Prior to the question of truth comes the question of meaning, with which conceptual analysis is occupied. Also independent of its role in argument-evaluation, conceptual analysis can be used as an autonomous technique for clarifying central concepts in philosophy, such as the concepts of knowledge, personal identity, moral rightness and, last but not least, the concepts of education and teaching (as we will see in the next section).

Answering the question 'What does concept  $c$  mean?' is the task of conceptual analysis. In the third period of the history of analytic philosophy, the one of direct relevance to analytic philosophy of education, the attention of analytic philosophers shifted from the ideal language of logic to the use of everyday, ordinary language as the instrument of analysis and clarification. In this postwar period, the technique of logical analysis acquired another identity. Instead of its association with '(analysis) in terms of symbolic logic', the adjective 'logical' became associated with '(analy-

---

<sup>6</sup>To clarify some terminology, a sentence (consisting of words) expresses a proposition (consisting of concepts). Loosely speaking, a proposition (concept) is a direct bearer of meaning, whereas a sentence (word) is an indirect bearer of meaning (via the meaning of the proposition (concept) it expresses). For my purposes, there is no need to distinguish between meaning as reference (extension) and meaning as sense (intension).

sis) in terms of logically necessary and sufficient conditions'. Analytic, linguistic philosophy became synonymous with the analysis of ordinary language. This type of linguistic analysis is closely connected with conceptual analysis. Ordinary language philosophers are not so much interested in the vocabulary or grammar of a specific natural language (e.g., English) as they are interested in the conceptual structure which different natural languages (e.g., English, French and German) have in common. They want to discover and systematize the (logically) necessary and sufficient conditions for the application of a concept *c* by means of investigating the use of the corresponding word *w* in different contexts and at different times. This linguistic examination of *what we do (or should) say when* in using word *w* and applying the corresponding concept *c* is a good way to get a grip on what we do (or should) mean by *w* and *c*. Thus, an analysis of concept *c* gives an answer to the question 'What does concept *c* mean?' because it is an analysis of *c* in terms of its necessary and sufficient conditions that specify *c*'s meaning.

Concept *c* applies to X, if and only if such-and-such individually necessary and jointly sufficient conditions are satisfied by X. The standard form of a conceptual analysis looks like this:

— if and only if —.

The first blank is called the *analysandum*, or the 'target' concept being analyzed. The second blank is called the *analysans*, or 'that' what does the analyzing, namely, a set of conditions each of which is necessary and which jointly are sufficient. If *x* is a necessary condition for *y*, then *y* is a sufficient condition for *x*. A necessary condition for *c* is something that must be satisfied if *c* is to occur; *only if* such a condition is present, then *c*. For example, oxygen is a necessary condition for combustion. A sufficient condition for *c* is something such that if it is satisfied, then *c* will also occur; *if* such a condition is present, then *c*. For instance, having a daughter is a sufficient condition for being a parent. A conceptual analysis is then an 'if and only if' or equivalence claim and, thus, a kind of definition.

Take as an example the analysis of the concept of bachelor<sup>7</sup>:

X is a bachelor, if and only if

- (1) X is a human
- (2) X is male
- (3) X is an adult, and
- (4) X is unmarried

If one thinks that divorced men or widowers are not bachelors, then (4) should be replaced by the stronger condition (4') X has never been married. Again, if one thinks that priests are not bachelors, then (5) X is ineligible to marry should be added as an extra condition.

Clear thinking involves concepts with good analyses. A good (noncircular) analysis basically has to meet three criteria. First, the *analysandum* and the *analysans* should be equivalent in meaning. This is evident. The *analysans* can involve neither

---

<sup>7</sup>Earle 1992, pp. 5–6.

more nor less meaning than the analysandum. Also, if the analysans would have another meaning than the analysandum, then the analysans could not possibly clarify the analysandum. Second, the analysans should be more intelligible than the analysandum. The analysis can clarify only if the concepts used in the conditions (the analysans) are clearer, or simpler, or more familiar than the target concept (the analysandum). Third, the analysis should be correct. To test whether the analysandum and the analysans are really equivalent, one tries to give or construct so-called “counterexamples” to the analysis. A counterexample is a coherent (imagined) scenario in which one side of the analysis holds but the other does not. For the most part, constructing a counterexample comes to the same thing as conducting a thought experiment. If a counterexample can successfully be constructed, then the analysandum and the analysans are not really equivalent. Alternatively, if no counterexample can be constructed, then this failure is good evidence for the correctness of the analysis.

Take as another example the standard analysis of the concept of knowledge:

Subject S knows that  $p$ , if and only if

- (1) S believes that  $p$
- (2)  $p$  is true, and
- (3) S is justified in believing that  $p$

Against this analysis of knowledge as justified, true belief (JTB), E. Gettier constructed counterexamples (to sufficiency).<sup>8</sup> A so-called “Gettier-counterexample” describes a scenario in which S fulfills all three conditions but still does not know. B. Russell already gave the following case: “There is the man who looks at a clock which is not going, thought he thinks it is, and who happens to look at it at the moment when it is right; this man acquires a true [justified] belief as to the time of the day, but cannot be said to have knowledge”.<sup>9</sup> If the man has no reason to distrust the clock, his belief might be justified as well as true. Consequently, the JTB analysis of knowledge is incorrect and has to be modified or expanded, if not abandoned.

The necessary and sufficient conditions of the analysans are not empirical conditions. The conditions for knowledge, for example, are neither (fully) psychological nor neurophysiological conditions. Empirical conditions are a posteriori discoverable and contingently true. By using the methodology of conceptual analysis (and argument-evaluation), analytic philosophers seek, in contrast, to discover a priori necessary truths.<sup>10</sup> What is essential to X is contained a priori in the content of X’s concept. Conceptual analysis is not based on empirical generalization but on intellectual scrutinization of conceptual content. To deliver a priori knowledge, conceptual analysis does not need the contribution of the empirical world. If the analysandum and the analysans are identical in meaning, then the analysis is correct or true by meaning alone. In a word, analytic philosophers are ‘armchair’ investiga-

<sup>8</sup> Gettier 1963.

<sup>9</sup> Russell 1948, pp. 170–71.

<sup>10</sup> McGinn 2012.

tors: without being roused from their armchairs, they discover the essence of the world by analyzing the constituents of thought—i.e., concepts.

### *Paradigm Breakdown*

But what exactly are concepts? There are problems not only with the ontology but also with the structure of concepts.<sup>11</sup> It is unclear what kind of things concepts are. Three proposals have been defended: concepts are abstract objects (Platonic forms or Fregean senses), concepts are mental representations (ideas), and concepts are epistemic abilities (concept possession is some sort of dispositional, epistemic condition). All these proposals have ontological and epistemological difficulties. But more importantly perhaps, it is even unclear how concepts are structured. The classical methodology of conceptual analysis assumes that concepts have a definitional structure in that their contents are definable by necessary and sufficient conditions. Alternative theories hold that concepts have a probabilistic structure (the prototype/exemplar theory), that they are structured holistically (the ‘theory’ theory) or that they do not have any structure at all (semantic atomism). All these theories about conceptual structure remain highly controversial.

The assumption that concepts are definitionally structured by singly necessary and jointly sufficient conditions has received philosophical as well as empirical criticism.<sup>12</sup> I leave the empirical critique aside, to concentrate on two major philosophical objections. It is alleged, firstly, that conceptual analysis cannot properly deal with functional (artifact) concepts or disjunctive concepts (e.g., a strike in baseball, which can be *either* a ‘called’ or a ‘swinging’ strike) and that it has difficulties with unclear cases (e.g., ‘Is a tomato a fruit?’). But most importantly, it is claimed, secondly, that conceptual analysis fails because it cannot satisfactorily specify the defining necessary (and sufficient) conditions. Wittgenstein made this devastating critical point.<sup>13</sup> He asked: What is the conceptual analysis of, for example, the concept of game? What does fill the blank in the scheme ‘X is a game, if and only if ———’? Take the following sample of games and their defining features (schematically represented as A, B, C, D):

game 1 (e.g., board game): A B C

game 2 (e.g., card game): B C D

game 3 (e.g., ball game): A C D and

game 4 (e.g., Olympic games): A B D

If one looks at these different games, then one cannot find one single feature F—such as amusing, competitive, or pastime—that is common to all of them. There just is no necessary condition that all and only games satisfy. What one sees when

<sup>11</sup> Margolis and Laurence 2014.

<sup>12</sup> Smith and Medin 1981. For the empirical critique, see pp. 33–51.

<sup>13</sup> Wittgenstein 1953, part I, pp. 66–71.

looking at these games are similarities, overlap, and criss-cross relationships. Such similarities are what Wittgenstein calls “family resemblances” because the characteristics of family members overlap and criss-cross in the same way. So, games do not have a unique essence but they form a family. Since the concept of game is a family resemblance concept, there is no feature F that can be specified as the necessary condition to fill in the blank of the scheme above. Wittgenstein generalizes this insight: if all concepts are family resemblance concepts, then conceptual analysis in terms of necessary (and sufficient) conditions is doomed. However, some analytic philosophers take his pessimism to be uncalled for and argue that he is wrong.<sup>14</sup>

Logical analysis either in its symbolic or conceptual mode was for more than half a century paradigmatic for doing philosophy in the analytic style. From around 1960 until today, analytic philosophy witnessed and still witnesses a paradigm breakdown, caused among other factors by the anomaly Wittgenstein allegedly pointed out. The fourth period in the history of analytic philosophy is an era of pluralism and eclecticism.<sup>15</sup> At least four strands are woven together. For one thing, weaker forms of conceptual analysis have been proposed: for instance, giving only (some) necessary conditions or only (some) sufficient ones, drawing up an open-ended list of criteria for the application of a concept, establishing coherent, mutually supportive connections between the central elements of our conceptual scheme. For another, new developments in symbolic logic, in particular the rise of the possible worlds approach to modal logic, reinvigorated the use of strictly logical analysis and formal modelling. In addition to possible worlds semantics, direct reference theory also made a significant impact. For still another thing, analytic philosophy became more detached from linguistic philosophy and loosely associated itself more with philosophy of mind (cognitive science) and even metaphysics. For a last thing, some ‘analytic’ philosophers, such as R. Rorty, H. Putnam, and J. McDowell,<sup>16</sup> returned to one or other form of idealism. This retreat from the foundationalist epistemology and realist ontology of earlier analytic philosophy is partly due to the growing influence of American pragmatism and postmodern anti-realism.

## What Is Analytic Philosophy of Education?

### *The Analytic Turn*

The two founding fathers of the analytic approach in the philosophy of education are Israel Scheffler (1923–2014) in the United States and Richard S. Peters (1919–2011) in Great Britain.<sup>17</sup> Although Scheffler published the programmatic manifesto

---

<sup>14</sup>For example, McGinn 2012.

<sup>15</sup>Williamson 2014.

<sup>16</sup>Rorty 1980, Putnam 1981, McDowell 1994.

<sup>17</sup>The ‘London Line’, a term coined to refer to Peters’ group and their work, includes P.H. Hirst, R. Dearden, R.K. Elliott, D. Cooper, and J. White. The second generation of analytic philosophers

'Toward an analytic philosophy of education' in 1954, educational philosophy only definitely took the 'analytic turn' some years later around 1960 at the end of the third period in the history of analytic philosophy.<sup>18</sup> The importation of ordinary language philosophy from mainstream analytic philosophy at that time really revolutionized the philosophy of education.

There are perspicuous as well as subtle differences between the two cofounders. Scheffler, much more than Peters, is a mainstream analytic philosopher in his own right. Conversely, Peters, much more than Scheffler, is a purely educational philosopher working within the analytic paradigm. Scheffler's background is primarily in logic and philosophy of language (in this domain he mainly worked on subjects such as linguistic ambiguity and vagueness, metaphor and symbolism). Influenced by American pragmatism and logical positivism, he made substantial contributions to epistemology (on topics such as truth, objectivity and justification) and philosophy of science (on themes such as explanation, falsification and confirmation).<sup>19</sup> By contrast, Peters' background is primarily in classics, psychology, philosophy of mind, and social and political philosophy. The more subtle divergence between them as to the use of philosophical analysis comes to the fore when one compares Scheffler's book title *The Language of Education* (1960) with Peters' *The Logic of Education* (1970; coauthored with Paul H. Hirst). Whereas Scheffler opts for a linguistically driven type of analysis, Peters directly goes for a conceptual analysis in terms of logically necessary and sufficient conditions. Below I will concisely contextualize the analytic turn in the philosophy of education in the light of Peters' analytic paradigm.<sup>20</sup> Of the two founding fathers, Peters is the purest philosopher of education who devoted all his energy exclusively to the promotion and expansion of the analytic approach to educational philosophy.

This then new, revolutionary approach differed from the older styles of doing philosophy of education in three ways. First, the analytic approach is ahistorical. It focuses on structural themes instead of historical figures in the philosophy of education such as Plato and Rousseau. Central themes for analysis are, among others, education, teaching, and the curriculum. Second, the analytic approach is anti-synthetic. It does not aim at an overall view of the place of education in the search for wisdom and the meaning of life against the backdrop of one or other world-image. As against devising global religious or ideological educational programs, conceptual analysis proceeds in a piecemeal and neutral way. Third, the analytic approach is practically relevant. It works bottom-up from actual problems in educational practice and policy. Philosophical analysis wants to be a toolbox philosophy

---

comprises, among others, D. Carr, T. McLaughlin, and J. Wilson in Great Britain and R. Barrow, H. Siegel, and E. Callan in North America.

<sup>18</sup>Hardie 1942 and perhaps also O'Connor 1957 are important forerunners.

<sup>19</sup>For instance, Scheffler 2000. See also, Holma 2004.

<sup>20</sup>For the full story, see Cuypers and Martin 2013. I draw upon material I wrote for this book in what follows.

for education and not a top-down philosophy applied to the domain of education.<sup>21</sup> So, the new, revolutionary approach identifies philosophy of education as an ahistorical, neutral, analytic method to handle (and hopefully resolve) concrete issues on the educational work floor.

This intellectual revolution in the 1960s and early 1970s had a double effect: the introduction of the analytic paradigm did not only establish philosophy of education as a respectable branch of philosophy at large but also as a contributory component of educational theory as such. On the one hand, revolutionized educational philosophy could participate in the growing prestige of analytic philosophy at large. From mainstream analytic philosophy, it imported the ideals of rigor, clarity, and argumentation as well as the goals of truth and progressing knowledge. Precisely because the analytic approach has a much more neutral and scientific character than the other approaches mentioned above, *analytic* philosophy of education could establish itself as a respectable branch of genuine philosophy, as opposed to woolly wisdom, spiritual improvement or dull history of ideas.

On the other hand, revolutionized educational philosophy could be taken seriously as an integral part of educational theory as such. On a plausible view,<sup>22</sup> education is a subject in its own right next to other subjects studied in the social sciences, though educational theory (or educational studies) is not a distinct academic discipline in the sense of having a single type of truth criterion and one determinate methodology. Education is a hybrid field of study where a group of separate disciplines meet for the purpose of dealing with practical problems of an educational nature. Educational theory by its very nature is, therefore, interdisciplinary. Obviously, one needs experimental data and empirical evidence to draw general conclusions and to construct educational hypotheses on the basis of such generalizations. Yet, to adequately deal with educational issues, one has to acknowledge that conceptual analysis and value judgements are indispensable. And it is in relation to these nonempirical aspects of the educational sciences that *philosophy* of education plays its vital role. Any attempt to solve educational problems involves, thus, the contribution of different types of expertise and various styles of methodology, namely, conceptual analysis and philosophical justification, besides empirical evidence from the social sciences, especially from psychology and sociology.

Now, educational philosophy, precisely for the reason that it is based on the analytic paradigm, could establish itself as an equal partner to the social sciences of psychology and sociology. Moreover, it could itself contribute to the academic seriousness and respectability of educational theory. In contrast to the low academic standing of older types of educational studies—undifferentiated ‘mixed bags’ of descriptive propositions, normative claims and directive exhortations—the partnership of the analytic methodology of philosophy with the empirical methodology of

---

<sup>21</sup> The reaction of Peters’ ‘London Line’ to the 1967 Plowden report on *Children and Their Primary School* is a noteworthy example of the real-world impact of the analytic approach on British educational policy. See Peters 1969a.

<sup>22</sup> Scheffler 1963 and Peters 1973.

the social sciences did much to establish the credibility of interdisciplinary educational studies in view of the acknowledged prestige of the scientific paradigm at large.

The analytic approach is impersonal and unemotional, precise and orderly, piecemeal and careful. As such, it complies with the requirements of logic, rationality and scientific forms of study. Consequently, this new, revolutionary approach is a natural ally of 'rationalism' in the philosophy of education. It is then no coincidence that spokesmen of the analytic paradigm, in particular Scheffler and Peters, criticize and oppose radical or extreme educational progressivism or child-centered education. This 'left-wing' educational philosophy is to be contrasted with the traditional, subject-centered, teacher-directed 'right-wing' educational philosophy.

Following such educators of the past as Jean-Jacques Rousseau and John Dewey, progressivism holds a distinctive view on the status of childhood, the nature of the child, the curriculum and the role of the teacher. Childhood is not a stage on the way to adulthood but a state on its own. Because children are seen *as children*, one respects them as individuals and recognizes their differences. Connectedly, the child has a specific nature or self with its own needs and interests and with individual talents. It unfolds 'from within' an innate potentiality, as an acorn growing into an oak. Accordingly, the child-centered educationalist defends an integrated curriculum, with curriculum units of a topic or project type based on the child's needs, interests and talents. The learning should not stand under the control of an external authority but proceed *vom Kinde aus* in harmony with the child's own nature. Because the child is a natural enquirer who learns by experience and discovery, the role of the teacher is not that of an instructor but that of a sympathizing by-stander or at most a facilitator.

Although both Scheffler and Peters criticized this progressive picture of educating children, they themselves did not defend the other extreme of rote learning traditionalism and pure formalism.<sup>23</sup> While preserving what is best in the progressive or humanistic educational philosophy, they argued for a sensible middle position which allocates a central place to the ideal of rationality. Reason plays a pivotal role in all types of education. Educating for life is educating for the life of reason, in which the ideals of reasonableness and the concern about truth take central stage. Again, there is a subtle difference between Scheffler and Peters as to the understanding and development of the ideal of rationality. Whereas Scheffler primarily conceives of rationality as exercising critical thinking, Peters predominantly identifies it with possessing forms of knowledge and understanding. This contrast should not be exaggerated, though, since it is only a matter of emphasis. For both of them, the core business of rationality is and remains reason-giving and rational justification.

### ***Exemplary Analysis of the Concept of Education***

Though conceptual analysis is of central importance to analytic philosophy of education, it is not an end in itself. It is only meaningful if it is done at the service of problems that crop up in educational practice and policy. This practical domain of

---

<sup>23</sup> Scheffler 1964 and Peters 1969a.

education is inevitably shot through with value judgements and moral questions. Yet, although normative issues—such as evaluating educational aims, determining the value of (possible) curriculum subjects, distinguishing good from bad teaching(methods), children’s rights, and the equal distribution of educational opportunities—have the full attention of philosophers of education, they cannot be adequately addressed before these issues themselves are sufficiently analyzed and conceptually clear. In this sense, questions of conceptual analysis take precedence over questions of normative grounds or justification. So, conceptual analysis is a necessary preliminary to answering other more important questions about educational practice and policy. It is indispensable theoretical groundwork before anything else sensibly can be said, decided or done in the practical domain of education. Peters’ classic *Ethics and Education* (1966) is the best illustration of this relation between theory and practice.

Key concepts in analytic philosophy of education are, to name but a few, though central ones, ‘education’, ‘teaching’, ‘indoctrination’, ‘curriculum’, ‘learning’, ‘development’, and ‘schooling’.<sup>24</sup> As an example of how the classical methodology (section “**Classical methodology**”) is applied in the philosophy of education, I briefly reconstruct Peters’ analysis of the concept of education.<sup>25</sup> Take the standard format: — ( *analysandum* ) if and only if — ( *analysans* ). What exactly is the *analysandum*? To make what is to be analyzed more precise, Peters appeals to Ryle’s task-achievement distinction (roughly, a kind of process-product distinction).<sup>26</sup> Educational processes relate to being educated as tasks (internally) relate to achievements. Being educated is the achievement or successful result relative to the performance of task activities, i.e., the realization of educational processes. For convenience, I built the task or process aspect into the analysis of ‘being educated’:

S is an educated person, if and only if

- (1) S is in a desirable state of mind which is realized in a morally unobjectionable manner and (partly) produced by S’s voluntary intentional action, and
- (2) S possesses ‘knowledge that’ and understanding of the ‘reason why’, both of which are produced by S’s learning processes (partly) assisted by educational processes; in addition,
  - (2a) S must take delight in knowledge and understanding for their own sake and must care about their standards of excellence
  - (2b) S’s knowledge and understanding must be (sufficiently) all-round and versatile, and
  - (2c) S’s knowledge and understanding must (sufficiently) actively transform S’s attitude to life and the world

Notice that (2a–c) are additional ‘nested’ necessary conditions into (2), which qualify the type of knowledge and understanding required for being educated. (1) and

<sup>24</sup> Peters and Hirst 1970, Winch and Gingell 1999.

<sup>25</sup> Peters 1967 and 1970. See also, Carr 2003 and 2010.

<sup>26</sup> Ryle 1949, pp. 131–135

(2) are the two central necessary (and sufficient) conditions or criteria: the desirability or value criterion and the cognitive criterion. We avoid circularity in condition (2)—note the conceptual circle in the analysis: ... educated ... if and only if ... educational ...—by substituting ‘*educational* processes’ with a plurality of more specific processes such as, given the inculcation of the basic skills of literacy and numeracy, instruction and correction, teaching and explanation, the dialogical method of question and answer as well as conversation.

Is this a good analysis? Until 1970, Peters thought that the analysans adequately specifies *the* meaning of ‘education’. In the light of the distinction between being (merely) trained and being (really) educated, the value and cognitive criteria define the *essence* of education in a culture-free way.<sup>27</sup> Below I will indicate the direction in which he changed his mind. Undoubtedly, the analysans makes the target concept of education more intelligible. The analyzing concepts of a worthwhile state, knowledge and learning systematically unpack and clarify the opaque concept of education. Although these analyzing concepts need to be analyzed further themselves, they are clearer and simpler than the concept of education. Moreover, the analysans offers the perhaps surprising insight that, in the end, all education is *self*-education. Although the internal learning processes can be assisted by external educational processes, the instigation of and control over the constitutive learning processes is ultimately only in the learner’s own hands. Also, the knowledge and understanding possessed are ultimately only for the benefit of the educated person him- or herself who tries to make something out of his or her own life.

Is the analysis correct? Counterexamples to necessity can be alleged against both criteria. First, some communities regard education as a *bad* state to be in. The Amish community, for instance, sees secondary and higher education as conceited, if not as corrupting. Apart from instilling the basic skills of literacy and numeracy, vocational training and the passing on of the (spiritual) ways of their ancestors, nothing else should be done in bringing up children. Nothing good can come from ‘worldly’ knowledge. So, the proposition that education is desirable or worthwhile is not an a priori necessary truth. Second, we speak of ‘Spartan education’ without implying that Spartans had differentiated forms of theoretical knowledge and/or rational understanding. Spartan children got an education which did not include more than the transmission of practical (military) skills and mythic folklore. Also, our notion of ‘specialized education’ puts the additional, nested, necessary conditions for knowledge and understanding under pressure. Hence, the proposition that education involves the development of (higher-level and/or all-round) knowledge and understanding is not an a priori necessary truth.

These counterexamples indicate that the analysandum and the analysans of Peters’ analysis are not really equivalent. To deal with this problem, he retreats to the weaker claim that the value and cognitive conditions are only sufficient but not necessary. We can also speak of ‘education’ in their absence, but when they are present we positively are entitled to apply the concept of education. To clarify this conceptual situation, Peters makes a distinction between an (original) more general-

---

<sup>27</sup> Peters 1969b, pp. 34–35.

ized conception of education and a (later) more specific conception of education. The more generalized notion refers to all kinds of bringing up or rearing children, whereas the more specific notion is synonymous with our conception of an educated person in Western culture. Accordingly, Amish and Spartan education resort under the former notion, whereas 'liberal education' under the latter. Although Peters seems to safeguard in this way his analysis as applicable, at least, to the specific conception of education, this conception of being educated fulfilling the desirability and cognitive criteria can itself be *contested*. Perhaps the concept of education is then in the end nothing but an essentially contested concept without any a priori necessary truth in it.

### *Post-Analytic Era*

A. Edel already in 1972 concludes his stock-taking paper 'Analytic philosophy of education at the cross-roads' with the complaint that the analytic method only 'yields an unsatisfactory half-house' because it leaves out empirical and valuational, as well as socio-historical components of educational issues. In combination with the analytic paradigm breakdown at large (section "[Paradigm breakdown](#)") and the attendant anti-foundationalism and anti-essentialism,<sup>28</sup> analytic philosophy of education, in the late 1970s, came under pressure and lost its predominance. The decline of the analytic approach made, as a consequence, the emergence of new perspectives in the philosophy of education possible. In this post-analytic period, educational philosophy took a more 'practical turn' and was more concerned with the 'political implications'. The general climate of the 1980s and 1990s was more utilitarian and instrumentalist. The political and institutional circumstances changed rapidly. This period witnessed the increase of bureaucratic control by the government as well as the rising influence of managerial conceptions of educational administration. Many educational philosophers resisted an unquestioning acceptance of the market and consumer conceptions of narrowly neo-liberalistic education. Both for their critique and their alternatives, they drew not only on post-empiricist Anglo-American philosophy but also on continental intellectual traditions such as phenomenology, existentialism, (neo-)Marxism, structuralism, critical theory, and postmodernism.

As of today, the situation has not altered much. Recent social changes have, of course, engendered new challenges to be dealt with in educational philosophy. The present-day scene features philosophical reflection (and empirical research) on the ways in which educational systems try to cope with, for example, multiculturalism

---

<sup>28</sup>Evers (1993) criticizes the analytic method on the bases of the untenable analytic (or conceptual)/synthetic distinction (in the line of Quine) and the hopelessness of delivering necessary conditions for concept application (in the spirit of Wittgenstein). These bases are, however, controversial. See Russell 2008 for a defense of the distinction and McGinn 2012 for a defense of conceptual essentialism.

and cosmopolitanism, globalization, changing notions of citizenship (such as digital citizenship) and the family, environmentalism, as well as with, for example, new conceptions of vocational education, the rise of information and communication technology (ICT) and the restructuring of higher education in both European and North American contexts. All these current issues are approached from different theoretical viewpoints and explored in diverse styles of reflection and research. In our day, philosophy of education is eclectic and cross-cultural in character.<sup>29</sup>

Still, some contemporary analytic philosophers of education argue that in the context of the heterogeneous and multifaceted present-day scene, the analytic paradigm is not just one of the alternatives to choose from among the different paradigms that are available. They claim that within the multi-paradigmatic structure of contemporary educational philosophy, the analytic paradigm is *primus inter pares*—the first among equals.<sup>30</sup> These philosophers roughly give the following argument, no doubt provocative and controversial.

All other paradigms—such as phenomenology, Marxism or postmodernism—*asymmetrically depend upon* the basic, analytic paradigm. That is to say, whereas all other paradigms, in a sense to be explained immediately, depend upon the analytic one, the latter does not depend upon any of the others. In that way, one cannot avoid engaging with the analytic methods and claims of an analytic philosopher such as Scheffler, Peters, or Hirst. In the light of this asymmetrical dependency thesis, the analytic paradigm is, in a specific sense, *foundational*. The sense in which the term ‘foundational’ is used here should not be misunderstood. The paradigm is not epistemologically foundational in the sense of trying to establish a set of infallible axioms for educational theory. It is, moreover, neutral as to the ontological commitments one holds at the foundations of one’s metaphysical world-view. Yet, the analytic paradigm is *conceptually* foundational in the sense that it deals with basic concepts that are constitutive of the discipline—the philosophy of education—*itself*. In that sense, too, all other paradigms depend upon the analytic one for the demarcation of their discipline and the identification of their central issues.

## What Is Liberal Education?

As a further example of the analytic approach, it is worthwhile to briefly look at an analysis of liberal education and its justifications. This example highlights the important point that analytic philosophy of education is not limited to (descriptive) questions of conceptual analysis but incorporates (normative) questions of justification as well. According to a classical view,<sup>31</sup> the concept of liberal education is coextensive with that of moral education and even with that of education *simpliciter*.

---

<sup>29</sup> A good example of the contemporary methodological pluralism is Heyting, Lenzen, and White 2001, a collection of essays on children’s rights.

<sup>30</sup> Among others, Siegel 1988 and 1997. The following argument is taken from Cuypers and Martin 2013, p. 227.

<sup>31</sup> Oakshott 1989.

However, the term ‘liberal education’ is highly ambiguous, and, hence, *the* concept of liberal education does not exist. Several conceptions can be distinguished historically and systematically.<sup>32</sup> One can only hope to give a sufficiently clear regimentation of some (of the most important) conceptions of liberal education and to say something useful about one or other selected (important) conception. One confusion should be cleared out of the way immediately. Liberal education is not the education *of* future liberals (children that will grow into liberal adults) *by* present-day liberals against the backdrop of a political theory of (neo)liberalism, although the term is also used in this context.<sup>33</sup>

## Conceptions

The ideal of liberal education is constitutive of European civilization from classical antiquity until today. During its history the ideal underwent several changes. Liberal education in Western culture originated in classical antiquity with the Greek ideal of *paideia* and the Roman teaching of the *artes liberales*. The medieval system of the seven liberal arts declined in the Renaissance when liberal education became exclusively associated with the *studia humaniora*. In Germany, during the Enlightenment, liberal education became associated with *Bildung* and *Selbst-Bildung*. This turn toward the self-realization of the individual is not necessarily related anymore to the pursuit of knowledge by means of the liberal arts curriculum or even the humanities. Despite the ambiguities inherent in the liberal education ideal and the dilemmas for its implementation in a modern liberal democracy, reference to this ideal is today made, for example, to counteract economy-based educational systems and to set up educational trajectories for creating citizens and cultivating humanity.

Systematically, three distinct conceptions of liberal education can be distinguished:

- (1) education for pursuing knowledge for its own sake
- (2) general education and
- (3) nonauthoritarian education

One way to sort out these conceptions is by interpreting liberal education as ‘liberating’ education, and to ask what such an education is liberating *from*. Liberal education by its liberating force wants to set the mind free from certain constraints. The first conception wants to liberate from pragmatic instrumentalism and mere vocational training, the second from too narrow specialization and excessive compartmentalization, and the third from indoctrination and dogmatism.

The first conception is reminiscent of the classical Greek *paideia* ideal in that it is based on a distinction between theoretical knowledge pursued for its own sake and knowledge pursued for practical ends. Since human beings are *rational* animals

<sup>32</sup>For the detailed picture, see Cuypers and Martin 2013, chap. 5. Below, I have drawn from this chapter.

<sup>33</sup>By, for instance, Levinson 1999.

whose perfection lies in the free development of their proper function, the value of the rational and theoretical overrides that of the practical and technical. The second conception harks back to the ideal of acquiring an all-round knowledge and understanding on the basis of a classical liberal arts curriculum. Liberal education as general knowledge acquisition aims at the open and comprehensive development of the mind by means of acquiring a whole spectrum of knowledge. The third conception is closely associated with education in the light of the ideals of (*Selbst-*)*Bildung* in that personal autonomy and critical thinking play pivotal roles in educational procedures. Whereas according to an extreme (but less plausible) version of this conception, self-realization depends wholly on individual experience and authentic choice, according to a more moderate (but more plausible) version, experience and choice, to be intelligible at all, must be informed by reason, knowledge, and a public understanding of the world. On the latter view, liberal education is certainly not the same as anarchic education.<sup>34</sup>

Arguably, the first ‘for its own sake’ conception has not so much application in the context of knowledge acquisition in schools as in that of the advancement of knowledge in the universities,<sup>35</sup> while the third (moderate) nonauthoritarian conception seems to presuppose the second general conception. Consequently, the second conception of liberal education as general education seems the most basic one. Note that the content of this second conception matches the content of Peters’ more specific conception of an educated person in Western culture (section “[Exemplary analysis of the concept of education](#)”).

## *Justification*

Although liberal education as general education clearly excludes narrow specialization, it is not clear what it positively includes. How broad must a person’s spectrum of knowledge be for him or her to be called ‘liberally educated’? Hirst, Peters’ closest collaborator, introduced the so-called forms of knowledge thesis in his 1965 landmark paper ‘Liberal education and the nature of knowledge’ to answer this question. The thesis says that the domain of human knowledge can be differentiated into a number of logically distinct forms of knowledge none of which can be reduced to any other. These non-arbitrary divisions within the knowledge domain can be made on the basis of distinctive types of conceptual schemes, truth criteria and testing procedures. This non-arbitrary differentiation into forms of knowledge is to be contrasted with the unifying ideals of mythology, religion and ideology, all of which involve forms of awareness that are comparatively undifferentiated. The differentiation of knowledge is one of the great achievements of Western civilization. The

---

<sup>34</sup> Suissa 2006.

<sup>35</sup> Moreover, the dichotomy between ‘for its own sake’ and ‘for practical ends’ is inadequate because practical activities can also be pursued for their own sake on the one hand and theoretical activities can also be infected by purely instrumental, practical ends on the other.

thesis differentiates between seven (or eight) distinct forms of knowledge: mathematics, physical sciences, human sciences, history, literature and the fine arts, religion, and philosophy (as well as moral knowledge).

However, given that this knowledge domain is enormously vast and that the *homo universalis* has become a psychological impossibility in the present-day knowledge society, which (sub)disciplines should be selected from the seven (or eight) different disciplines picked out by the ‘forms of knowledge’ thesis? Which kinds of knowledge are of most worth for the liberally educated person? This calls, of course, for a *justification* of which (sub)disciplines to include in—and, consequently, which others to exclude from—the liberal education curriculum.<sup>36</sup> Arguably, to deal with this issue of the content of liberal education, one should select, as the central core of an all-round understanding, *that* body of knowledge which is relevant for any person to cope with ‘the human condition’. In this way, all persons would have an interest in this body of knowledge on the basis of their existential concern. Such a selection of (sub)disciplines would then represent a kind of ‘survival kit’ or ‘life manual’ not only for the elite few but for everyone. A plausible view holds that the content of that body of knowledge, which is relevant for any person to cope with the human condition and life’s predicaments, is constituted by the *humanities*.<sup>37</sup>

With respect to the justification of the humanities as the core content of liberal education, one could argue that there exists a kind of asymmetry between the humanities and the natural sciences regarding their respective relevance for elucidating the human condition. Although physics (especially astronomy) and biology (especially Darwinian theory), for example, also contribute to the clarification of the human condition, the human sciences address the existential concern directly. In the light of a recent catalog of arguments for the value of the humanities,<sup>38</sup> it transpires that an appeal to existential concern as a justificatory basis is an original one.<sup>39</sup> It offers a non-instrumental justification because the humanities, as the body of knowledge which is relevant for any person to cope with life’s predicaments, are not ‘useful’ in the sense of being pursued for the sake of some practical or extrinsic end. Yet, the intrinsic value of the humanities is neither fully captured by the subjective value of taking pleasure in studying them nor by the objective value of possessing humanistic knowledge for its own sake. The value of the humanities is, at least to a considerable extent, firmly anchored in the *existential* value of them in coping with real life experiences. The heritage of the humanities is, in that sense, partially constitutive of a worthwhile life. It can, therefore, plausibly be claimed that an appeal to existential concern for the justification of liberal education as education into the humanities has a distinctive persuasive power in comparison with other justificatory arguments.

<sup>36</sup> See, for example, Hook et al. 1975 and Bailey 1984 for a detailed treatment of the justificatory issue(s).

<sup>37</sup> For my purposes, there is no need to distinguish between the humanities in a narrow sense (only including literature and the fine arts, history, religion, and philosophy) and in a broad sense (also including the ‘human sciences’, i.e., the social sciences).

<sup>38</sup> Small 2013.

<sup>39</sup> Cuypers (forthcoming) details this claim as follows. This article gives the full argumentation.

# Contemporary Conceptions of Jewish Education: A Philosophical Analysis

Hanan A. Alexander

What does it mean to obtain a Jewish education today, to receive an initiation into one interpretation or another of Judaism as a religious tradition, or to acquire a Jewish political or cultural affiliation through formal or informal learning? These are questions in the philosophy of Jewish education. In this context, philosophy entails clarifying the concepts and logic of educational research, policy, and practice (Soltis 1978); considering conflicts among ideas or assumption associated with curriculum, teaching, and learning (Popkewitz and Fendler 1999); or translating theological or ideological beliefs and values into instructional aims, content, or methods (Fox et al. 2003). Philosophers have long presumed that education involves the transmission or transformation of worthwhile knowledge across the generations (Plato 2008; Peters 1967). Understanding a conception of education, therefore, Jewish or otherwise, requires conceiving a perspective that offers criteria as to what should count as worthwhile knowledge. These criteria are often described as standards of criticism because they are used to determine the relative merit of ideals and values and the degree of truthfulness in beliefs and attitudes (Alexander 2001b: 44–50). Hence, to address questions about the meaning of various conceptions of Jewish education, one must account for how one or another view of Jewishness understands such criteria.

The term ‘Jewishness’ in this context denotes putative commitments to Judaism as a religion, according to some theology or interpretation, to the Jewish people as a national, cultural, or ethnic community, according to one or another political philosophy or ideology, or to some combination of the two. Contemporary conceptions of what it might mean to be Jewish divide broadly into three categories, therefore, centered on how each views the relation between these two basic historical strands of Jewish identity, one religious and the other political. Whereas anti-modern

interpretations conceive Jewishness in both religious and political terms, modern views tend to emphasize either religion or politics, and postmodern attitudes seek to deconstruct the distinction altogether (Alexander 2003, 2011).

Each orientation emphasizes a different account of the logic to justify the sort of knowledge that merits transmission or transformation across the generations, often influenced by or in dialogue with one or another influential philosophical or intellectual movement of the day, with consequences for curriculum content, instructional authority, pedagogic styles, and gender relations. Anti-modern Judaism is grounded primarily in hermeneutic scholarship which emphasizes the exegesis and eisegesis of sacred texts, both legal and literary, sometimes in dialogue with medieval interpretations of ancient pagan philosophers such as Plato, Aristotle, or Plotinus (Wolfson 1977). Modern Jewish experience, on the other hand, tends to rely either on Enlightenment understandings of Jewish history and sociology or counter-Enlightenment interpretations of Jewish memory and tradition (Berlin 1998). The Enlightenment approach draws on lower criticism to establish the texts and artifacts to be interpreted by means of higher historical criticism and on quantitative or qualitative research methods to collect behavioral data that can be assessed according to prevailing sociological theory. The counter-Enlightenment stance, on the other hand, references nationalist interpretations of collective memory or traditional commentaries on sacred texts and traditions. Finally, postmodern critique employs dialectical or conflictual reasoning to tease out and address unequal power relations among Jews and between Jews and non-Jews.

To understand how each of these orientations might conceive education requires some historical background. The Hebrew Bible, which recounts the Israelite narrative dating back to the tenth century BCE, if not before, emphasizes the responsibility of parents in transmitting Israelite narratives and customs to their children (e.g., Deut. 6:4–7; 20–25; Prov. 24:27–34; 27:23–27). It also alludes to schools established by priests and prophets in the centuries between the rise of the Davidic dynasty in the tenth century BCE and the destruction of the first Jerusalem Temple and Babylonian exile in the year 586 BCE (Judg. 17:10; Ps. 15: 19, 119; 78:1–4). The descendants of these exiles, who came to be known as Jews since they hailed mostly from the ancient Israelite province of Judea, returned to the land of Israel around 444 BCE (Alexander 2001a).

With the rebuilding of the Jerusalem Temple, worship moved gradually from the sacrificial cult to the recitation and study of sacred texts, until texts overtook sacrifice with the destruction of the second Temple by the Romans in the year 70 CE. The Hebrew Bible was canonized into what became known as Written Torah (Five Books of Moses, Former and Latter Prophets, and Writings) around the second century BCE (Bickerman 1949). In Hebrew, this text is sometimes referred to as 'Mikra'. A parallel tradition also emerged at this time that interpreted and applied Written Torah to changing circumstances. This Oral Torah was recorded in the second century CE in a legal code independent of the biblical text that became known as the 'Mishnah' (Cohen 1987). This code organized Jewish life into 613 'Mitzvoth' or divine commandments that are binding on all Jews from the age of 13. The case law of this oral tradition developed in the centuries that followed into what became

known as ‘Talmud’, although the term later came to refer to other forms of higher Jewish learning as well (Neusner 2004).

Although there were competing Judean sects during the first century CE (Bickerman 1949), according to the rabbinic tradition that prevailed the classical curriculum of Jewish schools was formally established when high priest Yehoshuaben Gamla appointed teachers of children for every village and town in ancient Israel (Babylonian Talmud, Bava Batra, 21a). The sages summarized this traditional curriculum by stating that a child is fit to study Mikra at 5 years of age and Mishnah at 10, to observe Mitzvoth at 13, and to study Talmud at 15 (Mishnah Avot 5:21). Ever since, scholars have interpreted these four terms—Mikra, Mishnah, Mitzvoth, and Talmud—according to their various understandings of Jewish life to describe the content that is sufficiently worthwhile to merit transmission or transformation across the generations through education (Alexander and Glick 2003). To be sure, anti-modern, modern, and postmodern approaches to contemporary Jewish belief and association do not emphasize each of these terms in equal measure or interpret them in the same way. Still, one would not be too far wrong to use them as a basis for organizing alternative ways of conceiving what it might be to obtain a Jewish education.

Accordingly, this chapter contains five parts. In the first part, I explain the roles of religion and politics in Jewish life to clarify why noting an emphasis on one or the other is a useful way of distinguishing among contemporary conceptions of Jewishness. In the second, third, and fourth parts, I examine how the logics of alternative anti-modern, modern, and postmodern accounts of Jewish life understand these key curriculum concepts and their consequences for authority, pedagogy, and gender. In the final part, I consider the consequences of this analysis for addressing the question of what it might mean to receive a Jewish education today. I answer that this entails engaging learners with some aspect of Jewish life in dialogue with some dimension of modern life, both broadly conceived, by means of a logic or hermeneutic intended to facilitate attachment to one or another account of what it might mean to be Jewish today. This is an exemplary case of what I have called “pedagogy of difference”, which holds that to know oneself requires engaging others who are different, but to genuinely engage others one must also know oneself (Alexander 2015: 87–138).

## Religion and Politics in Jewish Life

Being Jewish has historically rested on two interconnected conceptual pillars, one political, the other religious, both broadly conceived.<sup>1</sup> The Book of Exodus (19:6) describes the Children of Israel as “a kingdom of priests and a holy nation”—a

---

<sup>1</sup>The division between politics and religion is somewhat anachronistic in the ancient near eastern context in which matters of governance and worship were intimately intertwined. The distinction evolved over time, in part as an extension of Augustine’s Christian differentiation between the

political community with a sacred purpose. The eleventh-century Provençale sage, Rabbi Shlomo Yitzchaki, whose classic biblical commentary often reflects earlier rabbinic interpretations, understood the term ‘priests’ in this context to mean ‘ministers’, not descents of Moses’s brother Aaron, who according to tradition was the first high priest. According to the sixteenth-century Italian sage, Rabbi Ovadia Sforno, to be ‘holy’ means to be set apart or distinctive. In the traditional view, then, the mission of the Israelite nation is to lead the whole of humanity to understand the word of God. This is why the nation was to follow both political and religious leaders, judges as well as prophets, kings along with priests, where political power was always to be justified according to the dictates of faith. As the emphasis moved from the sacrificial cult to the study of Torah, both written and oral, the need for individual Jews to understand their religious obligations came to the fore, and the necessity for literacy and hence some form of universal education became paramount.

As Jews dispersed throughout the Diaspora during the centuries following the destruction of the second Temple, this intermingling of politics with religion survived until Napoleon emancipated the Jews at the beginning of the nineteenth century. Throughout the medieval period, Jews lived in independent corporate communities under the protection of—and too often also persecuted by—local Christian and Moslem rulers, each justified by their own religious traditions. Rabbinic scholars with expertise in Jewish law emerged as the religious leaders of medieval Jewry, while lay-leaders of one variety or another served as political heads of the community. This preserved the unity of the national and religious ties that had bound Jews together since biblical times.

This ancient arrangement was forever altered by the two revolutions of modernity, Enlightenment and Emancipation. The one challenged the religious foundations of Jewish life, the other its political underpinnings. The eighteenth-century European Enlightenment altered Jewish faith by asserting a new form of skepticism which admits only those statements that can pass an objective test grounded in reason (Gellner 1992). Moral and intellectual authority, in this view, rests on the rationality of autonomous individuals, not on the word of a transcendent God (Kant 1989, 1997). This intellectual revolution set the stage for a new sort of politics in nineteenth-century Europe known as Emancipation that liberated individuals from religion to choose their own life paths according to the dictates of reason. This new politics undermined the corporate identity of Jews who were now offered citizenship in modern nation-states independent (at least in principle) of religious or ethnic affiliations. These modern Jewish citizens were now empowered to choose whether

---

Cities of God and Man (Augustine 1998), which became a bedrock of eighteenth-century political philosophy and nineteenth-century Protestant theology that influenced the scientific study of Judaism. For the present purpose, both terms should be understood broadly to include overlapping notions of culture, custom, language, and narrative, the one emphasizing affiliation and sovereignty, the other faith and ritual.

or in what ways they would continue to adhere to the beliefs and customs of traditional Judaism.<sup>2</sup>

Anti-modern, modern, and postmodern conceptions of Jewishness constitute three broad responses to these two crises of modernity. The first sort of conception, often associated with various forms of ultra-Orthodoxy, rejects both modern revolutions seeking instead to preserve the longstanding traditional ties between faith and affiliation. The prefix ‘anti’ in this context involves both a chronological and a conceptual connotation. On the one hand, it means ‘before’, denoting a self-perception on the part of those who hold these views that their understanding of Judaism accurately preserves the traditions revealed by God at Sinai. On the other hand, it also means ‘against’ or ‘opposed to’, expressing an unwillingness to accept the two revolutions of modernity as offering any positive contribution to Jewish life. Indeed, this attitude even entails a fear that these modern developments will lead to an unraveling or erosion of tradition. This is why the Hebrew word for ultra-Orthodox is ‘Haredi’, meaning fearful, not only of God but also of modernity.

The second way of thinking emphasizes either religion or politics as primary form of Jewish attachment, but not necessarily both. On the one hand, liberal Jewish religion—Progressive, Reform, Reconstructionist, Conservative, modern Orthodox—tends to reconceive Jewish faith in consideration of Enlightenment reason while encouraging the political affiliation of Jews to modern (non-Jewish) nation-states. On the other hand, various interpretations of Zionism favor political affiliation with a Jewish state as the primary form of Jewish connection grounded in several influential counter-Enlightenment trends. These views either reject religion altogether; witness Political, Cultural, or Labor Zionism; or leave it essentially unaltered by the challenges of Enlightenment, as seen very often in Religious Zionism (Alexander 2003).

Drawing on assumptions associated with critical social theory (Marxism, neo-Marxism, postcolonialism), which takes left-leaning counter-Enlightenment thinking to its logical conclusions, and with several Jewish thinkers also influenced by trends in continental philosophy, the third approach views the distinction between these two aspects of Jewish identity as a false dichotomy imposed by one or another meta-narrative—rabbinic, liberal, or Zionist—which can lead to overly instrumental or nationalist consequences. These hegemonic or nationalist orientations often seek to preserve a status quo in which power and privilege are not allocated equitably, whether among various Jewish groups—Ashkenazi versus Mizrahi; male versus female; heterosexual versus gay, lesbian, and transgendered; rational versus

---

<sup>2</sup>As the influence of these two Western European revolutions spread eastward, and nineteenth-century counter-Enlightenment trends began to emerge, a movement of Jewish intellectuals arose in Central and Eastern Europe known as “Haskalah” or Jewish Enlightenment. A precursor to both modern Zionism and religious liberalism, this movement sought to preserve the Jews as a separate cultural collective, on the one hand, especially by reviving the Hebrew language for secular purposes, and to promote Jewish integration in the surrounding economy, on the other, through mastery of local vernaculars and adapting to modern values and dress. Naftali Hertz Wiesel, whose advocacy of an education that balanced secular with Jewish learning will be discussed in Part Three, was an early member of this movement (Litvak 2012).

mystical; etc.—or between Jews and gentiles, especially Jews versus Arabs or Israelis versus Palestinians. Associated with such trends as Jewish renewal (including post- or trans-denominationalism and neo-Hassidism) and post-Zionism, adherents to these approaches strive to reconceive Jewishness in ways that minimize these injustices or, if possible, eliminate them altogether. The prefix ‘post’ in the term postmodern, like the prefix ‘anti’ discussed previously, has both chronological and conceptual connotations. Chronologically, it means ‘after’ or ‘following’, since critiques of both Enlightenment and Emancipation could only be conceived once those modern developments had emerged. But the term also refers to a contrary or opposing position, since postmodernism draws on the various versions of critical social theory to cultivate skepticism about modern beliefs and practices that entail embedded forms of inequality and injustice (Alexander 2011).

