the wide-ranging rubric of 'Eastern philosophy of education'. This disclaimer acknowledges the need to be selective, and so in what follows we have chosen to focus on certain Eastern traditions that have seemed to provide the most enduring and substantive contributions to educational thinking. This inclusionary/exclusionary task should not be understood as disavowing other potentially important contributions and traditions (e.g., Shintoism, Sikhism, Jainism, Baha'i) nor that the categories 'Eastern' and 'tradition' can be offered without significant reservation.

Furthermore, the reader would be faced with a bewildering array of ideas without a conceptual frame with which to interpret less familiar contexts. We employ Plato's allegory of the cave as the methodological and pedagogical vehicle to frame and to drive the discussion that follows because it allows us to explore certain key ontological, epistemological, and ethical features within our selected Eastern pedagogies, providing the balance between meaningful encounter and coherent interpretation. If philosophy is concerned with what it means to be human, then philosophers of education are sometimes said to take up the question of what it means to *become* human: humanization. Our traditions define humanization through a set of practices and/or understandings. Thus, we will focus our attention both on the goal and the practices and processes by which the goal might be achieved. Our chapter includes three parts: the first part will briefly introduce key elements of Plato's allegory of the cave. Part two will include four sections that examine Buddhism, Hinduism, Daoism, and Confucianism in turn. It is important to note,

however, that each of these traditions is more of a tree with several branches, reflecting diverse schools of thought. This general difficulty becomes severe when discussing Buddhism and Hinduism (the former more appropriately conceived as *Buddhisms* and the latter a broad term that includes several belief systems), requiring us to select specific teachings/aspects within each tradition. Part three will offer some brief statements that may be surmised from our analysis, pointing to shared features of an ‘Eastern philosophy of education’.

## Part 1

### *Plato’s Cave Allegory*

The allegory of the cave appears at the beginning of the seventh book of Plato’s *Republic* (Plato 2012, 514a–520a).<sup>1</sup> The allegory presents a dualism between ignorance and knowledge, and an ascent of the mind that has ontological, epistemological, and ethical significance. The process of escape and return to the cave makes the allegory richly symbolic for educationalists.

Socrates likens the human condition, “in respect of education and its lack” (514a), to that of prisoners captive in a cave. The cave represents the sensual, tangible world. It is the only world that these prisoners know since they are shackled in such a way that their heads face the cave wall onto which shadows are projected. Behind the prisoners is a fire, and between the fire and the prisoners is a walkway with a low wall, behind which people walk carrying objects or puppets “of men and other living things” (514b). Having no idea of what is going on behind them, the prisoners know only what they see, which they take to be reality. However, their blindness is twofold. Not only are they unaware of the false nature of the shadows, they have no idea that there is a real world that exists outside the cave. The allegory goes on to elaborate how one of the prisoners is forced to turn his eyes toward the fire that is casting the shadows. He is then pulled further toward the cave entrance, and taken outside of the cave, leading to the dual realization of Truth that is at one and the same time the falsity of the cave-world. The freed prisoner is Plato’s ideal ‘educated person’ – the philosopher that has escaped the world of temporary, constantly changing appearances and has realized the world of ideal forms that are eternal, absolute, and unchanging Truths. The freed prisoner then returns to try, unsuccessfully, to educate his former inmates of the poverty of their condition.

The most common reading of the allegory is dualist in which the sensual world is one of ignorance, and the world outside the cave illuminated by the light of the

---

<sup>1</sup> Since the cave allegory follows Plato’s discussion of the metaphor of the sun (507b–509c) and the divided line (509d–511e), it seems plausible that the metaphor of the sun sets out our ontological condition, the divided line a methodological interpretation of stages of knowledge, and that the concern of the cave is primarily epistemological of the process of moving from ignorance to knowledge.

sun is of reason and true knowledge. Metaphors of the ascent of the mind from ignorance to knowledge are a common trope within the Western tradition, found, for example, in Moses' ascent and encounter with Yahweh on Mount Sinai in Exodus, as well as the Neoplatonic influence on Western mystical theology in figures such as Augustine, Bonaventure, and others (Turner 1995). Such metaphors of ascent from shadows to light seem to affirm a dualism between body and mind, where the world of ideas and reason endures, while the body and the sensual realm in general is destined to pass away. The idea that true being exists in a timeless transcendent realm can be detected in most forms of religious and philosophical expression. Since Nietzsche, Western philosophers have been increasingly suspicious of the identity between being and the timeless, though Eastern traditions, as we shall see, also have varied and complex relations to the dualism behind the ascent from body to mind (or, relatedly, from matter to spirit). In general terms, Buddhism and Hinduism lend themselves more directly to images of ascent from the mutable to the immutable yet in ways that challenge the substantiality of the dualism of the cave allegory. Consequently, the allegory of the cave will be used in different ways, sometimes as illustrative, and other times as a contrast against which Eastern ideas can be explored. The main questions we will attempt to address in this reading 'with and against' the cave allegory will be: What are the problems of the human condition such that require education (in the cave allegory's terms, what does each tradition present as the state of being a prisoner? What characterizes our cave-world)? What kind of practices (educative path/curriculum) are offered to ameliorate this problem and what are their aims (corresponding with, what parallels the philosophers' way out of the cave, the nature of the world outside the cave, and the philosophers' ethical choice to return to the cave and free the prisoners)?

Interpretations of the ethical themes found within the cave allegory are varied and complex. On the face of it, the good life seems to entail an escape from the cave such that the form of the good, symbolized by the sun, is apprehended directly. It should be remembered that, in Plato's allegory, the philosopher who is freed returns to the cave in order to free the others who remain trapped. This final aspect of the story speaks of an important ethical call, but also of an educational task. Having offered a brief characterization of Plato's allegory, we now move to examine our four Eastern traditions in order to see the ways in which they relate to the story.

## Part 2

### *Buddhism: The Cave as a Creation of the Mind*

The interest in Eastern philosophies of education in the passing decades is becoming more noticeable (Eppert and Wang 2008; Ergas and Todd 2016) yet within these traditions it is Buddhism that seems to be drawing the most attention (Hattam 2004; Hyland 2014; Todd 2015). The reasons for this specific interest are diverse and cannot be elaborated here. However, we will mention two important aspects that help

locate what we intend to offer here: (a) Buddhism is essentially an educative tradition (Thurman 2006). Its foundational teachings, such as the Four Noble Truths, are structured and organized in a way that makes it, at least theoretically, applicable to a direct discussion of ontological, epistemological, existential, and ethical questions that lie at the heart of education. (b) The dramatic rise in the contemporary research of mindfulness practice and its growing applications in schools invite both the examination of the roots of the practice within Buddhism, and a philosophical perspective on the ways in which such *meditative* practice and its contemporary interpretations are shaping educational theory and practice (O'Donnell 2015).

## Background

Buddhism begins with Siddhattha Gotama (not yet the Buddha) who lived between 563 to 483 BCE. The Buddha was raised as a prince, yet at the age of 29 he set out to live as an ascetic, renouncing his luxurious life and leaving his wife and child. This was the consequence of a series of life-changing encounters, sending him away in search of an answer to 'why we suffer?'. For 6 years, the Buddha roamed India with groups of ascetics, practicing various kinds of meditations, and yogic practices, fasting to near death, yet to no avail. Disappointed yet determined, he left his group and sat to meditate vowing to continue the practice until he found the answer he sought. Throughout the night he meditated until he became the 'Buddha' – the awakened one. What did he awaken from? What did the Buddha find that night and what does it have to do with education and philosophy of education? What parallels do we find between the Buddha, Socrates, and the cave allegory?

It is important to begin by saying that the Buddha did not initiate *Buddhism*. After his enlightenment, he spent the rest of his life teaching, yet Buddhism took its more organized form only in the centuries that followed as the Buddha's teachings were written. This led to the development of different schools of thought to the point at which there is no one Buddhism but rather many different and diverse Buddhisms (Gethin 1998; Williams 1989). A common division includes early Buddhism and Mahayana Buddhism (from which Vajrayana as well as Zen Buddhism emerged). In our analysis, we will focus on fundamental teachings that are usually accepted by all Buddhist schools of thought.

## The Human Condition

The foundational teaching of Buddhism to which all its diverse schools of thought subscribe is known as the Four Noble Truths that is repeated a number of times throughout the Buddhist Pali canon.<sup>2</sup> The Buddhist tradition at times compares the

---

<sup>2</sup>See Dhammacakkappavattana Sutta (The Discourse That Sets Turning the Wheel of Truth, Samyutta Nikaya 56.11), Maha-parinibbana Sutta (Last Days of the Buddha, Digha Nikaya 16), Mahasaccaka Sutta (The Greater Discourse to Saccaka, Majjhima Nikaya 36).

Buddha to a physician in the way he articulated The Four Noble Truths revealing a structure of a medical diagnosis (Gethin 1998, p. 63) that we apply here to an educational path:

1. The First Noble Truth – *dukkha* is often translated as ‘suffering’ or perhaps more appropriately – *dis-ease*. This dis-ease may be the equivalent of the prisoners’ condition in Plato’s cave proposing the need for education. This epistemological condition of ignorance symbolized by the cave is, however, *created* by our own minds through *uneducated* perception (Gethin 1998, p. 70). Human dis-ease manifests in our being possessed by a constant dissatisfaction. We are beset by a restlessness of either wanting things that we do not have (e.g., money, house, spouse, tenure) or wishing to disown things that we do (e.g., sickness, job interview, problematic relationship). Even when seemingly satisfied, undergirding satisfaction is the wish to prolong satisfaction; hence, ‘satisfaction’ itself holds the seed of dissatisfaction.
2. The Second truth – *samudaya* (origin/cause) – locates the source of the human problem within the uneducated human mind that suffers from ignorance (*avijja*).<sup>3</sup> The ‘educational’ responsibility then focuses on liberating the mind from an epistemological error (Olendzki 2011). Our minds witness the world of appearances (just as the prisoners in the cave), yet with every appearance the mind superimposes its cravings/aversions over perception. As Gethin writes, “craving goes hand in hand with a fundamental ignorance and misapprehension of the nature of the world” (1998, p. 73). Very much like the cave allegory, we confuse appearances with ‘things as such’. Acting upon such false perception, our morality becomes ignorance-laden. Two interesting aspects of *avijja* help further elaborate the second truth as well as point to parallels and distinctions between Plato and the Buddha:
  - (a) The understanding of *Ignorance*. The etymology of the term *a-vijja* reveals a parallel between Plato and the Buddha that runs as a thread through Buddhism, Yoga, and Daoism. *Vijja* connotes with knowledge but *a-vijja* is not lack of knowledge but rather its negation. We are thus not speaking of ignorance as a lacking of knowledge but rather as holding views that are the opposite of *right* knowledge. This aligns clearly with Socrates’s preference of unknowing (*aporia*) over the holding of wrong views. The ideal of knowing in both cases then is the liberation from viewing appearances (*doxa*) as if they are real.
  - (b) Dualism vs. non-dualism. The difference between Plato and the Buddha lies in the relationship between the ‘two worlds’. Whereas in Plato’s allegory there is an emphasis on the ‘world of appearances’ *against* a ‘world of forms’ the flavor one gets within Buddhism, especially in its later Mahayana interpretations, is one that stresses the codependence of the knower and the

---

<sup>3</sup>The cause of *dukkha* is associated with ignorance (*avijja*) or with craving (*tanha*). Both are possible entry points within the twelfthfold cycle of dependent origination (Loy 1988). Here we leaned toward the former given the clearer linkage to the cave allegory.

known (a theme that will be stressed in the section discussing Yoga). In a number of interpretations, these ‘two worlds’ coexist (Loy 1988). They are seen as two as long as the *uneducated* mind engages with them (Olendzki 2011, p. 68). Hence the problem we have is that our uneducated mind engages with the appearances and *creates* the cave. Liberation from ‘the cave’ is the liberation from the ignorance of our own mind. It is thus far less clear here whether objects have an ontological status without a mind that perceives them.

3. The third Noble Truth – *nibbana* – is a term that connotes diverse meanings including Truth, cessation of *dukkha*, ‘extinguishing of desires’, and others (Rahula 1959). When the ‘fire’ of our cravings is extinguished, or perhaps seen as an impersonal constant flux that ceases to be that which guides our actions, the cave will cease to exist with it. Perhaps the most important thing to understand here is that the meaning of a realization of the nature of appearances as insubstantial is automatically a realization of the nature of the insubstantiality of the seer of appearances. The ‘self’ that confuses appearances with things as such confuses itself as a ‘thing as such’. Enlightenment may thus be seen as the realization of the insubstantiality of knower and known, thus contrasting Plato’s dualism with a non-dual epistemology.

*Nibbana* constitutes the ideal of ‘the educated person’ that is reflected in a mind that has recovered from the human *dis-ease* of ignorance. This would be the equivalent of the philosopher’s escaping the cave and knowing the ‘good’. This points to a clear affinity between the Buddha and Plato that both viewed knowledge and virtue as unified. However, we believe that the Buddha would be more explicit in viewing knowledge as the means and virtue as its educational aim, given his anti-intellectualism manifested in a resistance to engage in metaphysical-philosophical discourse when it was not clearly linked to the liberation from suffering (see Gombrich 2009).

4. The Fourth Noble truth – *magga* (path) – may be likened to the Buddha’s curriculum. This curriculum is the eightfold path that culminates in the unification of wisdom and compassion. It is also known as the ‘middle path’ for it stems from the Buddha’s own experience from which he concluded that liberation will be achieved neither by extreme austerity nor by indulgence in sense pleasures (Rahula 1959, p. 45). Importantly, the emphasis on the human condition as dependent on how we perceive (from the mind *in here*), far more than on that which is perceived (*out there*), proposes a substantial shift in our perspective about education. Education becomes primarily an individual’s commitment to the purification of his or her own mind. The metaphorical journey out of the cave is understood as a path of the purification of the mind and its recovery from an epistemological error.

When the mind is transformed so that it awakens from the spell of *avijja* we are said to embody: Right understanding, Right thought, Right speech, Right action, Right livelihood, Right effort, Right mindfulness, and Right concentration. This

eightfold path is conventionally grouped into ethics (*sila*), mental discipline (*samadhi*), and wisdom (*panna*). In Buddhist terms, Plato's 'good' (the sun) is expressed in the unification of wisdom (*panna*) and compassion (*karuna*) that can be seen both as expressions of the purification of the mind, and as the pedagogical means for realizing this aim. Wisdom and compassion that must reciprocally balance each other (Rahula 1959, p. 46) are expressed in selfless action, altruism, and benevolence. The path that leads from self-centeredness of a mind that confuses things 'as such' with things as the mind *itself* perceives, to a mind that dispels the 'self' around which it had centered, will be inclined to wise and compassionate action. Such action would perhaps manifest in the return of the philosopher to the cave after enlightenment and transform this solitary act into a deeply ethical and socially engaged endeavor. Such, indeed, is at least the ethos of Mahayana Buddhism that posed the role model of the *bodhisattva* – one who engages in the Buddhist path, attains enlightenment, and dedicates his or her life to the liberation of all sentient beings based on endless compassion. This socially engaged ethos has become one of the central themes within contemporary Buddhism and within its educational interpretations (Eppert et al. 2015; Hattam 2004).

Given the contemporary interest in mindfulness practice, we offer some reflections on the place of mindfulness within the Buddhist tradition and comment on the relation of these practices to philosophy of education. As was noted earlier, *Right mindfulness* is the seventh constituent of an eightfold path that spans the full gamut of ethical living. However, the exponential rise in scientific research of the benefits of mindfulness *practice* and its growing incorporation in diverse educational settings (recently depicted in the *Handbook of mindfulness in education* (Schonert-Reichl and Roeser 2016)) has paradoxically led to both a growing awareness to *and* a hiding of its Buddhist origins (Ergas 2014). Philosophers of education have been responding to this movement in diverse ways that position Buddhism at the center of contemporary debates. This includes the appeal to Buddhism as a tradition from which to elucidate and rejuvenate educational practice (Eppert et al. 2015; Todd 2015) as well as a critical response to what has been derogatorily termed the 'McMindfulness' phenomenon (Purser and Loy 2013) – the extraction of mindfulness from its Buddhist ethos and hence its transformation into a school 'pathology proofing practice' (O'Donnell 2015). We believe this field will continue to develop in the coming years.

### ***Hinduism Through the Case of Classical Yoga: Absorbed in the Cave to Seek Liberation***

Of the diversity of belief systems that go under the term 'Hinduism' (e.g., advaita Vedanta, Purva Mimamsa, Shaivism) we will focus only on Patanjali's classical yoga for two main reasons: (a) This tradition will be more familiar to the reader given the pervasiveness of yoga practice in Western industrialized countries as well

as its contemporary applications within schools. (b) Of all four traditions discussed here, we suspect that classical yoga would be the one closest to the fundamental views presented in Plato's cave allegory.

Our analysis will be based on Patanjali's *yogasutra*, a text containing 196 aphorisms dated arguably to the third or fourth century CE. This text, written by a sage named Patanjali of which very little is known, is a compilation of diverse traditions of Patanjali's times. Essentially, like the cave allegory it provides us with a full worldview, along with a path toward an Absolute Truth, broadly understood here as an *educational path*.

## A Dualist Worldview

Most interpreters understand classical yoga as depicting a dualistic ontology-epistemology (Feuerstein 2001; Iyengar 1993; Larson and Bhattacharya 1987).<sup>4</sup> Such interpretation immediately locates us within the context of Plato's cave allegory. By pointing to the distinctions between these two forms of dualism, we will be able to inform our understanding of both perspectives. The dualism of classical yoga lies between *objective* nature (*Prakriti*) and *subjectivity* – the Seer or Self (*Purusha*).<sup>5</sup> Nature is the phenomenal. It is comprised of basic elements known as the three *gunas* – *tamas*, *rajas*, and *sattva*. The three are never in balance hence the phenomenal world is in constant flux in which things are tied in a chain of causality. The Seer, however, is of an entirely different ilk. It is beyond Nature, which means it is unconditioned, eternal, and never changing.

The most important thing to understand here is our own makings in this setting. A human being comprises of both Nature and the Seer. Supposedly, this would align well with Plato's or Descartes's body/mind dualism, yet that is where yoga offers a substantially different position. Thoughts, sensations, emotions, and feelings that are associated conventionally with the mind and the body all belong to Nature. They are all objects that can be observed and essentially are no different from the desktop or the paper at which you are looking. They are *not* our True identity, that is, "...the transcendental Self, Spirit, or pure Awareness, as opposed to the finite personality" (Feuerstein 2001, p. 458). The 'finite personality' that we experience normally in our day-to-day life is nothing but Nature, which has absolutely nothing to do with the Seer/Self. In fact, the aim of yoga is this very realization.

## The Human Condition and Its Problem

The 'educational' problem here is mistaking the phenomenal with the Real, a concern that is clearly shared by Patanjali and Socrates. The affinities, however, are deeper for in both cases the educational path is grounded in the fact that wrong

<sup>4</sup>It is however important to note Whicher (1998) as a critic of such position.

<sup>5</sup>The translations of *prakriti/purusha* vary (Feuerstein 2001; Iyengar 1993)

epistemology-ontology cannot but result in unethical action in the world. In this sense, both Patanjali and Socrates were concerned with correcting our misperception so that moral living will flow from the knowing of Truth. However, given the different views on the kind of dualism involved here, the error is conceptualized differently, and the 'educative' path differs.

According to yoga, the layperson travels in the world with the sense that he or she is seeing reality as such (as the prisoners in the cave) yet in effect he or she is looking through a Nature-mind through which all one can see is a Nature phenomenal reality. The mind is trapped in a hall of mirrors that it takes to be Real. Every sense perception seen *out there* invokes a movement *in here* that is owned by a Nature mind that conceives of this experience as 'my' experience. Prosaically put, if, for example, someone insults or flatters you, you perceive it based on your Nature-mind, and understand their words as referring to your 'real' identity. You then feel the insult and react, or feel the palpitation and rash resulting from that person's flattery, and you react to that. You would think of this as reality as such, yet classical yoga states that it is all simply a phenomenal world governed by causality and change – an endless drama of constant emotional turmoil with no way out.

The problem then, very much like in Buddhism, is human suffering and how it can be overcome. Overcoming suffering in yoga's case will result from disengaging from a false identification with Nature and dwelling in the Seer. This is the gateway to perceiving the Real, which is nothing like this drama that is created by the interplay of a mind that is part of the world of appearances. What we see here then is a clear affinity between Patanjali's yoga and the educative path of the cave allegory as we understand both to be concerned with a shift from identifying with the phenomenal, changing, and tangible world to that of the eternal, unchanging, and intangible world. At least conceptually speaking the Real that Patanjali speaks of would seem to resemble the eternal and unchanging world of forms that are outside the Platonic cave. However, this is where the affinity ends as we show by examining the educational path of yoga.

### The Educational Yogic Path

In contrast to Plato's allegory, Patanjali would by no means count on philosophizing as an educative path toward escaping the cave. This can be clearly shown by turning to the yogasutra itself. 'Yoga', Patanjali (2001) tells us in sutra I.2, 'is the restriction of the fluctuation of consciousness',<sup>6</sup> and in I.3 'then the Seer abides in its essential form'. What are these 'fluctuations of consciousness'? Patanjali elaborates in sutras I.5-11 (p. 218): they include sense impressions, thoughts, ideation, cognition, memory, psychic activity – pretty much all mental activity with which a mortal human being would be familiar (Feuerstein 2001; Raveh 2012). Strangely, even 'right knowledge' is included here. Patanjali lists it alongside: error, metaphor, deep sleep, and memory. Our highest reasoning and logical argumentation – essentially the

---

<sup>6</sup>We use Feuerstein's translation. See Patanjali (2001).

activity and results of *philosophizing* as we tend to understand it – are still considered by Classical yoga's ontology to be 'fluctuations of consciousness' that belong to Nature. While yoga will clearly distinguish between 'higher' ideation that is the result of *buddhi* (roughly equivalent to Plato's Reason) and a lower mind (*manas*) based on which we engage with the world reflecting our desirous nature, both will remain Nature's manifestations (Feuerstein 2001 p. 240; Iyengar 1993, p. 35). As such, they are a hindrance to the realization that the yogi seeks. In other words, the escape from the Platonic cave, mythical as it already is, is nothing even remotely close to our highest imagination. The highest realization and ultimate goal of yoga is to stop all mental activity including the most philosophically rigorous (Raveh 2012, p. 26). Only by the stopping of such internal motion can the unchanging Absolute truth be revealed, as the Seer is not moved by Nature. The state of such realization is *kaivalya* – 'aloneness' that Muller (1899, p. 309) viewed as *separation* between Seer and seen. While the Sanskrit word for yoga is derived from the verb *yug* translated as *integration*, what the yogi is in fact after, is a separation from Nature, and a full identification with the Seer – an utter content-less awareness.

What we see here is a complete mistrust of conceptualization and language. It is clear then that some other means must be proposed for our liberation. Indeed, the yogic postures with which many may be familiar emerge as one alternative vehicle for such a path. Yet this familiar aspect of the yogic path is, in fact, only *one* limb (*anga*) out of eight that constitute the yogic path (*ashtanga yoga*) that are elaborated in *yogastura* II.29 (Patanjali 2001, p. 224) and include moral precepts, practices of purification, postures (*asanas*), breath exercises (*pranayama*), disengagement of the senses, and three phases of growing concentration within meditation. With the exception of the moral precepts that are associated with the yogi's moral conduct with his own self and with others, these practices constitute an austere regime that the yogi practices on his own or with a Guru. In a most paradoxical twist, at least traditionally, liberation awaits the yogi *not* by climbing outside the cave but rather by deliberately entering the (Himalayan) cave and working directly with the mind that again, like in Buddhism, seems to be responsible for the creation of the cave of misperception.<sup>7</sup>

Patanjali's *yogasutra* points to the uncanny not only in its trajectory of a mystical experience but also in its third part (2001, pp. 226–230) that discusses magical spiritual powers (*siddhis*) that the yogi will gain through practice. Nevertheless, contemporary yoga practice is a pervasive phenomenon and its growing applications in schools as well as the scientific research of this domain are becoming noticeable.<sup>8</sup> We believe that this, like the growing pervasiveness of mindfulness practice, along with concerns of over-commercialization and the transposing of a practice

<sup>7</sup>I acknowledge Daniel Raveh for this idea that he suggested in a personal correspondence.

<sup>8</sup>In this context, it should be noted that the interpretation offered here follows more of a mythical orientation, which highlights the yogi as *retreating* from the world. However, contemporary interpretations have opposed this orientation, stressing the yogi as a socially engaged being, highlighting the moral precepts as well as postural yoga as *socially* oriented ethics (Iyengar 1993; Whicher 1998).

from its origins warrant a serious engagement for philosophers of education. It is specifically here, and perhaps in Daoism that appears next, that we find a fruitful direction for such engagement in exploring what has become the ‘trademark’ of contemporary yoga practice – postures and their educative role.<sup>9</sup> Contemporary yoga authorities in this domain elaborate how the body can be viewed as a vehicle for education in ethics based on postural practice grounded in yoga texts (Iyengar 2005). This orientation combined with contemporary accounts of the body (Shusterman 2008) appears to provide a substantial path toward the further analysis of educational theory and practice as some have begun to demonstrate (Helberg et al. 2009; Martin and Ergas 2016).

### ***Daoism: Following the Way Out of the Cave***

Daoism presents a particular challenge to the approach taken in this chapter. Unlike Buddhism and Yoga which allow for relatively systematic discussions and can to some extent be rendered in educational terms while also being read with and against the cave allegory, Daoism resists such systematization. Of all four traditions discussed here, it is perhaps the most distant from Plato’s cave and hence from the world of a ‘Western’ reader. We will nevertheless attempt to provide some kind of a coherent picture, within a worldview that thrives on paradox.

#### **The Human Condition**

The human condition for Daoism is simply one of unity with the Dao, the ‘way’ of nature. The Dao, way, or path could be understood as a way out of the cave into the light of real understanding. The Daoist sage would then be the wise figure who assists the student in finding the way out the cave, of distinguishing truth from error, with truth being understood as following the way, and error being a willful departure from it. However, this dualistic interpretation which suggests a division between the real and the illusory (or right and wrong paths) is somewhat foreign to the Daoist way. This is partly because the Dao refers not just to the way or path but also to the ultimate source of all. It is the source of both the darkness and the light, the yin and yang as classical Chinese cosmology sees it. In a certain sense, Dao contains all, and departure from it is illusory. So, if departure from the true way is illusory then the dualism between appearances and realities in Plato’s allegory is also, in a sense, insubstantial. The achievement of Dao is, paradoxically, through nonachievement or nonaction, through simplicity, spontaneity, and unity with the Dao. This unity resists ideas of becoming, growing, or developing, images that education often assumes.

---

<sup>9</sup>Of the 196 versus of Patanjali’s yogasutra, only two focus on this aspect. This is hence a development of later texts.

To come to a clear conceptual grasp of all of this might be to miss the point since, as the first line of Daoism's central text, the *Daodejing* states, "The Tao that can be told is not the eternal Tao."<sup>10</sup>

### The Way of Learning

It is common to contrast Daoism's lack of explicit moral precepts with the Confucian emphasis on virtue, ritual, and social order. However, this might be a rather too philosophical interpretation to Daoism. Some have argued that morality plays a more important role within Daoism than typical readings of the *Daodejing* would suggest (Palmer 1991, p. 11). Other texts, such as the *T'ai Shang Kan Ying P'ien* (The Writings of the Exalted One on Response and Retribution), extol the Daoist to the right path and speak of the dangers of proceeding on an evil path. But on the whole, Daoism seems to be more concerned to deconstruct the idea of ethical systems implicit within philosophical paths and images of Platonic ascent. So, although Dao can be seen as playing a role similar to *eudaimonia* (human flourishing) in ancient Greek thinking (Yu 2007) – as a regulative ideal – it can also be read as primarily descriptive, not requiring conformity to a particular path or set of virtues, indicating that the path is inscribed in the activities of the world (both human and nonhuman). Particularly, within the writings of Lao Tzu and Chuang Tzu, we find a nondualist recognition that, just as water flows downwards, so all of nature, including human beings, follow the rhythms of the Dao.

The idea that the ethical way is a natural expression of the Dao might seem to negate the need for becoming, or indeed for learning. In one sense, attending to the Dao is the principle mode of learning, even though sages can assist with the sensitivity and attention required for that learning. Ignorance, from the Daoist perspective, is more of a resistance or insensitivity to the Dao. But in fact, Daoists engage in a more subversive and playful logic in order to break open common ideas about progress, development, knowledge, and learning. Our expectations are challenged in order to reveal the rationalist framings that encumber human thought and action. Thus ideas of progress and advancement (through learning or otherwise) have always struck a discordant note within Daoism. In contrast to Confucian ideas where learning is more an acquisitive and positive process, Daoist learning entails an emptying or even 'unlearning', an idea that resonates with Socrates practices of *aporia*. As Chap. 48 of the *Daodejing* states,

In the pursuit of learning, every day something is acquired.  
In the pursuit of Tao, every day something is dropped.

Less and less is done.  
Until non-action is achieved.  
When nothing is done, nothing is left undone.

The world is ruled by letting things take their course.  
It cannot be ruled by interfering.

<sup>10</sup>The Feng and English translation is used here. See Lao Tzu (2011).

This image of emptying, or doing nothing, is reminiscent of Socratic ignorance, which could be interpreted as liberation from a kind of false image of a self who is able to acquire knowledge. Learning is not a process of accumulation because the Dao resists reification into representational or conceptual knowledge. The practice that Daoism advocates is known as *wu-wei*, nonaction. This is not simply passivity, but rather letting Dao regulate activity. Thus, the emptiness of *wu-wei* entails harmony with the Dao. This realization of learning seems to anticipate concerns about the dependencies and deficits implied in ideas about learning and teaching. The acquisition of knowledge through a planned educational process is an impediment to the Dao and so the image of ascent out of the cave toward a particular conception of knowing could be misleading. Daoist knowledge (*zhi*) is more akin to mastering, a mastering that – in typical Daoist rhetoric – must be achieved without mastering. This means that the world is not an object to be mastered by a knowledgeable subject, but that mastery is achieved through letting the Dao into itself through nonaction (Moeller 2004, 112). Practicing *wu wei*, the Daoist submits to the Dao, thereby achieving mastery without mastery. Becoming less, Daoist learning is as much unlearning.

### Daoism as Nondual

Within the unity of the Dao, there are tensions and changes, expressed in the cyclical movement of the Yin/Yang which, although perceived as an irreconcilable duality (i.e., a world of appearances), appears ultimately as complementary and interdependent: hence ontologically nondual. Consequently, although it is possible not to be aligned with the flow of the Dao, ethical concepts such as failure, wrongdoing, or lack of resolution seem out of place. No wonder, then, that Daoism, like Confucianism, is sometimes said to be quietist or fatalist in orientation. Since it emphasizes a kind of naturalism, Daoism has an intrinsic suspicion of human rationality which reflects the performative conception of language it assumes. Feng Youlan, of the ‘New Daoist’ school, claims a trans-rationality for Daoism (rather than irrational or a-rational) aligning mystical ideas of negativity that transcend the categories of conceptual reasoning (and has therefore been compared with Wittgenstein and Heidegger) (Moeller 2004, 22–24). More than anything, overthinking marks humanity’s separation from nature, a separation that paradoxically is insubstantial, even unreal. Learning to live with and *as* nature is, then, centrally Daoist, a learning to become nothing. But the nondualist tension with dualism recurs since, in a sense, we can do no other than be who we are. Human action, whether gentle or violent, rational or trans-rational, expresses itself as part of the Dao. If Plato’s image of the ascent out of the cave to become fully human is interpreted as a progressive ascent from ignorance to knowledge, it seems at odds with the nondual acknowledgement that everything is already part of the Dao. Conventional readings of the allegory presuppose the very idea of separation that Daoists would not recognize. By contrast, then, for Daoists the cave might be seen as a suitable dwelling place. This might accord well with other philosophies of education that resist a developmental or progressive view of childhood, as the

preparation for adulthood, where childhood and adulthood are simply phases of a flow, rather than hierarchically organized. Still, Daoism calls for a sensitivity to the world and the rhythms that guide it.

Although Daoism tends to avoid extremism, legends of ingesting precious substances, such as jade, cinnabar, and gold, in the pursuit of longevity might seem at odds with the naturalism of the Dao. Within the history of Daoism, the Daoist quest for immortality has sometimes been understood as a more literal pursuit than Buddhist liberation or Hindu Moksha, revealing the apparently inescapable need to define human existence in terms of a lack. Here Plato's ascent imagery is more clearly relevant, where immortality is the unchanging world. The Dao can be followed through meditative and physical practices, which are often intermixed. The traditional lineages of Daoist practitioners suggest an important aspect of Eastern pedagogy not much discussed: the relative importance of oral and direct transmission in contrast to the reliance of the written word in the West. Space prevents fuller discussion here of that vital aspect of Eastern pedagogy, though drawing attention to the efforts of the Chinese Cultural Revolution (1966–1976) to destroy that history by cutting that direct link to the lineages of great Daoist masters should encourage us to pay attention to the important recovery of Daoism (and even more of Confucianism) within China today. Across the world, the Daoist traditions and pedagogies are conveyed through the practices of Tai Chi Chuan, Chi Gung, and other related practices, many of which seem to fuse the development of *wu wei* with practices of longevity. The challenge for the future may be to ensure the popularized 'new age' or 'perennialist' Western appropriations of Daoist ideas which tend to reduce Daoism to universal system of self-help and cultivation are able to reconnect with the more established and ancient traditions. Daoist ideas around cultivation of virtue should be given more attention by educationalists (Culham 2015).

## ***Confucius: The Superior Path from the Cave***

### **The Human Condition**

Taking pleasure in learning is a principle assumption of Confucius' most well-known text, the Analects (Confucius 1893, 1: 1). It seems to be a natural aspect of human nature to take pleasure in the cultivation of the self by being respectful to others, particularly elders (Confucius 1893, 14: 42). This is one reason why Confucianism is often characterized as hierarchical and authoritarian, entailing the attenuation of critical thinking in favor of deference. Education might then be less as an emergence from the cave than being contained by it or even dragged into it. Following the 1978 reforms in China, Western educators are reported to have found Chinese teaching and learning practices that "contrasted markedly with current Western practice, though not necessarily with much earlier Western practice. These included teacher-centered whole class teaching, very large classes, apparent passivity on the part of learners with low levels of active learner participation, and much

use of teacher-led chanting, rote-learning and mimetic methods” (Starr 2012, 4). Images of mass education anywhere in the world lend Plato’s allegory a figurative realism that is striking. However, recent changes in Chinese social, cultural, and economic circumstances suggest these characterizations to be at best outdated, though more likely neo-colonial impositions and misrepresentations. Several scholars of Chinese thought and Confucianism have recently argued that these perceptions distort our understanding of both ancient and modern pedagogical approaches in China and that Confucian thought is not by any means antithetical to critical inquiry (Tan 2013; Kim 2003; Starr 2012). It is no surprise, then, that scholars have found similarities between the political and social interests of philosophers such as Dewey and Plato to resonate with Confucian theory, encouraging a revision and revival of interest in it (Sim 2009; Tan 2016).

The similarities between Confucius (551 to 479 BCE) and Socrates (470 to 399 BCE) are particularly notable. Both lived at similar times and despite neither writing anything down, they had enormous influence on Eastern and Western philosophical traditions, respectively. Understanding the need for rights to balance with social obligations is a common theme between Plato and Confucius (Dionisio 2014, 42). For Confucius, it is for the purpose of service to the state, in harmony with the individual, that education primarily exists. This order is expressed both through the harmony of the cosmos and those within it, again suggesting a correlation between the concerns of ancient Greek and Chinese philosophers (Wolf 1999).

### Confucian Education

The primary educational goal of Confucian education and central to the general philosophy is the development of *Junzi*, which has been translated as ‘gentlemen’, ‘superior person’, or the ethically well-cultivated person. Clearly, the image of escape from Plato’s cave can be associated with realization of *Junzi* which can be regarded as the goal of Confucian life. In the Han Dynasty (206 BCE to 220 CE), five principles of virtue were established on the basis of Confucian thought which have been influential: humaneness or benevolence (*ren*), righteousness or justice (*yi*), wisdom or knowledge (*zhi*), integrity or honesty (*Xin*), and ceremony or proper rite (*li*). This list might not look so out of place in an Aristotelian context. But a central component of virtue that will seem rather foreign to modern readers is that of ‘proper rite’, *li*. Approaching the world with appropriate sensitivity to rite, ceremony, or propriety might seem related to convention or custom rather than a question of morality, since “it is by the Rules of Propriety that the character is established” (Analects 8: 8). One explanation for this concern for rite could be the expectation that education should primarily serve to develop an elite rank of officials and civil servants in order to administer a large and enduring empire, a concern that correlates with Plato’s description of the guardian class in *The Republic*. It could be argued that Confucius’ concern for rite performs a social and civil function making administration in those circumstances more effective. But to regard rite as only a historical contingency would miss the deeper links between humanism, harmony,

and hierarchy which define the core of Confucian thought (Starr 2012, 8). There is ongoing debate about whether rite (*li*) stands in an instrumental relation to the core virtue of humaneness (*Ren*) (Li 2007), but even if *Ren* is the principle virtue, the order and respect of *li* is not incidental. Performance of rites with the appropriate level of respect is suggestive of a virtue in and of itself. In relation to this propriety, traditional Chinese culture regards the elders, parents, or rulers with particular deference, strikingly illustrated by the concept of teaching itself.

The Chinese character 教 *jiao*, which means to teach, is composed of 孝 *xiao* ‘filial piety’ plus the causative element 文. In other words, to teach can be literally understood as being ‘to cause someone to be filially pious’ (Starr 2012, 8). Thus, *Junzi* requires a virtue that Western educational theorists tend to avoid: filial piety. Little wonder, then, that Chinese education systems are sometimes characterized as less concerned with critical thinking and as lacking in egalitarian principles. While there are examples of educated women in Confucian history, for example, Ban Zhao (45–115 CE) (Berthrong and Berthrong 2000, 70), in general the conceptions of authority, piety, and deference appear to have encouraged traditional roles for men and women within a larger social hierarchy (Galtung and Stenslie 2014, chapter 37). Of course these issues are not unique to Confucianism. It is also worth keeping in mind that filial piety extends to the state as a whole, which in this context seems to include everything that is beneath heaven. In other words, the virtues of the family are also virtues of the state and of the cosmos itself.

Considering again Plato’s cave, this account of Confucian moral education may strike one as remaining in the cave rather than stepping into the light of truth. But, of course, this very much depends upon one’s conception of the allegory. The development of *Junzi* through *Li*, *Ren*, and the other virtues can certainly be framed in terms of the ascent of the individual out of the cave, and despite the misgivings about the patriarchy and deference play a role in establishing the proper ordering of things such that truth can prevail. While Confucians may be less concerned with metaphysical and ontological questions of truth vs. appearance, the ethical and spiritual ordering of the cosmos through the development of virtues can at least suggest some important connections between a Confucian and a Platonic cosmology.

### Part 3

#### *Toward an ‘Eastern’ Philosophy of Education?*

Reading with and against Plato to examine Eastern philosophy of education has revealed certain interesting tensions between: knowledge and ignorance; subjective and objective; nature and culture; dualism and nondualism. Put simply, we have explored whether the cave is suggestive of a state of illusion or ignorance and whether what is at stake is both epistemological and ontological. One wonders

whether analytical distinctions between knowing and being can be upheld or whether the compression into nondualism makes the distinction untenable.

To be human is to know. The prisoners cannot resist knowing, but their knowledge is of shadows framed by unknowing or ignorance. To understand our own ignorance is an important insight that cuts across Plato and these four traditions. Differences between the cave allegory and the diverse traditions are in many cases reflected in the substantiality of knower and its/his/her conceptualization.

Knowing is being, an idea that is most evident in questions around understanding the good life. Knowledge of virtue can only be practiced, having little or no substantial reality in a purely intellectual realm. In this sense, we detect a less intellectualist approach within the traditions reviewed in comparison to Plato. That is, most notably in Daoism and in Buddhism as well, there is a preference for the one who acts virtuously even if he or she would not be able to justify their virtue based on philosophical argumentation. This clearly points to a perspective that is characteristic of these traditions that are more suspicious as to the relation between language and world (a theme that had taken center stage only in later developments in Western philosophy). This is most famously captured in Eastern aphorisms such as: ‘When the wise man points at the Moon, the idiot looks at the finger’ as well as ‘Those who know do not speak’.