## Anti-modern Conceptions of Jewish Education

Ultra-Orthodoxy is a form of Jewish fundamentalism that takes a particular interpretation of sacred scripture as the literal word of God and so also the absolute truth. All forms of Jewish Orthodoxy—neo-Orthodoxy, modern Orthodoxy, and religious Zionism—embrace rabbinic exegesis as the correct understanding of the Hebrew Bible and are ambivalent to one degree or another about Enlightenment ideas (Salmon et al. 2006), but ultra-Orthodox Judaism is distinguishable by its complete rejection of Enlightenment and Emancipation altogether (Sofer and Stern 1996).

Many scholars consider the nineteenth-century sage Rabbi Moses Sofer, known also as the Hatam Sofer, to be the founder of this way of thinking. Concerned about the dangers to the life of *Torah* posed by modernity, Sofer founded an academy in Pressburg, Hungary (today’s Bratislava, Slovakia). As a slogan, he chose the rabbinic dictum “*hadash assur min hatorah* – innovation is forbidden by the Written Law”. In its original context, the term *hadash*, which means new, refers to the first fruits of spring grain harvest. According to the Hebrew Bible, first fruits are to be left for the priests and Levites, since they were allocated no portion of land from which to feed themselves and their families. These fruits were their rightful property in compensation for their service to God, and so forbidden—*assur*—to the farmer or landowner harvesting them. However, modernizers also used the word *hadash* to mean ‘modernity’. Sofer played on this ambiguity to suggest that modernity itself, and all of the potential change associated with it, is forbidden by divine decree (Samet 1972).

According to the tenets of ultra-Orthodoxy, only its view of Judaism constitutes the true word of God, as revealed simultaneously at Sinai in both Written and Oral Torah. However, the term ‘Orthodox’ appears nowhere in the Bible or rabbinic literature. It began to be used by Jews only after the rise of Reform Judaism in Germany during the nineteenth century, probably under the influence of eastern Christianity. The word itself is of Greek origin and indicates an emphasis on uniformity of belief that is uncharacteristic of rabbinic Judaism, which has historically

stressed practice over doctrine. It was not until the twelfth century, in response to the intellectual challenge of philosophical rationalism, that Jewish philosophers even tried to canonize a core of essential Jewish beliefs; and they achieved no agreement among themselves as to what should be included in this core (Kellner 1999). Pre-modern Jewry benefited from a dynamic conversation with the economic and intellectual environments in which they lived. The fruits of this interaction can be seen in medieval Jewish philosophy, mysticism, and biblical commentary. In abandoning this creative interaction, ultra-Orthodoxy represents a new, isolationist Judaism that is a reaction against the perceived dangers of modernity to the life of Torah.

Not surprisingly, the schools and academies that follow Sofer's ultra-Orthodoxy focus almost exclusively on a limited interpretation of the traditional terms 'Mikra', 'Mishnah', and 'Mitzvoth'. Strictly speaking, this approach is not fundamentalist in the sense that its followers read the Bible literally. Rather they read particular rabbinic interpretations *as if* they were the literal meaning of the biblical text. This view also favors interpretations of Jewish law derived from the oral tradition denoted in this context as 'Mishnah' that are viewed by its adherents as stringent and designed to separate them from both non-Jews and other Jews who are not ultra-Orthodox (Finkelman 2011).

Indeed, ultra-Orthodox scholars tend to embrace what is sometimes called a positive theory of law, which holds that the unequivocal meaning of a legal text is to be found within a legal tradition alone without reference to any external sources of authority, such as ethical or political theories. (Austin 1995). This position in legal philosophy actually emerged under the influence of scientific and historical positivism, or the view that the truth about nature, society, and history are only to be discovered within the confines of empirical rationality (Dilthey 1989; Comte 1988). This is an Enlightenment idea that seeks precise and definitive results to legal deliberations similar to those found in the exact sciences. However, in the ultra-Orthodox context, this view takes on a decidedly Hegelian meaning that texts can only be properly deciphered within the organic context of the cultures and traditions in which they were written (Phillips 1976). Jewish education, according to this view, involves inculcating adherence to an insular, rigid, and absolute account of positive Jewish law, born of a deep opposition to Enlightenment ideas (Alexander 2011).

If not already included in their understanding of 'Mishnah', then, ultra-Orthodox scholars would also agree that the term 'Talmud' refers to the study of traditional Talmudic texts, both law and lore, read in their various versions and interpreted through the lenses of multiple rabbinic commentaries. This said, additional aspects of higher Jewish learning, understood in a variety of different ways, are also sometimes included under this rubric. For example, followers of the twelfth-century Jewish philosopher Moses Maimonides and other like-minded scholastics include the rational contemplation of God as conceived by Aristotle as the highest form of 'Talmud' (Twersky 1972). By the same token, adherents to one or another interpretation of Jewish mystical traditions such as followers of various Hassidic sects may include the study of Cabbalistic texts and other contemplative, spiritual, or even

magical practices under this heading, although they often delay exposure to the most sensitive mystical traditions until the age of 40 (Scholem 1995a).

Both medieval approaches to Talmud, rational and mystical, entail a hermeneutic that Simon Rawidowicz (1957) has called *interpretatio* as opposed to *explicatio*. The Hebrew equivalents of these terms are *d'rash* as opposed to *p'shat*, or in English, eisegesis versus exegesis.

*Explicatio* eases the burden of a text by paraphrasing an older statement in a language more accessible to a contemporary reader. This is often accomplished by explaining problems in the text itself, such as when words or phrases are repeated in a manner that might be seen as superfluous or when alternative versions of a narrative contradict one another. This hermeneutic stance is motivated by the deep identification of a commentator with the text under consideration and a desire to convey its meaning and purpose faithfully to like-minded readers.

*Interpretatio*, on the other hand, attempts to reconceive the meaning of text by reading into it meanings that might not be readily apparent or juxtaposing it to documents from other worlds or ways of thinking. This hermeneutic is driven by both attachment to and alienation from a text. An act of reconciliation is involved in this case, which inevitably leads to a revolution from within planned and executed with the purpose of reshaping one's way of thinking. Although this innovated spirit may have characterized the hermeneutics of medieval Jewish life, when faced with the two crises of modernity, the ultra-Orthodox response involves freezing those medieval innovations in order to embrace them as if they were the one and only original meaning of the texts under consideration (Alexander 1992).

One important consequence of this anti-modern conception of Jewishness is that instructional authority is primarily hierarchical, derived from scholars assumed to have the greatest mastery of rabbinic sources according to the relevant ideological nuances of particular ultra-Orthodox subcommunities (Heilman 1992). Pedagogic styles, by contrast, are surprisingly egalitarian (at least among male students), emphasizing a traditional dyadic form of independent study known as 'havruta', in which as they mature, students engage one another in posing and addressing questions concerning the interpretation of sacred texts (Heilman 1983; Holzer and Kent 2014). Owing to the strict sexual ethic of this position, according to which religious piety is closely associated with carnal purity, there is a separation of genders in ultra-Orthodox schooling. Males and females not only study separately, the curriculum for each gender is also distinct, with a stronger emphasis on Jewish law in the curriculum for men than for women (Stadler 2009). This said, recent years have witnessed new opportunities for ultra-Orthodox women to assume professional positions, some even with religious authority, for example, as legal advisors in the deliberations of rabbinic courts (Lupo 2003).

Another influential consequence of this view is a principled rejection of the theological legitimacy of the Zionist state. The destruction of the second Jerusalem Temple along with the subsequent exile from the land of Israel is considered to be a divine punishment for baseless hatred among Jews during their war with the Romans in the first century. "Because of our sins we were exiled from our country, and banished from our land," reads a key passage of classical Jewish liturgy (Birnbbaum

1951: 331). Unlike the Christian belief that the messiah was sent by God in the form of Jesus of Nazareth, classic Jewish theology holds that the messiah has yet to arrive. The ultra-Orthodox interpretation of this doctrine entails the idea that only God can return the Jewish people to its land, which will only transpire with the coming of the messiah prior to the divine redemption of the whole of human kind (Scholem 1995b).

This form of anti-Zionism has no direct relation to more recent critiques of modern Zionism grounded in various forms of critical social theory which will be discussed in Part Four of this chapter. Social critics often fail to take account of the fact that Zionism constitutes a revolution within Jewish history and theology, one that was profoundly rejected by the ultra-Orthodox. Quite ironically, with the Nazi destruction of European Jewry, the largest Haredi community in the world has taken root under the protection of the State of Israel.

Although this anti-modern trend originated among Ashkenazi Jews in Eastern Europe, it has become increasingly influential in recent decades among Mizrahi Israelis as well, whose ancestors hail from North Africa and the Middle East (Ravitzky 2006). However, Mizrahi ultra-Orthodoxy never embraced the anti-Zionism of its Ashkenazi counterpart. With religious Zionists, Mizrahi rabbis view the establishment of the State of Israel as the harbinger of redemption. Ultra-Orthodox political parties representing both Ashkenazi and Mizrahi Jews participate actively in Israel's parliamentary democracy, and Haredi schools and academies receive funding from the Israeli government, which in recent years has sought to integrate Haredi Jews into mainstream Israeli life (Rosenak 1992).

## Modern Conceptions of Jewish Education

Although they are often combined in a variety of ways, modern conceptions of Jewish education can be broadly divided into two groups. One places a primary emphasis on religious liberalism, which stresses a variety of updated approaches to Jewish religion over Jewish political identity. The other highlights Zionism, which prioritizes Jewish affiliation in terms of several divergent political ideologies over religious faith and observance.

Religious liberals view the onset of modernity as a positive and unavoidable development. To the question of whether to be modern or Jewish, they respond that it is possible, indeed desirable, to be both. Liberals embrace the terms of Emancipation by deemphasizing the collective side of Jewish consciousness in order to be accepted as citizens in modern secular (non-Jewish) states. On the other hand, they reject the conclusion based on Enlightenment critique that faith should be abandoned, arguing instead with liberal Protestants that religion should be reformed to privilege the autonomy of the individual (Kant 1960; Cohen 1972).

This orientation emerged under the heading 'Reform Judaism' in mid-nineteenth-century Germany (Weiner 1997). The term 'reform' can be confusing in this context, because it is sometimes taken to refer to the entire process of liberalizing

rabbinic religion, but it also became the name of one of the denominations that emerged from this process. The term 'liberal' is only slightly less confusing. It too is used to refer to the entire category, but liberal Judaism is also one of the non-Orthodox movements founded in Germany during the mid-nineteenth that has survived, especially in countries affiliated with the British Commonwealth. Together the Reform and Liberal movements refer to themselves as 'Progressive Judaism', which emphasizes individual autonomy over divine authority or historical development in choosing whether and how to observe religious rituals (Borowitz 1984).

The terminological confusion is exacerbated by the fact that the other large movement in this category calls itself 'Conservative'—a term probably associated with the British conservative philosophy of its early twentieth-century American leader Solomon Schechter. Sometimes known as the other face of liberalism, this political philosophy emphasizes tradition in addition to, and sometimes even at the expense of, the individual (Alexander 2015: 87–138; Burke 2009; Gray 2002). Although more accepting of historical and sociological scholarship in Jewish life than Orthodoxy, for most of the first half of the twentieth century, this trend adhered fairly closely to classical rabbinic tradition (Gordis 1978). This is probably why by the middle of the twentieth-century Conservative Jews with progressive leanings sought to found Reconstructionist Judaism in the spirit of American pragmatism (Kaplan 1972). But progressive elements have continued to gain sway within Conservative Judaism until the present day as well, which has witnessed a number of bold decisions over the past half century, including enabling women and homosexuals to participate equally in worship and to receive rabbinic ordination. In Israel and England this approach goes by the name 'Masorti' or 'traditional' Judaism. In Hungary it has close ties to the 'Neolog' tradition represented today by the beautiful Dohány Street Synagogue in Budapest. These movements emphasize the role of historical development and contemporary sociology in deciding whether to preserve or change traditional practices (Dorff 1979; Gilman 1993).

Neo- or modern Orthodoxy is a final orientation in this category. Founded by Samson Raphael Hirsch in late nineteenth-century Germany, this movement hews closely to what it perceives as classical Jewish practice. For this reason, many are inclined to include it in the Orthodox camp, which is where Hirsch saw himself (Hirsch 1972). I refer to this view as liberal, however, because it embraces a positive disposition toward modernity, and encourages its members to integrate into the modern nation-state in the public sphere, while maintaining strict observance of Jewish law in the private domain. The leading spokesperson for this trend in twentieth-century North America was Joseph Soloveitchik, who sought a synthesis between strict observance of Jewish law and modern religious existentialism (Soloveitchik 2006).

If religious liberalism accepted the political terms of Emancipation and challenged the Enlightenment's theological critique, and ultra-Orthodoxy opposed both, Zionism rejected the political terms of Emancipation and, at least in its secular version, accepted the Enlightenment's critique of religion. Secular Zionism is first and foremost a political ideology. Jews can only become fully enfranchised,

according to this attitude, in the context of a Jewish nation-state, in which Jews qua Jews can assert political power to protect themselves and their families and to advance their collective interests. Anti-Semitism may be so deeply embedded in European consciousness, in this view, that Jews may never be completely accepted, even if they abandon their Jewish identity altogether. A Jewish state could address the problem of anti-Semitism by normalizing Jews as citizens in their own state (Hertzberg 1969: 204–225).

Political Zionism of this kind is often tied to a cultural form of Zionism that sought to preserve the moral values of the Hebrew Bible by transforming Jewish religion into a modern national culture. One key ingredient in this cultural revival is language. Ancient Israelite culture was created in Hebrew, which survived for centuries as a language of worship and sacred study. For the new national Jewish culture to take hold, it required the transformation of Hebrew from a language of prayer and learning to one of daily life (Fellman 1973). Secular Zionism does not reject Enlightenment ideas altogether, but only the view of Emancipation politics that Jewish life as a minority culture could thrive in large diverse democracies, since the public square of such a society will always favor the majority. In this view, political sovereignty is required for a culture to survive and flourish (Zipperstein 1993).

Inspired by Kant's contemporary Moses Mendelssohn (1983), who held that the modern Jew should reserve religious observance for the private sphere, while reflecting a neutral enlightened culture in public, Naftali Hertz Wiesel set the stage for modern conceptions of Jewish education. In his acclaimed 1785 *Words of Peace and Truth*, Wiesel argued that the emerging schools of modern Judaism should offer instruction in subject matter drawn from both Jewish life and secular society (Wiesel 1886). Hirsch approved this curricular orientation a century later when he reinterpreted the rabbinic dictum "It is good to combine the study of *Torah* with the ways of the world" (Mishnah Avoth 2:2), to mean that students should study both the written and oral traditions of Mikra and Mishnah, along with content drawn from modern sources that can be associated with the curriculum category of Talmud (Hirsch 1995). In this respect, liberal responses to the crises of modernity have sought to preserve, and in many cases advance, the innovative spirit of medieval *interpretatio* that has been frozen by ultra-Orthodoxy. However, alternative accounts of both liberal Jewish religion and modern Zionist politics differ over what content should be drawn from modern sources and how it should be studied in relation to Jewish life.

Three approaches have emerged within modern Jewish education to balance the study of non-Jewish with Jewish sources (Chazan 1984:19–36). One view holds that political liberalism and modern human and natural science are the primary arbiters of truth and goodness. Those who do not want their children to live in a Jewish Ghetto should see to it that their children receive a broad liberal education. Fortunately, it is possible to read Judaism as entirely consistent with modern science, liberal democracy, and secular humanism. The curriculum should therefore emphasize the natural and human sciences together with a liberal or humanist

interpretation of Jewish content. This position is most prevalent among Reform and secular Zionist educators (Aloni 2008; Cohen 1964).<sup>3</sup>

The second view places equal weight on both the secular and the Judaic portions of the curriculum. This position holds that truth and goodness can be found in both traditional Judaism and modern thought, although it does not expect to find total harmony between them—neither of which is monolithic in all events. Secular learning is often dubbed ‘general studies’ by advocates of this orientation, emphasizing their belief that these studies are common to the general public, whereas ‘Jewish studies’ are of parochial interest primarily to Jews. The educational task is to equip students with enough knowledge of Jewish tradition and modern civilization to enable them to identify conflicts and tensions within and between these complex cultures, and to address them as they see fit. This approach is found mostly among Conservative or Masorti Jewish educators and the liberal wing of Modern Orthodoxy (Ackerman 2008; Heschel 1953; Rosenak 1987).

A third attitude holds that the Judaism of the written and oral traditions are the primary arbiters of truth and goodness. Modern political and scientific ideas should be studied only to the extent that they do not contradict *Torah* Judaism. Secular studies may be important to earning a living, and young Jews ought to become sufficiently integrated into modern societies to enjoy civil liberties and avoid persecution. However, modernity should not be embraced at the price of abandoning Jewish faith and observance. Hence, the Judaic portions of the curriculum take precedence over the secular. Secular studies should emphasize disciplines that do not threaten ‘classical’ Jewish belief. These include technical subjects that are useful for gainful employment, not humanities and social sciences. This position is influential among the religious Zionists and more conservative segments of Modern Orthodoxy (Arand 2000).

All three of these approaches to this balancing act view the curriculum category of Talmud—understood as higher Jewish learning in general, not a particular classic rabbinic text—in terms of an intellectual engagement between Jewish and modern thought. The German Reform theologian Hermann Cohen, for example, interpreted Judaism in light of his Kantian leanings at the turn of the twentieth century (Cohen 1972), while by the middle of that century Reconstructionist theologian Mordecai Kaplan sought to engage Judaism with the pragmatism of John Dewey (Kaplan 1972) and modern Orthodox founder Joseph Soloveitchik struggled with tensions between Judaism and religious existentialism (Soloveitchik 2006). Similarly,

---

<sup>3</sup>Humanistic Judaism in Israel is distinct from Reform Judaism in the Diaspora, among other reasons, because of the Zionist emphasis on Jewish sovereignty. In an environment where the local language and public culture reflect a national conception of Judaism, there is a greater opportunity for rich Jewish engagement and integration between secular and Jewish sources. Studied in Hebrew as a native language, even math and science, not to mention literature and philosophy, can take on Jewish cultural meaning, and the distinction between secular and Jewish sources is blurred. In Israel, however, Reform Judaism has much in common with robust Jewish humanism in this regard.

leading Zionist thinkers, both secular and religious, brought leading modern political theories to bear on their conceptions of Jewish politics (Hertzberg 1969).

These orientations differ, however, when it comes to the curriculum categories of 'Mikra', 'Mishnah', and 'Mitzvot'. The first approach draws on scientific studies of Jews and Judaism grounded in modern history and sociology. Concerning the classical category of Mikra, this orientation emphasizes the historical criticism of the Hebrew Bible over traditional commentaries. Its attitude toward Mishnah and Mitzvot entails a sociological and humanistic understanding of Jewish customs and ceremonies that stresses their ethnic or ethical as opposed to theological significance, the one addressing relations among human beings, the other a response to divine command. The second approach seeks content that draws on both modern Jewish history and sociology as well as traditional exegesis and eisegesis. The category of Mikra, in this view, involves the study of both biblical criticism and traditional commentaries, while Mishnah and Mitzvot include both humanistic and traditional interpretations of Jewish holidays and rituals. Finally, advocates of the third orientation prefer a Judaic curriculum that stresses traditional exegesis and eisegesis, allowing the modern academic study of Jews and Judaism only so long as it does not challenge traditional doctrine. Mikra, according to this perspective, entails study of traditional biblical interpretations. The approach to Mishnah and Mitzvot is traditionally theological, emphasizing the obligation to obey the Divine commandments.

In contrast to anti-modern Jewish schooling, in which instructional authority is hierarchical but pedagogic styles are egalitarian and dyadic (at least for males), the greater the tendency of a modern approach to Jewish education toward religious progressivism or secular humanism, as opposed to modern Orthodoxy or religious Zionism, the more instructional authority becomes diffuse and individualistic while pedagogic styles becomes didactic, following the teaching models of modern schooling. This said, modern Jewish education has also given rise to several important pedagogic innovations, including congregational education that supplements state schooling with afternoon and weekend classes (Aron 2011) and experiential learning, such as summer camps, youth movements, and educational tourism (Bryfman 2011). Concerning gender, whereas boys and girls are strictly separated among the ultra-Orthodox, the greater the tendency toward progressivism or secularism within modern Jewish education, the more males and females are integrated in the classroom. This includes a strong egalitarian ethos, not only a common curriculum, leading to full political and religious enfranchisement of women, as members of the Israeli parliament, for example, or ordination as rabbis (Epstein 2011). Indeed, it has been argued that a chief accomplishment of modernity in Jewish life, especially its political expression in the State of Israel, has been the education and enfranchisement of women (Ackerman 2008). A recent extension of this inclusive attitude has been a growing acceptance of the LGBT community within Jewish political, educational, and religious institutions, in Israel and abroad.

## The Postmodern Condition and Jewish Education

Postmodernism in the broadest sense is usually thought to address how discourses of power saturate and corrupt every aspect of our lives, our pursuit of knowledge; our interpretations of the world and of human conduct; our understanding of language and law; the stories we tell ourselves and our children about who we are and how we ought to live and the religious, cultural, artistic, and other forms in which we express them; our interpersonal and gender relations; our sexual attitudes and orientations; and our institutions of personal and social governance. Those who embrace this complex array of attitudes, suspicions, questions, and analyses ask us to be aware of the myriad ways in which we dominate one another and to consider whether or to what extent we can conceive social relations that ameliorate if not all at least some of the most egregious effects of this domination (Alexander 2011).

An heir to left-leaning Hegelianism, postmodernism embraces the skepticism of Marxism and neo-Marxism concerning the unequal distribution of power embedded in economic, political, and social relations. However, it abandons the optimistic attitude of modern critics such as Karl Marx (Marx and Engles 1998), Max Horkheimer, and Theodor Adorno (Horkheimer and Adorno 2007) that liberation from the corrupting influence of power can be achieved for the more pessimistic view that discourses of power are present in all human endeavors. With Friedrich Nietzsche (1989), postmodern critics doubt the possibility that any grand narrative can adequately explain the meaning and purpose of human existence, since each such narrative is itself encumbered by unequal power relations. According to this analysis, the anti-modern and modern responses to Enlightenment ideas that have most influenced contemporary Jewish education embrace hegemonic assumptions concerning such issues law, autonomy, and sovereignty.

From a deconstructionist perspective, for example, the ultra-Orthodox idea that Jewish education should promote a heteronymous commitment to a limited set of religious rituals is deeply problematic. Any attempt to close the meaning of a text or limit the possibility of new understandings is a morally perverse act of domination that undermines the inherent freedom of the reader to find in the text whatever meaning he or she deems appropriate. Jacques Derrida (1998) applied postmodern skepticism to the meaning of language and the interpretation of texts. He argued that there is no essential relation between signifiers—linguistic symbols such as words and phrases that purport to say something about human experience—and that which they allegedly signify. Rather, any assertion that language means this as opposed to that is an act of domination. The task of interpretation, on this account, is to deconstruct the techniques used to impose meaning, not to uncover propositions embedded in authorial intent or the public context of speech.

Similarly, from a poststructuralist viewpoint, it is an illusion that liberal Jewish education can provide knowledge relevant to making autonomous choices based in reason. According to Michel Foucault (2001), the ‘knowledge’ transmitted as well as the ‘choices’ made, indeed even the very idea that people are capable of ‘free choice’, cannot be separated from the power relations in which they are embedded. The liberal Jewish trend to reread ancient texts in light of the study of modern

history and sociology or to combine these with an appreciation for traditional rabbinic interpretations should be problematized, because both entail dominations. The latter is tied to rabbinic power over Jewish life and the former to European colonialism. Both are nothing more than false ideologies. One replaced the authority of biblical religion with that of the rabbis and the other the power of rabbinic tradition with Enlightenment knowledge. Even the view that an individual person has the capacity to choose freely is embedded in Enlightenment power discourses, since the idea of a self that is unencumbered by socioeconomic class, culture, or language, is unimaginable other than in the context of a liberalism that reflects the interests of modern secular society.

Finally, in keeping with what Jean-Francois Lyotard (1984) called 'the postmodern condition', Zionist education too often imposes a single meta-narrative on the trajectory of Jewish history, in this view, one that leads ultimately and inevitably toward a return of the Jewish people to political sovereignty in the land of Israel (Gur-Ze'ev 2003). But this homogeneous story does not allow for the many complexities of Jewish history, the variety of languages Jews have spoken, the diversity of religious and cultural lives in which they have expressed their Jewishness, or the multiplicity of localities and communal structures in which Jews have lived and in many instances continue to live. Nor does it ring true to many Jews today, even those who among their many identities choose to affiliate as citizens of Israel. Indeed, some would argue that by eschewing the traditional Jewish ambivalence toward power and placing it at the center of collective Jewish existence, Zionism has exacerbated not ameliorated anti-Semitism, and by secularizing and nationalizing religious forms of cultural expression, Zionism has not redefined traditional Jewish values for a new age but robbed Jewish life of its most essential ideals, beliefs, and practices (Boyarin 1997).

Another trend on the margins of postmodern thought that has impacted Jewish education during the late twentieth and early twenty-first centuries can be found in the writings of Martin Buber, Franz Rosenzweig, Emmanuel Levinas, and Hannah Arendt. Also influenced by counter-Enlightenment tendencies in continental philosophy, these philosophers were less enamored with the vicissitudes of power than the likes of Derrida, Foucault, and Lyotard. Indeed some became outspoken critics of the more radical consequences of critical social theory. But unlike many modern Jewish philosophers such as Hermann Cohen (1972), who sought to discover Enlightenment ideas in Jewish sources, these thinkers sought to identify themes in Jewish particularity with broader human significance, the transmission of which across the generations might have transformative implications (Alexander 2014).

For Buber, one such theme was to be found in the relationship between the Hebrew Prophets and the biblical God. Buber believed that the sort of existential meeting reflected in that relation was revived during the late eighteenth century in the connection between the rabbis and followers of pietistic Eastern European Jewish sects known as Hassidism (Buber 2015). He called this an I-Thou or subject-subject relation. In contrast to I-It or subject-object interactions, which are maintained for some instrumental purpose, I-Thou relations entail a meeting in which each subject embraces the uniqueness of the other unconditionally in a moment of

mutuality in which the other ‘fills the firmament’ (Buber 1996). Although these moments of spontaneous spirituality could not be contained by the formalities of religious ritual, in Buber’s view, it is possible to embrace sacred texts as one would another person, such that they become sources of meaning and purpose in one’s life, and to build communities organized around this sort of existential meeting. He hoped that the labor Zionist communities known as Kibbutzim would become models of this type of social life (Schaefer 1973) and envisioned Israel as a binational state grounded in Jewish-Arab dialogue (Hazony 2001). In a famous letter to Buber, Rosenzweig suggested that rituals could also be embraced as subjects, provided that they were engaged as sources of personal commandment rather than externally imposed law (Rosenzweig 1955).

Whereas Buber and Rosenzweig completed their most original contributions between the two world wars, Levinas and Arendt were both post-Holocaust philosophers whose work was heavily influenced by the devastations of Auschwitz. In Levinas, this influence took shape in a critique of the totalizing ontology of Western philosophy as seen, for example, in the writings of Martin Heidegger (1996) and Edmund Husserl (1960). This ontology reduces the other to an ‘alter ego’ of oneself, the essence of which is identical to me. In contrast, Levinas held ethics to be first philosophy, not ontology, according to which each person is inescapably responsible for others who are different (Levinas 2005). Deeply rooted in rabbinic sources, Levinas’s responsibility for the other does not require a response as in Buber’s interpretation of biblical mutuality. Levinas held that a Jewish state in the land of Israel is permitted not promised, therefore, provided that the state takes responsibility for non-Jews as well as Jews; and he found it difficult to forgive Nazi intellectuals such as Heidegger who were unwilling to take responsibility for the Jews among them who are the perennial others of European society (Levinas 1990). This idea of Jews as European outsiders was also developed by Arendt in her anti-nationalist political theory in which the Jew is depicted as the quintessential pariah. Stripped of all national aspirations, this sort of Jew could serve as a model for the cosmopolitan social critic. Among other reasons, this is why Arendt was opposed to Zionism (Arendt 2008).

Two movements in Jewish life have come to the fore in recent decades in response to these postmodern ideas: Jewish renewal (including post- or trans-denominationalism and neo-Hassidism) and post-Zionism. Jewish Renewal describes a trend within contemporary Jewish life that seeks to reinvigorate what it views as a moribund and uninspiring Judaism with mystical, musical, and meditative practices drawn from a variety of traditional and untraditional Jewish sources. This movement brings Hassidic practices to egalitarian settings, a phenomenon sometimes referred to as neo-Hassidism. Hence, its approach to Mikra includes a combination of Cabalistic and feminist interpretations of the Hebrew Bible. Its orientation to Mishnah and Mitzvoth is highly eclectic as many followers of this trend augment traditional Jewish worship with ecstatic practices such as meditation and dance; some even borrowed from other faiths, such as Buddhism and Sufism. The movement’s understanding of Talmud, again as a curriculum category not classical text, is heavily influenced by left-leaning political thinking which incorporates such

social views as environmentalism and pacifism. Influences from this movement can be found within many of the Jewish denominations, which it seeks to transcend. Hence, Jewish renewal has also been associated with post- or trans-denominational (Kaplan 2009).

Post-Zionism includes a variety of sociological, historical, and philosophical critiques of Israeli society based loosely in critical social theory, especially postcolonialism (Silberstein 1999), and to a lesser degree in Buber's binationalism (Hazony 2001) and Arendt's cosmopolitanism (Butler 2014). Zionism is a hegemonic ideology, according to this critique, based on nineteenth-century European nationalism that imposed itself on the indigenous Arab people of Palestine. In this endeavor, Zionists have been agents first of the British, who acquired a mandate to rule the region from the League of Nations—predecessor to the United Nations—in 1917, and later of the Americans, who have sought to dominate the region more recently for their own political-economic gain. This ideology was created for the purpose of controlling the local Arab population by inserting European power into the region. Zionism on this account is a form of colonialism, the corrupt power relations of which seep into every aspect of the Israeli state (Sternhell 1998). Schooling in Israel, Palestine, and elsewhere ought to promote a form of counter-education that seeks liberation from the oppression imposed by this hegemonic regime (Gur-Ze'ev 1999). Regarding the classical categories of Jewish education, Mikra, Mishnah, Mitzvoth, and Talmud, this approach can lead in two directions. On the one hand, it can lay the foundation for an anti-modern ultra-Orthodoxy, at least in joining the traditional opposition to the very idea of modern Zionism, although as mentioned earlier this tendency often misses the theological character of the ultra-Orthodox critique of Zionism. On the other hand, it can tend toward a highly eclectic cosmopolitan form of Judaism in keeping with Jewish renewal.

## Conclusion

What might it mean, following this analysis, to acquire a Jewish education today? One answer entails engaging learners with some aspect of Jewish life (religious, political, or both) in dialogue with some dimension of modern life (viewed positively, negatively, or with ambivalence) by way of some logic or hermeneutic—exegesis, eisegesis, or a combination of the two—in order to facilitate attachment to one account or another of what it means to be Jewish. In keeping with the model set forth more than two centuries ago by Naftali Hertz Weizel, these elements were found in each of the conceptions considered here.

For some, this attachment is extraordinarily thick, occupying a highly significant portion of how they define themselves; for others, it is exceptionally thin, playing but a minimal role in how they conduct their lives (Walzer 1985). According to several interpretations, this attachment entails adhering to a heteronomous authority from on high; according to others, it involves embracing sources out of which one can define one's personal autonomy. While one approach may conceive the process

of acquiring such an attachment in terms of the transmission of a preexisting tradition across the generations, another may see it as a transformation of that tradition to meet the felt needs of a new generation. Many understand this attachment in mainly religious terms and even more see this affiliation as primarily political, ethnic, or cultural. Some view it as a combination of both.

Yet however these various conceptions may conceive the substance of today's Jewishness, they cannot help but do so in light of the two revolutions of modernity that continue to define the current Jewish condition. This is so even though the very assumptions of Enlightenment and Emancipation are being subjected to hard scrutiny today and even when the Jewish responses to these phenomena are consequently undergoing serious reconceptualization.

I have often called this dialectical educational process pedagogy of difference, which has roots in Jewish as well as other traditions (Alexander 2015: 87–138). It entails initiation into sources of primary identity or attachment alongside juxtaposition to views that may be in tension with those very sources. In the present case this entails engaging the standards of criticism associated with one or another account of historical Judaism, such as rabbinic *interpretatio* and *explicatio*, with products of modern culture, such as the natural and human sciences. Indeed, the several models by means of which Jews and Judaism have engaged modernity outlined here, which constitute the very heart of contemporary Jewish education, offer exemplary cases of how such a pedagogy can function. By viewing a tradition from both the inside and the outside, as it were, this pedagogic process allows for the possibility of criticism in the current context in which no universal agreement exists concerning appropriate standards of critique (Alexander and McLaughlin 2003). It also encourages dialogue among competing viewpoints in diverse societies, out of which it is possible to construct ways of living together across difference in peace (Alexander 2015: 107–124).

Although the term 'pedagogy of difference' is most apt to the extent that the sources of primary attachment in question are open to the possibility of adapting to that which is learned through this process of critical engagement, it can even be witnessed among more closed ultra-Orthodox attitudes, which adjust received tradition often unconsciously in order to resist rather than embrace the pressures of modern life. This diversity of Jewish educational orientations demands not only dialogue between various sources of Jewish and modern life but also among alternative accounts of what it means to be Jewish today. In a world increasingly engulfed by intercultural conflict, it must surely involve dialogue among Jews and non-Jews as well.

# On an Ethical Enunciation of Islamic Philosophy of Education

Nuraan Davids

## Introduction

The question – some might say, the controversy – about what Islamic philosophy actually is, might best be answered by looking at the very text, which Muslims consider as the irrefutable word of God, namely, the Qurān. In this text, one encounters terms like *‘ilm* (knowledge), *hikmah* (wisdom), *‘aql* (intellect), *tafakkur* (contemplation) and *hūda* (guidance) – terms which are generally associated with actions of inquiry and hence attuned to philosophical inquiry. It is therefore important to bear in mind that, although the Islamic faith came into contact with a number of other civilisations – such as Greek, Persian, Syrian, Egyptian and Indian cultures – thanks to the rapid expansion of the Muslim Arab civilisation, following the death of the Prophet Muhammad, these contacts should be not overestimated in relation to their philosophical influence. While the seminal thoughts of Socrates, Aristotle and Plato are widely evident in the works of Islamic philosophers, such as al-Kindi, al-Fārābī, ibn Sīnā (Avicenna), **ibn Rushd** (Averroes), ibn Miskawayh, al-Ghazzālī’ and ibn ‘Arabi, philosophy in Islam is focused expansively on hermeneutical expositions of the Qurān and most commonly related to the notion of *hikmah* (wisdom).

Since it is not possible to discuss an Islamic philosophy of education without taking into account the Qurān as its starting point, the first section looks at the Qurān as the primary source code of Islamic education. This is followed by a discussion of how the Qurān conceives of knowledge and education, and what it hopes to achieve through its insistence on the pursuit of education. Since there can be no Islam without those who believe in its tenets and philosophy, the third section explores the constructions of Muslim in relation to Islamic education. Finally, the

last two sections look at a philosophy of Islamic education and discuss its intimate connection to what it means to be and act as an ethical being. The decision to employ an ethical lens in this chapter is motivated by an understanding that inquiry into what education is, and what it ought to achieve, is consistently connected to notions of justice, human wellbeing, the social good and defensible social relations. Hence, in addition to analysing what an Islamic philosophy of education constitutes, the chapter aims to show that conceptions of education as espoused in the Qurān can neither be divorced from the propagation of good character, nor from the practising of just action and relations.

## The Qurān as the Foundational Text of Islam

There are numerous names associated with the Qurān. These include, says Arkoun (1994: 30), *al-kitāb* (the Book), the writings ‘descended’ from the sky in the course of the ‘Blessed Night’, *al-dhikr* (‘the warning’), *al-furqān* (‘the discrimination’) or the discriminating proof – that is, the revelation. In turn, Lunde (2002, p. 25) describes the Qurān as the foundation stone of Islamic society and its constitution and permeates all aspects of life – encapsulated in the verse: “We have sent down to you the Book explaining all things” (*al-Nahl*, 16: 89). However, as Al-Hasan et al. (2013, p. 11) explain, because the Qurān generally speaks about universal concepts, the specificity of conduct and behaviour expected of Muslims is reflected in the life example of the Prophet Muhammad. Muslims consider the *Sunnah* (lived example of the Prophet Muhammad) as a critical factor in the sustenance of their faith and the preservation of their identity. Abu Zayd (2004, p. 43) explains that, while both the content and expression of the Qurān are divine, the content of the *Sunnah* is therefore also divine, but its form is human. To this end, Abu Zayd (2004) reports, “Muslim jurists maintain that the Qurān is in need of the *Sunnah* more than the *Sunnah* is in need of the Qurān”. Ramadan (2001, p. 78) clarifies that the Qurān, together with the lived example of the Prophet Muhammad, defines the points of reference for all Muslim spheres of life – the individual, the social, the economic and the political. In Islam, differentiation between what is right and what is wrong cannot be left to a particular society, because society, or the individuals who constitute a society, has inherent weaknesses and might be inclined towards behaviour, which might be right or wrong (Al-Hasan et al. 2013; Al-Qaradawi 1985).

In drawing on its literal meaning – *Qurāis*, derived from the Arabic root verb *qar’a*, which means ‘to recite’ – Arkoun (1994, p. 30) explains that the Qurān has the sense of reciting rather than of reading. When the Qurān was first revealed to the Prophet Muhammad, it did not presuppose a written text. Hence, the instruction in the first revelation to: “Recite! (or Read!) in the name of your Lord and Cherisher” (*Iqrā or al-‘Alaq*, 96: 1). Because the principal idea of the Qurān is that of a recitation conforming to a discourse that is heard rather than read, Arkoun (1994, p. 30)

prefers to speak of Qurānic discourse and not of text in the initial phase of enunciation by the Prophet. Although Muslims consider the Qurān as the direct speech of God, rather than simply *from* or *about* Him, it is important to recognise, says Abu Zayd (2010, p. 282), that the Qurān was spoken, proclaimed and written down in a specific historical situation, in the intellectual milieu and the language of the seventh century. To this end, Abu Zayd (2010, p. 286) is emphatic that “one cannot find the meaning of a religion in the text but in the interaction between the text and the historical process, in the interaction between the believer(s)/the communities with their holy texts”.

Although the Qurān was compiled into a single text, says Esposito (1988, p. 21), it was not edited or organised thematically. Consisting of 6000 verses, the Qurān has no palpable chronology; it is a series of revelations and guidelines encompassed in a complex narrative structure. With the destruction of all partial compilations so as to avoid any dissent about the authenticity of the revelations, explains Arkoun (1994, p. 35), the compilation overseen by the Caliph, Uthman, was declared complete and closed – that is, the Closed Official Corpus (see Arkoun 1994). To Asad (2003), the Qurān should not be considered a compilation of individual injunctions and exhortations but one integral whole. This means that it has to be considered an exposition of an ethical doctrine in which every verse or sentence has an intimate bearing on other verses or sentences. As such, continues Asad (2003), the real meaning of the Qurān can only be grasped if one correlates every one of its statements by means of frequent cross-references, always subordinating the particular to the general and the incidental to the intrinsic.

Fakhry (1991: 11) explains that the early commentators of the Qurān, or the Traditionists and jurists

naturally engaged in analysis and interpretation involving a large measure of intellectual activity in the broad sense, but such an activity was closely linked to the original sources of religious Truth, i.e. the Qurān and the Traditions, and lacked for that reason the character of genuine dialectical or rational activity, with its double imperative of coherence and comprehensiveness.

Analysis and interpretation of the Qurān rely largely on Qurānic exegesis (*tafsīr*), jurisprudence (*fiqh*) and scholastic theology (*kalām*), to give impetus to ethical theories, scriptural morality, theological theories, religious theories and philosophical theories (Fakhry 1991, p. 1). Alongside analysis of the Qurān, traditional Islam accepts the possibility of giving new opinions or independent judgement (*ijtihād*) according to traditional legal principles. These are always based on the principles of analogy (*qiyās*), consensus of opinion (*ijmā*) and judicial preference (*istihsān*) (Nasr 2010, p. 18). According to Kamali (1997, p. 215), the essence of consensus of opinion (*ijmā*) lies in the natural growth of ideas:

It begins with the personal *ijtihād* of individual jurists and culminates in universal acceptance of a particular opinion over a period of time. Differences of opinion are tolerated until a consensus emerges and in the process, there is no room for compulsion or imposition of ideas upon the community.

Significantly, both consensus and dissensus emerge as corollaries of individual autonomous action in the form of independent critical judgement (*ijtihad*). That is, a consensus of ideas is a desirable outcome of engagement but not necessarily an enabling condition for engagement.

Following on the above, this chapter departs from the premise as articulated by Sinha (2003, p. 182), that it would be quite presumptuous to expect to find well-formulated or articulated theories of education in either the Qurān or the *Sunnah* – as espoused through the life and example of the Prophet Muhammad. The best one can do, as Sinha (2003, p. 182) observes, is to find general statements about knowledge and then follow Abu Zayd's (2004, p. 11) suggestion to shift away from considering the Qurān as only a text, but to move, instead, towards the Qurān as discourse or discourses. Abu Zayd explains that while it is indisputable that the Qurān is the 'speech of God', the discourse structure of the Qurān reveals a multiplicity of voices (Abu Zayd 2004, p. 19). It also recognises and distinguishes between two types of knowledge, which are hierarchical in nature: the *'ilm al-'aqliyah* (acquired knowledge), which is rational and which is attainable through the use of *'aql* (intellect), and *'ilm al-naqliyah*, which refers to revealed knowledge – as one encounters in the revelations to the monotheistic prophets (Hashim 2004, p. 31). On the one hand, therefore, adherents to Islam are exposed to a pre-determined type of knowledge as made manifest in the Qurān and through the revelations of the numerous Abrahamic prophets. On the other hand, Islam acknowledges that individuals, by virtue of their capacity to think and reason, bring their own type of knowledge to how they enact their lives. In Islam, both types of knowledge – that is, revealed and acquired knowledge – are necessary because the Qurān persistently reminds its readers not only to pursue knowledge but also to think and reflect upon it: "Why do they not reflect on themselves? God did not create the heavens and the earth, and everything between them, except for a specific purpose, and for a specific life span ..." (*al-Rūm*, 30: 8). To this end, the Qurān also differentiates between 'those who know' and 'those who reflect' from those who are 'heedless'.

The Qurān, says Abu Zayd (2004, p. 37), is not in itself a book of law: "[L]egal stipulations are expressed in discourse style, which reveal a context of engagement with human needs in specific time, which, in turn, opens up the appropriation of the 'meaning' intended into every paradigm of meaning". This implies that the Qurān cannot be treated as a monolithic text of laws unrelated to the flexibility of varying contexts. However, the problem with treating the Qurān as a text often has the implication that interpretation is considered as absolute without the consideration of the context in which revelation occurred. Thus, one finds that a textual interpretation of the Qurān only is seemingly oblivious of the contextual relevance that also affects an understanding of the divine revelation. Hence, the discourse approach to understanding and implementing the Qurān seems salient as both the text and context of varying proportions are considered in and through interpretation. In the next section, I pay attention to how the Qurān conceives of knowledge and education and why the pursuit of education is elevated to an obligatory status in Islam.

## Conceptions of Knowledge and Education in the Qurān

Following on the distinction between ‘acquired’ (*‘aqli*) and ‘revealed’ (*‘naqli*) forms of knowledge, Bakar (1992, p. 268), drawing on al-Ghazzālī, posits that the common thread that connects *aqli* and *naqli* sciences, is reason. Yet, others like Qutb al-Din assert, “there are revealed teachings which may be established independently by reason” (Bakar 1992, p. 269). Since human reason interprets these (non-) revealed truths, such truths are not un-situated for the reason that human reason is shaped by social conventions and the historical context within which it operates. Hence, no knowledge is value-free. Similarly, Wan Daud (1989, p. 12) posits that, regarding knowledge, there is no bifurcation between what is called ‘non-revealed’ or ‘acquired’ sciences (*‘aqli*) and revealed sciences (*naqli*). To bifurcate knowledge into *‘aqli* and *naqli* would imply that, through human reasoning, *naqli* must reveal knowledge in a specific way (i.e. by putting aside their prejudices, feelings), and *‘aqli* does not involve divine revelation. By implication, for the reason that no knowledge acquired by human beings is value-free, knowledge cannot be separated into isolated ‘non-revealed’ knowledge, on the one hand, from transmitted knowledge, on the other hand. This non-bifurcation between *‘aqli* and *naqli* is also cogently articulated by Al-Attas (1991, p. 20) who posits

... that from the earliest periods of Islam, Muslim thinkers have repeatedly made attempts to classify the sciences, and their various classifications were successfully increased in scope and content with the increase in knowledge ... At the same time the harmonious unity of the two kinds of knowledge has always been emphasized and maintained. No single branch of knowledge ought to be pursued indefinitely exclusively of others, for that would result in disharmony, which would affect the unity of knowledge, and render its validity questionable.

However, the integrality of revealed sciences and non-revealed sciences does not imply that these sciences are equal or that there is no priority in the categorisation of these sciences. For Muslims, divine revelation brought by the Prophets ranks higher than the ‘non-revealed’ sciences for the reason that revealed knowledge comes from God (*al-‘Alīm* or the Knower of everything), whereas the non-revealed sciences are developed through human reasoning. But even such a view seems ambiguous as even revealed knowledge depends on human interpretation for its enactment. Consequently, one finds that “Muslim scholars (such as Jalal al-Dīn al-Suyūti, Ibn Hazm and al-Ghazzālī) throughout the centuries have produced countless works on the categorization of the sciences where they seek to arrange various disciplines of knowledge according to their scheme of priorities ...” (Wan Daud 1989, p. 68). What is significant to note is that these scholars did not discount the role of reason in the construction and/or categorisation of both revealed and non-revealed sciences, or knowledge. Put differently, considering that all forms of knowledge require the element of human interpretation for its enactment, the distinction between what is revealed and what is not revealed is merely a prioritisation

of knowledge in order to accentuate the importance of God's agency in the transmission of knowledge. What follows from this is that a philosophy of Islamic education does not bifurcate between different kinds of knowledge, as both revealed knowledge and what is considered non-revealed knowledge can be used in the enactment of ethical practices, and the prioritisation of knowledge is merely an affirmation that God's agency cannot be ignored in either forms of knowledge. The latter is affirmed in the following verse: "And whomever God guides, he is rightly guided, and whomever He leads astray You will not find patrons for them, apart from Him" (*al-Isra'*, 17: 97).

Scholars, like Al-Attas (2005, p. 24), describe knowledge as the arrival of meaning in the soul and, concomitantly, the soul's arrival at meaning. To Al-Attas, human beings derive meaning from themselves and the world around them when they recognise their place in relation to God and their place in the order of creation. Thus, Islamic education, according to Al-Attas (1977, p. 11), is the "recognition and acknowledgement, progressively instilled into man, of the proper places of things, in the order of creation, such that it leads to the recognition and acknowledgement of God in the order of being and existence". However, to Al-Attas, the mere acquisition of knowledge does not mean the attainment of education. Education comes about when the knowledge acquired includes moral purpose – that is, when an individual practises *adab* (right action). In Islam, *adab* is manifested through sets of moral behaviour or virtuous action – all geared at extending respect and courtesy towards oneself and the other. In terms of Qurānic exegeses, the concept of *adab* is tied to conceptions and enactments of justice:

O you who believe, you shall be absolutely equitable, and observe God, when you serve as witnesses. Do not be provoked by your conflicts with some people into committing injustice. You shall be absolutely equitable, for it is more righteous. You shall observe God. God is fully cognizant of everything you do. (Chapter 5, verse 8)

In recounting a well-known *hadith* (report describing the words or actions of Prophet Muhammad), Bukhārī relates that the Prophet Muhammad said, "The best of you are those best in character". In this sense, *adab*, therefore, is considered the decorum through which Muslims are expected to live a just life. Inasmuch, then, as the Qurān is interested in three types of knowledge for humankind, namely, knowledge of nature, knowledge of history (and geography) and knowledge of humans themselves (Rahman 2009, p. 23), an educated individual is one who is able to differentiate between right and wrong action. And unless knowledge leads to awareness of oneself as being always in relation to God and His creation (which includes all others), then one cannot lay claim to being educated. In turn, as the twelfth-century philosopher, al-Arabi, points out, one cannot know one's Lord, unless one's Lord is made known to one – that is made visible through the creation of the universe, through the self and through scripture (essentially, the Qurān).

In the next section, I consider whom the Qurān has in mind when it talks about Muslims.

## Muslims and Islam

Etymologically, the word Islam (like Muslim) is derived from the Arabic verb *aslama*, which signifies to submit, accept or surrender. Muslim thus refers to a person who engages in an act of submission, acceptance or surrender. According to Arkoun (1994, p. 15), Islam means “to give something over to someone” or, more specifically, “giving one’s whole self over to God” or “entrusting all of oneself to God”. Following on this – at least, etymologically – a Muslim is considered to be someone who follows Islam and submits or surrenders to the will of God. Yet, if one understands the descriptor, Muslim, to refer to an individual who surrenders to the will of God, then it actually is non-specific in terms of any religious affiliation. Certainly, the Qurān does not offer any explicit definition of the term ‘Muslim’. Instead, it often embarks on the following types of dialogue:

Say: “O people of the Book, let us come to a common understanding between us and between you; that we serve none except God, and that we do not set up anything with Him, and that none of us takes each other as patrons besides God.” If they turn away, then say: “Bear witness that we have submitted”. (Chapter 3, verse 64)

Wadud (1999, p. xviii) shares that she used to think that ‘Islam’ and ‘Muslim’ were one and the same – that is, that all Muslims had the goal to be in a state of engaged surrender to God. Yet, what she found was that situations may arise where one might be forced to choose between the two – either being Muslim or be in a state of engaged surrender. She reflects that, at times, choosing to be Muslim might not always mean to surrender to God. Concomitantly, surrendering to God might mean slipping out of favour with those who claim to be Muslim. Following on this dichotomy, Wadud (1999, p. 1) asserts that no method of Qurānic exegesis is fully objective. Each exegete, she contends, makes some subjective choices in which some details of their interpretations reflect their subjective choices and not necessarily the intent of the text. Yet, as is the case between what might be understood as Islam or Muslim, no distinction is made between text and interpretation. Part of the explanation for the lack of distinction between text and interpretation, say Douglas and Shaikh (2004, p. 5; 8), resides in the poorly nuanced use of the word ‘Islamic’. They contend that because the descriptor ‘Islamic’ is often used interchangeably and inconsistently to describe doctrines of Islam as well as the practices of Muslims, the description often fails to take into account that which pertains directly to Islam, as in its tenets of faith, as opposed to that which its adherents perform in the cultural or social realm, which can more accurately be categorised as ‘Muslim’. Emanating from the arguments of Wadud (1999) and Douglas and Shaikh (2004) is the question, then, of who is a Muslim and why might being a Muslim not speak to what Islam is.

Many would be in agreement that Islam, like other religious traditions, cannot possibly lay claim to a singular or monolithic interpretation or practice. Notions of diversity and pluralism are explicitly advocated in the Qurānic verse:

O humankind, indeed We have created you from male and female and made you peoples and tribes that you may know one another. Indeed the most noble of you in the sight of God is the most righteous of you. Indeed God is Knowing and Acquainted. (Chapter 49, Verse 13)

Following on this verse, the propagation of differences among people would necessarily imply differences in understanding, beliefs and practices – not only across all of humanity but across and within Muslim communities and societies, whether in Muslim-majority or Muslim-minority countries. Consequently, as Moosa (2003, p. 114) points out, the proposition of a multiplicity of ‘Islams’ has suggested that there are many discursive traditions through which Muslims imagine themselves – that is, how they understand themselves and how they enact those understandings. To this end, as is made evident through the actions and practices of individuals and communities, there are multiple representations of being Muslim.

The prevalence of multiple identities and practices means multiple interpretations of the foundational text, the Qurān. In turn, the pluralistic interpretation of the Qurān implies that the signifier of Muslim cannot be tied just instrumentally to the identity of a person who professes his or her allegiance to the Qurān and Sunnah, since such a view of Muslim merely confirms an individual’s confessional stance. Instead, a Muslim is one who reflects upon him- or herself in relation to his or her Creator and in relation to others. A Muslim is not one who merely submits or surrenders to a Higher Being – the Qurān is clear in its evocation that those who read it have to do so with comprehension, understanding and critical engagement. It is equally clear that being a Muslim is inherently connected to a Higher Being – so that the qualities of a Higher Being are made apparent in the actions of what it means to be a Muslim. In this respect, God is described in relation to 99 names, known as the *asma-ul-husna*. These names ascribe a range of virtuous descriptors to God, which include being compassionate, loving, merciful, generous, peaceful and all embracing. A Muslim, as a trustee or vicegerent of God (*khalīfatullāh fī al-ard*), is expected to embody and manifest the 99 names or virtues:

Behold, thy Lord said to the angels: “I will create a vicegerent on earth.” They said: “Wilt Thou place therein one who will make mischief and shed blood? – Whilst we do celebrate Thy praises and glorify Thy holy (name)?” He said: “I know what ye know not”. And He taught Adam the names of all things; then He placed him before the angels, and said: “Tell Me the names of these if ye are right.” They said: “Glory to Thee: of knowledge we have none, save what thou has taught us: in truth is Thou who are perfect in knowledge and wisdom.” He said: “O Adam! Tell them their names”, God said: “Did I not tell you that I know the secrets of heaven and earth, and I know what ye reveal and what ye conceal?” And behold, We said to the angels: “Bow down to Adam”: and they bowed down .... (Chapter 2, Verses 30–34)

However, to fulfil the responsibility of God’s representation on earth requires a particular understanding and knowledge of God – that is, one cannot enact or manifest the trust of another being without having some understanding of and belief in what that trust might entail or desire. This means that conceptions of *khalīfatullāh fī al-ard* are embedded in both knowledge and comprehension of who God is and what it means to believe. In this regard, the Qurān makes particular reference to the notions

of *ra'y* (rational argumentation) and *ijtihad* (autonomous reasoning). As an ethical principle, *ijtihad* (autonomous reasoning) speaks to the individual's inherent ability and right to think and decide for him- or herself – without the interference of others. In terms of Qurānic exegeses, the principle of autonomous reasoning is addressed within many facets. It is especially made explicit in the verse: “Let there be no compulsion in religion: Truth stands out clear from error ...” (Chapter 2, Verse 256), which exemplifies the paradigmatic foundational ethic in Islam, that the decision to be Muslim and to accept the trust of the covenant is entirely an individual's decision. The provision of *ijtihad* (autonomous reasoning) in Islam is not only in relation to the individual's right to make his or her own choices, and to use the knowledge of the names of all things, but also to contemplate about Islam and about his or her relationship with God. Equally important is that *ijtihad* sets the context for measures of engagement and deliberation when the Qurān and the *Sunnah* are not as explicit in relation to particular contemporary challenges.

## Islam, Philosophy and Education

Halstead (2004, p. 518) explains that the rapid expansion of Muslim Arab civilisation in the 100 years after the death of the Prophet Muhammad brought the faith into contact with Greek, Persian, Egyptian, Syrian and Indian cultures, which led to the incorporation of those cultures into Islam. One of these incorporations or importations into the Arabic language was the term *falsafa* or philosophy. As a result, there have been a number of intellectual developments in the Islamic world, such as the rational theology of the *Mu'tazilites* (school of speculative theology) and the more systematic philosophy of *al-Kindi* (known as the father of Islamic or Arabic philosophy), who asserted the supremacy of reason over revelation in matters of morality, and al-Farābi (Muslim philosopher), who asserted the insufficiency of revelation and the priority of philosophy over religion in many areas of knowledge (Halstead 2004, pp. 518–519). However, the general perception of philosophy is that it is a foreign importation. That being said, asserts Nasr (2010, p. 166), Islam has established an influential philosophy within the scholarly domain of Abrahamic monotheism and the Qurānic revelation while integrating into its intellectual tradition those aspects of Greek philosophy that adhered to a Muslim Unitarian worldview. Consequently, Nasr (2010) elaborates, for the majority of traditional Muslims, the term ‘philosophy’ still implies *al-hikmah* (wisdom), which they associate with the prophets as well as the Muslim saints and sages.

Accepted Muslim opinion, continues Halstead (2004, p. 519), has leaned towards the understanding that anything outside the divine truth of the Qurān is unessential. According to Fakhry (1997, p. 3), the philosophers and theologians soon found themselves in disagreement despite their community of purpose in their quest for religious truth. The Aristotelian worldview, explains Fakhry (1997, p. 3), with its twin tenets of causality and the uniformity of nature which, in the words of Aristotle, ‘does nothing in vain’, was perceived by the theologians to be contrary to the

Qurānic worldview. The Qurānic worldview referred to holds that not only is God unaccountable for any of His actions, but He can effect His designs in the world without any limitations. Halstead (2004, p. 518) contends that until the time of al-Ghazzālī (1058–1111), the debate was fairly evenly balanced between the philosophers and rationalists. On the one hand, the philosophers and rationalists asserted that rationality was separate from religion and could in fact provide objective support for religion. On the other hand, the theologians, commonly known as the al-Ashʿariyya, maintained that rationality was valid only within the boundaries defined by religion. This balance between the philosophical and rationalistic schools of thought, however, was disturbed with the immense influence of al-Ghazzālī, who reasserted the dominance of religion over reason and gave superior status to revelation as a source of knowledge (Halstead 2004, p. 518). During later centuries, in most of the Arab world, philosophy as a distinct discipline became assimilated into either Sufism in its intellectual aspect or philosophical theology (*kalām*) (Nasr 2010, pp. 141–142).

Considered as the first philosopher of Islam, as well as the first writer on philosophical ethics, al-Kindī's starting point was not the Qurān and the Traditions (*hadith*) of Muhammad, but Greek philosophy. Al-Kindī is reported by the classical bibliographers, says Fakhry (1997), to have written a number of ethical treatises reflecting a profound interest in Socratic thought. In addition to a treatise on *Ethics*, he is credited with a work on *Paving the way to virtue*, as well as an extant tract, *Fī al-hilāl lī-dafʿ al-ahzān* (On the art of dispelling sorrows). Of his Socratic writings, a tract on the *Excellence of Socrates: A dialogue between Socrates and Aschines* and a short collection, *Alfāz Sughrāt* (*Socratic utterances*), which have survived, are mentioned in the classical sources. The first systematic writer on philosophical questions in Islam, continues Fakhry (1998), was al-Farābī, who had also contributed to ethical discussions. He appears to have followed Aristotle's lead in dividing the virtues into moral (practical) – which includes temperance, courage, liberality and justice – and intellectual, which includes practical reasoning, good judgement, sagacity and sound understanding. Echoing the Aristotelean argument, al-Farābī also argues that justice consists of the equitable distribution of 'common goods' in the city or the state.

In understanding what an Islamic philosophy of education is, one has to consider what Shahed Ali describes as "the source of any system of education ... [and which can] be traced to its philosophy of life and ... [which] is organically connected with the ethical and moral values that spring from that philosophy" (cited in Cook 2010, p. xxviii). In the case of Islam, the source of its education is the Qurān and the *Sunnah*. Waghid (2011a, p. 27) posits that an Islamic philosophy of education "does not only contain a body of knowledge which embeds the ontological, epistemological and ethical premises of Islam, because philosophy can also be considered as an activity which addresses major problems which can then explore for their implications for pedagogy". Moreover, he contends, if an Islamic philosophy of education were to exist, "it would have to comprise multiple derivatives, as there is not one universal, absolute understanding of Islamic theory and practice ..." (Waghid 2011a, p. 27). Following on Waghid (2011a), one would therefore have to refer to

Islamic *philosophies* of education, as opposed to an Islamic philosophy of education. These philosophies are evident in what Noaparest (2014, p. 2) describes as the three main strands in Islamic philosophy. The first one, he continues, is developed by relying on Aristotle's legacy. Scholars who belong to this strand are called peripatetic philosophers, such as al-Kindi, Averroes and Avicenna, further developed by al-Farābi, pursued by al-Amirī and Abu Ya'qub al-Sijistānī and culminated with ibn Sīnā, who became the prototype of the philosopher-scientist for all later Islamic history. The second strand of philosophers, according to Noaparest (2014, p. 2), is primarily based on the Platonic tradition, which is called the 'philosophy of illumination' led by Shahab al-Din Suhrawardi. The third strand commences with the works of Mohammad Shirazi, also known as Mulla Sadra, and Sadr al-Muta'lehin. To this end, philosophy, states Zaman (2016, p.8), serves "as a lens within which we may speculate on questions dealing with the purpose of education, how it conceives relations between God and man, what is known, and whether there are limits to formal reasoning". To Zaman (2016), such questions make a distinction between 'philosophy of Islamic education', which infers the interests of the larger subfield of philosophy of education, and 'Islamic educational philosophy', which denotes a narrower focus limited to questions of pedagogy and practice.

Following on the above, Waghid (2011a, p. 27) offers the following explanation:

My understanding of a philosophy of education as an activity is situated in the view that Muslim thinkers throughout Islam's intellectual epochs used particular modes of inquiry to pursue exegeses, whether through *tafsīr* (exegetical analysis), *ta'wīl* (deep exploration) and/or *ijtihād* (rigorous mindful action). In a way, the latter practices can be considered as constitutive of a philosophy of education because through these actions major problems or issues are examined and then their pedagogical implications can be determined.

What one encounters in Waghid's (2011a) argument for multiple philosophies of Islamic education or modes of inquiry resonates with other similarly held views, such as those by Biesta (2001, p. 125), who asserts that philosophy of education "is not there to provide ultimate answers". Instead, "[i]t exists to raise and introduce doubt'. Such a view of an Islamic philosophy of education would, in turn, find credence in the Qurānic injunctions 'to know', 'to question' and 'to reflect'. A view of multiple philosophies would simultaneously make explicit the multiplicity of human experiences, thinking and practices, as encountered within all religious traditions. In this regard, one is reminded of Dewey's (2004) elucidation of philosophy as being responsive, as being an idea of what is possible, rather than an account of an accomplished fact.

### ***Islamic Philosophy of Education***

Apparent from the preceding discussion is that conceptions of Islamic philosophy of education immediately place the individual in relation to others (creation) and God. For the purposes of this chapter, I am particularly interested in Islamic philosophy of education as it pertains to educational and, hence, human practices. In

this regard, one finds that Islamic education is connected to at least three discernible yet interrelated epistemological and ethical practices: *tarbiyyah* (socialisation), *ta'lim* (critical engagement) and *ta'dib* (social activism) (Waghid 2011b). These three practices do not only provide Muslims with the foundational understandings of their faith but underscore that understandings of faith are inherently couched in the social expression thereof. In this sense, conceptions of *tarbiyyah* (socialisation), *ta'lim* (critical engagement) and *ta'dib* (social activism) – as constitutive of Islamic philosophy of education – are made visible through the practices and lived experiences of Muslims.

Firstly, therefore, Muslims are expected to socialise themselves into an inherited body of knowledge as enunciated in the foundational source of the Qurān, as well as the *Sunnah* (life experiences and examples of the Prophet Muhammad). The Qurān and the *Sunnah* have been subjected to (re)interpretations that culminated in several juristic, theological and ethical texts, such as Imam al-Shafi'i, Abu Hanifah, Ahmad ibn Hanbal and Imam Malik together with the theological works of Jalal al-Din al-Suyuti and ethical texts of al-Ghazzālī that have gained prominence in the Arab and Muslim world since the demise of the Prophet Muhammad. Often, the socialisation of Muslims into the aforementioned sources of knowledge has taken the path of memorisation of especially the Qurān and several Hadith texts. In this respect, Muslims, through education, might be immersed into existing traditions and ways of acting, without necessarily being conscious of the socialisation. Children who attend madrassah (Muslim school), for instance, might not be aware that by doing so, they are becoming part of a historically embedded tradition that originates from the very inception of Islam. Similarly, teachings (whether at madrassah or in the home) in terms of how to greet, how to eat, how to perform ablution or how to perform prayer are all constitutive of the socialisation practices of Islamic philosophy of education. However, through practices of socialisation, children and students are, as per Qurānic injunctions, to think and reflect upon what they are learning. As such, *tarbiyyah* (socialisation) has in mind producing people who can think and act in accordance with knowledge as it is both transmitted and constructed vis-à-vis legitimate sources of knowledge. *Tarbiyyah*, therefore, does not have in mind an uncritical acceptance of particular ways of acting and being. The socialisation into sources of knowledge, therefore, necessitates a concurrent internalisation of what is being memorised and learnt, so that these might be reflected in the individual's conduct and his or her relationships with others. Hence, *tarbiyyah* (socialisation) aims to engender a particular type of person – that is, one who adheres to a particular code of conduct and set of virtues, as encapsulated in the Qurān and the *Sunnah*.

Secondly, knowledge, explains Al-Attas (2005, p. 23), only becomes education when it is accompanied by moral purpose. In turn, moral action can only be derived from and informed by *ta'lim* (critical engagement) and *ta'dib* (social activism). In this sense, *ta'lim* (critical engagement) is based on an understanding that Muslims who have been socialised into knowledge of the primary sources of Islamic education are encouraged to ask questions and reflect about their learning. As the Qurān (*al-Nahl*, 16:44) aptly states, “And we have revealed to you the message so that you

make it clear to people and that they may give thought". This is a clear vindication that uncritical acceptance of things is discouraged and that Islamic education obliges Muslims to reflect, contemplate and question understandings. In other words, Muslims are encouraged to challenge and think about what they encounter without uncritically accepting 'truths' at face value. Put differently, Muslims' learning depends on how they engage critically with texts and how they contemplate new understandings of their education. By implication, the assumption that a philosophy of Islamic education merely fosters doctrinaire thinking whereby knowledge should be internalised unquestioningly is indefensible. Interpretations of the Qurān and the *Sunnah* are varied, which confirms the plurality of understanding that has characterised Islamic education – as embodied in the four mainstream Sunni schools of thought or *madhāhib*, namely, the *Hanafīyya*, the *Malikiyya*, the *Shafiyya* and the *Hanbaliyya*. These four *madhāhib* (schools of thought) are in agreement with regard to the basic fundamental principles of Islam, but differ with regard to the domains of worship and social affairs. The practice of *ta'lim* (critical engagement) is based on the view that human experience, and by implication understanding, is flexible and cannot be assumed to be absolute and unchallengeable. Rather, interpretations are varied, and *ta'lim* (critical engagement) affords Muslims to look at their understandings with openness and the possibility that things could be otherwise. In this sense, *ta'lim* (critical engagement) is associated with doing things in community, that is, engaging with others and being attentive to the views of others.

Thirdly, *ta'dib* (social activism) is linked to an Islamic philosophy of education on the grounds that memorisation, reflection and openness to the unexpected cannot solely be associated with such a practice. Put differently, knowledge of Islamic content and ways of how such knowledge should be enacted cannot remain confined to the level of cognition. In this regard, Muslims are encouraged to engage in practices of contemplation, criticism and reflection: "Why do they not reflect on themselves? God did not create the heavens and the earth, and everything between them, except for a specific purpose, and for a specific life span" (*al-Rūm*, 30: 8) or "Will they not then ponder on the Qurān? If it had been from other than God they would have found therein much incongruity" (*an-Nisā*, 4:82). To Al-Attas (1991), *ta'dib* (social activism or just action) is the most appropriate term to denote Islamic education because it involves the quest to cultivate truthful and just human action in relation to knowledge. More specifically, Al-Attas (1991, p. 34) contends that knowledge of Islam should be accompanied by 'right and proper action' (just action) in a Muslim community so that one's 'proper' understanding of knowledge directs one to act with truth and justice in a community. In other words, Islamic education has a socially just orientation whereby Muslims are urged to act ethically in all their daily encounters, so that their actions should be endeared towards the cultivation of a virtuous society, that is, one that recognises the plurality of views of others albeit against their own, as well as connecting hospitably towards those whom they might not always consider as favourable in order to build a just and peaceful society.

Thus far, the focus has been on conceptualising an Islamic philosophy of education by drawing on the foundational source of the Qurān. In this regard, I have explored a philosophy of Islamic education as connected to at least three

interrelated practices, namely, *tarbiyyah* (socialisation), *ta'lim* (critical engagement) and *ta'dib* (social activism). Furthermore, I have explained that while Muslims are socialised into particular practices and ways of being and acting, they are also reminded to exercise their reason and to focus on their individual relationships with God and with others. In the next section, I will turn the attention to looking at an Islamic philosophy of education as ethical enunciation of what it means to be Muslim.

## Islamic Philosophy of Education as an Ethical Enunciation

The Qurān's emphasis on the pursuit and acquisition of knowledge, and hence education, is intimately connected to the pursuit of being a 'good' Muslim, which is essentially understood as an ethical being. The notion of an ethical being is that of an individual being attentive to him- or herself and to others, so that the individual recognises his or her place in existence. In this regard, the Qurān states: "Ye are the best of peoples, evolved for humankind, enjoining what is right, forbidding what is wrong ..." (*al-Imrān*, 3: 110) According to Qurānic exegeses, the striving towards a 'best of peoples' is encapsulated in practices of justice, equity and compassion. Stated differently, the socialisation into the inherited sources of Islam (i.e. the Qurān and the Sunnah) has to be made visible in the social activism of what it means to be an ethical being. To this end, the Qurān states: "Be just; that is nearer to righteousness" (*al-Mā'idah*, 5: 8) and is emphatic on just human relations, "O you who have believed, be persistently standing firm in justice, witnesses for God, even if it be against yourselves or parents and relatives" (*an-Nisā*, 4: 135). To al-Qaradawi (1991), the first principle of moderate and justly balanced thought is a comprehensive philosophy of Islam, which is characterised as being a creed and a way, knowledge and action, worship and interaction, culture and character, truth and strength, as well as an invitation and political engagement. Islamic doctrine, states Al-Qaradawi (1991, p. 9), appeals upon Muslims to exercise moderation and to reject and oppose all kinds of extremism, which includes excessiveness, religiosity and austerity.

At this stage, it might be apposite to look more closely at the way in which justice ought to manifest in ethical relations. Firstly, just human relations are attained when humans express a willingness to engage with one another. It does not make sense to claim that justice ought to guide human relations if humans, in the first instance, do not show the willingness to engage the other. One way of making oneself known to the other is to demonstrate a willingness to be known by others, that is, to subject oneself to scrutiny. Injustice happens when the self remains obscured to the other, because obscurity has the effect whereby the one or the other would remain inconspicuous, incomprehensible and unintelligible and, hence, unknown. To be willing to engage with others is a recognition that one's relationships with others are of mutual consent in the sense that one and the other agree to be known to the other. It is for this reason that ethical human relations geared towards the

attainment of justice (*'adl*) cannot unfold without inclusion of the other. This implies that just human relations can happen only on account of showing a willingness to want to engage the other even if it means that the other – with whom one might engage – be considered most abominable. Willingness to engage humans implies that one considers it important for humanity to engage those whom one might find most repulsive, such as perpetrators of atrocious crimes against humanity. How else will human beings address even the most detestable situations confronted by humanity if a decision has been taken in advance not to engage the other? Besides, what is the possibility that justice will ensue if recourse to exclusion and alienation is deemed the most appropriate form of action? In this regard, condemnation and exclusion of the other is neither desirable nor conducive to ethical human relationships. In fact, willingness to engage is a precondition for human engagement with the possibility that justice can ensue.

If *shūrā* (mutual, deliberative engagement) is considered as a Qurānic injunction in terms of which humans ought to resolve their affairs, then simply excluding them on the grounds that one considers them undesirable to engage with is to be remiss of the argument that mutual engagement only implies engaging with those with whom we share similar ways of being and doing. Sameness and agreement cannot be preconditions for human engagement as such engagement is conditional upon willingness to engage even if those with whom one engages are considered to be most repugnant. In any case, limiting one's engagement to interacting and participating only with those with whom one shares similar values and beliefs means that one might never know or encounter other than what one already knows. Consequently, the willingness to engage with all others is in fact a condition for just human action. In addition, willingness does not merely imply all people should engage in *shūrā* (mutual, deliberative engagement) with the understanding that disagreement and criticism should not be part of the engagement. Of course, willingness to engage, like engagement itself, would benefit from disagreement and criticism, as these are human qualities that enhance a willingness to engage and deliberative engagement. It is in this regard that al-Fanjārī (in Alibāsīc 1999, p. 243) avers that critical opposition is compulsory for meaningful and just *shūrā* (mutual, deliberative engagement) to take place.

Secondly, just human action implies that non-coercion – “[l]et there be no compulsion in religion” (*al-Baqarah*, 2: 256) – is a condition of such relations. Coercion undermines human freedom and advocacy and cannot be associated with just action. Condemning and restricting people on account of one's disagreement with them, or that others should be coerced to think and do like one, are actions that work against just action. Therefore, non-coercion as just human action implies that one should engage with criticisms of Islam with argumentation and the provision of counter-evidence – *qul hātū burhānakum* (“say, produce your proof if you are truthful”) (*al-Baqarah*, 2: 111).

Thirdly, along with non-coercion in human relations of an ethical kind, one should also consider the notion of *ikhtilāf* (diversity, pluralism, disagreement). In the first place, a philosophy of Islamic education, according to the Qurān, should encourage differences as these are “God-intended and they cannot be eliminated”

(Alibāsīc 1999, p. 258). This makes sense because reconciling with others in the enactment of human relations is a condition of justice that would prevent humans from denying one another's right to be different. And, reconciliation also implies that human beings are still willing to engage despite their differences and points of departure. A denial of *ikhtilāf* (disagreement) is a form of injustice as people are sanctioned into some form of absolutism that does not allow space for any form of dissent. In this regard, we concur with al-Awwā (in Alibāsīc 1999, p. 292) that Qurānic verses that refer to *ummah* (*community*) refer to such a united community in creed (*'aqīdah*) and not political, social, economic, literary or medical community (*ummah*).

In sum, ethically just human relations would most appropriately be enacted if individuals connect their reasons for engagement to notions of willingness, non-coercion and disagreement. And, when Muslims do the aforementioned, they enact their roles as humans in society in acknowledgement of their commitment to God and His Creation. In turn, an educated individual, therefore, if he or she is to act ethically and justly, is one who is able to exercise *ijtihād* (independent critical judgement). In other words, such a person is able to formulate and articulate particular responses to contemporary social issues so that the response is always geared towards just and fair action as well as inclusion. The Qurānic provision of *ijtihād* (independent critical judgement) is not only in relation to the individual's right to act autonomously – connecting to the pronouncement: “[l]et there be no compulsion in religion” (*al-Baqarah*, 2: 256) – it also sets the context for measures of engagement and deliberation when the Qurān and the Sunnah are not explicit regarding particular contemporary challenges. On the one hand, therefore, there are particular dogmas or undisputed truths within Islam – as there are within all other religions – that elude critical questioning. The six articles of faith, namely, belief in the oneness (*tawhīd*) of God, belief in the angels, belief in the divine books, belief in the prophets, belief in the day of Judgement and belief in God's predestination, might not be interrogated, since these are explicitly expressed in the Qurān. The six articles of faith, as Arkoun (1994, p. 64) explains, define what it means to be Muslim.

To accept the six articles of faith, therefore, implies compliance with the fundamental virtues associated with God and His message, as articulated through the Qurān and the Sunnah. As such, to live as an educated and ethical Muslim means to live by the virtues and practices of justice (*'adl*), righteousness (*birr*), mutual consultation (*shūrā*), compassion (*rahmah*), patience (*sabr*) and forgiveness (*maghfirah*). These virtues or practices are all incommensurable with actions, which speak to any form of exclusion or discrimination. This is confirmed in the verse:

O humankind, indeed We have created you from male and female and made you peoples and tribes that you may know one another. Indeed the most noble of you in the sight of God is the most righteous of you. (*al-Hujurat*, 49:13)

This verse explicates, firstly, gender equality (humanity having evolved from male and female); secondly, it intimates that human equality and coexistence depend on how humans engage with one another; and, thirdly, the verse advises humanity to discern people by piety rather than by any other criterion such as status, wealth or

lineage. As an ethical text, this verse lucidly accentuates the Qurān's preference for an ethical code that is commensurate with equality and diversity, pluralism and dialogical engagement and moral virtue – all aspects of religious ethics that invoke the virtues of recognising otherness, tolerance, peace and dialogue.

In conclusion, the propagation of differences among people would necessarily imply differences in understanding, beliefs and practices – not only across all of humanity but across and within Muslim communities and societies, whether in Muslim-majority or Muslim-minority countries. To this end, the advancement of peaceful human coexistence is only realisable in an Islamic philosophy of education that is non-intrusive and recognises all people irrespective of their religious, cultural, ethnic and ideological differences.

# Postmodernism and Poststructuralism

Claudia W. Ruitenberg

## Introduction

When students ask me to explain ‘postmodernism’ and ‘poststructuralism’, I am often inclined to give the answer Jacques Derrida gave when François Ewald invited him to comment on the term ‘deconstruction’: “It is never indispensable, and I would rather not” (Derrida and Ewald 1991/2001, p. 67). The terms ‘postmodernism’ and ‘poststructuralism’, it seems to me, are used too often and with too little nuance, both by those who claim to be proponents and by those who claim to be opponents. Consider, for example, Francis Fukuyama’s (1995) claim that “many postmodernists seem to think that their critique of traditional philosophy leads to a kind of de-politicized, de-ideologized *faut de mieux* [sic] liberalism” (p. 36) or Kristján Kristjánsson’s (2000) claim that “after the person’s self and its emotions have been disposed of, the only irreducible in the postmodernist scheme of things becomes the body: as the ‘site’ at which all the diverse forms of power and oppression are ultimately registered” (p. 69). Neither of these claims is supported by evidence based in the analysis of particular texts by particular thinkers; the objects of critique are unspecified ‘postmodernists’ and ‘the postmodernist scheme of things’. Indeed, it is ‘never indispensable’ to use these broad –isms, as it is generally more helpful to discuss particular ideas by particular thinkers, regardless of the school of thought or collective tendencies with which they have associated themselves or, more often, with which others have associated them. So, with these caveats in mind, this chapter discusses how postmodernist and poststructuralist work, or work that has been classified as postmodernist or poststructuralist, has influenced educational theory and practice.

## Postmodernism

One of the difficulties with the term ‘postmodernism’ is that it is used to refer to an artistic development as well as to a historical period or social condition and a philosophical approach or framework. A book that is often mentioned as one of the first in which the term ‘postmodern’ was used and had a clear meaning was Charles Jencks’ *The Language of Post-modern Architecture* (1977). Jencks discussed architecture that resisted and protested the dominant modernist approach to architecture, with its emphasis on functionalism, simplicity, and geometric purity. This resistance to modernism became a new movement that spread rapidly in the arts at large (literature, visual, performing, cinema, etc.). Jean-François Lyotard (1982/1984) picks up on this sense of the postmodern when he explains:

A postmodern artist or writer is in the position of a philosopher: the text he writes, the work he produces are not in principle governed by preestablished rules, and they cannot be judged according to a determining judgment, by applying familiar categories to the text or to the work. Those rules and categories are what the [postmodern] work of art itself is looking for. The [postmodern] artist and the [postmodern] writer, then, are working without rules in order to formulate the rules of what *will have been done*. (p. 81)

This questioning of preestablished rules and methods resulted in work that was more whimsical and playful than the sober functionalism that was so characteristic of modernist art and architecture; texts were less linear and did not follow established structures of narrative plot but rather experimented with them, trying to reformulate the boundaries of what constituted narrative or the novel. The terms ‘postmodern’ and ‘postmodernism’ in reference to artistic and literary developments are not uncontested, and they have affected the teaching of art, literature, and literary theory, but they are not my primary concern in this chapter. The term ‘postmodern’ in philosophy is an indication of certain philosophical tendencies, not of the time or social condition within which authors who displayed these tendencies lived and worked. This explains why Nietzsche is sometimes referred to as a postmodern philosopher, although he lived in the condition of modernity rather than postmodernity (Koelb 1990). Lyotard also cautions against the assumption that postmodern thought takes place within a postmodern era: “‘Postmodern’ is probably a very bad term, because it conveys the idea of historical ‘periodization.’ ‘Periodizing,’ however, is still a ‘classic’ or ‘modern’ ideal. ‘Postmodern’ simply indicates a mood, or better, a state of mind” (Lyotard 1983/1986, p. 209). Let me move on, then, to the sense of ‘postmodernism’ that is more germane to education: the shift from modern optimism to postmodern doubt.

## Postmodern Doubt

Within philosophy, the most distinctive sense of the ‘postmodern’ is probably Lyotard’s (1979/1984) definition: “Simplifying to the extreme, I define *postmodern* as incredulity toward metanarratives” (p. xxiv).<sup>1</sup> Examples of such ‘metanarratives’ are “the dialectics of Spirit, the hermeneutics of meaning, the emancipation of the rational or working subject, or the creation of wealth” (p. xxiii). All of these are examples of overarching teleological narratives of progress; whether the *telos* is greater justice, greater liberty, greater wealth, or greater knowledge, organizing society according to one of these narratives means we are improving in some way. The difficulty is that the ‘we’ benefiting from progress often turned out to come at the expense of a ‘they’ who were left behind, actively harmed, or simply forgotten in the story of progress. Disappointment in the broken promises of metanarratives thus led to a loss of faith. Elsewhere Lyotard (1988/1993) explains the deception and doubt that motivate the postmodern attitude as follows:

We can observe and establish a kind of decline in the confidence that, for two centuries, the West invested in the principle of a general progress in humanity. This idea of a possible, probable, or necessary progress is rooted in the belief that developments made in the arts, technology, knowledge, and freedoms would benefit humanity as a whole. ... After two centuries we have become more alert to signs that would indicate an opposing movement. Neither liberalism (economic and political) nor the various Marxisms have emerged from these bloodstained centuries without attracting accusations of having perpetrated crimes against humanity. (pp. 77–78)

In the western world, the main examples of these crimes perpetrated by proponents of what were supposed to be narratives of progress are the totalitarian Nazi and Stalinist regimes. The Nazi regime showed that technical rationality, which was supposed to have set human beings free from religious dogma, could be used to advance a murderous ideology. Stalin’s regime, also responsible for the deaths of millions, was supposedly guided by a Marxist metanarrative aimed at greater social justice.

The deception in the failures and harms of regimes supposedly guided by metanarratives of progress had a profound effect on educational thinkers. David Orr (1994) observes: “The designers and perpetrators of Auschwitz, Dachau, and Buchenwald ... were the heirs of Kant and Goethe, widely thought to be the best educated people on earth. But their education did not serve as an adequate barrier to barbarity” (p. 7). Nel Noddings (1992) concurs: “Intellectual development could not ensure against moral perversity” (p. 11).

Gert Biesta (2012) writes that postmodernism’s intervention in modernism was about recentring ethics and politics, after technical rationality and other metanarratives of progress had shown the destructive potential of a focus on knowledge unguided by ethics and politics. Postmodernism, he writes, can be seen

---

<sup>1</sup> “En simplifiant à l’extrême, on tient pour « postmoderne » l’incrédulité à l’égard des métarécits” (Lyotard 1979, p. 7).

as a critique of the epistemological worldview, that is, a critique of the idea that our most basic, fundamental and original relationship with the world is a knowledge relationship and that everything else—including ethics and politics—is derived from and based upon it. (p. 582)

In direct response to those who confuse postmodernism with moral relativism, then, Biesta writes that “postmodernism comes with an explicit ethico-political imperative which could be summarised as ‘Thou shalt not totalise’. This imperative is neither about relativism, nor does it express an absolute or a truth. It rather summarises a lesson learned” (p. 582).

The incredulity of metanarratives (*grands récits*), according to Lyotard, heightened awareness of ‘small stories’ (*petits récits*) that showed the singularity of individual voices and lives that had previously been excluded—or worse. In education, postmodern incredulity took aim at, for example, the metanarratives of psychology. John Morss (1996) discusses how the work of, especially, John Shotter and Kenneth Gergen exemplified postmodern doubt:

For Shotter, psychology of orthodox varieties has been modernist. It has sought for universal, abstract theories of human activity—the kinds of theory that allow for detached contemplation of the experience of others. In contrast to this, a postmodern attitude would for Shotter involve practical, socially involved and responsible consideration of human lives. ... For Gergen, a valid psychology would accept a plurality of stories, whereas modernist psychology has been dominated by the ‘grand narrative’ of scientific progress. (pp. 43–44)

With the focus on multiple stories characterized by their differences rather than their consistency with a larger narrative thread, critiques emerged of psychological grand theories. Carol Gilligan’s (1982) famous critique of Lawrence Kohlberg’s theory of supposedly universal stages of moral development is an example of a feminist disruption of a psychological metanarrative.

Another educational example of postmodern incredulity is Elizabeth Ellsworth’s (1989) essay ‘Why Doesn’t This Feel Empowering? Working Through the Repressive Myths of Critical Pedagogy’. Ellsworth recounts her experience of teaching a Media and Anti-Racist Pedagogies course at the University of Wisconsin-Madison in 1988. This experience led her to conclude that central assumptions and practices of critical pedagogy—which she had hitherto supported—actually served to “perpetuate relations of domination” (p. 298). Ellsworth recounts:

As an Anglo, middle-class professor in [this course], I could not unproblematically ‘help’ a student of color to find her/his authentic voice as a student of color. I could not unproblematically ‘affiliate’ with the social groups my students represent and interpret their experience to them. In fact, I brought to the classroom privileges and interests that were put at risk in fundamental ways by the demands and defiances of student voices.

The way in which Ellsworth’s ‘small narrative’ interrupts the neo-Marxist emancipatory metanarrative of critical pedagogy is an enactment of the postmodern incredulity Lyotard describes.

Sociologist Frank Furedi (2006) believes that this emphasis on the critical intervention of the ‘small story’ in the larger narratives of progress is evidence not of the value of the voices of the many but, instead, of a lack of faith in the public’s educability:

One of the distinctive features of the contemporary so-called postmodern era is the loss of conviction in the idea that the public is capable of being enlightened. ... We live in an era where clear statements about people's ability are obfuscated by a vocabulary that relies on terms like 'special needs students', 'differently abled people', 'non-traditional students' and 'the intellectually challenged'. This confusing language coexists with the rhetoric of flattery that declares that everyone is special and creative. But at a time when normal university students are routinely described as vulnerable, it is evident that the mental capacity of the public is not held in high esteem. (p. 151)

Furedi's suggestion that postmodern doubt extends to doubt about whether "the public is capable of being enlightened" is worth unpacking, as it speaks directly to different conceptions of education. Furedi is right that the postmodern attitude is a loss of conviction; however, it is a loss of conviction not in people's ability to be 'enlightened' but rather in the desirability and appropriateness of 'enlightenment' as the mode, objective, and indeed metanarrative of education. Postmodern thinkers call into question the metanarrative of 'enlightenment' as progress from darkness to light—i.e., from obscured thinking to clear thinking—based on an awareness of the necessary context specificity of conceptions of who is considered an 'educated person', what should be considered 'core knowledge', and what texts should be part of the curricular canon (see, for instance, the debate between E. D. Hirsch's (1988) *Cultural Literacy: What Every American Needs to Know* and critical responses such as Eugene Provenzo's (2005) *Critical Literacy: What Every American Ought to Know* and Herbert Kohl's (1992) 'Uncommon Differences: On Political Correctness, Core Curriculum, and Democracy in Education').

The passage also illustrates well how significant language use is for postmodern thinkers; Lyotard (1979/1984), for instance, analyzes 'language games' as "the minimum relation required for society to exist" (p. 15). This perspective stands in sharp contrast to the disdain that authors such as Furedi have for what they perceive to be a vacuous political correctness. Furedi assumes that language is merely 'vocabulary', a representational layer separate from the linguistically independent world outside of it. This is a view challenged especially by poststructuralist scholars, as I will discuss in the next section.

## Poststructuralism

In philosophical conversations, including those in philosophy of education, the term 'poststructuralism' is often seen as more precise than the term 'postmodernism', both because it avoids the confusion with postmodern artistic developments outlined above and because it positions the work as critical in relation to *structuralist* modernist perspectives rather than in relation to all modernism. As Standish (2004) summarizes: "Poststructuralism comes about in part as a complication or

unravelling of the structuralism of Saussure and Lévi-Strauss, but in so doing it draws extensively on the influence of Nietzsche” (p. 488). ‘Saussure’ is a reference to Ferdinand de Saussure (1857–1913), the Swiss founder of structural linguistics. In structural linguistics, language is viewed as composed of signs, and each sign consists of both a signifier—the carrier of meaning such as the sound (phonic signifier) or the black marks on a page (graphic signifier)—and a signified, the corresponding meaning. There is no necessary connection between the signifier and the signified; this connection is based on human convention. As Blake et al. (1998) put it, there may be a historical explanation but “there is no philosophical reason why the English word for river must be *river*” (p. 16). According to de Saussure, meaning is differential. “To understand, say, the meaning of the signifier green ... is to know how to draw practical distinctions between green and not-green. ... Meaning is relational and the primary relation for analysis is the relation of difference” (Blake et al., p. 17). De Saussure claimed that these differential relations are not disordered, but form certain structures, such as binary pairs. In addition to de Saussure, Standish also mentions Claude Lévi-Strauss, the French anthropologist who, as Michael Peters and Nicholas Burbules (2004) put it, argued that cultures and societies, like languages, are “organized by structures that the participants may not be aware of, but which nevertheless give their social practices and institutions coherence and meaning” (p. 15). Poststructuralism is best understood as a critical response to structuralism or, more precisely,

as a specifically philosophical response to the alleged scientific status of structuralism—to its status as a mega-paradigm for the social sciences—and as a movement that ... sought to decenter the ‘structures,’ the systematicity and scientific status of structuralism, to critique its underlying metaphysics and to extend it in a number of different directions, while at the same time preserving central elements of structuralism’s critique of the humanist subject. (p. 8)

As Peters and Burbules observe, it is important to understand poststructuralism’s critical response not as sheer opposition; poststructuralism is not anti-structuralism and does not seek to overturn all of structuralism’s insights.

Nonetheless, one of poststructuralism’s significant departures from structuralism is that it shifts its focus on what language *means* to what language *does*. Rather than analyzing how people understand language and make meaning, post-structuralist philosophers have asked, for example, whether binary structures are as stable as they appear at first glance, what the effects are of a reliance on language that works through binary differences, and how subjectivity is produced by the discourse. For example, Michel Foucault (1969/1972) argues that discourses should be seen not “as groups of signs (signifying elements referring to contents or representations) but as practices that systematically form the objects of which they speak” (p. 49). This view on discourses as practices has inspired many discursively oriented studies in educational contexts examining how discursive practices ranging from textbooks to teachers’ spoken language to the visual discourse of the school environment make students into certain kinds of subjects. Blake et al. (1998) explain further:

A discourse is a collection of statements (involving knowledge or validity claims) generated at a variety of times and places, in both speech and writing, and which hangs together according to certain principles as a unitary collection of statements. A great variety of discourses can be generated within any one language. And, moreover, a single discourse can include statements in a variety of different languages. (Think of scientific discourse). ... [T]he poststructuralist claims that we are constituted as subjects within an indefinite plurality of disparate discourses. (p. 14)

This being ‘constituted as subjects’ within discourses is highly significant, as it indicates an understanding of language not as representation of an independent external world *that remains untouched by this representation*, but of language as having an effect on that external world, especially through its framing of our access to it. Education most obviously involves educational discourse, and, as Lynn Fendler discusses in her chapter ‘Educationalization’ in this *Handbook*, we can witness today the tendency to construe social problems within discourses of education. Being constituted as subjects within educational discourses that now capture a wide range of social phenomena, we begin to imagine that “the amelioration of those problems is accomplished through pedagogical intervention” (Fendler).

## Deconstruction

Recalling my own admonition that it is generally more helpful to discuss particular ideas by particular thinkers rather than the broad label ‘poststructuralism’, I turn now to some of the key ideas of Jacques Derrida. Derrida’s work, which is also typically classified as poststructuralist, shares with Foucault a focus on discourse and discursivity but takes a different angle. As I have argued elsewhere (Ruitenber, 2005), this can be explained well through one of his oft-cited and oft-misunderstood claims: “*il n’y a pas de hors-texte*” (Derrida 1967/1976). Spivak translates this as “there is nothing outside of the text” and “there is no outside-text” (p. 158). Some believe that Derrida claims here that all there is is the world of language, but this is not the case. If Derrida claims that we can never separate our experience of the world from language, this does not mean that there is no world to be experienced at all, but rather that we do not have any non-discursive access to it. Derrida (2002) himself also denies that his claim means that all there is is language:

On the one hand, I always think it necessary to recall the dimension of language, and, at the same time, essentially what I do and what begins with a deconstruction of logocentrism consists in, and calls for, a beyond-language, or an outside-language. Often my work is interpreted as the work of someone who says, in the end, everything is language, there is only language, there are no things, there is nothing beyond language; this is an absolute linguisticism. A very paradoxical reception of work that begins by doing the opposite. But I think that the two need to be done. One must constantly recall a certain irreducibility of the textual or discursive dimension of language, and, at the same time, recall that there is the textual something that is not discursive, a trace that is not linguistic. (p. 33)

Unfortunately, Spivak's translation "there is nothing outside of the text" does not quite dispel the 'linguisticist' interpretation of "*il n'y a pas de hors-texte*". Instead, I might suggest the less literal "there is nothing that escapes text", or "there is no extra-textual realm" (Ruitenberg 2005, p. 42). Attridge proposes the literal translation "there is no outside-the-text" and comments that it means that "there is nothing that completely escapes the general properties of textuality" (in Derrida 1992, p. 102, n. 21).

The reason I dwell on Derrida's claim and its translations is that it is particularly helpful for understanding the focus on discourse of poststructuralist thinkers and how this 'discursive turn' involved a critique of the materialist orientation of Marxist thinkers. Derrida's claim and its various translations and interpretations also goes some way to explaining the subsequent (re)turn to materiality among new materialist thinkers, who have argued that poststructuralists have been too focused on discourse. Sara Ahmed (2008) begins her analysis of the new materialist critique of poststructuralist feminism with the following observation:

I have had numerous conversations with friends, colleagues, participants at conferences, which have involved the use of quite casual forms of expression, which evoke a position that is not held by the speaker. One example of this is the expression, 'I don't think everything is just social', which has been repeated to me a number of times. ... I would suggest that the word 'social' here works metonymically: it acquires significance in part through its nearness to other words such as language, discourse, culture. The speech act might express that familiar or even habitual anxiety that feminism and poststructuralism have reduced 'everything' to language and culture, in what is often referred to as 'textualism', and have forgotten the 'real' of the real world, or the materiality of what is given. (p. 25)

Karen Barad (2003) provides a clear example of this anxiety when she writes:

Language has been granted too much power. The linguistic turn, the semiotic turn, the interpretative turn, the cultural turn: it seems that at every turn lately every 'thing'—even materiality—is turned into a matter of language or some other form of cultural representation. (p. 801)

As the above discussion clarifies, any claims that poststructuralism involves a denial of materiality and amounts to linguisticism are baseless. Poststructuralists argue that material structures—whether those are social structures or biological structures—do not determine and are no more foundational than discourse and culture. They do not, however, replace this with the inverse claim that discourse and culture determine or are more foundational than material structures.

Ian Munday (2011) refers to the claim, "*il n'y a pas de hors-texte*", to critique dominant conceptions of success and failure in educational discourse. He writes that understanding the referent of language as not something outside of language but as something that is, itself, always already affected by and tethered to language, we can break the expectation of successful educational communication that represents the 'outside world' in a transparent, stable, and assured manner. Munday writes:

Teachers are often told not to speak too much and when they do speak they should be as clear as possible, otherwise meaning will go awry, their utterances will not be understood. ... The issue that is at stake here concerns whether when teachers speak (particularly when they, heaven forefend, speak 'for a long time'), they are generally misunderstood. ... Yet,

As Derrida shows, the very possibility of communication is dependent on the iterability of language, and this iterability requires a necessary division that means words are not at one with themselves. Consequently, trying to pin words down through excessive adherence to clarity is destined to failure, but this is only ‘failure’ because communication is thought of here as something that must be full and transparent. (p. 413)

The language that teachers (and textbook writers, curriculum designers, educational administrators, and so forth) use depends for its intelligibility on previous iterations and remains susceptible to subsequent iterations. It thus cannot be understood and analyzed as a text whose context consists of non-discursive elements such as geographic and historical context, and which is affected by other non-discursive conditions, but must be understood as part of a practice that is discursive through and through, and whose discursivity cannot be eluded.

The discussion around “*il n’y a pas de hors-texte*” also illustrates how the binary pairs success/failure and within-the-text/outside-of-the-text do not hold. This constitutive failure of binary structures is known as deconstruction (see Biesta 2009). In relation to Munday’s paper discussed earlier, I might say that the binary success/failure deconstructs itself, as the very idea of ‘success’ is dependent on the idea of ‘failure’, without which it would be meaningless. Biesta (2009) discusses the dominant conception of success and failure in education as follows:

If we want to teach our students that 2 and 2 makes 4, if we want them to learn how to drive a car, how to weld, how to administer anaesthesia, if we want them to understand how the convention of the rights of the child came into existence, what racism is and why it is wrong, what democracy is and why it is good, what evolution theory and creationism are about, or why deconstruction is not a method and cannot be transformed into one, our aim is to get it ‘right’ and, more importantly, our aim is for our students to get it ‘right’. Teachers have a special ‘trick’ for getting it right. It is not called effective teaching but assessment. (p. 398)

Assessment understood as the reliable verification that certain knowledge or skills have been mastered is, as Biesta acknowledges (p. 402, n. 5), a legitimate part of education, but it cannot be the sole model that shapes all of education, as that would reduce education to training and socialization. Education, as Biesta, Munday, Standish, Masschelein, and other educational scholars who have written from post-structuralist perspectives have argued, necessarily involves a risk, openness, and weakness that take its irreducibly discursive, and thus iterable, nature into account.