It is thus clear that an educational path that follows in the footsteps of these traditions will rely on a curricular-pedagogical approach that addresses the human mind based on means that are other than conceptualization and in fact attempt to ameliorate, reduce, or even stop this tendency at least for certain periods of time. Meditation, yogic postures, tai chi, compassion meditation, and other contemplative practices, engaged in solitude or in communion, can be viewed as pedagogies that follow this orientation. They seek to detach the practitioner from identifying necessarily with a reason-based substantial knower characteristic of Plato-Descartes-Kant and appeal to a body-heart-mind as an insubstantial process of knowing. They bring into view the possibility of direct pedagogy, sometimes wordless, sometimes unwritten, and often at the fringes of language. Although twentieth century phenomenology draws us somewhat closer to this kind of engagement with philosophy of education (Lewin 2015), nevertheless a leap may still remain as those working from the position of Eastern traditions are required to mobilize the uncanniness of a post or pre-discursive meditative experience to the world of philosophical argumentation.

Overall, we find that the four traditions reviewed very briefly in this chapter open an incredibly rich and nuanced terrain for the future of philosophy of education. This applies to the analysis of the curricular-pedagogical approaches that are proposed by them as well as to the substantially different premises from which these traditions engage in the understanding of human existence and its aims. The current contemplative turn in education and the emergence of a ‘post-secular age’ may be signs that this orientation will prove both fruitful and necessary for the further development of the field (Ergas 2017; Lewin 2016).

# What Is Indigenous Philosophy and What Are Its Implications for Education

Lesley Le Grange and Carl Mika

## Introduction

Indigenous philosophy might be viewed as a collective term for the philosophies of the indigenous peoples of the world – peoples who have and continue to experience a oneness with places they inhabit (or that inhabits them) over the long term. The strong connection to local places suggests distinctive philosophies of disparate indigenous communities. An indigenous metaphysics comprises three interlocking cosmic registers: the physical world, the human world and the sacred world. For indigenous peoples, the physical world is the land and they believe that they are constituents of the land – the land is not something that is possessed or exploited for economic gain. The human world concerns peoples' relations with one another, the enactment of ceremonies, ways of living and the ability to change. The spiritual is not only metaphysical because it is the foundation of both spiritual and physical well-being of all of life – wisdom of this is shared through oral tradition by elders. The three interlocking worlds are dynamic and fluid and as a consequence indigenous cultures are not stable or fixed, although they are anchored. The interlocking worlds are localised, relying on the distinctiveness of peoples' own histories and landscapes. Moreover, flowing from this ontology is a particular view of knowledge – knowledge is living, active and dynamic and can therefore not be owned, possessed or controlled. Knowledge is intimately embedded in how we relate to one another and the more-than-human-world. The first sense in which the term indigenous philosophy might be used is as a signifier for the distinctive philosophies of local indigenous communities.

When the term Indigenous<sup>1</sup> is invoked, it holds the danger of homogenising the values, beliefs and worldviews of local indigenous communities, thereby eroding the distinctiveness of local philosophies. However, contemporary Indigenous scholars have argued that indigenous peoples across the world share common beliefs and experiences of colonisation, which could be harnessed so as to internationalise Indigenous philosophy/knowledge. As Wilson (2008: 15) writes:

The first peoples of the world have gained greater understanding of the similarities that we share. Terms such as Indian, Metis, Aborigine or Torres Strait Islander do nothing to reflect either the distinctiveness of our cultures or the commonalities of our underlying worldviews. Indigenous is inclusive of all first peoples unique in our own cultures but common in our experiences of colonialism and our understanding of the world. When using the term Indigenous research, I am referring specifically to research done by or for Indigenous peoples.

The second sense of Indigenous philosophy therefore concerns doing philosophy from the standpoint of all colonised peoples of the world and has a decolonising agenda aimed at decentring (not destroying) Western philosophy by giving legitimacy to Indigenous philosophy in the academy. In line with this understanding when we as authors write about Indigenous philosophy we are not separated from the values or ethics that take place when conducting this Indigenous philosophical research. Within the Indigenous research paradigm, axiology (ethics) is relational. Chilisa (2012) avers that a relational axiology is based on the 4Rs: relational accountability, respectful representation, reciprocal appropriation, and rights and regulation during the research process. Relational accountability concerns the fact that all parts of the research process is connected and that the research is accountable to all relations. Respectful representation relates to how researchers listen to, acknowledge and create space for the voices and knowledges of Indigenous peoples. Research appropriation relates to ensuring that the benefits of research accrue to both the communities that are researched and the researchers. Rights and regulation refers to observing ethical protocols that accord ownership of the research process to Indigenous peoples of the world. Therefore, we aim to consider the role of indigenous thought in education from the standpoint of the values mentioned and by reiterating the ontology of interconnection that lies at the heart of most indigenous beliefs, and we simultaneously emphasise the reciprocity and animacy of the non-human world that cannot help but impinge on thought and writing.

In this chapter, Indigenous philosophy will be explored in detail with a particular emphasis on its implications for how knowledge is viewed. Such an exploration promises to illuminate how education is viewed and practised by indigenous communities, but also has implications for how education might be rethought and practised in a contemporary world. The latter is important because even though

---

<sup>1</sup>We use indigenous (with a small 'I') to refer the local communities that are connected to particular places for many years including how their cultural beliefs and knowledges are embedded in the places they inhabit or that inhabits them. Indigenous (with a capital 'I') refers to the internationalization of the term, and it is invoked to depict the common experiences of colonialism shared by indigenous peoples across the world.

Indigenous knowledge concerns ways of knowing that existed prior to colonialism, it has re-emerged in contemporary times because of a growing awareness of the marginalisation of subordinated peoples' knowledges in an era of globalisation. In this chapter, we discuss problems created by language when terms such as Indigenous is invoked, we discuss two senses in which term Indigenous philosophy might be used and provide some concluding thoughts.

## Problems with Terminology

There are both benefits and drawbacks to be had from the notion and expression of 'Indigenous worldview' or 'Indigenous philosophy'. 'Indigenous philosophy' is undoubtedly a shorthand signifier that can threaten to ride too seamlessly over the local thinking and knowledge that it aims to protect. When we are using the term, then, we need to keep in mind how it can unwittingly play into homogenising discourses. In a most fundamental sense, the term 'indigenous' alone can be apprehended as a particularly non-indigenous one (Battiste and Henderson 2000; Corntassel 2003); it may reflect a Western<sup>2</sup> tendency to try and organise what are diverse conceptual frameworks into one schema, so that thereafter they can all be referred to rather too economically. In opposition to the term, knowledge, thought and experience are so thoroughly grounded in the specific location that they cannot be generalised (Battiste and Henderson 2000). Moreover, such labels can render identity itself static, not simply by referring identity to set criteria (Corntassel 2003) but, in a more spiritual way, by setting the people and entities behind the term up so that they are easily referred *to*, rather than forming part of their original local territories. In other words, indigenous peoples are conceptualised through the use of the term; and therefore they may no longer retain a lived experience with their own terrain.

However, there are both strategic and real reasons for adopting the 'Indigenous' discourse when theorising around a common philosophy. There are specific differences from the West as to how indigenous peoples view the world such as the belief that things are interconnected and one (Mahmoudi et al. 2012; Calderon 2008) – a univocity. There are, of course, variations on that common utterance; some writers prefer a conceptual demarcation between objects while noting that they are connected (Callicott 1997; Durie 1994), and others will express entities as if they are thoroughly collapsed (that is, one). The consequences of the latter are huge and diverge greatly from the Cartesian view of the world (Ermine 1995). In indigenous thought, the main disciplines of health, law and education are reliant on the oneness of the world. In Aotearoa (New Zealand), for instance, the *whare tapa wha* (house of four walls) (Durie 1994) emphasises that one's well-being depends

---

<sup>2</sup>When we use the term Western, we refer to the Eurocentrism entrenched in much of Western philosophy. We acknowledge that Western philosophy is not monolithic and that there are points of resonance that some of Western philosophy, e.g. poststructuralism, new materialism and speculative realism might have with Indigenous philosophy.

on the balance between spiritual, psychological, familial and physical components of existence. In fact, these elements are not separate in themselves, but constitute each other so that the distinction between them is somewhat artificial, although the division is useful when defining indigenous concepts within Western contexts. For Maori, the issue of health is rather more complex than the depiction of a house allows; more generally, attempting to describe indigenous existence in all its complexity is curtailed by the strictures of rationalism, whereby indigenous statements about holism are made to conform to various colonising discourses that silently underpin text. With this in mind, the Indigenous philosopher is forever trying to overcome not just the outward idea of colonisation but also the colonising mode of representation available to him/her.

Despite these limitations imposed by both text and by the fragmenting idea that the indigenous writer decides to take to task, what seems to remain important for indigenous peoples is that, regardless of the way interconnection is expressed, there is indeed an interconnected world that needs to be acknowledged as such. Thus, Indigenous philosophy is particularly useful when it is used to address its antithesis – fragmented thinking and conceptualising – and it takes on a political as much as a theoretical hue. As Arola (2011) points out (but in specific relation to American Indian philosophy), a regard for the ethics and politics of any idea of the ontological prior is called for with Indigenous philosophy, so that it does not simply comprise an abstract study. Moreover, Indigenous philosophy, in its resistance to colonisation, can be drawn upon to develop what may be thought of as ‘counter-colonial’ philosophies. These speculative propositions are embryonic and keep colonising discourses within their sights whilst proposing that the writer incorporate something more positive that originates directly from the writer’s cultural origins. This type of thinking accords with Kincheloe’s (2011) ‘critical ontology’, with an emphasis on each indigenous group drawing on the consequences of the common utterance of interconnectedness to ultimately explain resistance and the more positive aspects of worldview from their own vantage point.

Very little has been written about Indigenous philosophy in terms of its relationship to its Western counterpart. The emphasis of the former on metaphysics, one suspects, would incur some critique from more orthodox Western philosophy. Here, we meet one of the main points of difference between the two, both substantively and discursively. Indigenous philosophy does not distinguish between the idea of something and the thing itself (Mika 2015); thus, the entities that comprise the creation stories of various groups are at once both ential and able to be represented. They are present whilst being conceptualised and discussed. In the dominant Western canon, though, we are delivered the very strong message that metaphysics is solely a discipline of study. Adorno (2001) makes his view very clear, for instance, that primordial entities do not in themselves constitute metaphysics; Cassirer (1953) and Bakhtin (1981) urged distance from the things themselves; and Kant is well known for shunning metaphysical speculation (Fuchs 1976). In general (although not exhaustively by any means), Western philosophy has been premised on the

insertion of a unit of representation between the self and the thing being discussed, so that it can be discussed objectively. Immediately, Indigenous philosophy must deal with this most fundamental Western demarcation between the entity itself and that entity's presentation if it is to claim to be 'philosophy'. Due to indigenous peoples' unwillingness to make this distinction, Indigenous philosophy is not considered to be 'philosophy' in many universities. With Western philosophy's disdain for Indigenous worldview in mind, Garfield and Norden (2016) proposed that philosophy departments in universities be more honest about their position and should call themselves 'Western' philosophy departments. These authors suggest that other groups have as much right to term their worldview 'philosophy' as the West does; rather than forming part of a Culture Studies theme, the Indigenous worldview is capable of being theorised (whilst simultaneously being real) to the same degree that Western philosophy is.

Not only must indigenous peoples deal with the term 'indigenous', then, but it would seem that 'philosophy' is also contentious. This inconvenience that language ends up posing is not a new one for indigenous peoples, who have also had to consider whether their law is in fact 'law', or whether what they enact in their teaching and learning amounts to 'education'. It is a difficulty that is compounded by the Indigenous proposition that the world is indeed interconnected, because the silos and disciplines that Western thought holds dear are not so commensurate with indigenous thought (see for instance Pere (1982)). Indigenous thought is less wedded to indicating where one practice begins and ends – philosophy is immediately law and education, education is immediately law and philosophy and so on. A possible colonising practice occurs in attempting to indicate the commencement and conclusion of a discipline. In the context of this chapter, then, 'philosophy' by its very nature as a label separates one phenomenon out from all others, and it may therefore be problematic for indigenous thought. On the other hand, 'philosophy' as a way of describing the pursuit of wisdom may be quite convivial with indigenous groups, who would then insist that such wisdom is given by the world to which one is forever connected. In its etymology, 'philosophy' resonates well with the collapse of the entity and its presentation that could be at the base of much indigenous thinking. It is the task of indigenous peoples, then, to claim the term 'philosophy' with their own critique at hand and on their own terms. A similar response to the notion and practice of 'research', incidentally, has been suggested by various writers (see Smith 2005; Pihama 2001; Ermine et al. 2004); however, there may be other issues at stake with language, and the tendencies it opens up, that need to be addressed by each discrete indigenous group. In a Maori context, for instance, it is possible that a Western term has already accrued to it so much historical matter and expectation that it is not usable by indigenous writers. This complex issue is beyond the scope of this chapter, but it suggests the need for indigenous groups to consider their own philosophies of language and the relationship of language to the world and its objects, away from the conventional view that language is simply a means of conveying a Platonic idea.

## Two Senses of the Term Indigenous Philosophy (of Education)

### *Indigenous Philosophy of Education and Philosophical Sagacity*

Once sense in which we might understand Indigenous philosophy of education is as a distinctive construct of each indigenous community. However, instead of discussing the philosophies of different indigenous communities we shall discuss more generally how philosophy is produced in such communities with specific attention to the wisdom of the elders.

As mentioned, the physical, human and sacred worlds are intertwined in Indigenous philosophy. Insights into the interconnectedness (the oneness) of these worlds have been provided by elders over many generations and passed on through oral tradition. These wisdoms shared by elders are regarded by some as philosophy in its own right, known as philosophic sagacity. One of the advocates of philosophic sagacity, Oruka, based the idea on research he conducted on Kenyan wise men and wise women. For Oruka (1990) philosophic sagacity is the “thoughts of wisemen and women in any given community and is a way of thinking and explaining the world that fluctuates between popular wisdom and didactic wisdom” (p. 28). He argues that “one way of looking for the traces of ... philosophy is to wear the uniform of anthropological field work and use the dialogical techniques to pass through the anthropological fogs to the philosophical ground” (p. xxi). Oruka views philosophic sagacity as distinct from ethno-philosophy, since sages do not simply transmit the thoughts of their communities, but rather critically evaluate what might be unquestioningly accepted by members of communities. One of the difficulties with philosophic sagacity is that one cannot easily distinguish the source of the field reports when the researcher is a trained (Western) philosopher – Are the field reports a record of the philosophic ideas of the sages or a reconstruction of them by a trained philosopher (as was the case with Oruka) after engagement with the ideas of the sages (Gratton 2003)? Bodunrin (1984) has sympathy with Oruka’s notion of philosophic sagacity, but argues that together with ethno-philosophy it comes perilously close to non-philosophy because it is based on the views of everyday people. The latter criticism is of course only valid if viewed from the perspective of Western philosophy. From the perspective of the Indigenous world, the wisdom of the elders is philosophy.

In line with the notion of philosophical sagacity, education for indigenous peoples involves the transmission of Indigenous knowledge, primarily through symbolic and oral traditions. Indigenous knowledge comprises complementary modes of knowing and caring about the sensory and spiritual realms, and it is this sensibility/spirituality that is the essence of Elders’ wisdom. According to Battiste (1986), this sensibility/spirituality is transmitted in the oral tradition from the spirits to the elders and from the elders to the youth. Indigenous languages play a crucial role in the transmission of indigenous knowledge. Battiste and Henderson (2000) aver that indigenous languages are not only the vital links to Indigenous knowledge, but are also descriptive of indigenous peoples’ relationship with their ecosystems. They

write: “Knowing as ecosystem is not a knowing derived from curiosity or the need to control, but rather a knowing derived from caring about other people and about the world” (p. 49). Importantly, when indigenous knowledge is transmitted it is not done in written form and is not distant as is the case with codified knowledge produced in Western education. Instead, the transmission of indigenous knowledge is intimate and oral. Battiste and Henderson (2000) point out that language for the Mi’kmaw,<sup>3</sup> for example, is not just a knowledge base, it is essential for the survival of the community. They argue that language reflects the Mi’kmaw philosophy of how we should live with one another, treat one another and how the world works and fits together. What distinguishes Mi’kmaw language from English, for example, is that it is a verb-based language and focuses on the processes, cycles and interrelationships of all things (Inglis 2002). In contrast, English is a noun-based language that identifies objects and concepts in terms of their use or their relationship to other things (Battiste and Henderson). In summary, the link between the wisdom of elders (philosophic sagacity) and education within indigenous communities is clear because education involves the intimate oral transmission of Indigenous knowledge to the youth by elders. Language is intimate to this transmission of Indigenous knowledge. In fact, education (transmission of Indigenous knowledge) and language acquisition is one process.

An additional kind of philosophy that may or may not draw on the wisemen and women appears to be more transcendent in nature. In other words, it infuses the wisdom of the elders with Western notions of philosophy. It is less well explored in the literature of Indigenous meta-philosophical analyses than its more ethno-philosophical counterpart. In indigenous thought, it veers towards a sort of necessary ‘harm’ because it involves withdrawing from the world in order to talk *about* it. Although this intellectual detachment might seem like an inevitable part of the academy – and, indeed, a necessary aspect of education – it carries with it certain risks because it asks the Indigenous student or researcher to tacitly disavow their ontological oneness with the world and instead to rise above the latter. It involves an idealism that sits uneasily with traditional indigenous thought. It is especially abstract and engages with the idea that things in the world can be made into concepts and studied from that perspective. It aligns nicely with dominant Western philosophy with one major exception: the Indigenous thinker in this scenario must determine how to situate him- or herself back within the conceptual matter at hand. Here, it is not just the indigenous ontological idea that is at stake; it is moreover the mode of *presentation* of the idea so that it once more assumes a vital link with the indigenous thinker. The Indigenous (philosopher) writer, for instance, may decide to counter coloniality by critically evaluating a colonising idea. However, the act of evaluating the idea might itself be colonising and not of the indigenous thinker’s world and therefore become a strongly Cartesian entity. The task of the indigenous thinker in this case is to remind him- or herself of their immediate and indivisible link to the idea even as they represent it through the stark mode of the mind.

---

<sup>3</sup>Mi’kmaq is the last Eastern Algonquian language to be still spoken with any degree of functional use to the world (Inglis 2004).

The Indigenous idealism that characterises this form of philosophy is typical of education in general. Education in its dominant form is unethical both against and for the Indigenous student because it deliberately emphasises a quietly confident ascent above the fully worlded phenomena that should be considered. Instead, a more authentic education informed by an Indigenous philosophy hopefully aims to see the disappearance of the atomised subject – rather than subjectivity being individual, it is ecological. It would ethically signify a shift from the arrogant ‘I’ (of Western individualism) to the humble ‘I’ – to the ‘I’ that is embedded, embodied, extended and enacted. In the case of the Maori term for education, ‘Ako’, for instance, the human self is constituted by the ‘external’ world in which it is embedded. Thrupp and Mika (2012) aver that ‘Ako’ is therefore not just a process of teaching and learning through the human realm; but what teacher or learner does is to mediate that which originates prior to teacher or learner. Exactly how one implements this value, which would probably be conceived of as ‘supernatural’ in dominant Western thought, is uncertain. But even here, the Indigenous thinker is ethically required to consider him- or herself as part of the idea that governs such a transformative project. Thus, the ethical call extends to all nodes of thought, including metaphilosophy that might conventionally be conceived of as rarefied and not having any particularly concrete impact on the world.

Because knowledge itself is embodied, it is less cognitively derived, and education therefore plays a crucial role in either acknowledging or ignoring its animacy. Moreover, from an Indigenous philosophical stance, knowledge originates in the self-organisation of the world, and this additional dimension of knowledge would need to be respected as an ethical necessity in education. Questions around the relationship of knowledge to phenomena and the place of the self in attending to this intimate relationship could indeed be posed for the Indigenous student, who may gravitate more readily towards responding to them than to questions that are simply conceptual. That latter assumption that underpins dominant views of knowledge in education at present may be unethical to the extent that it is incomplete and colonising from an Indigenous worldview. From an indigenous perception, ‘education’ should hence become less self-conscious because it is itself one phenomenon of many interconnected phenomena. It may need different approaches that recognise its distinctiveness, but ultimately it calls for the Indigenous student or thinker to remain immersed within a holistic ontology.

### *Indigenous Philosophy as a Decolonising Project*

We have discussed the importance of the local/particular in relation to Indigenous philosophy, or the tie between indigenous thought and the places that indigenous peoples inhabit or that inhabit them. However, some indigenous scholars have argued for the internationalisation of the term Indigenous, that is, that Indigenous/colonised peoples should use the spaces that globalisation affords for sharing common experiences, beliefs and world views. Such scholars argue for inserting the

capital 'I' in the word Indigenous. Indigenous with a capital 'I' has reference to peoples who share common experiences of colonialism, and so it is a word that holds political implications. Scholars such as Wilson (2008) and Chilisa (2012) argue that the upshot of the internationalisation of Indigenous (with a 'capital I') is an Indigenous paradigm. This Indigenous paradigm is an emerging and evolving one based on commitments, worldviews, beliefs and values held in common by the world's colonised peoples.

The second sense in which Indigenous philosophy might be understood as an emerging alternative research paradigm to that of Western paradigms. This emerging Indigenous research paradigm captures the common beliefs, values and experiences of the world's colonised peoples and provides the impetus for the struggle to have these included in the academy. And so, we begin with a discussion on paradigms and what might be understood by an Indigenous research paradigm.

In general, paradigms are distinguished from one another based on different views of reality (ontology), different views of knowledge (epistemology), different values (axiology) and different views of how research should proceed (methodology). With this in mind, the Indigenous research paradigm is elaborated upon in terms of these constructs: ontology, epistemology and methodology. Axiology was discussed in the introduction of the chapter. Notice that these different constructs that are one in reality are merely separated conceptually to clarify what is meant by an emerging Indigenous paradigm. So, let us begin with a discussion on ontology. As mentioned, ontology concerns ideas or theories about reality. The ontology of Indigenous peoples of the world is a relational one, where everything in the cosmos is connected. In southern African, this idea of connectedness is captured in the Shona word *Ukama* which mean relatedness. Murove (2009) argues that ubuntu (humanness) is the concrete form of ukama (relatedness) in the sense that "human interrelationship within society is a microcosm of the relationality within the universe" (p. 316). Chilisa (2012) points out that when social reality is investigated by Indigenous researchers, the reality is understood in relation to the connections that humans have with the living and the non-living (the more-than-human-world). An Indigenous ontology is therefore based on a holistic worldview rather than an atomistic one. This discussion on ontology provides the platform for a detailed discussion on indigenous knowledge and its protection.

Knowledge is not so easily discussed without a return to that more fundamental metaphysics of interconnection, because it needs to be clarified alongside its origins. Cajete (2000) and Deloria (2001) both argue for a return to the basic tenets of holism when discussing knowledge; Deloria in particular suggests that a discussion around knowledge without its ontological premise can result in self-colonising ideas and argues that a type of mental and spiritual disorder can end up afflicting Native scientists if they ignore interconnection. Knowing how to do something is therefore often immediately thought of as embodying a connection with the thing being crafted or made. This direct relationship between the artefact and the creative self may be traced through genealogical links between the material being fashioned and the fashioner. Creating a piece of work requires the self to be aware of this link at all times, and there may be various ceremonies performed, or spiritual modes of

approach relating, to the gathering of the material; what is often scientifically thought of as inanimate stuff is acknowledged as living and retaining to itself its own way of working with the human artist or fashioner. The belief that the material in some way chooses and collaborates with the human diverges greatly from the dominant canon of knowledge for two main reasons: first, matter in Indigenous belief has agency and calls to the attention of the human self; and secondly and relatedly, it possesses its own life. The human creator has some degree of autonomy in relation to the outcome of the process, but the artefact is seen as allowing the fashioner to do some things and preventing him or her from doing others. It is hardly surprising that seemingly inert stuff is placed on an equal footing with the human it comes into contact with, given that Indigenous thought often does not privilege the human self in any particular act and that the 'stuff' is not inert after all.

The interconnection of the world's dimensions extends to those realms that are not immediately perceptible, and yet these realms are also part of the current, discernible world. The degree of that otherworldly reach can only be speculated on, but it is likely that knowledge itself is imbued with the 'supernatural'. Knowledge for indigenous peoples may then mean that the fashioner of an object has to refer to those worlds and pay homage to them, whilst carrying out his or her craft. Knowledge in this case is highly dependent on what the observer can perceive of an object *and* what remains beyond his or her grasp. Indigenous experience in this instance is perhaps less concerned with 'knowledge', and more with the manifestation of the object as a part of its environment. It would thus be the way the object displays itself to the human self that becomes most important. He or she would be guided by what the object opened up for perception and may even be guided by the intermeshing of all elements that relate to the object. Of course, speculation on that idea becomes complex when we reiterate that one object is completely constituted by the world in its entirety, and the fashioner of a new object or craft must then, at some point, simply allow the object to display itself in whatever way it sees fit.

The more rarefied, abstract knowledge that is often in Western philosophy is equally related to the holism of Indigenous metaphysics although the divisions of concrete and abstract are unhelpful in Indigenous philosophy but are sometimes invoked by different indigenous groups: in Maori thought, for instance, Marsden (1985) indicates that "abstract rational thought and empirical methods cannot grasp the concrete act of existing [for Māori] which is fragmentary, paradoxical and incomplete" (p. 163). Here, we brush up once more against the problem of language in attempting to present the full world through equating portions of it with colonising language. Marsden's supposition may best be understood in relation to the idea that 'abstract rational thought' is in fact immediately concrete and paradoxical, where the strict delineation between abstract/concrete and rational/paradoxical is irrelevant. As indigenous peoples are beset by colonising ideas about knowledge, however, it can be just as useful to briefly and strategically invoke these binaries as it is to use the terms 'Indigenous' and 'philosophy'. In a counter-colonial era, we can take from Marsden's assertion that it is not good practice to separate the abstract realm from the concrete when knowledge and existence is being described.

The representational problems that arise with terms and concepts for the indigenous philosopher stand alongside the tendency of Western knowledge to *substantively* oppose indigenous propositions about their own forms of knowledge. That is, dominant Western views of knowledge do not align with those of indigenous groups. Where Western knowledge aims to conceptually fragment elements (Calderon 2008; Deloria 2001) and to seek greater certainty about a component (and thus culminate in a fragmented form of knowledge), Indigenous knowledge mostly seeks to keep these elements together. Working with an object, then, is dependent on keeping the fashioner's idea of it as close to the object's display of itself. The carving of a piece of wood, for instance, brings together all of the object itself: the appearance of the object to the carver, and the idea of how the object should appear in the future (how it should be carved, in other words). While we as Indigenous writers can separate these phenomena, they are one; the object, its outcome, and its appearance are in fact inseparable. Thus, even when objects are not apparent – if an Indigenous writer is dealing in the world of ideas – objects are still present in some form or another, and they possess a connection with the realm of ideas and with their future presentation in a particular form (Mika and Tiakiwai 2016).

Of all aspects of experience, it is perhaps epistemology that is most widely traversed in discussions about Indigenous experience. But an Indigenous epistemology, as we have seen, is related to its ontology. An Indigenous epistemology is a relational one in the sense that knowledge is not an individual pursuit and is never owned by an individual. As Wilson (2008) writes:

An indigenous paradigm comes from the fundamental belief that knowledge is relational. Knowledge is shared with all of creation. It is not just interpersonal relationships, or just the research subjects I may be working with, but it is a relationship with all of creation. It is with the cosmos; it is with the animals, with plants, with the earth that we share this knowledge. It goes beyond the individual's knowledge to the concept of relational knowledge ... you are answerable to all your relations when you are doing research. (p. 56)

Unlike dominant approaches to Western research where the researcher comes to know by separating herself/himself from world, Indigenous researchers come to know through sensibilities embedded in complex relations in the world and may sometimes refer to this arrival at knowledge as a method.

Methodology refers to ideas or theories about method – ideas or theories about how we should proceed when conducting research, and Chilisa (2012) argues that methods produced within the Indigenous research paradigm incorporate both decolonising methodologies and third-space methodologies. By decolonising methodologies, Chilisa means methodologies that resist the production of 'universal' knowledge, critique Eurocentric Western research approaches, produce and are informed by Indigenous knowledge systems. Another strategy she refers to is that of coalition, where methodologies are produced through partnerships between and among Indigenous researchers and 'Western' researchers, who share common goals with Indigenous researchers. Third-space methodologies are produced in what Homi Bhabha (1994) called 'spaces in between'. In such spaces, dominant Western methodologies are decentred and productive ways are found for Western and Indigenous methodologies to be performed together giving rise to new knowledge

spaces and new, 'hybrid' methodologies. For example, Aborigines in Australia's Northern Territory have for many years through their own performative modes mapped their country by identifying every tree and every significant feature of their territory. Today some Aborigines are doing the same using the latest in satellites, remote sensing and Geographical Information Systems (GIS). By representing their local knowledge on digital maps they are able to make their ways of knowing visible in Western terms – "a new knowledge space which will have transformative effects for all Australians" (Turnbull 1997, p. 560). Similarly, in South Africa San trackers are being equipped with digital devices (as part of the CyberTracker programme) to record animal sightings, a local example of traditional African ways of knowing working together with sophisticated Western technologies (Le Grange 2009, 2015).

So how might third-space methodologies play out in the classroom? We shall discuss an example in science education that opens up ways of thinking and doing bicultural education. The context is where students who come with indigenous cultural frames have to learn the culture of Western science in schools. Jegede and Aikenhead (1999, p. 55) suggest that the teacher needs to take on the role of cultural broker, that is, he/she should help learners mediate or negotiate cultural borders. They suggest that in some instances the teacher needs to be a *tour-guide* cultural broker and in other instances a *travel-agent* cultural broker. When cultural border crossing (from life-world culture to school science culture) is difficult for the learner, the teacher needs to take on the role of a *tour-guide*, whereby the teacher takes learners to the principal sites in the culture of science and coaches them on what to look for and how to use it in their everyday lives. In doing so, the teacher uses an extended repertoire of methods. In other instances, where learners require less guidance when border crossing, the teacher may take on the role of *travel-agent*, whereby the teacher provides learners with incentives such as topics, issues, activities or events that create the need to know the culture of science. In other words, border crossing occurs through academic bridges and less through guidance.

In South African classrooms, learners experience cognitive dissonance when learning about certain phenomena in science classrooms. For example, the scientific perspective that lightning is caused by the discharge of electricity between clouds or from a cloud to the earth is in conflict with learners' cultural understanding that lightning is caused by, for example, witchcraft. Two strategies may be useful in helping learners to deal with cognitive perturbation in this instance. The first strategy is what Bajracharya and Brouwer (1997, p. 436) termed "a narrative approach". This approach involves arranging learners in small group discussions on questions such as 'Is lightning caused by witchcraft?' What this approach does is to provide to a small degree a conceptual ecocultural paradigm that can serve as the basis for the teacher to take on the role of cultural broker. The second approach is one that was introduced by Aikenhead (1996), where border crossing is made concrete by asking learners to divide the page in their notebook in half to form two columns: 'My ideas' and the 'Culture of science ideas'. This strategy/activity enables the learner to consciously move back and forth between the indigenous world and the world of Western science: "switching terminology explicitly, switching language

frameworks and conventions explicitly, switching conceptualizations explicitly” (Jegade and Aikenhead 1999, p. 57). The teacher is able to assess learners’ recordings and navigate his/her own changing roles of *tour-guide* and *travel-agent* so as to facilitate learners’ border crossings.

But, hybrid knowledge spaces could also hold potential dangers as is evident in the case of ethnobotany. Smith (2005) argues that Indigenous knowledge, which was once denied by Western science as irrational and dogmatic, now is one of the frontiers of knowledge. For example, the field of ethnobotany that has emerged involves botanists working closely with indigenous communities in the collection and documentation of plants for medicinal remedies. Ethnobotany involves moving beyond traditional scientific inquiry, deploying qualitative research methods such as interviewing community experts, observing practices, and developing word banks and other resources (Smith 2005). The recent interest in ethnobotany in the global knowledge economy is the commercial potential of the knowledges of indigenous peoples about medicinal plants. If the necessary intellectual property protocols are not carefully observed, then the protection of such knowledges are threatened.

We have noted that an emerging Indigenous paradigm has become possible because of the internationalisation of Indigenous knowledge. However, it is important to also discuss implications that the internationalisation of Indigenous has for philosophy (of education) on a broader level. As noted, Indigenous scholars across the world are using the spaces that globalisation affords to build solidarities. These scholars invoke Indigenous (with a capital ‘I’) to reclaim the term Indigenous so that it represents the experiences, beliefs and commitments that the colonised peoples of the world have in common. This development has an overtly political agenda to advocate for cognitive justice in the light of epistemicide that colonisation has produced. Santos (2014) refers to epistemicide as “the decimation of knowledge” or “the murder of knowledge” (p. 92). He writes:

Unequal exchanges among cultures have always implied the death of the knowledge of the subordinated culture, hence the death of the social groups that possessed it. In most extreme cases, such as that of European expansion, epistemicide was one of the conditions of genocide. The loss of epistemological confidence that currently afflicts modern science has facilitated the identification of the scope and gravity of the epistemicides perpetrated by hegemonic Eurocentric modernity. (p. 92)

Part of the project of seeking cognitive justice is decolonisation. Poka Laenui (2000) suggests five phases in the process of decolonisation: *rediscovery and recovery*; *mourning*; *dreaming*; *commitment* and *action*. Rediscovery and recovery is the process whereby colonised peoples rediscover and recover their own history, culture, language and identity. Mourning refers to the process of lamenting the continued assault on the world’s colonised/oppressed peoples’ identities and social realities. It is an important part of healing and leads to dreaming. Dreaming is when colonised peoples invoke their histories, worldviews, and Indigenous knowledge systems to theorise and imagine alternative possibilities – in this instance, a different philosophy (of education). Commitment is when academics/students become political activists who demonstrate the commitment to include the voices of the colonised – in this case, the ‘inclusion’ of Indigenous philosophy (of education) in the university

curriculum. Action is the phase where dreams and commitments translate into strategies for social transformation, in this instance, cognitive justice. It is important to note that the cognitive justice means that Western philosophy (of education) needs to be decentred. Decentring does not mean destroying Western philosophy but questioning its dominance so that it becomes a philosophy of education and not the philosophy of education. Indigenous philosophy in this instance informs an education pathway that focuses on learning indigenous ways of knowing, (un)learning Western ways of knowing or learning interculturally without one way of knowing dominating the other. The latter is akin to what some Elders in Canada's Mi'kmaw nation refer to as "two-eyed seeing" (Aikenhead and Michell 2011, p. 142, Le Grange and Aikenhead 2017, p. 33).

## Conclusion

Indigenous philosophy and Indigenous education cannot be discussed without direct and sustained reference to its metaphysics. A continual reference to what lies beneath the obvious recognises the world's complexity. Reflections on knowledge therefore cannot proceed without incorporating the deeper insights held by both the wise person of one's community and, in some measure, by the Indigenous academic thinker. Education moves carefully and ethically when it consciously reflects on education processes against the backdrop of both Indigenous and colonial thought. Put differently, when we are educating Indigenous students about one particular idea or object, we need to encourage continuous speculation on what gave rise to that idea or object. Given the complexity of the co-existence of the indigenous and the colonial, the task of education is to urge the thinker to cast their gaze to the other whilst simultaneously considering the concept or object through their own traditional lenses – what some indigenous elders have called two-eyed seeing (Le Grange and Aikenhead 2017). The impetus for education is always the obvious/immediate from which the Indigenous student, teacher, writer and researcher proceeds. The potential located within this complexity should lie at the heart of education, which is really an existential immersion within the world whilst it is being consciously contemplated.

There are two senses in which we have invoked the term Indigenous philosophy of education (acknowledging that such invocation might be contested). The first sense acknowledges that there are disparate philosophies of different indigenous groups located in different parts of the world. The knowing and being of such indigenous communities are embedded in the places that they inhabit (and that inhabit them) and in the languages that they speak. The philosophies of such communities are articulated by elders as a complementary mode of sensory and spiritual realms. The transmission of this sensory-spiritual knowing (Indigenous knowledge) is done by elders who share this knowing with youth through intimate oral communication. As mentioned, because language actively reflects the philosophies of such individual communities, education is tantamount to language acquisition. The fact that each

Indigenous community/group speaks a different language implies that there are nuanced differences among their philosophies and therefore education of different Indigenous communities has distinct features. Education for these singular communities is about the transmission and learning of a community's embeddedness in the sensory and spiritual dimensions of the particular places they inhabit and the right to self-determination of such communities. This sensory-spiritual knowing has enabled indigenous communities to survive for centuries without harming the earth.

The second sense Indigenous philosophy of education relates to is the internationalisation of Indigenous knowledge and the inserting of a capital (I) in the invocation of Indigenous. Rather than focusing on the distinctive philosophies of particular indigenous communities, the emphasis shifts to the common experiences, beliefs and commitments of the world's colonised peoples. The second sense of Indigenous philosophy education clearly has an overtly political agenda. The role of philosophy and education is a decolonising one: it involves righting the mistruths told about colonised peoples by Western philosophers, it concerns decentring (not destroying) Western philosophy (of education) so that Indigenous philosophy (of education) can hold a legitimate place in the academy, and it is about telling the stories of pain, suffering and loss as precursors to healing.

Both senses of Indigenous philosophy of education are important, not only for indigenous philosophers of education but for all philosophers of education and for all education communities. From local indigenous communities, we can learn much about how to live lightly on earth and how to respect all life (the rock and human alike), particularly at a stage characterised by the threat of ecological disaster to the earth, and in an era where human arrogance has reached its zenith, evidenced by the fact that humans have become so dominant that as a species it is capable of destroying all life, leading geologists to postulate a new geological epoch, the Anthropocene. An emerging Indigenous paradigm that the internationalisation of Indigenous knowledge has made possible advances the project of legitimating the 'inclusion' of Indigenous philosophy (of education) in the academy and in decentring Western philosophy (of education) so the latter becomes one way and not the way of doing philosophy of education.

# African Philosophy of Education Reconsidered: Implications for Pedagogical Encounters

Yusef Waghid

## Introduction

In this chapter, I take my cue from Stanley Cavell (1979), who says that philosophical inquiry is not merely about giving thought to a set of related problems, but rather a way to examine a set of texts, including what can be identified as problems within texts, whether written or oral. Ontologically speaking, African philosophy of education comprises texts that are situated in the sub-texts of Négritude, African Americanism and Africana-ism as advocated through the seminal thoughts of Leopold Senghor, W.E.B. du Bois and Lucius Outlaw, respectively. And, firstly, an examination of the aforementioned texts is tantamount to doing African(a) philosophy of education on the grounds that these texts are aimed not only at deprecating stereotypical value judgements that depict Africans as uncivilised, but more importantly at cultivating dialogues amongst all Africa's people – the latter involving experiences of an educative kind. Secondly, I argue that one such text, namely Africana-ism – as a gathering term for all other texts – delineates African(a) philosophy of education into three traditional genres: ethno-philosophy of education as enunciated by Richard Bell, critical philosophy of education as espoused by Paulin Hountondji and sagacious philosophy of education as advocated by Henry Odera Oruka. Combined, these genres make up African(a) philosophy of education on the basis that any philosophy of education in the first place is concerned with human actions. Thirdly, I argue that African(a) philosophy of education also has a strong moral, socio-political and economic imperative, aimed at engendering justice, democratic engagement and human development on the African continent, respectively. In relation to the notion of *Ubuntu* (or a particular kind of communitarian philosophy of education) articulated through the seminal thoughts of Mluleki Munyaka and

Mogethi Motlhabi and Magobe Ramose, I show how justice, democracy and human development can be enacted. I specifically focus on *Ubuntu's* inherently democratic bias that can disrupt inhumane forms of human injustices on the African continent, and conclude my defence of African(a) philosophy of education by examining some of its implications for a more just society, and hence for educational experience with its unconstrained pedagogical encounters.