Returning to the new materialist critique of poststructuralism I discussed earlier, Ahmed (2008) notes that “the new materialism reintroduces the binarism between materiality and culture that much work in science studies has helped to challenge” (p. 35). From a poststructuralist perspective, the binary of matter (or materiality) and culture (or associated terms like discourse) is untenable and deconstructs itself. This means that all discourse has material traces and effects that are not reducible to discourse itself, and that all matter is already ‘contaminated’ by discourse and cannot be considered in a purely material, a-cultural realm. In the context of educational contexts and practices, Ahmed’s perspective is worth noting, as studies of ‘embodied’ pedagogy or students’ ‘embodied’ learning are not a-discursive any more than studies of policy or textbook discourse are a-material.

To put it most succinctly: deconstruction is the failure or self-undoing of the boundaries that purportedly keep the two sides of a binary pair apart. Note that deconstruction is not an action or intervention that a scholar performs on a text or even a binary pair; no, as Derrida (1991) explains, deconstruction *happens*: “Deconstruction is not ... an *act* or an *operation*. ... Deconstruction takes place” (pp. 273–274, italics in original). The role of the poststructuralist scholar is, in Biesta’s (2009) words, to *witness* this happening. In the close scrutiny of boundaries in binary pairs, these boundaries reveal themselves to be unstable, porous, and flawed.

One of the areas in which this deconstructive perspective has played out forcefully is gender studies and queer theory, as the binaries that have traditionally structured the social organization of sex (male/female), gender (masculine/feminine), and sexuality (heterosexual/homosexual) have all been shown to deconstruct themselves. The social (and legal, medical, etc.) organization of sex, gender, and sexuality has relied on the stability of these markers and identities and has assumed people can be classified—and ought to be classifiable—reliably and permanently according to these binary pairs. A failure to be classified or classifiable in these binary schemas was seen to be a form of deviance or abnormality on the part of the subject. From a deconstructive perspective, masculinity is not the opposite of femininity but rather dependent on it; masculinity not only relies on femininity as its ‘constitutive outside’—which is to say that ‘masculinity’ is not intelligible in the absence of ‘femininity’—but is also always touched and affected by it.

As I have written elsewhere (Ruitenberg 2005), a binary conceptual demarcation is a border that cannot possibly be what it is intended to be: indivisible. Derrida (1993) writes:

where the identity or indivisibility of a line ... is compromised, the identity to oneself and therefore the possible identification of an intangible edge – the crossing of the line – becomes a *problem*. There is a *problem* as soon as the edge-line is threatened. And it is threatened from its first tracing. The tracing can only institute the line by dividing it intrinsically into two sides. There is a problem as soon as this intrinsic division divides the relation to itself of the border and therefore divides the being-one-self of anything. (p. 11)

Touching on both sides it is meant to keep apart, the border is, from the moment it is drawn, two. The border is never indivisible, never individual, always two. This is the case for borders between more abstract concepts such as presence and absence as much as for borders between concepts with a more immediately felt personal and political relevance such as masculinity and femininity.

## Poststructuralist Perspectives on Equality and Justice

Let me conclude this chapter with a discussion of how poststructuralist thinkers approach questions of equality and justice in and through education, as this showcases some of the notable differences between structuralist and poststructuralist approaches. The topic of equality and justice in education is one where the persistence of more modernist, structuralist perspectives, and in particular the Marxist

heritage, manifests itself clearly, for example, through the work of Antonio Gramsci and Paulo Freire. In much educational scholarship, injustice is taken to be an issue of unequal power between identifiable groups. As Naomi Hodgson and Paul Standish (2009) explain:

In educational research concerned with social justice the group or individual is seen as without power and the research process is concerned with empowerment – the giving or getting of power. It is perhaps the neo-Marxist understanding of power that characterizes much of the desire to work ‘for social justice in education’. (p. 315)

Structuralist approaches to social injustice in or through education may focus, for example, on empowering girls in science education, emancipating immigrants through literacy classes, giving voice to working class students, enabling black students to resist racial oppression, highlighting the stories of gay and lesbian teachers, and so forth. Poststructuralist scholars do not deny that people lead unequal material lives: that some students live in large houses, while others live in small apartments; that some students are slammed into school lockers for looking or talking a certain way, while others do the slamming or walk away; that some students have a passport of the country in which they live, while others have passports of other countries, or no passport at all. The poststructuralist interruption comes from not assuming that these material conditions are associated with stable identities and subjectivities, but rather questioning how material conditions as well as the discourses that circulate turn people into certain kinds of subjects. Poststructuralist scholarship “resists those categories of identity around which discussions of social justice ossify and instead questions the truth on which they are based” (Hodgson and Standish 2009, p. 325).

One of the distinctive perspectives that poststructuralist scholars bring is on subjectivity or, more precisely, on becoming-a-subject. From a poststructuralist perspective, we are not preexisting medical subjects who enter into medical discourses and practices, but rather we become medical subjects (e.g., ‘patients’) by entering into, participating in, and recirculating these medical discourses and practices. Likewise, we are not preexisting educational subjects who enter into educational discourses and practices, but rather we become educational subjects (e.g., ‘students’) by entering into, participating in, and recirculating these educational discourses and practices. Foucault’s work has had the most sustained focus on the practices by which human beings become subjects. In his own words, his “objective ... has been to create a history of the different modes by which, in our culture, human beings are made subjects” (Foucault 1982, as cited in Rabinow 1984, p. 7). This focus on becoming-a-subject does not mean that human beings are seen as culturally determined or without agency; the subject still has agency, but this agency is not autonomous. In Judith Butler’s (1997) words, “Agency exceeds the power by which it is enabled” (p. 15).

The modernist focus on autonomy in education thus meets a poststructuralist critique that questions the possibility of this autonomy. In addition, and taking up Biesta’s (2012) point that postmodern interventions predominantly have an ethical purpose, the poststructuralist critique of the focus on autonomy also questions the *desirability* of the narrative of autonomy. The subject is reminded of its fundamental dependence on others as well as on discourses, practices, and structures not of its own making.

In education, the poststructuralist attention to how human beings become subjects enables different questions. For instance, instead of asking how girls can be empowered to pursue science education, it might ask how certain knowledge has come to be classified as ‘science’, how science has come to be associated with masculine characteristics, and how both girlhood and masculinity have been constructed and are constantly produced and reproduced discursively. Instead of seeking to give voice to working class students, poststructuralist scholarship might ask how the binary of voice and voicelessness, of speaking and silence, plays out in education. It might ask also how particular kinds of labor come to produce ‘working class identity’ and how the working class subject is a gendered and racialized subject. In other words, poststructuralist research in education resists binaries of oppressors and oppressed, of haves and have-nots, and of the educated and the uneducated, because it seeks to disrupt the certainty with which we pursue curriculum reform, educational policy change, and educational research ‘for social justice’. It calls attention to that which is excluded from each of our attempts at social justice and, thus, to the very conception of justice that animates the attempts. “A closer reading of poststructuralist literature should raise questions about the nature of the justice that is the concern of much educational research” (Hodgson and Standish 2009, p. 325).

Daniel Vokey and I have previously analyzed the nature of justice in writing about equality and justice in education (Ruitenberg and Vokey 2010). We distinguish the conceptions of justice as harmony, as equality, as equity, and as difference—or, more accurately, justice as *alterity*. This last conception is the one that can be found in poststructuralist scholarship. Instead of asking how a stable subject might become more ethical or act more ethically, poststructuralist ethics is more likely to ask how subjectivity itself is constituted by ethical acts and relations. If, as Derrida (1993/2002) writes, we take justice to be not a structure but “the experience of the other as other, the fact that I let the other be other, which presupposes a gift without restitution, without reappropriation, and without jurisdiction” (p. 105), then how can justice possibly be done in education? The answer, perhaps unsurprisingly, is that it can never fully be done. Biesta (2001) writes:

We could argue that the only way to do justice to the other, the other whom we dare to educate, is by leaving the other completely alone. It is not difficult to see that this neglect (which would not even count as a border-case of education) would make the other unidentifiable and unrecognizable. (p. 51)

Education is, by definition, an intervention, and, as such, it does not leave the other alone and always risks doing injustice to the other. As it seeks to minimize the injustice it does to one group of students, it creates a new injustice by seeing students as members of social groups and thus misrecognizing their uniqueness. As it seeks to minimize the injustice it does by misrecognizing an individual student, it neglects to attend to the exclusion of those who never become a ‘student’ in the first place. Where modernist approaches to education and educational research brought the confidence and optimism of structural progress, the postmodern doubt that I discussed above characterizes poststructuralist approaches. Poststructuralist scholars do not give up on justice, but they imagine it less as a stable target to aim

for—whether in form of the education of the oppressed, equal educational opportunity, or education for individual autonomy and freedom—and more as an idea that haunts educational theory and practice, spurring it to return to question and rethink itself again and again.

# Feminism

Rita Casale and Jeannette Windheuser

The history of feminism is the history of a theoretical and political movement. Even though from a European perspective the French Revolution already signals the start of an organised women's rights movement, the present analysis takes the mid-twentieth century as its point of departure. In so doing, the epistemic and the historical developments following the Second World War will be discussed in three phases using a historical-conceptual approach. The reconstruction of the contemporary history of feminism according to equality feminism, difference feminism and gender feminism draws upon a canonisation that established itself within the feminist historiography of the 1990s and, above all, corresponds to the European and Anglo-American context.<sup>1</sup> Aware of the situatedness of one's own epistemic access, this canonisation will initially be adopted as well as both historically and conceptually examined. At the same time, in the second part the attempt will be made, by means of the analysis and reconstruction of the institutionalisations process of feminist theory and politics, to revise the prerogative of interpretation of such a Eurocentric canonisation.

## The History of Ideas of Feminism After 1945

### *Equality Feminism*

Gender equality was the central aim of first-wave feminism (1848–1918), which promoted liberal and socialist positions. At the conclusion of the Second World War, Simone de Beauvoir's work *Le Deuxième Sexe* represented the theoretical reference point of equality feminism. The text was published in 1949 in a fairly conservative climate in France, where, on the one hand, women were granted the right to vote, and, on the other, the scope of action they had during the war was being lost. Once the men came back from the front, the women were once again banished to the domestic sphere. The analysis of the *situation* of women in *Le Deuxième Sexe* – the historical, cultural, economic, biological grounds for their immanent imprisonment in the realm of the natural – acts as a provocation toward the attempt in the 1950s in Europe and the USA to make marriage and family central factors of societal consolidation. From the perspective of an existential ethics, the aim of de Beauvoir's critique is women's *freedom*. Freedom is understood in terms of transcendence, that is, as the liberation from the imprisonment in nature, which is viewed as the sphere of immanence. *Equality* comprises the *conditio sine qua non* for freedom. The emancipation of the woman is similar to the freedom of the man in that it is an emancipation from nature achieved through *work*. In her analysis, work represents, following Hegel, both the processing and objectification of nature, thus is itself the precondition for the transcendence of nature, i.e., for freedom. In a capitalist society, work takes place in an alienated form. Nevertheless, for de Beauvoir, work retained its freeing potential. It forms the precondition for the equality of the sexes; an equality to be realised both politically and economically speaking.

Betty Friedan's liberal feminism is to be situated in this tradition, as well. Her book *The Feminin Mystique* (1963), much like Simone de Beauvoir, takes aim at the conservative gender hierarchy with its conceptions of the family that had taken hold during the McCarthy Era in the USA. Her massive assault on the concept of 'occupation: housewife' targeted the individual self-liberation of women by means of economic independence. As a co-founder of NOW (The National Organization of Women, 1966), Betty Friedan set the tone for second-wave feminism (1968–1980).

The theoretical and political prerequisite for equality feminism is the critique of the *patriarch*. For equality feminism the male domination of women, and thus the exploitation connected with it, operate in a patriarchal society not only at the economical and political levels but also at the sexual level. If equality feminism acted at the political level pushing for the recognition of women's rights as human rights,<sup>2</sup> then at an economical level it did not merely strive to achieve the financial independence of women. It also criticised the devaluation of reproductive work, which is understood in terms of both housework and the psychical work performed associated

---

<sup>2</sup> Gerhard (2001/1990).

with the cohesion of the family. The analysis and critique of the function of the so-called *work of love*<sup>3</sup> is followed by the demand by equality feminism for a *sexual politics*, the consequence of which leads to a calling into question of the postulate of equality itself.

The immediate political goals pursued by equality feminism in sexual politics include combating sexual violence as well as decriminalising abortions. However, more generally, the self-determination of sexuality is claimed. Works such as Shulamith Firestone's *The Dialectic of Sex* (1970) or Kate Millett's *Sexual Politics* (1969) transform the sexual into the political. The politicisation of sexuality leads to a critique of a central tenet of liberal society: the separation of the public and private spheres. One of the central themes of the international second-wave feminism is the motto formulated by Millett: 'the personal is political'.

Criticism of the hierarchical relations of gender in the private as well as public spheres leads to a radical confrontation with representatives of the student movement and, above all, with the Marxist tradition, which derived the question of gender from the question of class. In contrast, the difference between class and gender as well as patriarch and capitalism is emphasised.<sup>4</sup>

Initially inspired by Beauvoir's principle of equality,<sup>5</sup> second-wave feminism as a whole shifted its focus from women's rights to women's liberation. Whereas equality feminism takes up the central themes of freedom, socialisation ('One is not born a woman, but becomes one') and reproduction/work, difference feminism deals with the shift of the political to the sexual. Sexuality becomes the crux of the question of women's rights.<sup>6</sup>

## *Difference Feminism*

Already in first-wave feminism one finds the concept of 'mental spiritual motherhood',<sup>7</sup> which emphasises the difference between masculine and feminine. Second-wave feminism emerges from the observation of sexual difference as *difference*,<sup>8</sup> which is distinguished from that which is given, i.e., the other of history. When the feminine in a patriarchal society is reduced to the second gender, to *other than* man, to his mirror, then difference feminism is not content with an emancipation of women that confirms the specularity of the female sex in terms of a second sex. For difference feminism, the liberation of women cannot be modelled upon the masculine conception of transcendence. A precondition for this is rather the nega-

<sup>8</sup> Due to the ambiguity of the term in English, those instances referring to the understanding associated with difference feminism in the Italian and French traditions will be denoted.

tion of the universal character of freedom, which is assumed by the model of emancipation tied to work. In this sense, the sexual difference is to be understood as the affirmation of the division of the human species. The human species is the divided sex – the sex not unified. Difference is the concept used to characterise the distinction in the sexual (*Geschlechtlichen*). The sexual difference refers to the position of women in the symbolic order and becomes the point of departure for the possibility of a relational connection. Here, alterity is understood in terms of difference – one that makes it possible to think of a formation of the subject that goes beyond the universal model of patriarchal societies.

First, let us turn to *difference as the division in the symbolic order*: amidst the student revolution (1968–1970), several women in France (among others Luce Irigaray 1985/1977a; Julia Kristeva 1980/1969 und Hélène Cixous 1976/1975), who stemmed from the group Psy-et-Po (*Psychoanalyse et Politique*), took the opportunity to shake up the conventional understanding of politics. The change of the order of representation presupposes the calling into question of the identity character of the symbolic order. This critical treatment does not limit itself to the political understanding of the student movement and the Marxist inspired organisations. It is perpetuated along with the entirety of the tradition of Western thought, which is subordinated under a phallogocentric logic. Following Martin Heidegger and Jacques Derrida's critique of Western philosophy as a metaphysics of presence, they accuse the Western tradition of conceiving of Being as having a specific signifier: the phallus. The phallus has become the primary signifier of a symbolic order that identifies Being with that which is visible. In this order, according to Jacques Lacan, the woman does not exist. Her gender is one that isn't one.<sup>9</sup> The sexual difference characterises first and foremost this negativity in the symbolic order. In *Speculum* Luce Irigaray (1985/1974) attempts to give a face to the invisible and a language to the unsayable. The sexual difference, then, becomes the name for another symbolic order.

If Lacan's psychoanalysis assumes the centrality of the mirror stage for subject formation, then the representatives of difference feminism, with the help of the *Speculum*, show something that cannot be seen in the mirror: the sexual difference as the *terra incognita* of Western philosophy and the psychoanalysis of Freud and even Lacan.

The sexual difference becomes a presupposition for a relational ethics: Difference as relational connection.<sup>10</sup> Toward the end of the 1970s, Adrienne Rich (1976) and Nancy Chodorow (1978), among others, dedicated themselves to the analysis of the meaning of the relation to the mother, considered from the perspective of an object relation, for the reproduction of gender-specific divisions of labour as well as for the emergence of bonding relations.<sup>11</sup> The mother-daughter relationship becomes the foundation for an ethics of care, which Carol Gilligan (1982) formulated via a critical reading of Lawrence Kohlberg's theory of moral development.

---

<sup>9</sup>Irigaray (1985/1977a, b).

<sup>10</sup>For a reconstruction of the history of such an ethic, see Dingler (2016).

<sup>11</sup>Later Benjamin (1988).

Since the 1980s in Italy, a *pensiero della differenza sessuale*<sup>12</sup> has developed that is based on two pedagogical concepts: the practice of *originating from oneself (a partire da se)*<sup>13</sup> and the practice of *affidamento*.<sup>14</sup> The practice of *from out of oneself* describes a movement of thinking, which emerges from the experience of one's own corporeality and situatedness. In the practice of *affidamento*, this movement is embedded in a generational logic. It refers to a symbolic relation to the mother. In this symbolic relation, that is, in the linguistic mediated relation to the mother,<sup>15</sup> the recognition of the mother's authority as the possibility of a feminine genealogy is at issue. In her symbolic relation, the mother is observed not only reproductively, but also attributed a generative function. The practice of *from out of oneself* and *affidamento* is understood in terms of symbolic politics of relation, in which the freedom of the woman is first made possible.<sup>16</sup>

## ***Gender Feminism***

The discussion about the character of sexual difference, i.e., whether it is a product of culture or nature, lies at the heart of gender feminism, which has above all established itself in the North American and German contexts. The issue concerning the relation of nature and culture with a view to gender identity and the gender binary was already discussed in the 1950s in the area of medical psychiatry and in the 1970s in the field research inspired by anthropology. When medical psychiatry was dealing with the separation of bodily identity and sexual identity in the case of transsexuality,<sup>17</sup> the feminist anthropology was attacking the androcentric canon of anthropological field research,<sup>18</sup> which was above all dominant in the USA. With the publication of Gayle Rubin's text *The Traffic in Women: Notes on the Political Economy of Sex* (1975), the debate surrounding nature and culture was conceptually conceived in terms of a 'sex/gender system'. Making reference to the analyses of Lévi-Strauss on familial relationship and those of Marx and Engels on the economic and moral meaning of family, Rubin underscores the significance of the obligatory heterosexuality for the production and stabilisation of the gender order. The equation of the gender binary and symbolic order is considered as the common denominator between the three central streams of gender feminism: The ethnomethodological-sociological, the linguistic-philosophical deconstructive and the

<sup>17</sup> Becker-Schmidt and Knapp (2000, p. 71).

<sup>18</sup> Wischermann et al. (2010, p. 231).

scientific-theoretical deconstructive forms of gender feminism.<sup>19</sup> While difference feminism discusses the patriarchal gender order, assuming the phallus as the primary signifier, gender feminism sees the gender binary as constituting the epistemic matrix of gender relations. For difference feminism, the 'difference' represents the unsaid and, at the same time, the utopian surplus of feminist theory and praxis. Gender feminism sees in the difference of the genders, fixed as gender binary, the reason for the hierarchy of the genders. In this case, the utopian moment consists in the idea of an overcoming of the gender identities.

The ethnomethodological-sociological gender feminism investigates empirically the reproduction of the gender binary and the supposed hierarchy of genders, both in everyday practices and with regard to the scientific codification of naturalised stereotypes. In the now classic analyses carried out by Candace West, Don Zimmermann and Sarah Fenstermaker, gender was processualised<sup>20</sup> and indicated the interactive character of the production of difference.<sup>21</sup> At the heart of this approach lies the question about how sexual identity emerges. Carol Hagemann-White's social-constructivist investigations of socialisation processes (1984) conducted in the 1980s are to be situated in this context within the German-speaking countries. In the 1990s, the ethnomethodological approach was, above all, adopted by the sociology of knowledge, which has dealt with, among other things, the production of hierarchies in highly qualified careers.<sup>22</sup>

The target of the linguistic-philosophical deconstructive gender feminism is the normalisation by means of naturalisation of the gender binary. The dimension of desire lies at the heart of the analysis, which mediates sex and gender. It is about a mediation that in no way possesses a natural character. It is not biological gender that explains the nature of desire, but rather its cultural form. The explicitly political concerns of such an approach, whose theoretical highpoint was the publication of Judith Butler's *Gender Trouble. Feminism and the Subversion of Identity* (1991), lies in the recognition of the forms of sexuality and forms of life of those who are politically and culturally marginalised in the name of a normalising heterosexuality. In her analysis, Butler deconstructs the fixation of the norm of heterosexuality through a series of performative, interactive speech acts.

The object of the scientific-theoretical deconstructive gender feminism is the critique of the production of knowledge of natural facts in late capitalism. Following Bruno Latour, Donna Haraway, who – above all due to her publication *Simians, Cyborgs and Women: The Reinvention of Nature* (1991) – can be viewed as the central theorist of the third current of gender feminism, attacks the dualistic logic of scientific and technological production. This logic is articulated in the demarcation between humans and animals, between organisms and machines and between the material and immaterial. This kind of logic obstructs access to the phenomena that have emerged from the entanglement of knowledge and technology in late

<sup>20</sup>West and Zimmermann (1987).

<sup>21</sup>West and Fenstermaker (1995).

<sup>22</sup>Wetterer (1992).

capitalism.<sup>23</sup> It is about hybrid entities (e.g. embryos in test tubes, the HIV virus, the ozone hole) that neither completely belongs to nature or culture. In order to investigate such phenomena, an epistemology is necessary that overcomes the dualisms of subject-object, idealism and materialism, as well as realism and nominalism.

Haraway's work expands the gender feminism's critique. Now, the focus is no longer just on the gender binary of the heterosexual matrix, but also the dualistic normalising logic of scientific and technological production.

## The Institutionalisation of Feminism After 1945

If one wants to pursue the second step in the analysis and reconstruction of the institutionalisation of the positions outlined above, then it should be noted that it involves a non-linear relation. It is about the institutional translation of concepts and critique, how it was formulated in the political theory and praxis of feminism, which itself leads to new, unanswered questions. Knowledge concerning gender, both in its production and its dissemination, is subject to a circulation process (Sarasin 2011), and therefore translates, implements, shifts and glorifies both that which is thought and that which is said under specific economic, political and societal conditions.

The following reconstructs this process of institutionalisation of feminist theories and practices (especially in education and *Bildung*), taking into consideration the historical and social conditions, which in the time after the Second World War shaped the knowledge-historical horizon of both feminism and the gender questions and were subsumed under the following three conceptions: human rights, post-colonialism and human capital.

### *Human Rights*

The second half of the twentieth century begins with a significant institutionalisation of the feminist demands in which women's rights is explicitly incorporated into the 'Charter of the United Nations' (1945 (UN) as well as in the UN's 'International Declaration of Human Rights' (1948).<sup>24</sup> Initially, it referred to an international standard that by means of the 'International Bill of Human Rights' (1976) became international law. Gender is recognised three times in the documents: first, in the sense of a principle of equality, which grants men and women equal rights; second,

---

<sup>23</sup> Haraway (1988)

<sup>24</sup> The inclusion of women was thanks to the involvement of the handful of women who took part in the drafting. The majority of the nations who signed the Charter and Declaration had not yet introduced legal equalisation of the sexes as clarified in the documents—in particular when it came to voting rights (Jain 2005).

as a non-discrimination principle, including other characteristics such as ‘race’, skin colour, political opinion or social background; third, in the form of protective measures for women against unequal treatment and violence.<sup>25</sup> What’s more, from the perspective of education and *Bildung*, there is the decisive article concerning the special protection for mothers and children, the right to education and both the free choice of profession and free exercise thereof.<sup>26</sup> With the adoption of the Beijing Declaration at the Fourth World Conference on Women in 1995, it becomes clear how the actual violence against women and girls as well as the still pending equality requires the further specification of their rights. At the same conference, the so-called platform for action strategies for the realisation of the already existing rights were implemented.<sup>27</sup> This includes, in particular, institutional organisations concerned with the advancement of women and girls and the measures regarding gender mainstreaming, which is, above all, a strategic approach towards the equality in national and international public institutions.<sup>28</sup> The specific protection against gender-specific oppression is expanded via the 2011 and 2016 UN resolutions concerning the protection against discrimination based on ‘sexual orientation and gender identity’.

In this way, gender equality, freedom from discrimination and protection against violence are transnationally institutionalised, which is tied to the fundamental demands of the women’s movement concerning human rights, as they have been negotiated since the French Revolution.<sup>29</sup> Already in 1791, Olympe de Gouges, in her *Déclaration des droits de la femme et de la citoyenne*, criticised the ‘universal’ declaration of human rights from 1789. It ignored the relation of equality and difference in the gender relations.<sup>30</sup> As Carol Pateman (1988) has historically reconstructed using the example of the emergence of the modern social contract, the exclusion of women was constitutive for the development of civil society and modern democracy. In the feminist (human) rights debate, in particular, the relation of legal philosophy and legal practice is analysed<sup>31</sup> and the ‘male bias’ in the human rights declaration criticised (Okin 1998). At the same time, the feminist human rights debate has to come to terms with its own ‘cultural bias’, as the post-colonial feminist critique shows (Grewal 1999).

The philosophical debate concerning the question of human rights for women is, above all, characterised by the distinction between *equality in difference* vs. *equality*

*of equals*. In her declaration, de Gouges already makes reference to an equality of diversity, as it was later advocated for – visible in the previous reconstruction – in the new women's movement from the perspective of difference feminism by the Italian philosophical group Diotima (1989) and Luce Irigaray (1990).<sup>32</sup> In contrast, for equality feminism – as we have seen – the demand for human rights for women consists in the equal access to the public and thus political as well as economic spheres.

Since in the 'Declaration of Human Rights' from 1948, the principle of non-discrimination is introduced alongside the principle of equality, a connection can be made to the gender-theoretical debate carried out in the 1980s and 1990s regarding the recognition of different sexual orientations and gender identities. First, this concerns access to fundamental rights (including the undiagnosing and decriminalisation of non-heteronormativity, the sex-independent marriage, the right to adoption by homosexual couples) and second the critique of a heteronormative concept of humanity as the point of departure for human rights (Butler 2004).

The institutionalisation of feminist human rights demands is to be seen in their historical connection to the wider social movements of their time. The relation is by no means free of conflict, as Sara Evans (1979) already demonstrates in the case of the USA regarding the Civil Rights Movement and the New Left, as well as Gayle Rubin (2001/1982) shows for the common, yet separately affected gay liberation and feminism during the so-called Sex Wars.<sup>33</sup> Toward the beginning of the 1980s, the interpretational sovereignty of white feminists is called into question by black activists and authors, who attack the separation by class, gender and 'race' in the feminist and leftist movement (among others, Combahee River Collective 1982/1977). Regarding human rights, two phases of analysis and critique can be identified, whereby the former from the end of the 1960s till the mid-1970s focused on the political and economic suppression of women, and the latter, starting in the mid-1970s turned its attention towards sexual violence as well as reproductive and sexual self-determination (Lonzi 1996/1970; Dalla Costa and James 1972; Rubin 1975; Irigaray 1985/1977a).

After the economic as well as socially constitutive separation of the reproductive and productive spheres in the nineteenth century, the patriarchal structures of the welfare state, which institutionalises the separation of spheres in the family income, stand over and against a feminist demand for autonomy (Fraser 2016). The second phase of the critique expresses itself, especially in the campaigns for legalised

---

<sup>32</sup>Caravero (1990), Irigaray (1993/1984, 2008), Zakin (2007); also see MacKinnon (1987); MacKinnon indicates that the freedom to be treated regardless of gender runs counter to the protective freedom of systematic subordination.

<sup>33</sup>In the late 1970s and early 1980s, there was an inner-feminist fight between anti-porn and sex-positive positions. This fight involved, among other things, the conflicts between homosexual emancipation (including lesbian, gay and SM-practices) and the fight against sexual violence.

abortions<sup>34</sup> as well as in the confrontation with reproductive rights and sexual violence.<sup>35</sup>

Through these institutionalisations in the contexts of *Bildung* and education, it once again becomes possible to grasp the twofold demand of equality and difference, which is also expressed in the understanding of the meaning of the institutions. On the one hand, by means of the demand to accept educational institutions and according to the social handling of reproduction, the public, institutional and political equality of women and the issues affecting them is demanded. On the other, the exclusion of women and the anti-statist critique of representation of the social movement lead to the development of separatist – that is, different – connections<sup>36</sup> among women. These changes in the conception of education and *Bildung* are to be situated within this dual development.

The important institutionalisation of human rights for women in education affects the steadily growing influx of women into the institutions of higher education since the 1970s.<sup>37</sup> The claim to the right of education already played a major role in the older women's movement, and it enabled the establishment of the so-called feminine/maternal courses of study and occupations (Kleinau and Mayer 1996; Kleinau and Opitz 1996; Scott 1996b).

Philosophical and historical interpretations of classic pedagogical figures, as well as social scientific investigations about co-education demonstrated the limits of the concept of equality as a model of emancipation. In the first case, the classical figures' contribution to the establishment of a bourgeois understanding of education and *Bildung* is brought to light (see Schmid 1993; Kuster 2005; Casale 2012). In the second case, co-education is shown to be a significant accomplishment in the equality of women, and, at the same time, as an instance of the reproduction of hierarchal gender relations. Above all, it was the feminist research on co-education that contributed to the analysis of this historical, social and cultural problem, which has, among other things, called attention to the gender-specific 'hidden curriculum' (Frazier and Sadker 1973; Kuhn and Wolpe 1978).

In addition to the deconstruction of the canon and the conceptual change of educational institutions, the epistemologically inspired feminism itself has changed our understanding of *Bildung*, education and knowledge. In particular, their supposed neutrality has been criticised. *Bildung* and education are subjected to a dichotomous and hierarchal order of gender (Rendtorff 1998). Understood in terms of a *situated*

---

<sup>34</sup>LeGates (2001). 1971 published in France *Le Nouvel Observateur* the statements of hundreds of women who had had abortions, in 1972 a similar campaign is published in the German journal *Stern*. About the Pro-choice movement in the USA, also see Staggenborg (1991). For an international comparison: McBride Stetson (2001).

<sup>35</sup>Two radical positions are taken up by Firestone (1970) and Brownmiller (1975). Firestone sketches out in her feminist connection of Marxist and sexual revolution a utopia, where women are to be liberated from the 'tyranny of procreation'. In her research on rape, Brownmiller assumes that it is connected with the male gender and thus the masculine order.

<sup>36</sup>This cannot always be absolutely distinguished from one another, like the West German '*Kinderladenbewegung*' Baader (2015) was reconstructed.

<sup>37</sup>OECD (2015).

*knowledge*, moreover, an argument is being made for an epistemological perspectivism (Harding 1986; Haraway 1988).

Beyond the increased equal opportunities in the educational system, extra-institutional practices alter our understanding of *Bildung*. In the groups of women where ‘consciousness raising’ is practiced, both the separation of subject and object and of mind and body is called into question (Koedt et al. 1973). In particular the Italian women’s movement treats other forms of *Bildung* and knowledge transfer, which presupposes sketches of feminine genealogy and authority (Milanese Feminists 1977/1974). This includes the debate in the French-speaking context regarding language as an expression of a phallogocentric logic and the nascent *écriture féminine*, which proceeds from the feminine body as primary signifier (Cixous 1976/1975; Irigaray 1985/1977b).<sup>38</sup> In addition to the attempt to design a language originating out of the sexual difference, new language practices are being developed that, first and foremost, call the generic masculine into question (e.g. via the naming of both sexes or new ways of spelling, such as ‘s/he’ (Miller and Swift 2000/1980)). In the 1990s, attention was drawn to the performative force of language (Butler 1990, 1997). The aim is a gender undisambiguation of the language (via changes to the word suffix with \_ or \*, and in Swedish via the introduction of new a gender-neutral personal pronoun ‘hen’), which above all affects languages possessing grammatical gender (Hornscheidt 2011).<sup>39</sup>

The feminist confrontation with reproductive and sexual self-determination and the protection against sexual violence leads to conceiving of the woman’s body as a site of political, social and economic negotiation, as well as individual and collective experience.<sup>40</sup> For the new women’s movement, this debate is politically connected with the demands for reproductive rights, which affects family planning, contraception and abortion. In this sense, it goes beyond legal questions and involves sexual education.

Sexuality is decoupled from procreation and, in critical debate with the representatives of the so-called sexual revolution, thought of and practiced as the discovery of the feminine body and feminine desire (Lonzi 1971<sup>41</sup>; Firestone 1970; Koedt 1970). Awareness raising projects and women’s healthcare centres are being established as autonomous/self-organised institutions.<sup>42</sup> The liberation of feminine sexuality accompanies the new insights regarding the structures and mechanisms of male violence against women (Brownmiller 1975; Alcoff and Gray 1993). State

---

<sup>38</sup> In the 1970s till the 1980s, Mary Daly searched in the English language for ‘another language’, which was associated with the female passed along practice of weaving (see Caputi et al. 1987).

<sup>39</sup> For the aesthetic meaning of gender in school-based educational processes see Windheuser (2013).

<sup>40</sup> An artistic implementation of the topic was provided via a print by Barbara Kruger 1989 (no title) with the words: “Your body is a battleground”.

<sup>41</sup> See Brückner (2014).

<sup>42</sup> Boston Women’s Health Book Collective (1971), Nelson (2015). Medical-historical and psycho-analytical distortions of the female body and gender relations have also been analysed Duden (1998/1987), Benjamin (1988).

institutions, one's own family and partners are perceived as unlikely to be helpful; instead, as domestic violence, its concealment and the lack of adequate legislation show, they are more likely to be identified as accomplices or collaborators. A consequence of this is the establishment of women's shelters, which above all focus on self-determination (Pizzey 1974). This has pedagogical consequences to the extent that girls become the future recipients of the girls' empowerment.

Alongside the women's movement, LGBTIQ<sup>43</sup> activists are also fighting against discrimination and for the de-criminalisation and de-psychiatrisation on the basis of sexual orientation or identity as well as for an end to the compulsory medical treatment of intersexuality. In this way, the international medical and psychiatric classification system (ICD-10 and DSM-5) has changed, and marriage, family and adoption rights in some countries have been altered. On the international scene, recognition of LGBTIQ rights through the UN and other transnational organisations is occurring (Lavinás Picq and Thiel 2015). Even in this context, approaches to sexual *education* are being developed.

Both the women's movement and the later LGBTIQ movement have achieved institutional effects, in that they pushed forward the legal equalisation and the anti-discrimination legislation at the national and international levels,<sup>44</sup> and in that they have opened up new theoretical points of access and fields of research. In the end this means that women's studies and gender research have been able to establish themselves since the 1970s (initially emanating outward from the USA and Europe), and starting in the 1990s the establishment of professorships for gender and queer studies (Hark 2005).

At the same time, empirical investigations show that the economic and political inequality of the sexes and sexual violence<sup>45</sup> against women has in no way been overcome (World Economic Forum 2016; OECD 2015; UNESCO 2012).

## *Post-colonialism*

Feminist theory and politics as depicted above are primarily anchored in the academic and socially motivated context of the 'West', i.e., the 'global north'. The hegemonies and exclusions associated with it are the objects of post-colonial critique. Post-colonialism is understood in terms of a historical, theoretical and political concept: it is historical because it describes the situation of decolonised states or territories in terms of their pre-colonial and colonial historical development, their colonial history and its effects, as well as its neo-colonial developments. The prefix

---

<sup>44</sup>About the establishment of 'state feminism', i.e., of women's rights in national legislation, in an international comparison: McBride Stetson/Mazur (1995), Outshoorn and Kantola (2007).

<sup>45</sup>For the educational studies discussion, moreover, the continued gap in the connection of generations and gender is fairly significant in the debate on sexual violence against children Windheuser (2014).

'post' does not mark an end; instead, it considers the traces of what took place in the past as manifested in the present. Theoretically speaking, the goal is to investigate the process of colonisation, the continuing de-colonisation and neo-colonisation. Post-colonial theory has been influenced by post-structuralist and Marxist approaches, and it focuses analytically on the epistemic violence as well as the material relations of the post-colonial situation.

The concept of post-colonialism is political to the extent that it expresses a critical resistance against colonialism, its ideologies and effects (Dhawan and Varela 2005). Important proponents of post-colonial theory are Edward Said, Homi K. Bhaba and Gayatri C. Spivak. In his analysis of *Orientalism* (1978), Said exposed the Orient as a specific projection of the West. Bhaba, with his concept of cultural hybridity, divides the colonial conception of cultural identity (1994). Spivak is above all associated with the feminist perspectivisation of post-colonial theory (1988a, 1995). She criticises the Western claim of representation and denounces Western ignorance towards economic relations that have emerged out of the colonial history and neo-colonial present (Spivak 1999). Feminist or international human rights-oriented interventions from the perspective of the former colonial states – which according to this perspective are located in the UN as well – repeat a discourse of the North, which once again brings the post-colonial woman into a spectating position. In this position, she is violated twofold by means of neo-colonial economic exploitation and via patriarchal gender relations (Spivak 1995, 1988b). Proceeding from her break with the conception of a Western-male subject position developed in *Can the subaltern speak?*, Spivak additionally deals with questions of post-colonial pedagogy. Her critique primarily focuses on the Western academic canonisation and historiography (Spivak 1990). As an educational challenge, she attempts to learn to hear the subaltern and how to unlearn one's own privileges, and, among others, through this to practice undoing subaltern space.<sup>46</sup>

Post-colonial cannot restrict itself to the historical experiences of colonisation and its effects, but must also deal with the effects of colonisation on cultures and societies (Ashcroft et al. 2000). This extends its perspectives to include questions about racism, diaspora and migration in a globalised world (Hall 1990, 1992). According to this perspective, a critique of feminism's cultural bias cannot be reduced to the post-colonial perspective, as the earlier interventions by black feminists in the USA and by feminist migrants in European countries show (Combahee River Collective 1982/1977; Hooks 1984; Spelman 1988; Gümen 1996).

The anti-racist and post-colonial critiques become the starting point for Critical Whiteness Studies, in which feminist epistemic figures are brought to bear on and who appeal to the experience within their own situatedness. *Whiteness* can be understood as an experiential knowledge of blacks or enslaved/exploited people – a form of knowledge that already began with the establishment of colonialism and slavery and was brought forth by the affected persons. Within the black community this knowledge was primarily passed on verbally (Hooks 1992). Till this day, female domestic servants/workers continue to offer us, as an 'outsider within', a specific

---

<sup>46</sup> Spivak (1990, 1999).

perspective in which they through caring for the children both belong and do not belong to the family (Collins 1990). Critical Whiteness Studies are, for this reason, historically as well as empirically connected with the experience of black women, and moreover, with the critique of hegemonic-white feminism. Black activists direct their attention to the previously unmarked position of white activists. Characteristic of this theoretical perspective of Critical Whiteness Studies is their perspectival change in which Whiteness, just like racism, becomes the object of analysis.<sup>47</sup>

While the women's movement within the context of the New Left located itself in the marginalised position as over and against men, and, as a result of this experience, distanced itself from a Marxist approach, it nevertheless, in light of post-colonial and anti-racist theory, has to contend both with the category 'race' and, as a result of the global economic inequality, once again with the meaning of class. The theoretical connection of these central 'categories of the modern' (Klinger 2008) are given an analytical framework via Kimberley Crenshaw's (1989) concept of *intersectionality*. Crenshaw's approach is based on a critical race theory and the anti-sexist prescribed legal studies, and uncovers the fundamental problem tied to anti-discrimination law, according to which simultaneously or multiple instances of discrimination are not adequately taken into account. Crenshaw conceives of intersectionality in terms of an analytic instrument in order to comprehend how racism, sexism and classism intersect (Crenshaw 1991).

Post-colonial theory, critical whiteness studies and intersectionality shift the feminist theory and politics in that they neither make reference to a universal patriarchy nor to a given global sisterhood. Decisive topics of feminist politics lose their universal claim when, for example, racist practices are uncovered in the context of contraception and abortion (Davis 1982). Furthermore, even international efforts against trafficking or female genital mutilation can be called into question (as paternalistic) when they come from an unmarked 'white' point of view (Murray 1998; Lionnet 1992).

Against this background, the aim for *Bildung*, education and their research is to make their own post-colonial assumptions about history, curriculum, language and praxis into objects of investigation. This also includes the economic conditions of social coexistence, to the extent that women in the global North profited from the exploitation in the neo-colonial context. Here, the phenomena of brain drain via migrant academics or the transnational care chains should be looked at.<sup>48</sup> And in light of the increasing presence of women on the labour market, without such transnational care chains to address the reproductive work that still needs to be accomplished, this would not be manageable.

---

<sup>47</sup> Morrison (1992), Walgenbach (2005).

<sup>48</sup> S. Hochschild (2000, 2003).

## *Human Capital*

From an economic perspective, the time following the Second World War, to the second women's movement of the 1960s and 1970s, and even up to the new millennium is characterised by the transition from a 'state organised capitalism' (Fraser 2009) to neo-liberalism. In this connection, the concept of *human capital* stands for a new (at first economic) valuation of capital in which the labour force is conferred a new significance in the creation of value. Labour force – understood as human capital – comprises the entirety of the physical, social, cognitive, psychic and cultural assets of population (Becker 1964; Mincer 1958; Schultz 1961). From this perspective, national economic calculations have to incorporate both untapped and even future human capital, i.e., women as an unused resource for the production process and children in terms of resources to be trained. The basis for this is rational-choice theory. It is assumed that the individual (monetary and non-monetary) costs and benefits will be analysed in order to make decisions in both the market and non-market sectors (Becker 1964). Similarly, demographic policy decisions are to be assessed from the perspective of whether investments in education, healthcare or social projects promise future returns. While the state organised capitalism, as Nancy Fraser locates it in the OECD welfare states and ex-colonial development regimes in the post-war period, operate in the market and social reproduction with intervening top-down strategies, the neo-liberal is placed on top of this in order to create incentives for individuals, to act in the sense of an entrepreneurial self (Bröckling 2016/2007), to view oneself as a market actor.

State-organised capitalism was characterised by a gender-specific division of labour that called for the exclusion of women from the productive sphere.<sup>49</sup> At the same time, reproductive work – a precondition for the labour force of production – was covered by unpaid female labour (already accounted for in the male family income) and the welfare state arrangements. In contrast to this, in neo-liberalism, women's labour becomes integrated into the productive sphere – that is, in the production of goods – and yet continued to operate from the assumption of unpaid care services.<sup>50</sup>

From a feminist perspective, neo-liberalism is characterised in terms of a paradox: on the one hand, female procreativity, private care, education and other reproductive activities are viewed as a prerequisite for the so-called population quality and supported by means of the reconciliation of work and family life as well as

---

<sup>49</sup>Federici (2009): The analysis of gender relations in capitalism in terms of the separation of spheres is above all attributed to the feminist Marx critique, as it has been articulated since the 1970s by the activists of the 'Wage for Housework' campaign, comprising Selma James, Mariarosa Dalla Costa und Leopoldina Fortunati, and the feminists of the Bielefeld School Werlhof et al. (1983).

<sup>50</sup>This is accompanied by the dismantling of the social security system, as it was assumed in the welfare state Brodie (2004). Under the premises of human capitalism, all areas of life are to become objects of the 'work on oneself' toward the optimisation of one's own market value. In so doing, the separation of public and private disappears Boltanski and Chiapello (2007).

public educational institutions.<sup>51</sup> On the other hand, the naturalisation of human capital is faced with a gender-neutral support of productivity and competitiveness (Casale and Forster 2011). In this regard, a paradoxical achievement of feminist demands for equality and recognition can be postulated, which accompanied the failure of difference feminism's demands for another order. Difference works, if only as a biological or identitary establishment in the contemporary discourse.

While the two women's movements struggle against a state-organised capitalism – which was shaped by the separation of spheres, androcentrism and paternalistic social security – and the subordination of women justified by the family wage, the neo-liberalist double-earner family model represents a new challenge (Fraser 2016). This affects the integration of feminist critique in economic strategies, e.g., in which previously private tasks and responsibilities become public and women receive equal access to the professional life.<sup>52</sup> At the moment, the question to be asked is: To what extent did feminism and gender theory, as well as the entire social movements since the 1970s, contribute to the formation of a neo-liberal regime? It is worth noting initially that it has come to a significant shift in the relation of reproduction and production, to the extent that specific areas of education and *Bildung*, as well as of the social life have experienced an enhancement regarding their monetary wage. Care is retrieved from the unpaid arena in which institutions more and more look after toddlers and children outside of the regular school hours and also nursing care for the elderly is increasingly becoming a waged labour (OECD 2011). Furthermore, social skills and informal education are becoming more valuable (Boltanski and Chiapello 2007). Luc Boltanski and Ève Chiapello refer in this regard to a shift from social to artistic critique between the late 1960s and 1980s. Thus, the effect of the justified critique of authoritarian and paternalistic structures in business and political institutions has been replaced by the hard-earned security via autonomy and creativity. And despite their best attempts to the contrary, the anti-capitalist social movements<sup>53</sup> have thereby contributed towards the neo-liberal optimisation of the welfare state.

Fraser's analyses take on a central role in the feminist debates. Accordingly, the feminist cultural success legitimates the structural reconfiguration of capitalism. The 'dangerous liaison' between feminism and capitalism (Eisenstein 2005) certainly did promote gender justice (*Geschlechtergerechtigkeit*) in the area of wage labour and in the recognition of women and non-heteronormative identities. At the same time, however, a shift took place from the struggle for redistribution to cultural rec-

---

<sup>51</sup> In so doing, government support is increasing – especially in Scandinavia and Germany – when it comes to the reconciliation of family and work. This involves the financial support of (better earning) young parents and the expansion of public care facilities for toddler and pre-school kids, as well as supervision after school see OECD (2011, 2016). This data also shows that gender-specific divisions of task still exist. Against this background, it is worth re-considering the supposed 'youth crisis' and thesis of 'feminisation' Forster et al. (2011).

<sup>52</sup> Hochschild (2003), Eisenstein (2005), Rosen (2007), Hess (2013), Fraser (2016).

<sup>53</sup> For Boltanski and Chiapello this includes women's-, homosexual-, anti-nuclear- and environmental movements.

ognition under the given conditions. Fraser holds feminism primarily responsible for this. Feminism strives to overcome the androcentric separation of the private/public, yet without taking the economic assumptions for it into consideration (Fraser 2009).

With regard to the supposed feminist neglect of the economic conditions, queer- and gender-theoretical approaches are falling under criticism. Tove Soiland and Rita Casale accuse them of a culturalisation of the political and epistemic claims of feminism.<sup>54</sup> Demands for autonomy, equality and recognition undergo specific translations in neo-liberalism, which express themselves in the withdrawal of state responsibility in the economisation of *Bildung* and education as well as in part of the care sector. Globally speaking, the proportion of exploitation has intensified along the categories *gender, class and 'race'*. In the global North, the anti-racist and anti-sexist social criticism is changing into an individually enforceable anti-discrimination legislation. The integration in the productive sphere is regimented through *gender and diversity management*. The question of care, in contrast, is spatially and temporally postponed: spatial in that neo-colonial practices of the global care chain are being installed. Care is additionally temporally pushed back through new technologies of reproduction (e.g. egg freezing).

Women play in multiple respects a central role in such processes: they belong integrally to the carriers of care drain and brain drain.<sup>55</sup> The educational advancement of the latter is accompanied by a shift in the former. The institutionalisation of feminist theory and politics has, above all, moved along the path of equality and the expansion of the productive sphere, and thus also lead to a further valuation of wage labour. Against this background, the integration of feminist demands in an existing economic-political system has taken place, so that it, as a whole, has lost some of its character of difference.

As the relation between the central concepts of feminist theory production and the social impact of feminist critique on institutions in the two parts of the article shows, feminism has to be described both as a theoretical *and* political movement. Therefore, feminism exceeds disciplinary boundaries, especially due to its transdisciplinary nature and both its academic and non-academic background. Emphasising feminism as a movement reflects the fact that neither theory production nor institutional changes taken alone correspond to the surplus that feminism represents as a historical process for modern societies. The importance of feminism for educational studies, philosophy of education and educational practice has to be explained in terms of an entanglement of the following: the critique of patriarchal and misogynous structures, the ideas and practices explicitly related to different understandings of generational relationships, the importance of the mother-child relationship for the formation of the subject, the critique of the patriarchal family-model as well as the institutional and curricular changes in the educational institutions. Regarding the idealistic concept of *Bildung*, feminist theories deconstruct the modern under-

<sup>54</sup> Soiland (2010), Casale (2008, 2014).

<sup>55</sup> See OECD/IOM (2014): Brain drain is, moreover, characterised in terms of gender in that, above all, highly qualified women have little ambition to return to their countries of origin.

standing of knowledge, primarily by pointing out the role of the body in the production and acquisition of knowledge. That feminists claim to think of a subject theory that goes beyond the Cartesian and idealistic traditions remains one of the central challenges facing the philosophy of education.

# Posthumanist Education?

Stefan Herbrechter

## The Posthumanization of the Education System

One might be very tempted to dismiss posthumanism as another Anglo-American theory fashion and to simply wait for this latest ‘postism’ to go the way of all the previous ones. If there was no globalization with its tangible effects both at an economic and a media and cultural level, this might be possible or even a sensible thing to do. But the fact is that, even in disciplines that have always been predominantly focused on their respective national spaces, cultures and institutions such as the humanities and social sciences – which includes education, of course – global flows nowadays increasingly provide the main political and institutional impulses. This occurs through global competition via mechanisms of international ‘transparency’ and ‘accountability’ (cf. university league tables, or international studies of education systems like the OECD’s PISA studies), which connect comparative educational standards with business location and correlate local training standards with an increasingly global competitive and mobile workforce. This puts national education systems under pressure to open themselves up to international and global benchmarking. Education, as a still predominantly national institution is forced, due to more flexible tax legislation under the conditions of global neoliberalism, to make major investments to convince mobile international and global corporations and elites that the right political decisions are being taken to provide attractive educational opportunities and business locations including a flexible and skilled workforce ready for the so-called knowledge society (cf. Zajda et al. 2008; Novelli and Altinyelken 2012; Meyer and Benavot 2013; Zajda 2015; Zajda and Rust 2015; Lingard et al. 2015).

e-mail: [stefan.herbrechter@coventry.ac.uk](mailto:stefan.herbrechter@coventry.ac.uk)

International comparison is thus regularly used to break up apparently too rigid or obsolete local structures within educational systems and to create greater transparency, accountability, flexibility and competitiveness (all classic ideologemes of neoliberalism). The aim is to prevent or maybe reverse the culturally and financially disastrous losses to educational investment through so-called brain drain. The pressure on education systems under these conditions of competition and free market ideology as well as fashionable notions like for example ‘transferable skills’, which are aimed at streamlining and adjusting national workforces with regard to global employability and mobility, in my view, already constitute a context which one might wish to call ‘posthumanist’. The posthumanist school and university, in this rather reductive economic sense, together with the accelerating and intensifying digitalization and ubiquity of (new) media technologies, therefore, in a sense, are heavily implicated in and are affected by the ongoing process of ‘posthumanization’.

Already in 1996, Bill Readings’s *The University in Ruins* provided a critique of the neoliberalization of the university. Readings’s debunking of the vacuity of neoliberal ideologemes like ‘excellence’, however, was not enough to prevent the further managerialization and the global reach of the ‘corporate university’. In fact, similar trends have been spreading throughout the entire education system ever since, so that the traditional and fundamental link between humanism and education, for better or for worse, has become much more tentative. If universities all over the world are anxious to invest ever more money in marketing to improve their ranking and to attract lucrative international students and establish satellite institutions all over the world, as well as setting up distance learning environments, this is happening in the form of a repackaging of the (humanist) notion of education as ‘knowledge transfer’, with a view to the proclaimed advent of a global ‘information society’. At the same time, mobility, transparency, flexibility and multiliteracy are used to sell an entirely instrumentalized form of education as individual investment and as ‘lifelong learning’ to the global constituency of ‘customers’. This means that the previous humanist consensus that education most importantly serves to help develop some idea of ‘personality’ has almost entirely disappeared.

This is the historical context in which the phrase ‘posthumanist education’, in my view, now has to be placed. In my *Posthumanism: A Critical Analysis* (2013; German edition 2009), I introduced some differentiations which I believe are still helpful to understand the emergence and the development of the *discourse* of posthumanism. A distinction should be made between “posthuman” and “posthumanist”, in which *posthuman* refers to a more or less fictitious *figure*, usually represented as either a spectre, a desirable ideal or simply human destiny (cf. also Braidotti 2013); while *posthumanist* refers to something like a current task, namely a questioning or an ongoing deconstruction of the entire intellectual *tradition* and the *set of values* that humanism is based on (cf. Badmington 2000). Posthumanism, in sum, therefore works like a discourse, with its own posthuman objects and its construction of a new social reality. Within this discourse, one should further differentiate between a variety of positions with regard to the changing nature of social reality (i.e. a variety of *posthumanisms*): namely a popular posthumanism and a critical

posthumanism, on the one hand, as well as a posthumanism ‘with’ and ‘without’ technology, on the other hand. Popular posthumanism is based on the idea of present or future transformation of humans into ‘posthumans’ and can be seen at work in a number of popular science magazines, television debates, YouTube videos and ubiquitous science fiction scenarios (all of which are increasingly merging into what might be called a new ‘cultural imaginary’). *Critical* posthumanism means above all a questioning of the current ambient ideas and trends with regard to the process of ‘posthumanization’, especially its motivations and ideological presuppositions. Critical posthumanism thus provides a kind of ‘psychoanalytic’ reading of current desires and fears of human transformation and self-understanding. It understands the prefix “post” as a symptom of a usually repressed lack of meaning at the core of the human (cf. Herbrechter and Callus 2008). The commonsensical understanding of posthumanism, however, focuses on technological change. This posthumanism “with” technology usually constitutes an approach based on the idea of an autonomy or autopoiesis of technological development, while a posthumanism “without” technology is of course not literally to be seen as “luddite”, but intends to divert the emphasis of the discussion away from technocentrism and technological determinism towards a more general anthropological (and postanthropological) trajectory (cf. Herbrechter and Callus 2007).

Another clarification with regard to the meaning of critical posthumanism concerns the historical dynamic of all things posthuman. More specifically, critical posthumanism problematizes the prefix ‘post-’ – in analogy with Jean-François Lyotard’s notion of the ‘post-’ in ‘postmodern’ – in the sense that it questions the very possibility of overcoming or transcending a humanist world picture. In this sense, posthumanism is clearly distinguished from transhumanism. As the prefix ‘trans-’ indicates, transhumanists like Hans Moravec, Vernon Vinge or Nick Bostrom argue for a transcendence of the human as such – a kind of transformation of humans into something else (i.e. into a new species, superhumans, artificial intelligence). Popular posthumanism often plays with such transhumanist scenarios. In its critical variety, however, posthumanism places the emphasis on a re-evaluation of humanist tradition and refers back to *proto*-posthumanist approaches, which already exist in various humanist traditions and antihumanist stances. It is therefore necessary to be aware of existing posthumanizing tendencies within humanism itself (and their critique) in order to keep a critical handle on the actual potential of and resistance to the excesses of current posthumanization processes and scenarios.

## Posthumanism and Pedagogy

The academic debate about posthumanism from the start has had an important educational component, even though this might have remained somewhat in the background until more recently. The first academic use of the term, in 1977, by the American literary and cultural theorist Ihab Hassan, occurred in the context and the

genre of what he called a ‘university masque’. With regard to what Hassan refers to a nascent posthumanism in the university he says:

There is nothing supernatural in the process leading us to a posthumanist culture. That process depends mainly on the growing intrusion of the human mind into nature and history, on the dematerialization of life and the conceptualization of existence. (Hassan 1977: 835)

And he continues:

At present, posthumanism may appear variously as a dubious neologism, the latest slogan, or simply another image of man’s recurrent self-hate. Yet posthumanism may also hint at a potential in our culture, hint at a tendency struggling to become more than a trend... We need ... to understand that the human form – including human desire and all its external representations – may be changing radically, and thus must be re-visioned. We need to understand that five hundred years of humanism may be coming to end, as humanism transforms itself into something that we must helplessly call posthumanism. (843)

The essential link between education and humanism lies in education’s historical aim of preparing children for majority (*Mündigkeit*; cf. Adorno 1971). And it is by no means a surprise that there are many current attempts to defend humanist objectives within education especially in the face of humanism’s demise (see for example Nussbaum 1997; Nida-Rümelin 2013). However, what seems to be irreversibly broken is the previous social and cultural consensus about humanist ideals and values – even though it has become increasingly obvious that these were in fact never as universalist or universalizable as they were made out to be. Humanism’s ambition to be universal in reach, based on the essentialist notion of a common *human nature*, was in fact always underwritten by a very specific *normativity* (i.e. white, male, European, cosmopolitan, enlightened, rational). It is precisely this universalist norm that has become contested and untenable, or has simply lost its implied addressee and thus its appeal, in the age of global migration, multiculturalism and radical pluralism of values. From a sociocultural point of view, posthumanism emerges precisely out of this (postmodern) discussion about pluralism, but, crucially, adds another component to it. This component is based, on the one hand, on technological development, and, on the other hand, on environmental change. Both developments lead to, what might be called, the emergence of a *postanthropocentric* world picture, as can be seen in the idea that humans are, from now on (but, in retrospect, have always been) only one group of actors among many other nonhuman forms of agency. Although this has always been the case, the spreading awareness that humans and ‘their’ environment (humans and nonhuman animals, humans and machines, objects, etc.) form units and are in fact *networked* is relatively new. When taken seriously, this has far-reaching consequences for ‘our’ current and future human self-understanding and thus, of course, for the education of future generations.

This is not to say that the current turn towards the posthuman and posthumanism within the theory and philosophy of education is without precedent. There have been previous attempts – mainly following the poststructuralist ‘ends of man’ or ‘death of the subject’ debate, on the one hand, and Donna Haraway’s ‘cyborg

manifesto', on the other hand – to engage with the new figure of the posthuman (without addressing the full implications of posthumanism as such, however). The poststructuralist-deconstructive route is maybe best represented in the interventions by Gert Biesta, while the cyborg-route was pioneered in Noel Gough's and John Weaver's work. However, only now are there volumes or collections appearing that provide an overview of the wider implications of posthumanism for educational theory and practice. The earliest strategic use of posthumanism in relation to educational theory is probably by William Spanos in his *The End of Education: Toward Posthumanism* (1993), whose starting point is the poststructuralist critique of the ideology of 'disinterestedness' that underlies the discourse of humanist education. In a similar vein, Biesta, in 'Pedagogy Without Humanism; Foucault and the Subject of Education' (1998), builds on the poststructuralist critique of the liberal humanist subject and the ends of man debate (cf. Derrida 1982; Jean-Luc Nancy and Philippe Lacoue-Labarthe 1981) as an attack on the "manipulative" character of humanist pedagogy (see also Biesta 2006). This philosophical trajectory based on a critique of power and a deconstruction of the liberal humanist subject is supplemented in the work of a number of other education theorists with a discussion of the social implications of "cyborgization" as introduced by Donna Haraway in the mid-1980s (cf. Haraway 1991). As early as 1995, Noel Gough, in 'Manifesting Cyborgs in Curriculum Enquiry' (1995) proposed to use the figure of the cyborg and the genre of science fiction as a way of opening up new forms of narrativization for science teaching – an approach which in later publications he supplemented with a turn to actor-network-theory, or ANT (see Gough 2004). This line of argument is also taken up by John Weaver in *Educating the Posthuman: Biosciences, Fiction, and Curriculum Studies* (2010), which calls for an engagement with posthumanism and the challenges posed to the idea of human nature by biotechnology and the new biosciences. In line with the erosion of human exceptionalism and the acknowledgement of nonhuman forms of agency, there are also more recent attempts to rethink education from other theoretical positions, which, nevertheless, may be subsumed under the label posthumanism, namely *new feminist materialism*, the already mentioned actor-network-theory (cf. Fenwick and Edwards 2010; 2011) and object-oriented-ontology (cf. Snaza and Weaver 2015).

In a special issue of *Gender and Education* (2013) on 'Material feminisms: new directions for education', the editors explain that:

The radical shifts occurring across the social sciences make this an exciting time for educational research. New material feminisms, post-humanism, actor network theory, complexity theory, science and technology studies, material culture studies and Deleuzian philosophy name just some of the main strands that call us to reappraise what counts as knowledge and to re-examine the purpose of education. Together these strands shift the focus away from individualized acts of cognition and encourage us to view education in terms of change, flows, mobilities, multiplicities, assemblages, materialities and processes. (Taylor and Vinson 2013: 665)

Two other recent publications are worth mentioning here to show the extent to which the discussion about posthumanism has entered educational and curriculum theory. In *Education out of Bounds: Reimagining Cultural Studies for a Posthuman*

*Age* (2010), Tyson Lewis and Richard Kahn argue for what they call “exopedagogy” – i.e. a pedagogy that goes beyond the “bounds” of anthropomorphism and which takes into account the entire “bestiary” of “posthuman (zoomorphic) monsters” (10ff). Similarly, and most recently, *Posthumanism and Educational Research*, edited by Nathan Snaza and John Weaver (2015), starts from the premise: “What would a world be that did not insist on human superiority or dominance and that did not disavow the human’s ecological entanglements?” (3; see also Snaza et al. 2014).

In the following, I propose to briefly discuss some of these different positions, spell out the stakes and implications of the phrase ‘posthumanist education’ and relate them to a few curricular aspects. I begin with a discussion of comments made by Peter Sloterdijk – whose importance for education theory in my view has not been sufficiently recognized. I am referring especially to the controversy surrounding his so-called Elmau Speech which takes as its starting point the current crisis of human “technologies of domestication” (*Zähmungstechniken*).

## Humanism as a Technology of Domestication

In recent years Peter Sloterdijk’s work has increasingly relied on the term “anthropotechnics” (cf. Sloterdijk 2009). In his ‘Response to Heidegger’s “Letter on Humanism”’ (the subtitle to his Elmau speech, entitled ‘Rules for the Human Zoo’), Sloterdijk recalls Heidegger’s critique of humanist metaphysics. Heidegger chastises humanism’s *Seinsvergessenheit* (forgetting of being) in the face of the modern technological challenge. Consequently, Sloterdijk puts forward his own technical or rather media-technological definition of humanism, which he understands as “telecommunication in the medium of print to underwrite friendship” (Sloterdijk 1999: 12) and as a “chain letter through the generations” (12), whose underlying “communitarian fantasy” of “participation through reading the canon reveals a common love of inspiring messages” (13). At the heart of this media technological illusion lies “a cult or club fantasy: the dream of the portentous solidarity of those who have been chosen to be allowed to read” (13). However, this ‘reading nation’ has been thrown into a deep crisis by the processes of globalization and digitalization. Sloterdijk describes the resulting squeeze in these words:

If this period [i.e. humanism] seems today to have irredeemably vanished, it is not because people have through decadence become unwilling to follow their national literary curriculum. The epoch of nationalistic humanism has come to an end because the art of writing love-inspiring letters to a nation of friends, however professionally it is practiced, is no longer sufficient to form a telecommunicative bond between members of a modern mass society. (14)

The disintegration of the humanist (phatic) bond is accompanied by growing fears that humanism actually might always have been relying on somewhat negative values as its main motivation, namely on the fear of a people governed by natural *Verwilderungstendenzen* [“a tendency towards the bestialization of humanity” (15)]. Basically, humanism understands itself as a melioristic antidote to humans’ inherent

barbarity: “Anyone who is asking today about the future of humanity and about the methods of humanization wants to know if there is any hope of mastering the contemporary tendency towards the bestialization of humanity” (15). Humanist education based on reading therefore amounts to what Sloterdijk calls *Zähmungstechnik* [technology of domestication], which is supposed to immunize humans against the spectre of the “unconstrained homo inhumanus” (15).

From this rather provocative analysis Sloterdijk draws two conclusions, which, in my view, have profound effects on any posthumanist educational programme. Behind the opposition between humanism and posthumanism and their respective fantasies or desires, according to Sloterdijk, lies the question of “anthropodicy” – that is “a characterization of man with respect to his biological indeterminacy and his moral ambivalence” (16). This implies the view that humanism is basically a specific media technological communication model, and that it is precisely the technical inadequacy of this model which has provoked the current crisis: “Above all... from now on the question of how a person can become a true or real human being becomes unavoidably a media question, if we understand by media the means of communion and communication by which human beings attain to that which they can and will become” (16). What is at stake in a move towards a posthumanist notion of education relies therefore on a return to the ‘underdetermination’ of the human – the openness and ambivalence of the human – while the specific pedagogical challenge lies in a fundamental change of media technologies. The pedagogical question that arises out of Sloterdijk’s analysis is: how does one prepare humans today, i.e. in the age of biopolitics, new media, digitalization and climate change, for the enormous and planetary challenges that lie ahead?

Sloterdijk understands the contemporary crisis of (European) national bourgeois humanism as an opportunity for a (transhumanist) thinking to emerge, where Heidegger’s critique, as well as that of a number of poststructuralist thinkers, such as Derrida, Lyotard, Foucault, Lacan, may be giving birth to new posthumanist schools of thought. What distinguishes these emerging posthumanisms from the earlier Heideggerian and poststructuralist critiques of humanism is, on the one hand, the reopening of the question of technology (in following but also going beyond Heidegger, especially as far as interdisciplinary approaches negotiating between the sciences and the humanities are concerned), and, on the other hand, the overcoming of Heideggerian or even Foucauldian anthropocentrism that remains inscribed in even the most radical antihumanist critique. Once humans begin to take the notion of postanthropocentrism seriously, fundamental ontological, ethical and environmental questions necessarily arise – questions that must inevitably affect any future-oriented pedagogy. For Sloterdijk, this epochal question should be articulated as follows:

What can tame man, when the role of humanism as the school for humanity has collapsed? What can tame men, when their previous attempts at self-taming have led primarily to power struggles? What can tame men, when, after all previous experiments to grow the species up, it remains unclear what it is to be a grown-up? Or is it simply no longer possible to pose the question of the constraint and formation of mankind by theories of civilizing and upbringing? (Sloterdijk 1999: 20)

In answer to the last question, Sloterdijk, conscious of writing in a time of what might be called (following Agamben, in his rereading of Foucault) the age of generalized “biopolitics” (cf. Agamben 1998), proposes a rethinking of a humanist *Zähmungsgeschichte* [history of taming] as a history of ‘breeding’ (Sloterdijk here alludes to the return of eugenics as a result of biotechnological advances).

Globalization, digitization and biotechnology in the process of a complex media-technological convergence produce an emergence of humans from their previous humanist state of ‘self-domestication’ and lead to a post- (or maybe trans-) humanist form of ‘self-cultivation’:

With the thesis of men as breeders of men, the humanistic horizons have been pried apart, so that the humanist can no longer only think, but can move on to questions of taming and nurture. The humanist directs himself to the human, and applies to him his taming, training, educational tools, convinced, as he is, of the necessary connection between reading, sitting, and taming. (Sloterdijk 1999: 22)

Posthumanist educationalists would thus necessarily have to start by questioning not only existing humanist taming technologies and adapt them for ‘our’ time, but they would equally have to query the very idea or necessity of and motivation for ‘taming’ as such. However, if Sloterdijk’s analysis is correct, would the very possibility of pedagogical thinking and pedagogical reason not break down altogether? Which minimal consensus about values, what minimal notion of humanity and which minimal idea of education for humans could still be established or presupposed, once the idea of ‘self-cultivation’ through educational reproduction was abandoned? Is the phrase ‘posthumanist education’, in this sense, not a contradiction in terms?

The current “intellectual discomfort in the human zoo” (Sloterdijk 1999: 25) – the (theme) park-like conditions that Sloterdijk refers to as the anthropotechnological “spheres” that humans have been creating to protect themselves and which allow for their “hominization” in the first place – demands a posthumanist thinking in the face of a “zoo-political task” (25). Interestingly, in his interpretation of the crisis of humanism Sloterdijk, almost instinctively, returns to the very beginning of European humanist thought – Plato – and explains that:

Plato’s dangerous sense for dangerous ideas finds the blind spot of all high culture pedagogies and politics – in particular, his admission of the actual inequality of people before the knowledge that power gives. (25; translation modified)

What transpires here, however, is that Sloterdijk turns out to be not so radical a thinker of a progressive posthumanist project for a transformed democratic education, after all, but someone who remains profoundly caught up, rather like Heidegger, in a feeling of late humanist frustration. He seems to place himself, somewhat nostalgically, in the position of a (reluctant) observer of the current ‘archiving’ process of the humanist tradition. It is this nostalgic tone which in the end poses the greatest challenge for a *critical* posthumanism whose aim must be the development of a *positive* educational programme, without this kind of *ressentiment*:

Everything suggests that archivists have become the successors of the humanists. For the few who still peer around in those archives, the realization is dawning that our lives are the confused answer to questions which were asked in places we have forgotten. (27)

A cynic might be tempted to say Sloterdijk has thus replied to Heidegger's letter in a somewhat melodramatic fashion. Despite its critical disguise, however, this reply has simply performed a continuation of the humanist trajectory while invoking its end. The letter, in this sense, has not failed to arrive at its destination. However, taking Sloterdijk's own analysis seriously, one would have to write very different kinds of 'letters' – on other media platforms, for example. The question would be to what extent these would still afford letter writing. Rhetorical and stylistic consequences necessarily would arise and the very idea of a correspondence would be challenged. It is this new (media) situation which constitutes one of the main starting points for a *critical* posthumanist education – namely the move from literacy to what might be called *mediacy*.

### ***Critical* Posthumanist Education**

So can there be a posthumanist education at all? This is where I need to come back to the meaning of the term *critical* in the phrase 'critical posthumanism'. One reaction to Sloterdijk's reply to Heidegger would thus need to be performative, so to speak. The humanist founding and legitimating gesture of writing letters – a gesture on which 'men' and 'republics of letters' have been relying and to which they cannot stop 'replying' (which of course includes my own humble response here) – always presupposes a certain ideal of literacy at the core of any humanist understanding of education. Given the requirement of this most important of humanist technological *dispositifs* – i.e. literacy – how would a *critical* posthumanist education look in terms of curriculum (if, indeed, the notion of curriculum can escape its posthumanist deconstruction)? If we follow the logic of postanthropocentrism I outlined above, a focus on proliferating environmental issues including ethical, political as well as epistemological aspects seems to suggest itself. In the remaining part of this section I would like to briefly turn to each of these aspects (i.e. ethical, political and epistemological).

We can assume that the crisis humanist education finds itself in has been caused by changes both to the (humanist) system as well as to the (humanist) subject that supported this system and in turn was supported by it. In terms of the system, this crisis has been exacerbated by neoliberal globalization and the resulting global competition in educational standards. In terms of the subject, new media technologies have led to a change in the fundamental self-understanding of humans as well as to new forms of subject positionings or interpellations (to extend Louis Althusser's term). How would a critical posthumanist pedagogy support, as well as provide possibilities for a critique of, these emerging new subjectivities and thus enable them to critically and creatively address their new systemic environments. This requires, in my view, an ethical-ecological, a political-technological and an epistemological-cognitive conceptualization, which need to be associated with their respective appropriate learning contents. To recapitulate, this move is based on the understanding of the 'post-' in 'posthumanism' not as a displacement, an overcoming of or a

detachment from the humanist tradition, but as a critical reappropriation, a per-laboration or rewriting of it.

In the biotechnological age and the time of generalized biopolitics, a posthumanist and postanthropocentric ethics must, by definition, be 'organic', in the sense that it should be concerned with life, its affirmation and its survival. A posthumanist ethics is therefore, on the one hand, characterized by the awareness of human-induced climate change with its global impact on the geosphere, biodiversity, resource extraction and the associated problems of sustainability (cf. the emerging geological debate around the Anthropocene (see for example Clark 2015; Malone et al. 2017)). This aspect is so central – a question of survival, not only for the human species, but for the entire life-supporting environment with its nonhuman actors (animals, plants, machines, objects, etc.) – that ecology is in fact becoming the new core educational subject. Instead of being just a new subject, however, ecology functions more like a complex of ideas that informs every teaching practice and curriculum, in any school or university from the very outset. Whether natural sciences, social sciences or humanities, at the beginning of any subject-specific training there has to be an engagement with postanthropocentric questionings designed to develop an environmental consciousness. For the humanities in particular, this means a shift towards teaching the history of hominization from a postanthropocentric standpoint that also addresses and critically evaluates the idea of human exceptionalism and incorporates a focus on environmental entanglement as well as the importance of nonhuman forms of agency.

One step in this direction would be creating a responsiveness to the work that has emerged out of (critical) animal studies, and which would address and reverse the literal disappearance of animals from human-centred environments throughout modernity (with the exception of some selected companion species, zoos, nature television programmes and, of course, ever-increasing meat consumption). The affective changes that the *deanimalization* (both material and psycho-social) and the segregation of human and nonhuman environments have produced throughout modernity need to be critically addressed and if possible reversed, to create a human self-image that recognizes the entanglement of human and nonhuman animality at both a material (embodiment) and ethical-ecological level (biodiversity as an intrinsic good). As long as animals are primarily seen and dealt with as goods and industrial products, the process of human denaturation cannot even begin to be taught appropriately. The technophantasm of a complete separation between spirit and matter, as promised by transhumanists for example (which merely continues in the tradition of two millennia of Christianity and dualist metaphysics), will have to be detracted and its cruelty and exclusionary character exposed as part of a long history of the displacement of physicality and the devastating effects this has had on our fellow animals as well as on our human self-image. An ethical-ecological education therefore has to critically respond to the positive *and* negative aspects of posthumanization, especially with regard to issues of sustainability, redistribution and social justice, in which the interest of humans may not automatically be considered as a priori central. As an example, let me refer at this point to the extremely

valuable work by Helena Pedersen which engages with educational theory and animals in the classroom (Pedersen 2010a).

The presence of nonhuman animals in education, according to Pedersen, “makes visible the coercive and exclusionary implications” of current education policy, and “requires education to seriously scrutinize its own embeddedness in reproductive practices and thought patterns and take effective measures toward its transformation” (Pedersen 2010b: 693). The benefit of engaging with posthumanist theory, for Pedersen, lies in the fact that it “complicates many assumptions surrounding the relations between education and democracy and provides new perspectives on the notion of ‘voice’ in a context where individual and collective voices of disadvantaged or subordinate groups (human or animal) are marginalized or silenced” (687). In this context, the decisive challenge that posthumanism poses is: “What would it mean for democracy education to respond to the ‘voices’ and lived experiences of nonhuman animals?” (ibid.). Posthumanist approaches to animals in education, on the other hand, should address the implications for formal education if approached as a web of socio-material relations where humans, animals, scientific knowledge, technologies and artefacts interact under shared conditions in a biosocial space (cf. Pedersen 2015). Practically, for a truly posthumanist education this means that the constitutive speciesism at work in existing pedagogy does not only have to be addressed as such but would need to be actively undone, deconstructed, in order to jam, so to speak, what Agamben (1998) refers to as “the anthropological machine”. This alone would begin to tackle humanist education’s implication within the (re)production of human self-understanding based on exceptionalism (cf. also Pedersen 2010c).

In connection with this ecological trajectory of postanthropocentrism the question of the distribution of and access to resources – material, biological, as well as cognitive and media technological – also needs rearticulation. This entails the second aspect, namely the political-technological dimension of any posthumanist pedagogy worthy of its name. For our current situation, this means a reorientation not only as far as the accessibility of the latest technologies are concerned (for the purpose of communication, commerce, mobility, health, leisure), but it requires a kind of second ecological shift towards postanthropocentrism with its new understanding of humans and nonhumans in relation to an emerging global media technological environment. The most advanced approach in this respect, in my view, can be found in Bernard Stiegler’s work (1998, 2016), in which he refers to the “originary technicality” of the human (not unsimilar to Sloterdijk’s “anthropotechnics”), and in which he insists on the co-evolution of humans and technology.

The question of technology – as it was so insistently formulated by Heidegger – today returns with a vengeance and with increased urgency (i.e. in the context of global bio-media-politics). It returns as the increasingly urgent question of human self-understanding, in the face of ever greater disappearance and ambient extinction threats. So, while all human being is ‘technical’ (Stiegler) – in the sense that it was the technical supplement or prosthesis that made us human in the first place, and that, today, in the ‘fourth age of technology’, promises to make us posthuman – the ‘essence’ of technology is still nothing technical but instead stubbornly remains ‘poietic’ (i.e. transformative, creative, ‘challenging forth’). It is important, however,

when speaking of technology, technicity or the technical not to forget the processes of mediation which is their *raison d'être*. It is more than plausible that early techniques developed in the Stone Age may have started the hominizing process. The techniques that have been developed since then through trial and error and steady perfecting, however, beyond their simple instrumental character have had an ontological and medial side effect: ontological, in terms of developing a specific human self-understanding (e.g. in the sense of a modern *homo faber*) and medial, in that they allow the development of externalized media of communication. Marshall McLuhan (1994) referred to this media-technological understanding of technicity as 'extensions of man'. However, as indicated above, even though technicity and mediality might overlap, they are not quite identical. During the course of modernity the relationship between technicity and mediality, for example can be said to have 'flipped'. The development of technics and technology is basically congruent with the development of modernity – namely with industrialization, rationalization and globalization. Three aspects that play a special role in this process are language, culture and embodiment, which thus render an identification of this process with technicity problematic and instead are better understood as changes in mediality.

This is even more relevant since, for Stiegler (following Heidegger), "*every technical object is pharmacological: it is both poison and remedy at the same time*" (Stiegler 2013: 421). A 'pharmacology' (e.g. the understanding of what Stiegler refers to as '*épistémè numérique* [the episteme of the digital]' as *pharmakon*) thus involves a critical analysis of the socio-political use of technologies in view of their fundamental ambiguity (as remedy, poison, scapegoat and, as I would add, as *media*). The digital, for Stiegler, is precisely such a challenge which concerns "la vie de l'esprit" [the life of the mind], which is essentially based on "exteriorization", that is to say, on "the conditions of its expression, which are also those of its impressions" (Stiegler 2014: 14): "we claim that digital evolution of technical exteriority and the processes of interiorization that it produces in return constitute a new age of the mind, a new mind that would be made possible by this new form of writing that we believe the digital to be, and which forces us to rethink the mind itself in its totality" (14; my translation). This digital (r)evolution and the constitution of a "knowledge society", according to Julien Gautier and Guillaume Vergne, "with their promises and above all, for the moment, with their dangers, put the educational system into a new central and at the same time problematic situation":

In particular, the new technologies whose development oscillates between stultifying mass industry and unprecedented democratization of access to knowledge, seem to spell the end of a school whose aims seem to have become obsolete and whose methods are deemed archaic. However, does a solid formation of judgment and of culture not appear so much more primordial since we have entered an age that leaves us more and more to our own devices, with our minds weighed down by a constant flow of information and incessant solicitations. (Gautier and Vergne, in Kambouchner et al. 2012: 13–14; my translation)

The question of what teaching might mean in the digital age, for Stiegler, is the question of education's 'pharmacological' desire to '*prendre soin*' [take care] of the mind, to control and form the mind's capacity for attention and taste. This means that it is essential to address the "toxic" effects of digital technologies and to place

them within the service of a “knowledge society” and exploit their potential of new forms of “transindividuation” for positive political ends (Gilbert Simondon’s term, see Gautier and Vergne 2012: 17).

It follows, therefore, that the third aspect of a posthumanist pedagogy is aimed at the development of a new aesthetic. This includes the above-mentioned ethical-ecological and political-technological aspects. It arises out of the changing forms of mediality and the new methodological issues raised by them. As indicated, Sloterdijk’s insistence on the centrality of changing media, through digitalization and globalization, from a literary to a posthumanist, i.e. post-literary, value system, does not necessarily lead to nostalgia or a sense of loss, but may as well constitute a chance or even a necessity. This is, for example, Michel Serres’ attitude in *Petite Poucette* (2012). In this short educational treatise addressed to ‘Thumbelina’ – the name he gives to the generation growing up with the new haptic environment of keyboards, screens and mobile media – Serres states that:

Without us noticing a new human was born within the brief interval that separates us from the 1970s. He or she does no longer have the same body, the same life span, no longer communicates in the same way, no longer perceives the world in the same way, no longer lives in the same nature, no longer inhabits the same space... . Since they no longer have the same head as their parents, he or she knows otherwise. (Serres 2012: 13; my translation)

For Serres, the move away from the ‘format-page’ (the format of the page but also the formatting page – of which screens are the latest but also possibly the last remainder) opens up the possibility of new forms of intelligence based on invention, which, for Serres is measured by its opposition to and distance from knowledge per se.

In the same measure as the global media system converges in new media, a new form of media literacy thus becomes a central educational demand, both for the purposes of the system itself, as well as for its critical observation and thus for a creative intervention within it. Mostly this new skill-set is still referred to as “literacy”, or as “new literacies” and “multiliteracies” (Buckingham 2003; Cope and Kalantzis 2000). The demand for new literacies for new media-technological environments, with their new forms of sociality, cooperation and participation, whether they serve to improve the use of stationary media (e.g. computer terminals), or the rapidly increasing number of mobile media (smart phones, tablets, etc.), is closely related to media convergence, i.e. the transition from mass to open and p2p media. Henri Jenkins, one of the pioneers of media convergence, was asked to translate the challenges of this new participatory media culture into a rationale for a media education for the twenty-first century. Jenkins’s intervention was designed to lead to a reorientation within the debate between traditionalists and sceptics about how a future-proof media education would have to proceed. The goal, as Jenkins writes, was to “shift the focus of the digital-divide discourse from questions of technological access to those of opportunities for participation and the development of cultural competencies and social skills needed for full involvement” (2009: xiii). To this end, Jenkins focused on:

*new media literacies*: a set of cultural competencies and social skills that young people need in the new media landscape. Participatory culture shifts the focus of literacy from individual

expression to community involvement. The new literacies almost all involve social skills developed through collaboration and networking. These skills build on the foundation of traditional literacy and research, technical, and critical-analysis skills learned in the classroom. (xiii)

What at first glance looks like a radical change in Jenkins's approach, however, is largely taken back at the end of this passage and relinked to traditional *literacies* developed through humanist educational practice. Even the pioneer of virtual reality and of the notion of virtual communities, Howard Rheingold, in his book on the subject, *Net Smart* (2012), bases his argument on an expansion of current literacies and advocates their "supplementation" by skills that optimize the usage of the internet: "attention, participation, collaboration, the critical consumption of information (aka, 'crap detection'), and network smarts" (Rheingold 2012: 5).

Thus, whether we are dealing with arguments for developing new forms of literacy (e.g. 'ludoliteracy', i.e. enhancing literacy through gaming practices and strategies) or for integrating new participatory forms of media skills into the educational programme (see e.g. 'peeragogy'), these conceptualizations all have one thing in common: they present themselves in terms of continuity with the idea of the literate. In my view, all these varieties of new literacy remain caught up in the dynamic of Sloterdijk's notion of (humanist) domestication. Even if this taming process might no longer affect humans exclusively it nevertheless remains an attempt at taming the potential for change in digital and new social media. These attempts might thus all be described as weak defences in that they stress the idea that traditional literacy skills are more in demand than ever as people move into the digital age, in which we apparently do not read less, but indeed more – even though we have less and less time for more and more reading material. Of course, this does not only have stylistic, grammatical and pragmatic effects on language use, but also on cognition and the attitude towards media more generally. These effects are fundamentally *aesthetic* in nature and concern the existing linguistic and cultural ecology more generally (think for example of the dominance of English in the emerging new social media world or the spreading of a global popular culture by global mobile media).

The positive argument that lies behind the drive towards an adequate integration of digital media within current pedagogical theory and practice (cf. Buckingham 2007) is thus merely the reverse side of the often quite grotesque attacks on the 'dumbing down' potential of new and, by implication, all screen media (a thesis that is well known at least since the advent of commercial television). The dumbing down argument usually refers back to the idea of an assault on the reading culture of humanism (cf. for example Mark Bauerlein's *The Dumbest Generation: How the Digital Age Stupefies Young Americans and Jeopardizes Our Future* (2009)).

In my view the potential benefit of a *critical* posthumanist education lies entirely elsewhere. If one takes the potential for change contained in new media and digitalization seriously (keeping in mind the context of globalization in which these new media are functioning), there are indeed high risks but also great benefits. And this is where the political task for a posthumanist education lies: namely in taking the potential seriously and thinking it through so to speak before negating or stressing any continuities. This is also the way I understand Gautier and Vergne in their

preface to Kambouchner, Meirieu and Stiegler's discussion of the "digital school", in *L'Ecole, le numérique et la société qui vient* (2012):

There is no time any more to ask ourselves whether standards are 'going down' or 'rising', nor whether we need to place the child, the teacher or knowledge at the centre of the system, nor whether we should introduce new technologies in school or not. (2012: 12; my translation)

In the face of the 'digital revolution' which leaves the new 'pharmacological' exploitation of technologies of memory ('hypomnemata'), described by Stiegler, to the economy, a posthumanist education would have to reclaim the critical and creative potential contained in new media technologies for pedagogical purposes. Some early attempts of this were already made in the 1980s, and can be found, for example in Gregory Ulmer's work, which argued for a shift from literacy to "electracy" (cf. Ulmer 1989, 2003; Holmevik 2012).

Katherine Hayles, whose *How We Became Posthuman* (1999) is usually seen as the beginning of a critical engagement with the cybernetic vision of posthumanism, in her more recent work deals with the cognitive changes and their (among other aspects, pedagogical) potential of digitalization. In *How We Think* she starts from the assumption that "we think through, with, and alongside media" (2012: 1) and shows how this has already affected the current educational programme, especially in the humanities. Her starting point corresponds to the posthumanist self-understanding and positioning laid out above: "The ability to access and retrieve information on a global scale has a significant impact on how one thinks about one's place in the world" (2). In the intensified interaction between human and computer and the new subjectivities and forms of embodiment that arise from this process, Hayles claims that we are witnessing a shift towards "extended" and "distributed cognition" (3). Consequently, she argues for establishing 'comparative media studies' as a new and central subject for schools and universities, which helps investigate the mentioned co-evolution of humans, technology and media (or, as Hayles calls it, 'technogenesis').

Even though Hayles also still relies on the metaphor of expanding *literacies* to designate new competencies, she nevertheless focuses on the cognitive changes that are produced by new forms of reading behaviour. She proposes a three-tiered system of reading: traditional (humanist) "close reading", "hyper reading" and "machine reading" (Hayles 2012: 11):

Hyper reading, which includes skimming, scanning, fragmenting, and juxtaposing texts, is a strategic response to an information-intensive environment, aiming to conserve attention by quickly identifying relevant information, so that only relatively few portions of a given text are actually read. (12)

This form of reading behaviour if formalized and pedagogically supported correlates with "hyper attention, a cognitive mode that has a low threshold for boredom, alternates quickly between different information streams, and prefers a high level of stimulation" (12). This is virtually the opposite of what is going on in 'close reading'. While "hyper attention" is often (mis)interpreted as a deficit (if not a pathology, cf. ADHS), it would be preferable for educational purposes to focus on hyper

reading as a cognitive (and possibly evolutionary) survival technique in the age of “information overload”, because “attention as a focus for inquiry opens onto a complex and urgent set of issues, including the relation of human to machine cognition and the cycles of epigenetic changes catalyzed by our increasing exposure to and engagement with digital media” (Hayles 2012: 12).

Bernard Stiegler sums up what is at stake in a more enlightened educational engagement with the ‘post-literary’ potential of new digital media and the ‘new attentional forms’ they produce (for better or for worse):

If in fact an appropriate therapeutic response to this pharmacology of attention is conceivable and able to be transindividuated, then the question would be to what degree can and even must these digital relational technologies also give birth to *new attentional forms* that pursue in a different manner the process of psychic and collective individuation underway since the beginning of grammatisation; new forms that make this network society arrive at a new stage in the individuation of this plural unity of the *logos* where the attentional forms we recognize as our culture abound? (Stiegler 2012: 8; see also Stiegler’s latest work on the very ambivalent effects of digitalization on the ideas and practices of work in an increasingly ‘automated’ society, cf. Stiegler 2015a, b and 2016)

## Conclusion

The either feared or anxiously awaited pharmacological and neuronal ‘rewiring’ of humans through digital media technology is necessarily related to changes within our human self-understanding. A critical posthumanism should of course not start from the purely ‘neurocentric’ or cognitive assumption, that this change might be fully explained by a correlation of neurological adaption and media-technological change, but instead should also emphasize the cultural, contextual and aesthetic aspects of current transformations. The main task remains to learn to critically and fairly assess the potential for change in order to draw the right conclusions for post-humanist education policy. As Hayles proposes:

The trouble, as I see it, lies not in hyper attention and hyper reading as examined but rather in the challenges the situation presents for parents and educators to ensure that deep attention and close reading continue to be vibrant components of our reading cultures and interact synergistically with the kind of web and hyper reading in which our young people are increasingly immersed. (2012: 69)

But what if it is exactly this rational attitude of compromise that is stopping us from seeing and understanding the true transformational (i.e. critical-creative) potential of the digital, and what if it was exactly this critical-creative potential that was needed to solve the massively complex and entangled problems that our future and the survival of the planet hold? One cannot help but think that it might be our inveterate humanist reflexes themselves that have led us into the current situation, and that it could be precisely the concealed, posthumanist, potential of an entirely other form of reason, hiding behind the dynamics of new media technology, that we need to do justice to if we want to even begin to tackle the entirely new form and

dimension that future crises may have. Herein lies, in my opinion, the urgency of the posthumanist challenge to rethinking education – namely, in developing a new impartiality outside anthropocentrism, wary of our most strongly and invisibly ingrained humanist reflexes.

**Section III**  
**Revisiting Enduring Debates**  
Contributing Editors:  
Ann Chinnery, Naomi Hodgson,  
and Viktor Johansson

# Introduction: Section 3 – Revisiting Enduring Educational Debates

Ann Chinnery, Naomi Hodgson, and Viktor Johansson

Debate is arguably a central aspect of philosophy. There are a number of topics, however, on which the weighing of argument and counter-argument does not reach a final conclusion, but only a temporary settlement before the issue raises itself again. Understanding the historical development of such debates in philosophy of education is crucial to an appreciation of contemporary discussions in the field of education more broadly. They are debates that seem to have been always there and that continue to challenge new developments. Each chapter in Section 3, Revisiting Enduring Educational Debates, situates the debate related to a particular topic, considers its relevance, and highlights how it continues to influence educational theory and practice today.

Each author for this section, invited to contribute based on their expertise in the topic, explores a range of positions on and approaches to the topic to draw out potential points of tension between them. Readers will thus not only be able to locate themselves within the international debates, but also be invited to consider future directions for study in these areas. The chapters in this section vary in both tone and scope, but each includes the following aspects:

- Emergence of the topic as an educational concern
- Historical changes in framing/addressing the topic as an educational concern

- International dimensions
- Predominant approaches to understanding the topic within philosophy of education
- Key points of recurrent debate on the topic in philosophy of education
- Current state of the debate

When read together, the chapters can be seen as exploring three broad subthemes: (a) the politics of education and the educated citizen; (b) education and human being; and (c) knowledge and the curriculum. Introducing the chapters through the lens of these subthemes demonstrates the contribution of philosophy of education to these enduring educational debates.

Philosophy of education has always developed in response to a particular, concrete political reality. The philosophy of Socrates, Plato, and Aristotle, for example, engaged in various ways with educational aspects of the political problems of their day, but the questions they raised recur today in response to our own sociopolitical conditions. Perhaps the most obvious example of such an enduring debate is on the relationship between citizenship and education. This is reflected in Quentin Wheeler-Bell's chapter on democracy and education. The chapter shows how rich and complex educational articulations of political concepts can be, and how demanding it can be to approach them through this lens, for both philosophers of education and educators. Penny Enslin and Mary Tjiattas take up the concept of citizenship directly in their chapter, in which they discuss the different notions of citizenship education that have been informed, variously, by liberalism and republicanism, and show how philosophers today discuss it in relation to nationalism and patriotism. These issues recur in the chapter 'Refugees, Statelessness, and Education' by Niclas Månsson. He shows how philosophers have addressed transnational immigration as an issue in education by appeals to various conceptions of citizenship. This overlooks, he argues, the existential dimension of the condition of refugees, which raises it as an educational-philosophical matter rather than just an issue for education. Also challenging the language in which we conceive of the relationship between politics and education, Chris Higgins shows how conceptions of the private and the public in education have been debated since Plato in response to the conditions of the time. Higgins relates this to the idea of the common school to show that the school that has emerged in actuality serves neither the public nor private exclusively.

Education philosophers' analyses of their conditions have often led to the creation of new concepts that become matters of further debate and thus issues in themselves. This becomes clear in Claudia Schumann's chapter on cosmopolitanism and globalization, in which she shows how different notions of cosmopolitanism respond to various understandings of the 'globalized world'. We see how cosmopolitanism itself becomes an educational concept to which philosophy responds. Similarly, multiculturalism has been subject to various philosophical and political treatments, and is a recurrent issue for philosophy of education, in part due to shifts in the way we think about diversity. Reflecting on personal experiences, Judith Suissa draws out historical shifts in how we have conceived issues of diversity

in education, and how philosophical reflections on multiculturalism have become a challenge for philosophy of education.

Another example of an educational and political issue giving rise to a particular conceptualization, which then becomes an object of scrutiny in philosophy of education itself, is found in Sheron Fraser-Burgess' chapter on identity politics and belonging. Here, questions of belonging, initially raised regarding persons with disabilities, have been conceptualized and taken up in political and educational practice in terms of a 'politics of belonging', a term that itself is now problematized. Fraser-Burgess shows how the development of new conceptualizations of political issues in education gives rise to further forms of educational thought and practice. Not all of the topics addressed have as long a history as these, however; some are the result of more recent shifts in politics, ideologies, and societal structures. Ian Munday's chapter on performance and performativity treats one such, relatively recent yet prominent, development. As in many of the other debates, the very terms 'performance' and 'performativity' are highly contested. As Munday argues, this has not only led to a variety of philosophical positions in relation to the issues, but also to confusion about the meaning of the terms and how they are used. These chapters demonstrate how philosophy of education not only struggles with challenging issues, but also has the potential to clarify both what is at stake and the great variety of meanings involved in using the same terms, especially when those terms are contested.

As seen in relation to the long history of debates on the relationship between politics and education, questions of what it means to live a good life, and what it means to be human, endure and recur in philosophy (of education), taking on greater urgency in the face of political, economic, and social change. A number of chapters take up questions of education and human being and address the ways that the object of these enduring debates has changed and the shape they take today, from both normative and more descriptive, phenomenological perspectives.

The concept of *Bildung* has been central to humanist educational philosophy and theory. Heikki A. Kovalainen recounts its history, and its resonance in different linguistic contexts, and asks whether this rich conception of education is compatible with educational assessment as we understand and practice it today. Drawing on philosophical sources and a practical example from Finland, Kovalainen challenges the assumption that *Bildung* and assessment are antithetical. The tension between rich conceptions of education and human flourishing and the constraints imposed by the societies and systems in which we are raised and educated is encapsulated in the 'nature-nurture' debate. Koichiro Misawa surveys the emergence of this debate in a late nineteenth century Anglo-American natural-scientific conception of nature. He shows, however, that this tension as a focus of educational-philosophical thought can be traced back at least to Ancient Greece. Drawing on Aristotle and John McDowell, Misawa highlights the false dichotomy of the nature-nurture debate in the idea of 'second nature': although we acquire particular traits and virtues through 'nurture'/culture, these become natural to us. Beginning again with Aristotle, Johan Dahlbeck takes up a different register of human nature in his consideration of the current emphasis on character in education. Dahlbeck considers the Western

tradition of virtue ethics and how it shapes the understanding of free will in contemporary character education before positing a Spinozan alternative to the current Aristotelian/Kantian rendering.

The enduring concern with *Bildung* and character and virtues education reflects a general human concern with ‘well-being’. As Doret de Ruyter states, whether understood as the subjective positive evaluation of one’s life or a conception of what it means to be an educated person, well-being is a concern of most educational theories. De Ruyter provides an overview of different conceptions of well-being and the normative claims they make about how educators can best enhance the well-being of children. Educational theory and practice concerning well-being and character education draw increasingly on psychological frameworks, however, and there is a danger that this overlooks the philosophical aspects of these areas of human life. Liz Jackson, in her chapter on care and justice, draws out these aspects, referring not only to accounts of ethics in the Western tradition – from liberal framings of justice that give little or no space to emotion, to care theories that afford it a more central role – but also to approaches in the Eastern tradition that intersect with and challenge them. In debates concerning educational justice ‘capability’ has been a highly influential concept. Ashley Taylor’s chapter considers both its most familiar form, in Capability Theory, and its broader philosophical treatment.