## **Textual Analysis: Négritude, African Americanism and Africana-ism**

Firstly, *négritude* emerged as an ideological response and more specifically as a cultural and intellectual denunciation of oppressive colonial rule and white supremacy. Irele (2003, p. 38) describes *négritude* as a testimony to the injustices of colonialism and the black [wo]man's refusal of western values and religious indoctrination. On the one hand, as an intellectual movement, much of its literature "is dedicated to a rehabilitation of Africa, a way of refurbishing the image of the black [wo]man" (Irele 2003, p. 42). On the other hand, as an expression of cultural autonomy, Leopold Senghor's version of *négritude* is inclined towards accentuating the emotions through which humans can apprehend reality (Senghor 1970). In other words, discursive reasoning is not enough to understand the world, as it does not penetrate what is hidden, but also intuition as it is through the senses that human consciousness can be understood (Senghor 1975). Moreover, Senghor's *négritude* considers solidarity and communion – that is, communitarianism – as more important to African identity and society than individual autonomy (Masolo 2004, p. 489).

Secondly, as an extension of *négritude*, African Americanism gained momentum as a concern about race through the denial of people's sense of humanity. Du Bois (1997, p. 270) describes 'race' as

a vast family of human beings, generally of common blood and language, always of common history, traditions and impulses, who are both voluntarily and involuntarily striving together for the accomplishment of certain more or less vividly conceived ideals of life.

Initially, Du Bois's conception of race shifted from mere talk of colour towards socio-historical and political action, such as being attentive to the social and economic exploitation of people of colour such as African Americans (Bell 2002, p. 52). According to McGary (2004, p. 597), African Americanism is an experience on the part of black people to gain recognition and equal respect in the midst of a society that devalues their worth. Building his theory on the thoughts of W.E.B. du Bois – who contends that being 'black' and 'American' are not contradictory in terms of belonging to the human race – he argues that African Americanism is a struggling experience against a lack of recognition in the face of hostility, racial discrimination, poverty, inhumanity, oppression and stereotypes. In his words, African Americans "must constantly struggle to maintain a healthy sense of self in a hostile society that causes them to experience self-doubt and a range of negative

states” (McGary 2004, p. 598). However, as noted by Bell (2002, p. 52), the depiction of blacks, in this instance African Americans, along the lines of race is the culmination of the articulation of *négritude*. Put differently, African Americanism can be represented as the pinnacle of *négritude* in terms of which African Americans are bound by a common history, suffered a common disaster in slavery – the zenith of discrimination, insult and oppression that remain rooted in the memory of the “Negro” (Du Bois, in Bell 2002, p. 53). It is for this reason that African Americanism (like *négritude*) seems to have been associated with an enactment of human experiences that denounced disrespect, inequality and injustice. Although Du Bois’s idea of African Americanism as a response to racism and injustice seems laudable, his prejudice towards commonality makes his view vulnerable to notions of difference and otherness. Appiah is quick to remind us of Du Bois’s reductionist view of race, which treats collective identities as similar (such as blacks experiencing racial oppression), without taking into account that those other than racially ‘black’ can also suffer dehumanisation (Appiah 2003).

Thirdly, in an attempt to assemble various representations of African philosophy, in a similar manner to how Cavell (1979, p. 77) thinks of a word having a grammatical schematism or point of application within a context, Lucius Outlaw (2004, p. 90) introduces the notion of *Africana-ism*. For Outlaw, the heuristic promise of African(a) philosophy is that it ‘gathers’ representations of the concept under an umbrella term. As a gathering notion it collects and organises representations – that is, philosophical and related articulations, practices and traditions of Africans on the continent, African-descended persons and peoples (like African Americans) and the African diaspora, and of persons who recognise the legitimacy and importance of African and African-descended peoples (Outlaw 2004, pp. 90–91). African(a) philosophy in a Cavellian sense recognises the applications of the concept in varying contexts, thus invoking the concept’s historical and cultural foci. According to Outlaw (2004, p. 94), the latter involves “processes of retention and reinterpretation of cultural practices that originated in Africa, development of new ones, and appropriation and adaptation of elements and practices from cultures of the non-African peoples with whom blacks folks have been in sustained contact”. Hence, *Africana-ism* is situated within ethno-historical life-worlds – including beliefs, art, folklore, music and language – of African and African-descended peoples.

I now move on to a discussion of African(a) philosophy of education.

## African(a) Philosophy of Education

Earlier I borrowed Cavell’s (1979, p. 3) understanding of doing philosophy, which involves understanding a ‘set of texts’. And the ‘texts’ related to African philosophy involve descriptions of *négritude*, African-Americanism and *Africana-ism*. As an extension of such an understanding of African philosophy, African philosophy of education – following Cavell – involves understanding, explaining, analysing, examining, evaluating, commenting on, judging, criticising and being attentive to

problems of and about education in texts vis-à-vis “the [African] human voice” (Cavell 1979, pp. 4–5). More specifically, doing African(a) philosophy of education involves being attentive to ‘criteria’, referred to by Cavell (1979, p. 9) as specifications in terms of which a person judges ‘whether something has a particular status or value’ – in this instance, problems in and about education on the African continent. And such specifications are attended to rationally, consistently, coherently, impersonally and non-arbitrarily – a matter of following a rule (Cavell 1979, p. 14).

Now considering that some problems of education on the African continent vis-à-vis the texts of Africana-ism are identified with exclusion, injustice, gender inequality and sexual harassment (Assié-Lumumba 2007, pp. 1–2; Moja 2007, pp. 65–66), doing African(a) philosophy of education should involve being attentive to such human predicaments as they unfold in textual narratives. Of course, this does not mean that everything about African(a) philosophy of education is confined to written texts only, as much of the discourse is also reported through the oral tradition. In this regard, Cavell (1979, p. 5) clarifies that texts of an oral kind would be acceptable for analysis and judgment. This implies that African(a) philosophy of education should attend to the history, arguments and criticism (criteria in a Cavellian sense) of such concepts and respond appropriately to the predicaments that confront Africa’s education and its peoples. I have identified three ways (genres) in which African(a) philosophy of education can be responsive to the human predicaments that constitute Africa’s education.

Firstly, ethno-philosophy as an instance of African(a) philosophy of education is both universalistic and pluralistic in its ways of seeing the world: Universalism implies that there is only a unique (singular) concept of black (African) identity and consciousness, whereas pluralism recognises the plurality of African cultures, thus neutralising the universalistic idea (Bell 2002, pp. 24–25). Paradoxically, ethno-philosophy has been guided by both universalism and pluralism to counteract colonialism and dependence (Bell 2002, p. 24). As a manifestation of ethno-philosophical thought, oral accounts of traditional worldviews (stories, songs and mythologies) and ethnographies of the ritual practices of Africans have been transcribed into a written mode (Bell 2002, p. 24). What follows is that African(a) philosophy of education with a strictly ethno-philosophical bias would be concerned with the potentiality of a unique African identity and the recognition of the cultural differences of Africans. This means that an identification of race, gender and acts of injustice would determine how an African(a) philosophy of education would respond to exclusion and inequality, for that matter. The universalistic idiosyncrasies associated with being black, woman and sexually violated would be determinant factors in combating exclusion and inequality. Similarly, disrespect towards multifarious cultures should be contested through the recognition of a dimension of cultural differences associated with ethno-philosophical thought. Thus, doing African(a) philosophy of education with an inherent partiality towards ethno-philosophical thought would involve evaluating and commenting on the beliefs and activities found in religions, legends, folk tales, myths, customs, superstitions, poems, taboos, songs and dances in an attempt to thwart exclusion, inequality and multiple forms

of injustice. It is for this reason that I concur with Oruka (2003, p. 121) that “ethno-philosophy may not be without a useful role in African philosophical history”.

Secondly, critical philosophy as an instance of African(a) philosophy of education partially rejects ethno-philosophical practices in the forms of traditional cultural beliefs, popular folk behaviour, moral tales, legends and proverbs in the oral tradition (Bell 2002, pp. 27–29). By far the most ardent proponent of such a philosophy is Paulin Hountondji (1996), who in *African philosophy: myth and reality* takes issue with a strict emphasis on ethno-philosophy, with its focus on myth through the oral tradition. For Hountondji (1996, pp. 104–105), African(a) philosophy cannot develop as an intellectual activity if it remains confined to only memoirs and other oral narratives:

[P]hilosophy ... is a perpetual movement of critique and counter-critique rather than quiet certainty, it is clear that philosophy can flourish and fulfill itself only in a civilization with writing (in the empirical sense). Purely ‘oral’ writing, on the other hand, without of course entirely prohibiting criticism, tends to contain it with narrow limits and to perpetuate a conservative, traditionalist culture, jealous of its heritage and exclusively concerned to increase it quantitatively, without ever questioning it ... Philosophy, a critical reflection *par excellence* cannot develop fully unless it ‘writes its memoirs’ or ‘keeps a diary’.

My interest is in Hountondji’s articulation of African(a) philosophy as a form of ‘critical reflection’. ‘Critical reflection’, Hountondji (1996, p. 67) avers, aims to “promote and sustain constant free discussion about all the problems concerning their discipline ...”. The promotion of ‘free discussion’ involves engaging African(a) philosophy in dialogue with Western and Eastern thought (Hountondji 1996, p. 67). In other words, it is the primary task of critical African(a) philosophers to embark on ‘demythologizing’ African thought from an overemphasis on the oral tradition, which in any case intellectually prejudices and prevents it from becoming an authentic discipline (Hountondji 1996, p. 66). And, engaging critically in reflection about African texts should be closely bound to addressing problems of racism, poverty, non-participation, alienation, sexism, inhumanity and underdevelopment on the African continent.

Thirdly, the notion of sage philosophy (philosophic sagacity) seems to represent what Cavell has in mind with the idea of scepticism. To view something as being sceptical is to recognise the inconclusiveness associated with that something (Cavell 1979, p. 429). This means that something is being perceived ‘in the face of doubt’ – that is, with strangeness and suspicion such that there is no ‘best case’ and always are alternatives (Cavell 1979, pp. 440, 448). In a Cavellian way, philosophic sages are “rigorous indigenous thinkers [men and women] without the benefit of modern education [and] are nonetheless critical independent thinkers who guide their thought and judgements by the power of reason and inborn insight rather than the authority of the communal consensus” (Oruka 2003, p. 121). Sages are capable of rigorously, critically and reflectively analysing a problem in the face of accepting or rejecting an established communal judgement on the matter (Oruka 2003, p. 122). More poignantly, “philosophic sagacity is skeptical of communal consensus, and it employs reason to assess it” on the basis of open-mindedness and tentative rationalism (Oruka 1990, p. 45). To be open-minded and tentatively rational is to adopt a

philosophical approach that is responsive to the strange and to act suspiciously towards traditional ‘truths’, and “reflexively presents and re-presents the story of Africans” being in the world (Bell 2002, p. 35). According to Hallen and Sodipo (1997, p. 13), sages are constantly requested by their communities to offer advice and to counsel them “about business dealings, family problems, unhappy personal situations, and the future, as well as about physical and mental illness”. In this way, African(a) philosophy of education with a sagacious bias has the potential to address educational matters, as the latter have a futuristic orientation as well. That is, it is quite conceivable that some parents would seek advice and counsel on matters pertaining to their children’s moral educational upbringing.

### ***Ubuntu* as an Enactment of Justice, Democracy and Human Development**

Thus far, I have shown how African(a) philosophy of education manifests in three genres: ethno-philosophy, critical philosophy and philosophic sagacity. These different and interrelated genres of African(a) philosophy of education can be attentive to some of the predicaments on the continent, particularly exclusion, inequality and various forms of injustice. I shall now offer an account of how *Ubuntu* (human interdependence and humanness) as a particular communitarian notion of African(a) philosophy of education can engender justice, deliberative democracy and human development in relation to some African practices and institutions.

The *question* arises: How is *Ubuntu* connected to Africa(a) philosophy of education? Considering that the aforementioned genres of ethno-philosophy, critical philosophy and sagacious philosophy constitute African(a) philosophy of education, it can be argued that *Ubuntu* – a term derived from the indigenous languages of Africa’s peoples – has some connection with such a philosophy of education: First, ethno-philosophically, *Ubuntu* is linked ontologically to the traditional value systems of black Africans – that is, a ‘gerundive’ or verbal noun that denotes a dignified state of being and becoming; second, *Ubuntu* is epistemologically underscored by such critical actions that include sharing and mutual care that can result in the alleviation of human suffering and prejudice and, third, the concept is an exemplification of the ‘human-ness’ that is achievable through affirming one’s humanity in a Cavellian and sagacious sense, by recognising the humanity of others (Ramose 2003, p. 643). According to Munyaka and Motlhabi (2009, p. 63), *Ubuntu* is present in most African languages and is recognised as *Ubuntu* in IsiNguni, *Botho* in Sesotho, *Vumunhi* in XiTsonga and *Uhuthu* in TshiVenda. It is derived from the word *mntu* (a person, a human being), and it involves both human acts and dispositions concerning a person’s self-realisation and manifestation as a human being and the realisation of the well-being of others in community (Munyaka and Motlhabi 2009, p. 65). This realisation of individual self in association with other persons (community) is most appropriately captured in the following cultural expression of

mutuality: *Umntu ngumuntu ngabany' abantu* [Xhosa] or *motho ke motho ka batho ba babang* [Sotho] – meaning, a person is a person through other persons (Munyaka and Motlhabi 2009, p. 65).

According to an African understanding, all persons are endowed with *isidima* (dignity); hence, *Ubuntu* is a recognition that all people deserve mutual respect by virtue of their equal humanity (Munyaka and Motlhabi 2009, p. 66). As aptly stated by Ramose (2002, p. 42), “Ubuntu understood as be-ing human (humane-ness); a humane, respectful and polite attitude towards others constitutes the core meaning of this aphorism”. To come back to the meaning of *Ubuntu* as the recognition that an individual person is such on the basis of his or her relation to others in community, it can be claimed that the concept is strongly oriented towards the collective – that is, “it points to the interdependence that exist amongst people” and “promotes the spirit that one should live for others” (Munyaka and Motlhabi 2009, pp. 70, 72). In the words of Shutte (2001, p. 12),

[t]he idea of community is the heart of traditional African thinking about humanity. It is summed up in the expression *umuntu ngumuntu ngabantu*, a person is a person through persons. This means that a person depends on personal relations with others to exercise, develop and fulfil those capacities that make one a person. At the beginning of one's life one is only potentially a person. One's life, if all goes well, is a continual becoming more of a person through one's interaction with others. Personhood comes as a gift from other persons ... Community, as an interpersonal network of relationships, is thus the fundamental value in traditional African thought.

The aforementioned understanding of *Ubuntu* seems to resonate with Cavell's notion of humanity in the sense that a person has the capacity to acknowledge others “simply on the grounds of his [her] humanity, acknowledgement as a human being, for which nothing will do but my revealing myself to him [her] as a human being ... his or her *semblable* [fellow] ... [and] that others count, in our moral calculations, simply as persons” (Cavell 1979, pp. 434–435).

That *Ubuntu* is a philosophy of tolerance, compassion and forgiveness is confirmed by the following dictums: *umntu akalahlwa* – one cannot completely discard a person for wrongdoing; *umntu akancanywa* – one cannot give up on a person (Munyaka and Motlhabi 2009, pp. 70, 72). Such a view of *Ubuntu* confirms the acknowledgement of human fallibility – that is, as Cavell reminds us, “that a human being may lack the capacity to see [other] human beings as human beings” (1979, p. 378). In other words, human fallibility is a ‘human possibility’, and forgiveness applies to those humans who bear an ‘internal relation’ with other human beings, yet also treat them unjustly (Cavell 1979, p. 376).

Bearing in mind that *Ubuntu* is intertwined with actions such as upholding human dignity and respect, exercising sharing and mutual care, and cultivating humanness through recognising oneself in solidarity with others – with the possibility of forgiveness being offered – people, justice, democracy and human development are very much attainable. Firstly, taking into consideration that, in African higher education institutions, women remain underrepresented as students, faculty, researchers and administrators, coupled with a lack of representation in decision-making structures (Moja 2007, p. 60), respecting human dignity as demanded through *Ubuntu*

could counteract such forms of deliberate exclusion from education. Justice would stand a better chance of being realised in the face of such inequality if human dignity could be restored, which would lead to the engendering of organisational cultures that include women's representation in African higher education.

Secondly, deliberative democracy, following Seyla Benhabib (1996, p. 68), is the result of "free and unconstrained public deliberation of matters of common concern". People are considered as moral and political equals as they embark on a procedure of "free and reasoned deliberation" (Benhabib 1996, p. 68). Such a process of deliberative democracy is characterised, firstly, by equal participation of individuals in a collective; secondly, by all individuals having the same opportunities 'to initiate speech acts, to interrogate, and to open debate; and thirdly, by all individuals having the right to initiate reflexive arguments in the discourse' (Benhabib 1996, p. 68). Such a view of democracy seems consistent with an application of *Ubuntu* on the grounds that the latter allows individuals space for collective (and deliberative) participation, critical reflection about one another's views and opinions in an atmosphere of openness, and a revision and re-examination of one another's views until a plausible conclusion is reached. The very practice of *Ubuntu* is aimed at engaging individuals collectively, without disrespect being showed towards one another through the silencing of dissenting or minority views. Again, the commensurability between democracy and respect is highlighted by Benhabib (1996, p. 79), who avers that "[t]he norms of moral respect and egalitarian reciprocity allow minorities and dissenters both the right to withhold their assent and the right ... to challenge the agenda of public debate". Ramose (2002, p. 113) cogently reminds us that *Ubuntu* involves *lepatata* (summoning people to participate) and *kgotlalkgorollegotla* (engaging people in deliberations). Again, the similarity between *Ubuntu* as a democratic practice is justified in terms of the following statement:

The [idiomatic] expression, not unfamiliar in the deliberations of the *kgotla*, is that *le seke la mo thlakola pele a fetsa go nyela*. Literally, it means that the unclean anus of someone defecating may not be cleaned until the person has completed the process. We can therefore see that one were simply not to be summarily silenced on the ground that one was talking nonsense. Important lessons, for example, in reasoning and rhetorics, could be drawn even from nonsensical talk. The *kgotla* as a traditional parliament was thus a form for free and serious discussion aimed at making laws and finding communal solutions to the problems at hand (Ramose 2002, p. 113).

Thirdly, human development, following Martha Nussbaum (2000, p. 5), can most appropriately be enhanced through a recognition of human capabilities, that is, "what people are actually able to do and to be – in a way informed by an intuitive idea of life that is worthy of the dignity of the human being". Her focus on human capabilities is spawned by the lack of opportunities women in developing countries have in "leading lives that are fully human" (Nussbaum 2000, p. 4). For her, "too often women are not treated as ends in their own right, persons with dignity that deserves respect ... Instead they are treated as reproducers, caregivers, sexual outlets, agents of a family's general property" (Nussbaum 2000, p. 2). That is, women are subjected to unequal social and political circumstances that give them unequal human capabilities. So, instead of asking about their satisfactions and what resources

they are able to command, we should inquire “about what they are actually able to do and to be” (Nussbaum 2000, p. 12). Nussbaum’s argument that human development can most appropriately be addressed along the lines of human capabilities seems to resonate with *Ubuntu*, because the latter considers all people with dignity and therefore worthy of respect. In a similar way, Cavell (1979, p. 434) accentuates the importance of acknowledging others – that is, recognising that people have capabilities according to which they act. In his words, “[there is] a surmise that another [person] may be owed acknowledgement [recognized for his or her capabilities] on the ground of his [her] humanity”. For this reason, *Ubuntu* is considered “a person’s self-realization and manifestation as a human being” (Munyaka and Motlhabi 2009, p. 65).

## Implications of *Ubuntu* for Pedagogical Encounters

I now turn my attention to a discussion of African(a) philosophy of education, more specifically *Ubuntu* in relation to pedagogical encounters. In the same way that some people are subjected to exclusion, inequality and inhumanity on the African continent, teaching and learning can also be vulnerable to these constraints. In this section, I focus on how teaching and learning in a pedagogical encounter will unfold if informed by aspects of *Ubuntu* – that is, I show how an emphasis on mutual respect and care, deliberative engagement and treating others humanely (with a recognition of their fallibilities) can engender more credible pedagogical relations amongst university students and teachers.

Firstly, *Ubuntu* recognises respect for individual autonomy in relation to community. This implies that an individual has a responsibility, what Gyekye (1997, p. 66) refers to as a caring attitude, towards other persons. Similarly, other persons in the community reciprocate their sense of caring towards an individual. This *Ubuntu* relationship between an individual and other persons is guided by “solidarity, reciprocity, cooperation, [and] interdependence” (Gyekye 1997, p. 67). Again, Gyekye (1997, p. 69) avers that “an autonomous, self-assertive being ... care[s] for her own well-being or needs just as she cares for the needs of others ... [t]his is because the concern for the interests and needs of others cannot imply the dissolution of the self”. Thus, in a pedagogical encounter, a student learns autonomously without relinquishing her right to challenge and question, otherwise her autonomy will be undermined. Assumptions that Africans merely imitate without questioning might be true, but indefensible in terms of the individual autonomy they ought to exercise in a communitarian (*Ubuntu*) pedagogical encounter. It is not surprising to note Gyekye’s (1997, p. 109) pedagogical description of learning on the basis that

... individuals [for instance, African students] ... consciously and systematically employ the mind and are irresistibly attracted to, or fascinated by, ideas, apply themselves with unrelenting assiduity to conceive and produce them, argue them, and battle with them, always prepared to abandon their own intellectual positions in the face of the superior ideas or arguments of others.

Such a pedagogical encounter in which individual students mutually respect others' thoughts on the grounds that they can be persuaded by other persons' thoughts through reflection and argumentation is testimony that an *Ubuntu* pedagogical relationship is informed by the practice of critical learning – that is, to argue, and to modify one's views in the light of more convincing 'truths'. Like mutual learning, teaching is equally based on the notion of reciprocity. It is often erroneously assumed that a university teacher with epistemological authority does not have to consult with students in African institutions because of the cultural practice of obeying elders to which students remain subjected. However, Gyekye's (1979, p. 122) description of elders' authority is that "[t]he chief (or ruler) is required by the first injunction not to abuse or insult his subjects but rather to respect them: that is, the chief should recognize their equality as beings, even if they are not equal in directly wielding political power". Gyekye (1997, p. 123) continues by describing that the elder as political authority "rule[s] with the consent of his people ... willing and prepared to listen to their complaints or to what they have to say about any matters that concern them". What follows is that university teachers as educational authorities equally are expected to listen to students without treating them with disrespect – that is, unjustly. In other words, university teaching based on the customary notion of *Ubuntu* encourages a reciprocity of knowledge exchange that puts to bed the idea that knowledge in African higher education institutions should be merely about transmission and the unquestioning transfer of knowledge from pedagogical authorities, like university teachers, to passive students. Hence, an *Ubuntu* pedagogical encounter relies on mutual respect between university teachers and students who engage with each other equally about ideas they mutually share and care about.

Secondly, *Ubuntu* governance within tribal communities traditionally uses "basic ideas of democracy" (Gyekye 1979, p. 129). Although a chief is appointed through hereditary succession, the chief relies on the people for his rule – that is, there is "active participation of the people in running the affairs of the community ... [without any] distance between the government and the governed" (Gyekye 1979, p. 128). Consensus is aimed when dealing with disagreements, divisions, disputes and deliberations. According to Gyekye (1979, p. 130),

[*Ubuntu*] allows everyone an opportunity to speak his mind and promotes patience, mutual tolerance, and an attitude of compromise – all of which are necessary for democratic practice, in which everyone is expected to appreciate the need to abandon or modify his position in the face of more persuasive arguments by others.

Even more pertinently, *Ubuntu*

... allows for many to participate in making decisions about the affairs of community. Anyone, even the most ordinary youth ... will offer his opinion or make a suggestion with an equal chance of its being as favorably entertained as if it proceeded from the most experienced sage (Gyekye 1979, p. 127).

What follows is that deliberative engagement along the lines of mutual respect for a diversity of views, trust, the recognition of persuasive arguments and compromise is of interest for African communities. Similarly, pedagogical encounters in higher educational settings have much to gain from such a democratic enact-

ment of *Ubuntu* amongst African communities. In *Ubuntu* pedagogical encounters, teachers and students would listen attentively to what the other articulate and would not hesitate to take each other's views into controversy. In other words, disagreements and disputes would not be seen as detrimental to teaching and learning, but rather teaching and learning would happen under conditions of trust and mutual appreciation for each other's perspectives. No one in such a pedagogical encounter would be affronted if challenged, as even the most 'ordinary' view would be appreciated and responded to in an atmosphere of mutual tolerance and in the recognition that someone else has something worthwhile to say. Teachers and students would also be prepared to modify their views in the light of more persuasive arguments and would not hesitate to abandon some of their implausible perspectives – a view of educational (pedagogical) encounters that considers critique and equal recognition of voice as enabling conditions for more plausible views to ensue.

Thirdly, *Ubuntu* implies that people should be treated humane-ly, that is, they should be recognised as persons associated with human dignity and equal respect (Wiredu 2002, p. 313). Wiredu (2002, p. 314) posits that every (African) person "has the right to do his/her own thing, with the understanding, of course, that ultimately one must bear the consequences of one's own choices". To bear the consequence of their own actions is to acknowledge that not only do persons have individual rights, but also that they would face the consequences of their actions in the event that they have erred – that is, persons in the African sense are fallible. No wonder then that Wiredu (2002, p. 315) makes that claim that persons (humans) are "entitled to help from others [that is, other persons – onipa hia moa]. Entitlement to help from others is itself an acknowledgement that persons are vulnerable as humans and rely on the assistance of other humans to sustain their humanity'. Thus, in pedagogical encounters, teachers and students should realise their fallibilities and vulnerabilities and that not all views would necessarily appeal to all others. It is then that human dignity, equal respect and support of another's view, especially if such a view is underdeveloped, would be highly relevant. For once, antagonism and irconcilability would be ruled out, as the possibility is always there to treat people humane-ly – that is, with dignity and respect and the recognition that something worthwhile might yet ensue – on condition that support is rendered.

Thus, in a pedagogical encounter, students and teachers are highly supportive of one another and, whenever views and ideas are undeveloped, they (teachers and students) do not ridicule one another or treat one another with hostility. Collegial support through *Ubuntu* is encouraged in African university classrooms on the grounds that equal respect and dignity towards others are upheld. Quite aptly, Cavell (1979, p. 440) remarks: "[T]o humanize this creation ... one might undertake ... the return of the human [that is, to treat ourselves and others with dignity and respect]".

Of course, African(a) philosophy of education seems to be hampered in some African communities by excessive authoritarianism, what Wiredu (1980, p. 4) refers to as the "unquestioning obedience to superiors, which often meant elders" in Ghanaian society. Likewise, Wiredu (1980, p. 15) also notes the presence of an "unanalytical, unscientific attitude of mind [including superstition]" that pervades some sectors of African society. Inasmuch as such grotesque cultural practices

would work against any possibility of an African(a) philosophy of education, Wiredu (1980, p. 24) himself acknowledges “some of the more positive aspects” of African culture, such as *Ubuntu*, that would affect human actions more favourably. Thus, although not discounting the presence of anachronistic cultural practices that in many ways undermine the implementation of *Ubuntu* in some African communities, I was more intent on showing what positive understandings of African(a) philosophy of education could bring more “dignity, respect, contentment, prosperity, joy, to [wo]man and his [her] community” (Wiredu 1980, p. 6) – more specifically how *Ubuntu* has a positive impact on pedagogical encounters in university settings.

# Education and Modernity

Christiane Thompson

I have little control over myself and my moods. Chance has more power here than I. The occasion, the company, the very sound of my voice draw more from my mind than I find in it when I sound it and use it by myself. Thus its speech is better than its writings, if there can be choice where there is no value. This also happens to me: that I do find myself in the place where I look; and I find myself more by chance encounter than by searching my judgment (Montaigne 1992: 26–7).

This chapter begins with a passage from Michel de Montaigne's *Essays*, because this may be taken as a point of departure for the experience of modernity. Written by the end of the sixteenth century, Montaigne's *Essays* throw a skeptical glance on human life and human affairs. He scrutinizes human behavior, virtues, but also education and friendship in his tentative and experimental texts. The examination of common life practice is carried out in accordance with the skeptical tradition as an exercise of the mind. It discloses that traditions are questionable and that humans tend to overestimate the scope of reason. Along with the skeptical examination the question arises as to how to lead one's life.

The abovementioned passage stems from the essay 'Of Prompt or Slow Speech'. Montaigne contemplates about the ego and makes it clear that his experience with the ego does not justify considering it as self-consciousness or substance. Rather, the ego experiences itself from elsewhere – chance has a considerable influence. The intellectual introspection bears little fruit. So Montaigne's skepticism differs very much from that of Descartes,<sup>1</sup> the central thinker of modern philosophy. Instead of being a method of certainty, Montaigne employs skepticism as an examination or inspection of the self, an examination that may call for changing one's life.

---

<sup>1</sup>It was Descartes who employed skepticism and doubt in order to arrive at the *foundation* of science: With any doubt that I raise, Descartes argued, I cannot doubt the fact that it is me who executes this doubt (Descartes 1960).

C. Thompson (✉)  
Goethe University Frankfurt, Frankfurt/Main, Germany  
e-mail: [c.thompson@em.uni-frankfurt.de](mailto:c.thompson@em.uni-frankfurt.de)

Skepticism is a form of life that brings openness and questionability into the farthest reaches of life.

Both thinkers – Montaigne and Descartes – provide hints as to the evolving role of Reason in the modern age. It is the path of enlightenment, i.e., the quest to build life on the grounds of rational reasoning: How can a social order take shape that stands in accordance with knowledge and science? Montaigne and Descartes have become important points of reference for this project and have shaped and formed this tradition. While the reference to Descartes is linked to the regulation of method and system-building in science, Montaigne has time and time again been brought up to call into question the trust into rationality or scientific rationalization, e.g., by thinkers like Voltaire, Nietzsche, and Horkheimer.

Montaigne's skeptical take on the ego is also important because it shows how modernity – as a liberation from answers thus far provided by the tradition – is linked to education or *Bildung*. When former answers regarding human existence no longer prove convincing, when the investigation of everyday life, as Montaigne shows, displays the misconceptions about what we think we know about ourselves, then it becomes indispensable to explore human existence, i.e., to practically engage in (other) possibilities of existence. Kant will voice this in the cosmopolitan framework of philosophy: What can I know? What shall I do? What can I hope? What is it to be a human being? (Kant 1968: 25).

This chapter will elaborate on how education or '*Bildung*' is closely related to the abovementioned quest of modernity. The concept of '*Bildung*' is closely linked to the English term 'liberal education'. Both of them are anchored in the humanist tradition of the '*artes liberales*', the free arts. '*Bildung*' is frequently linked to the German speaking educational tradition and its relevance in the social and political development of the civil society. Yet, it can be argued that the way *Bildung* is linked to the liberation project of the Enlightenment makes it a general reference point to reflect on the modern framework of education. In other words, the concept of *Bildung* articulates a *general* dimension of modern life in Western democracies. This could also be the reason why '*Bildung*' has recently been discussed quite intensively in the international context.<sup>2</sup>

In order to set out the concept of *Bildung*, it is necessary to delineate more clearly the notion of modernity. With Montaigne, it has already become clear that 'modernity' is about the loss of reliable traditions and secure/assured knowledge. In the following, some references to conceptual history are used in order to elaborate the structure of 'modern experience' (1). In short, this structure is about a different relation to time, a particular consciousness of change. In the second part of the chapter, Schiller, Humboldt, and Hegel's respective contributes regarding the relation of modernity and education will be examined (2). In the final part of the chapter, the borders or limits of modern *Bildung* are presented without, however, overlooking our contemporary entanglement with it (3).

---

<sup>2</sup>Among the many contributions, I will name exemplarily: Cleary and Hogan (2001), Løvlie (2002), Peukert (2002), Reichenbach (2002), Thompson (2005). In the context of pragmatism and its relation to the German tradition, see English (2013).

## The Signature of Modernity

The development of modern education is closely related to the promises of civil society and its close relation to the ideas of humanity and rational self-determination – ideas that have their roots, as already mentioned, in the tradition of the ‘*artes liberales*’ (see Herbrechter 2018, in this volume).<sup>3</sup> In modernity, a new experience of time takes shape. This time can no longer be grasped as a ‘period’ or ‘era’. Rather, the terms ‘modern’ and ‘modernity’ describe a particular mode of change that concerns all aspects of human life. Basically, modernity describes an experience of time that questions the legitimacy of prior or traditional life forms. The theological idea of ‘*ordo*’, i.e., a creational order that grants every being its place in the world, is delegitimized. This development has also to be seen in relation to the religious wars, the rise of capitalism and industrialization, as well as the scientific exploration and subjection of nature in early stages of the modern era.

The rise of modern science brought forth a worldview where simply everything is at the disposal of human beings. A thoroughgoing research will bring out all of nature’s secrets (Bacon 1990). Humans cease to be the referent spectator and admirer of God’s orderly creation – as described by the humanists in Renaissance (Pico 1990). Being a clever and inventive creature, man systematically explores nature and extends his scope of action. Thereby, the limits of action are increasingly extended: Action is not grasped from given frameworks and conditions anymore. Rather, human action is increasingly oriented toward what is not yet real, what is possible. The example of the atom bomb is quite illustrative in this regard: The idea of using the power of the atom precedes the technological abilities to (safely) do so. Furthermore, this technological program *exceeds* human action in a way that was formerly inconceivable (i.e., tens of thousands of years). In this regard, Hans Blumenberg has spoken of a ‘reflected curiosity’ taking shape in the modern era. In his view, this curiosity is not about the expectation of discovering something new, but rather in the “never ending question, how we are to go on from here” (Blumenberg 1988: 271). This quote marks a reflective dimension within the human explorations. In the following, the link of this dimension to *Bildung* will be explicated from the perspective of conceptual history.

The conceptual historian Reinhart Koselleck (1984, 2004), whose works are also translated into English (Koselleck 2004), has intensively researched the formation of ‘modern experience’ in the way that historical consciousness was described by the contemporaries. At the second half of the eighteenth century “time becomes a dynamic and historical force in its own right” (Koselleck 2004: 214). When d’Alembert and Diderot went about their master project of the *Encyclopedia* in their quest for progress, they referred to a time consciousness that links human action to the principles of formability and of self-exploration.

---

<sup>3</sup>They are astronomy, music, arithmetic, geometry, dialectic, grammar, rhetoric. It was Cicero who translated this ‘study program’ into the Roman tradition – and he linked this study program to the concept of the ‘*homo humanus*’, that is, the idea of humanity. For centuries, the *artes liberales* would form the basis of Western education.

Koselleck strongly emphasizes a shift in experience, viz., that it is increasingly oriented toward the expectation of what is to come. One's own present is grasped in the mode of change and transformation as is shown with reference to Schlegel: "No time has ever been so strongly, so closely, so exclusively, and so generally bound up with the future than that of our present" (Schlegel 1971, op. cit. Koselleck 2004: 219). Time is perceived as a permanently overtaking movement, which never stops to delegitimize the foregoing time as tradition: "My thesis is that during *Neuzeit* the difference between experience and expectation has increasingly expanded; more precisely, that *Neuzeit* is first understood as a *neue Zeit* from the time that expectations have distanced themselves evermore from all previous experience" (Koselleck 2004: 237).

To be sure, Koselleck's general description of modernity has to be read in context with the complex sociopolitical and economical frameworks of the time: The discovery of a New World, the success and superiority brought about by technological innovation, the development of commerce, etc., play into what can be described as 'progress'. To this progress, education or *Bildung* form a correlate; for to attribute to human beings the power of history and practice required a conceptualization of 'becoming'. '*Bildung*' and education precisely take up this role – in philosophical discourse as well as in the wider social and political public discourse (Vierhaus 1972). Without going into further social-historical details, '*Bildung*' can be seen as a leading category of modernization. It connects individual and social development and takes up the promise of a better future. With *Bildung* human practice is bound to the acquisition of knowledge, to judgment and reflection, as well as to morality and culture. The self of *Bildung* is related to the quest of giving oneself a history.

As a 'carrier' of the modern idea of progress, *Bildung* gains a central role for the social and political discourse. Its basic philosophical consequence for subjectivity shapes the project of modern anthropology: *Bildung* is the relation of the self to itself and to others, the articulation of the question of one's own existence. Ricken (2006) speaks of the 'anthropological matrix' of *Bildung*: "individual life is altogether conceived as a relational and epigenetic process of self-determination" (Ricken 2006: 185, see also Meyer-Drawe 1998, Masschelein and Ricken 2003).

As mentioned above the question of how to lead one's life can no longer be answered on the grounds of tradition and preceding experiences. Social status no longer determines one's course of life (even if social advancement is – until today – related to social background). Rousseau has described this 'open becoming' paradigmatically in his educational novel 'Emile': "We do not know what nature allows us to be" (Rousseau 1963: 156). This statement not only makes obvious the disintegration of theological and metaphysical references that formed the basis for premodern conceptions of *Bildung* (Buck 1984), but it also demonstrates that the individual has to explore himself or herself. He or she has to find out about his or her abilities and interests – they are not simply given. *Bildung* amounts to a process of experience that allows us to find out about ourselves.

In the following, I would like to draw on three different theoretical references that offer philosophical descriptions of modern *Bildung*: Schiller, Humboldt, and Hegel. To be sure, there are more conceptions and ideas available in the modern tradition. These authors are chosen for several reasons. First of all, they all offer us a view on

the process of *Bildung* as experience. This is to say that these thinkers offer translations of the former perspective of conceptual history into systematic argumentation. Secondly, these three thinkers were all concerned with the claims of rationality within modernity. Thus, they are a compelling source for reflecting on the possibilities and limitations of Western rationality. Thirdly, these authors (who are not included in the chapters in section ‘[The signature of modernity](#)’ of this Handbook) still exert a strong influence on the current debates in philosophy and education – especially in the German-speaking context, but also elsewhere.<sup>4</sup> It seems these thinkers still have something to offer to us in our current educational-philosophical efforts.

In the following, *Bildung* as process of self-determination is presented in the context of the thinkers’ influential works. It is shown that the recognition of human rationality and sensibility (Schiller), the sociality of language (Humboldt), as well as the negativity of experience (Hegel) mark essential reference points in thinking modern education.

## Modern Reflections on *Bildung* with Schiller, Humboldt, and Hegel

### *Friedrich Schiller’s Letters on ‘Aesthetic Education’*

Schiller’s letters on *Aesthetic Education* stem from 1793.<sup>5</sup> The point of departure for the letters is Kant’s ‘Critique of Judgment’ (Kant 1987) and what this text means for art and beauty. In his third Critique, Kant had attempted to connect theoretical and practical reason: How can nature and freedom, sensuality, and morality be related in a critical philosophy? Kant works on this problem developing a theory of ‘reflecting judgment’.<sup>6</sup> Kant thinks of ‘reflective judgment’ as a faculty to judge our (singular) experiences, and in doing so it finds rules concerning how all our experiences relate to one another. In this context, Kant also takes into consideration the dimension of pleasure/displeasure in our experience with objects (‘aesthetic judgment’).

Schiller sees in Kant’s connection, that is, between the realms of nature and freedom by judgment, a way to escape the one-sidedness of rationality in Enlightenment, and he gives this project a political and philosophical-historical interpretation. With the experience of the French Revolution and the terror coming along with it, Schiller regards the revolution as failed. He interprets it as a final point of human develop-

<sup>4</sup>For Schiller, see, e.g., Rancière (2006), Zirfas (2014), Weber (2011), Løvlie (2002).

<sup>5</sup>They are dedicated to Prince Christian of Schleswig-Holstein-Sonderburg-Augustenburg. The letters were destroyed in a fire at the castle Christiansborg in Copenhagen. One year later, Schiller rewrote the letters, and the new versions incorporated considerable changes.

<sup>6</sup>In his ‘Critique of Judgment’, Kant distinguishes ‘reflective’ from ‘determinant’ judgment. The latter follows the logic of subsumption: The universal is given and judgment ‘subsumes’ the particular under the universal. In the former, the particular is given and judgment is oriented toward the universal.

ment, viz., as a turning away from the absolutization of reason. Schiller describes this as an alienation, as a history of decay in modernity, a history of ‘fragmentation’ (Schiller 2000: 23). Both the specialization in the field of science and the rationalization of the world of work exemplify this. In this situation, Schiller poses the question of a fulfilled human history, and he is convinced that this question can only be adequately posed when considering the relationship of sensibility and morality. The task then is as follows:

It is therefore not going far enough to say that the light of the understanding only deserves respect when it reacts on the character; to a certain extent it is from the character that this light proceeds; for the road that terminates in the head must pass through the heart. Accordingly, the most pressing need of the present time is to educate the faculties of sensation or sensibility (*Empfindungsvermögen*), because it is the means, not only to render efficacious in practice the improvement of ideas, but to call this improvement into existence (Schiller 2000: 33).