Educational debates around injustice and inequality – concerning race, sexuality, gender, religion – are perhaps more commonly found in sociology. The frameworks according to which such research is undertaken, however, often go unquestioned. Carrie Paechter addresses this in her chapter on gender. She raises issues with the unquestioned adoption of the thought of Judith Butler – developed with a focus on adult sexuality as a condition of political participation – in research regarding children’s identity. In addition to the pertinence of the topic itself, the chapter is an important reminder that our theories are as much a construction as any form of knowledge or identity. We must remain aware, then, not only of what we *do* do when we theorize, but also of what we *don’t* do, of what is left out. In Stefan Ramaekers’ chapter, ‘Parenting, Childrearing, Upbringing: Philosophy of Education and the Experience of Raising a Child’, he considers what is left out of our understanding of what it means to raise children by the shift to the language of ‘parenting’. But also he raises the issue that the pedagogical context of childrearing and family life has largely been left out of philosophy of education, particularly in its Anglophone form. Similarly, Joris Vlieghe draws our attention to our neglect or suppression of the body in accounts of education; it is either treated negatively, or not at all. Identification of this suppression is not new; both Freud and Nietzsche remarked upon it. Vlieghe provides an overview of those schools of thought – phenomenology, feminism, post-structuralism – that have attended to the physical nature of our being human. His account of ‘physical education’ itself shows that although there have been recent attempts to treat the body positively in educational terms, it remains problematic, and further work is required to give it its due in our theorizing.

As the introduction so far indicates, the recurrence of debates in philosophy of education is driven not only by pressing policy issues of the day, but also by the very

language in which those debates are constructed. The matter of what – and whose – knowledge we pass on to the next generation constitutes a further important facet of this. In his 1884 essay, ‘What knowledge is of most worth?’, Herbert Spencer posed the question that lies at the heart of ongoing debates over curriculum and conceptions of the educated person: ‘In education, then, this is the question of questions ... The first in importance, though the last to be considered, is the problem – how to decide among the conflicting claims of various subjects on our attention’ (p. 13). David Bridges tackles the matter head-on by looking at the school curriculum and the normative character of decisions about what should be included, as shaped by three particular points of reference: the good life, the good society, and the good person. He then considers debates over who should control the curriculum and explores two contrasting conceptions of the curriculum: one that sees it as analogous to a production line, the other to a research site. This leads nicely into Alis Oancea’s chapter on the practice of educational research. In contrast to long-held assumptions about the division between theory and practice, Oancea presents an argument for considering educational research as a form of practice.

The next three chapters address themes that are now receiving greater attention in philosophy of education. John Tillson’s chapter on religious education asks how children ought to be influenced with respect to religions, focusing especially on the moral and legal permissibility and desirability of various answers to that question. Michael Bonnett examines the increasingly important role of environmental education in philosophy of education. He discusses core concepts such as sustainability, ‘place’, anthropocentrism, ecocentrism, eco-justice, instrumentalism, post-humanism, post-ecologism, and scientism, and the various perspectives that inform debates around these ideas. Gerard Lum’s chapter on vocational education looks at the global trend toward so-called competence-based approaches to education. The widespread influence of these approaches, from kindergarten through to higher education, Lum argues, has revitalized philosophical disputes about the knowing-how/knowing-that distinction and the relationship between theory and practice. Pulling back again to a wider view on questions of knowledge and the curriculum, Emma Williams charts the historical debates on knowing-how and knowing-that, focusing in particular on the limited and reductive ways such conceptions of knowing often find their way into educational policy and practice. She then takes the debate in a different direction by offering a renewed, richer account of knowing by acquaintance informed by Heidegger’s phenomenology. In the next chapter, Anna Kouppanou addresses the debates about technology, digitization, and education. She introduces key questions in the philosophy of technology and offers alternative conceptualizations of technological artifacts and human beings. In the final chapter of this section, Viktor Johansson explores philosophy for children, the role of children in philosophy, and how childhood itself may impact philosophy. He invites readers to think of philosophy for children not as a particular discourse or movement, but as something that comes to us as a gift, an unexpected encounter with a particular child in which we – adult and child alike – are “struck by a question we don’t even know how to begin to answer, by the expression of an idea we [have] never heard of, or by the child trying to find ways to express something never said before”.

It is this encounter with and between different expressions of ideas – on topics on which we feel we have a common-sense understanding, or on others that seem utterly intractable – that gives these educational-philosophical treatments of recurrent debates their purchase in today's conditions. Debate has not only been a constitutive element of philosophy since at least Plato, but also is arguably a major part of what makes it educational.

# Education and Democracy

Quentin Wheeler-Bell

## Democracy and Education

Democracy is a contested concept. Generally, democracy is interpreted as a political system that promotes self-government; however, once we unpack these terms a number of questions emerge (see Cunningham 2001). For example: what counts as ‘a political system’? What counts as political? What does it mean to self-govern? Is self-government an individual process, a collective process, or both? What are the social conditions for democracy? And, what aspects of society should be democratized? Each of these questions—as well as others—raises deep disagreements that influence how scholars interpret democracy, and its value: not only do scholars disagree over the meaning of democracy, they also disagree over the value of democracy (especially in nondemocratic or quasi-democratic contexts). To respect these disagreements, I shall leave the definition of democracy and education undefined. Instead, I shall highlight the different debates around education and democracy, which will also explain how the definition of democracy is contested.

To bring to life these debates, I want to focus on three major areas of concern over the relationship between democracy and education. The first concern is: How should we conceptualize the role of education *within* a democracy? As I shall explain, attempts to address this question are generally focused on the role of education within a democracy as well as the process through which democracy legitimates the education system. The second major concern is: How ought we to understand education *for* a democracy? Education *for* democracy is generally concerned with an education for social justice in which the focus is on the role of education in ‘creating citizens’. The final concern is: How do we conceptualize the role of

education *without* democracy? Philosophers often neglect this concern, but here the focus is on the role of a ‘democratic education’ in contexts where democracy is either nonexistent or the social conditions for democracy are being systematically eroded. In the end, by framing our discussion through the lens of an education *within, for, and without* democracy, I hope to invite the reader into the rich, yet contested, debate over the relationship between education and democracy. Thus, we shall begin our discussion with the role of education *within* a democracy.

## Education *Within* a Democracy

Education *within* a democracy addresses the role of education within a democracy as well as the process through which democracy legitimates the educational system. Generally speaking, when addressing the role of education *within* a democracy, scholars tend to focus on: What ought to be the reasons why we educate children within a democratic society? Often the debate on education *within* a democracy is conflated with the discussion over the aims of education. However, we want to separate these two debates because the debate over the aim(s) of education tends to conceptualize aims from a context-independent standpoint—i.e., What aims should guide education regardless of context? (see Brighouse 2005; Peters 1970). When thinking about aims *within* a democracy, however, the debate is contextually specific. Here our attention is on: How should democracy reasonably determine the aims that ought to govern education *within* a democratic society?

We shall begin our discussion with John Dewey, who has put forth one of the most influential arguments for education *within* a democracy (and *for* democracy). Because of the influence of this book, I shall spend some time explaining Dewey’s argument and two specific criticisms—in addition, doing so will set the tenor for the rest of this chapter. In *Democracy and Education*, Dewey (1966) interprets education and democracy as coextensive ideas. This means, for Dewey, no separation exists between education *for* democracy and education *within* democracy. This is because democracy, according to Dewey, is a cooperative activity of social inquiry aimed at solving collective problems. And in order to solve collective problems, the public must be educated about said issues (Dewey 1955). Democracy, for Dewey, is more than a form of governance or institutional arrangements: democracy is a form of associational living of conjoined communicated experiences held together more by its ethos (e.g., habits, norms and dispositions), rather than its social institutions. For Dewey, the democratic ethos is manifested and cultivated within forms of associational living that contribute to the ‘growth’ of a democratic society. And since all individuals belong to a social group or forms of associational living, every individual ought to learn the knowledge, habits and skills needed to ensure such associations contribute to experiences that expand human growth. In this sense, citizens must not only learn about their rights and responsibilities but also develop the habits and dispositions needed to engage in associational living aimed at solving social problems. Thus, education’s primary and almost sole function, for Dewey, is

ensuring the production of a democratic society. As Dewey argues, “democracy has to be born anew every generation, and education is its midwife” (cited in Campbell 1995). Consequently, according to Dewey, embedded within democracy is an educational principle: democracy depends upon citizens learning the necessary habits and skills to form publics, participate in associational living, and collectively solve social problems in a manner that expands human growth.

Dewey seems to have two different explanations as to why education and democracy are coextensive. The first justification is straightforward: democracy depends upon an educated citizenry, thus the purpose of education within a democracy is to create citizens. The second justification is more circuitous, and is based upon Dewey’s conception of an educative experience. Educative experiences, for Dewey, are those that contribute to growth—in fact, Dewey makes the strong argument that education is growth (see Dewey 1997). For Dewey, education is growth because learning experiences should open up opportunities for further growth, and learning should open up opportunities for further learning. However, learning is also about learning something that is socially situated. Thus, as we learn more and open up opportunities for further growth, we gain a greater understanding of the social practices supporting that which we are learning about. For example, learning history, according to Dewey, is not merely learning a set of facts: learning history entails learning how certain ideas have come about as well as how to participate within the community of historians (Dewey 1966, pp. 207–219). For Dewey, then, learning how to participate within communities is what ties education to democracy: democracy depends upon associational living, and individuals are inherently part of associational living, thus learning how to engage in communities of associational living is the same as learning how to engage in democratic practices.

Dewey’s coupling of democracy and education has sparked major disagreements. Here I shall only focus on two problems: *Dewey’s illiberalism* and *the problem of conflating democracy and education*. Some argue that Dewey’s conception of democracy is illiberal, and so is his educational theory. For instance, Eamonn Callan (1981) argues that “Dewey’s democracy is somewhat repugnant to the value of individuality” because it places too much emphasis on “the desirability of social solidarity” at the expense of valuing individuality (p. 171). This problem extends into Dewey’s conception of education insofar as Dewey inadequately conceptualizes the educational value of learning beyond participating within a particular community. For example, Callan argues that Dewey misconceptualizes the importance of teaching art to students because he only focuses on the shared values and interests giving rise to art, rather than on the artistic imagination “untrammelled by whatever interests are widely shared in society at a particular point in time” (Callan 1981, p. 175). In the end, Callan concludes that “Dewey did not go wrong in believing that fraternity was desirable...His fundamental error was in assuming that to accord it its proper importance it was necessary to promote massive social solidarity at the expense of human diversity” (p.174).

The second criticism is that Dewey conflates education and democracy, and as a result, he overlooks key tensions between education and democracy. This criticism is less about Dewey’s relationship to liberalism, and more about Dewey’s

misunderstanding of the role of education within a democracy. To understand this criticism, we need to revisit the two ways Dewey connected education with democracy. The first way was fairly straightforward: democracy does depend upon citizens acquiring the habits and dispositions to participate in democratic associational living, thus the purpose of education is to cultivate democratic citizens. This argument, however, assumes education is only valuable to enhance civic participation, and thus, neglects the importance of other nonpolitical purposes of education—such as education for personal enjoyment. To Dewey's credit, he does acknowledge the value of teaching children certain subjects beyond civic participation; however, this brings us to the more circuitous way Dewey connects democracy with education.

The second way Dewey connects democracy with education is problematic because it undermines Dewey's own distinction between 'publics' and 'community'. Dewey distinguishes between publics and community in order to explain that not all associational forms of living are a "public". Communities are more general forms of associational living with a set of shared values and actions; whereas 'publics' are a particular form of community in which individuals form collective associations aimed at solving social problems. In other words, 'publics' are associations aimed at *solving social problems*; whereas 'communities' need not be aimed at solving social problems. This distinction is important because Dewey tends to assume that learning an activity to participate within a certain community is what connects education and democracy. However, Dewey provides little evidence that the learning to participate within a community inherently translates into learning the habits and dispositions to participate within the public sphere. For example, learning history to participate in the community of historians does not inherently translate into an enhanced ability to engage in public life. Dewey, however, seems to assume these habits are the same, which is why he assumes democracy and education are mutually constitutive. At this point, if Dewey is going to maintain a distinction between the community and the public—as he should—then he must also distinguish between an education *for* public engagement and the other aims of education. This also entails acknowledging a plurality of educational aims, which cannot be reduced to their value for democratic life. Moreover, if there are a plurality of educational aims, then Dewey must decouple the relationship between democracy and education, and distinguish between education *within* a democracy and education *for* a democracy. This distinction, as I shall explain, is central to understanding the current debate around education and democracy. And, the importance of this distinction can be seen in the debate between democracy and liberal rights.

### ***Democracy and Liberal Rights***

Besides John Dewey's *Democracy and Education*, Amy Guttmann's (1999) book *Democratic Education* provides one of the most comprehensive arguments for education's place *within* democracy—as well as education *for* democracy. Guttmann

argues that education should aim towards the “conscious reproduction of a democratic society”, which she defines as “the ways in which citizens are or should be empowered to influence the education that in turn shapes the political values, attitudes, and modes of behaviour of future citizens” (p. 15). According to Gutmann, educational practices are democratically legitimate when they uphold two principles: *nonrepression* and *nondiscrimination*. Nonrepression, as Gutmann argues, “... prevents the state, and any group within it, from using education to restrict rational deliberation of competing conceptions of the good life and good society” (p. 44). Nondiscrimination, on the other hand, “prevents the state, and all groups within it, from denying anyone an educational good on grounds irrelevant to the legitimate social purpose of that good” (p. 45). Stated differently, nondiscrimination, according to Gutmann, means “no educable children may be excluded from an education adequate to participating in the political processes that structure choice amongst good lives” (p. 45). Gutmann lays out these two principles to provide a basic threshold for determining when an educational decision is democratically legitimate. She also argues these basic principles set normative standards for addressing several educational issues.

Political liberals have criticized Gutmann for unduly limiting the purpose(s) of education. Harry Brighouse, for instance, argues that Gutmann neglects a tension between democratic legitimacy and liberal rights (see Brighouse 1998). As Brighouse argues, while democratic legitimacy requires providing children with a civic education, an education that respects the rights of children (i.e., a liberal education) entails respecting the nonpolitical aims of education—like the intrinsic appreciation of learning. According to Brighouse, since Gutmann reduces the purpose of education within a democracy to the process of democratic legitimacy, she overlooks the tension between democratic legitimacy and liberal rights. Moreover, Brighouse argues, to respect the liberal rights of children, democratic decisions must take a child-centered perspective (i.e., what’s in the best interest of children) rather than a socially centered perspective (i.e., what’s in the best interest of society). However, Gutmann’s position takes a socially centered perspective because she places the interests of society over the interests of children. One key issue raised by Brighouse is: while there is a plurality of educational aims, democracy must deliberate over the aims of education, and how to prioritize these aims. However, reasonable democratic decisions must be made from a child-centered perspective, rather than a socially centered perspective.

Meira Levinson (2011) provides a different dimension to Brighouse’s critique of Gutmann. Levinson argues that Gutmann conflates education *for* a democracy with education *within* a democracy. Education *for* a democracy, Levinson argues, “...is that which enables the next generation of citizens to participate in, promote, and preserve representative democracy in the future” (p. 135). Whereas education *within* a democracy “...focuses on what makes an educational system democratically justified, in a particular on the extent to which public schools must be subjected to adult citizens’ democratic deliberation and control in order to be legitimate” (p. 125). For Levinson, separating education *within* a democracy from education *for* democracy is necessary because “democratically legitimate control over education within a

democracy may well undercut children's legitimate claims to receiving an education that equips them for democracy" (p.135). In this sense, Levinson is highlighting a tension between democratic legitimacy and civic education itself. For example, for Gutmann democratic legitimacy and civic education are mutually constitutive because legitimate democratic decisions *must* promote a civic education. For Levinson, however, democratic legitimacy can be achieved at the cost of civic education. In this case, democracy could arrive at legitimate decisions; however, these decisions can come at the cost of an education *for* democracy—such as, a national curriculum that does not focus on civic education.

### ***Radical Democracy***

While radical democrats acknowledge the separation between education *within* and *for* democracy, they tend to reject the philosophical foundation of political liberalism and liberal democracy. To be clear, the term radical democracy is contested—like the term democracy. Furthermore, not all radical democrats reject political liberalism or liberal democracy. Nonetheless, one of the distinct features of radical democracy is its attempt to move the debate on education *within* democracy in a more *critical* direction. And by “critical” I mean they are focused on two interrelated issues: the role of education in the reproduction of domination and oppression, and the ways education can be used as a means of social transformation (see Apple 2012). In this sense, radical democrats argue that while education is *within* a democracy, education is also *within* structural practices that reproduce domination (i.e., radical, class, or gender domination). Furthermore, some forms of domination are not mere abnormalities within democracy—they are structurally connected to the reproduction of democracy itself (see Apple 1995). For example, one way class domination is reproduced is through the structural connection between education and the capitalist labor market, via credentializing. In addition, the process of credentializing is a major means by which individuals are able to access political positions of power. As a result, the structural connection between education and the labor market also reproduces class domination—which also is embedded within various forms of racial and gender domination (see Dale 1989). The point here is: if various forms of domination are structurally embedded within democratic societies, then it's problematic to proceed from the assumption that the purpose of education within a democracy should be to consciously reproduce a democratic society.

Following this line of reasoning, Kenneth Howe (1997) critiques Gutmann's principle of nonrepression for being too thin, and thus unable to prevent education from reproducing oppression. As Howe argues, a democratic decision-making process could uphold Gutmann's two principles and still end up with a curriculum or deliberative process that fails to empower marginalized and oppressed groups. In this sense, Howe argues that the principle of nonrepression should be replaced with a principle of nonoppression, which aims to: “protect groups that are threatened with marginalization and exclusion from meaningful democratic participation”

(p. 69). The principle of nonoppression is meant to “define injustice and to mediate among the claims of different groups” (p. 77). The general argument is that democracy could make legitimate decisions yet these decisions could reproduce oppression; as a result, we need different normative principles for regulating educational decisions when oppression exists.

Radical democrats also critique the liberal/democratic approach to education *within* a democracy for neglecting the *issue of social transformation*. By social transformation, I mean that if domination is structurally embedded within the design of social institutions, like schools, then it is problematic to apply normative principles to preexisting educational arrangements. This being the case, social institutions must be transformed in order to ensure oppressed groups are able to have a real and effective opportunity to participate within the democratic process. Here the central question is: What principles ought to govern the empowerment of marginalized groups to participate in the process of deepening democracy within education? Kathleen Knight Abowitz (2010) advances an argument along these lines, in which she argues for a “qualified faith in public schools” in which we break the assumption that public schools must be state-run schools. This assumption, according to Knight Abowitz, is problematic because the structure of state-run schools reproduces racial domination and limits the participatory parity for communities of color—i.e., their ability to participate fairly and equally in the democratic process of structuring the educational system. As a result, we must begin to look beyond state-run public schools, and envision different educational arrangements—like public charter schools—which could transform the educational system in ways that advance participatory parity for disenfranchised groups (also see: Abowitz 2014; Fung 2006).

In many cases, radical democrats are not challenging the importance of democratic legitimacy or certain liberal rights; instead, they are contesting the facts scholars take for granted when constructing and applying their normative principles.<sup>1</sup> More specifically, radical democrats are arguing that once oppression is acknowledged as a fact within society, we must rethink the normative principles as well as the institutional arrangements that must be constructed to ensure oppressed groups are given an equal and fair opportunity to contribute to the process of education *within* a democracy.

## Education *for* Democracy

While education *within* a democracy is generally focused on the process of ensuring the educational system is democratically legitimate, education *for* democracy focuses on the role of education in ‘creating citizens’. Overall, education *for* a democracy deals with a social justice education. The argument for civic education

---

<sup>1</sup>I am not saying radical democrats agree with (political) liberalism. Rather, they may agree with certain liberal rights. See Terry Pinkard (2007) for a useful discussion on this distinction.

parallels both Dewey's and Gutmann's argument, which was: democratic legitimacy depends upon ensuring its citizens are educated and able to effectively participate within democracy. Consequently, a democratic society has an obligation to provide all individuals with a civic education. To be clear, arguments for civic education are not made at the expense of acknowledging other educational aims; here scholars are only focusing on the aim of creating citizens. In this section, I want to focus on three debates within civic education: (1) *civic education, pluralism, and diversity*, (2) *civic education and power*, and (3) *pedagogic practices for civic education*.

### ***Civic Education, Pluralism, and Diversity***

The debate over *civic education, pluralism, and diversity*, by and large, revolves around the contours and limits of liberal tolerance. Here the primary question is: How should education promote liberal democratic values, like autonomy, while respecting diversity? Eamonn Callan's (1997) book *Creating Citizens* is a seminal book which attempts to address this tension. According to Callan, a tension exists between a political education and liberal rights because civic education requires teaching children how to become autonomous agents; however, respecting diversity entails respecting nonautonomous ways of life. Callan tries to address this tension by arguing for a 'minimalist conception of liberalism' in which autonomy is acknowledged as a good promoted within liberal democracies; however, liberal democracies are justified in teaching the value of autonomy so long as teaching children to become autonomous would not make their lives bad. Simply put, a liberal civic education can respect 'nonautonomous' ways of living while still promoting civic education, because autonomy does not harm or undermine an individual's ability to participate in nonautonomous ways of living.<sup>2</sup>

Some liberals, like Stephen Macedo (2003) and Jason Scorza (2007), advance a more 'tough-minded liberalism' or 'strong liberalism', which entails preserving liberal tolerance while also recognizing and responding to intolerance and other threats to liberal values. For Macedo and Scorza, unlike Callan, liberal democracy should not only acknowledge the value of autonomy but also actively promote and nudge groups to value autonomy. Thus, rather than assuming nonautonomous ways of living are worthwhile, liberals should own up to the fact that they view such lifestyles as less valuable. In this regard, as Macedo argues, promoting the value of autonomy is deemed justified because "our civic ideals are not narrowly political...they are surely within the range of legitimate discretion of democratically constituted educational aims" that should be promoted (p. 239). The difference between 'minimalist liberals' and 'strong liberals' revolves around how we should teach children liberal values, like autonomy: minimalist liberals believe autonomy can be promoted while

---

<sup>2</sup>Rob Reich (2002) and Walter Feinberg (2000) provide an additional discussion on liberalism and diversity.

acknowledging the value of nonautonomous ways of life; as a result, we should teach children the value of autonomy, while also acknowledging that nonautonomous ways of living are worthwhile. Strong liberals, conversely, argue that liberals should own up to the fact they deem nonautonomous ways of life as less than valuable. Moreover, they believe the value of autonomy is actually wide enough to respect reasonable ways of living the good life; as a result, it is completely justified to unequivocally promote an autonomous civic education.

### *Civic Education and Power*

While the liberal debate on civic education tends to focus on the moral dimensions of tolerance, scholars who identify with the ‘radical’ or ‘critical’ democratic tradition believe a focus on tolerance alone is too limited, and more attention should be given to challenging various forms of power and domination. For example, Barbara Applebaum (2011) argues for a social justice education based upon what she calls “a white complicity pedagogy”. According to Applebaum, white privilege can be reproduced both consciously and unconsciously, thus a social justice education must help white students “...be willing to contemplate how they are complicit in sustaining the system even when they do not intend to or are unaware that they do so” (p. 4). For Applebaum, a white complicity pedagogy requires moving beyond the limited notion of responsibility embedded within the liberal tradition—wherein individuals are only responsible for their intentional actions or inactions. For Applebaum this notion of responsibility reproduces white privilege because it only holds whites responsible for their intentional racist actions, and thus excuses them from their larger role in reproducing racial domination and white privilege.

Extending the discussion on civic education and power, others have argued that civic education must teach children how to challenge various forms of domination and injustice permeating society. For instance, Meira Levinson (2012) argues for an “action civics” education wherein students—specifically, students of color— “learn the language of power”. For Levinson, learning the language of power is a dual process, which includes: learning how to gain access to “the halls of power as they are currently structured” as well as “master strategies for amassing and deploying collective power...so as to change the political opportunity structures themselves” (p.92). In a similar vein, Sarah Stitzlein (2013) argues for a “citizenship education for dissent”. Such an education would teach students how to do “...more than just participate in civic and public life, she also critiques established systems to understand them, identify when they perpetuate injustice, and challenge and alter them when they do so” (p. 168). In addition, I (2012) have argued for a critical civic education that cultivates “the spirit of activism”. I argue children need the habits, skills, and abilities to transform society. And such an education requires identifying the normative principles that ought to govern society (including the political economy), helping students identify feasible institutional arrangements and political strategies (specifically social movements) that would move us toward the ideal

society. In sum, scholars focusing on power and domination envision a civic education that helps students acknowledge the various forms of domination and injustices present in society, as well as the morally appropriate educational and political means for helping students learn how to transform society and advance democracy.

Finally, others have challenged the basic logic of civic education. For example, drawing upon post-structuralism and post-Marxism, Gert Biesta (2011) argues that civic education operates from the assumption that its task is to produce good citizens. For Biesta, this logic leads to a “domestication of the citizen” insofar as it results in the “pinning down of citizens to a particular civic identity” and “leads to the erosion of more political interpretations of citizenship that see the meaning of citizenship as essentially contested” (p. 141). For Biesta, citizenship should not be equated with particular social institutions or identities because this closes off the possibility of radically challenging the very institutions and social identities that frame citizenship in the first place (also see: Biesta 2015). Nuancing Biesta’s discussion on citizenship, Claudia Ruitenberg (2015) argues for a civic education that acknowledges the “dialectic between inequality and equality”. For Ruitenberg, Biesta is correct that the very definition of citizenship can be contested, which means we should avoid a priori conceptions of citizenships. However, she believes citizenship must be embedded within social institutions, which requires establishing relations of inequality. For example, democracies must determine who can and cannot vote; and such decisions inherently exclude someone, thus creating an inequality. And while democracy requires respecting the fact that anyone can contest who can and cannot vote (*equality*), institutionalize voting criteria inherently exclude someone from being able to vote (*inequality*).<sup>3</sup>

According to Ruitenberg, this dialectic is inherent to democracy itself. Thus, unlike Biesta who interprets citizenship as fundamentally contested, Ruitenberg advocates for a civic education that operates on two interconnecting levels. First, civic education curriculum or policy “...acknowledges and addresses citizenship as the democratic, political role of holding the state to account” (p. 5). And second, such an education “...positions citizenship as something that can be enacted now rather than something for which the student is being prepared” (p. 5). The post-structuralism and post-Marxist critique of civic education should not be interpreted as an attempt to jettison civic education; instead it is foregrounding the political nature of citizenship and pushing the civic education debate to consider the pedagogical implication of teaching children how to act democratically and be open to the contestation of the very notion of citizenship.

---

<sup>3</sup> See Razmig Keucheyan (2014) for a useful overview of the different strains within the critical tradition.

## ***Pedagogical Practices for Citizen Education***

The final aspect of education *for* democracy we shall discuss is *pedagogical practices for citizen education*. Educating citizens raises complex ethical concerns for teachers. Ideally teachers should help children develop well-informed, reasonable, yet autonomous decisions; however, this requires teachers avoid indoctrinating children or presenting unfair and unbalanced perspectives, while also teaching children how to distinguish between reasonable and unreasonable arguments. Diana Hess and Paula McAvoy's (2014) book *The Political Classroom*, which combines social science with philosophical analysis, is one of the most comprehensive books addressing the moral tensions teachers face when educating citizens. As Hess and McAvoy argue, civic educators must deal with "the political education paradox", which they describe as: "the need to provide students with a nonpartisan political education on the one hand with the need to prepare them to participate in the actual, highly partisan political community on the other" (p. 4). According to Hess and McAvoy, the political education paradox is best addressed when teachers are viewed and view themselves as learners, which entails being well-informed about content knowledge needed to teach political issues. In addition, teachers set high aims and pay close attention to the needs of their students. And finally, they work collaboratively with other teachers to create effective pedagogical practices for a political classroom (p. 204–215).

Adding a different perspective to pedagogical practices for civic education, Katy Swalwell's (2013) book *Educating Activist Allies* is an ethnographic study explaining the moral dilemmas two social justice teachers face when teaching civic education within "elite schools". As Swalwell explains in her study, teaching social justice to privileged students faces different ethical issues than teaching social justice to the least advantaged, and often teachers are unsure how to provide privileged children with a social justice education that challenges their privileges. For example, Swalwell explains how social justice teachers in elite schools struggle with ensuring they have sound pedagogical practices that encourage inquiry and problem solving on the one hand, while on the other hand, disturbing student's privileged worlds by 'bursting their bubble'. While Swalwell's book is not philosophical per se, she acknowledges the philosophical and normative questions raised in her study as well as the need for philosophical exploration around this issue.

## **Education *Without* Democracy**

Unlike the debate over education *with* and *for* a democracy, education *without* democracy explicitly focuses on the tension between the *ideal* of democracy and the *real* conditions undermining democracy, or preventing democracy from emerging. When thinking about democracy *without* education the concern is how to provide an 'education *for* democracy' when the conditions for democracy are severely strained

or nonexistent. Thinking about education without a democracy is important because scholars tend to assume the social and background conditions for civic engagement are present. However, when these conditions are threatened or absent, we must reconsider the civic knowledge, skills, habits, and dispositions that children and adults must learn to revitalize or bring into existence a democratic society—if so desired. Here I shall address three different ways of conceiving of an education *without* democracy: (1) When the conditions for democracy are severely strained—such as war-times, genocide, or famine. (2) When the conditions for democracy are nonexistent—such as authoritarian states. (3) When the ‘common sense’ conception of democracy is distorted, and thus the professed ideals of democracy are inadequate at analyzing the conditions undermining democracy.

### ***Education and the Weakening of Democracy***

When the conditions for democracy are severely strained, certain background conditions are weakened; and as a result, being civically engaged faces a higher level of risk than typically associated with civic involvement. For instance, as Sigal Ben-Porath (2006) explains in *Citizenship Under Fire*, the civic virtues associated with democratic participation depends upon a level of peace, which is often taken for granted in discussions on civic education. However, in war-time situations, such as the Israel/Palestine conflict, such peace is limited. According to Ben-Porath, war-time situations require us to rethink certain facets of civic education. A civic education appropriately responsive to war-time conditions, according to Ben-Porath, requires an “expansive education”, which “is fundamentally aimed at cultivating a commitment to civic engagement in the process of such mutual justification and at endorsing a host of views that maintain both democratic and national commitments” (p. 121). For Ben-Porath, expansive education depends upon “the *process* of mutual justification”; and *process* should be emphasized because civic education must focus more on developing the skills associated with democratic citizenship as well as how to mobilize civic values in a climate in which peaceful conditions are either undermined or nonexistent.

### ***Education Without Democracy***

One area that needs further investigation within the civic education literature is the type of civic education needed when the conditions for democracy are nonexistent—such as authoritarian states. While philosophers have insufficiently addressed this issue, critical social science research has highlighted the tensions and normative issues for providing education *for* democracy within contexts where democracy does not exist. For example, Min Yu’s (2016) ethnographic study of migrant children schools in China details the ways in which teachers and community members mobilize within a

nondemocratic society to create schools that serve migrant children—children excluded from traditional schools in China. As Yu explains, these migrant schools are operating as ‘counter-public spheres’ or ‘counterhegemonic spaces’: spaces where teachers, students, and parents are developing the ‘collective identity’ required for even seeing oneself as capable of making democratic demands. In this case, education *for* democracy is taking place within a context *without* democracy, and part of what is occurring is individuals are learning how to see themselves as a person deserving equal respect and mutual justifications. What Yu’s study highlights is that democratic practices must be embedded within social practices; however, democratic practices can exist even when the larger social context is not democratic (also see Kurasawa 2007). This study, nonetheless, raises interesting philosophical questions, such as: What makes democracy universally valuable? Should an education for democracy be provided within nondemocratic contexts?

### *The Distortion of Democracy*

The last condition of education *without* democracy we shall discuss occurs when ‘common-sense’ concepts of democracy, held by the general public and philosophers, are themselves distorted or compromised; as a result, certain situations undermining democracy are systematically neglected, or distorted because the principles themselves are inadequate. A prime example here is the assumed link between democracy and capitalism. Often philosophers either assume democracy depends upon capitalist markets or their conception of democracy inadequately conceptualizes what it means for democracy to regulate the political economy. Kenneth Strike (2003), for example, develops an argument for legitimacy in public education which assumes capitalist’s labor markets are necessary for democracy. Strike treats the political economy as separate from democratic control; and as result, he inadequately addresses the ways capitalism undermines democracy and educational legitimacy (see Wheeler-Bell 2014). Liberal egalitarians, like Brighouse and Swift (2006, 2011), on the other hand, inadequately conceptualize what it means for democracy to control the political economy. For instance, they treat the least advantaged as passive recipients of justice—i.e., as individuals in need of preestablished goods. As a result, their conception of justice and democracy overlooks the fact that justice requires the least advantaged be able to democratically control what (educational) goods are produced, how (educational) goods are produced, and how goods are distributed (see Forst 2007; Laden 2013; Pereira 2013; Young 2011). In sum, as critical theorists argue, our common sense conceptions of democracy can often become ideological, and when this occurs, accepted democratic principles can operate in a manner that distorts and/or overlooks the practices undermining democracy—in our case, capitalism (also see: Chari 2015; Wright 2010). What is important here is that our common-sense conception of democracy can become either inadequate for addressing neoliberal capitalism (or some other problems) or can treat certain systems as inherently compatible with democracy. When this occurs, we are

not only facing a crisis within democracy but also a crisis in our collective imagination: the inability to imagine what democracy could look like beyond particular social systems, like capitalism. This in turn creates a crisis in education *for* democracy because we are unable to honestly teach students how to address the conditions that are undermining democracy.

## Conclusion

One of the essential insights gleaned from John Dewey's understanding of democracy is that democracy is a creative process. Democracy must renew itself to address new social problems: renewing democracy is not merely about applying commonly held beliefs about democracy to new social problems (although this is sometimes necessary); but, it also entails being open to radically rethinking our commonly held beliefs. Rethinking commonly held beliefs is necessary because sometimes our inability to deal with new social problems is a result of the commonly accepted beliefs themselves (Dewey 1939). In this sense, Dewey is reminding us to constantly interrogate what it means for education to exist *within* a democracy, what does it mean to educate *for* democracy, and what does it mean to educate *without* democracy. And even more radically, Dewey believes we must be open to the possibility that new problems may arise which challenge the very three questions just mentioned.

If Dewey was correct, which I think he was, we should not see the debate over education and democracy as an endless circle. Rather, the ongoing debate is a sign of a continued faith in democracy: a faith that new issues and problems require us to revisit old traditions and values, and rethink said values so we can collectively solve new social issues. And one important task of educational philosophy is to clarify the issues and problems facing society, and do so in a manner that helps equip the public with better tools for addressing social problems facing democracy. Hopefully this chapter clarifies some of the debates and current issues facing education and democracy, and contributes to renewing our collective faith in democracy and education.

# Citizenship

Penny Enslin and Mary Tjiattas

## Introduction

This chapter focuses on normative conceptions of citizenship and their implications for moral and civic education. In the course of providing accounts of the historical emergence of different conceptions of citizenship, it will make note of important conceptual links between notions of citizenship and agency, democracy, general will formation, political authority and legitimacy, rights and duties, and moral and political standing that are involved in different conceptions of citizenship. It will then turn to a discussion of the cognitive and affective capacities that these notions of citizenship involve, and discuss the role of education in the development of citizens, emphasizing contemporary analyses and debates. It will conclude by exploring the idea of global citizenship and its implications for citizenship education.

## Citizenship: A Genealogy of the Concept

A citizen is a member of a state or polis who is accorded status or standing expressed in a set of rights and duties that accrue to her as a citizen. The significance of this has been long recognized. For Aristotle, whose *Politics* (1984) incorporates the first extended theory of the citizen, the centrality of citizenship follows from his belief

that man is, by nature, a political animal — “kata phusin zoon politikon” (Aristotle 1984, 1253a1–15). Not only is he uniquely able to perform the functions of a citizen, but doing so is necessary to his personhood. So the functions of citizenship correspond to distinctively human activities. This ideal of the active, engaged citizen is taken up by key figures in Western thought, most notably, Rousseau. In contemporary writing, it is reflected in Oldfield’s (1990) assertion that failure to participate in politics makes one an incomplete and stunted being.

According to many political theories, citizenship is not only the status accorded to beings for whom active participation in public life is a central element of a good life, but is also a fundamental condition of authoritative or legitimate government.

Aristotle is also the first political philosopher who advanced a conception of citizenship that recognizes the intricate conceptual links between citizenship and legitimate political authority. As many have noted, Aristotle arrived at his views of man and citizen by breaking explicitly with central assumptions of Plato and, in doing so, inaugurated a long-lived tradition. Plato (2000), in his reflections on the proper relations between rulers and ruled, was not faced with a challenge that has been at the centre of political theory for much of the history of Western thought, namely, how to justify the authority of those who govern over autonomous, rational individuals who are nonetheless held to be bound to comply. This is because Plato assumes that, as long as the rulers have superior natural talents, there is no problem about their being fit to rule, and so no question about their legitimacy (Plato 2000, Book 5, 462 A/B).

For Aristotle, however, all citizens are by nature equal. So the problem for him (and egalitarian positions in general) is: On what ground is it legitimate for some to rule over others? If egalitarianism is assumed, then political authority, to be legitimate, must result from the authorization of those citizens over whom authority is claimed. This abiding view is endorsed by Rousseau, for whom the “concurrence of obedience and freedom” is “the essence of the political body” (Rousseau and Gouretich 1977, SC 3.13.5). The fundamental problem is to “find a form of association ... by means of which each, uniting with all, nevertheless obey only himself and remain as free as before” (Rousseau and Gouretich 1977, SC I.6.4), one which will provide security (through authoritative constraints on the conduct of each member) without infringing personal autonomy. The notion of citizenship is central to Rousseau’s solution to this problem of how self-determination can be compatible with political authority.

## **Citizenship and Political Authority: Republicanism and Liberalism**

The widespread agreement that citizenship and political legitimacy are inextricably interwoven has not by itself resulted in a convergence on a single theory of citizenship and legitimacy.

Canonical republican views (as represented by Aristotle, Rousseau, contemporary communitarians and some deliberative democrats) emphasize ‘the liberties of the ancients’, especially active participation, and treat citizenship as intrinsically (not merely instrumentally) valuable. On this view, ongoing citizen participation is required in order for the state to exercise its functions legitimately. Not only must its institutions be regulated by principles of justice, but it must enjoy the authorization of its members. Freedom as non-domination by the will of others is of paramount concern. Political authority is legitimate only when the laws reflect the universal will of the people. In Rousseau’s words, the agency of the people is the locus of the general will. “The People subject to the laws ought to be their author” (Rousseau and Gouretich 1977, SC 2.6.10). Subjects in the society of the general will “obey no one, but only their own will” (Rousseau and Gouretich 1977, SC 2.4.8), and so are free. Republicanism thus takes as central the claim that the authorization to exercise public power is linked to collective decisions of citizens. The capacity to participate in the general will is also the source of rights and duties. This is because for decisions to be binding and for authority to be legitimate, citizens must participate in advancing proposals and defending them with considerations that others can acknowledge *as reasons*. For authority to be acceptable in a community of equals, it must be democratized. So democratic procedures of collective decision-making play a justificatory role. Moreover, when, in a community of equals, the ordering of reasons gives priority to reasons of the common good, civic unity, the constitution of a *we* is the result (Cohen 2010, p. 55).

In contrast, liberal conceptions of citizenship (grounded in the ‘liberties of the moderns’) endorse a more restricted notion of citizenship, at the extreme taking it to be exhausted by the set of rights that the polis owes its members. These are held to be formidable and possibly inviolable constraints on what political authority may do with respect to citizens. Citizenship is ‘the right to have rights’. Classical liberal views focus on limitations of state authority, which are taken to be grounded in basic liberties. Basic liberties are invoked both to determine the legitimacy of authority and to provide an instrumental justification for it. The proponents of this view seek to motivate the establishment of institutional checks and balances, and the division of political power. The conception of citizenship, accordingly, is passive and private. Citizens are bearers of rights, but are obliged, as citizens to be only minimally active participants in the political order. In great part, they discharge their duties by refraining from interfering with the activities of others. Active political participation is required only to the extent to which it is necessary to safeguard the private domain, which is taken to be a realm of personal fulfilment, joy, love etc. Citizens may set their own ends; they espouse very different conceptions of the good, and their right to do so is basic. Political duties are rights based, and political participation is, at best, instrumentally valuable and, under favourable conditions, only episodic (Ackerman 1991).

It is, incidentally, worth noting that those who endorse liberal conceptions of citizenship can differ on the rights that they attribute to citizens. For example, the rights endorsed by Locke are largely negative, while those endorsed by T.H. Marshall (1950) include economic rights.

## Contemporary Debate

The idea that democratic procedures and citizenship are essential to political legitimacy pervades current discussions of liberals and republicans alike.

One of the central questions of contemporary debates concerning citizenship is whether a thicker (more republican) conception of citizenship, involving active exercise of citizenship participation in decision-making and the cultivation of civility and reasonability, is necessary for its legitimating function. If so, the question arises of whether such a conception is compatible with fundamental commitments of liberalism (e.g. the priority of basic liberties and the right over the good). One specific form of this question is whether requiring citizen-virtues of citizens is compatible with respect for the individual liberty and autonomy insisted on by liberals. This question can be discerned in influential contemporary writing in political theory.

There is a broad consensus in contemporary political philosophy (which includes Rawls, Scanlon, Habermas, Benhabib) that if there is to be an inclusive, public basis of justification for dealing with fundamental social and political questions in pluralist societies, their citizens must be able to recognize the force of justificatory reasons, and be willing to engage in respectful deliberation with each other on a range of matters of common concern. Moreover, for Rawls, for whom justice is the central concern of political philosophy, virtues of citizenship are required in order for society to be well ordered. Principles of justice will be satisfied, and there will be a stably just society only if citizens have shared political values and a commitment to a common conception of justice, which includes standing motivations to support just institutions based on publicly justifiable reasons.

This overlaps with some aspects of republicanism, but diverges from republicanism in other ways. Rawls (1993, pp. 205–6) distinguishes between ‘classical republicanism’ (a thin republican view that he takes to be compatible with his own liberalism) and ‘civic humanism’ (a thicker republicanism represented by Aristotle, some aspects of which he takes to be incompatible with liberalism). ‘Classical republicanism’, as he describes it, is the view that citizens of a democratic society must have the ‘political virtues’ and be willing to participate in public life if basic rights and liberties are to be preserved. This requires “...active participation of citizens who possess the political virtues needed to maintain a constitutional regime” (Rawls 1993, p. 205). Although this is a thinner republicanism than ‘civic humanism’, it goes beyond minimalist liberalism (as expounded by, e.g., Locke). Rawls insists, among other things, that norms of respect receive constitutional protection and that ‘principle dependent sentiments’ be a focus of public education. His view that civility implies a moral duty for citizens also augments classical liberalism (see Nussbaum 2015, p. 16). But he does not endorse the distinguishing claim of ‘civic humanism’, which is opposed to liberal principles, namely, that the obligation to participate stems from man’s essential nature as a social or political animal, for whom taking part in democratic politics is “the privileged locus of the good life”

(Rawls 1993, p. 206). Rawls follows Kant in rejecting Rousseau's claim that a 'civil religion' is a condition for citizenship. He does so on the ground that it imposes a particular conception of the good on everyone, thus usurping their right to make their own decisions, and failing to accord persons the respect due to them as autonomous beings with the capacity to set their own ends and form and revise their own conceptions of the good.

This thinking leads naturally to the idea of deliberative democracy (Cohen 1995, p. 1996), according to which political decisions are to be made on the basis of free public reasoning among equals. Deliberative democracy requires a framework of social and institutional conditions that facilitates free discussion among equal citizens and bases the authorization of public power and the exercise of public power on its responsiveness and accountability to such discussion. For contemporary theorists of deliberative democracy, decisions are to be supported by reasons acceptable to others. Offering reasons to others is the way one expresses respect for them as equal members of a deliberative body.

The deliberative conception of democracy offers a robust rendering of the idea of recognizing that citizens are free and equal: everyone's interests are to be recognized and their reasons respected. This requirement effectively connects institutions and practices that are involved in the exercise of political power to a system of public reasoning among citizens, to public, democratic deliberative processes essential to both the rationality and the legitimacy of collective decision-making (Rawls 1993, p. 390; Cohen 1995, p. 1). Contemporary theorists, in exploring this possible solution to the problem of reconciling autonomy and authority, have developed a distinctive notion of public reason.

Rawls, taking as his starting point the notion of a just society whose institutions are justifiable on the basis of standards acceptable to all, and assuming that in pluralistic democratic societies political justification is more difficult to demonstrate, provides an extensive account of reasons that can be expected to be available to all. This notion of public reason, providing as it does a public basis of justification, is crucial to the legitimacy of political institutions in pluralistic societies. Public reason is central to Rawls's elaboration of his 'political liberalism', but it has often been misunderstood. It should therefore be noted that public reason is only one kind of reasoning in which citizens engage in constitutional democracies (Nussbaum 2015, p. 16). Political liberalism gives citizens latitude to appeal to reasons that depend upon their comprehensive doctrines in their everyday lives and in many aspects of their interactions in civil society and the political domain. It is only when issues of 'constitutional essentials and matters of basic justice' are under discussion, that citizens have special duties, based on respect and reciprocity, to display virtues of reasonability and civility, central to which is the ability and willingness to provide reasons that are not only intelligible to others, but also function as *reasons* for them (Postema 1995). For an individual's reason to be accorded weight in public reasoning, it must be 'a reason others can share'. Reasonable people, Rawls says are "... willing to govern their conduct by a principle from which they and others can reason in common" (Rawls 1993, 49n.1).

In contemporary, pluralist constitutional democracies, in which there is a diversity of comprehensive doctrines, this notion of reasonability imposes substantial constraints on what can be taken to count as a 'public reason', excluding many of the reasons that people actually have for choosing and acting as they do (See, e.g., Benhabib 1996, p. 68; Holmes 1988, p.233; Cohen, J. 1996, p. 95, 1998, p. 186; Bohman 1996). Nagel (1997) says that the ideal of acceptability to all is attainable by putting ourselves in others' shoes. Similarly, Scanlon (1982) claims that "... the source of motivation that is directly triggered by the belief that an action is wrong is the desire to be able to justify one's actions to others on grounds they could not reasonably reject" (1982, p. 116).

But questions arise: Why should a restricted form of justification be the standard of political legitimacy? Why should people refrain from acting on their most cherished beliefs (which they take to be true) in deference to beliefs to which they are less committed? How can claims that public reasons trump others be justified? Political liberalism's constrained conception of public reason may seem to oppose to the idea of 'enlarged thought' and at best gives rise to a problem of reconciling the different considerations we take as reasons in different contexts (See, e.g., Nagel 1997, p. 5).

In short, there is a question of whether political liberalism can provide a context-sensitive limiting of the range of reasons that does not unfairly advantage comprehensive views that are liberal and secular.

So, it is not surprising that the contemporary idea of public reason has met with strong objections. On traditional conceptions of public reason, such as Kant's, the links between public reason and 'enlarged thought' are clear. Public reason involves distancing oneself from one's own immediate and parochial concerns in order to attain a more impartial (and self-correcting) point of view. This does not require that one leave one's own reasons behind; rather, one embeds them in a larger set. In contrast, the contemporary conception of public reason proposes substantive and procedural constraints on candidate reasons. On the account proposed by political liberalism, differentiating public reasons from reasons in general involves 'methods of avoidance', 'conversational constraint', and 'selective repression'. Is this a preferable way of respecting everyone?

Although Rawls is the best-known contemporary theorist of public reason, his position overlaps significantly with various contemporary accounts of deliberative democracy, all of which are committed to democratic states having significant obligations to prepare citizens for participation in civic decision-making. These positions require appropriate agencies, such as educational systems, to develop citizens' capacity for practical reasoning and give them a broad understanding of economic and political structures.

For Rawls, the ideal of democratic politics requires that we be able to justify our actions to others in terms they could reasonably accept. This ideal of democratic politics commits citizens to rational norms of conversation and the duty of civility. Effectively, this means that they have a duty to provide "public reasons" (Rawls 1993, p. 218) and to submit voluntarily to restrictions in the interests of inclusion, neutrality and tolerance. The Rawlsian conception of a person as citizen is,

accordingly, a conception of someone who is able to participate in social and political life, exercise its rights and respect its duties. Benhabib (1996) identifies the content of practical rationality as normative presuppositions of deliberative democracy and shares with Rawls an emphasis on discursive norms and the sharing of reasons.

It should perhaps be noted that liberal and republican ideals of citizenship alike, committed as they are to universal or unitary ideals of citizenship, have been subjected to criticism by proponents of multiculturalism who insist that they are inimical to cultural practices and norms, and are thus exclusionary. These charges have initiated an independent set of debates, which are somewhat orthogonal to those discussed above, posing as they do a radical challenge to the very concept of the ideal of citizenship as traditionally conceived. Multicultural theorists like Young (1995) argue for a non-unitary, differentiated model of citizenship that would recognize the status of individuals as members of particular groups and incorporate them into political communities *qua* members of groups (as well as individually). This is based on the claim that differentiated citizenship and group rights are necessary means for inclusion in pluralistic societies, especially for members of groups that have been oppressed historically. The contrast with positions like that of Rawls's political liberalism, which are similarly motivated by 'the fact of pluralism', is stark: Rather than attempting to accommodate diversity by delimiting a sphere of possible consensus, based on public reason, multiculturalists emphasise difference, and take this to be indispensable to accommodating particular identities. However, several theorists (Beiner 2006; Kymlicka 2002) warn, against these claims, that the means multiculturalists insist upon would effectively undermine the very political, social and cultural arrangements to which admission is being sought (namely, a shared political community). And since citizenship involves treating people as equals, 'differentiated citizenship' would undermine the integrative function at its core.