Here, Schiller rejects all forms of education that skip sensibility when relating to our experience. According to Schiller, it is the task of education to involve sensibility in our experience. This means that we need to be or need to feel addressed by experience. Schiller uses the expression that the “road that terminates in the head must pass through the heart”. This receptivity as opening of the head through the heart becomes a genuine task of *Bildung* in a time that precisely misjudges the role of receptivity. The quoted passage presents the very fundamental significance that Schiller attributes to sensibility for the end of enlightenment and human flourishing.

Schiller constructs a dualistic anthropological model to develop his idea of aesthetic education or *Bildung*. According to Schiller, human being is a being of conflict, for human being is determined by two driving forces: forces that mutually contradict and exclude each other. One driving force is the so-called *sensuous drive*.<sup>7</sup> This concerns human’s receptivity and the possibility to be affected by something. Human being is open and can be addressed by the world (*Stoff*). This drive provokes all kinds of states (*pathe*) and sensations: the world of emotions, anxieties, and passions. The other drive is the so-called *formal drive*, which captures understanding and rational thought. The drive of form suspends sensations, for it strives toward rational understanding of the world, to disclose its essence and form historically relevant knowledge.

According to Schiller, human being is in danger of self-alienation from a one-sided orientation that prioritizes either sensibility or reason. The sensuous drive comes with the risk that humans get lost in their feelings, and that they are driven and overwhelmed by external influences. In this case, it is impossible to take a critical stance toward the world. The formal drive, however, goes together with the risk of uncompromised rational domination: sensibility is suppressed and brings about barbarianism – as Schiller notes with respect to the French Revolution.

---

<sup>7</sup> It is challenging to translate Schiller’s thoughts into English, e.g., his concept of ‘*Trieb*’, which is not to be conflated with the psychoanalytic idea of a ‘dark force’ that is primarily attributed to the ‘nature’ of man. Schiller precisely wants to problematize the nature-culture divide.

Schiller views modern civilization – with its views of science, economy, and bureaucracy – as a one-sided expression of the formal drive.

In his anthropological model, Schiller describes humans' rational and sensuous sides as incompatible. According to Schiller, there is no superior authority in order to establish a balance between the drives, to put them in a proper relationship. This is why human being is an incomplete and fragmented being – a being that is separated from unity and completion. Basically, human beings are condemned to alienation, to a rupture of the self. This is why Schiller describes humans' reconciliation (with themselves) as a *precarious ideal*.

On the one hand, for Schiller it is clear that human beings can never reconcile sensibility and rationality, for they remain bound to contradicting drives. On the other, he also points at a *mere appearance* of reconciliation where the drives are active without mutual erasure. In other words, Schiller interprets aesthetic experience as a place where reconciliation can *appear symbolically*. By providing *visions* of reconciliation, aesthetic experiences have an educational, i.e., productive, effect on us.

Schiller uses the concept of play in order to describe the educational dimension of aesthetic experience; for it is play where reality takes a new shape. It is a characteristic of play that it modifies the limits of reality – or that it forms other realities.<sup>8</sup> Play changes the mode of reality and this is why they are suitable for humans' imagination of reconciliation. Let me use the game 'Don't be upset, man!', a German version of 'Ludo' (both derived from the Indian game 'Pachisi'), as an example.

In this game, the figures are moved over a board while being threatened by the other players' figures. If the opponents capture a piece – especially when the piece is close to the final 'safe' zone – the player will feel the exact opposite of what the game's title warns against: she will feel upset. So anger management is part of this game: Whoever, for instance, sweeps away all the pieces from the board in frustration ends the game. Likewise, someone who shows no emotional commitment or real interest in playing also effectively impedes the game. Anger and emotional involvement represent integral parts of the game, and this is where the contradicting drives take up a mode of resonance.

More specifically, we can imagine ourselves feeling real anger while playing the game; an anger that is *bracketed* by the fact that we know it is a game. Therefore, we might qualify our anger – at the same time – as childish or funny. Here, sensuous and formal drive stand in interrelation while the limits of reality become blurred: it is no longer clear whether I am upset or not. Playing offers different possibilities for interpreting reality, making rationality and sensibility present, at the same time, without taking them as the only determinant of the situation. This, however, opens up questions about ourselves, about our relations to others, about different ways to (re)act. For Schiller, this is the path of aesthetic education, i.e., of (unreachable) human fulfillment.

---

<sup>8</sup>When a spectator begins to comment on a game of chess the players might feel provoked by this intrusion into the game. This is to say that they attempt to draw the limits of the game; however, the fact that they start speaking about it can also be taken as a starting *game on the rules of the game*. See Schäfer and Thompson (2014).

Play and aesthetic experience, for Schiller, are closely related. It may not come as a surprise that the same holds for the confrontation with art. Take, for instance, questions like, ‘What is art?’ or ‘Why does a work of art appear to us in this or that way, and how does it affect us?’ These are all questions that relate to the state of indeterminacy. Art cannot be pinned down. It invokes very different scenes and dimensions of reality. As might have become clear above, it is the ‘in-between’, the indeterminacy between formal and sensuous drive that makes them educationally productive (see with respect to Adorno: Thompson 2005).

Schiller’s descriptions are not so much about idealistic imagination, but rather serve as a strategy to point toward the significance of a particular mode of experience. This mode of experience is important since a final reconciliation of humans’ inner conflict is impossible: In aesthetic experience we get in touch with our dual nature without being able to clarify what is going on. However, we get an idea about the one-sidedness of rationality or sensibility in our lives (and how this one-sidedness is destructive).<sup>9</sup>

### ***Wilhelm von Humboldt’s ‘Theory of Bildung’***

Wilhelm von Humboldt is famous for his anthropological and linguistic writings as well as for his political activities in the state of Prussia. Even if his career as minister of education was a short one,<sup>10</sup> his writings have been very influential in the German educational context. Humboldt’s main idea is that *Bildung* is an end in itself and that it should not be treated as a means to an end. *Bildung* is *not for* something. Rather, it is about the question what to do with ourselves.

In his famous fragment ‘Theory of human being’s *Bildung*’<sup>11</sup> (1793), Humboldt declares *Bildung* as *that* human enterprise that will surpass the fragmentation and specialization of science. *Bildung* is described as the interaction of ego and world; an interaction that is regarded as free and not regulated. According to Humboldt, ‘*Bildung*’ is seen as a process where the ego follows forces or drives, engages with the surrounding world, and changes through this engagement. It is not clear from the beginning, where the road will take the ego.

Let us take the learning of a foreign language as an example. *To turn toward* the other and foreign language is the point of departure for *Bildung*. There is a move toward the other, a form of interest that draws the ego in the other language. There is an experience of alienation here: Others speak this (for me) foreign language as their own language. To approach the language of others will also alter one’s own language, a language that is foreign to others. We do not simply learn grammar and

---

<sup>9</sup>Schiller will end with a model concerning the “utopia of an aesthetic state”. This shows the connection between aesthetics and politics that has recently been discussed by Rancière (2006).

<sup>10</sup>Humboldt soon withdrew from his political duties, because his liberal ideas contradicted the restorative political forces of the time.

<sup>11</sup>Humboldt did not select this title.

vocabulary. We also experience the difference of languages, their plurality. They refer to differing sensuous worlds. Finally, we also experience ourselves differently in another language: beginning with our individual expression in the other language. While speaking a foreign language, we experience ourselves as other or different.

For Humboldt it is important that we see *Bildung* as something inextricably linked to the individual. This is to say that we all have very different paths of learning this or that foreign language. It is precisely this individual confrontation that constitutes our experiences with the world. This is why Humboldt is critical toward pedagogical programs (and some interpreters have concluded from this that Humboldt has adults and not children in mind). The crucial point for Humboldt is that the development of humanity cannot spring from a general idea of reason but from the plurality and manifold experiences of individuals. Emphasizing difference and the manifold (instead of referring to shared measures or belief systems) is quite a ‘modern’<sup>12</sup> move.

In particular, Humboldt’s linguistic studies provide strong support for a pluralistic interpretation of humanity and culture: Humboldt is of the opinion that languages shape different realities that are irreducible and plural in nature (see Koller 1999, 2012; Thompson 2009). In a way, Humboldt anticipates the linguistic turn, because he presents language as “the forming organ of thinking” (Humboldt 2002, III: 191). From the perspective of education, Humboldt’s focus on language emphasizes *Bildung* as a permanent individual confrontation with the plurality of life forms. This is to say that the individual is confronted with her or his own ‘worldview’ – including its limitations and restrictions. In other words, the confrontation with other languages and thus other worldviews enables us to see the particularities and limits of our own language.

In summary, Humboldt’s reference to languages presents *Bildung* as an experience of difference and problematization. Foreign languages – and this means foreign worldviews – confront us with ourselves. They also confront us with the question of how a common life is possible. With this question the self-evident worldviews are challenged. This is how modern experience is articulated from the perspective of education.

Let us use the example of the slang language ‘Sheng’ in Kenia. This language may be seen as a modern challenge in Humboldt’s sense. ‘Sheng’ is a language predominantly spoken by young adults in Nairobi and is a ‘mixture’ of Swahili and English. What is special about ‘Sheng’ is the fragile character of the language community due to the rapid pace of change and the formation of new expressions. Sheng is described as an attempt by the younger generation to speak their ‘own language’ – a language that differs from the language of the elder generation. Currently, Sheng is not socially accepted form of communication, thus it is scorned.

---

<sup>12</sup> *Bildung* does not have to be seen as a metaphysical or teleological idea, as some interpreters see it (see Menze 1965, who placed Humboldt in close relation to Leibniz’s Monadology). Dietrich Benner (1990) has argued that Humboldt was after an open idea of practice (which lies in contradiction to teleological ideas). There are further readings placing Humboldt beyond the ‘humanist illusion’ (Schäfer 1996).

The conflict of language marks simultaneously a generational difference as well as a problem of *Bildung*. The current clash of the new language with the official languages (Swahili and English) primarily involves experiences of difference. It is heavily discussed what properties belong to a language. This discussion, however, is accompanied by the experience that speaking a language marks belonging and affiliation. What does it mean to have different belongings among people who live together? What does it mean that only some languages are allowed and taught at school? The language conflict refers to social issues and conflicts – social conflicts that become apparent by the language conflict. So the discussion is not primarily about language proficiency but about how to live together. *Bildung* is about confronting oneself with the question of how to live together: in the task of coming to terms with the conflict and the differing worldviews associated with them. To be sure, this does not provide a ‘solution’ concerning the question of ‘Sheng’. Rather this calls for the reflection on the life forms and sociality in a group of peoples from more than 40 ethnic groups.

### *Hegel’s Phenomenology of Experience*

Hegel’s ‘Phenomenology of Spirit’ offers itself for an educational-philosophical reading precisely because it is concerned with the science of the experience of consciousness. The main insight of the *Phenomenology* is that truth cannot be put in the pocket like a coin (PhG 40). Hegel criticizes his philosophical predecessors – especially Kant (1990) – for not having placed the acquisition of knowledge in connection with the experience that consciousness has with itself. Deceit and dogmatism start where we think that knowledge simply exists: “The dogmatism of thought in the knowledge and study of philosophy is nothing else but the view that truth can be captured in a statement that is a fixed result or that can be known without mediation” (see Hegel PhG 41). The *Phenomenology* takes place as a continuous dialectical confrontation, where consciousness recognizes that it has to leave its (former) standpoint: By being confronted with the knowledge of the object the latter changes because the consciousness of the object changes.

The educational-philosophical point is the insight into this change of consciousness. Thus, the process of *Bildung* is about the readiness to give up one’s own standpoint. It is the questioning of the given, the moment of negativity, that is constitutive for *Bildung*. Conceptually, Hegel grasps this as ‘alienation’ as well as “relinquishment (*Entäußerung*) of the self” (Hegel PhG 359ff.). These concepts entail that which is known to us has to become strange – in order to bring about confrontation.<sup>13</sup> Hegel’s view implies thus a criticism of Enlightenment. Kant’s famous dictum ‘*sapere aude*’ envisions the ‘enlightened self’ as an independent and autonomous being in social practice. In light of this call for autonomy, Kant cannot thematize

---

<sup>13</sup> In this context, one may also refer to Plato and Aristoteles and their idea that philosophy starts with wondering (*thaumazein*).

how individuals confront themselves with opinions and experiences in order to change their point of view (see Gelhard 2017). For Hegel, this is precisely the starting point for *Bildung*; *Bildung* is part of the power play within social practice.

In Hegel's *Phenomenology*, the general motif of *Bildung* is failed identity. Consciousness can never gain the state of self-fulfillment. It is permanently in movement – it has the experience that it cannot come to rest, as it has to keep looking for itself in confrontation with others. As can be seen in the dialectic of master and servant, the subject does not live in accordance with itself because it is determined by the other. What Hegel describes is that we have to go beyond ourselves – and this is even the case when using the simplest words. For example, we say in strong conviction that “it is night” to find out very soon that this sensuous certainty fails us (Hegel PhG 84). So we are called to go beyond this former state of thinking, to not close ourselves in with what we thought is simply true. The path of our experience is structured by challenge and by our readiness to giving up the formerly self-evident views and insights (of objects and of ourselves).

Reading Hegel's ‘absolute spirit’ not as a formula of idealistic fulfillment but as the strongest presence of negativity and fallibility, we encounter a very different Hegel (Gamm 1997) than sometimes portrayed. The metaphysical absolute is replaced by the consciousness of unrest: “The language of inner conflict is, however, the absolute language and the true existing spirit of this entire world of *Bildung*. This self-consciousness is related to the exasperation that distorts its distortion. In an immediate way, it is absolutely identical precisely in the absolute conflictuality, the pure mediation of pure self-consciousness with itself” (Hegel PhG 384). What Hegel portrays here is the priority of nonidentity over the idea of knowledge as ‘final identification’. For Hegel, conflict and contradiction form the inner heart of knowledge production. To put it differently, the more we confront ourselves with the contradictions the richer is our view of reality.

Let me use the ‘principle of charity’<sup>14</sup> as an example in this regard. This principle requires speakers who are in conflict with one another to place their opponent's argument in the best light. This is to say that the opponent's utterances should not be taken up in a sophistic fashion. The principle calls for an ethos that turns its back to controversial rhetoric. It places the speakers in difference to their own position. They are forced to think of the other position as their own. Therefore, the principle demonstrates truth as difference (Gamm 1986) – a difference that is characteristic to every speaking.

This is in accordance with Hegel's relinquishment of the self. By confronting our position with its strongest opposition, we gain more insights of what we think ourselves – and furthermore, can see more clearly the relations to the position of the other. This not only widens the argumentational scope of the field that lies before us, it can also make us susceptible to other approaches, other placements of ‘relevant arguments’. In other words, there might be a recognition of otherness and difference. So the example of the principle of charity demonstrates the admittance of the other.

---

<sup>14</sup>Among others, Neil L. Wilson (1959) has re-established this principle, which has advanced as a central reference in the analytic philosophical tradition. See also Quine (1960).

Committing myself to the position of the other, I might arrive at seeing everything (the confrontation, my own position, the other) in a different way.

In this reading of Hegel, a strong emphasis is placed on the notion of negativity; for negativity is crucial in order to bracket consciousness' presupposed self-assertion, viz., the way it claims truth and knowledge. According to Hegel, truth and knowledge require exposition. The experience that we have in this exposition is the crucial point about *Bildung* as 'relinquishment of the self'.

### ***Bildung* and the 'Ethos of Modernity'**

In the first part of the chapter, it has been argued that '*Bildung*' forms the core of modern experience, for modernity is characterized by the breakup of traditional order. What comes up is the question of practice and along with it: '*Bildung*'. This concept precisely thematizes the task of human being's self-determination within the open and optimistic idea of modern progress. '*Bildung*' captures the endless self-transgression in modern experience. It is about the never-ending promise of becoming.

Referring to Schiller, Humboldt, and Hegel, different variations of modern *Bildung* have been presented. Schiller's letters on aesthetic experience present humans as beings of alienation and rupture. There is an irreconcilable tension of sensibility and rationality, of the sensuous and the formal drive. In play this tension presents itself as bracketed, it *appears* as being resolved; for in play a complex reality takes shape and allows for multiple sensuous and rational references. In this network (or root work) of references the answer to the question of who we are and what is going on in the situation at hand is opened and can be reformulated. This is the starting point for the transformation of the self, and Schiller was of the opinion that the transformation provoked by play will overcome the domination of rationality and recognize the aesthetic utopia of the state.

Humboldt describes the close relationship of language and *Bildung* in the roles they play in the constitution of reality. As speaking creatures we engage in a worldview; a worldview that is experienced as alien when confronted with another one. Humboldt's idea that all languages are different and irreducible forms a strong picture of modernity (until today). It connects *Bildung* with astonishment and liminality: We are confronted with the limits of our understanding – limits that might impact or affect our own lives; for it is a problem, then, to simply suppose a 'universal' that would encompass all particular world views. The experience of irreducible plurality requires us to confront ourselves with the language of the other. *Bildung* is precisely the mode of this confrontation (and not a result). Following Hegel, the experience of consciousness of itself has been placed in the foreground. Hegel sees it as a problem that consciousness places the limits and problems outside itself. The *Phenomenology* shows that consciousness can never reach identity with itself. We can only come to know ourselves on the terrain of otherness.

The readings in the second section present *Bildung* as a relation of difference: *Bildung* is not realized, but rather it exists in the form of a confrontation, of negativity and irreducible plurality. It has been argued that all three thinkers take identification and positive self-determination as a problem. Schiller determines humans in the context of a dual anthropology; Humboldt sees the ego at the edges of its worldview; Hegel, finally, describes the path of consciousness as relinquishment of the self. In each of these three positions, a criticism of metaphysics has been put forth in order to determine the significance of these readings for today.

With these readings in mind it is possible to criticize common philosophical views of modernity. It was Habermas who – in a famous lecture course on modernity (Habermas 1991) – presented modernity as determined by a limited concept of rationality, on the one hand, and who criticized the post-metaphysical thinking (Nietzsche, Heidegger, Derrida, Foucault) in its criticism of humanism as well as of philosophy, on the other. For Habermas, the modern criticism of Reason has maneuvered philosophy into a dead end, e.g., when Foucault discusses humanism as effect and process of disciplinary power. What Habermas suggests is to resituate modernity using the concept of dialogical reason. His own approach of ‘communicative action’ is, so to speak, the result of a particular philosophical reading of modernity.

The readings provided, here, show that modernity has indeed a much wider scope. The exemplary readings from Montaigne (1992) to Schiller (2000), Humboldt (2002), and Hegel (1970, 1990) emphasize the *opening* of Reason and the primacy of a skeptical reflection that can also serve as a point of departure for thinking *Bildung*. In these readings, there is space for difference, dispute, and dialogue. While Habermas’ view of communicative action is very strongly driven by the idea of consent, the readings presented here connect modernity to notions of negativity and irreducible difference. These concepts indicate that there is an auto-deconstructive move within modernity itself – and it might be this move that allows us to go back to these thinkers to provide (ever new) readings of a philosophy of *Bildung*; for is it not precisely the modern concept of experience that sets out the self in a permanent mode of transformation?

Lyotard, a thinker who discussed the margins of modernity, described the structure of experience as follows: “I am not anymore what I am and I am not yet what I am” (Lyotard 1998: 85). The modern experience of the self is about withdrawal. It is about the impossibility to declare one clear standpoint from which we could judge all our life or that of others. In a nutshell, this thought contains all the phenomena of educationally relevant modern *diachrony*, e.g., generational difference<sup>15</sup> in modernity. To be sure, the notion of diachrony is used, here, to name the problematization of tradition and the inconclusiveness of modernity. This also includes the readings of Hegel and other figures presented in this chapter. In other terms, the

---

<sup>15</sup>The example of generational difference can illustrate what is meant by ‘educational diachrony’: What is important to learn, according the older generation, is not accepted by the younger generation. Moreover, what the older generation thinks cannot suffice for the following generation because there will be new developments. The notion of generational difference is also important when it comes to framing theories of *Bildung* in order to escape solipsism in educational theory.

move to go back to these authors and engage with them can precisely be seen as modern, i.e., as an attempt to grasp the conceptual frameworks of experience. Thus, what is argued here is that the mode of educational-philosophical reflection in this chapter rests on the modern notion of experience, the notion that we have not anymore and not yet said what there is to say about Schiller, Montaigne, etc. This kind of educational-philosophical reflection complements the approach of conceptual history that was also presented in this chapter, and it is about reconstructing how concepts (of time and progress) shaped modern experience around the 1800s.

So far I have not only argued that the concept of *Bildung* has to be grasped and explicated in the context of modern experience, which is in turn connected with plurality, negativity, and the overcoming of the one-sidedness of rationality, but I have also argued that the form of engagement with philosophical authors and texts in order to ‘re-actualize’ their meaning for us is itself part of modernity. So there is space for speculation and conceptual experimentation (in a positive sense), which is something different from how Habermas has presented modernity – as a very clear and evident *positioning* of a discourse. If modernity, however, is not to be understood as a discursive succession of philosophical positions, but rather as a form of ‘ethos’ – understood in terms of a certain comportment to the past, present, and future that is conscious of the inconclusive side of modernity – then we arrive at the notion of *Bildung*.

In his shorter texts on Enlightenment, Foucault has developed this notion: the ‘ethos of modernity’ (Foucault 1984, 1996). Going back to Kant’s famous text on Enlightenment in the *Berlinische Monatsschrift*, Foucault emphasizes that the important move in this text is to *claim the question of the present*: What are the conditions and the phenomena that we live in today? How do we relate to them? So modernity is about the work of the present, and Paul Rabinow, the editor of ‘What is Enlightenment?’ (where Foucault takes up this ‘ethos of modernity’) has, indeed, pointed out an intimate relation between *Bildung* and ethos (Rabinow 2003: 3). In his own book, Rabinow explores a form of philosophical research that is founded in this ‘ethos of modernity’, which he refers to as ‘*Wissensarbeitsforschung*’ (Rabinow 2003: 83). Rabinow presents this, literally translated, ‘researching knowledge work’ as a kind of ‘fieldwork in philosophy’. The outstanding task involves the further elaboration of the current modes of educational-philosophical inquiry and to reconstruct how and in how far they are indebted to a particular notion of modernity. To be sure, this task has to wait for another opportunity. In the final paragraphs of this chapter, some inherent problems and limitations of the modern conception of *Bildung* should be expressed.

Over the course of this chapter, it has been argued that modernity has an auto-deconstructive move because it is bound to its inconclusiveness. This idea is in accordance with the way contemporary thinkers such as Derrida have conceptualized the history of metaphysics, that is, as something that cannot be overcome. However, it has not yet been discussed whether current (post-metaphysical) approaches employ other modes of philosophical reflection than presented here. In this context, one would have to reflect on the notion of immanence as proposed by

Deleuze and Guattari (see Sanders 2018, in this volume) or the notion of impotentiality by Agamben (Vlieghe 2013; Lewis 2013). Are these intellectual projects of a *different kind*? How do we speak about difference in the broader field of philosophy (of education)?

Our time might be particularly challenging in view of the current fragmentation of knowledge and discourse. The experience within the academic world, i.e., its integration into capitalism, but also the ongoing devaluation of knowledge and research that is so clearly visible in current politics can give the impression that the inconclusiveness of modernity has collapsed on itself. The openness of and commitment to progress has turned against itself: It has turned modernization into the pressure of adaptation.

This is the assessment that Adorno (2003) reaches in his analysis of *Bildung* and modernity. Turning toward the history of the civil society, Adorno shows in his ‘Theory of *Halbbildung*’ that the promise of freedom and equality for civil society was abandoned and (violently) overturned. Do the current developments still fit the analysis that Adorno provided at the end of the 1950s? While this is, indeed, a ‘modern question’, it is still unclear how it should be addressed. Without providing a further reading of Adorno, it might be argued that the current developments of a ‘post-factual era’ can be presented as a dialectic of modernity. However, this statement cannot serve as a substitute for the need and significance of further analyses into the current situation of public and academic discourse. So it is an important task to grasp this crisis of academia (which appears, at the same time, as a crisis of democracy and *Bildung*).

It has been argued in this chapter that it might be productive to draw on the philosophical traditions of modernity and *Bildung* in order to work on questions and problems, even if we might come to the conclusion that our attempts have failed. For this experience might also be telling – for as Montaigne claims: “We are never at home, we are always beyond. Fear, desire, hope project us toward the future and steal from us the feeling and consideration of what is, to busy us with what will be, even when we shall no longer be” (de Montaigne 1992: 8).

# Marx and the Philosophy of Praxis

Valerie Scatamburlo-D'Annibale, Brian A. Brown, and Peter McLaren

## Introduction

In the introduction to the first book in a contemporary series dedicated to Marx's contributions to pedagogical thought, the authors acknowledged that it was a "bleak time" for Marxist theory and research "in regard to education" (Green and Rikowski 2007, p. 3). Their sentiments were not without basis. In the halcyon days of postmodernism's apogee when the ideals of human liberation and social transformation were regarded as 'modernist', 'essentialist' forms of outmoded and 'totalizing' demagoguery, Marx was typically relegated to history's chilly attic of misguided dreams.

Yet, by the time the third text in the series was published in 2011, Marxists "had unexpectedly, unbelievably, come in from the cold" and there was an evident revival of interest in Marx's thought within the educational realm (Jones 2011, p. 1). Several events in the intervening years fueled this renewed interest including the 2008 global financial meltdown, the collapse of the world's largest economy, and the government bailout of American banks dubbed 'too big to fail.' And, there were, of course, various uprisings and anti-austerity movements challenging neoliberal economic policies in countries across the globe. Then came the Occupy Movement whose mantra 'We are the 99%' pointed to the obscene global disparities of wealth both between and within 'developed' and 'developing' nations. Expressions of popular outrage directed at the "deepening social contrasts highlighting social insecurity profiled against conspicuous elite greed" are increasing (Green 2012, p. x). Capitalism has reentered

common parlance and is being debated in contexts beyond specialist academic and marginalized radical discourses. It is being named as a deeply problematic system and is “less securely empowered” as the “unspoken silent signifier for political economy of *the-way-it-is*, the TINA dispositional default which cancels possibilities for recognition or thinking through alternatives” (Ibid, p. xii).

However, recognition of capitalism’s ‘problems’ is not enough; they require serious scrutiny. The guiding thread of such educational analyses

must be the contradictions of capitalist political economy, the structures, forms, and processes of the ways in which value is created through routine exploitation, demutualization, and concomitant devaluing of the creators, while empowering property and accumulated value for corporate and individual *haves* at the expense of the *have-nots*, thereby devaluing humanity in general (Green 2012, p. x).

As Kumar (2012) argues, capitalism is about the “perpetual destruction of human creativity and bringing into the ambit of capital circulation every possible aspect of our life”; neoliberalism simply “represents the most callous and aggressive form of this capital-on-offensive” (p. 1). Neoliberalism has ushered in the corporate domination of all aspects of society, subjecting the world’s population to the judgment, whims, and morality of capital. It supports state enforcement of the unregulated market, offers limitless concessions to transnational corporate entities, establishes the market as the patron of educational reform, and permits wealthy interests to control most of social life in the pursuit of profits for the few. Its quest for ‘flexible’ labor has resulted in precarious conditions for many, including the well educated, for which the guarantee of social and economic security is nothing more than a faint memory of a bygone era. As we write, the gap between the rich and poor continues to widen as we observe, with horrifying regularity, a grotesque concentration of social, political, and especially economic power in the hands of the few.

In this context, we suggest Marx’s enduring relevance should not be underestimated. Most of his life was spent studying capitalism for he was committed to its abolishment so the potentialities of humankind could be realized for the benefit of all rather than being exploited by the few. Of course, today’s global capitalism is different from those earlier industrial forms he analyzed but it is “certainly not less class based” (Standing 2014, p. 10). Moreover, Marx’s “sketch of history remains remarkably prescient” and it continues to ground “many of the most persuasive visions of our own moment” (Kunkel 2017, p. 32). As such, Marx’s *fundamental* insights into capitalist formations still carry considerable conceptual weight. It is, therefore, imperative neither to approach his *oeuvre* as an inert body of ideas for mere contemplation nor to simply describe his philosophical influence on educational thought. Rather, his materialist formulations can be engaged as educative tools – Marxism as education – for challenging the reproduction of capital.

The guiding thread woven throughout this chapter is the ‘philosophy of praxis’ – a dialectical synthesis of theory and practice oriented toward transforming extant social relations. Praxis emphasizes the reflective human capacity to alter the natural and social world, sheds light on the historical specificity and structural foundations of that world, our ideological formation within it, and the conditions in which antagonisms take root. In so doing, it helps us to grasp the mutually constitutive

relationship between subjectivity and the objective, material world. In what follows, we begin with an overview of the key tenets of historical materialism in order to contextualize the philosophy of praxis and then proceed to examine how two of the most cited figures in educational thought – Antonio Gramsci and Paulo Freire – incorporated and expanded upon Marx’s revolutionary formulation.

## Historical Materialism

Historical materialism is not a phrase Marx himself used – he preferred ‘the materialist conception of history’, – and while scholars have long debated the degree to which there exists a conceptual continuity between the ‘early’ and ‘late’ Marx, few would refute the materialist core of his worldview reflective of his focus on modes of production, the production of ideology, and forms of consciousness.

### *Modes of Production and Capitalist Social Relations*

For Marx and Engels (1978), the “first premise of all human history” is the existence of humans who distinguish themselves from animals based on how they “*produce* their means of subsistence” and “their actual material life”. This mode of production is a “definite form of activity”, a “definite form of expressing their life”. What humans ‘are’, therefore, coincides both “with *what* they produce and with *how* they produce”, and depends “on the material conditions determining their production” (pp. 149–150). The human necessity to produce and reproduce thus underwrites all social relationships.

A mode of production comprises the entire complex of social life at a specific stage in history, including human actors as productive forces – that is, how they work to produce forms of sustenance – as well as relations of production which refer to the sum total of social relations humans establish in the production of their material lives. Taken together, productive forces and relations of production (the latter includes the economic relations between groups of people – i.e., forms of class structure) constitute the conditions in which people work to produce/reproduce the world. From a materialist perspective, history can be viewed as a succession of various modes of production each of which generates different sets of relations between the exploiting and exploited classes.<sup>1</sup>

The capitalist mode of production is based on private ownership of the means of production and was quite different from the ancient and feudal systems that preceded it. Within societies shaped by slave and serf labor, exploitation is blatant; the threat of physical violence ever-present. Under capitalism things *appear* to be

---

<sup>1</sup>This notion of a succession of modes of production enabled Marx to critically historicize economic categories (e.g., wages and profits) that were conceptualized as timeless by political economists such as Adam Smith and David Ricardo.

different. Workers are legally 'free;' they are not bound to the capitalist in the way the slave is to the master nor the serf to the lord and are presumably able to sell or withhold their labor power. However, this freedom is illusory insofar as they become dependent on the sale of their labor capacity or risk "begging, vagabondage and robbery" as their "only source of income" (Marx 1973, p. 507). Within capitalism, then, exploitation is concealed and depends not on outright coercion but on the economic necessity to sell one's labor to capitalists for a wage.

The basic principle of capitalism is the "sanctification of private (or corporate) profit rooted in the extraction of surplus labor (unpaid labor) as surplus value from the labor-power of workers" (Hill 2012, p. 72). Labor-power is a commodity bought and sold on the market. Yet, it is different from other commodities since it is able to create value. This is its usefulness to capital for it is the extraction of surplus value from waged labor for the purpose of producing capital – wealth used to make more wealth – that is the ultimate aim.

In theorizing capitalism as a *social* relation, Marx identified the historical specificity of value-producing labor. For Marx (1967), the value of any given commodity is determined by "the labour-time socially necessary ... to produce an article under the normal conditions of production, and with the average degree of skill and intensity prevalent at the time" (p. 41). Commodities are exchanged in the market at costs that correspond to the necessary labor time embodied in them. However, surplus value is realized when a commodity is sold or exchanged for more than its labor value. When an individual works beyond what is necessary to ensure his or her survival, he/she is generating surplus value. To "extract the greatest possible amount of surplus-value, and consequently to exploit labor-power to the greatest possible extent" is the "directing motive, the end and aim of capitalist production" (Marx 1967, p. 331, as cited in Kelsh and Hill 2006, p. 4). Capitalists "must exploit their workers if they are to remain in business" since "exploitation is the fuel that moves capitalist production and exchange". Without "surplus value there would be no wage employment, no capitalist production, and the system would grind to a halt" (Saad-Filho 2003, pp. 35–36).

This remains the case despite manifold changes to the technological 'means of production' that have led some to conclude that we now live in an era of immaterial economies (cf. Lazzarato 1996; Hardt and Negri 2000). The notion of immaterial labor posits a constitutive change in capitalist relations brought about by the innovations of new technologies, the growth of service industries, and of knowledge work and suggests that a reconceptualization of labor and value is necessary because the relationship between them has changed since Marx's day. However, we agree with Ollman (2004) who acknowledges that while capitalism has "changed a great deal since Marx wrote" in many ways it "has changed not at all since that time". As he further notes,

the main structures of capitalism – that workers have to sell their labor power to capitalists in order to survive, that capitalists use their control over this labor to produce value and surplus value, that everything that workers produce carries a price and goes into the market ... have changed hardly at all since Marx wrote. And these are the basic structures, relations and processes ... that Marx devoted most of his life to studying.

Here Ollman implies that while some theorists of immaterial labor state that capital no longer relies on the exploitation of labor as the source of new value, there has not,

in fact, been a *substantive* transformation in the capital-labor dynamic. When the market capitalization of prominent exemplars of the immaterial economy (e.g., Microsoft, Amazon, etc.) is considered alongside Marx's economic formulations, calling immaterial labor exploitative is, arguably, justified. Not only can the 'waged immaterial labor' of the type done by Google or Amazon employees be regarded as exploitative, so too can all of the 'unwaged immaterial work' being done, for example, by so-called 'users' of social media sites and services (Brown 2013). Additionally, Fuchs is quite persuasive in his contention that the unpaid work done by 'users' on platforms such as Facebook, Twitter, Snapchat, etc., constitutes a situation of "infinite over-exploitation" (2011, p. 298). That 'users' do not often recognize the work they perform on social media sites as *work* further emphasizes the need to understand Marx's essential insights into the labor-capital relationship for while the location of production and the technological means of production may have changed, the exploitative relationship between owner and (un)waged worker has not.<sup>2</sup>

Unfortunately, the fundamental, exploitative basis of capitalism is rarely addressed in dominant educational discourses that too often ignore or render incomprehensible the historical specificity of the capitalist mode of production; capitalism simply becomes naturalized and normalized. Schooling is part of the way in which students (especially working class students) "mistakenly naturalize the social system, personalize success and failure, and, relating it to their schooling experiences, internalize the demands of the methods of production as self-evident laws of nature" (Green 2007, p. 18).

Since capitalism is a system based on the imposition of universal commodification, including, centrally, the buying and selling of human labor, it tends to reduce all activity to the law of value and the socially imposed law of exchange. Under "this classificatory grid – this 'classing' of the world – human subjects figure only as so much labor power" (Dyer-Witheford 1999, p. 9). This form of reductionism, unique to capitalism, has a totalizing grip on the planet. While other dominations such as sexism and racism are also reductive, neither "patriarchy nor racism has succeeded in knitting the planet together into an integrated, coordinated system of interdependencies. This is what capital is doing today ... it is subsuming every other form of oppression to its logic" (Ibid, p. 10).

The power of historical materialism lies in its ability to reveal how all forms of social oppression under capitalism are mutually interconnected and linked to its central organizing principles. In the totalizing logic of commodification, the specific antagonism is between labor and capital. The relationship between labor and capital, however, is not symmetrical. While capital depends on labor that it must permanently exploit, Marx illustrates how capital is relative, historically specific, and, therefore, historically surmountable. Capital, as a "relation of general commodification predicated on the wage relation, needs labor. But labor does not need

---

<sup>2</sup>Some have suggested that the very notion of immaterial labor has worked to obscure the basic reality of life in which the condition for survival still depends upon the ability to sell one's labor power and has assisted capital in establishing the ideology that in a world of immaterial labor, capitalism has moved beyond exploitation (Camfield 2007; Cotter 2008).

capital. Labor can dispense with the wage, and with capitalism, and find different ways to organize its own creative energies” (Dyer-Witheford 1999, p. 68).

Indeed, Marx envisaged education and free time as essential to the development of one’s full potential and humanity. Whereas, capitalism created conditions in which “man’s own deed becomes an alien power opposed to him, which enslaves him instead of being controlled by him” and in which a singular, particular sphere of activity is “forced upon him”, in a noncapitalist society, nobody would be confined to one exclusive sphere of activity but could become “accomplished in any branch he wishes”. It would be possible for one “to do one thing today and another tomorrow, to hunt in the morning, fish in the afternoon, rear cattle in the evening, criticise after dinner, just as I have a mind, without ever becoming hunter, fisherman, shepherd or critic” (Marx and Engels 1978, p. 160). This points to the ideal of a nonalienated existence, one in which individuals forge alternative forms of social production that ‘humanize’ humans and transcend the dehumanizing tendencies of capitalism which produces divided selves.

Through the notion of alienation, Marx established a contrast between extant alienated labor in which labor-power is transformed into a commodity and the worker reduced a mere ‘thing’ and the ideal of nonalienated labor encapsulated in his concept of ‘species-being’ by which he meant the humanness of humanity, as constituted by our capacity for collective and creative production. The source of alienation in capitalist society stems from the fact that the “overwhelming majority of people” have to labor for a wage “in order to ensure physical survival” and a semblance of dignity while a minority “owns and controls the means of production”. A worker, therefore, hands over “effective control of his or her labor – in other words, his or her species being” (Brook 2011, p. 97). For Marx, the full development of humanity can only be realized outside of capital’s value form. And, since it is the working class that is radically alienated from its species being, it is in a unique and powerful position to challenge capital at its core.

The primacy Marx accorded to class has been the subject of much debate and those working in the Marxist educational tradition have often been castigated for privileging it over other conceptual categories. While it is beyond our purview here to engage these debates in depth as we have elsewhere (cf. Scatamburlo-D’Annibale and McLaren 2004, 2009), resistance to historical materialism is generally premised on the assertion that foregrounding class undermines other ‘forms’ of ‘difference.’ However, constructions of ‘difference’ (e.g., race, gender, etc.) are structurally implicated in the international division of labor. Social class is the “inevitable and defining feature of capitalist exploitation, whereas the various other forms of oppression are not *essential* to its nature and continuation, however much they are commonly functional to this – and however obviously racialized and gendered capitalist oppression is” (Hill 2012, p. 74). Having a concept of class

helps us to see the network of social relations constituting an overall social organization which both implicates and cuts through racialization/ethnicization and gender ... [a] radical political economy [class] perspective emphasizing exploitation ... takes the issues of ... diversity [and difference] beyond questions of conscious identity such as culture and ideology, or of a paradigm of homogeneity and heterogeneity (Bannerji 2000, p. 7, 19).

It is not Marxism that recognizes no differences; rather, these differences are abolished by capitalism that turns all humans into vessels of production. ‘Difference’ is encapsulated in the production/reproduction dialectic of capital, resulting in an acutely polarized labor market in which disproportionately high percentages of ‘people of color’ (especially, ‘women of color’) are trapped in the lower rungs of domestic and global labor markets and provide capital with its super-exploited labor pools. Undermining the “significance of class as a category that cuts across diverse forms of social divisions as well as the way it impacts and influences the systemic aspects of the world within which we live” disconnects “everyday human existence from the larger system where labor-capital conflict constitutes the basis of existence ... [it] is largely this disconnection, which has allowed the intrusion of capital in every aspect of our life (and now in its most aggressive form under neoliberalism) to become normative” (Kumar 2012, p. 3).