## **Citizenship and Education: What Capacities Do Citizens Need?**

The requirements of citizenship education implied by different political theories are not the same. They vary substantially, depending on the social and political ideal that is assumed. While we explore these requirements here, we note that some have objected to the idea of citizenship education itself, including its politicization of values education (see Kristjánsson 2004).

The strong republican (civic humanist) view requires the inculcation of capacities required for the formation of a general will, including the capacity to recognize common interests, giving equal weight to the interests of each, and the disposition to pursue them. It also requires the resistance to the vices that threaten the motivation to act on the general will (Rousseau and Gouretich 1977, SC 4.1.6). Oldfield (1990) is one contemporary representative of strong republicanism. He proposes that

citizenship needs to be authoritatively inculcated. Through the formal education system, civic virtues are to be internalized in children, who are thereby moulded into citizens. Sandel (1996) echoes these ideas in talking about the “formative politics that cultivates in citizens the qualities of character self-government requires” (1996, p. 6).

Classical liberal conceptions of citizenship, on the other hand, require only education about rights, since they do not specify duties of citizenship, other than refraining from interfering with the rights of their fellows.

Most recent views on citizenship education seem to occupy a middle ground between those of strong republican and classical liberal views. Contemporary liberal theorists focus on education for autonomy and are concerned to distinguish various conceptions of autonomy and their promotion within educational institutions (especially schools). These accounts are attentive to tensions between promoting autonomy as critical inquiry and respecting diversity while also trying to foster cultural coherence under conditions of growing diversity among the citizens of liberal democracies (see McLaughlin 1992).

In his later work, Rawls himself has focused on what he takes to be the core civic virtues of civility and reasonableness. In contrast to ‘civic humanists’ like Rousseau, Rawls’s conception of civility and the virtues it involves permits individuals to choose both their own ends and the extent of their political involvement. Although the implications of political liberalism are weaker than those of civic humanism, they share with it a commitment to the inculcation of civic virtues. For Rawls, citizens have an indispensable role in ensuring the stability of a just (well-ordered) society. The dispositions and attitudes this requires include those that would support just institutions, and in particular, the two principles of justice he identifies as central to justice as fairness. Political virtues are those that dispose citizens to perform their crucial role in the stability of a just society. Only if citizens have suitable moral dispositions will the basic structure continue to meet requirements of justice. Fair practices cannot be achieved by laws or principles alone. Justice also requires that citizens possess and practise political virtue, including reasonability. This involves both cognitive and moral capacities: for rational judgment, and a sense of justice and a conception of the good.

Rawls’s requirements of children’s education seem to be rather modest, and they are justified solely by the state’s interest in their role as future citizens. In particular, he lists: knowledge of constitutional and civil rights, preparation to be self-supporting, fully cooperative members of society and encouragement of the desire “... to honor the fair terms of social cooperation in their relations with the rest of society” (Rawls 2001, p. 156). Rawls seems to be confident that citizens will acquire political virtues and knowledge of political principles simply by living in just societies. Ideas implicit in the public culture will gradually become apparent, and indeed compelling, to them. This sanguine attitude has been questioned by commentators otherwise sympathetic to his overall position. Is it realistic to expect, especially in actual, rather than ideal societies that mere exposure to, and participation in, political activity is sufficient to foster political virtues? Some find it more plausible that targeted mechanisms are called for.

In discussing ‘the seedbeds of civic virtue,’ Kymlicka (2002) rejects the idea that families, associations of civil society and markets, could function as adequate sites of citizenship education (2002, pp. 302–307). One deficiency common to all of these (Costa 2011) is that children who are most vulnerable, whose circumstances are least advantageous are also least likely to be beneficiaries of ‘invisible hand’ cultural mechanisms which are often at work in families, civil society and markets. They are the least likely to be systematically exposed to educative elements in the general culture. A failure to develop civic knowledge (about, e.g., legal and political structures and mechanisms) would diminish the worth of their civil liberties and consolidate their position of relative disadvantage. This is at odds with Marshall’s interpretation of citizenship as a social right that includes a right to the very education that makes agency as a citizen possible (Marshall 1950).

Educational institutions are, for many, the proper site of the development and exercise of the dispositions involved in civility and reasonability (Brighouse 2012). It is through educational interventions that children learn to obey laws (provided that society is one with democratic institutions with reasonable protections of individual rights), to engage in political participation and to do so in a way that demonstrates respect for others and a willingness to engage in public reasoning. Rawls’s concept of public reason requires children to be taught to reason critically and to develop the ability to put themselves in others’ shoes. As citizens, in deliberating with others about matters of basic justice and constitutional essentials, they should have the capacity to refrain from appealing to (private) reasons they know are not acceptable to other reasonable people. It should be part of citizenship education, therefore, to teach students “...to offer and consider publically accessible reasons and see how those relate to private reasons” (Brighouse 2012, p. 201).

In order to do this, students need to acquire both knowledge and cognitive and affective skills. Gutmann’s work (1987) has advocated education for democratic citizenship that fosters the ability of children to think critically about authority so that they can “...live up to the democratic ideal of sharing political sovereignty as citizens” (Gutmann 1987, p. 307). A central point of civic education is to raise free and equal citizens who appreciate that they have both rights and responsibilities to fellow citizens. Key goals include the development of an ability to deliberate and the disposition to participate.

Future citizens require an education that fosters the ability to judge, to weigh and consider reasons and evidence, to evaluate arguments, to be adept at individual and collective decision-making. As Rawls and others (e.g. Kitcher 2011) have stressed, they also require a general understanding of science, economics and the political context in which decisions are made. In addition, theorists like Young (1996) emphasize the importance of empathy and the development of the capacity to appreciate a wide range of perspectives. Such an educational policy differs from one advocated by civic humanism, insofar as it does not promote political participation as the highest or best form of human life.

Peterson believes that civic education programmes in Western democracies display an allegiance to civic republicanism – through their concern to teach students to participate in deliberative practices and to introduce them to concepts of civic

virtue, civic obligations and the common good. The United Kingdom, the US, Canada, Australia and the Council of Europe have all proposed frameworks for civic education that emphasise its formative role in producing democratic citizens. This is well illustrated by the Crick Report in the UK, the Scottish Curriculum for Excellence, the Australian Statement of Standards in Civics and Citizenship and the CIVITAS framework in America (Peterson 2011, pp. 24–30).

Within such civic education programmes, would citizenship education focused on civility and reasonability be sufficient to address the requirement for both cognitive and affective citizen capacities to be developed? Some have expressed doubts about Rawls's account of reasonable citizenship, on the ground that it eschews the cultivation of feelings of national identification (e.g. Miller 2007). Without such feelings, some allege, the stability of a just society cannot be secured. White (1996) claims that patriotic sentiments are beneficial to a democratic society, arguing that they are required to motivate citizens to support redistribution: "If they feel themselves to be part of the same community as those in need, their emotional bonds with time may outweigh narrower considerations of advantage and disadvantage. National sentiment can help to provide this bonding" (1996, p. 331).

Rawls requires that citizens display commitment to political values that have their source in democratic traditions of their society. They have a natural duty to support just institutions, but do not have a duty to be patriotic, which would be incompatible with pluralism in modern democratic societies. Hand's observation (2011) that love of country can hinder civic judgment, clouding critical scrutiny of its history, its place in the world and its government's actions, indicates how the affective and the cognitive dimensions of citizenship may collide. And globalization prompts further doubts about the viability of promoting national identity in citizenship education.

## Citizenship and the Global Sphere

The conceptions of public reason previously considered (especially that of Rawls) tended to apply to and presuppose the public sphere of the nation state, and political citizenship was assumed to be citizenship of a particular nation state. But is the nation state the *sine qua non* of democratic citizenship? Many political theorists take this as given and treat national identity as a precondition of citizenship and participation in a deliberative democracy. Globalization, however, puts pressure on the idea that democratic requirements and practices apply only within the nation state, that national citizenship alone sets the bounds of inclusion. In an increasingly integrated global system, the flow of information, people, goods, money, disease and environmental degradation across national borders has brought with it new global problems as well as collaborative practices, structures and norms. Rules with global scope set standards of conduct across schemes of co-operation that include trade agreements and conventions on trade, economic security, labour regulation, collective security and peacekeeping, election and corruption monitoring, human

rights and education. The sovereignty of national governments has been diluted both by voluntary agreements to collaborate with other states and international organisations, and by transnational economic and political activities that governments do not have the power to control, as well as by the increasing wealth of transnational corporations.

Recognizing these 'facts of globalization' leads to the questioning of widespread statist assumptions that the geographical boundaries of nation states demarcate autonomous, sovereign powers and that citizens are to be defined exclusively by their standing and obligations to their own national state and to their co-nationals. But, geographical boundaries of nation states no longer coincide with the boundaries of common interests. New forms of association occasioned by globalization challenge the assumption that matters of political legitimacy involve only members of bounded states, and raises questions about both liberal and republican conceptions of citizenship, thus demanding reconceptualization of basic political concepts (Bohman 2007). What is the source of legitimacy of decisions to be achieved and demonstrated in non-traditional political spaces, in which participants don't make up a '*demos*'? Who constitutes the 'justificatory community?' (G.A. Cohen 1991). Some political theorists (including, e.g., Bohman 1997; Kuper 2004; Fraser 2008) are sensitive to these changes.

The reconstruction required to meet the consequences of globalization is not only conceptual, but also practical and institutional. Global politics and institutions are increasingly "enduring and institutionally dense" (Cohen and Sabel 2006, p. 166), providing scope for an increasing involvement of will beyond the institutions of the state. Although there is no agreement on what new institutions are required to supplement the diminished powers of nation states the idea of a world state is widely rejected (whether because of a general scepticism concerning the possibility or legitimacy of cosmopolitan political institutions (e.g. Nagel 2005) or because current forms of international political authority are undemocratic (e.g. Bohman 2007)). Conceptual revision towards a post-Westphalian notion of citizenship should not therefore presuppose a world state, but should be based on conceptions of transnational civil society and public spheres, and the normative power of human rights.

For those who hold out hope for a cosmopolitan global order, transnational civil society and public spheres are much more promising routes than states, especially in the light of emerging globalized forms of domination. Such associations are seen as necessary (though not sufficient) conditions for transnational democracy (Bohman 2007, p. 62). Publics constituting the global citizenry can provide forums for the associative life of civil society and the diffusion of public opinion, in which the pool of reasons available to deliberation can be enlarged and transformed. Whereas in the case of a single *demos* publics provide access to influence over states' sovereign power by mediating public opinion through the collective deliberation of the *demos*, in transnational politics, the democratizing effects of publics consists in the creation of communicative networks as dispersed and distributed as the authorities with which they interact. Networks open up informal channels of influence, especially for civic and corporate NGOs, but while they are decentred and

transnational they lack sufficient popular legitimacy. Human rights have a crucial role to play in supplying the missing normative basis of political community that constitutes humanity as the global demos. International institutions already hold actors accountable to widely endorsed norms of human rights that extend the traditional republican view that rights are in the first instance attached to a responsive political community. Such international institutions justify thinking of humanity as an emerging political community, in an international system constituted by a human rights framework (Benhabib 2007).

Benhabib argues that transnational constitutionalism is indispensable for the creation of a reflexive, deliberative, dispersed order that is continuously subject to deliberative assessment of citizens (2007, p. 156). This process is necessary for the constitution of authoritative decision-making in a public sphere that is open to democratic control. This is far from the image of a world state and as a nascent transnational order it does not yet constitute a fully fledged polity. Its contours and the accompanying forms of citizenship that it requires will take time to develop. Whatever the institutional form of a global public sphere as an authoritative transnational structure turns out to be, the consensus is that it will be a complex structure that allows for 'distributed will formation'. Such a structure has been variously described as 'deliberative polyarchy' (Cohen and Sabel 2004), 'vertically dispersed sovereignty' (Pogge 2002) and 'plurarchic sovereignty' (Kuper 2004).

## Educating Global Citizens

In the post-Westphalian world of global association, future global citizens need to be educated to participate in decisions not only about local issues but also about matters that go beyond the concerns of the members of the nation state and extend to issues that affect distant others. The frame of the nation state is no longer adequate as the context for interpreting citizenship, as the context in which democratic citizens address matters of shared concern. Many of the cognitive and affective capacities considered earlier in our account of the liberal and republican traditions still apply, but some reconceptualization of the concept of citizenship *education* is required to match the notion of global citizenship adumbrated in the previous section. So enlarged thought and the democratic principle of equal standing among those who participate in processes of will formation can no longer be confined to awareness of the needs and interests of fellow national citizens, as a far wider public connects future citizens to others implicated in shared global problems. This suggests that the more minimal forms of citizenship that are restricted largely to inculcating civility are not sufficient. Education for global citizenship must develop a critical understanding of transnational institutions and the conditions of their legitimacy. Preparation for a maximal form of citizenship in a directly deliberative polyarchy calls for learning to exercise wide participation and capacities for problem-solving to make global institutions democratically accountable, for 'globalization from below'. Critical discussion of the actions of transnational institutions must

include a thoroughgoing, serious investigation of global issues (Singer 2002; Sachs 2008), as well as wider understanding of the contexts and perspectives of others.

The global citizenry needs to be sufficiently informed and motivated to be able to engage a far wider range of institutions and issues, to be aware of the needs and perspectives of others no matter how different they may be. Citizenship education, in addition to fostering commitments to global objectives, needs to ensure that students receive adequate exposure to issues that clearly depend for their successful treatment or resolution on worldwide co-operation and interaction, such as human rights, climate change, sustainability, and conflict and migration. This requires a robust conception of civic education, a sense of membership of a global community and ability to access and participate in will formation in complex, polyarchic structures, some overlapping and permeable to one another, that allow for distributed will formation. Global citizenship is multilayered and complex, requiring a form of civic education that expands respect, reciprocity and civility far beyond the multiculturalist dispositions now widely accepted as integral to citizenship education within national states. Varying global contexts require development of citizenship education to address local conditions and regional histories. So, for example, citizenship education in the Arab and Muslim world should “extend the current understandings of democratic citizenship education towards invoking a culture of acceptance and hospitality” integrated with Islamic discourses (Waghid and Smeyers 2014, p. 542).

These requirements point to curriculum reform to accommodate outward-looking perspectives and engagement. The broad understanding of economic and political structures standardly required for citizenship in liberal democracies will need to be extended to take in a more global perspective including the histories, languages and literatures of other societies, international politics, and critical literacies that embrace understanding of the media as a globalized institution that both fosters globalization and offer ways to learn with pupils elsewhere on the globe. Successfully educated people will think of themselves as global citizens with obligations that extend beyond national boundaries. And if the historical meaning of citizenship embraces not only citizen capacities and the exercise of citizenship as agency, but also equal standing and a right to the social dimensions of citizenship, as articulated by Marshall, this will have radical implications for global redistribution of educational resources as a necessary dimension of post-statist, global citizenship.

# Refugees, Statelessness, and Education

Niclas Månsson

## Introduction

Transnational migration is not new. It has been a constant element of human existence. In recent years, the issue of migration, voluntary and nonvoluntary, has been a frequent subject of public discourse in many countries, especially with regard to nonvoluntary migrants as refugees and asylum seekers. They come from different places such as Syria, Somalia, Afghanistan, and Iran, fleeing from war, genocide, political and religious persecution, harassment, discrimination, and torture. The numbers of refugees worldwide is at the highest level since World War II, and, according to the United Nations Refugee Agency (UNHCR), more than 51 million people are forcibly displaced refugees or asylum seekers or internally displaced persons (Zetter 2015). Approximately 95% of this forced displacement occurs in the global south, and over 50% of those refugees live in urban areas (Zetter 2015). The majority of people fleeing their homes are internally displaced persons. The 1951 Refugee Convention does not consider them refugees, however, because they are not outside their own countries or states. Even though internally displaced persons flee their homes on the same grounds as refugees, they stay in the territory of their home country and do not seek refugee status in another state (Zetter 2015; Kugelmann 2010).

The refugee situation has evolved since World War II and the Cold War era, and the legislation does not seem congruent with today's refugee situation. A refugee can be defined in at least two different ways: There can be *de jure* refugees, reflecting UNHCR's legal definition, and *de facto* refugees, reflecting the empirical

[https://doi.org/10.1007/978-3-319-72761-5\\_57](https://doi.org/10.1007/978-3-319-72761-5_57)

situation worldwide (Kugelmann 2010). According to the 1951 Refugee Convention, a *de jure* refugee is someone who

owing to a well-founded fear of being persecuted for reasons of race, religion, nationality, membership of a particular social group or political opinion, is outside the country of his nationality and is unable or, owing to such fear, is unwilling to avail himself of the protection of that country. (UNHCR 1990, p. 6)

The convention stipulates the legal criteria of refugee status using a definition of being ‘at risk’. Thus, less than half of the world’s forcibly displaced people are refugees in a *de jure* sense. *De facto* refugees are refugees—for instance, asylum seekers—whose applications are pending or have been denied but who cannot be expelled due to humanitarian reasons. Such refugees are not included in the formally recognized status of refugees according to the Refugee Convention (Zetter 2015; Kugelmann 2010). Their legal and personal situations depend on the laws of the countries they are in. In some countries, *de facto* refugees receive the same social and political rights as *de jure* refugees, but in other countries *de facto* refugees have no social or political rights. Although different categories of refugees have different legal statuses and different political and social rights, they all differ from voluntary migrants and nonmigrants. Refugees have all been deprived of their legal status as citizens—either they have lost it (*de facto* refugees) or they cannot enjoy its associated rights (*de jure* refugees)—and thereby their right to political belonging and agency (Krause 2008; Kugelmann 2010).

Migration policies for providing safe havens usually place refugees and asylum seekers in detention centers, often at the margins of society, situated far from the average citizens who enjoy the unrestricted right to reside in their own countries. This type of center is usually called a ‘camp’ because it can contain a certain amount of people in a specific area (Turner 2015). Refugees thus come to live in fenced camps or in territories set aside as refugee settlements. The camp can be defined in different ways and can take different forms, such as the government-run camps in Turkey that host approximately 217,000 Syrian refugees, the Grande-Synthe camp near Dunkirk in France that accommodates up to 2500 migrants, or an old, abandoned school in a small town in Sweden that offers shelter to approximately 100 people. But camps are temporary (in some cases, some might say ‘permanently temporary’) solutions to house people who are “out of place” (Bauman 2002, p. 113; Turner 2015, p. 2). Thus, refugees are in a state of being neither/nor rather than either/or. They do not belong to the host country, and they no longer belong to the country they left; although they inhabit the territory, they are “in it, but not of it” (Bauman 2002, p. 113).

Even though the question of refugees cannot be confined to Europe, the issue in Europe deserves some attention because the European Union has become a geopolitical hotspot with regard to refugees seeking safe haven. A so-called ‘immigration crisis’ erupted in Europe in the middle of 2000, culminating in 2015 with a massive increase in displaced persons seeking asylum, the largest since the end of World War II (Guild et al. 2015; Peters and Besley 2015). In the wake of the crisis, EU member states are taking new measures to develop restrictive and defensive immigration

policies to keep the unsolicited and uninvited migrants out. The focus on national security has eclipsed the focus on solidarity for the forcibly displaced populations within the European Union. The increasing needs for state security and border control have led to stricter asylum policies, preventing refugees from being granted temporary or permanent residence and making it more difficult to obtain asylum in the European Union (Kraler et al. 2015). These measures have not been able to stop people from entering the EU (or countries outside the EU, for that matter). As Zetter (2015, p. 3) points out, “Given the global scale of irregular migration, there are likely to be millions more forcibly displaced people who have not traveled through legal challenges or registered their claim for protection with authorities”. These nonvoluntary migrants are not seen as refugees in the legal sense; they are *de facto* refugees.

The state of affairs of people being on the move is complex, and it influences different societies in different ways. The refugee situation also influences educational praxis and educational research and raises the question of how educators should respond to the refugee crisis (Devine 2015). The question concerns not only the growing numbers of refugee children in schools and of people involved in adult education or other sorts of educational measures—or even how the crisis affects ideas of national identity and notions of solidarity and social coherence; the question also concerns understanding and taking responsibility for the crisis the refugees are facing and what it means to be in but not of a place.

When it comes to the question of refugees, educational research has generally focused more on migrants (refugees included) and the process of admission, inclusion, and citizenship, rather than on the existential state of the refugee living in a condition of statelessness. Even if the processes of admission, inclusion, and citizenship are important issues, the focus seems too narrow because it only includes *de jure* refugees and misses those who remain outside the political community (Krause 2008; Parekh 2014). Since refugees have no legal or effective citizenship and thus cannot enjoy its associated rights, they live more or less outside humankind. They are Agamben’s *Homo Sacer* (1998) incarnate, as their political and legal status is considered a temporary state. With the help of the works of Hannah Arendt and Giorgio Agamben on refugees and citizenship, I will show that even if questions of admission, inclusion, and citizenship are important when it comes to issues concerning refugees and education, the existential dimension must be illuminated as well (cf. Parekh 2014). Without ignoring the legislative dimension, our including the existential dimension is fundamental for keeping alive the educational questions about the past and the present, the local and the global, and inhabitants and migrants. Hence, in the analyses that follow, I will explore the complexity that surrounds the question of refugees in educational research.

## Refugees and Educational Research

Educational research on refugees usually takes its point of departure from the Universal Declaration of Human Rights, which, as Brown (2013, pp. xiii–xiv) expresses it, says that “we all have a responsibility to protect, educate, and provide

solace for the displaced (migrants, asylum-seekers, refugees, stateless, and undocumented) among us”.

Empirical studies on refugees and education usually focus on the relation between education and refugees in their homelands or in their host countries, describing how education actually works during conflicts. In such situations regular education tends to be disturbed or disrupted, and there are no guarantees that the home country or host country will want to start a systematic education for children who inhabit different detention centers or camps (see, e.g., Demirdjian 2012; Brown and Krasteva 2013). The studies usually describe actual educational conditions or situations and successful or unsuccessful educational efforts and either suggest or discuss policies and practices for the promotion of social justice and educational opportunities for refugees.

Educational research with a philosophical approach generally focuses more on what education can do for refugees in terms of enabling them to be included in and a part of society, rather than on life in the camp. That education is an important tool for social inclusion is widely recognized, but integrational measures take varying forms. A more liberal tradition of integration is based on a vision of individuals as autonomous beings and views social participation as a free and autonomous choice. A more communitarian approach proposes a collective solution and takes care not to disregard a person’s language, culture, religion, tradition, values, ethnicity, and so forth when it comes to social inclusion and social relations (Vertovec and Wessendorf 2006). The discussion of inclusion and education usually relates to questions of multiculturalism, the multicultural society, and multicultural education in liberal democracies. It does so for at least two reasons: (a) because states are more ethnically diverse due to migration and (b) because the increased legal and political status of minorities has led to greater acceptance of cultural diversity (Enslin and Hedge 2010, p. 387). The term multicultural society applies to a society that contains a variety of ethnic and national cultures and where there is a flow of cultural propositions and liberties of cultural choice. A multicultural democracy needs an increased recognition of diversity in order to promote a sense of unity and recognition of an overarching set of values, ideals, and goals to which all citizens are committed. Below, in relation to the question of refugees, I will discuss three traditions that all show how it is possible to invoke such ideals in education.

### ***Multicultural Education, Citizenship Education, and Cosmopolitan Education***

I am aware that this short description of the traditions—multicultural education, citizenship education, and cosmopolitan education—does not include or represent the diversity and the complexity of their content. I will describe and discuss the main characteristics of the chosen traditions in relation to the question of education

and refugees in order to clarify how these traditions respond to the refugee crisis. I will begin by describing multicultural education.

According to Gutmann (2009), multicultural education is not just an educational task directed to students; it is also a way of schooling society toward the very guiding principle of multiculturalism—namely, civil equality. A multicultural education that builds on ideals of freedom, justice, equality, equity, and human dignity helps students learn about, and of, other cultures and to develop positive attitudes toward cultural diversity and tolerance (Levinson 2009; Enslin and Hedge 2010). With tolerance comes respect for other cultures and the different ways people lead their lives. Multicultural education also promotes social change, especially by eliminating racism, prejudice, and discrimination.

Citizenship education is much in line with the guiding goals of multicultural education; that is, it aims to foster a caring and enlightened population, with citizens who participate in discussions concerning society (Banks 2008). Citizenship education is about bridging the gap between the individual as an autonomous subject entitled to the rights inherent in the human condition and the citizen as one entitled to the civic and political rights recognized by the national constitution of any given liberal democracy. People are both individuals and citizens of the societies to which they belong; hence, human rights and citizenship are strongly connected or interdependent.

Multicultural education and citizenship education carry their own internal tensions. In her mapping of multicultural education, Levinson (2009) points to one such tension involved with the goal of preserving minority groups' cultures, or ways of living, saying that the goal "may require the implementation of an *exclusive* curriculum that teaches the beliefs of the minority group culture *instead* of the beliefs of other groups" (p. 437). This example shows, according to Levinson, how one goal within multicultural education works in opposition to other goals, "such as increasing individual autonomy or promoting mutual respect" (p. 437). On the other hand, some cultures might need a more preserving goal in order not to lose their language and cultural identity. Gutmann (2009) sees a challenge to civic equality when "some multicultural conditions successfully challenge the democratic framework itself" and suggests "the need for a guiding principle other than civic equality" (p. 422). Other scholars do not use universal principles or goals as Gutmann does; they acknowledge that existing structures are not enough for an inclusive education since the universal goals of multicultural education belong to the dominant culture (Enslin and Hedge 2010).

Multicultural education and citizenship education are used as arguments against the dehumanization of refugees. Since these types of education are not possible without identity politics, they risk estranging people rather than dissolving categories such as 'we and them', 'inside and outside', and 'the familiar and the strange'; "the preservation of bounded membership within ethnic and citizenship boundaries" comes with identity (Zembylas 2010, p. 34; see also Månsson and Langmann 2011). Critics might argue that this is the case with multiculturalism and democracy

in general, since they are principles for the regulation of social life from above. These traditions offer little or no space for inclusion of refugees, at least not for de facto refugees because they live outside the legal realm and thus do not belong to the political community.

When it comes to arguments against the dehumanization of strangers and for the promotion of equality and social justice on a global scale, the idea of cosmopolitanism and cosmopolitan education comes to mind. Cosmopolitanism denotes a vision, or an idea, of the world that sees all humanity as belonging to the same community as citizens of the world, a community that transcends local loyalties and traditions. The idea is to connect an abstract universalism (shared values such as freedom, justice, and equality) with a specific moral commitment that serves to govern a well-ordered society, or city-state, where citizens, irrespective of religious, cultural, or political affiliation, belong to the same polity on equal grounds and with equal entitlements and obligations (for an overview, see Held and Brown 2010). There is, however, a tension between an abstract universalism and the specific commitment. As Peters (2010) points out, there is a certain risk that the abstract principle of cosmopolitanism “mask a Eurocentrism of values and take the place of analysis anchored in the geopolitical realities of the contemporary world” (p. 3). Hence, cosmopolitanism needs to be rethought against the background of the emerging spatial policies of late-capitalist globalization in order to develop a new form of cosmopolitanism that responds to “the mounting pluralism in societies around the globe” (Todd 2009, p. 25). The cosmopolitan idea has been appealed to in the field of education as a form of critical global awareness or as the basis of citizenship education (Strand 2010). The notion of cosmopolitanism is, in other words, a benign form of globalization. Whether in its classical or its newer strand, “educational cosmopolitanism is devoted, by and large, to the world of human beings and/or human emergencies” (Spector 2014, p. 425).

There is no doubt that classical and new aspects of cosmopolitanism and cosmopolitan education express a humanitarian and moral response that capture mankind as such and include all human beings in a global community as citizens of the world. They therefore have the potential to also embrace the refugee (both de jure and de facto). However, when it comes to the situation of the refugee de facto, at least according to the empirical situation worldwide, cosmopolitanism seems to overlook the fact that such refugees live more or less outside of humankind and do not share the world with the rest of humanity. They are in it but not of it, and they are not part of the juridical and political system that surrounds them. According to Biesta (2015), these refugees fall outside the rationale or world view of cosmopolitanism because the very existence of de facto refugees makes it evident “that the world is...not an ordered and encompassing (kosmos) political entity (polis) but is actually full of cracks” (Biesta 2015, p. 1381). These refugees represent ‘the cracks’ Biesta is talking about in that they are neither foreigners nor citizens. Asylum for people who effectively live in limbo—as neither/nor rather than either/or—“is a demand that in a fundamental sense cannot be met by a system because it constantly exposes the insufficiency of systems and will continue to do so” (Biesta 2015, p. 1382).

To conclude, multicultural education and citizenship education are political and juridical responses to migration rather than to the refugee crisis in that they look at admission, inclusion, and citizenship from a more national or local perspective. Even though the education system is one of the critical arenas in society through which the incorporation of refugees is organized, the focus on the processes of admission, inclusion, and citizenship obscures the existential conditions or circumstances refugees face living in a state of statelessness. With the devotion to humanity and human rights, cosmopolitan education seems to be a proper political and moral response to the refugee crisis because it goes beyond the processes of admission and takes a global perspective on inclusion and citizenship by welcoming all humankind to share the same world together, despite differences. In this sense, there is a cosmopolitan response toward the other as neither/nor (see, for example, Todd 2009). However, with its focus on citizenship, humanity, and human rights, cosmopolitan education does not encompass *de facto* refugees because their empirical reality does not really fit cosmopolitan education's rationale.

When it comes to developing an understanding of refugees and statelessness—or the state of temporariness, which is a more appropriate description of the current global situation—the works of Arendt and Agamben on refugees and statelessness are important. Their views on refugees and human rights offer ways of thinking differently about the educational response to the refugee crisis, as they go beyond traditions that really cannot approach terms like otherness, human rights, and citizenship without reference to identity or commonality. Arendt and Agamben perceive the state of the refugee not only as a legal issue but also as an existential matter (Parekh 2014). Agamben uses Arendt's perspective on statelessness—namely, that the common conception of human rights contains a paradox: that is, it supposes each person in his or her natural condition to be the source and bearer of inborn rights while presupposing that person to be a citizen with membership in a nation-state (Gündoğdu 2011; Parekh 2014). Both Arendt and Agamben demystify the “cosmopolitan aura of human rights” (Gündoğdu 2011, p. 2), which turn out not to be universal “but in fact the property of citizens” (Schuilenburg 2008, p. 88; see also Todd 2009).

## Refugees, Statelessness, and the Making of the Nonhuman

According to Arendt, the key to understanding the refugee as a stateless individual is to grasp his or her political significance. In her description of the state of mind of being a Jewish refugee, Arendt does not only describe her own experience; she also highlights the plight of the stateless human being who has no legitimate legal or political status (Arendt 1943). In *The Origins of Totalitarianism*, Arendt (1951/1994a) gives witness to the emergence of an increasing number of people (i.e., refugees) whose condition literally places them outside the law. According to Arendt, in addition to a juridical dimension that entails the loss of political community, the state of statelessness has an existential dimension that entails the loss of identity, expulsion from common humanity, and the loss of agency (Parekh 2014).

According to Arendt (1951/1994a), refugees experience two kinds of loss, one juridical and one political: the loss of their homes and thus of “a distinct place in the world” and the loss of governmental protection and thus of legal status in their home countries and “in all countries” (p. 173–174). When Arendt discusses the juridical state of the refugee as a stateless person, she is not referring to a number of rights protected by the law: the stateless person’s deprivation is much more profound in that they are deprived of the right to have rights—the fundamental right to belong to an organized community: “Once they had left their homeland they remained homeless, once they had left their state they became stateless; once they had been deprived of their human rights they were rightless, the scum of the earth” (Arendt 1951/1994a, p. 147).

Standing outside the law, being neither citizens nor foreigners, the stateless reveal a crisis of human rights rather than being protected by human rights: “If a human being loses his political status, he should, according to the implication of the inborn and inalienable rights of man, come under exactly the situation for which the declaration of such general rights provided” (Arendt 1951/1994a, p. 180). But according to Arendt (1951/1994a), that is not true. Instead of becoming a part of the nation they are admitted to, refugees’ “statelessness spread[s] like a contagious disease” (p. 165). Being neither a citizen nor a foreigner, the stateless person’s nonpolitical condition also affects the person’s identity and existential mode (Parekh 2014).

In an existential sense, statelessness deprives people not only of governmental protection “but also of all clearly established, officially recognized identity” (Arendt 1951/1994a, p. 167). This third kind of loss, which is existential rather than juridical or political, reduces stateless people to mere humans thrown back into a state of nature, so to speak. Being a mere human does not mean being human among peers: it means being less than human, deprived of human rights, suffering “rightlessness” and profound “loss of political status” (p. 175). Expelled from common humanity, a condition engendered by statelessness, refugees live politically, economically, and socially outside the common world, even though they are physically in it. According to the totalitarian ideology, they are superfluous:

The totalitarian attempt to make men superfluous reflects the experience of modern masses of their superfluity on an overcrowded earth. The world of the dying, in which men are taught they are superfluous through a way of life in which punishment is meted out without connection with crime, in which exploitation is practiced without profit, and where work is performed without product, is a place where senselessness is daily produced anew. (Arendt 1951/1994b, p. 155)

The condition of being stateless also diminishes a person’s right to express an opinion, to speak, and act in a political manner as ordinary citizens may do (Arendt 1951/1994a, p. 176). Because of the severe limitations on the possibility to act politically, which amount to a deprivation of political agency, the refugee is no longer free.

Agamben (1998, 2008b) agrees with Arendt in his comment on the connection between the fates of the rights of man and the nation-state. Rather than serving to protect the human, the rights of man are connected to the rights of the citizen rather than the rights of the refugee. The refugee presence signals a crisis of the rights of man. The rights of man, or human rights, are thus not compatible with the (merely) human: the political and legal status of refugees is under consideration or ques-

tioned because refugees have fewer rights than citizens of the nation-state. A person is not a true human being, so to speak, until he or she becomes a citizen. This seems to be why Agamben (1998, 2008b) wants to separate “the concept of the refugee” from “the concept of the rights of man” (Agamben 1998, p. 78) instead of reconsidering human rights, as Arendt does.

Agamben (1998) goes back to the formulations of human rights in the eighteenth-century declarations. In his discussion on the juridical state of the refugee, in particular the 1789 Declaration of the Rights of Man and Citizen, he shows how these declarations highlight the fissure between political and natural life. When Agamben argues on questions regarding the relation between the nation-state, citizens, and refugees, he uses the ancient distinction between *zoē* (naked life) and *bios* (political life). This distinction separates the (merely) human life, which is called simple or natural life, from the qualified life of an individual or group belonging to a political community. Agamben uses the figure of *Homo Sacer*, from ancient Roman law, to describe the form of life called naked or simple life (Agamben 1998). *Homo Sacer* is comparable to the bandit, the outlaw who has been excommunicated and stripped of his right to belong to a political community. Once a person is excommunicated, he or she loses his or her juridical identity and is assigned the identity of an outlaw. Hence, the refugee does not live outside society, even though he or she is not considered to belong to the society. When a person is expelled from a political community, the existential conditions of his or her life change such that his or her life is less valuable than other people’s lives.

According to Agamben (1998), the distinction between *zoē* and *bios* rests on the biopolitical. Instead of distinguishing biopower from sovereign power, as Foucault did, Agamben sees sovereign power as biopolitical, as it is defined as power over life. When life becomes biopolitical, *zoē* becomes part of the qualified life—but only through a person’s excommunication. Biopolitics is not grounded in the community or the people: it rests on the power to declare the state of exception. Hence, biopolitics operates under the logic of the “ban” (p. 23), where the separation between *zoē* and *bios* is constituted by the simultaneous exclusion and inclusion of bare life. *Zoē* is trapped in a certain status known as “inclusive exclusion” (p. 12). The life of *Homo Sacer* is not only bare life but also a life trapped in a special relation to the law, a life lived in the ‘exception-zone’—the “inclusive exclusion (an *exceptio*) of *zoē* in the *polis*” (p. 12). With this in mind, *Homo Sacer*’s possibilities for agency seem remote, if not nonexistent (as for Arendt’s stateless person).

*Homo Sacer* is not only a figure in ancient Roman law; it is a recurrent figure in modern history. One example is Agamben’s reference to the racial laws and the legal status of Jews in Nazi Germany, where Jews were deprived of all dignity: “The Jew is a human being who has been deprived of all *Würde*, all dignity; he is merely human—and for that reason, non-human” (Agamben 2008a, p. 68). Another example is the Taliban fighters at the Guantánamo Bay detention camp, who are neither prisoners nor convicted, and as such, subject to detention for indefinite periods of time (Agamben 2005). Stripped of political and legal rights, the Jew and the Taliban fighter share the fate of the refugee: existing in a state of exception, as less worthy than other human beings.

This political strategy that leaves the refugee in a state of exception produces a boundary that separates the outside from the inside. If there are no limits, or restrictions, to what it is possible to do to a person living outside the law, the refugee stands without legal protection. In order to understand the consequences the refugee faces, the refugee has to be regarded as “the central figure of our political history” (Agamben 2008b, p. 93). Further, in order to go beyond current refugee politics, the refugee must be considered for what he or she is: “nothing less than a limit-concept that at once brings a radical crisis to the principles of the nation-state and clears the way for a renewal of categories that can no longer be delayed” (p. 94).

What the renewal of these categories means is not clear, however (see Schuilenburg 2008). What is clear is that Agamben is experimenting with going beyond biopolitics, or with escaping the gaze of sovereignty, by developing an alternative ontology based on relations not as we know them but “beyond every figure of relation” and beyond “the limit relation that is the sovereign Ban” (Agamben 1998, p. 33). It is in this respect that Agamben (2007) develops the notion of “whatever singularities” (p. 5), which manifests the rethinking of community. *Whatever singularity* is a manifestation of a community that allows a formation without the affirmation of identity; it is no more than a co-belonging of singularities. *Whatever* being is “neither particular nor universal; the example is a singular object that presents itself as such, that *shows* its singularity” (p. 9). It is a community of singularities who share nothing more than their singularity.

Agamben sketches the contours of a common community—a community to come—but they remain vague and seem hard to operationalize. It is clear, however, that Agamben wants to challenge or even dissolve normative distinctions—such as nature and politics, human and nonhuman, and normality and exception—by which the world is constructed and understood and that he wants to go beyond the point where mere humans (such as refugees) are the main focus for political control and management:

Only in a world in which the spaces of states have been thus perforated and topologically deformed and in which the citizen has been able to recognize the refugee that he or she is – only in such a world is the political survival of humankind today thinkable. (Agamben 2008b, p. 95)

### ***Beyond Education for the Included***

The thoughts of Agamben, developed with Arendt’s understanding of statelessness, can help us understand how different forms of domination manifest in discourse practices and are materialized in human relations, such as in education, for Agamben’s thoughts help us diagnose new forms of domination in contemporary politics that are either “hidden in benign humanitarian and liberal claims” (Zembylas 2010, p. 42) or protected by the UN Declaration of Human Rights.

Since education is one of the most important tools for social inclusion and social participation, it is also a crucial issue for the integrational measures taken in order

to meet the needs of refugees arriving in unknown places. The deliberative claims of education, social justice, and citizenship are governed by an idea or perhaps several different ideas that promote a certain social fabric in order to control plurality and a democratic way of life, and these ideas create possibilities for those who are supposed to be included in society. The transformation and structuring of social reality based on an “assumed sameness” of those who are supposed to be socialized is similar to the transformation of new members of society into governable subjects. In this process, citizenship becomes a marker of difference that specifies the juridical and political state of the person and risks strengthening rather than dissolving group identities. In this situation, it becomes obvious that education is a place for the included (including *de jure* refugees) rather than for *de facto* refugees, who are unprotected by the law.

Even though multicultural education, citizenship education, and cosmopolitan education have some differences, they also have something in common: their devotion to humanity, human rights, and citizenship. According to these traditions, a proper educational response to the refugee crisis is to be found in the Universal Declaration of Human Rights, which expresses that “we all have a responsibility to protect, educate, and provide solace for the displaced...among us” (Brown 2013, pp. xiii-xiv). Both multicultural education and citizenship education, with their focus on admission, inclusion, and citizenship, build their ideas of a just education within the existing political and juridical system and, it seems to me, focus more on migration and not particularly on refugees. A cosmopolitan educational perspective takes its response to the refugee crisis a step further by invoking a global perspective on citizenship that captures all mankind belonging to the same global community, without bringing any negative attention to local differences. The empirical situation of refugees seems to be given less attention, however, than globalization, human rights, and citizenship. The situation of *de facto* refugees does not really fit the picture of the cosmopolitan citizen of the world, which is shaped by a critical global awareness and based on citizenship and human rights.

With regard to citizenship and human rights, there is a need within educational research to focus on the parallel processes of the preservation and protection of human rights and citizenship and the making of the nonhuman. If a person is considered not truly human until he or she becomes a citizen, there is a need to either reconsider human rights, as Arendt does, or to detach the concept of the refugee from the concept of the rights of man, as Agamben suggests. Thus, Arendt’s and Agamben’s views on the “nonpolitical” and “nonjuridical” condition of refugees offer ways of thinking differently about the educational response to the refugee crisis, since they go beyond traditions that cannot come to terms with “whateverness” without reference to identity or commonality. A responsible educational response to the refugee crisis should start not from what we already know but from what we do not really know and travel toward a state that has not yet been. It would offer a view of education that is not built on the same power structures as society, where mere humans become the subject of political control and social security, and would go beyond education only for the included.

## Concluding Remarks

In this chapter, I have explored the question of how the current issue concerning refugees, or the refugee crisis, influences educational research (and thereby, presumably, educational praxis). As I said earlier, an educational response to the refugee crisis is not only about the number of refugees receiving education or how the crisis affects ideas of national identity and notions of solidarity. It must also involve understanding and taking responsibility for the problems refugees face and for their condition of being in but not of the place. The educational approaches I have addressed in this chapter—multicultural education, citizenship education, and cosmopolitan education—provide important contributions toward understanding how education can be more inclusive and more just. By including newcomers to a multicultural and democratic society, they focus on the juridical and political processes of what it means to be a refugee or what it means to become a citizen, but they seem to (more or less) forget the existential state of the refugee. The traditions described in this chapter do not include a notion of the state of the refugees but only notions of how the refugee can be one of us, a peer among peers in a pluralistic democracy. I have raised the question of the existential state of the refugee in order to give another perspective on the issue. Although we need not neglect the processes of admission, inclusion, and citizenship, we must try to understand the loss of human significance and agency the refugee faces as a nonvoluntary traveler who is denied equal access to society and the same rights as ordinary citizens if we are to share the world of the refugee and thus be able to approach the refugee in a common world rather than from a position outside the refugee's world.

Sharing the world of the refugee is a question of proximity—rather than one of deliberation and achieving consensus—through which there is the possibility to meet the refugee on his or her own terms and in his or her own rights, as a human among humans. The potential for sharing an unknown person's world is by no means certain, as living together in a world of difference has its obstacles. Nationality, religion, ideology, culture, and so forth have all been proven important elements in refocusing the concern for the refugee toward a concern for the well-being of society. There is, in the works of Arendt and Agamben, a call for a renewal of categories such that the refugee is not reduced to a lawless figure revealing a crisis of human rights. The refugee, or rather, acknowledgement of the state of the refugee, can instead be considered a vehicle for social and political change or transformation. Even though the borders have their own tragedies, they also have their own dynamics that might provide opportunities for something new to be born. Hence, educational concern for refugees must comprehend the existential question of what it means to be a refugee in order to sustain the conversation between the past and the present, the inside and the outside, the local and the global, and newcomers and residents.

# The Public and Private in Education

Chris Higgins

## Introduction

The purpose of this chapter is to examine the origins, conceptual contours, and current state of the perennial debate over the public and private in education. The problem is that there is no single such debate, since the contrast between public and private constitutes one of the West's 'grand dichotomies', one "used to subsume a wide range of... important distinctions" emerging out of different "universes of discourse, each with its own complex historical cargo of assumptions and connotations".<sup>1</sup> Indeed, given their "protean" nature (Weintraub 1997, p. 2), concepts of public and private can be seen as central to every chapter in the history of Western education.<sup>2</sup>

Consider first the long prehistory of modern, mass, compulsory schooling. For centuries, education was understood primarily as civic education, as the shaping of dispositions for successful participation in public life. Three brief examples will suffice to show the dominance of civic rationales from ancient Rome to the Renaissance. As Bruce Kimball (2010, p. 32) remarks, Cicero's *De Oratore* (On the Orator) served for two millenia as the "classic expression of the idea of liberal education understood as a preparation for someone seeking to lead the political and social affairs of a republic". In the twelfth-century *Metalogicon* of John of Salisbury, Chambliss (1987, pp. 3–4) notes, the "aim is not to study [the] arts for their own sake, but for... examples of human conduct" and for "the sake of doing 'good works'". Similarly,

---

<sup>1</sup>I am quoting from Weintraub (1997, pp. 1, 3) who credits this phrase and idea to Bobbio (1989), apparently preferring "grand dichotomy" as a translation of Bobbio's "la grande dicotomia".

<sup>2</sup>Higgins and Knight Abowitz (2011b) examine five key ambiguities in the concept of the public.

Grafton and Jardine (1986, pp. 1–2) characterize the humanistic education of the fifteenth and sixteenth centuries as aimed at the “the active man of affairs”.

The history of education takes a dramatic turn in the late eighteenth and nineteenth centuries, as we see not only the increasing equation of education with formal education and a widening participation in formal education but also a new role for a new kind of state. Without denying such factors as the invention of the printing press, the Reformation, and changing conceptions of childhood, it is the needs of the new, centralized nation states that primarily drive universal, compulsory schooling.<sup>3</sup> In the rapid shift from an artisan-merchant to an industrial mode of production, the new states needed an institution capable of training a skilled, differentiated workforce accustomed to a new time discipline and work rhythm; amidst constant geopolitical conflict, the new states needed a citizenry willing to march to war and thus an institution capable of fostering a strong allegiance to a more abstract polity (e.g., Germany rather than, say, the Principality of Waldeck and Pymont).<sup>4</sup> Modern schooling is, thus, state education, and public in that sense.<sup>5</sup>

As modern mass, schooling has evolved, the public/private contrast has only become more central to our educational thinking. With the rise of the ‘common school’ in modern democratic nation states, educational debates have gravitated to questions of liberty and solidarity, equality and diversity: To what extent can the state legitimately compel participation in common schools? What are the limits of allowing citizens to opt out of common schools before this begins to erode public life? Do common schools actually function according to their own democratic rhetorics, namely, (1) to bring citizens together productively across differences and (2) to ensure meritocratically that individual life opportunities are a product of individual effort and talent rather than of accidents of birth (socio-economic status, religion, race, gender, etc.). These are questions about the conditions of democratic, public life.

In recent years, the very idea of public education has come into doubt as scholars have turned their attention to the new logics of privatization operating in this rather late stage of capitalism typically tagged with the catch-phrase ‘neo-liberalism’. As Blacker (2013, pp. 25–27 and *passim*) explains, neo-liberalism is a superstructural, “justificatory fantasy” accompanying four basic shifts in the structure of capital: (1) “the globalization of labor and consumer markets”; (2) “the propping up of demand...through the massive... pusher-like extension of consumer credit”; (3) the rise of casino capitalism (i.e., “the mass migration of capital from production to... the highly leveraged, phantasmagoria of speculative finance”); and (4) “an increased

<sup>3</sup>On the rise of print culture and changing conceptions of childhood, see, e.g., Postman (1982, Part 1). For a colorful encapsulation of the Protestant argument for mass literacy, see Massachusetts’ “that old deluder Satan” Law of 1647 (in, e.g., J. W. Fraser 2001, p. 8).

<sup>4</sup>Here I am following the pocket history offered by Kieran Egan (2008, p. 6). For a thorough treatment of the symbiosis between modern schooling and state formation, see Green (1990). On the relation of modern schooling to the rhythms of industrial work, see, for example, Thompson (1967, p. 84ff).

<sup>5</sup>That non-government-run schools arise as exceptions only prove the rule.

adventurism toward accumulation by dispossession as stressed elites seek to marketize, financialize and finally burglarize erstwhile public resources such as criminal justice, health, and education systems”.

In education, the justificatory project is hinged on the rhetoric of ‘choice’, a project launched in the writings of Milton Friedman, from the cautiously titled ‘Role of Government in Education’ (1955) to the ultimately impatient if not imperious, ‘Public Schools: Make Them Private’ (Friedman 1997). Meanwhile, educational versions of ‘accumulation by dispossession’ are not hard to find. In the United States, while the initial frontal assault of the voucher movement has been slowed by that pesky little thing called the Establishment Clause, profiteers have nonetheless made deep inroads through charter schools and through the privatization of what has emerged as the main activity of contemporary schools, testing. One recent estimate valued the testing business at \$2 billion annually, noting that just one company, Pearson, spent \$8 million lobbying US lawmakers over a 5-year period (Strauss 2015; on Pearson’s grander ambitions, see Kamenetz 2016).