It is not that “some individuals manifest certain characteristics known as ‘class’ which then results in their oppression; on the contrary, to be a member of a social class just is to be oppressed”, and in this regard, class is “a wholly social category” (Eagleton 1998, p. 289). Although all categories are social, class is the “quintessence of the social”; unlike other categories, class cannot be determined except by the “position of the individual in society, and cannot be reproduced except through participation in the functioning of an economic system ... Class ... was created by capitalism” (Kagarlitsky 2000, p. 95). Class, then, is not merely another ideology serving to legitimate oppression; rather, it denotes exploitative relations between people mediated by their location in relation to the means of production.

Class has an objective existence as an empirical category and a subjective existence in terms of how it is lived and interpreted. Forms of ‘culturalism’ that have taken hold in contemporary educational thought cleave class from the relations of production and treat it merely as a subjective phenomenon that is culturally determined. Class is effectively cut off from the political economy of capitalism in which those who control and benefit from collectively produced resources only do so because of the value generated by those who do not. Culturalist narratives often confuse class with ‘class consciousness’, the latter of which is conditioned by social forces. Merely because individuals might not consciously articulate their sense of self/identity in terms of class or possess ‘class consciousness’ does not negate the fact of their objective location within larger class structures. This much Marx well understood for he postulated a clear distinction between the objective nature of class and the subjective aspects of class consciousness.<sup>3</sup> Writing about the French peasantry, he noted that

In so far as millions of families live under economic conditions of existence that divide their mode of life, their interests and their culture from those of the other classes, and put them in hostile contrast to the latter, they form a class. In so far as there is merely a local interconnection among these small peasants, and the identity of their interests begets no unity, no national union and no political organisation, they do not form a class (Marx 1978, p. 608).

---

<sup>3</sup>Although Marx himself rarely used the phrase ‘class consciousness’, he did distinguish between a class in itself and class for itself in the ‘18th Brumaire’ and elsewhere.

Marx took great pains to “stress that social class as distinct from economic class necessarily includes a political dimension, which is in the broadest sense of the term ‘culturally’ rather than ‘economically’ determined” and that “class consciousness does not follow automatically or inevitably from the fact of class position” (Hill 2007, p. 82). This goes to the distinction between class ‘for itself’ and ‘in itself’. A ‘class-for-itself’ consists of members who are conscious about their commonalities; they form a group with shared interests and pursue them collectively. A ‘class-in-itself’ refers to members of a group who share a similar position in society’s economic structure but are largely unaware of their membership in the group and who consequently do not pursue their interests in a collective manner. In the contemporary world, it is the capitalist class that “does not lack class-consciousness, the subjective appreciation of its common interest, and its relationship within the means of production” (Hill 2007, p. 83).

### *The Production of Ideology*

Within historical materialism, ideology is not a ‘thing’, nor an ossified set of ideas; it is an embodied, lived, and dynamic set of social practices. Marx drew attention to ideology as an *epistemology*; he focused on the methods of knowledge production that de-historicize and depoliticize social understanding and serve to abstract and fragment social life. Marx and Engels expose the practices of ideologists who disembed “everyday ideas, events, and experiences” from their “originating social relations and interests” (Bannerji 2011, p. 53). Considering ideology as an epistemological maneuver used in the process of de-contextualization, Marx and Engels reveal how this is accomplished by the use of what they call ‘tricks’. Bannerji (2011) paraphrases them thusly:

We can begin by ‘considering the course of history’ by ‘detach[ing] the ideas of the ruling class from the ruling class itself and attribute[ing] to them an independent existence.’ Having detached them from their specific social and historical locations, we now ‘confine ourselves to saying that these of those ideas were dominant at a given time, without bothering ourselves about the condition of production and the producers of these ideas.’ Now we have a set of ideas or discourses independent of their social ontology. They appear to generate each other, appear even *sui generis*, but are claimed to be shaping, even creating, the very social realities that gave rise to them in the first place ... Only ‘if we ignore the individuals and world conditions which are the source of these ideas,’ says Marx, then we truly produce ‘ideology’ (p. 53)

Ideological methods/tricks sever ideas from their historical emergence and articulation within specific social/power arrangements. This “pulling apart of the social world is a political project” for such fragmentation “obscures the relationships between various social phenomena” and “experiences of exploitation” (Carpenter and Mojab 2011, p. 11). In an educative sense, Marx’s epistemology underscores a recognition that knowledge itself is historically specific and always in the making:

Rather than relating knowledge as if it were a thing to be acquired or possessed, with Marx’s epistemology, knowledge is a tool that we use to delve deeply into reality, and it is

a tool that we constantly test in order to ascertain whether it is enabling us to develop a more complex and comprehensive understanding of the world and our existence and experiences within it. We also test it to determine whether it enhances our ability to transform ourselves simultaneously with our immediate social relations, i.e., the social relations within which we are learning (Allman 2007, p. 61).

Although Marx's main focus was the method by which ideology is produced, he was also concerned with the thought content/ideas generated. Since they are ideas of ruling, they must be engaged as part of political practice. This requires contextual understanding and directs attention to who is producing ideas, for whom, for what purpose, and under what material conditions. In the realm of education, such a formulation directs us to examine where our social forms of consciousness are derived from; to ask how do we know what we know and where do our forms of knowledge come from? It accentuates the ontological dimensions of the 'social' and seeks to illuminate the material conditions undergirding the production of particular knowledges so as to reveal the contradictions that enable the circulation of certain ideas to the exclusion of others. It inquires not only as to what is said, but also into "what is not said, into the silences and the suppressed or missing, in order to uncover the concealed operations of power and the socio-economic relations connecting the myriad details and representations of our lives" (Ebert 1996, p. 7). In this sense, it is intricately linked to Marx's theory of consciousness.

### *Marx and the Social/Forms of Consciousness*

Marx's theory of consciousness grew out of what, in retrospect, may appear to be an abstract philosophical debate about Hegelian idealism. After Hegel's death, a group of radical philosophers (the 'Young Hegelians') – of which Marx was initially a member – began to challenge his idealist worldview. However, Marx eventually broke away from the group over a fundamental question: Who makes history and how is it made? In the Hegelian system, history was made, determined, and advanced by and through the development of human consciousness that existed exclusively in the mind or 'spirit'. Idealism essentially separated ideas from the material world and then designated them as "the creators or causes of real phenomena" (Allman 1999, p. 36). Ideas were perceived of as temporally prior to reality and the categories of thought used to interpret the world treated as if they were the underlying dynamic – the driving forces of history.

As a prominent 'Young Hegelian', Feuerbach developed a form of materialism that transformed the traditional subject of idealist philosophy into a predicate, and the traditional object, 'man', into a subject. By privileging 'man' rather than mind/spirit as the focus of philosophical contemplation, Feuerbach believed one could produce a more radical, secular worldview – a corrective to the abstractions (and quietist, conservative aspects) of Hegelian metaphysics. While Marx was initially drawn to Feuerbach, he eventually became a critic of both idealism and materialism for they created a dualism, a separation between thought and reality that led to a

reified way of thinking that he sometimes described as ‘thingness’. Marx believed the real world and consciousness should be understood relationally rather than as separate ‘things’. The “real world was, and always would be, changing and developing, and therefore it was historically specific” (Allman 1999, p. 37). Unlike the idealist view of history that in every period looks “for a category”, Marx and Engels (1978) believed it was necessary to remain “constantly on the real *ground* of history”. Rather than explaining “practice from the idea” it is important to explain “the formation of ideas from material practice” (p. 164).

While for Hegel and the Young Hegelians alike consciousness determined life and the course of history, Marx believed it was not the consciousness of humans that determined their being, but their social being that determined their consciousness. Consciousness is therefore understood as a social product but this does not undermine the capacity for human agency as some have claimed. For Marx, one of the flaws of both Hegel’s idealism and Feuerbach’s materialism was a passivist view of human existence. In both, human agency was the subtext rather than the ‘engine’ of history; “history and reality moved around and passed people, as if people were passive observers of a world moving without them” (Carpenter and Mojab 2011, p. 120). Marx believed that just as circumstances help to form human beings, human beings also help to form circumstances; they are not passive actors of historical processes. Consciousness and the activities of real people cannot be separated: “men are the producers of their conceptions, ideas, etc., – real, active men, as they are conditioned by a definitive development of their productive forces” (Marx and Engels 1978, p. 154).

This nonreductive materialism represented a decisive shift from Feuerbach’s formulations in which reality and sensuousness remained ‘objects’ to a materialism rooted in sensuous, human activity and practice. At issue here, however, is more than a theory of consciousness. In Marx and Engels’ new materialism, the active subject is restored to real-life processes, methods of inquiry that pertain are in the world, not separated from it and hence enable a form of practice explicitly linked to political possibilities. By combining a revolutionary approach to both being (ontology) and knowledge (epistemology) and positing “the inseparable unity of active existence with thought”, they had “created a theory of praxis (rather than simply one of consciousness) that linked thought and action” (Allman 1999, p. 40).

## Gramsci and the Philosophy of Praxis

The ‘philosophy of praxis’ is the theoretical nucleus of much of Gramsci’s thinking. An oft-ambiguous concept, the phrase was deployed as a linguistic camouflage and “euphemism to deceive the censor” (Hoare and Smith 1971, p. xxi). Imprisoned by fascist dictator Benito Mussolini, most of Gramsci’s *oeuvre* was composed in prison and subject to redaction. Hence, his use of the philosophy of praxis was essentially “a synonym for Marx’s historical materialist method” (Hill 2008, p. 7) as well as part of his polemic against deterministic and mechanical interpretations of Marx (Allman 1999).

Gramsci understood that humans do not make history in a cultural interregnum disinfected of the social, rather human agents

make their own history, but they do not make it as they please; they do not make it under self-selected circumstances, but under circumstances existing already, given and transmitted from the past. The tradition of all dead generations weighs like a nightmare on the brains of the living. And just as they seem to be occupied with revolutionizing themselves and things, creating something that did not exist before ... they anxiously conjure up the spirits of the past to their service, borrowing from them names, battle slogans, and costumes ... (Marx 1963, p. 1).

For Gramsci, the consciousness transforming potential of a philosophy of praxis may assist in lifting the weight of historical nightmares alluded to by Marx, leaving in their stead collectives free to envision and create new relations within which they could realize their “human potential to plan and direct” the historical future (Allman 1999, p. 11). However, the explanation of why individuals and collectives revert to modes of thought/action conjured from the hymns of nightmares past is explored by Gramsci via his interpretation of hegemony.

In Gramsci’s work, hegemony and its dialectical foil, counter-hegemony, are the conceptual anchors that ground an appreciation of the importance of ‘education’ – understood in the broadest sense possible – to either the defensive maintenance or revolutionary transformation of a given social order (Mayo 1999). One of his central insights is that physical force is, by itself, an insufficient mechanism of suasion. Like other socialist intellectuals of his era, Gramsci was trying to grasp why worker’s revolutions had not occurred in the West. Through his various investigations, he concluded that within Western ‘democracies’ there had to be two stages of revolution since power is exercised and consent manufactured not just through the political state, as was the case in pre-revolutionary Russia, but also within the sphere of ‘civil society’ inclusive of educational institutions.<sup>4</sup> In modern capitalist nations with ‘liberal-democratic’ institutions such as those that existed in the 1920s Italian context he examined, the dominant class gains consent to its rule, in large part, through the exercise of ‘hegemony’. Given that reality, Gramsci maintained that any socialist movement would have to undertake an extended campaign of organization and education in order to wrest cultural and political leadership from the dominant capitalist class. The building of oppositional or counter-hegemonic movements must therefore take place in the context of struggle in which class resistance and intellectual combat are dialectically related (McNally 1997; McLaren 2000).<sup>5</sup>

Hegemony denotes those processes through which beliefs commensurate with the interests of the dominant class are woven throughout the entire social fabric.

---

<sup>4</sup>Gramsci distinguished between the state which he viewed as an oppressive instrument used by the dominant class to exert control – through force when necessary – and civil society which is the sphere in which a dominant class seeks to garner consent to its rule through institutions such as schools, media, etc.

<sup>5</sup>As some of us have argued elsewhere, while some suggest that Gramsci precipitated a conceptual shift from Marx’s class-based focus to a form of neo-Marxism in which the struggle for cultural/discursive hegemony trumps class struggle, such interpretations are, arguably, suspect for they take Gramsci’s critiques of certain overly economistic/deterministic versions of Marxism to mean that analyses of economic/class relations are epiphenomenal to cultural considerations (Scatamburlo-D’Annibale and McLaren 2008).

Achieving hegemonic control of a population is the condition of a dominant class no longer having to resort to force so as to manipulate the thought processes and actions of the ruled. Rather, it refers to the “consent of the led, a consent which is secured by the diffusion and popularization of the world view of the ruling class” (Bates 1975, p. 352). Hegemony is thus a commonly shared value consensus but one which is, nonetheless, constructed in the interests of the ruling class (Gramsci 1971). Securing consent is not a one-time process. As a result of the dominant class’ constant need to repopulate and regenerate the ideological content of civil society’s collective consciousness with perspectives congruent to its interests, as well as to immunize against ideas that may challenge it, the work of hegemony is ongoing since it is never absolute nor uncontested but open to challenges by opposing forces seeking to make evident the fallacies, oppressions, and exploitations lying just beneath the ideological veneer of taken-for-granted ‘normality’.

The creation and maintenance of hegemony is a matter of intellectual and moral leadership and is materially produced by conscious agents. Gramsci (1971) made a distinction between ‘organic’ and ‘traditional’ intellectuals. Organic intellectuals are those which a major social class creates for itself; they are tasked with promulgating the ideas and objectives of the class from which they are derived in order to provide it with “homogeneity and an awareness of its own function not only in the economic but also in the social and political fields” (p. 5). Traditional intellectuals were those ecclesiastics, scholars, etc., who “experience through an ‘*esprit de corps*’ their uninterrupted historical continuity and their special qualification” and hence fancy themselves as “autonomous and independent of the dominant social group” (Ibid, p. 7). For Gramsci, this independence was illusory and he exposed as mythical the notion of intellectuals as a distinct social category independent of class; similar to arguments made by Marx and Engels in *The German Ideology*, he believed their ignorance of their own location within the capitalist division of labor was the source of their erroneous theoretical musings. However, Gramsci’s major preoccupation was the extent to which the working class could generate its own intellectual force, one capable of leading people in counter-hegemonic struggles on behalf of their class interests (educating them to become a class-for-themselves) that could potentially abolish capitalism’s exploitative economic and social order.

Gramsci distinguished between common sense, ideology, and the philosophy of praxis. He stressed that “all men *(sic)* are philosophers” (1971, p. 323) insofar as all people hold some conception of the world. However, common sense is “fragmented due to the limitations and contradictions of our lived relations” (Allman 1999, p. 112). Those who create ideological forms of knowledge draw upon those fragments, offering partial explanations, but they “do so with a coherence capable of organizing people and cementing the hegemony of a particular ruling group” (Ibid). For Gramsci, the philosophy of praxis was a superior conception of the world, a thorough understanding of the social as shaped by the material conditions of production, a form of knowledge that stands in opposition to ideology since it attends to the analysis of the *origin* of ideas and thus has a contextualizing rather than decontextualizing impetus.

In relation to socialist struggle, Gramsci (1971) implied that leaders should problematize people's already existing thought (common sense); his political strategy is therefore based on a radical/critical education process that is collective and dialogical:

An historical act can only be performed by 'collective man,' and this presupposes the attainment of a 'cultural-social' unity through which a multiplicity of dispersed wills, with heterogeneous aims, are welded together with a single aim, on the basis of an equal and common conception of the world ... great importance is assumed by the general question ... of collectively attaining a single cultural 'climate' ... and must be related to the modern way of considering educational doctrine and practice, according to which the relationship between teacher and pupil is active and reciprocal so that every teacher is always a pupil and every pupil a teacher. But the educational relationship should not be restricted to the field of the strictly 'scholastic' relationships ... This form of relationship exists throughout society as a whole ... Every relationship of 'hegemony' is necessarily an educational relationship (pp. 349–350).<sup>6</sup>

In such a context, the notion of the organic intellectual takes on a collective character within a working-class social formation in which the role of theory is organically linked to the ebbs and flows of daily proletarian life and in which these intellectuals live their lives in an ongoing state of praxis (Fischman and McLaren 2005). Moreover, Gramsci's prioritization of an organic form of education emphasizes willfully ignoring the institutional boundaries that have historically confined it so as to denude the ideological distortions that cage human creativity and activity in ways that limit its transformative potential.

By actively engaging politically with others, rather than imposing ideas on them, organic intellectuals begin with people's concrete perceptions of their world (their limited praxis) and help them achieve a more critical conceptualization – one that lays bare the mystifications of 'common sense'. Gramsci, like Freire years later, urged organic intellectuals to forge a relational knowledge of, and with, the masses of workers to help them become self-reflective. His understanding of the indissoluble link between theory and practice requires active participation in all facets of the quotidian (and sometimes extraordinary) struggles of the working class and an investment in their future beyond the social universe of capitalism.

Organic intellectuals of the working class not only resist hegemonic processes but also strive to displace the existing order by leading the 'class-in-itself' to more elaborate forms of understanding capital's incessant drive for expansion, the antagonistic relation between labor and capital, and the political and ideological nature of class rule. The characteristics of consent and coercion that underwrite Gramsci's model are dynamic categories and therefore are capable of being adapted in counterhegemonic practices in which workers may be educated about the persuasive power of capitalist hegemony. In the contemporary context, this means acknowledging the root of capitalist exploitation within the extraction of surplus value and the potential for resistance that resides with workers on whom the system of capital

---

<sup>6</sup>This conception of the educational relationship is one of Gramsci's many mediations on Marx's third Theses on Feuerbach – namely that the educators must be educated.

depends, even in the technology-driven world of the 'information economy' that supposedly thrives on 'immaterial' labor (Fischman and McLaren 2005).

As well, these organic intellectuals serve as role models who articulate the possibilities of workers to act as members of a 'class-for-itself' in order to secure a more equitable system of societal organization which, for Gramsci, took the form of a socialist society committed to uprooting value production and breaking from capitalism's pernicious logic (Ibid). Although the philosophers of praxis/working class organic intellectuals may at first be a small group, their historical task is to help others develop a revolutionary way of thinking about the relationship between 'knowledge' and 'being', to become themselves philosophers of praxis in the struggle to regain their humanity.

## Paulo Freire and the Liberation of the Oppressed

Like Gramsci, Freire was greatly influenced by Marx's theory of consciousness and his conceptualization of ideology – not as a thing – but rather as explanations, actions, and symbols that are “really only partial and fragmented and therefore distorted” (McLaren 2015, p. 141). In *Pedagogy of the Oppressed*, Freire analyzes the relationship between oppression and liberation in the context and historical development of capitalism and capitalist schooling. His pedagogical project seeks to transform individuals from being objects of educational processes and the mere receptacles of knowledge via what he called the 'banking method' of education, to empowered subjects able to participate actively in their own self-liberation. Although there have been attempts to domesticate Freire in the service of liberal/neoliberal education, his own writings (rather than interpretations of them) reveal a commitment to social transformation:

Dehumanization, which marks not only those whose humanity has been stolen, but also (though in a different way) those who have stolen it, is a *distortion* of the vocation of becoming more fully human. This distortion occurs within history; but it is not an historical vocation. Indeed, to admit of dehumanization as an historical vocation would lead to either cynicism or total despair. The struggle for humanization, for the emancipation of labor, for the overcoming of alienation, for the affirmation of men as persons would be meaningless. This struggle is possible only because dehumanization, although a concrete historical fact, is not a given destiny but the result of an unjust order that engenders violence in the oppressors, which in turn dehumanizes the oppressed. Because it is a distortion of being more fully human, sooner or later being less human leads the oppressed to struggle against those who made them so (Freire 1970, p. 28).

Similar to Marx's notion of 'humanization', Freire's pedagogy is dedicated to the historical, material, and situationally specific needs of humanity. His contact with Brazilian peasants in his early years shaped his subsequent assent to popular revolts against economic exploitation in Latin America and elsewhere. A central task is challenging both the logic of commodification and the pursuit of profit:

The oppressor consciousness tends to transform everything surrounding it into an object of its domination. The earth, property, production, the creations of men, men themselves, time – everything is reduced to the status of objects at its disposal. In their unrestrained eagerness to possess, the oppressors develop the conviction that it is possible for them to transform everything into objects of their purchasing power ... money is the measure of all things, and profit the primary goal. For the oppressors, what is worthwhile is to have more – always more – even at the cost of the oppressed having less or having nothing. For them *to be is to have* and to be the class of the ‘haves’ (Freire 1970, p. 44).

For Freire (1970), it is the location of the oppressed within structures of domination that positions them as agents of transformative change for they most acutely “suffer the effects of oppression” and therefore grasp the “necessity of liberation” (p. 29). But liberation will not be gained “by chance but through the praxis of their quest for it, through their recognition of the necessity to fight for it” (Ibid).

As in Marx and Gramsci, the concept of praxis is central to Freire and similar to Gramsci, he understands revolution to be a process with a significant educational component. He stresses that pedagogy must be forged *with*, not *for*, the oppressed and that educators/leaders must engage dialogically with them. Like Gramsci’s working class organic intellectuals, the task of educators is to work with people so they develop their capacity for praxiological modes of thinking that ultimately lead to action. Their role is not to tell people what to think but to enable them to think critically. The pedagogy of the oppressed has two distinct stages:

In the first, the oppressed unveil the world of oppression and through the praxis commit themselves to its transformation. In the second stage, in which the reality of oppression has already been transformed, this pedagogy ceases to belong to the oppressed and becomes a pedagogy of all men in the process of permanent liberation ... In the first stage this confrontation occurs through the change in the way the oppressed perceive the world of oppression; in the second stage, through the expulsion of the myths created and developed in the old order, which like specters haunt the new structure emerging from the revolutionary transformation (Freire 1970, p. 40).

Freire (1970) recognized, however, that the first stage must deal with the “problem of the oppressed consciousness” insofar as the perceptions of the oppressed may be “impaired by their submersion in the reality of oppression” and “conditioned by the myths of the old order” (p. 30, 31). Hence, “critical and liberating dialogue, which presupposes action, must be carried on with the oppressed” and the content of that dialogue “can and should vary in accordance with historical conditions” (Ibid, p. 52). At all stages of the pedagogical process, the oppressed must see themselves as fully engaged in the “ontological and historical vocation of becoming more fully human” (Ibid.).

Moreover, the insistence that the oppressed engage in “reflection on their concrete situation is not a call to armchair revolution. On the contrary, reflection – true reflection – leads to action”; this action constitutes “an authentic praxis” which becomes the “new *raison d’être* of the oppressed” (Freire 1970, pp. 52–53). In order to achieve this praxis, however, it is “necessary to trust in the oppressed and their ability to reason”, (p. 53) in their ability to critically comprehend the conditions of their being and how they are shaped by the dehumanizing social relations established by the oppressor. While Freire contends that leaders must trust the capacities

of the oppressed, he does not imply they simply accept their perceptions of reality. Rather, the perceptions must be “re-presented as a problem” since they may be “permeated by the dominant class’s ideology” (Allman 1999, p. 95).

This form of “[p]roblem-posing education is revolutionary futurity . . . it affirms men as beings who transcend themselves, who move forward and look ahead . . . for whom looking at the past must only be a means of understanding more clearly what and who they are so that they can more wisely build the future” (Freire 1970, p. 72). It also “posits as fundamental” that those subjected to “domination must fight for their emancipation . . . The world – no longer something to be described with deceptive words – becomes the object of that transforming action by men which results in their humanization” (Ibid, p. 74). This unmasking of deceptive words (ideology) is not merely a scholastic exercise or the simple attainment of critical consciousness for its own sake. It must involve action for it is only “when the oppressed find the oppressor out” and become involved in organized collective “struggle for their liberation” that they are truly engaged in praxis (Ibid, p. 52). The “correct method for revolutionary leadership” is not to implant ideas in the minds of the oppressed; the “correct method lies in dialogue”. The belief “of the oppressed that they must fight for their liberation is not a gift bestowed by the revolutionary leadership, but the result of their own *conscientizacao*” (Freire, pp. 53–54).

This conscientization necessarily entails ideology critique but more than this it calls for a critical awareness of the exploitative basis of capitalism and the need to transcend a mode of production rooted in the selling of labor-power. As Freire (1970) writes:

To achieve critical consciousness of the facts that it is necessary to be the ‘owner of one’s own labor,’ that labor ‘constitutes part of the human person,’ and that ‘a human being can neither be sold nor can he sell himself’ is to go a step beyond the deception of palliative solutions. It is to engage in authentic transformation of reality in order, by humanizing that reality, to humanize men (p. 185).

Contrary to liberal reformists who often equate conscientization with innocuous forms of ‘consciousness raising’ and have attempted to disinter Freire from the Marxist soil that nurtured him, Freire had little use for forms of social activism that left untouched the fundamental structures of society. For him human beings “do not get beyond the concrete situation, the conditions in which they find themselves, only because of their consciousness or their intentions, however good those intentions may be”. Praxis, in short, does not limit itself to a “simple verbal denunciation of social injustice . . . while still leaving intact the structure of society” (Freire 1985, pp. 154–155).

## Conclusion

The philosophy of praxis signals both an epistemological and ontological shift in the way we think about ‘knowledge’ and ‘being’ and the relationship between them; it is a method of analysis and a conception of the ‘social’ that involves a holistic, dialectical comprehension of reality. It allows us to grasp the ways in which capital

(and capitalist schooling) imposes on our lives certain forms of knowing, doing, and, indeed, ‘being’ and how its ideological practices preclude us from thinking about how we might realize, individually and collectively, our capacities for ‘becoming’ more human.

Its radical thrust lies in the recognition of the agenic potential of people to change the inherited circumstances that shape their existence and its commitment to overcoming a particular form of social being – a capitalized and commodified life. In this sense, its intent is to assist educators in imagining a vision of the world outside of capital’s value form, a space where labor would no longer be alienated and exploited and where labor would cease to be a compulsory activity and instead become a striving that encourages the full development of human capacity. It also poses a challenge to (i) idealist forms of educational thought that engage neoliberalism as a form of ‘cultural’ pedagogy but largely overlook that neoliberalism *is a class practice*, that it is “in the first instance” a set of “political economic practices” (Harvey 2005, p.2) promoted by capital’s organic intellectuals and (ii) those who invest themselves in discourses of scholarly ‘neutrality’ in which educators are expected to speak and write dispassionately and/or merely descriptively. For Marx, Gramsci, and Freire, it is not enough to simply interpret social realities; rather, there is a *pedagogical* mandate to transform them since the philosophy of praxis openly acknowledges that

there is no such thing as a *neutral* educational process. Education either functions as an instrument which is used to facilitate the integration of the younger generation into the logic of the present system and bring about conformity to it, *or* it becomes ‘the practice of freedom,’ the means by which men and women deal critically and creatively with reality and discover how to participate in the transformation of their world (Shaul 1970, p. 15).

# Critical Theory and Its Aftermath

Carsten Bünger and Ralf Mayer

Within the field of philosophy and theory of education there exists a plurality of theoretical perspectives that attribute the term ‘critical’ to themselves in some way, shape or form. ‘Critical Theory’ in a narrower sense was adopted to refer to those writings associated with the Institute for Social Research – the ‘*Institut für Sozialforschung*’ (henceforth: IfS) – founded in Frankfurt in 1923 (cf. Jay 1973; Held 1980; Wiggershaus 1988; Demirovic 1999; Honneth et al. 2006). This tradition, also named the ‘Frankfurt School’, was labelled ‘Critical Theory’ over the course of the 1950s in the field of German-language sociology. Due to the different social movements around 1968, this school of thought came to be the object of increasing public attention. However, the thought of a ‘Frankfurt School’ as a somehow homogeneous strand of theory is misleading. Rather, it must be viewed as a cluster of different and often conflicting perspectives (cf. Dubiel 1992: 12f.; Rush 2004; Rieger-Ladich 2014: 66f.). For this reason, it cannot be the aim of this contribution to give a complete overview of these positions and writings.<sup>1</sup>

With its aim of being not only socio-critical but also self-reflexive, Critical Theory has developed different understandings of ‘critique’. Nonetheless, a few central themes can be identified. First of all, critique in this context can hardly be compared to scientific procedures in the tradition of critical rationalism. Critique here is not a scientific method that considers the falsification of scientific statements

---

to be its main task. Instead, the term stands for the – both analytical and normative – objective of questioning forms of power and domination embedded in modern society. Understanding the effects and mechanisms of the latter is then part of a discussion that can itself be understood as an unorthodox self-reflection of Marxism (cf. Horkheimer 1937/2002: 213ff.). Thus experiences of suffering and injustice, as opposed to propositions to be falsified, constitute the onset of critique. It aims at historically constituted social structures and the specific mediation of social forces and individual dispositions. In order to question these elements of force within society, concepts such as exploitation, alienation, reification or disregard come into play. Critique thereby focuses on the analysis of social forms of domination whilst simultaneously searching for possibilities to change and overcome them.

In the following, we focus on selected aspects of Critical Theory that have opened up new ways of thinking for a philosophy of education that are not yet fully explored. The second part focuses on the educational discussion at different points in time, how it has profited from a new political climate influenced by Critical Theory and how the reception made use of certain motifs and works. Finally, we emphasise the possibilities of combining critical perspectives in the field of educational philosophy rather than putting the different positions against each other.

## Critical Theory of the ‘Frankfurt School’

The history of what would be known as Critical Theory in the field of social sciences and research is often divided into different phases. Max Horkheimer’s appointment as director of the Institute of Social Research (IfS) in 1931 is often portrayed as the starting point of the development of this research perspective. The IfS was founded in 1923 by Felix Weil in Frankfurt am Main and financed by a foundation, therefore, enabling it to work independently. Around the time of his appointment, Horkheimer also became professor of social philosophy at the Goethe University Frankfurt. Taking this as our point of departure, we will outline some of the problems treated by the IfS during its foundation phase (section “[From inception to exile](#)”). We will focus on some of the theoretical shifts that are linked to the members’ experiencing the rise of National Socialism and the Holocaust (section “[Radicalisations of critique](#)”). This unprecedented historical situation significantly impacted the development of the IfS during the post-war period and its effects continue to influence it to the present day. Subsequently, we shall outline the generational succession of the ‘Frankfurt School’ represented first and foremost by the theoretical advancements of Jürgen Habermas and Axel Honneth (section “[The aftermath: reconstructions of critical theory](#)”).

## *From Inception to Exile*

A fundamental idea that oriented the group around Horkheimer follows a specific understanding of philosophy and social theory as ‘our time comprehended in thoughts’, which goes back to Hegel. This points to the goal of theoretically grasping society as a whole. Rather than analysing the social problems and crises of their times as isolated phenomena, the group around Horkheimer was, instead, trying to view them on a much broader scale, taking into account the general mediatedness of a multitude of particular social problems and society as a whole.<sup>2</sup> ‘Their time’ was formed by the economic crises and political struggles at the turn of the twentieth century, the devastating effects of the First World War, the failure of socialist ideas and their authoritarian manifestation in the Soviet Union as well as the collapse of the Weimar Republic (cf. Dubiel 1992: 12; Türcke and Bolte 1994: 10ff.). In these days, the disparity between the humanistic ideals implied by the Enlightenment, democracy and Reason, on the one hand, and social reality, on the other, became apparent. The analysis of these discrepancies was in principle led by the intention to continue with and renew Marxian economics (cf. Keckeisen 1983: 119).

This led to a second *leitmotiv*. As Marx states in the last thesis on Feuerbach: it isn’t enough to merely comprehend ‘our times’ in thoughts. Thus follows the demand for a significant change in social praxis as a main task of social theory. But in their perception of the society surrounding them, the social scientists at the IfS also noticed that those aspects (i.e. effects of class struggle or technological advances) considered to be agents of change in Marx’ prognosis did not in fact lead to the envisioned human emancipation from natural and social dependencies. Though society and its power structure were stricken with massive social inequalities, in addition to catastrophic events, the “powers of resistance that ought to have been mobilized were pulled in by the capitalist means of production” (Lehmann 2015: 20). Horkheimer once expressed this quite simply in 1932: “The world now has more raw materials, machines, and skilled workers, and better methods of production than ever before, but they are not profiting mankind as they ought. Society in its present form is unable to make effective use of the powers it has developed and the wealth it has amassed” (Horkheimer 1932/2002: 4).

In principle, there was a shared objective among early members of the ‘Frankfurt School’ to find explanations for the social calamities of the time in “the basic structure and the utmost aggravation of the pathologies of modern societies in order to draw conclusions for a practise of change” (Peukert 2015: 166). But to speak of a ‘founding date’ and Horkheimer as *spiritus rector* is misleading insofar as it tends to obscure the difficulties that, nonetheless, existed in developing a common ground for their diverse theoretical endeavours. Far from insinuating an identity of theoretical perspectives, we nevertheless would like to present two possible leads favouring

---

<sup>2</sup>Because of the complexities of institutional and other relationships, we will not elaborate on the comings and goings of employees and associates of the IfS from different disciplines like psychology, sociology, (social) philosophy, economics and political science, art, literature and music studies.

the idea of a common theoretical basis, the various differences notwithstanding. First, one can speak of a certain *stance* or *mindset* common to all of these authors. This stance can be thought of as an underlying scepticism in the face of power structures that consider human beings, first and foremost, as disposable variables in the realm of economics and politics (cf. Horkheimer 1937/2002: 207; Winter and Zima 2007: 14). According to Leo Löwenthal, the connecting motif can be found in a certain negative and critical attitude prompting an “unrelenting analysis of the existing” (Löwenthal 1980: 80). Such a holistic horizon, however, makes such an analysis a complex and open-ended search for appropriate forms of theorisation.

This leads to a second trait or feature that these works can be said to share: the result of this search for reflexive modes of expressing this sceptical stance of refusal, as described above, is *the struggle to come up with a comprehensive theory of society and the individual*. The focus here lies on the struggle itself, since the traditional form of a materialistic theory of society had lost its driving force. Horkheimer and his colleagues were forced to look for changed theoretical positions as they grew more and more sceptical of Marxist concepts of social progress. Still the Marxian perspective was not dismissed altogether, but in fact radicalised in terms of a critical self-reflection of the materiality and historicity of all practical and theoretical discussions. Critical Theory, therefore, not only aims its critical trajectory at the historically conditioned forms of economic and political practice but also at the production of scientific knowledge itself. What is also at stake in this brand of critique is the position of the theorist herself as well as her intention to enable the formation of critical consciousness through an enlightened reflection of social grievances. This intention itself remains inseparable from the rationality and irrationality of an interest-based social practice. Theoretical concepts such as ‘reason’, ‘autonomy’ and ‘need’ are deeply interwoven in the socioeconomic structure of capitalist class relations (see Horkheimer 1937/2002).<sup>3</sup> In this respect, critical thinking is directed towards opposing dynamics. On one the hand, it does not abandon the historical perspective describing the social situation as a consequence of man’s struggle with himself and others as well as with the external natural circumstances as historically conditioned. On the other, this social situation is experienced as a “second nature” confronting the individual with its force and resistance (cf. Lehmann 2015: 21f.; Wiggerhaus 1988: 69).

In order to be able to work with this contradiction, the IfS sought to supplement its theoretical works with empirical social research. For Horkheimer this meant broadening the range of phenomena considered relevant to a theory of society: “namely, the question of the connection between the economic life of society, the psychological development of individuals, and the changes in the realm of culture in the narrower sense (to which belong not only the so-called intellectual elements, such

---

<sup>3</sup>Early on, Walter Benjamin, who was only loosely associated with the IfS throughout his lifetime, sometimes with tragic consequences, demanded a revision of the Marxian thesis of the historical conditioning of all interpretation – applying not only to the phenomena to be analysed but also to the position of the researcher himself. For any proposition claiming to be true remains “bound to a nucleus of time lying hidden within the knower and the known alike” (Benjamin 2002: 463).

as science, art, and religion, but also law, customs, fashion, public opinion, sports, leisure activities, lifestyle, etc.)” (Horkheimer 1931/95: 12). This effort to include various parts of everyday life, socioeconomic aspects like social class as well as individual and collective cultural expressions required an interdisciplinary programme. As a result, Horkheimer considered the cooperation between different disciplines of theoretical and empirical sciences to be an indispensable strategy for the IfS.

The reception of psychoanalytic concepts was able to bridge these different disciplinary perspectives. It was Erich Fromm (1932: 23) who used a Freud-Marxist social psychology to explain influences of economic conditions on personal dispositions. His focus on the social conditions of the psyche results in a ‘characterology’ that claims to offer explanations as to why a majority of the population acts counter to their own objective interests (cf. Fromm 1932: 56). The analytic potential of this approach appears in the empirical works on the problem of *conformism, authority* and *prejudice*. Fromm (1980) was in charge of the first empirical study at the IfS in the late 1920s, which set out to find answers to the question why these social psychological phenomena were particularly prevalent among workers and employees – the segment of the population that would have been expected to be more immune to the fascist ideas that were on the rise at the time of this study. Because of the disillusioning findings that resulted in the concept of the ‘authoritarian personality’, the reactionary attitudes in the majority of the population became overt. A second collection of studies was thematically similar and is known mostly for Fromm’s contributions concerning the implementation of the authoritarian personality within the workings of the modern family (cf. IfS 1936).<sup>4</sup> Special emphasis was placed here on the thesis that in order to understand processes of submission in familial contexts, which Fromm already conceptualises as socially mediated, these are not to be understood merely in terms of repression. Instead, submission is linked to libidinal investments through ideology. Conformist behaviour is promoted by the promise of power yields and the possibility of compensating the erosion of traditional orientations in modern societies by means of (re)assurance through alternative authoritarian mechanisms. Another internationally known study grew out of the research project *Studies in Prejudice* conducted – in cooperation with researchers from the University of California at Berkeley – by those members of the IfS who had immigrated to the United States in the 1940s. The results from previous studies were developed further by Theodor W. Adorno. *The Authoritarian Personality* (1950) was an inquiry into the degree of susceptibility among Americans for antidemocratic propaganda, predispositions for ethnocentric prejudice and other authoritarian tendencies. As in earlier studies, the research was “guided by the following major hypothesis: that the political, economic, and social convictions of an

---

<sup>4</sup>From the very beginning, Herbert Marcuse had been contributing to the work on the programmatic integration of psychoanalysis into a critical theory of society. His contributions to the studies of the IfS initially focused on the history of ideas. It was not until 1955 that he tried to combine this integration of psychoanalysis and critical theory with a utopian idea of the “liberated eros” (cf. Marcuse 1955).

individual often form a broad and coherent pattern, as if bound together by a ‘mentality’ or ‘spirit’, and that this pattern is an expression of deep-lying trends in his personality” (Adorno et al. 1950: 1). Although its methodological design and the generalisability of the results have frequently been called into question, it can be stated that the basic propositions, especially of this study, are of increasing relevance again today in the face of new populist movements and authoritarian regimes across the globe. The study also was an important source for discussions concerning the problem of authority and the difficulties with the collective memory of the National Socialist regime in post-war Germany, especially around 1968 (see section “[Critique of education: critical theory as philosophy of education](#)”).

### *Radicalisations of Critique*

According to Horkheimer, Critical Theory and its inquiries are led by the shared normative aim to find a way for society to implement “reasonable conditions of life” (Horkheimer 1937/2002: 199). The accounts of the atrocities committed during the NS-regime, antisemitism and violence against everything that the fascist regime perceived as deviant, and above all the widespread approval thereof among the German population at the time, caused the protagonists of the Frankfurt School to radicalise their theoretical position. In the end, it was civilisation itself that was at stake for Horkheimer and others. The *Dialectic of Enlightenment*, which Horkheimer and Adorno had been working on during the mid-1940s, may be the most prominent example of this intensification of negativity in their theoretical approach. The book relentlessly deconstructs the claims of the Enlightenment in an attempt to come to terms with the fact that the Enlightenment was unable to prevent the barbarity of the Nazi regime. It traces the genealogy of the instrumental use of concepts such as reason, liberty or truth, in which the ‘wholly false totality’ of society appears as both knowledge and practice. The authors’ objective here is to decipher this identitarian and instrumental calculus that has been predominant in Western societies since the disenchantment of mythical world views through progress and knowledge. Moreover, they analyse how this sort of calculus inscribes itself in spheres of politics, markets and culture but also in seemingly unconstrained everyday interaction (cf. Horkheimer/Adorno 1947/2002). As to the functioning of this enlightenment rationality, which had fueled the organized mass destruction of human beings in the first half of the twentieth century, Adorno writes: “There is nothing innocuous left”. (Adorno 1951/2005: 25). No such concept – whether it be reason, utility or humanity – can be assumed to contain a nucleus impartial to socioeconomic and historical conditions, which could somehow ensure the meaning and ‘innocent’ use of the concept. Each concept attains its relevance only in the ever-changing conditions of its particular usage and is, therefore, rendered problematic at its core. This also means that critical reflection, in terms of a goal and in terms of an intellectual practice, may not be dismissed, although it cannot hope to come to a final conclusion. It also implies that the search for change cannot make use of either the enlightenment

concepts themselves or whichever promising alternative. All that is left, according to Horkheimer and Adorno (2002: XVIff.), is a relentless form of critical self-reflection that cannot come to a halt in any given form or concept.

In this argument, the critical theorist needs to focus on what is both the problematic nature and the possibility of critique itself: on the delimiting dynamics of a use of instrumental reason submitting any object qua identification to domination. Critique in the sense of Horkheimer and Adorno is always all-encompassing insofar as it points to the reification of all natural, individual or collective expressions in the name of comparability and identity, fungibility and exchange value. For them “public life has reached a state in which thought is being turned inescapably into a commodity and language into celebration of the commodity” (Horkheimer and Adorno 2002: XIV). Moreover, both diversity and difference are used, disciplined and destroyed according to the “friend or foe” formula (cf. *ibid.*: 137ff.; Adorno 1951/2005: 131f.). This, in a dialectic turn, contradicts the concept of reason itself. As it turns out it is reason itself, as a praxis, that is responsible for the irrational developments contradicting the rational goal of emancipation “which aims at [...] an alteration of society as a whole” (Horkheimer 1937/2002: 208). For the authors of the *Dialectic of Enlightenment* (as well as for Herbert Marcuse 1964/2002), it seems impossible to separate the focus on epistemological views from the analysis of historically conditioned social structure, technology or *Lebenspraxis*.

Adorno’s further writings all adhere to this critical perspective and can be considered paradigmatic for the first generation of Critical Theory, radicalising the concept of negativity. His renunciation of affirmation, of any notion of reconciliation, nevertheless, tries to preserve a transformative view. This is achieved paradoxically by conceding to the historical and social conditionedness of thought, to the fact that thinking is always necessarily entwined in power relations. In terms of this radically negative dialectic, Adorno emphasises that criticism can only be of the immanent type. It is impossible for the individual to take a position outside of the social conditions surrounding him precisely because these social conditions are the determining force of him becoming a subject in the first place. The modern experience of reification and alienation<sup>5</sup> is inscribed in the individuals to the point that “the possibility of breaking out of it without unbearable internal conflict, even just in one’s mind, is ever shrinking” (Adorno 1965/95: 18). Adorno calls this a “triumph of integration” and ideology. Accordingly, the critical stance itself is, even in its innermost being, identifiable with the object of its criticism that it is trying to break away from theoretically and practically.

This radicalness is a recurring theme also in Adorno’s later works, in his antisystematic effort to systematize his philosophical positions in the *Negative Dialektik* (1966a/97) and the *Minima Moralia* (1951/2005), as well as the unfinished *Ästhetische Theorie* (1973/2000). It is also what shaped his role in the public dispute about positivism in German sociology (*‘Positivismusstreit’*). Together with Jürgen Habermas (who became a member of the IfS in 1956) Adorno criticised the perspective and methodology of Karl Popper and others (cf. Adorno et al. 1969/93) accusing

---

<sup>5</sup>For current contributions to this debate, see Jaeggi 2005; Honneth 2015.

them of ‘fetishizing’ a formal-logical concept of science without taking into account the limits of formal logics or the social relations of productions that science is embedded in (cf. Adorno 1969/95: 280ff.). On the one hand, Adorno agrees with Popper and his criticism of an all too easy transfer of methods from the natural to social sciences and the basic relevance of working in a problem-oriented fashion versus misled beliefs in objectivity and normative neutrality (cf. Adorno 1962/95: 550f.). Contrary to Popper, on the other hand, it is central to Adorno’s position that the social sciences work with a concept of society at large and its reproduction through antagonistic processes on different micro-, meso- and macro levels.

### *The Aftermath: Reconstructions of Critical Theory*

As we have seen, for those belonging to first generation Critical Theory was centred around the assumption that all thought and action is embedded in its social conditions and their normativity in an all-encompassing fashion. It is precisely here that a point of contention emerges for the generation coming after Horkheimer and Adorno, whose protagonists will choose alternative theoretical paths. Here, too, we will have to limit our remarks to sketches portraying the two internationally known theorists that have shaped the project of Critical Theory since the mid-1960s: Jürgen Habermas and Axel Honneth.<sup>6</sup>

The diversity of their research had a big impact internationally and across (sub) disciplines in the social sciences and humanities. Both their inaugural lectures (Habermas 1968: 301ff.; Honneth 1994) refer to and, by the same token, adapt the programme that Horkheimer had announced in the 1930s: an “interdisciplinary endeavor of a critical diagnosis of social reality” (Honneth 1994: 88). But both also turn away from the postulate of radical negativity that was eminent in the theoretical framework of their predecessors, who had seen society riven by fundamental antagonisms, humanity dominated by an omnipresent principle of exchange, reason paradoxically turned into unreason and who were critical of ideology as a societal “total context of deception/delusion” (*‘universaler Verblendungszusammenhang’*) (Adorno 1973/2000: 252).<sup>7</sup> Both pursue the issue of how the “trace of immanent transcendence in everyday culture” (Honneth 1994: 90) can be conceptualised, which in turn can motivate critical research. They both stand for the reconstruction of Critical Theory and for a specific turn in its programme trying to avoid the first generation aporias (cf. Peukert 1993). Profiting from the influence of other

<sup>6</sup>Habermas succeeded Horkheimer in 1964 and was appointed chair of philosophy and sociology at the Goethe University Frankfurt. Honneth has been a professor for social philosophy in Frankfurt since 1996 and has served as director of the IfS since 2001.

<sup>7</sup>This concept reflects the fact that societal integration is imposed primarily by economic principles – a fact which is, throughout society, ideologically obscured, so that the experience of the corresponding contradictions, for example, between processes of alienation and the postulate of self-realisation, cannot be adequately expressed (cf. Adorno 1966a/97: 364).

international theorists, the leading paradigms in Critical Theory become the theory of communicative action for Habermas (a) and a concept of intersubjective recognition for Honneth (b).

(a) For Habermas, a social-scientific critique aiming at possibilities for emancipation is rendered impossible by the verdict of a historical and societal totality. In order to free himself from the theoretical necessity to conceptualise a pervasive subjection of inner and outer human nature to such a totality, he makes two important theoretical decisions. First, he disbands the prominent position of the Enlightenment concept of reason and its continuation in the philosophy of consciousness in German idealism. This allows him to analytically decouple the moral and cognitive development of the individual, on the one hand, and the internalisation of historical and societal forms of rationality, on the other. He then abstracts the levels of societal development from particular forms of everyday practice (cf. Habermas 1987: 382f.). Habermas is trying to separate the excessiveness of the structures of domination from the historically conditioned processes of communication and learning. The shift in his theoretical approach moves the focus from the subject to intersubjectivity, on the one hand, and from the modern concept of reason to communicative action, on the other. It is the structure of language itself that makes the difference (cf. Habermas 1971: 314): a language-based interaction does not simply follow the logic of reification, exchange and utility but needs to refer to the autonomy and responsibility of the individual. This “expresses unequivocally the intention of universal and unconstrained consensus” (ibid.). Habermas’ *Theory of Communicative Action* therefore “describes structures of action and structures of mutual understanding that are found in the intuitive knowledge of competent members of modern societies” (Habermas 1987: 383). These structures are seen as founded in human nature, on an anthropological level, as well as in the sedimentations of intersubjective communication processes.

A second pillar of Habermas’ theory is the differentiation of the concept of practice itself. In Marxian thought, this is located in the economic sphere of relations of production. In Habermas’ view, this reduces action to instrumental forms. His theoretical shift in the paradigm of production and interaction is supposed to overcome this perspective of an integration of all societal action in an all-encompassing system. By taking into account the differences between forms of action in this manner, it becomes possible to describe the conditions of social progress (cf. Iser 2008: 163; Honneth 1994: 94). This concerns another differentiation Habermas makes: his understanding of the concept of ‘work’ as an instrumentally rational action bound by technical rules and strategic analytical knowledge is opposed by his concept of communicative action. Communicative action is “symbolically mediated interaction” (Habermas 1968: 62) that can develop its own rational dynamic rather than being completely determined by social structures. It requires the intersubjective negotiation of shared values and mutual recognition (cf. ibid.: 62ff.). Ultimately, there is “a potential located within the individual and the human species – a potential for communicative reason constructed for intersubjectively mediated self-reflection, that stands opposite to the power and force of functional systems and which expresses itself historically not only in postconventional ethics but also in

modern legal systems and constitutions” (Peukert 2015: 185; cf. Peukert 1993: 164f.). The pathologies of modern societies stem from the powerful mechanisms of integration of economic, political, administrative systems or systems of mass culture that colonise different social arenas with their own instrumental rational action. Habermas’ thesis of colonisation thereby stresses the precarity of everyday communicative interaction and its validity (Habermas 1987: 113ff.374ff.).

(b) Axel Honneth’s adaptation of the Hegelian “struggle for recognition” (Honneth 1992: 7) presents another shift in Critical Theory. Honneth starts out by pointing out a deficit he sees in Habermas’ effort to fundamentally relate sociocritical analysis to normative principles of communication. For Honneth, criticism becomes relevant only in response to the “experience of infringement of intuitive concepts of justice” (Honneth 1994: 99). It is a ‘moral sensitivity’ that constitutes the starting point for theoretical and social-scientific criticism of social grievances. This type of moral sensitivity precedes communicative action rather than being triggered by the deformations of symbolic interaction. The painful experience of a “violation of identity claims acquired through processes of socialisation” (ibid. 98) is the primary precondition for connecting negativity and practical resistance (cf. Iser 2008: 162ff.). In the framework of Honneth’s concept of intersubjective relationships of recognition, subjective experience is situated in the context of the social organisation and distribution of appreciation. Critical analysis thus pertains to the damage to human identity formation that is done in the context of pathological developments of society and reason. This damage can be articulated in terms of injustice, discrimination or disadvantage and provokes reactions of outrage and shame on a corporeal level. In order to answer the always problematic question as to what can count as legitimate and reasonable in differing social contexts, Honneth distinguishes between three forms of intersubjective recognition. “The communicative preconditions of successful identity formation are: emotional attention and care in intimate relationships such as love or friendship, the legal recognition as a morally competent member of society and finally the social recognition of individual achievements and abilities” (Honneth 1994: 104). Honneth refers to the historical achievements in the extension of relationships of recognition – in the fields of family and friendship, politics and law, workplace and market relations. By the same token he refers to the dynamic contexts in which criticism of normative injuries is triggered, for example, in terms of disrespect for individual achievements or the discrediting of processes of self-realisation and solidarity (cf. Fraser and Honneth 2003; Honneth 2007).

In light of these negative images of social relations, the claims of the Enlightenment are still relevant, as Honneth points out: “To name the legacy of Critical Theory would entail to pinpoint the explosive charge contained in the thought of a social pathology of reason still pertinent for present-day theory; as opposed to the tendency to reduce social criticism to a normative, situational or local utterance of opinion, one would have to make clear its interrelation with historically conditioned reason” (Honneth 2007: 30).<sup>8</sup> This critical endeavour has

---

<sup>8</sup>It is still a matter of debate whether Honneth’s work itself can live up to these standards. For an overview of the development of Honneth’s theory of recognition, see: cf. Iser 2008: 162ff. For a critical examination, see Fraser and Honneth 2003; Bedorf 2010.

neither been abandoned nor completely fulfilled, as indicated by the numerous international debates in fields like social philosophy and sociology, philosophy of language and discourse, aesthetics, ethics, legal studies (cf. Benhabib 1986; Honneth et al. 1989; Demirovic 2003; Rush 2004; Winter and Zima 2007; Forst et al. 2009) – as well as philosophy of education.

## **Critical Theory and Educational Thinking: Passages and Lines of Reception**

One can pose the question concerning the relationship between Critical Theory and educational reflection on different levels. First it needs to be noted that the authors of the ‘Frankfurt School’, especially those of the first generation, have themselves commented on issues pertaining to education and philosophy of education. A common theme here is the emphasis on the necessity to connect basic conceptual debates with sociocritical reflection. Therefore, most of their thoughts on the subject were overtly critical of the actual forms of educational studies predominant in Germany until the 1960s (see Adorno 1971: 133ff.). During this period of widespread search for alternative concepts of educational practice, new theoretical perspectives appeared on the scene (section “[Translations: from critique to educational programmes](#)”) that eventually became referred to as ‘critical educational studies’ (*Kritische Erziehungswissenschaft*). These approaches draw more upon Habermas’ theory than the theories and ideas developed by the first generation. As a response to this, further developments, in turn, called for a deeper reflection and wider reception of Adorno’s work in the field of philosophy of education. Another strand in the reception of Critical Theory constitutes a more philosophical debate concerning the concept of *Bildung* that draws on the work of Adorno (section “[Negativity and experience – connections to a philosophy of Bildung](#)”).

### ***Critique of Education: Critical Theory as Philosophy of Education***

Critical Theory refers to questions of education because it does not analyse social formations along the lines of ‘objective’ structural conditions. This is precisely the deficiency it sees in Marxist thinking, insofar as Marxism underestimates and does not sufficiently reflect the subjective dimensions of capitalist societal integration – i.e. the processes working on a psychological level and their repercussions on social demeanour. On a theoretical and methodological level, this opens up a space for concepts of psychoanalysis to step in, whereas on another, more thematic level, this causes Critical Theory to make education an object of attention.

The first work published by the group of authors at the IfS, ‘Studies about Authority and Family’ (*Studien über Autorität und Familie* 1936), is a theoretical and empirical enquiry into historically specific forms of mediation of society and the individual. Erich Fromm describes the family as the “psychological agent of society” (Fromm 1932/1999, S. 42) and, thereby, dismisses Freud’s view that the family and its inner dynamics is itself the root cause of individual personality formation. Educational practices are initially viewed as places where the reproduction of certain functions of society takes place. At the same time, these processes are not seen as simple, tension-free assimilation. Family, as a social institution, is much rather a room where contradictory elements are mediated. In this way, the authors of the study can show how the overall societal change towards a growing authoritarianism that was taking place at the time (see section “[From inception to exile](#)”) was generated by the interplay of individual, educational, social and family factors. So, already at this point in the history of Critical Theory, the possibility arises to frame the question of progressive and emancipatory change as a question of educational concepts.<sup>9</sup>

As Adorno’s later works and especially his radio essays show, the mediation of individual and society in relation to an authoritarian horizon is one – if not the most eminent (cf. Friesenhahn 1985) – educational problem for Critical Theory. The radio lectures – published posthumously (see Adorno 1971) – are perhaps Adorno’s best-known work in the German-speaking field of education. Although he explicitly takes a stand concerning questions of contemporary education, this is not to be misread as moral self-assurance or practical orientation for those working in the field of education.<sup>10</sup> The common theme of these essays can be identified in Adorno’s effort to promote a debate about urgent problems that are not sufficiently considered by educational studies in his view. The famous and often cited sentence “the premier demand upon all education is that Auschwitz not happen again” (Adorno 1966b/2005: 191) poses the question of accountability that Adorno himself could not answer in a non-conflictual way. Here, ‘Auschwitz’ does not just stand for barbarity as opposed to civilisation but, just as in *Dialectic of Enlightenment*, for a dialectic turn, i.e. for the worst excesses of rationalisation resulting in the rationally planned and calculated mass murder of European Jews and other persecuted groups. “If barbarism itself is inscribed within the principle of civilization, then there is something desperate in the attempt to rise up against it” (ibid.). Adorno says this in order to emphasise that one has to be conscious of this desperate element so as not to fall prey to a mere “idealistic platitudes” (ibid.). His aim is to invoke sensitivity for a problem that is

---

<sup>9</sup>Especially Fromm was interested in educational concepts, and from the 1950s onward he became involved in educational projects, for example, in Cuernavaca, Mexiko: “He propagated A. S. Neills ‘Summerhill’, cooperated with Ivan Illich and Paolo Freire in Illich’s ‘Centro Intercultural de Documentación (CIDOC)’ and reflected on the pedagogy of Father Wasson, who managed an orphanage in his neighbourhood in Cuernavaca” (Funk 1983: 114; cf. Claßen 1991).

<sup>10</sup>Although this has not kept readers from ‘finding’ both in the texts (see section “[Translations: from critique to educational programmes](#)”).

just as urgent as it seems to be unsolvable. But it is precisely this sort of sensitisation for the entwinement of psychological dynamics and the greater social context that becomes an educational problem. The only remedy against the reproduction of the “authoritarian” and “manipulative character” (ibid.: 199) would be ‘autonomy’ – understood as “power of reflection, of self-determination, of not cooperating” (ibid.: 196), though there is no way of pointing out the specific educational means to achieve this. Adorno often expresses such reservations against educational solutions for social problems (e.g.: 195), but without implying that he does not still see these problems as educational.

Adorno and Horkheimer also adapted this idea of a dialectic turn from progressive developments into new forms of domination and oppression in relation to the concept of *Bildung*. In a speech given in 1952, on the occasion of a matriculation ceremony, Horkheimer stated that education was undergoing a crisis resulting from the process of civilisation itself (cf. Horkheimer 1985: 411). *Bildung* represents, for Horkheimer, a specific relationship between inner and outer nature rather than mere individual development as in idealistic concepts. The formation implied in *Bildung* has – through the historical developments of industrialisation and modernity – turned into a kind of treatment or processing, so that nature (including human nature) now appears as nothing more than the raw material to be handled in an instrumental fashion. Put differently, in these historical circumstances, education refers to the domination of nature and self. Confronted with this diagnosis, Horkheimer then sketches out an alternate concept of *Bildung* that consists in a certain form of dedication (‘Hingabe’) to objects closely tied to the reflection of their social contexts and collective debates around them. In doing so, Horkheimer emphasises the proximity between *Bildung* and political involvement (cf. ibid.: 416 ff.).

In comparison, one of Adorno’s well-known texts on the topic – ‘Theory of decayed *Bildung*’ (*Theorie der Halbbildung*, 1959a/97) – appears to take up where Horkheimer’s speech left off: addressing the same issues as well as the problems insinuated therein. Adorno understands *Bildung* in terms of the subject’s relation to culture (ibid.: 94). At the same time, he stresses the ambivalence in the concept of culture referring to certain antagonisms within society: in cultivation, the productive work or processing of natural resources, on the one hand, and culture in the arts and humanities as well as the noninstrumental production of cultural assets, on the other. The philosophical idea of *Bildung* once represented the emancipatory potential embedded in this antagonism in the sense of human enlightenment. In contrast, the social reality of *Bildung* is torn between assimilation and a calculus of fungibility, on one side, and social distinction and hierarchisation, on the other. Yet another difficulty lies in the fact that even the perception and reflection of these antagonisms are obscured for individual experience. What remains is ‘anachronism’ – i.e. the confrontation of the actual social reality with what the concept of *Bildung* is supposed to mean – in order to be able to refer to the critical nucleus in the concept of *Bildung* (cf. ibid.:121).

## *Translations: From Critique to Educational Programmes*

The German<sup>11</sup> reception of Critical Theory began during the formative years after the Second World War when the ‘Frankfurt School’ had considerable impact on the political and cultural climate of the new German republic (cf. Demirovic 1999). Within the German public consciousness, the suppression of both guilt and memories of National Socialism represented the prevailing attitude for much of the post-war period. Until the 1960s the working through the Past<sup>12</sup> was not seen as a political, biographical and educational task. But for the so-called *68 generation* the confrontation with their parents’ past deeds also leads to a general questioning of the bourgeois family and contemporary educational practices. In the search for suitable references in social theory, they (re)discovered the publications of the IfS, especially Adorno’s works, but also writings by Fromm, Horkheimer and Marcuse. Psychoanalysis, in connection with Marxist social criticism, similar to the earlier perspectives of Wilhelm Reich and Siegfried Bernfeld, gave rise to new points of view on educational relations and practices (cf. Baader and Hermann 2011). ‘Antiauthoritarian Education’ became the label for the new concepts of education that made an effort to better meet the ‘natural needs’ of children in the hopes that they would become confident individuals, also politically speaking, and that the intergenerational (re)production of the ‘authoritarian personality’ could be stopped (cf. Claßen 1973 and also, referring to international sources: Schroedter 2007).

Alongside these more practical considerations in the communes and in the *Kinderladen-movement*, educational studies were beginning to take note of Critical Theory around the same time.<sup>13</sup> The predominant strand of theory in German-speaking academic discourse during the first half of the twentieth century was the *Geisteswissenschaftliche Pädagogik*. By the 1960s, more and more doubts were voiced concerning the ontological determination of pedagogy and the isolated focus on an idealised ‘reality’ of education. Whilst some were trying to overcome this by promoting a ‘realistic turn’ to more empirical research, authors like Herwig Blankertz, Klaus Mollenhauer and Wolfgang Klafki, among others, made an effort to use the theoretical means provided by Critical Theory to enable a critical self-reflection of the *Geisteswissenschaftliche Pädagogik* (cf. Heyting and Winch 2004,

---

<sup>11</sup> In the following section, we will focus on the German-speaking field of social sciences since the Frankfurt School was considerably influential here, though its impact went further than that. The writings and ideas of Critical Theory have been widely received in many different international contexts, as well, which cannot be discussed here in detail. For further reading, see, for example, the contributions in Kohli 1996, Sünker and Krüger 1999 and Gur-Ze’ev 2005 as well as further references in Peukert 2015; for an overview of the Brazilian sources, see Pucci and de Oliveira Silva (2015).

<sup>12</sup> See Adornos lecture of 1959b (2005): *The Meaning of Working through the Past (Was bedeutet: Aufarbeitung der Vergangenheit)*.

<sup>13</sup> Moreover, different perspectives aiming at a sociocritical reflection of education and/or *Bildung* also referred to Marx and Hegel. Especially, the critical philosophy of education of Heinz-Joachim Heydorn (1970/2004; cf. Bünger et al. 2009) can be read in light of parallels and differences to the educational reception of Critical Theory.

314ff.).<sup>14</sup> Jürgen Habermas served as the central point of reference for this endeavour, especially since he promoted a critical, emancipatory interest for the sciences in his inaugural lecture in 1965 (Habermas 1968: 301ff.) and an even more in-depth treatment in *Knowledge and Human Interests* (Habermas 1971). The above-mentioned authors adopted this emancipatory stance (see Klafki 1971: 262ff.; 1992). Contrary to the sciences with a more practical or a more technical orientation, they established the profile and scientific self-conception of a ‘critical science of education’ (*Kritische Erziehungswissenschaft*) through an emancipatory turn of traditional concepts and methods.

From the late 1960s onward, this perspective grew increasingly influential,<sup>15</sup> due in part also to political tendencies of the time towards a reform of certain parts of the educational system. On a theoretic level the concept of emancipation refers to the problem of its specification (cf. Keckeisen 1983, S. 128 ff.). Again, Habermas became an important point of reference in this debate. His understanding of human interaction as a basic anthropological form independent of instrumental forms of action like ‘work’ enabled the educational discourse to conceptualise communicative action as a principle that could be seen as a remedy against the excesses of instrumental reason (cf. Peukert 2015: 183). According to this view, education itself was understood as communicative action (cf. Mollenhauer 1972) but also as an effort to create the competence necessary for the individual to communicate and develop informed relations to one’s self, the world and others. But this leads to the classic paradox of education: in order to create something, educational programmes need to presuppose precisely what they are trying to create, and in this case that would be communicative action and the individual ability to engage in it.<sup>16</sup> Generally speaking, it should be noted that in terms of this particular strand of educational studies “the reception of Critical Theory did not so much adopt the radical critique of reason of *Dialectic of Enlightenment* but rather certain key concepts like ‘emancipation’, ‘autonomy’, ‘responsibility’ and ‘criticism’” in order to apply them to a “much needed modernization of political culture” (Peukert 2015: 192). Accordingly, one can speak of a selective reception – if not a ‘non-reception’ – in this context (cf. Baader and Hermann 2011; Schäfer 2004). The disillusionment with the results as well as the political changes over the course of the reform of the school system, just as with this theory-immanent background, gave rise to numerous new variations on critical pedagogics and educational studies (see Paffrath 1987; Sünker and Krüger 1999).

---

<sup>14</sup> Important sources are: Dahmer and Klafki (1968); Mollenhauer (1968); Blankertz (1963/1985).

<sup>15</sup> In particular, the expansion of the secondary and tertiary education sector, which was developed up to the mid-1970s, and the expansion of comprehensive schools, through which the Federal Republic of Germany sought to connect with international structures in the education system (see Peukert 2015: 187).

<sup>16</sup> In his critique of the educational reception of Habermas, Jan Masschelein (1991: 196ff.) has pointed out that such problems are related to a traditional philosophical understanding of action centred around the subject, which obscures the ethical implications of the Habermasian concept of intersubjectivity.

Contemporary perspectives linked to Critical Theory are trying to overcome the problems and deficiencies of the *Kritische Erziehungswissenschaft* described above. Instead of using only select concepts, Andreas Gruschka aims at explicitly describing a ‘negative pedagogy’ (Gruschka 1988). Drawing on the *Dialectic of Enlightenment* and *Negative Dialectics*, his objective is to incorporate the impetus of critical self-reflection that has not yet been fully explored for educational theory. For Gruschka, the fact that education’s encounter with Critical Theory had comparatively little impact is symptomatic for educational thinking in itself: the claim of directly linking theory and practice is traditionally embedded in educational thinking. This causes educational theory to shy away from thorough analysis of problems and inquiry into possible reasons for the failure of specific programmes. Instead, it all too easily soothes itself with postulates of seemingly ‘right’ forms of practice. By focusing on the conceptualisation of the ‘right thing to do’, pedagogy forgets to ask whether such concepts can in fact be redeemed. It can learn from Critical Theory how the socially conditioned irreconcilability of theory and practice can become productive when seen as a frame for critical self-reflection. The goal here is to scientifically reconstruct – and also find empirical explanations for – the interrelation and mediation of requirements and reality in order to understand “why pedagogy isn’t what it claims to be” (Gruschka 2015: 44). To understand the contradictory praxis that gives rise to the difference between what is and what ought to be, qualitative research uses the methodology of ‘objective hermeneutics’, which was developed by Ulrich Oevermann (1983) and draws on Adorno’s works. Besides providing insight into problematic educational cases, the task of critique here is to find options for practical improvements (see Gruschka 2015: 48 ff.).

Further theoretical developments connected to Critical Theory shed light on topics like heterogeneity and inequality, inclusion and difference. Annedore Prengel (1999) sees an important source for her ‘pedagogy of diversity’ not only in Honneth’s writings on the concept of recognition but already in Adorno’s thoughts on the motif of the ‘nonidentical’. This shows that Critical Theory’s objection to the formation of bourgeois-capitalist society is not confined to issues of the labour movement that more traditional Marxist theory used to be focused on. Its theoretical concepts are rather open to a wider scope of issues ranging from feminist to anti-racist or other political perspectives concerned with anti-discrimination and diversity. Moreover, since Honneth’s theory of recognition contains the theme of the basic human need for reciprocal recognition, it has been adapted both for educational concepts and in philosophy of education (see, for example, Hafeneger et al. 2013; Schäfer and Thompson 2010). It is important to point out that in the discussion surrounding the ‘recognition of the other’ the concept of recognition does not – as in the concept of tolerance – simply point to the mutual respect for one another’s specific individual or group identity. Instead, it interrupts and transcends such a logic of ascription and identification of group membership and identity categories. Recognition, understood in this way, is an ambivalent phenomenon infused with power and a form of constituting relations to one’s self and others. In this interpretation of the concept of recognition – and in light of *theories of subjectivation* – the discussion goes well beyond the ideas promoted by Honneth (cf. Balzer and Ricken 2010).

## *Negativity and Experience – Connections to a Philosophy of Bildung*

The strand of theory concerned with a philosophy of education is, even more than Gruschka's 'Negative Pedagogy', very cautious when it comes to programmatic designs. It is primarily concerned with the question of *Bildung's* scope as an expression of human self-realisation in the face of an indetermined relationship with one's self and the world. According to this view, not only Critical Theory's earlier works appear as a radical questioning of *Bildung*. Especially the form of critique prominent in Adorno's thought can be interpreted in light of a theory of *Bildung*. The above-mentioned text *Theorie der Halbbildung* bids farewell to the idealistic concept that categorically places *Bildung* outside of social forms of power. Here, the mere possibility and preconditions of *Bildung* are tied to processes of socialisation in which, for example, the 'culture industry' plays a substantial role in shaping the individual's experiences, one's ways of thinking and perceiving. Nevertheless, this reasoning is not just stating a completely closed 'context of deception' (*Verblendungszusammenhang*) eliminating even the slightest potential for *Bildung*. The paradoxical position of critique cannot be itself determined by the person inhabiting that position in the face of "objective deception" (Gamm 1985; cf. Adorno 1951/2005: 50). Therefore, critique, in an epistemological sense, and criticism of society are two inseparable analytical pathways. All thought – including critical thought – finds itself entwined in the social logics of disposing of and identifying 'things'. According to Adorno, this type of thinking necessarily cuts off everything that remains incommensurable with these logics. But the fact that this rational grasp can never completely take hold of the self, the other and the world opens a space of self-critical potential in which the identification can be turned against itself in order to "transcend the concept through the concept" (Adorno 1966a/1997: 27). Transposed to the realm of *Bildung* in terms of the interrelationship of the I and the world, this means that this interrelationship would be called to question its own formation, its own social conditionedness.

Current reflections referring to the concept of educational experience (*bildende Erfahrung*) also follow the path just sketched out and critically adapt the traditional concept of experience connecting it to some of Adorno's thoughts (see Pongratz 1986; Schäfer 2004; Thompson 2006, 2009). Central to Humboldt's neo-humanist concept of *Bildung* is the basic interrelationship of 'self-action' and 'receptiveness' (*Selbsttätigkeit* und *Empfänglichkeit*). If this is not to be conceptualised as a pre-social resource centred in the individual and its 'pure' and unobscured access to the world, then the eminent question is how to conceive of the experiences of experience obscured by sociocultural dispositives (cf. Kappner 1984: 20).<sup>17</sup> *Bildung* in this sense means the experience of the conditionality of experience, and enables at best

---

<sup>17</sup>Adorno's *Aesthetic Theory* (1973) tackles the related question, whether modern art can be the place where the issue of impeded experience can or ought to be broached so that experience becomes accessible by way of its inaccessibility.

self- and sociocritical reflexive processes. Other themes that have inspired recent advances in the theory of *Bildung* are the manifold aspects of the concept of the nonidentical as well as the meaning of sensuality and corporeality. As a dialectic of identitarian perception and inevitable deception, the ideas of ‘mindfulness’ (*Eingedenken*) in light of the nonidentical and the “somatic dimension” (Adorno 1966a/1997: 203) call for new discussions about the presumed self-assurance of the subject of *Bildung* and its non-affirmative access to the world in the educational process (cf. Meyer-Drawe 1990; Koller 1999; Huhtala 2016).

## Critical Theory of Education Across Theoretical and Practical Borders

As much as Critical Theory is itself subjected to modern claims of self-understanding – due to its own problematisation of the contradictory consequences of the Enlightenment – it cannot easily be subsumed under categories like ‘modern’ or ‘postmodern’, which are often seen as dichotomous worlds of thoughts (cf. Wellmer 1993). It also seems plausible to view the relation between various critical theories – such as (post)structuralist, materialistic or cultural studies – not as mutually exclusive but rather in terms of discursive axes. The shared refusal to be confined to one theoretical place or approach to research, for instance the self-reflexive analysis of the manifold contexts of power and domination, currently open spaces for further discussions relevant to educational issues (Snir 2017; Gur-Ze’ev 2005; Dammer et al. 2015).

The above-mentioned philosophical ideas already point towards a type of thinking that recognises the fact that educational theory cannot rely on domestic concepts and traditions alone to describe educational thought and practice. Following these ideas, a philosophy of education would entail working on an open, transdisciplinary and critically informed (re)search. This openness and ‘estrangement’ of familiar educational programmes and conceptualisations can also be understood as a certain ‘boundary work’ seeking to question concepts such as emancipation, reason, subject etc. in terms of their limitations and delimitations in the context of societal formations. To illustrate this, the spectrum of critical reflections that can be linked to the critical theory includes (a) various forms of criticism of capitalism, its contradictions, (re-)production of injustice and inequality; (b) the problem of authority and authoritarianism, discipline or other forms of power and (political) resistance; (c) feminist and postcolonial deconstructions of concepts like rationality, recognition and desire, which question, e.g. the specific situating of the subject (cf. Masschelein 1998; Pongratz et al. 2004; Allen 2016).

Therefore, the reception of international critical perspectives – that in many different ways take into account the problem of the foundation of the critical position itself – seems to make sense in light of the project of a thorough and unrelenting analysis of social grievances (cf. Boltanski 2010). Moreover, the proximity to

Foucauldian analyses of power mechanisms and practises are discussed. These discussions focus, for example, on problems surrounding autonomy and self-realisation, pointing to the ideology and reversal of these concepts, especially in institutional educational contexts. Perhaps, what we are currently facing is precisely, as Judith Butler puts it with regard to Foucault and Adorno, the challenge “to rethink critique as a practice in which we pose the question of the limits of our most sure ways of knowing” (Butler 2001).

# Phenomenology and Education

Malte Brinkmann and Norm Friesen

## Phenomenological Philosophy

Edmund Husserl (1859–1938) is widely regarded as the founder of phenomenology as a transcendental philosophy of consciousness. Phenomena do not simply *exist* for phenomenology, but *appear as something*, according to the *intentionality* of consciousness, which links subject and object. Referring to intentionality as the ‘shibboleth of phenomenology’, contemporary phenomenologist Bernhard Waldenfels explains that it simply means “that something shows itself *as something*, that something is meant, given, understood, or treated in a certain way... The formula *something as something* means that something (actual, possible, or impossible) is linked to something else (a sense, a meaning) and is at the same time separated from it” (2011, p. 21). Something appears as close or distant, strange or familiar, in memory, in taste or touch, or in plain view. A plurality of meanings arise according to one’s position, interest, and context and in keeping with spatiotemporal, intersubjective, and (im)material structures. As Husserl observed, such structures, in turn, can be said to represent ‘regional ontologies’ for various disciplines for phenomenological investigation.

Intentional engagement is constituted as *experience*, and many phenomenologists profiled below understand phenomenology specifically as the study and theory of *lived experience* (*Erfahrung*). However, the meanings that arise in and through such experience are not simply ‘subjective’ or ‘arbitrary’. Experience, as Husserl explains, occurs between the active making of meaning and its passive reception, arising both through ‘active passivity’ and ‘passive intention’ (2001). Also, in being

directed to something in the world, experience is not the accumulation of sense data, but set in a context, and delimited by a 'horizon'. Every experience is situated in a horizon which encompasses earlier experiences, memories, and schemas and also anticipations and expectations as well as their fulfillment or disappointment (cf. Gadamer 2013).

Husserl's famous call to return to the 'things themselves' represents a rejection of the scientism, reductionism, and historicism of both the natural and human sciences and calls for a decisive turn to the lifeworld (Husserl 1970a). It also entails a method rather different from the experimental and observational methods of the former and the historical hermeneutic methods of the latter. The phenomenological method is that of the 'reduction' or *Epoché*, which takes three principal forms: the eidetic reduction, the skeptical *Epoché*, and the phenomenological attitude. In the first, meanings are multiplied by considering a range of perspectives, schemas, and theoretical models which can be playfully and imaginatively varied and applied. Husserl uses the simple example of the possible variations of a table's color, shape, and size, explaining that through an initial "abstin[ence] from acceptance of its being, we change the fact of [our] perception into... pure possibility" (1970b, p. 70). The skeptical *Epoché* appears initially as its opposite, namely, as the heuristic or provisional *exclusion* of possible interpretations, particularly those that might be considered dogmatic. Ranging from the understandings of the natural sciences and psychology to everyday discourses, phenomenology asks that researcher "keep strictly to that which shows itself, no matter now meager it may be" (Heidegger 1925/2009, p. 47). This abstemious exercise in 'letting-appear' or 'letting-see' is also known as 'description' (*Deskription*). The third form of the reduction, the phenomenological attitude can be regarded as the culmination of the *Epoché*, as a broadening of the particularly of the skeptical and eidetical methods to a more general attitude in which the world is not "accepted as actuality" (Husserl 1970b, p. 32), but becomes, "in a quite peculiar sense, a phenomenon" (p. 152).

Heidegger's critique of Husserl's conception of intentionality and of Husserl's grounding of phenomenology in transcendental consciousness is based on a hermeneutic phenomenology of being (*Dasein*) in which aspects of the phenomenological method (*Deskription*) are reconfigured as an existential process of understanding, as the explication of self and of being. In the late Heidegger, this "hermeneutic of *Dasein*" becomes a kind of "phenomenology of *Ek-sistence*" with the latter representing a kind of "standing out into the truth of being" (1998, 249)—and with language itself becoming the "house of being" (1982). Through phenomenology, philosophy critically breaks with the natural sciences and conceptualizes reality not in positive functional terms, but in negative ones reflecting a play between disclosure and concealment. "Being" appears only in a negative sense in the ontological difference between different "beings" (1976). Heidegger's post-human ambitions, namely, the de(con)struction of Western metaphysics, and the construction of the human not as identical with but as separate from being—rather than as identical with it—have had an enormous impact on recent continental philosophy (e.g., in Foucault, Derrida, Deleuze, Waldenfels).

Finally, Merleau-Ponty takes the experience of the body—which Husserl saw as a phenomenon of empathy and as the ‘zero-point’ of orientation in the world—and develops it as the foundation of social intercorporeality, contra Husserl’s egological and transcendentalist emphases. In *The Phenomenology of Perception*, Merleau-Ponty (1966/2013) describes corporeality as an ambiguous, social event situated between ownness and alienness. In *The Visible and Invisible*, Merleau-Ponty moves beyond what he came to see as his own dualistic emphases, focusing instead on the unity of the “flesh” of body and world, and the chiasmus that at once separates and joins this metaphorical flesh (1968).

In the wake of Husserl, Heidegger, and Merleau-Ponty, phenomenological philosophy has been taken up and reworked, above all in French philosophy. The challenges of the linguistic turn and structuralism, already recognized by Merleau-Ponty, have been addressed by Foucault and Derrida. While Foucault takes up Husserl’s critique of science and Heidegger’s philosophy of care (*Sorge*), he simultaneously recasts them through his conceptions of archaeology and genealogy, in terms of discourse, epochal *epistemes*, and practices of the self. At the same time, Derrida has corrected the ‘presentism’ of phenomenology, insofar as he notes a temporal displacement in the form of *différance*, in the absence highlighted through the presence of the word.

## Beginnings and the Anthropological Turn

The following paragraphs trace the connections between phenomenological philosophy and studies of education. There are numerous points of contact between the two disciplines or traditions (cf. Lippitz 2003a; Brinkmann 2016a, b, 2017a, b). The “phenomenological movement” (Spiegelberg 1960), of course, has not only influenced education but has also impacted psychology, sociology, and literary studies among other disciplines. Husserl’s notion of the various ‘regional ontologies’ of phenomenology has, in effect, been realized and elaborated—at least to some extent. The history of phenomenology developed here begins very early and has since branched out in a number of different fields and directions and is characterized by a turn toward philosophical anthropology relatively early in its development.

### *Aloys Fischer: Descriptive Pedagogics*

In his 1914 paper *Deskriptive Pädagogik*, Aloys Fischer formulates one of the earliest programmatic accounts of the relationship of pedagogy and phenomenology. Fischer is a representative of the *Münchener Schule* (Munich School) that developed around Theodor Lipps. The Munich School critically rejects Husserl’s egological conception of consciousness that claims the primacy of primordial experience and refers instead to the primacy of ‘reality’ or ‘*Real-Ontologie*’. In taking the ‘real’ as

their starting point, these early Munich phenomenologists broke away from Husserl's subject-centered perspective and anticipated ideas later introduced by Merleau-Ponty in his interpretation of the lifeworld.

Phenomenology, Fischer believed, is not a normative 'science' of practice. It is instead a *descriptive* one: It tries to grasp the subject matter at hand before this matter is defined theoretically or understood in relation to normative goals or judgments. He maintains that description can lead to pure facts (*Tatsachen*), free from presuppositions and prejudices. Of course, this is a proposition that is often problematized today. Fischer points out that describing a student's practice in school requires a highly developed pedagogical and humanist-psychological awareness: "[It] comes very seldom as a natural gift and can only be attained as the result of sound practicing" (1914/1961, p. 140). Fischer also identifies an important epistemological problem that affects educational studies (*Wissenschaft*) to the present: That education, unlike disciplines with clearly defined objects of research (e.g., geology), is notoriously insecure about its own subject matter. The method of description for Fischer is a way to reach intersubjective validation of experiences and a way to redefine *experience* as the subject matter of education. Fischer's thoughts and research have identified issues indispensable to phenomenological-pedagogical thinking and reflection to this day (cf. Brinkmann 2017a, b).

### ***Otto Friedrich Bollnow and Dutch Phenomenology***

After World War II and the years of Nazi terror, the phenomenological movement was in a weakened position in Germany, leading to a shift in orientation from the specifically phenomenological to the more broadly anthropological. Anthropology in this context refers to the science (*logos*) of concepts and notions of mankind (*Anthropos*) and operates on historical, philosophical, and linguistic levels. Otto Friedrich Bollnow, one of the main representatives of pedagogical anthropology, combined Heidegger's phenomenology with philosophical, linguistic, and anthropological emphases, as well as with a critical reception of existential philosophy and *Lebensphilosophie* (literally: "philosophy of life"). *Lebensphilosophie* focuses on life in its vitality, multiplicity, and emotional irrationality. It pays special attention to its elemental contexts (e.g., the lifeworld) and (dis)continuities within the life course (e.g., birth, growth, death). For example, in his book *Existentialism and Pedagogy: An Essay on Discontinuous Forms of Education*, Bollnow highlights phenomena that are part of what he calls an "education of discontinuity" (Bollnow 1959), including crisis, awakening, encounter, and failure. He carried out only a few studies which can rightly be called descriptive phenomenologies. These explore the phenomena of practicing (*Übung*), as well as human space and the 'pedagogical atmosphere'. In contrast to Fischer, Bollnow did not consider the ontological 'reality' of these phenomena as "pure" empirical facts. Instead, he theorized his object, education, in terms of expressions of life itself according to the understandings of *Lebensphilosophie*. Accordingly, 'the pedagogical' for Bollnow is almost entirely

reducible to the emotionally charged ‘pedagogical relation’, a notion developed before World War II by Herman Nohl, and one that reappears in the work of Max van Manen.

In the Netherlands, particularly in Utrecht, scholars similarly influenced by philosophical anthropology, existentialism, and *Lebensphilosophie* were developing broadly phenomenological approaches to pedagogy, psychology, criminology, medical practice, and other disciplines. These scholars included educationist M.J. Langeveld, who advocated for the development of the ‘anthropology of the child’ as an educational sub-discipline (1968a). Langeveld attempted to understand school and curriculum from the perspective of the child (1968b) and based his work on explicit epistemological linkages between phenomenology and pedagogy, approximating Husserl’s vision of ‘regional ontologies’. A second important Dutch figure was F.J.J. Buytendijk, a veterinary physician and theoretical psychologist who worked closely with the German Helmuth Plessner and who produced book-length phenomenological studies on *Woman* (1968) and on the subject of pain.

Despite (or perhaps because of) their contemporaneity and proximity, these Dutch scholars did not produce any writings that explicated the method and theory underlying their studies. They did not explicitly locate their work in the German tradition of philosophical phenomenology, nor was their work particularly germane to English-language notions of ‘method’ as a process applicable to any number of potential objects of research. Max van Manen has since positioned himself as interpreting the thought of these scholars for the English-speaking world and as advocating for their approaches to phenomenology and pedagogy.

## **From Existentialism to Lifeworld Theory: Phenomenology in Twentieth-Century Germany**

In West Germany in the 1960s and 1970s, German scholars developed concepts which reflected their changing intellectual and cultural circumstances, and which are critically differentiated from Bollnow’s anthropological and hermeneutical pedagogy. Günther Buck, Werner Loch (a student of Bollnow), Heinrich Rombach, Eugen Fink, and Egon Schütz all refer centrally to Husserl, Heidegger, and Hans-Georg Gadamer and have developed novel phenomenological approaches toward theories of learning, *Bildung*, and education (cf. Brinkmann 2016a, b, 2017a, b).

### ***Learning as an Experience (Günther Buck)***

Günther Buck’s study *Learning and Experience* was first published in 1967 and has since become a classic in German pedagogy (1989). Buck examines the experience of the process of learning from a historical perspective (referring, for example, to

Aristotle, Bacon, Hegel, and Husserl). Buck also develops his own theory of learning, which he frames with a hermeneutic of practice or action (*Handlungshermeneutik*). Buck's theory of understanding and learning as well as his theory of experience in *Bildung* are strongly influenced by Gadamer. From a hermeneutic perspective, understanding and learning are situated within a temporal horizon. Referring to Husserl's analysis of intentionality, Buck describes the structure of these experiences as involving cycles of experiential anticipation and fulfillment—or alternatively, disappointment or negation. The structure of experience is always based on previous experience, but it is also open to what is new or different—what can be delimited through the extension or expansion of the horizon that surrounds it (*Horizontwandel*). As our horizon is changed in an experience, future anticipations change, as do our understandings of experiences from the past.

In *Learning and Experience*, Buck presents a very precise account of the structure of learning-as-experience. Buck defines the 'negation' implied in disappointment or failure as a 'determinate negation', as a Hegelian dialectical annulment that is at once particularized and produces something positive. Such a negation nullifies a given intention and brings a moment of discontinuity into the continuity of experience. In this way, we not only experience something outside of ourselves, but we also experience ourselves reflexively: "Only in experience, in its turning back on itself, which at the same time is a change in our capacity to experience, lies the actual educative power of experience" (Buck 1989, p. 3). It is in this way that learning from experience consequently becomes learning as experience.

### ***Werner Loch: Learning and the Life Course***

Following the ideas of philosophical anthropologist Helmuth Plessner, Werner Loch developed a biographically based theory of education. Loch takes as his starting point a non-essentialist anthropology that sees the human being as an "open question." He then proceeds to conceptualize the phenomena of education *structurally*, both in biographical and intergenerational terms, as well as in terms of the process or experience of learning itself (Loch 2001). Similar to Buck, Loch succeeds in establishing an original, pedagogically significant conception of learning which goes well beyond the theory of his teacher, O.F. Bollnow. Like Hubert Dreyfus (discussed below), learning for Loch is concerned with 'knowing-how' (rather than with 'knowing that' or with 'propositional knowledge') and thus can be understood in terms that are both non-empirical and non-cognitivist. The lived body becomes important both as a category of reflection and as a phenomenon in and of itself, and learning is connected to sedimented habits and the habitus in general. To obtain this knowing-how, supportive and helping educational practices are important—as well as those educational practices that may be experienced as inhibiting and limiting. Loch works toward a determination of the negative aspects within educational processes. These are aspects which Buck has referred to as 'negativity' and which have attracted also attention in more recent German approaches (see below). In terms of

methodology, Loch points out the ‘poetic’ and ‘creative’ function of the phenomenological method and contrasts it to methods of hermeneutics and psychoanalysis.

### ***Heinrich Rombach and Eugen Fink: Structural Existentialist Phenomenology***

Towards the end of the 1960s, Heinrich Rombach and Eugen Fink developed new phenomenological perspectives on the lived experience of *Bildung* and education by using a type of reflection they christened ‘categorical reflection’ and by focusing on structures and what they referred to as ‘elemental phenomena’ (*Grundphänomene*).

Rombach developed a structural phenomenology (*Strukturphänomenologie*). He advocated a shift from anthropology to structural anthropology and from phenomenological pedagogy to structural pedagogy. Following Heidegger’s later thinking on humanism and ‘the human’, Rombach described humankind as (a) structure and as existing within structures, with the implication that one must give up a subject-centered and explicitly *human* science perspective as well as an explicitly sociological one (1979). Rombach distinguishes between various kinds of experience (e.g., political, economic, aesthetic) and contrasts them with the specific domain of *pedagogical* experience. Within education, concern and care, learning, wonder and astonishment, questioning and advising become basic phenomena for Rombach. Rombach’s distinction between *types* of experiences, which is important for educational reflection generally, was originally introduced by Rombach’s mentor in Freiburg, Eugen Fink.

Fink earned his doctorate under Husserl and Heidegger and remained Husserl’s loyal assistant, even when Husserl (of Jewish descent) was persecuted by the Nazis. Fink saw educational studies as a cultural practice that is to be sustained both as a field of study and also as a collection of practical life lessons (*Lebenslehre*). In his social phenomenology, Fink differentiates six fundamental co-existential elemental phenomena: play, power, work, love, death, and education. He sees these as connected to social, co-existential, and embodied practices in the time and space of society, and as an expression of care regarding *Dasein* after the ‘end of grand narratives’, to borrow a phrase from Lyotard (1984). Fink’s fundamental thesis sees ‘man as a fragment’, as something which exists neither as a complete being nor as an object. One can only experience oneself in relation to the world and to oneself in a fragmentary way. In this way, Fink shatters the totality of man and world or of man and nature as suggested by the human sciences has been shattered.

*Bildung* for Fink can no longer be *Allgemeinbildung* or general *Bildung* in a holistic sense; it can only be fragmentary. For this conception of *Bildung*, negativity (as defined above) is not an operation of consciousness but an existential trait of experience. *Bildung* can then be described as kind of coping with this ‘negative’ existential predicament. Accordingly, *Bildung* becomes a practical-existential experiment of meaning of a provisory nature: It is an existential and co-existential

practice, an engagement in the production and creation of meaning that is at most *provisional*. *Bildung* is also a reflective practice, given that the method of phenomenological variation can mark and compare different modes of experience in politics, arts, love, time, and labor. At the same time, the phenomenological reduction as a dimension of *Bildung* enables us to free ourselves from what are generally simply taken as facts and it opens up a broader perspective on what is possible. Phenomenology as a method for Fink is inseparable from the structures and dynamics of education and *Bildung*, forming a true ‘regional ontology’ in the sense anticipated by Fink’s teacher, Husserl.

Fink describes educational practice in terms of a ‘community of questioning’. This community is determined by power, by society, and culture, and it has as its reference point the collective predicament of ‘not-knowing’ and ‘not-knowing-how’ (1970). According to Fink, the relation between the generations is one that is also marked by ‘alienness’ (a notion also developed by Waldenfels, see below). Under conditions of alienness and insecurity, the community of questioning of the young aims toward future situations and considers options or possibilities to overcome difficulties particular to their situation. Education is thus characterized by difference and controversy concerning interpretations of such difficulties and situations. Fink’s theory of *Bildung* and education offers connections to Foucault and Derrida and to other poststructuralists who were themselves influenced by phenomenology.

### *Egon Schütz Bildung and the ‘Anthropological Circle’*

Fink’s student Egon Schütz developed his teacher’s approach into to “existential-critical pedagogy” and deepened it in the context of his many studies on anthropology, ethics, and aesthetics (Schütz and Brinkmann 2016). Schütz adds five existentials to the six co-existentials identified by Fink, seeing them as modes of human ‘relationship to being’ (*Seinsverhältnisse*): freedom, reason, historicity, language, and the lived body. The core of Schütz’ theory can be said to be constituted by the ‘anthropological circle’ as a fundamental mode of and limitation to human self-understanding. This ‘anthropological circle’ (also outlined in the final chapter of Foucault’s *History of Madness*, 2009) can be explained as follows: Theoretical, practical, scientific, and everyday definitions and conceptions of humankind can never lead to complete self-transparency. Humans remain subject to their finiteness and corporeality particularly where reflective and projective processes of self-formation (*Sich-Bilden*) and self-imagination (*Sich-Einbilden*) are concerned. Taking this anthropological circularity into account, Schütz describes *Bildung* as an existentially risky act of limited freedom, which takes place under the conditions of finiteness, corporeality, and co-existentiality.<sup>1</sup> Schütz sees education as a

<sup>1</sup> See also the archive of Egon Schütz at Humboldt-University Berlin: <https://www.erziehungswissenschaften.hu-berlin.de/de/allgemeine/egon-schuetz-archiv>

co-existential experiment, in which humans engage in practices of dealing with themselves and with one or multiple others as incomplete or imperfect beings. He applies the phenomenological methods of reduction and variation to develop this further: One's own view as well as different scientific theories and models are to be critically evaluated in terms of their anthropological presuppositions. The pre-meanings and pre-judices identified through this process are then bracketed in a skeptical *epoché*. Following this step, perspectives can be varied and stepping back from one's own approach and others' theoretical conceptions enables a variation of different views on the thing itself (*die Sache selbst*).

Viewed from the perspective of methodology, Schütz and Fink can be seen to clearly differentiate phenomenological research in education from a *pedagogical hermeneutics* (*hermeneutische Pädagogik*). Phenomenological description, unlike many other research frameworks—including others hermeneutic in nature—necessarily relies on intentionality; it is able to study acts and experiences only insofar as they are intentionally structured. Hermeneutics, for its part, practices a reconstructive interpretation (*Auslegung*) of something that is given as a text. As Loch puts it, phenomenological description aims at “working out how a human creature, who is equipped with a lived body, soul, consciousness and conception of self and thus becomes a self, can express sense-giving intentions at all” (2001, p. 1198; cf. Brinkmann 2015, 2017b).

## Conceptual and Methodological Plurality in the English-Speaking World

In the English-speaking world, phenomenological discourse in education has been defined by either an affirmation of or resistance to the dominant psychological and sociological paradigms, with notably little emphasis on the traditions, theories, and structures commonly associated with *Bildung*. English-language contributions are typically much more disparate and eclectic than the ones reviewed above, and include prominent researchers and methodologists from both cognitive and humanistic psychologies.

Starting in the 1970s, a wide range of texts and influences from the German sociology and the human sciences—including works of Dilthey, Husserl, and Gadamer—appeared in translation and have been gradually taken up by educational researchers and also by those developing qualitative research methods in education and psychology. Since that time, a range of approaches to phenomenology both as an empirical method and as offering insight for pedagogy and other practices have emerged. These range from relatively ‘egological’ articulations of phenomenology as a transcendental study of verifiable essences to a broadly Heideggerian interpretation of learning as ‘concernful coping’.

The survey of this pluralism provided below is not intended to be exhaustive, but rather broadly representative. The contributions considered include Hubert and

Stuart Dreyfus' 'model of learning' as the gradual acquisition of skillful coping or expertise. Particular methods also include 'phenomenography', developed by Ference Marton at Gothenburg University and popular in the UK, and the 'phenomenology of practice', and the 'descriptive phenomenological method' developed (respectively) by Amedeo Giorgi in the USA and van Manen in Canada. These also include Clark Moustakas' 'transcendental phenomenology', as well as 'interpretative phenomenological analysis' primarily associated with Jonathan Smith in London. With the exception of van Manen, these methodological variations emphasize an empirical, often positivistic rigor—all relying on data derived from informant interviews. In addition, none of these methods—again with the possible exception of van Manen's earlier methodological conceptions (e.g., 1989)—view education as representing a 'regional ontology' to which phenomenological methods are ontologically linked.

### *Hubert Dreyfus, Learning as Skillful and Concernful Coping*

Philosopher Hubert Dreyfus and his students and mentees (e.g., Mark Wrathall, John Haugeland) have engaged in a particularly productive and influential interpretation of the phenomenological tradition in general and of Part One of Heidegger's *Being and Time* in particular. Dreyfus, his co-authors, and many of his students do not see phenomenology as a research method, but instead regard it as offering a powerful refutation of and an alternative to broadly 'Cartesian', 'representationalist' theories of mind. They see these theories as being manifest in both scientific and popular discourses primarily in the form of 'computational cognitivism', a term which includes cognitive neuroscience, and which remains influential, especially in America. In developing this critical alternative, Dreyfus' work also articulates a widely referenced theory of learning and mentoring. Dreyfus' approach to Heidegger, as well as to learning as 'skillful coping', proceeds from an important and bold interpretive claim: That it is "our nature... to be world disclosers", meaning that Heideggerian *Dasein*—in contradistinction to Fink's and Schütz's interpretation—is individually embodied, situated, and directed by 'everyday concernful coping'. *Dasein* as individual consequently discloses "open, coherent, distinct contexts or worlds in which we perceive, feel, act, and think" (Dreyfus and Spinosa 2006, p. 265).

Dreyfus' 'model of learning' is most prominently articulated in the 1986 book co-authored with his brother Stuart, titled *Mind over Machine: The Power of Human Intuition and Expertise in the Era of the Computer* (Dreyfus and Dreyfus 1986). As in his other texts, this book is framed by a critique of the cognitive and computing sciences and artificial intelligence—particularly of models of expertise or 'expert systems' that were then fashionable. Adopting a stance reminiscent both of Loch's 'mode of knowing-how' and Schütz's 'co-existentiality', Dreyfus and Dreyfus present a five-stage model of learning as the acquisition of types of 'know-how'—forms of concernful coping in the world. These stages begin with close adherence to pre-

existing rules or plans, initially confirming rationalist empiricist accounts of mind and knowledge. But through gradual increased situated awareness, the final stages of “proficiency” or “expertise” are characterized by an intuitive grasp of situations based on deep, tacit understanding and by a kind of “ongoing mastery which... cannot be expressed in situation-free, purpose-free terms” (1992, p. 250).

These characterizations, like the model as a whole, confirm Dreyfus’ central premise that we are not simply aggregators of perceptual data, but ‘disclosers of worlds’, and the model has also been widely taken up in education—receiving the greatest recognition in healthcare and management. This model is seen, for example, as fruitful in the study development of “clinical problem-solving skills” or as providing richer understandings of “competency building” processes in professional development (e.g., Bergum 1997; Benner 2001). Dreyfus himself has also applied his model, albeit with mixed results, in discussions of the online world in general and online teaching and learning in particular (2001).

### ***Max van Manen: The Phenomenology of Practice***

Max van Manen has developed both a phenomenological method for empirical research and the outlines of a phenomenological approach to ‘pedagogical practice’. Van Manen characterizes his method as a “hermeneutic phenomenology”: an “abstemious reflection” that has as its goal an explicitly foundational “primitive or originary contact with the primal concreteness of lived reality” (2014, pp. 26, 41). Following Husserl, van Manen sees this reflection as abstemious or methodical in that it involves the phenomenological *epoché* or reduction. This is a process for which he outlines at least nine possible paths or approaches, including heuristic, hermeneutic, methodological, experiential, and ontological reductions. Van Manen’s abstemious reflection is hermeneutic in a heuristic sense in that it occurs through the composition, revision, and reflective interlinking of concrete but creative descriptive *texts*. These are texts which van Manen characterizes as (among other things) simultaneously vocative (or appellative) and evocative: “In the reflective process of writing the researcher not only engages in analysis but also aims to express the noncognitive, ineffable and pathic aspects of meaning that belong to the phenomenon” (2014, p. 240). “This task of reflection and imagination”, van Manen continues, “is mediated by empirical material drawn from life, such as anecdotes, stories, fragments, aphorisms, metaphors, memories, riddles, and sayings” (2014 pp. 240, 248). Despite its foundationalist emphases, van Manen links his methodology with conceptualizations from a wide range of philosophers, particularly French post-structuralists such as Jacques Derrida and Maurice Blanchot.

In defining ‘practice’ in his phenomenology of practice, van Manen is all-inclusive: “A primal notion of practice”, he explains, “refers to our ongoing and immediate involvement in our everyday worldly concerns” (2007, p. 15). Thus *unlike* other phenomenologists in education such as Fischer or Schütz, and *like* phenomenologists such as Dreyfus, the later van Manen comes to see his descriptive

phenomenology as a method that does *not* exist in a one-to-one relationship with education or pedagogy as its object. Instead, it appears in his most recent books as significant for the broadest range of involvements or forms of participation—all of which he regards as ontologically primary and simultaneously as the empirical ground for all phenomenological investigation.

However, unlike other popular understandings of practice (e.g., of Pierre Bourdieu or Étienne Wenger), van Manen understands practice in terms of ‘our pragmatic *and* ethical concerns’ (emphasis added). The ethical dimension is ultimately indispensable to van Manen’s account of practice, and it is unclear how it might apply to the term in its broader, cultural, ethnographic sense. Regardless, this ethical emphasis is pervasive in his work on *pedagogical* practice, where van Manen has focused on traditional human science notions of the *pedagogical relation* between adult and child and especially on the adult’s pedagogically *tactful* engagement within it. The pedagogical relation is seen by van Manen—as it was by Nohl, Bollnow, and Langeveld before him—as a singular relation that is simultaneously personal and professional, that arises *sui generis* between adult and child and in which the adult acts intentionally for the sake of the child’s present circumstances and his or her likely future (Friesen 2017). In this context, the adult’s actions are to be guided by ‘tact’ which van Manen characterizes in terms of ‘pathic’ understanding: situated, relational, embodied, and enactive forms of ‘non-cognitive’ learning and knowing. Indeed, both pedagogical engagement and research work for van Manen can be said to focus on a kind of ethically charged tactful engagement with their objects—with their common goal being to affect the student or the reader in ways that are pathic or non-cognitive, rather than in ways more immediately accessible to explicit awareness or cognition.

### ***Amedeo Giorgi and Clark Moustakas: Transcendental Psychological Methods***

Amedeo Giorgi’s *descriptive phenomenological analysis* works through what he calls ‘situated structural descriptions’. Giorgi views such descriptions as ultimately irreducible to any single interpretation. Giorgi’s is a ‘pure’ phenomenology, seeing its task as the description of objects of consciousness through the exercise of the phenomenological reduction, with the aim of arriving at ‘scientific’ essences, with the emphasis on the natural sciences that this brings in English. It “follows Husserl as strictly as possible: it uses intuition, it is descriptive, it acknowledges eidetic findings and it employs the pretranscendental reduction along with imaginative variation” (2007, n.p.). Giorgi’s method interprets Husserl’s contributions in isolation from the myriad aspects of phenomenology developed subsequently, including those hermeneutic-anthropological (e.g., Heidegger) or phenomenological-pedagogical (e.g., Fink) in emphasis. Recent examples of studies using Giorgi’s descriptive phenomenological analysis include *The Phenomenology of Koan*

*Meditation in Zen Buddhism* (Grenard 2008) or *The Lived Experience of Early-Stage Alzheimer's Disease: A Three-Year Longitudinal Phenomenological Case Study* (Robinson et al. 2012).

Given its transcendental ambitions, it is not surprising that Clark Moustakas' *transcendental phenomenology* follows Giorgi in its rather single-minded focus on Husserl's earlier accounts of his method, and its avoidance of subsequent developments in phenomenology and the human sciences. Moustakas, like Giorgi, also worked as a psychologist and developed his method through book-length studies on (and including) *Loneliness, Creativity and Love* (2004). In his transcendental approach, Moustakas encourages open-ended questions and dialogue as a form of data gathering, asking the researcher to focus on the 'naïve' descriptions available in these data. These descriptions are then subject to a type of phenomenological reduction, bracketing or *epoché*. In describing this process, Moustakas speaks of the researcher as working to attain a 'transcendental consciousness' that is open and purified, and through which the researcher can engage in 'an authentic encounter' with the object in question (1994, p. 85). In other words, Moustakas (like Giorgi) conceives of 'the transcendental' in terms of its most idealist and egological articulations in Husserl—conceptions that has been widely rejected in both phenomenology and philosophy since Husserl's time. These difficulties are exacerbated by the relatively matter of fact, point-form manner in which Moustakas and others present the results of their 'transcendental' investigations. These factors, along with Amedeo Giorgi's aspirations to 'scientific essences', can be seen to have encouraged a search for methodological alternatives in phenomenological research.

### ***Jonathan A. Smith and Ference Marton: Interpretative and Educational Variations***

Jonathan A. Smith's *interpretative phenomenological analysis* appears to be one of the alternatives just mentioned appealing to an explicitly cognitive and constructivist epistemology rather than to any egological 'transcendental consciousness'. Smith's approach shares with cognitive psychology and its constructivist variants a concern with mental processes, specifically those of 'sense-making'. Sometimes known simply as IPA, Smith's method has cognition as a central analytic concern and integrates aspects of symbolic interactionism of George Herbert Mead and John Dewey to understand how this process occurs in both social and personal worlds. It thus takes questions such as 'how do transgendered persons think of sex?' or 'how does HIV impact one's sense of self?' and discusses them in the context of structured or semi-structured interviews. It then analyzes participant responses in terms of what is called a 'double hermeneutic', in which the researcher tries to make sense of the participants who are in turn trying to make sense of their worlds. In this context, the researcher is asked to adopt both an "empathetic" and a "critical"

hermeneutic stance, with each presumably entailing a particular type of “bracketing” or *epoché* (Smith et al. 2009).

Finally, there is Ference Marton’s phenomenography. Although Marton emphasizes that his “phenomenography” is *not* “an offspring of phenomenology” (1986, p. 40), it is in many ways overtly positioned as a Husserlian ‘science of consciousness’. Like Giorgi’s descriptive phenomenology and Smith’s interpretive phenomenology, phenomenography has as its focus participants’ conceptions of the world around them, conceiving of these as the products of intentionality. In place of a pursuit of Husserlian ‘essences’, phenomenography derives ‘categories’ from this empirical data. Although Marton himself disavows any reliance on phenomenological bracketing, his method is dependent on a set of collaborative and also explicitly comparative or eidetic techniques intended to minimize the influence of preexisting theory and individual preconceptions.

Unlike Giorgi, Moustakas, and Smith, who developed their methods as phenomenological *psychologies*, Marton and his method are firmly situated in *education*. In this sense, Marton, like van Manen, can be said to have made broadly phenomenological contributions to educational theory. One particularly prominent example is Marton’s distinction, developed in the mid-1970s, between ‘surface-level’ and ‘deep-level learning’ or ‘processing’ in reading. In superficial reading, consciousness has as its intentional object *the sign* itself, or the rote learning of the text; in deep processing this object is replaced by *the signifier*, or the intended meaning of the text (Marton and Säljö 1976). Although rather reminiscent of Craik and Lockhart’s 1972 computational (and thus non-intentionalistic) notion of deep and surface encoding of stimuli in memory, Marton’s distinction is still widely cited.

## Contemporary Developments in English and German

As Marton and Smith both illustrate, when conceived of in terms of a research method, phenomenology has proven—and continues to prove—to be highly adaptable. This is further illustrated by ongoing work undertaken by both van Manen’s students and those of the generation of Fink, Rombach, and Waldenfels. Van Manen’s students, for example, are showing that his hermeneutic phenomenology can be adapted to the study of the widest range of experiences—from ones aesthetic in nature to others that might be deemed pathological. These same students have continued his work on both method and practice. Friesen (2011) has recast van Manen’s nine modes of reduction in the form of the basic ontological distinctions invoked in the everyday use of the pronouns ‘I’, ‘you’, and ‘we’ and applies these in critiquing cognitivist conceptions of learning and the self. Further directions are being explored by other phenomenologists in the field of education not necessarily connected with the phenomenologists covered thus far, with Samuel Rocha (2015) and Eduardo Duarte (2012), for example, experimenting with the imaginary and aesthetic aspects of phenomenological study and writing, and Gloria Dall’Alba (2009), Glen Sherman (2016), Mark Vagle (2015), and Oyvind Standal (2016)

working to connect phenomenology and a range of educational and methodological themes and emphases.

In the German-speaking world, scholars connected to Rombach and Fink have taken contemporary issues—ranging from biologicistic ‘neuro-pedagogies’ to ‘practicing’ as an exercise in power/knowledge—and addressed these phenomenologically, integrating insights of Merleau-Ponty, Levinas, Derrida, and, in particular, Waldenfels and Foucault. Bernhard Waldenfels’ notions of sociality, corporeality, responsivity, alterity, genealogy, and power, as well as his expansion of Husserl’s concept of intentionality have played a central role in this integrative work. Wilfried Lippitz (2003b) combines Levinas’ insights into otherness and their radicalization in Waldenfels’ notion of the ‘alien’ together with ‘exemplary’ lifeworld description to produce pedagogical phenomenologies of relationship with oneself and between generations. Käte Meyer-Drawe (1984/2001) also refers to Merleau-Ponty and his phenomenology of intercorporeality in order to rethink learning as ‘re-learning’ or ‘learning anew’ (*umlernen*) in connection with intersubjectivity. In so doing, Meyer-Drawe has also articulated a powerful genealogical critique of learning as an exclusively neurological phenomenon. Her work has inspired related phenomenological investigations of “learning-as-experience” by scholars connected with the University of Innsbruck in Austria who have developed a method of observation and description they refer to as “vignette research” (e.g., Agostini 2016). Finally, based on a phenomenological theory of practicing (*Übung*; see Brinkmann 2012) and attention (Brinkmann 2016c), Malte Brinkmann is examining temporal and corporeal experiences of power within learning and education by using video research. He works to develop the approaches of Fink, Schütz, and Lippitz further—toward a historiography, epistemology, and methodology of the phenomenological movement in education (see Brinkmann 2015, 2016a, 2017a/b).

## Conclusion

The epistemological question of the subject matter and the core of pedagogy as a discipline and profession on the one hand and the methodological question of adequately researching these concerns on the other were first raised in Aloys Fischer’s *Descriptive Pedagogy* (1914/1961). Subsequent work has followed paths both divergent and convergent, with some retaining the normative anthropological impulses of the human sciences through to the present (e.g., van Manen), others focusing on existential and ontological concerns (e.g., Fink, Rombach), and still others reaffirming moments in Husserl’s earliest methodological conceptions (e.g., Marten, Moustakas, Giorgi). Today, phenomenology is applied anew to reevaluate key theories of learning, practicing, and education to show them as lived experiences that are situated within the horizons of corporeality, responsivity, foreignness, and power relations. In German-speaking Europe, phenomenology has come to represent a discipline that connects education with broader questions of *Bildung*. In the English-speaking world it has gradually expanded to offer a plurality of variations

and possibilities for qualitative researchers. Its adaptability and longevity both as a philosophical orientation and a method strongly suggest that phenomenology will remain a vital and changing but philosophically grounded source of insight into education and other contexts of human care and formation.

# Pragmatism and Its Aftermath

Stefano Oliverio

## Introduction

In what may have been the first comprehensive volume on the relationship between the pragmatist tradition as a whole and education, John L. Childs (1956) argues that “[i]n no sphere of American life has the influence of pragmatism been greater than in that of education” (p. 4). Indeed, “we can grasp the meaning and the worth of what has come to be known as ‘the new education’ only as we understand the salient features of the philosophy which *gave it birth*” (Ibid., p. 5. Emphasis added).

Childs makes almost incidentally a momentous statement: in his outlook not only does there seem to be an intimate bond between pragmatist philosophy and the new education but the latter *was born* from the former. In this sense, a sort of ‘genetic relationship’ is postulated. A couple of decades later, Sidney Hook (1973), the standard-bearer of pragmatism in the epoch of its academic eclipse, assumed a different position: on the one hand, he curtly contested that “a metaphysical or epistemological position has logical implications for educational theory and practice” (p. 15); on the other, he recognized that “there is an organic connection in Dewey’s own thinking between his philosophical ideas and his educational proposals”, although “they are not related as logical premise to logical conclusion” (p. 40). More recently, Randall Curren (2009) has given a negative answer to the question of “whether there is a distinctively pragmatist approach to philosophy of education” (p. 499).

Despite the different focus of their reflections, considering together Childs, Hook, and Curren allows one to identify a sort of (admittedly sketchy) map of the positions regarding the relationships between pragmatism and (philosophy of)

education, ranging from the genetic dependence of the latter on the former to a substantial unconnectedness. In this chapter, while no genetic relationship between pragmatism and specific educational movements is advocated, the endeavor is that of highlighting how it has introduced into the philosophical discourse some ideas which have reverberated on education (and still do).

The motifs which have marked pragmatism as a ‘school’—despite some incontrovertible differences among its representatives—are epitomized by Richard Bernstein (1991), who has listed “five interrelated substantive themes that enable us to characterize the pragmatic *ēthos*” (p. 326): anti-foundationalism, fallibilism, the social character of the self and the nurturing of critical communities, the awareness of chance and contingency, and plurality (Ibid., pp. 326 ff.). Bernstein has also pointed out how classic pragmatists “were robust naturalists stressing the *continuity* of human beings with the rest of nature” and insisted on “the need for philosophy to be informed by, and open to, the significance of novel scientific developments” (Bernstein 2010, pp. 8–9). In the wake of these considerations, in section “Themes and motifs of classic pragmatism and their educational import” some major themes of classic pragmatist philosophy will be discussed and their import for (philosophy of) education explored.

Section “Neo-pragmatism and the linguistic turn” will be devoted to the ‘aftermath’ of pragmatism: as it will be impossible to present the multifarious ways in which neo-pragmatism has been resuming and reviving the classic pragmatist heritage in the light of some outcomes of the analytic tradition (Cometti 2010; Malachowski 2013; Misak 2013; Calcaterra et al. 2015), the focus will be rather confined to some traits that distinguish the neo-pragmatist stance.

In the final section, in the light of some recent debates, I am going to indicate what seems to be the topicality of a pragmatist attitude in contemporary educational scenarios.

## Themes and Motifs of Classic Pragmatism and Their Educational Import

Dewey has argued that philosophy is “a conversion of [a] culture as exists into consciousness, into an imagination which is logically coherent and is not incompatible with what is factually known. [...] If American civilization does not eventuate in an imaginative formulation of itself, if it merely re-arranges the figures already named and placed, in playing an inherited European game, that fact is itself the measure of the culture which we have achieved” (LW 3, p. 9).<sup>1</sup> Accordingly, pragmatism should be construed as an imaginative formulation of American civilization in a specific

phase of its development. Born in Cambridge (Mass.) in the 1870s, with the meetings of the Metaphysical Club—a circle of scholars of different background<sup>2</sup>—pragmatism can be read as a way of articulating a philosophical response to the challenges that the US society had to face in the aftermath of the Civil War and, subsequently, over the last decades of the nineteenth century and the first decades of the twentieth century, with the emergence of industrialism (understood as the social outcome of the development of science and technology), the rocketing urbanization, and the massive immigration; all these phenomena were reshaping the US society and invoked adequate responses to keep the American experiment alive.

The classic pragmatists were well aware of this background: in his introduction to Mead's *Mind, Self, & Society* (1967), Charles Morris writes: “Darwinism, the experimental method, and democracy are the headwaters of the pragmatic stream” (p. x). This outlook echoes Dewey's preface to *Democracy and Education* (MW 9, p. 3) and represents a valid snapshot of the intellectual and cultural forces from which pragmatism emerged as a philosophy (of education). It should be complemented, however, with the reference to a typical philosophical element: pragmatism is characterized by a fundamental anti-dualism. This habit of thought has been hegemonic throughout the history of Western metaphysics from its very inception and was re-launched by Descartes with the *res cogitans/res extensa* opposition, reverberating on most epistemological debates. A vast array of dualisms (body/mind, experience/thought, impulse/reason, action/theory, etc.) has consequently dominated the modern philosophical reflection, and the antithesis between philosophical schools has been constant (fundamentally epitomized in the contrast between an empiricist and a rationalist strand).

Although all the pragmatists are characterized by a clear anti-dualist stance, it is John Dewey to be most committed to smoking out and dissolving the dualisms that have been plaguing the Western tradition. Dewey is particularly careful in detecting not only their theoretical untenability but also their “disastrous effect” (LW 3, p. 27) at the socio-political level: indeed, the separation of the domain of mind (=thought = knowledge) from that of body (=experience = action) has been matched and strengthened by a division between a leisure class dedicated to the ‘pure’ task of knowledge and the menial masses, who should therefore accept a subordinate and passive role in society.

The very disconnection of theory and practice—which pragmatism completely overthrows in its original move—is the sign of the dualistic flaw of Western history. In Dewey's understanding, instead, all the “various metaphysical, epistemological, and axiological distinctions” of our tradition should be regarded “as functional relationships rather than as oppositional dichotomies” (Alexander 2006, pos. 3211), that is, they are differences in function emerging within the continuum of natural events.

In this perspective, in the following three subsections the engagement with some major notions of pragmatism (inquiry, belief and habit, and mind and the social self)

---

<sup>2</sup>The leaders of the club were William James, Charles Sanders Peirce, and Oliver Wendell Holmes Jr. For a popular presentation of the Metaphysical Club, see Menand (2001).

can be construed also as the exploration of how the classic pragmatists contribute to deconstructing some deep-seated dualisms of modern thought (respectively, action/thinking, body/mind, and individual/society).

### *The Attack on Cartesianism and the Method of Inquiry*

Peirce has noted that pragmatism is “scarce more than a corollary” (CP 5.12)<sup>3</sup> to the definition of belief provided by Alexander Bain as “that upon which a man is prepared to act”. For Peirce “the rational purport of a word or other expression lies exclusively in its conceivable bearing upon the conduct of life” (CP 5.412). It is proper to situate these ideas against the backdrop of the Peircean polemic against Descartes, which will grant us a major access to the peculiarities of the pragmatist mindset.

Presenting what he means by inquiry, Peirce notes that it is “a struggle to attain a state of belief” (CP 5.374). Belief is “a calm and satisfactory state” (CP 5.372) that appeases the irritation of doubt. In this sense, inquiry is intermediate between a prior (disrupted, that is, called into doubt) belief and a new belief emerging from inquiry. However, it is not any doubt that can trigger a genuine inquiry, as Peirce remarks by scornfully criticizing those “philosophers [who] have imagined that to start an inquiry it was only necessary to utter a question whether orally or by setting it down upon paper, and have even recommended us to begin our studies with questioning everything” (CP 5.376). Instead, we do not need a futile questioning but “a real and living doubt”, without which “all discussion is idle” (CP 5.376).

In this criticism of the idea of radical doubt a fallibilist attitude and the refusal of any foundationalism are manifest. The Cartesian strategy aimed at thoroughly dismantling any previous knowledge in order to attain an Archimedean point on which to rebuild science. In this sense, the Cartesian pursuit expresses the “search for certainty” that Dewey (LW 4) denounces as the ill of the Western philosophical tradition and a major source of the “epistemological industry” (MW 1, p. 122; MW 10, p. 23; LW 14, p. 179). In rejecting the Cartesian foundationalism, Peirce replaces it with an experimental outlook:

Philosophy ought to imitate the successful sciences in its methods, so far as to proceed only from tangible premises which can be subjected to careful scrutiny, and to trust rather to the multitude and variety of its arguments than to the conclusiveness of any one. Its reasoning should not form a chain which is no stronger than its weakest link, but a cable whose fibres may be ever so slender, provided they are sufficiently numerous and intimately connected. (CP 5.265)

It is to be highlighted how for Peirce doubting “is not a thing you can do in a minute” (CP 6.498), on command, so to speak, but it “is an art which has to be acquired with difficulty” (Ibidem). The pragmatic attitude requires one not to be “content to

---

<sup>3</sup> Citations of Peirce are from the *Collected Papers* (CP) edition (Peirce 1931–35).

*ask himself* whether he does not doubt” but rather it urges him to invent “*a plan for attaining to doubt, [to elaborate] it in detail, and then [to put] it into practice, although this may involve a solid month of hard work*” (CP 5.451. Emphasis added). In this perspective, education for inquiry (a major pragmatist theme) is interwoven with a cultivation of the art of the experimental doubting.

The meaning of doubt resonates in Peirce’s distinction of teaching and learning institutions, only the latter being genuinely scientific:

In order that a man’s whole heart may be in teaching he must be thoroughly imbued with the vital importance and absolute truth of what he has to teach; while in order that he may have any measure of success in learning he must be permeated with a sense of the unsatisfactoriness of his present condition of knowledge. The two attitudes are almost irreconcilable. (CP 5.583)

Charles Wright Mills (1966, p. 163) has spoken of a ‘laboratory habit of mind’ intimating that Peirce breaks the Cartesian mould by appealing to a view which is ultimately grounded in the social practices of scientific laboratories. In fact, Peirce distinguishes four methods of fixing belief (tenacity, authority, truth agreeable to reason, and science), and it is noteworthy how the succession of these methods is marked by an increase (a) in their social tenor and (b) in the cultivation of the art of doubt. Scientific inquiry is the best way of establishing beliefs precisely because it dovetails these two features with each other. In this sense, it is built on and promotes cooperative habits of mind and a fallibilist attitude, which is rooted in the conception that inquiry is a self-correcting enterprise thriving on the work of public criticism and on the testing of hypotheses and theories.

The notion of community of inquiry has become current in many educational theories and pedagogies, sometimes within a clear Peircean lineage as with Matthew Lipman’s and Ann Sharp’s *Philosophy for Children* approach (see Lipman 2003; Oliverio 2012, 2017), in other cases by referring solely to a Deweyan matrix as with the COI (Community Of Inquiry) framework in distance education developed by Randy Garrison and other representatives of the school of Alberta (for a general introduction to the COI framework see Randy et al. 2010). More generally, in the Peircean concept of a cooperative and self-correcting undertaking we find a primary source of the idea—which Dewey (LW 7) and Mead (2008) will develop—that education for reflective thinking is modeled after the paradigm of science as experimental inquiry, although relevant differences between Peirce’s and Dewey’s views of inquiry should not be gainsaid (Talisie 2002).

Due to space constraints, it is impossible to examine here other dimensions of Peirce’s anti-Cartesian stance, but it should be pointed out how the notion of belief is itself as anti-Cartesian as possible. According to Peirce, “[t]he essence of belief is the establishment of a habit, and different beliefs are distinguished by the different modes of action to which they give rise” (CP 5.398). Connecting belief with habit, understood as a rule of action, entails a marked distance from the Cartesian epistemology. Belief is diametrically opposed to the Cartesian notion of ‘idea’. This latter was the pivot of a ‘mediational epistemology’, that is, “an understanding of the place of mind in a world such that our only knowledge of reality comes through

the representations we have formed of it *within ourselves*” (Taylor 2005, p. 26. Emphasis added). Cartesian representationalism—which re-emerges today in the theories of cognition as symbol-processing (for a philosophical-educational assessment of these see Bredo 1994)—is the epistemological counterpart of the separation between mind and body, organism and environment. This stance goes hand in hand with the gulf between theory and action that is sanctioned in what Dewey calls “the spectator theory of knowing”, in which “thought [is] viewed as an exercise of a ‘reason’ independent of the body” (LW 4, p. 195). The overcoming of the split between mind and body, thought and action, means that “learning must have a firm biological basis and mind is not separate from the body, its feelings, desires, and interests” (Garrison and Neiman 2003, pos. 469).

In the next subsection, I will valorize this biological dimension by appealing to James’s and Dewey’s treatment of education within a Darwinian horizon.

### ***The Influence of Darwin on Education and Learning As the Formation of Habits***

There is a sense in which one of the main tenets of pragmatism could be captured in a pun: it is the passage from knowledge as copying to knowledge as coping. The former is the view according to which the truth of knowledge consists in the agreement between thought and reality, theories and facts. The agreement is here construed in terms of the adequacy of the ‘copy’ (idea or internal representation) to what it is the copy of. Instead, to use the vocabulary of James’s *Pragmatism*, “[t]o ‘agree’ in the widest sense with a reality *can only mean to be guided either straight up to it or into its surroundings* [...] Any idea that helps us to *deal*, whether practically or intellectually, with either the reality or its belongings [...] will agree sufficiently to meet the requirement” (James 2000, p. 93). Theories become, accordingly, “*instruments, not answers to enigmas, in which we can rest*” (Ibid., p. 28).

James pinpoints wider existential and even ‘onto-cosmological’ implications: “The essential contrast is that *for rationalism reality is ready-made and complete from all eternity, while for pragmatism it is still in the making, and awaits part of its completion from the future*. On the one side the universe is absolutely secure, on the other it is still pursuing its adventures” (Ibid., p. 113). In an educational perspective, this antithesis reverberates in that between education understood as the process of the conformation of people (usually the youth) to a world as it is and to a past that has to be replicated and perpetuated; and, on the other hand, education as the process of the ‘enablement’ of people, which provides them with the formative powers to in-habit and take part in the making of a world still open to the future.

Eric Bredo (2002) has sagaciously pointed out ‘the Darwinian center’ to these Jamesian visions. In *Talks to Teachers on Psychology* (1899), James illustrates the role that the theory of evolution has played in the abandonment of the old image of reason and of the human being, and he indicates the educational dividends of this

revolution: “[...] man, whatever else it may be, is *primarily a practical being*, whose mind is given him to aid in adapting to this world’s life” (James 1899, pos. 33788. Emphasis added). This implies regarding education as consisting in “*the organization of acquired habits of conduct and tendencies to behavior*” (James 1899, pos. 33841). The pedagogical fruit of this evolutionary view of the mind is summarized, for James, in the maxim “[*n*]o reception without reaction, no impression without correlative expression” (James 1899, pos. 33879), that is, anything which is merely ‘delivered’ to the pupil’s ear or eye without changing his/her active life is doomed to be educationally inane.

What has been presented here is an admittedly partial and perhaps tendentious account of James’s *Talks*, insofar as it has privileged only those parts in which pragmatist motifs crop up. Randall Curren has driven a good point home when noting that “[i]t would be an immense stretch to find pragmatist philosophy in James’s *Talks to Teachers*” (Curren 2009, p. 496). However, one can sustain Dewey’s pragmatist appropriation of this book, when he refers to its merits in emphasizing “the active and the motor” (LW 14, p. 338) in education and in considering pupils as principally ‘behaving organisms’. Moreover, he remarks that “[i]t was the work of James and others to lay a foundation on which later educators have carried forward in marked degree the new type of education thus foreshadowed” (LW 14, p. 339).<sup>4</sup>

It is possible to interweave the two threads of the argumentation developed thus far (the anti-Cartesian and the Darwinian) by stating that pragmatism has represented an attack on the typical modern epistemology by drawing the philosophical consequences of Darwin’s revolution. In a series of three papers appearing in 1908–1909 Dewey illustrates the “bearings of pragmatism upon education” (MW 4, pp. 178–191) on the basis of its differences from the theory according to which it is “the business of thought to mirror with theoretical or speculative exactness an outside world” (MW 4, p. 179). The mirror-theory of knowledge was developed in modernity in two different directions: “the transcendental theory of pure knowledge”, in which knowledge “simply represents the deposit that results from the exercise of a purely theoretic faculty” (Ibidem), and the theory of the mind as a blank slate. The two philosophical strands of modernity found their educational translation in the differentiation between an elite education aiming at pure knowledge and ‘culture’ in the eulogistic sense; and education for the ‘masses’ as the “mold[ing]” of “their minds [...] into passive and obedient conforming to the existing [environment] about them” (MW 4, p. 181). In contrast, in pragmatism

[m]ind is, so to speak, a device for keeping track of the increased differentiation and multiplication of conditions, and planning for, arranging for in advance, ends and means of activity which will keep these various factors in proper adjustment to one another. This explains the fact that all intelligence involves a peculiar combination of the sensory and receptive factor (emphasized by the passive theory of education) with the active, intellectual factor—emphasized by the theory of pure rational activity. (MW 4, p. 184)

---

<sup>4</sup>Dewey partly qualifies this positive comment by stating that “while James praised the promising new, he was as regards school-keeping still the child of his age and time” and, consequently, many of his pedagogical tips are “looking backward not forward” (LW 14, p. 339).

From this reading of pragmatism against the backdrop of the modern epistemological dualism some relevant educational ‘guidelines’ stem: (a) “[e]very educative process should begin with *doing something*” (MW 4, p. 185); (b) senses are trained by the engagement in activities; and (c) the same principle obtains for “[t]he more intellectual side of education [...] All thinking at its outset is planning, forecasting, forming purposes, selecting and arranging means for their most economical and successful realization” (MW 4, p. 187).

Speaking of the ‘bearings of pragmatism upon education’, Dewey seems to intimate that, although innovations in educational practice should not be read merely as the translation of a philosophical stance—the point made by Hook—pragmatism can operate as “a working hypothesis in educational theory” (MW 7, p. 329) and grants a philosophical framework for reconnecting some educational reforms to a broader intellectual horizon. For instance, interpreting the emphasis on doing through the lens of pragmatism helps one avoid the simplifications of the discourse of the ‘learning by doing’. Not only does the notion of ‘learning by doing’ have a much longer history (Knoll 2011, pp. 287 ff.), but it risks being an inadequate representation of the core of a pragmatist stance in education: it is not the stress upon ‘doing’ per se, which is important, but the recognition both of the articulation of action and thinking, paradigmatically embodied in modern science, and of the situated character of knowledge, namely, of the fact that knowledge is not something merely occurring ‘in the head’ but is a phase in the reconstruction of experience, that is, of the organism/environment transaction.

In the same vein, characterizing learning as habits-formation can be misleading if we lose sight of the sophisticated pragmatist view on habits. These are not mechanical ways of acting, forms of readymade behavioral response but rather ‘rules of action’, in Peirce’s vocabulary, or “arts”, with a Deweyan expression (MW 14, p. 15), that is, ways of “assimilat[ing] objective energies, and eventuat[ing] in command of environment” (MW 14, p. 15–16). Learning consists, accordingly, in the forming of flexible habits, which are the outcome of a readjustment between the organism and the environment through paths of inquiry and not of drill-and-practice pedagogical methods as in the Thorndike paradigm (Koschmann 2000; Tomlinson 1997).

In the understanding here advocated, pragmatism as a philosophy (of education), on the one hand, contributes to the elicitation of the meaning of educational methods and practice and, on the other, preserves them from being misused and drained of their democratic-emancipative potential.

### ***The Social Character of the Self and the Democratic $\tilde{\text{E}}\theta\text{os}$***

Peirce’s implacable attack on Descartes’s intuitionism and on his idea that we have immediate intuitive knowledge of our selves is the source of one more major shift initiated by pragmatism, namely, the break with “the modern, consciousness-centered conception of human subjectivity” (Biesta 1999, p. 476). This Peirce tenet

found a peculiar inflection in the work of Dewey and George Herbert Mead, who, being close collaborators and friends, developed *together* their view of ‘the bio-social mind’ (Baggio 2015) and a theory of the social character of the self. As in Part One of this *Handbook* a chapter is entirely devoted to Dewey, I will refer here initially to Mead’s ideas on mind and self, hinting at their educational import and showing their connection to another of the aforementioned ‘headwaters of the pragmatic stream’, namely, democracy as a social ideal.

The mind for Mead (1967) is not a pre-existent human faculty or endowment but an emergent phenomenon of human interactions. As he notes, “[t]he thought process is *dependent on intercourse*. This is very important in education. The social relationship comes before thought, thought arises out of the consciousness of social relationship, of separation” (Mead 2008, p. 85).

If, commenting on Peirce, the social matrix of inquiry has been highlighted, we reach here the social insurgence and, therefore, rootedness of the mind and thought themselves. A crucial implication is that education is ‘essentially’ social interaction, communication, that is, in Deweyan terms, “participation, sharing” (LW 1, p. 132). And as, “[w]hen communication occurs, all natural events are subject to reconsideration and revision [...] [and] turn into objects, things with a meaning” (Ibidem), education is a process of collaborative and participatory meaning-making and not of meaning-transfer in which the educatee, in a broad sense, is the addressee of the delivery of some contents. It is within this process that Mead sees the emergence of that kind of experimental mindset which is pivotal for pragmatism: “[T]he scientific attitude is one which was essentially derived from education; that of preparing the younger generation that it may take its place in the life of the community” (Mead 2008, p. 148).

As well as the mind “[t]he self is something which has a development; it is not initially there, at birth” (Mead 1967, p. 135). In particular, the self emerges through the internalization of what Mead calls “the generalized other”, namely, “the attitude of the whole community” (Ibid., p. 154), the set of the rules of social communication and conduct. In this perspective also the typically pragmatist reflection on democracy receives its full significance. Indeed, as Mead argues,

[i]t is possible for the individual to develop his own peculiarities, that which individualizes him, and still be a member of a community, provided that he is able to take the attitude of those whom he affects. [...] One may say that the attainment of that functional differentiation and social participation in the full degree is a sort of ideal which lies before the human community. The present stage of it is presented in the ideal of democracy. (Mead 1967, p. 326)

In the same vein, Dewey coins his definition of democracy as “more than a form of government” and “primarily a mode of associated living, of conjoint *communicated* experience” (MW 9, p. 93. *Emphasis added*) and states that it is “not an alternative to other principles of associated life” but “the idea of community life itself” (LW 2, p. 328).

It is to note that Dewey introduces his memorable definition in order to provide a ‘deeper explanation’ for the ‘familiar fact’ of “[t]he devotion of democracy to education” (MW 9, p. 93). While this is usually traced back to the need for a literate

citizenry, as the government rests upon popular suffrage, Dewey refers to an intimate bond between democracy and education, which is incomprehensible outside the argumentative device that ties together social interaction, communication, education, and democracy, the latter being the most developed stage of the community life.

Both Dewey and Mead developed their views at the crossroads of two influences, creatively synthesized (especially by Dewey) in one argumentative pattern: on the one hand, in the Chicago at the end of the nineteenth century and the beginning of the twentieth century they both joined the settlement movement and, in particular, the experience of Hull House. In this way, not only did they acquire a first-hand knowledge of the conditions of poor people and workingmen, mostly immigrants, in a rapidly industrializing city and not only did they realize how this represented the chief challenge for a society aspiring to be democratic, but they also became familiar with the response that Jane Addams, the Hull House co-founder, had been providing in terms of a social re-definition of the idea of democracy and, therefore, of an intimate connection with new educational tasks:

As democracy modifies our conception of life, it constantly raises the value and function of each member of the community, however humble he may be. [...] We are gradually requiring of the educator that he shall free the powers of each man and connect him with the rest of life. [...] As the political expression of democracy has claimed for the workingman the free right of citizenship, so a code of social ethics is now insisting that he shall be a conscious member of society, having some notion of his social and industrial value. (Addams 1902, pos. 12911 and 13009).

When Dewey and Mead construe the democratic ideal in terms of the need for differentiation as well as social participation they have in mind also the challenge of the socialization of immigrants without erasing their peculiarities but rather by liberating these as a factor of growth for the community as a whole.

On the other hand, this is only part of the story and, more specifically, that part related to the highlighting of the “prepolitical dimension of social communication” (Honneth 1998, p. 770), grounded in the social division of labor. But, as Honneth argues, Dewey understands “democracy as a *reflexive* [*sic*] form of community cooperation” (Ibidem. Emphasis added) and the ‘reflective’ character is rooted in “his research in the logic of science”, which allows Dewey to develop “an epistemological argument that proposes regarding democracy as a condition for increasing the rationality of solutions to social problems” (Ibid., p. 773). In this sense, “[t]he political sphere is not [...] the place for communicative exercise of freedom but the cognitive medium with whose help society attempts, experimentally, to explore process, and solve its own problems with the coordination of social action” (Ibid., p. 775).<sup>5</sup>

---

<sup>5</sup>I have extrapolated Honneth’s considerations from the wider context of his reflection showing the productivity of Dewey’s theoretical device in comparison with Arendt’s and Habermas’s. While Bernstein (2006) establishes a parallelism between Arendt’s and Dewey’s tenets on democracy, I concur with Honneth’s emphasis on their differences. And I think that also from an educational viewpoint Dewey’s understanding is still more promising. On these differences see also Biesta (2006), who highlights, instead, some limitations of Dewey’s idea of democratic education in comparison with Arendt’s.

In other words, Honneth helps us to see the complex view that Dewey has of democracy as rooted in a pre-political dimension—“a form of democratic ethical life anchored [...] in the consciousness of social cooperation” (Ibid., p. 776)—within which, however, habits of inquiry should be cultivated in order to promote an intelligent management of social problems. We could interpret the first aspect, that is, democracy as the bond that links together all the members of society, ‘however humble they may be’, as the Addams-Dewey-Mead side of the coin (=the level of democracy as social ethics), whereas the model of the scientific community and the understanding of democratic procedures in terms of a cognitive medium is the Peirce-Dewey-Mead side (=the level of democracy as a reflective and experimental undertaking and a community of inquiry).

If appropriated in the perspective of this two-side differentiation, the ingenious re-signification, in *Democracy and Education*, of the notions of ‘social efficiency’ and ‘social control’, which have raised many misgivings, manifests its productivity: the former is “nothing less than that socialization of mind which is actively concerned in making experiences more communicable” (MW 9, p. 127), while the latter is “the formation of a certain mental disposition; a way of understanding objects, events, and acts which enables one to participate effectively in associated activities” (MW 9, p. 41). Larry Hickman (2006, p. 71) has forcefully summarized Dewey’s position in a passage that could be considered as a sort of chart of the trajectory—portrayed in this subsection—from the social character of the self to democracy as a cognitive medium for experimental inquiry:

Socialization occurs, for good or ill. Beyond that, when socialization meets the two criteria that Dewey has suggested [=varied and numerous shared interests; fullness and freedom of interplay between groups *S.O.*], social efficiency emerges and grows, expressing itself as the expansion of mind. And, beyond that, when experimental habit-formation enters the picture, then it may properly be said that there is social control.

## Neo-Pragmatism and the Linguistic Turn

Even the fiercest critics of his interpretations of the pragmatist legacy recognize that Richard Rorty has represented the single most important driving force to (re-)situate pragmatism at the center of the philosophical stage. He attained this goal essentially through a double move: first, by combating the view of pragmatism as a parochial movement, he showed that authors like James and Dewey had anticipated—and often better settled—questions debated among the most influential philosophers of the twentieth century, both in Analytic and Continental philosophy. Secondly, he shifted the focus from ‘the cult of experience’ (Jay 2005) to the ‘linguistic turn’, meaning by this “the view that philosophical problems are problems which may be solved (or dissolved) either by reforming language or by understanding more about the language we presently use” (Rorty 1967, p. 3).

Actually the phrase ‘the linguistic turn’ could be slippery if incorrectly understood: the point is not merely to replace the reflection on ‘mind’ and ‘experience’ with that of ‘language’, if this continues to be understood in a transcendental way,

namely, in reference to a common structure that is clearly identifiable and over which the users of a language have the command before they can use it (Rorty 1991c). Or, to put it differently, the inquiry into what language is and what its use is in our coping with the world—as if it were possible to study its ‘adequacy’ from without—risks surreptitiously perpetuating the view that there is some vantage point outside language that allows us to compare it with reality. What Rorty has in mind by grafting pragmatism onto the linguistic turn is, instead, that the latter can provide more sophisticated insights to fully develop the pivotal pragmatist theme of communication (uncoupling it from a vocabulary still dominated by the old-fashioned notion of experience); and the former, with its anti-foundationalist, fallibilist, and anti-representationalist stance contributes to avoiding any relapse into forms of transcendental reflection.

In this perspective, the attention is to the contingent, historically situated linguistic practices in which we are immersed and that we cannot explore and criticize with a ‘view from nowhere’ but we rather inhabit and transform through a continual (and always tentative) re-definition of our vocabularies, through re-descriptions which allow us to better tackle society’s challenges.

Although Rorty (1990) was fairly Hookian (1973) in inviting us not to over-philosophize education, we can establish a parallelism between the previous outline of his philosophical stance and his educational ideas. The stress upon our being immersed in contextualized socio-linguistic practices leads Rorty to a peculiar inflection of Dewey’s idea of education as socialization: he reads it in terms of Hirsch’s (1988) ‘cultural literacy’, that is, as a process of familiarization of the youth with the social discourses of their elders through the piling up of linguistic information and the acquisition of some ‘vocabularies’ thanks to the access to texts and narratives (Rorty 1999, p. 118). This is the phase (typical of primary and secondary schooling) that he defines the “gathering of raw material” (Rorty and Ghiraldelli jr. 2008, p. 189), to which another ensues (at the college level), the ‘individualization’, when education is primarily “a matter of inciting doubt and stimulating imagination, thereby challenging the prevailing consensus” (Rorty 1999, p. 118). This second phase roughly corresponds to what has been called above the ‘re-definition of vocabularies’.

There can be the tendency to read this dual distinction of the educational process in terms of one of Rorty’s (1989) most famous ideas, namely, that of the ‘liberal ironist’: thus, the process of socialization would be serviceable to instigate the sense of solidarity with one’s own group (the liberal moment), while the process of individualization would be conducive to a self-creation tendentially destitute of any significance for society (the irony moment). As Ramón del Castillo (2014) has noted, this oversimplifies the picture: irony, as the awareness of human contingency, is not completely incompatible with socialization because irony is connected with a historicist stance, which should be promoted at all educational levels. Indeed, “[a] society that transmits its convictions ‘without reservations’ cannot be a decent or a civilized society” (del Castillo 2014, p. 72). On the other hand, there can be a ‘social side’ in the individualization process insofar as the ironist can develop a broader

awareness of the existence of cruelty and, thus, can *indirectly* contribute to the realization of a more decent society.

What is most noteworthy in Rorty's Hirschian re-appropriation of Dewey is that he seems not only to accept a sort of "acquiring" (MW 3, p. 236) schooling but—and more importantly—to completely abandon the idea of a reconstruction of education on the basis of the model of scientific inquiry, which Dewey considers as pivotal for democracy in education (MW 3, p. 236 ff.). In the reading here proposed, this is closely related to Rorty's linguistic turn and to his rejection of the notion of experience. As Bernstein (2010, p. 132) highlights with a remarkable 'educational' metaphor, "[e]xperience is our great teacher". And, playing Peirce against Rorty, he adds that the "brute compulsiveness" of experience (what Peirce calls Secondness), that is, "the way in which experience 'says NO' [...] is required to make sense of the self-corrective character of inquiry and experimentation" (Bernstein 2010, p. 134). To confine oneself to speaking of "conversational constraints" means "ignor[ing] the facticity, the surprise, the shock, and brute constraint of our experiential encounters" (Ibidem).

Rorty ends up rejecting the very vocabulary of inquiry because he seems to see it as ultimately doomed to perpetuate the Platonic search for objectivity, which should be instead replaced with a more humane aspiration to solidarity (Rorty 1991a). This is one of the major dividing lines with another prominent representative of neo-pragmatism, Hilary Putnam. As a reader of Isaiah Berlin (1996) and, accordingly, operating on the basis of the opposition between Platonism and Romanticism, Rorty considers pragmatism as a heir of Romanticism and wants to substitute the language of creation for that of discovery, the emphasis on literature for that on the experimental method and science, whose value is spelled out by him merely in terms of its being an example of human solidarity (Rorty 1991b). In this view, Rorty bravely disconnects what classic pragmatists tend to keep united: democracy and science, the latter understood, though, not in the Platonic meaning of *epistēmē* but in the sense of inquiry. In Rorty's outlook, democracy will thrive more on the exposure of citizens to narratives of the achievements of our democratic societies (at the school level) and on the cultivation of our poetical creativity (at the university level) than on the promotion of experimental habits of inquiry.

In contrast, not only does Putnam counter what he sees as Rorty's relativism but he arrives at endorsing an 'epistemological justification of democracy', emphasizing that democracy is a 'cognitive value' insofar as it is "a requirement for experimental inquiry in any area. To reject democracy is to reject the idea of being experimental" (Putnam 1992, p. 180). Although, in a Rortyan perspective, it could be plausibly objected to Putnam that Dewey would never have spoken of 'an epistemological justification of democracy', both due to his aversion to the very idea of 'epistemology' and because he was deeply aware of the contingent character of the democratic adventure, Putnam's reference to the close relationship between democracy and science is crucial. As Len Waks (1998) has argued, Rorty's post-experimentalist pragmatism risks leaving us without an adequate method to tackle

the problems of social cooperation, which are the ones that Dewey (and Addams and Mead for that matter) had in mind when elaborating his ideas about democracy. In this sense and *contra* Rorty, education for inquiry should be considered as a still valid part of the pragmatist legacy and a pillar of the democratic project.<sup>6</sup>

### **The In-between of ‘Tough-Mindedness’ and ‘Tender-Mindedness’: Engaging with Education ‘Pragmatically’**

Within the framework of a re-assessment of the pragmatist tradition as a whole, as well as of the search for a new start away from the debates between the advocates of a classicopragmatist stance (committed to the idea of experience) and the representatives of a neo-pragmatist approach (focused on language),<sup>7</sup> Colin Koopman (2009) has invited us to “seek in pragmatism’s meliorism a unique and insightful tradition of cosmopolitan philosophy” (p. 48).

In certain respects, this interpretation of pragmatist meliorism in terms of cosmopolitanism is convergent on some tenets of Thomas Popkewitz (2005, 2008), who, however, speaks from a completely different vantage point. He is interested in how “the pedagogical projects throughout the 19th century to the present” have promoted the education of the “reasonable person who is cosmopolitan” (Popkewitz 2008, p. xiii). Indeed, one is not reasonable but *s/he* is to be *made* so “and that is where the schooling and its pedagogy becomes central. That ‘making’ is treated as a unity of ‘all children learning,’ and that unity is the crux of cosmopolitanism” (Ibidem). Cosmopolitanism is the project of re-forming society by forming the child through science (which should contribute to the planning of life) and specific constructions of reason and human agency. By focusing in particular on Dewey, he notes that “[p]ragmatism embodied this faith in science that circulated in the later part of the nineteenth century as a process in developing desired outcomes [...]” (Popkewitz 2005, p. 24). In his interpretation, Dewey’s “[p]ragmatism was a device to intervene in childhood with the intent of ultimately influencing what society should be” (Ibid., p. 18). By espousing a different view in comparison with Koopman, Popkewitz is attentive to how, precisely in pursuing its goal of an educa-

---

<sup>6</sup>It is to note that, without accepting the Rortyan strategy, the need to weaken the exclusively experimentalist, science-oriented thrust by complementing it with insights from other philosophical traditions has emerged also from within the Deweyan philosophical-educational scholarship. To pick out a representative instance, Paul Fairfield has raised the question of “how well [Dewey’s] experimental conception of experience stands up today” (Fairfield 2009, p. 82). In advancing reservations about the one-dimensionality of Dewey’s conception, Fairfield invokes a Gadamerian stance: “[E]xperience ‘in the genuine sense’, as Gadamer aptly put it, is indeed experimental yet not only in Dewey’s scientific understanding of the word [...] but in the sense that it is profoundly transformative. Ultimately it is oneself and one’s point of view that experience transforms, in the sense not only that one has resolved a problematic situation but that one has become changed in one’s being” (Ibid., p. 86).

<sup>7</sup>For a reconstruction of this debate see Hildebrand (2014).

tion for *all* children, ‘leaving no child behind’, pragmatism as a form of cosmopolitanism leads to practices of abjection, understood as “the casting out and exclusion of particular qualities of people from the space of inclusion” (Popkewitz 2008, p. 6).<sup>8</sup>

The perspective from which Popkewitz engages with pragmatism draws our attention on how some themes—e.g., the strategic role of science for the reconstruction of society and education for inquiry and reflective thinking as a condition for education for democracy—should not be uncoupled by an exploration of the practices of exclusion associated with them, which could end up undermining the democratic tension, especially if they go unnoticed. Rather than as a mere dismissal of the conclusions of the previous section about the permanent legacy of (classico)pragmatism in terms of the promotion of democracy through inquiry, positions like those endorsed by Popkewitz should be taken—at least, this is the suggestion here put forward—as an enrichment of the pragmatist conceptual device, in order to shirk possible simplifications or naïveté.

At the same time it is to note that, with his historical perspective, Popkewitz examines pragmatism as “an important symbol of progressive education and today’s reform” (Popkewitz 2008, p. 69) and, therefore, much in the vein of the approach of Childs, from which I have taken my cue. In the wake of the argumentation developed in other parts of this chapter, it should be asked, instead, whether the topicality of pragmatism as a philosophy of education may reside not so much in its relationship with specific educational practices but rather in the conceptual tools it provides us when engaging with some relevant aspects in the current educational discourse.

From this viewpoint, it is precisely the emphasis of the (classico)pragmatist tradition on science which is a major resource. William James establishes his understanding of pragmatism within a reflection on how the progress of science had furthered “the growth of naturalistic or positivistic feeling” (Ibid, p. 12), that is, the craving of people for scientifically robust explanations of the world, while not extinguishing the desire to have a cordial relation also with an idealistic view of existence. James identifies the main significance of pragmatism precisely in its role as “the mediating way of thinking” (Ibid., p. 23) between the tough-mindedness typical of science-oriented philosophical temperaments and the tender-mindedness of those who are not ready to sacrifice any reference to values and principles on the altar of scientism.

This mediating function continues to be—however updated—urgently needed also in contemporary educational scenarios, as I would like to argue in reference to at least two distinct levels, that of theoretical reflection and that of the understanding of educational professionalism.

---

<sup>8</sup>While Popkewitz deploys a Foucaultian strategy to reveal the processes of abjection inscribed in the pragmatist projects of progressive education, Koopman invokes, instead, an integration of Foucault’s and Dewey’s devices, as he argues that “genealogy (understood as the historical practice of problematizing the present) has a natural place alongside pragmatism (understood as the philosophical practice of reconstructing the present)” (Koopman 2009, p. 214).

As to the former, in order to counter the excesses of evidence-based education, the pragmatist tradition continues to offer us valuable conceptual instruments to combine the need for a scientific approach in education with the ideals and aspirations of democracy (Biesta 2010, pp. 28 ff.). In a similar vein, Bellmann (2007) has shown that, far from undergirding the philosophy of PISA, Dewey's pragmatism "can be used as a tool to find out something about our present" (p. 434) and to make explicit the theoretical assumptions and the normative presuppositions of many educational 'reforms'.

More generally, there is presently the risk of backsliding into a calamitous search for certainty in educational research and practice, forgetting an important pragmatist lesson concerning the scope of a science of education. Indeed, James (1899) and Dewey (LW 5, pp. 1–40) seem to be at one in rejecting the idea that the results of scientific research can be "converted into an immediate rule of educational art" (LW 5, p. 9). On a more specific level, nowadays, when the "attraction of psychology" (Smeyers and Depaepe 2013) can become fatal and the hegemony of the neuroscientific discourse risks turning into a neuromania (Legrenzi and Umiltà 2011), more topical than ever does the warning of William James become, namely, that of not thinking that

psychology, being the science of the mind's law, is something from which [teachers] can deduce definite programmes and schemes and methods of instruction for immediate school-room use. Psychology is a science, and teaching is an art; and sciences never generate arts directly out of themselves. An intermediary inventive mind must make the application, by using its originality. (James 1899, pos. 33573)

James's reference to the idea of art and to the need for a mediation of an inventive mind introduces the second aforementioned level. A mistaken orientation to science (assumed as the purveyor of certain truths just to be imported into the educational contexts in order to make them more 'monitorable' according to the standard criteria of efficiency and efficacy) brings with it the idea that the professional in education should be a sort of technician who, equipped with the relevant expertise and the adequate, evidence-based, strategies, could pursue pre-established goals. This is a view of the role of the practitioner to which as early as in 1929 Dewey objected in his *The Sources of a Science of Education* and whose untenability was denounced, more recently, by Donald Schön (1991). Consciously inscribing himself in a Deweyan lineage (see Schön 1992), Schön emphasized that—in all professions but all the more so in education—the practitioner has to do not with mere problem-solving, that is, with situations predefined in their problematic character and for which we are already in possession of the correct, 'scientifically certified', responses, but with situations which are indeterminate and unique and with which we have to engage through a 'reflective conversation' by mobilizing what he calls 'artistry'. It could be plausibly argued that, like Dewey (LW 5, p. 6 and p. 23), also Schön thus draws the profile of a practitioner who, instead of being a technician, operating according to a deterministic model (Biesta 2010, pp. 32 ff.), is an 'artist' with a scientific attitude and inquiring habits: if the artistry-theme refers us to the need to avoid any narrow-minded and reductionist scientism, the inquiring stance prevents

us from re-lapsing into a merely charismatic (or a vapidly idealistic) view of the educational undertaking, disconnected from the development of an experimentalist attitude conducive to the growth of communicable professional knowledge. And this balanced complementing of art and science—which matches, at the level of professional practice, the typical pragmatist epistemological stance—is pragmatism at its best, due to its mediating role between philosophical temperaments.

By valorizing a remark of Carol Nicholson (2013, p. 250), who has invited us to read pragmatism “as a way of thinking that is best described in terms of adverbs rather than nouns ending in ‘ism’”, it could be maintained in conclusion that, rather than specific educational theories and practices derived from it (*pace* Childs), what can be learnt from pragmatism is a specific way of ‘inhabiting’ the educational undertaking in all its dimensions (theoretical, methodological, and practical) and a method of sieving educational proposals in reference to their potential to live up to the needs of contemporary times.

# Analytic Philosophy of Education and the Concept of Liberal Education

Stefaan E. Cuypers

## What Is Analytic Philosophy?

### *Character and History*

The label ‘analytic or Anglo-American philosophy’ is used in contrast with the label ‘continental or European philosophy’. These labels designate two main traditions of thought in contemporary Western philosophy. This is not a deep philosophical contrast but a conventional and sometimes contested distinction that roughly separates two ways of doing philosophy on the opposite sides of the English Channel and Atlantic Ocean. Both traditions started around 1900, the continental one with E. Husserl’s book *Logische Untersuchungen* (1900/1901) and the analytic one with G.E. Moore’s article ‘The Refutation of Idealism’ (1903). Analytic philosophy has its origins in British empiricism and American pragmatism, whereas continental philosophy is rooted in the German idealism of Kant and Hegel as well as the critical philosophy of Marx and Nietzsche.

Although the labels ‘analytic’ and ‘continental’ might be misleading and tendentious, they nonetheless broadly indicate two different styles of doing philosophy. While continental philosophy tends to engage directly with existential concerns, cultural critique and prospects for emancipation, analytic philosophy is disposed to occupy itself primarily with language, logic and science. Somewhat exaggerated, one can say that the first movement copes with the meaning of life, whereas the second deals with the *Wissenschaftliche Weltauffassung* (the scientific conception of the world). One can add that continental writing is often much more literary in exposing sweeping hypotheses and (de)constructing grand theories, and that analytic writing, in contrast, is mostly literal and logically rigorous in arguing for

limited conclusions. Again somewhat overstated, there is much more tolerance of cognitive vagueness and emotive persuasion in the continental than in the analytic tradition. Yet, the distinction between these two traditions is perhaps not really fruitful, and we should not lay too much weight on such a polarized view of philosophical schools.

There are four periods in the history of analytic philosophy<sup>1</sup>:

- (1) 1900–1930: logical analysis (G. Frege, B. Russell, G.E. Moore, L. Wittgenstein)
- (2) 1930–1945: logical positivism or empiricism (*Wiener Kreis* philosophers, A.J. Ayer, W.V.O. Quine)
- (3) 1945–1960: ordinary language philosophy (J.L. Austin, G. Ryle, L. Wittgenstein)
- (4) 1960–today: pluralist or eclectic analysis

The period of direct relevance to analytic philosophy of education is the third one. After some general remarks about analytic philosophy and its first two periods, I will focus on the methodology of this postwar period.

The most general characterization of analytic philosophy is that it is the philosophy which took the ‘linguistic turn’.<sup>2</sup> Analytic philosophy turns from the objects and phenomena to the way we *think* and *talk* about them as the primary subject matter of study. Philosophical questions are questions of language. Since semantics and not syntax is of primary interest, analytic investigations often do not distinguish between the words (e.g., ‘cat’ and ‘dog’) and the concepts (CAT and DOG). Until 1960, analytic philosophy is synonymous with ‘linguistic’ philosophy. Analytic philosophers approach problems against the background of either the ideal (artificial) language of logic or the ordinary (natural) language of speakers and hearers, and they try to (dis)solve these problems by the method of logical or ordinary language analysis.

The initial period built on the new developments in mathematical logic during the nineteenth century. Logical analysis decomposes the surface structure (or grammar) of a sentence into the distinct elements of its depth structure (or logic). The logical form of a potentially misleading sentence, such as Russell’s example sentence ‘The present king of France is bald’, can be laid bare by means of quantificational, symbolic logic to dissolve problems of meaning, reference and existence.<sup>3</sup> In the second period, (emigrated) philosophers of the *Wiener Kreis* combined the formal techniques of logic with the basic tenets of empiricism to rationally (re)construct a scientific conception of the world. For the logical positivists, analytic philosophy is a second-order discipline that has no material object of study of its own. For them, philosophy is a kind of handmaiden that rationally analyses the first-order (linguistic) activities of the (natural) scientist. Explicating scientific concepts, such as those of natural law and probability, and formulating a (verification) criterion of meaning for claims to a posteriori knowledge are for them the central philosophical tasks.

## *Classical Methodology*

Analytic philosophers are united into one recognizable group not by a common doctrine but by a shared methodology. They use a technique, or cluster of techniques, known as ‘logical (or linguistic) analysis’ or, more generally, ‘philosophical analysis’. The adjective ‘logical’ can get a strong or weak reading. In its strong sense ‘logical’ stands for ‘(analysis) in terms of symbolic logic’, whereas in its weak sense it stands for ‘(analysis) in terms of logically necessary and sufficient conditions’. Below I come back to this distinction, but first I comment on the technique of philosophical analysis in general.

This classical technique should be interpreted in the broad sense so that philosophical analysis not only includes the clarification of concepts but also the evaluation of arguments. Hence, philosophical analysis comprises both analysis of concepts and analysis of arguments. Besides aiming at conceptual clarification, the drawing of clear distinctions, and the avoidance of equivocation, analytic philosophy aims at the evaluation of arguments, logical rigor, and attention to detail in the steps of reasoning. In short, the business of analytic philosophy is conceptual analysis and argument-evaluation.<sup>4</sup>

Correct reasoning involves good arguments. A good argument fulfils three conditions. First, it does not commit informal fallacies. Begging the question (*petitio principii*), attacking the man (*ad hominem*) and equivocation are among the most important fallacies our reasoning should avoid. Second, a good argument is formally valid. An argument is valid when its deductive steps from the premises (Pr) to the conclusion (C) comply with the rules of formal logic.<sup>5</sup> In a formally valid argument, the conclusion follows deductively (—) from the set of premises:

Pr<sub>1</sub>  
Pr<sub>2</sub>  
⋮  
Pr<sub>n</sub>  
—  
C

Third, a good argument is sound. A valid argument is not automatically true. Validity is not synonymous with truth, and validity itself offers no guarantee of truth. Validity is a property of whole arguments, whereas truth is a property of individual premises and conclusions. Yet, logicians use the concept of truth to define the concept of validity. To say that an argument is valid is to say that *if* its premises are true, *then* its conclusion must also be true. So, for a valid argument, it would be impossible for its premises to be true and its conclusion false. But an argument with one or more premises which are actually false and a conclusion which is also actually false might still be valid. The validity of an argument is a necessary but not a sufficient

<sup>5</sup>Tomassi 1999, chap. 1.

condition for its soundness. The soundness of an argument has to do with the actual truth of its premises and conclusion. A sound argument, then, is a valid argument of which all premises are actually true (and, consequently, of which the conclusion is also actually true). Hence, if one rejects the truth of the conclusion of a valid argument, then one has also to reject the truth of at least one of its premises. In sum, analysing or evaluating an argument involves a triple task: first, checking whether the argument commits informal fallacies or not; second, certifying whether it is valid or not; and, third, verifying whether it is sound or not. (Sometimes the demand for the truth of the premises will be too strong. In order to have at least a valid and plausible argument, one has to retreat to the weaker demand for the plausibility of its premises.)

The last part of argument-evaluation calls for the technique of conceptual analysis. In order to verify an argument's (un)soundness, one has to determine the truth or falsity of its premises. A premise consists of at least one sentence or proposition ( $p$ ).<sup>6</sup> Yet, in order to ascertain whether or not a proposition is true, one has to establish first its meaning. One cannot determine whether or not  $p$  is true unless one knows what  $p$  means. A proposition consists of at least two concepts ( $c_1, c_2 \dots c_n$ ). So, to establish the meaning of a proposition, one has to clarify first the meaning of the concepts out of which it is composed. And clarifying the meaning of concepts is precisely the business of conceptual analysis. Thus, the crucial question about an argument's (un)soundness—about the truth value of its premises—gives rise to other preliminary questions:

- (1) Is  $p$  true?
- (2) What does  $p$  mean?
- (3) What do  $p$ 's constituents  $c_1, c_2 \dots c_n$  mean?