As even this brief history makes clear (cf. Feinberg 2012), our thinking about education – from early forms of civic education to modern state schooling, the dialectics of democratic education, and the new forms of privatization – is inseparable from our thinking about the public and private. Without further specification, then, a review of the public/private question in education becomes a review of education itself. In order to frame a more tractable object of inquiry, we will need to make some distinctions.

## What Makes a Public School Public?<sup>6</sup>

Let us begin with the classical, economic distinction between private and public goods. Ironically, the concept of ‘public goods’ is classified by economists under the category of ‘market failures’. The idea is that market mechanisms are disrupted by the presence of “non-rivalrous” goods (e.g., looking at a painting in museum) for which “each individual’s consumption... leads to no subtraction from any other individual’s consumption of that good” (Samuelson 1954, p. 387). Market efficiency is further undermined by so-called ‘free riders’ who consume ‘non-excludable’ goods (e.g., fish, in public waterways) without paying, who benefit

---

<sup>6</sup>This section draws in part on Higgins (2011b, pp. 455–457). For a special issue devoted to this question, see Higgins and Knight Abowitz (2011a). As we explain, it is hard even to pose this question given “the banality of the phrase [‘public school’] in some contexts and its sacredness in others” (Higgins and Knight Abowitz 2011b, p. 365). Educational discourse displays a number of creative ways of dodging the question, including:

*nominalism* (the public schools are those schools designated as such), *formalism* (a school counts as public if it is funded by tax dollars, overseen by elected officials, and so on, regardless of how well it realizes its public mission), *sentimentality* (our public schools ensure equal opportunity, an educated electorate, and social unity), and *indirectness* (the public school does not favor any particular view of the good life). (Higgins 2011b, p. 455, emphasis added; see also Higgins and Knight Abowitz 2011b, pp. 365–369)

from positive ‘spillover effects’ generated by the investment of others (e.g., when one house’s renovation lifts real estate values for the whole block), or by passing on the costs of negative spillover effects (e.g., pollution). For economists, then, public goods are those we secure collectively because their lack of rivalry and excludability makes them inimical to market logics. It is hard to generate a market in lighthouses when you cannot stop non-paying boats from seeing the beacon and when their seeing it saps none of its power to alert others.

Interestingly, it is not at all clear that modern mass schooling, with its thoroughgoing tie to credentialism (see, for example, Collins 1979), meets either of these criteria. The credential market is clearly rivalrous (Labaree 1997; Donoghue 2008, pp. 111–138). The more holders of a particular degree, the less exchange value it has. This makes admissions rivalrous and exerts a downward pressure on earlier stages of schooling even if they feature open admissions: if getting into the school wasn’t rivalrous, getting out, with the marks necessary to win the right spot at the next level, surely is. There could even be rivalry for educational goods when we bracket off credentialing. Imagine that the best piano teacher in the area says that she will give lessons to adult beginners for free, but only has room for ten students. Education comes closer to meeting the requirement of non-excludability, but only by way of spillover effects. While it is easy to limit who has access to (formal) educational institutions and experiences, the effects of education tend to radiate far beyond the individual student. We are all grateful to the teachers of J.D. Salinger and Jonas Salk. Economically speaking, then, formal education would seem to fall short of counting as a ‘pure public good’, instead constituting at best a so-called ‘common resource’ or mixed (rivalrous, non-excludable) good.

This is, to say the least, a deeply uninspiring conclusion. Surely the idea of public education names an aspiration greater than that of a partial market failure! This is where a further distinction offered by Charles Taylor (1995) proves helpful. For Taylor, this economic approach fundamentally misses the point. What the economists call public goods, he calls “convergent” goods (Taylor 1995, pp. 190–191). These are goods, as we have seen, that we tend to secure collectively since it is all but impossible to do otherwise. But they are still essentially private goods, objects of separate private valuations that happen to converge. National defense, for example, matters to me and it matters to you and it makes sense to pursue it together. Against both private (non-convergent) goods and convergent (private) goods, Taylor sets a category he calls ‘common goods’. These are goods that matter to me because they also matter to you. Taylor (1995, p. 190) identifies two varieties of common goods: “mediately common goods”, where what we value emerges only within an inter-subjective space of shared meanings, and “immediately common goods” where the good is precisely that we share some experience or meaning. Think of how strange it would be to speak of a good conversation as the convergence of two independent rational actors’ separate interests in conversing. While *Homo economicus* enters into relationships because they satisfy pre-existing preferences or serve as instrumental means to realizing another preference, human beings find themselves already situated in relationships within which they are able to perceive horizons of value, meaning, and purpose.

Like Taylor, Walter Feinberg (2016, p. 85) distinguishes individual values held individually (private goods), and “neighborhood effects” or “shared values held individually” (convergent goods), from genuinely “common values”. However, Feinberg (2016, pp. 85–86) adds a helpful further distinction, pointing out that common values can be held both unreflectively and reflectively. While many of our common values remain hidden to us as the “implicit background conditions that generate shared judgments and emotional responses”, Feinberg (2016) wants to reserve the term “public values” for that subset of common values that we are able to lift into the foreground and subject to critical reflection. The development of concepts such as ‘sexual harassment’ and ‘rape within marriage’ is illustrative. Such concepts were impossible to formulate while we were still in the grips of deep (and deeply problematic) common values such as the idea that a woman’s place is in the home and that a wife is a husband’s property. Until we were finally able to surface these ideas and subject them to critical reflection, it was difficult to name, and perhaps even to think, why consent still mattered in marriage or why it was unacceptable to fill workplaces with images, utterances, and actions casting women as sex objects.<sup>7</sup>

Taylor’s and Feinberg’s distinctions immediately throw educational controversies of the last several decades into relief. It turns out that most defenders of public education in fact share a key assumption with the privatizers, namely, that the chief good of education is the private one of relative social mobility for individuals and families. The heated disagreement over the degree to which these private goods should be seen as convergent, and thus whether market mechanisms or common, social provision is most appropriate, serves to disguise a tacit agreement to beg the question of what might truly public, educational goods.

Before turning to this question, let me add two qualifications. First, I certainly do not mean to trivialize these debates, which involve basic questions of liberty, equality, and distributive justice. In the United States, we see increasing economic stratification, ongoing structural racism, and a system through which, as Richard Rorty (1999, p. 121) observes, “an increasingly greedy and heartless American middle class [has let] the quality of education a child receives become proportional to the assessed value of the parents’ real estate”. We have private schools for the super rich, lavish quasi-public schools for the pretty rich, and bleak public schools for the poor and working classes. By quasi-public, I mean government-run schools with ample physical, emotional, and intellectual resources, located in wealthy (and often mostly white) enclaves where parents pay the equivalent of private school tuition in the form of expensive homes and high property taxes to live in exclusive neighborhoods. In contrast, children living in poor neighborhoods will typically encounter behaviorist pedagogy, a curriculum narrowed to transmission of skills needed for low-wage jobs, and physical environments that range from the deeply anesthetic to the outright unsafe.<sup>8</sup> These are crucial, pressing matters, but the point is that we

<sup>7</sup>Here I am following Feinberg (2012, p. 16).

<sup>8</sup>The most famous chronicler of such conditions is of course Jonathan Kozol, from *Death at an Early Age* (1967) through *Savage Inequalities* (1991) to *The Shame of the Nation* (2005). For

need not choose between calling for distributive justice in the credential market and questioning the complete economization of contemporary education with its concomitant assumption that the goods of education are merely convergent. Education, we must insist, is a longstanding and robust sphere of valuation with its own distinctive goods, some of which may prove to be true public goods.<sup>9</sup>

The second caveat is that, even were we to conclude that educational attainment was merely a convergent good, the pursuit of justice related to its distribution seems like a perfect example of Taylor's 'mediately common goods', since our appreciation of justice requires the community of its seekers. What then are the truly public goods of education? With this refined concept of a public and public values in mind, let us now look at the historical project of the common school.

## The Common School: Ideals and Realities

The ideal behind the nineteenth-century, US common school movement is as simple to state as it is hard to realize. I offer two passages, one from Horace Mann himself and one from Lawrence Cremin, characterizing Mann's project:

According to the European theory, men are divided into classes,—some to toil and earn, others to seize and enjoy. According to the Massachusetts theory, all are to have an equal chance for earning, and equal security in what they earn. (Mann 1957, p. 84)

In [the common school] would mix the children of all creeds, classes, and backgrounds, the warm association of childhood kindling a spirit of mutual amity and respect which the strains and cleavages of adult life could never destroy. (Cremin 1957, p. 8)

In this prime example of nineteenth-century, New England trash talk, Mann captures the way in which schools could become instrumental to distributive justice.<sup>10</sup> Notice though that, at least in theory, it might be possible to provide this equal opportunity in separate schools. A century later, *Brown vs. Board* was to famously reject this as a live possibility in a structurally racist society.<sup>11</sup> But even for Mann

---

example, on the new behaviorism in high-poverty, majority-minority schools, see Kozol (2005, Chapter 3); on their dumbed-down, no-collar vocationalism, see Kozol (2005, Chapter 4); on the anesthetic qualities of such schools, see Kozol (2005, Chapter 7).

<sup>9</sup>As Michael Walzer has argued, justice requires a twofold struggle against both the monopolization of goods in any one sphere and against the dominance of one sphere over others. The more the boundaries between spheres dissolve and one set of goods becomes a universal currency translatable into standing in the other spheres, the greater the chance that a society will suffer a form of tyranny even worse than simple inequality. For a defense of spherical integrity in education, see Blacker (2007).

<sup>10</sup>With hindsight, the trash talk now seems unjustified since, while income inequality remains a problem in Europe, the problem is even more severe in the United States (OECD). The GINI coefficient for the United States is just shy of 0.4 (where zero is perfect equality and 1 is perfect inequality). The GINI values for EU countries range from 0.25 (Denmark) to 0.36 (Estonia).

<sup>11</sup>*Brown v. Board of Education of Topeka*, 347 U.S. 483 (1954).

himself, as Cremin suggests, ‘common’ refers not only to equal provision but also to learning together across differences.

The theory is that congenial, early contact with those who are different from us will instill the dispositions needed for later public life, namely, the ability to show care for the ideas and values of others precisely when they differ from our own. However, Cremin’s rendition starts to dissolve into pure sentimentality unless we temper it with some hard truths. Take race as the main ‘cleavage of adult life’. In the United States, *de facto* segregation of the ‘public’ schools (via seemingly voluntary residential segregation which relies on the proxy of wealth when not backed by overt housing discrimination by landlords, banks, and insurance companies) has undone any gains accomplished by *de jure* desegregation. Already by 2004, the resegregation of US schools was such that you would have to go back to 1968 to find a lower percentage of African-American students in majority white schools. In 2009, 50% of African-American and Latino students attended ‘high-poverty’ schools, compared to 7% of white students.<sup>12</sup> Meanwhile, more than 2 million African-American students attend what Jonathan Kozol, following Gary Orfield, calls ‘apartheid schools’, in which 99–100% of the students are non-white.<sup>13</sup>

The common school ideal is not only subverted by *de facto* segregation and stratification across schools. Schools that do possess a more racially and socially economically diverse student body may simply divide and stratify within the school through tracking (also known as ‘streaming’ and ‘ability grouping’). Even if we thought that tracking constituted a beneficial form of differentiation, rather than a practice doomed repeatedly to prove the Pygmalion effect, it certainly belies Cremin’s talk of inter-group mixing. As has been excessively documented, the hierarchies of school tracks closely mimic social hierarchies of race and class. Consider the decade long studies conducted by Jeannie Oakes’ team in four mid-sized US cities.<sup>14</sup> Not only do track placements follow standardized test scores that themselves follow racial patterns, but even at the same ‘achievement level’ majority (white and asian) students are more likely to be placed in advanced classes than minority students. In Rockford, Illinois, 27.1% of majority students scored in the top two deciles, compared to only 4.8% of minority students. But even that small cohort of minority students making it to the 9th and 10th deciles were less likely to be placed in upper track courses than their majority counterparts. In the 9th decile, 79% majority students were tracked to advanced classes, but only 59% of minority

---

<sup>12</sup> See Aud et al. (2010, p. 39). To be exact, 47% of African-American students and 52% of ‘Hispanic’ students attend ‘high-poverty’ schools, defined as schools 75% of whose students qualify for free and reduced lunch.

<sup>13</sup> See Kozol (2005, p. 19). Kozol cites two studies conducted by Gary Orfield and colleagues at Harvard’s Civil Rights Project.

<sup>14</sup> For an overview of these mixed-methods studies (in connection with desegregation lawsuits) in Rockford, Illinois; San Jose, California; Wilmington, Delaware; and Woodland Hills, Pennsylvania, see Oakes (2005, pp. 233–234), who provides an overview noting that Welner (2001) offers the most comprehensive presentation of their findings.

students; in the 10th decile, 85% of majority students were placed in advanced classes, but only 63% of minority students.<sup>15</sup>

Even in heterogenous schools where interaction across race and class occurs, there is cause for pessimism since it is the quality of interaction that matters. Recall the conditions that Gordon Allport attached to his famous ‘contact hypothesis’. “Allport consistently stressed that at least five formidable criteria must be fulfilled”, Merry and New observe, “before stereotypes could be challenged” and “positive emotions could be experienced”:

(1) equal status between persons of different backgrounds in a particular situation; (2) common goals around which members of different backgrounds are united; (3) intergroup cooperation, in which competition is avoided or minimized (4) the mutual recognition of some authority that can facilitate interactions and adjudicate in matters of disagreement; and finally (5) there needs to be informal, personal interactions between persons of different backgrounds, particularly between members of conflicting groups if intimacy, respect, and meaningful interaction are to be achieved and sustained. (Merry and New 2014, pp. 207–208)

How many schools, even among those that manage to put kids from different racial and socio-economic backgrounds in the same room, meet these five criteria? One can imagine the right drama teacher or sports coach creating an extracurricular oasis that meets these conditions, but the fact remains that the unequal status of the groups is reproduced within the school walls and schooling is by its nature competitive, individualistic, and largely inimical to intimate, meaningful interactions. Meanwhile, it is hard to share Cremin’s and Mann’s optimism when, after a century and a half of the common school, we see a surge of nationalism, xenophobia, and scapegoating across a range of Western Democracies.

Considerations such as these have led some scholars to conclude that the very notion of public education is best seen as an instrument of mystification.<sup>16</sup> For others, the concept still serves an authentic regulative function. Feinberg (2012, p. 87) sees public schooling as one necessary component of a larger set of educative pro-

---

<sup>15</sup> See Oakes (2005, p. 234, Table 11.2). As Oakes (2005, pp. 228–236) shows, ample research over the two decades since the first edition of *Keeping Track* confirms the prevalence and continuation of racial disparities in tracking policies.

<sup>16</sup> See, for example, Michael Merry’s (2013, 2014, 2016) critique of diversity and publicity rationales for the schools and his egalitarian defense of voluntary separation. For a critical response, see Abowitz (2016). Indeed, there is a line of thought skeptical not merely of the common school but of the very existence of the public. Alasdair MacIntyre’s (1987) search for the last real example of an educated public takes him back to the Scottish Enlightenment. Richard Sennett (1978) similarly dates the *Fall of Public Man* to the end of the eighteenth century. Thus, Walter Lippmann (1993) concludes that the public is a ‘phantom’ whose spectral existence aids manipulators of ‘public opinion’ who rely on the myth of a public sphere in which individuals express, contest, and revise judgments. For a thinker such as Nancy Fraser (1992), while it is not necessary to jettison this idea of the public sphere, it is necessary to supplement it with the idea of counter publics, discursive arenas in which subaltern groups work to articulate the revision of common values needed to make the mainstream public genuinely inclusive of the difference they represent. For a development of this idea, see Warner (2005). For explorations of educational counterpublics, see Knight Abowitz (2001, 2003) and Suissa (2016).

cesses that work to reproduce a public or “an authoritative body of (mostly) strangers” that engages in “direct and indirect communication” so that, without negating their “separate affiliations and cultural identities”, they can work together to shape a common future. Public schooling, for Feinberg, serves to stabilize existing common values and to cultivate the skills of reflection and dialogue necessary to make such values explicit so that they may be tested and revised. On this view, education constitutes not only a public good but a foundational public good. It meets the criteria of Taylor’s common goods since the ‘we’ precedes the valuing. We must recognize ourselves as bound together by a common fate in order to concern ourselves with the reproduction of the conditions of that recognition. It is foundational because the good in question is not only a reflective value held in common but the good of sustaining the form of life in which such collective, but not homogenous, reflective valuation may continue.

## The Individual Versus the Blob

Having pointed out the widespread conflation of public and convergent educational goods, having suggested that, while education and public life are theoretically connected in a very basic way, it has been very hard to realize that connection in practice, one might assume that modern education has at least tended to nurture our private lives. Perhaps if education has struggled with its civic mission, it has least seen to the tasks of individuation and self-cultivation. To see why this assumption proves to be false, we must consider another distinction, this one from Hannah Arendt.

In the discussion so far, the private has figured only as a negative concept, as a lack of public standing.<sup>17</sup> Arendt (1998, p. 58) begins here as well, emphasizing the root sense of privation: “To live an entirely private life means above all to be deprived of things essential to a truly human life: to be deprived of the reality that comes from being seen and heard by others”. Notice, though, that Arendt warns only against an *entirely* private life. To have no opportunity to engage in the public realm and appear before others in word and deed – to never experience release from “the weightless irrelevance of [our] personal affairs” (Arendt 1977c, p. 4) would be, she boldly declares, to live something less than a fully human life. Arendt (1977a, p. 186) is, however, just as quick to point out how untenable it would be to live our lives forever exposed to “the glare of the public”. Human beings need spaces of withdrawal and privacy, “humane corner[s]” where one can encounter, if not public happiness, than at least the “*petit bonheur*” possible “within the space of their own four walls, between chest and bed, table and chair, dog and cat and flower pot”.<sup>18</sup>

<sup>17</sup>The discussion of Arendt that follows draws in part from Higgins (2011b, pp. 457–458).

<sup>18</sup>The quotations are from Arendt (1998, p. 52). On public happiness, see Arendt (1977b, p. 224 and passim). On the young’s special need for shelter from the glare of the public, see Arendt (1977a, pp. 186–187). Even if we thought that adults needed no such protection, Arendt (1998, p. 71) points out that,

For Arendt, then, private life has its place and its charms. The good life includes both appearances in public space and opportunities for privacy.

Can we conclude, then, that at least modern education is succeeding at half of its job? For Arendt, the answer is no, employing a helpful tripartite distinction to make her point. It is Arendt's thesis that in modernity we have all but lost both publicity and privacy, both having been overrun by what she calls the 'social'. We can capture Arendt's conception of public life with the metaphor of a table around which individuals gather. The table stands in for the common world, the world of meanings (stories, practices, spaces) and their material supports (languages, institutions, and the built environment) that possess a stubborn (though by no means permanent), reassuring reality beyond subjective caprice. Because there is one table at which we sit, we can come together, but notice that by definition this will mean that we each pull up a chair from a different angle. Having something in common and seeing it from different perspectives go hand in hand.

To get a feel for the social, by contrast, picture the same scene – now take away the table! As Arendt (1998, pp. 52–53) puts it:

The public realm, as the common world, gathers us together and yet prevents our falling over each other, so to speak. What makes [modern] society so difficult to bear is not the number of people involved, or at least not primarily, but the fact that the world between them has lost its power to gather them together, to relate them, and to separate them. The weirdness of this situation resembles a spiritualistic séance where a number of people gathered around a table might suddenly, through some magic trick, see the table vanish from their midst, so that two persons sitting opposite each other were no longer separated but also would be entirely unrelated to each other by anything tangible.

Modernity is, to alter the metaphor a bit, like a long ride on a crowded subway car. Crammed together but far apart, the social affords none of the restorative withdrawal of private life nor the enlivening qualities of public life. Being part of 'the blob', as one of Arendt's interpreters (Pitkin 1984) dubs it, leaves us simultaneously distanced both from our own natality (that small and often misplaced part of ourselves that is never done being born, that is capable of origination, that chafes at habit and custom) and the distinctiveness of others. The social is, in effect, the private writ large. It is "getting and spending" (Wordsworth 1965) as a collective pastime. Instead of the "theater of display and witness" (Curtis 1999, p. 71), we are left simply 'Dancing with the Stars'.

The schools struggle, as we saw, to embody public goods, but it is not clear that they fare any better in helping students individuate, a process that requires articulation between public and private spheres and a rhythm between public provocations to self-enactment and private spaces of regroupment. Thus, we begin to see the contours of a second debate related to privacy and publicity in education. Where the

---

A life spent entirely in public, in the presence of others, becomes, as we would say, shallow. While it retains its visibility, it loses its quality of rising into sight from some darker ground which must remain hidden if it is not to lose its depth in a very real, non-subjective sense.

For a detailed exploration of Arendt's views on the relation of education and public life, see Higgins (2011a, Chapter 7).

first concerned education as an object of common or merely individual valuation, the second cuts the other way targeting individuation itself as a worthy aim of education, with socialization as its foil. To what extent does schooling promote self-cultivation? Can schools simultaneously promote socialization and individuation? How shall we assess these seemingly rival educational aims?

## Socialization and Individuation as Educational Aims

The critique of socialization as an educational aim far predates the modern marriage of schooling and socialization. In Book VII of Plato's *Republic* (1991, p. 193 [514a]), Socrates offers his interlocutors an allegorical drama depicting our 'nature' and 'condition' in its 'education and want of education' (*paideia* and *apaideusia*). Famously, Socrates casts us as prisoners who are bound from an early age in the dark corner of a cave and come to mistake mere shadows (of puppet-like artifices illuminated by firelight) and echoes (of deceiving sounds made by the puppeteers) for reality itself. When Glaucon remarks on the "strange image... and strange prisoners", Socrates simply replies that, "they are like us" (p. 193 [515a]). And in fact the Allegory has resonated with generations of readers, themselves the largely passive recipients of education understood as transmission of the conventional names for conventional things. Indeed, the text not only critiques enculturation in general but even presages the pathologies of modern schooling and testing. The shadow school will not only reward those who can correctly name each image as it flickers across the cave's back wall but will single out those who can game the test, offering:

honors, praises, and prizes for the man who is sharpest at making out the things that go by, and most remembers which of them are accustomed to pass before, which after, and which at the same time as others, and who is thereby most able to divine what is to come (p. 195 [516c-d])

The true *paideia*, Socrates concludes, is not a matter of "putting sight into blind eyes" but of turning the soul from appearances toward reality (p. 197 [518c]). Far from defining education, Plato suggests, this socializing of the young into the mores and conventions of the community constitutes a dangerous form of miseducation, dangerous because it not only turns the soul toward appearances but also because it offers these up as if they were the real articles. This creates an insularity so deep, an inertia so profound that, even were the prisoners released from their shackles and told of their troglodytic condition, emancipation would still require being "dragged... by force along the rough, steep, upward way" (p. 194 [515e]).

Whether or not Whitehead (1978, p. 39) was right when he quipped that all of Western philosophy "consists of a series of footnotes to Plato", Plato's critique of socialization certainly looms large in the history of education. After all, the dominant interpretation of the dominant educational tradition, liberal learning, is Socratic in spirit: "Each of us", as Oakeshott (1989, p. 24) puts it, "is born in a corner of the

earth, and at a particular moment of historic time, lapped round with locality” and liberal learning invites us into a conversation that can emancipate us from such caves of convention. As Bruce Kimball (1986) demonstrates, however, this represents only one ‘philosophical’ strand in the tangled tradition of liberal learning. It was not Socrates but Isocrates, and especially Cicero, who inspired the ‘oratorical’ strand of liberal education that dominated for more than a millennium. The philosophical strand, Kimball shows, only begins to emerge in the High Middle Ages and does not fully coalesce until the Enlightenment when Socrates would be claimed retroactively as its patron saint. On Kimball’s reading, the modern debate over liberal learning then proceeds as a series of compromises and syntheses of these oratorical and philosophical visions of the educated person.<sup>19</sup>

As it turns out, this defining tension in our oldest educational tradition is none other than that between socialization and individuation. Here is how Kimball (adapted from 1986, p. 228) characterizes the major tenets of each ideal:

The oratorical (or *artes liberales*) ideal:

(1) Training citizen-orators to lead society (2) requires identifying true virtues, (3) the commitment to which (4) will elevate the student and (5) the source for which is great texts, whose authority lies in (6) the dogmatic premise that they relate the true virtues, (7) which are embraced for their own sake.

The philosophical (or liberal-free) ideal:

(1) Epistemological skepticism underlies (2) the free and (3) intellectual search for truth, which is forever elusive, and so all possible views must be (4) tolerated and given (5) equal hearing (6) with the final decision left to each individual, (7) who pursues truth for its own sake.

On the oratorical conception, the learner is socialized into a tradition of eloquence and judgment with the aim of serving society. On the philosophical conception, the learner is promised the tools to critique tradition. Paradoxically, Plato is more likely to be assigned reading in the oratorical tradition, offered to students as a font of wisdom. A purely Socratic invitation to liberal learning might well ask students to jettison the baggage of the past, including Plato’s dialogues, to think for themselves.

Ralph Waldo Emerson (1983a, p. 57) captures this latter idea well in ‘The American Scholar’ when he declares, “I had better never see a book, than to be warped by its attraction clean out of my own orbit, and made a satellite instead of a system”. Emerson picks up the theme again in “Self Reliance” when he reminds his readers that “the highest merit we ascribe to Moses, Plato, and Milton is that they set at naught books and traditions, and spoke not what men but what they thought” (Emerson 1983b, p. 259). To imitate such men, Emerson (1983b, p. 279, spelling modernized) explains, is a contradiction in terms: “Shakespeare will never be made

---

<sup>19</sup>Thus, though I drew on Oakeshott’s colorful description of provincialism to introduce the Socratic spirit in modern theories of liberal learning, Oakeshott best fits what Kimball (2010, p. 228 and *passim*) calls the “*artes liberales* accommodation” in which neo-humanists combined the rationale of the liberal-free ideal (see below) with an “appeal to classical letters and texts”.

by the study of Shakespeare". Indeed, "Plato himself", as Kimball points out, "maintained that one cannot learn philosophy by reading his or others' works".<sup>20</sup>

By 1902, John Dewey (1996) was already good and tired of what he perceived as the false choice of "individual nature vs. social culture" (p. 274), rehearsing in *The Child and the Curriculum* the all-too-familiar slogans perpetually bandied back and forth: mastery of subject matter vs. self-realization (p. 276), interest vs. discipline (p. 277), guidance and control vs. freedom and initiative (p. 277), and conservation of past achievement vs. change and progress (p. 277). According to Dewey, this debate makes no sense. We might as well ask basketball players which they value more, the ball or the hoop. As Dewey puts it:

The fundamental factors in the educative process are an immature, undeveloped being; and certain social aims, meanings, values incarnate in the matured experience of the adult. The educative process is the due interaction of these forces. (p. 273)

Dewey never denies that this interaction entails *practical* difficulties. It is no easy thing to create the conditions for educational experiences that close the gap between "the narrow but personal world of the child" (p. 275) and "the impersonal but infinitely extended world of space and time" (p. 275), between a world unified by the "practical and emotional bonds of child life" and the "fractionize[d]" (274) world of the subject matter bound together only by a highly "abstract principle of logical classification and arrangement" (p. 275). What Dewey objects to is the turning of this practical challenge into a theoretical dichotomy.

Given that "by the late 1940's and 1950's, progressive education had become the conventional wisdom in the United States", it is easy to conclude that Dewey's intervention was successful (Cremin 1988, p. 241). However, as he makes clear in his Kappa Delta Pi lectures (Dewey 1938), delivered three and half decades after the appearance of *The Child and the Curriculum*, Dewey sees the progressives as just as prone as the traditionalists to dogmatism (p. 22) and sloganizing (p. 91). Worse, progressivism has become the name not for the overcoming of the dichotomy but merely for another swing of the pendulum, back toward the child. "Many of the newer schools", Dewey (1938, p. 22) laments, "tend to make little or nothing of organized subject-matter of study; to proceed as if any form of direction or guidance by adults were an invasion of individual freedom, and... the past had little or no role to play in education".

For E.D. Hirsch (1987, p. xv), such nuances are beside the point. He lumps Dewey in with the Rousseauian, child-centered movement that led him to eschew what he claims is the crucial, if admittedly unexciting, activity of 'piling up information'. In particular, Hirsch argues, students need to pile up the broad, superficial understanding of the terms, names, and dates likely to be presumed of readers by authors in 'mainstream' publications. "This shouldn't sound too controversial",

---

<sup>20</sup> Kimball (1986, p. 223) is referring to Plato's *Seventh Letter* (341c–d) but might have also pointed to the critique of writing in the *Phaedrus* (275d–e and following). See Plato (1961a, pp. 1588–1589; 1961b, p. 521ff).

Hirsch (1987, pp. xv, xvi) says, since “all human communities are founded upon specific shared information” and even disparate cultures share the idea that “the basic goal of education is acculturation”.

Maxine Greene sees the matter very differently. What Hirsch casts as a story of progress – children from a range of social backgrounds acquiring the background knowledge needed to participate not only in their home culture but also in a second, national/print culture – Greene (1995, p. 73) recasts as a story of a fall: “We are first cast into the world as embodied beings trying to understand. From particular situated locations, we become open to fields of perception”. “We reach out into the world”, she continues, “touching, listening, watching what presents itself to us from our pre-reflective landscapes, primordial landscapes” (p. 73). For Greene, we are situated but not solipsistic: “on the original landscape where an individual is grounded... there is always a sense of consciousness being opened to the common” (p. 75). But then we begin “distancing”, “symbolizing”, and “abstracting” (p. 75). Our early encounters with the world become “obscured by the sediments of rationality” (p. 73). What Hirsch sees as missing from the schools, Greene finds in all too ample supply, leading her to this conclusion: “Much of education as we know it is an education in forgetfulness. Distracting the young from their own perceived landscapes, we teachers insist on the givenness of predetermined explanatory frames” (p. 74). For Greene, this is best understood as a fall not from subjectivity into objectivity but from “the true conditions of objectivity” (p. 74) to its conventional semblance. In our early knowing, it is the world we want to explore, not some private menagerie; but “our conceptualizations are grounded in” what Greene, following William James, calls “vividness or pungency, the vital factor in reality” (p. 74). Thus, Greene counters the traditional tale of growing up, suggesting that true maturation entails “growing in childlikeness” (Dewey 1916, p. 55), whereas it is precisely the putting away of “childish things” that leads us to see “through a glass darkly” (1 Corinthians 13).<sup>21</sup>

Scholarly opinion is divided on whether and how the aims of socialization and individuation might be reconciled. For Dewey, as we saw, no theoretical reconciliation is necessary, only the cultivation of the teacher’s ability to see the subject matter

---

<sup>21</sup>About a Romantic view such as Greene’s, we should ask two questions: Does the author think that it is possible to return to the prelapsarian state? and Is the claim that the fall might not have occurred in the first place? Regarding the first question, Greene (1995, p. 76) makes a point of acknowledging, with Robert Frost, that “there is no ‘going back’”. On the other hand, the point of the essay is that aesthetic experience affords some contact with our earlier extra-conventional ways of making sense of the world. For Greene (p. 76 and *passim*), meanings from childhood come through the gateway of imagination where they infuse adult sensibilities with added depth while also being revised in the process. There are two ways of taking the second question. Greene’s is not a Peter Pan theory of education. But does Greene advocate a form of unschooling? Might it be possible on her view to grow up without becoming distanced from our ‘primordial landscapes’? It is hard to say but, given that she ties the fall into rationalization and conventionality with the moment we “enter into the life of language” (p. 73), this would seem to be an inevitable detour. The path to maturity, for Greene, would lead through ‘the life of language’, where we encounter both Dewey’s schematic ‘recognition’ and an antidote in the form of imaginative literature. On Dewey’s distinction between recognition and perception, see Higgins (2008).

simultaneously through a logical and psychological lens. As newcomers learn to participate directly and indirectly in social practices (Dewey calls them ‘vocations’ and ‘occupations’), they learn how to engage the world in socially valuable ways while simultaneously fulfilling their ‘dominant vocation’ of ‘intellectual and moral growth’.<sup>22</sup>

Kieran Egan (2008, p. 32) is less optimistic noting that:

It is true that being a social animal, we find our fulfillment within society, but we will always find some conflict between society’s need to homogenize and constrain and our individual desire for freedom and exploration of our uniqueness.

Egan sees modern schooling as tied in a knot around three conflicting aims. To socialization and individuation (which he calls ‘individual development’), he adds a third, the “academic ideal” or “shaping the mind through disciplined forms of understanding” embodied in canonical texts (p. 33). Each of these aims, Egan shows, has serious internal problems, and we have built our schools upon the vain hope that knotting them together might ‘prevent each other from doing too much damage’. What emerges is a bizarre system of mutual undercutting:

We socialize, but we undercut indoctrination by the academic program calling society’s values into question and by commitment to individual development reducing society’s claims on any particular individual; we pursue an academic program, but we undercut intellectual élitism by egalitarian pressures from socialization and by attention to other dimensions of individual development; we encourage individual development, but we undercut its fulfillment by the homogenizing pressures of socialization and by the standardizing brought about by a common academic curriculum. (p. 28)

Surely we can do better, Egan concludes, than a system whose success is its failing *equally* to socialize (whether this be to pass on cultural heritage and inculcate civic virtue or simply to fulfill its role in social sorting and vocational placement), to create disciplined, critical thinkers, and to help students achieve self-knowledge and actualize their unique gifts.

Richard Rorty (1999) sees socialization and individualization not as rival educational aims but as distinct and equally valuable educational processes. “Primary and secondary education”, Rorty argues,

will always be a matter of familiarizing the young with what their elders take to be true, whether it is true or not. It is not, and never will be, the function of lower-level education to challenge the prevailing consensus about what is true. (p. 118)

By contrast, he suggests, “non-vocational higher education is... a matter of inciting doubt and stimulating imagination, thereby challenging the prevailing consensus” (p. 118). For Rorty, then, while the two processes conflict, they are complementary over time and form a natural sequence: “Socialization has to come before individuation, and education for freedom cannot begin before some constraints have been imposed” (p. 118). Unlike Greene, Rorty imagines no true childhood self before socialization and, unlike Plato, no terrain beyond our interconnected cultural caves.

---

<sup>22</sup> See Dewey (1916, p. 310). For a detailed exploration of Dewey’s theory of vocation, with a focus on the vocation of teaching, see Higgins (2011a, pp. 113–130 and 241–154).

“There is no such thing as human nature”, he writes, “only the shaping of an animal into a human being by a process of socialization, followed (with luck) by the self-individualization and self-creation of that human being through his or her own later revolt against that very process” (p. 118). Is Rorty right, however, that we can cold-start the engine of critical thinking and creative self-fashioning at the age of 18 and what are we to make of Rorty’s own warning that we currently make genuinely higher education available only to a relatively small elite?

## Conclusion

We began with the observation that every chapter in the long history of education can be understood through the protean concepts of public and private. We then focused our inquiry on two specific problematics within this ‘grand dichotomy’. First, we turned to the question of whether education is a public good. Following Taylor and Feinberg, we saw how the common economic approach confuses this question with others: how to distribute private educational goods equitably, whether private educational goods are best pursued collectively, whether such overlapping educational goods should be provided by government-run schools? In the common school ideal, that we ought to learn together across our differences so that we might later form a public capable of productive deliberation and caring contestation, we found a candidate for a genuinely public educational good. However, we also found a troubling history of failing to live up to this ideal.

This led us to consider a second problematic defined by the tension between the educational aims of socialization and individuation. That this is a distinct problematic can be seen in multiple ways. First, consider how not only the meaning but the valuation of the terms public and private shifts. In the first, the question is how to achieve the public, understood as dialogue across difference and shared responsibility for our common fate, in light of our rampant egoism. In the second, the question is how we can defend “the private vision” (Greene 2007) in the face of modern schooling, arguably the most powerful institutional instrument of socialization ever invented.

That these two problematics are distinct is also clear from the fact that we have both a personal and a collective interest in both socialization and individuation. The collective interest in socialization (e.g., a skilled, differentiated workforce, a common language, and sense of solidarity) and personal interest in individuation (my wanting to make something good of myself and my life) are perhaps the most obvious. But there is also a personal interest in socialization, since I want to belong and internalize group mores enough to succeed. And there is also a collective interest in individuation. This comes out in one way in the gray dystopia of Ursula Le Guin’s *The Lathe of Heaven* (1984), a be-careful-what-you-wish-for story in which a man whose dreams can alter reality is asked to dream an end to human conflict and winds up erasing difference. It comes out in another way in democratic theory, for example, in David Blacker’s (2007, Chap. 5) defense of the idea that democracy requires

individuals who engage in experiments in ‘Cartesian inwardness’, meditative practices aimed at radical doubt of received ideas and the fabric of common sense.

Distinct though they might be, our two lines of inquiry have led to the same surprising conclusion, that modern schooling paradoxically fails both to secure truly public goods and to foster robust individuality. Even as they struggle to live up to their mission to reproduce a democratic public, the schools also struggle to cultivate “self-reliance” (Emerson 1983b) and independent thinking. Privatization and conformity proceed apace as education has become an instrument of what Hannah Arendt calls the ‘social’.

# Cosmopolitanism and Globalization in Education

Claudia Schumann

*Where have we received the image of cosmopolitanism from?  
And what is happening to it?*

(Jacques Derrida 2010: 413).

## Entering the Global Era

This chapter will look at different theorizations of cosmopolitanism and globalization in education. Within philosophy of education the discussion on different cosmopolitanisms and cosmopolitan imaginaries is by far more developed and differentiated than comparable discussions on globalization which will also influence the weight put on the two concepts respectively in the present chapter. Globalization, in this context, is often understood as the empirical-factual development, shaping our presence, the world we live in and want to prepare our children and (future) citizens for, to which cosmopolitanism in one form or another helps us articulate a moral, ethical, or political response. Not all authors, however, perceive of the relationship between globalization and cosmopolitanism in this way. In order to be able to adequately contextualize the present discussion on cosmopolitanism, it seems nevertheless useful to first outline some of the main aspects that characterize what has come to be called the 'globalization of education'. Only against this background can the revival of the old idea of the cosmopolitan in recent decades be understood, including the various insistences on a necessary distance between the concept of globalization and the concept of cosmopolitanism in education. The chapter will therefore start with an outline of those characteristic features which have come to mark the present globalist era, including a sketch of different strands of globalism and globalization in education, before we enter into the vast body of work engaging with historical conceptions of cosmopolitanism as well as the more contemporary, so-called new cosmopolitanisms and cosmopolitics as they inform philosophy of education in the present.

Far beyond the scope of educational policy and theory, in the general media as well as public discussion, the idea has become popularized that a mere national orientation in education is no longer sufficient. In order to successfully navigate the challenges of contemporary life, from social media to the job market, the global has come to inevitably and irreversibly infiltrate the local. Even basic everyday routines have become tightly connected to places, cultures, and actors in the world that only a few decades ago might have appeared much too far removed in both time and space so as to exert influence over our local lives in this manner. Sociologist Anthony Giddens prominently defined globalization as “the intensification of worldwide social relations which link distant localities in such a way that local happenings are shaped by events occurring many miles away and vice versa” (Giddens 1990: 64). When speaking about globalization in this broad sense, we mostly refer to the empirical reality of the tremendously increased economic and cultural mobility and exchange in the last decades. The term ‘globalization’ had been in use earlier, but gained wider attention through the publication ‘Globalization of markets’ by economist Theodore Levitt in 1983. Transnational companies and businesses operate across national borders with growing access and influence in markets other than the countries they are placed in and budgets that often exceed that of individual nation-states. While the term globalization was used by Levitt primarily in a context concerned with those changes in the global economic system which aid these processes of increased global activity, globalization as a phenomenon remains notoriously complex and many-faceted leading to an incalculable amount of interpretations and definitions.

For present purposes it shall suffice to state that besides the predominant economic dimension, there are also political, cultural, technological, and environmental aspects which are addressed under the heading of a globalizing world. The Internet, the new media, and the new technologies have enabled an international flow of ideas which allows for the spreading and dissemination of news and other information in unprecedented speed. Traveling has become cheaper and is used by a much wider segment of the public. Yet, mobility has not only increased in the sense that travel for business and tourist purposes now allows for much more frequent and intensified cross-cultural contact, but migrants and refugees are forced to transgress borders trying to survive or safeguard lives worth living for themselves as well as for their dependents that often remain behind in areas ravaged by war, exploitation, poverty, and broken political systems. This in turn leads to a growingly diverse population in those Western countries which have become the desired destination of many of the refugees. In this cultural sense, on the one hand this increased diversity is celebrated to a multiplication of choices of lifestyle and for consumption according to individual taste (restaurants, music, religious holidays, etc.). On the other hand, it is discussed as contributing to different local cultures slowly being replaced by dominant, homogenizing global cultural trends (cf. for example George Ritzer’s ‘McDonaldization of society’ (1993)).

On a political level, the growing influence of supranational political organizations and associations, prominently for example the United Nations and the European Union, shape and transform policies with local and national impact, as for example in the worldwide promotion of human rights and human rights education.

Already in 1995, David Held interpreted the growingly enmeshed and interconnected world economy as well as interstate political structures as a call for a cosmopolitan model of democracy in order for democracy to remain sustainable in the new global world order (Held 1995). Twenty years later, Wendy Brown's assessment is less hopeful and states that neoliberalism has succeeded in undermining the very basis of democracy (Brown 2015). Last but not least, the world's continuously growing interconnectedness is probably nowhere else as tangible as in the environmental costs of the industrial revolution. The environmental damage committed by one nation in one part of the world is no longer contained as a problem in that region and for that nation-state, rather the repercussions and consequences affect other peoples and often most harshly in the poorer, more vulnerable parts of the world.

## Globalizing Education: A Contested Concept

How do these processes and developments become translated and visible in education? Joel Spring defines globalization of education as the "worldwide networks, processes, and institutions affecting local educational practices and policies" (Spring 2015: 2). As Spring shows, the influence of international intergovernmental and nongovernmental institutions as well as multinational testing and learning corporations has shifted the discourse on education in a direction which prioritizes the understanding of education as the cultivation of human capital in the knowledge economy and more generally the economization of education. The World Bank's educational agenda (cf. *Education Strategy 2020*, (Spring 2015: p. 37)) through its networks shapes national policies emphasizing education for the knowledge economy and lifelong learning allocating to the state the task of performance assessment and control. Also the OECD, another supranational organization of similar reach and influence as the World Bank, understands education primarily in economic terms, the primary purpose and interest of education being interpreted as the preparation of skilled workers for the labor market (cf. Rizvi and Lingard 2006: 259). Philosopher of education Michael Peters has written extensively on the implications of this new understanding of an economy of knowledge. The improvement of skills through early educational investments and life-long learning is assumed to lead to better jobs and thus better standards of living for all. Testing through global institutions such as the International Association for the Evaluation of Educational Achievement (IEA) purports to make the educational efforts and achievements of different nation-states comparable with each other so that their comparative successes and failures can be judged against a more and more uniform worldwide benchmark. The IEA's declared mission is to develop international benchmarks. In this way, large-scale assessment tests such as Programme for International Student Assessment (PISA) and Trends in International Mathematics and Science Study (TIMSS) contribute to shaping a more and more homogeneous world educational culture, defining, for example, that 'literacy' in terms of the knowledge and skills to meet real-life challenges is to be more highly valued than comprehensive

knowledge in distinct school subjects. In this way, the tests impact national policies: in order for the nation-states to remain competitive in the global comparative assessment schemes, they cannot avoid to adjust their own educational policies according to the interpretation and focus of education suggested in the tests.

When we now turn to the discussion on cosmopolitanism in philosophy of education, the reference to globalization will remain constantly present. Cosmopolitanism has often been conceptualized as an (educational) response to the challenges of globalization. As Fazal Rizvi has described, “the new interest in cosmopolitanism is based upon a recognition that our world is increasingly interconnected and interdependent globally, and that most of our problems are global in nature requiring global solutions” (Rizvi 2009: 253). By thus conceptualizing cosmopolitanism as “a set of principles with which to interpret and respond to the contemporary conditions of globalization” (Rizvi 2009: 253), Rizvi and others might distinguish carefully between educational cosmopolitanism as a mere reaction to globalization and economization of education from a responsible moral, ethical, or political response to these conditions. The reactive moment nevertheless is retained, together with the emphasis on the new global mobility and interconnectedness as requiring new modes of ‘cosmopolitan learning’ (Rizvi 2009; Sheller 2011). The preceding discussion, however, should have cautioned us to not fall prey to the common usage of globalization as an “ideological device that states and governments employ as an excuse for imposing certain policies that would otherwise fail to gain public acceptance or support” (Papastephanou 2012: 38). As Marianna Papastephanou firmly emphasizes, our conception of cosmopolitanism need not necessarily “depend on globalization; even less is it included in it, directed by it, or answerable to it” (Papastephanou 2012: 27). Her “eccentric cosmopolitanism” is not developing the normative “Ought” to the “Being (the so-called empirical Is)” (Ibid.) of a globalist reality we presently find ourselves in. To her mind, it is “rather a potentiality placed *side by side* with the actuality on which it can shed critical light” (Ibid.). Papastephanou reclaims cosmopolitan thought in its own right, independent of the contemporary globalizing state of the world and its theorization in what she calls the ‘globalist’ discourse, which tends to either praise the new possibilities for conviviality in diversity or warn about the hegemonic, homogenizing detrimental effects of globalization. In contrast to the trends in this globalist discourse, what globalization is and entails, who the leading actors and interests are, is a question that should be open for discussion in research rather than a taken-for-granted reality whose impact we can merely passively experience and endure, and which cosmopolitanism is meant to articulate an adequate political, social, moral, or cultural answer to.

## Old and New Cosmopolitanisms

Let us now ask with Derrida, “Where have we received the image of cosmopolitanism from? *And what is happening to it?*” (Derrida 2010: 413). As David Hansen and many others have been keen to emphasize, the idea of cosmopolitanism, while

finding its most comprehensive articulation in the Mediterranean region, is by no means an exclusively Western project. The notion has been developed in similar ways in Eastern and Southern philosophies, and many cross-cultural processes of translations and mutual influences have shaped the concept over the centuries (Hansen 2011: 6). The first mention of the idea of the ‘citizen of the world’, the ‘kosmopolites’, is generally attributed to the Cynic philosopher Diogenes of Sinope (c. 412–323 BC). As legend has it, when meeting Alexander, the Great, Diogenes is said to have introduced himself as ‘Diogenes, citizen of the world’ instead of the way which would have been common at the time as ‘Diogenes of Sinope’ (cf. Kleingeld/Brown 2014). The cynics in general challenged social rules and attachments in their philosophy as well as in their practiced way of living, questioning customs of arranging family relations, ownership and property, and rejecting the importance of upholding conformity for social status. This critical practice and the challenging engagement with the local community already foreshadows many of the negative criticisms that cosmopolitanism was charged with, promoting footloose detachment, rootlessness, homelessness, and a general absence of a sense of responsibility and concern for anyone and anything other than the self. It is important to stress, however, that Diogenes’ vision is a rather demanding version of cosmopolitanism, which not least in its rejection of any focus on economic gain does in no way reduce to “mobility beyond locality or to a moralized Other orientation” (Papastephanou 2012: 101).

The idea of an allegiance to humanity, as a universal moral obligation toward all fellow human being, prior to particular local responsibilities, was further expanded in Stoic philosophy, in the writings of Zeno, Cicero, Seneca, and Marcus Aurelius. Building on this tradition, and its later full-blown political and legal articulation in Immanuel Kant’s *Perpetual Peace: A Philosophical Sketch*, Martha Nussbaum was one of the first influential contemporary intellectuals who prominently argued for a cosmopolitan education. In her mind, “we have great power over racism, sexism and other divisive passions that militate against cosmopolitan humanism, if we will only devote enough attention to the cognitive moral development of the young” (Nussbaum 2002: 23). Nussbaum’s approach has received criticism for its rationalist angle and rather narrow focus on certain Western ideals of liberalism, as promoting just another form of Western imperialist universalism. Even Nussbaum herself came to reject her cosmopolitan educational project in favor of a renewed patriotic education, claiming that it puts an excessive demand on us to care for strangers as for our close family and friends. It is important to note, however, that her later rejection is connected to the earlier strict version of cosmopolitanism she proposed, and that many other, not less demanding, but yet more livable interpretations of cosmopolitanism are available and have been proposed in the literature (cf. Schumann 2016a, b). Klas Roth (cf. Roth/Burbules 2011; Roth/Papastephanou 2012), for example, has worked extensively on developing a Kantian reading of cosmopolitanism within philosophy of education which goes beyond the narrow universalism of the interpretation put forth by Nussbaum, thus demonstrating the continued importance, relevance, and applicability of Kantian thought for contemporary cosmopolitan education.

In recent decades a variety of so-called ‘new cosmopolitanisms’ has entered the scholarly discussion in cultural studies, social theory, philosophy, and political sci-

ence. As transformations and extensions of the Greek and Kantian tradition, they retain central aspects of the classical and modernist versions, but inflect its universalist aspirations with socio-historical particularisms. Kwame Anthony Appiah's 'rooted cosmopolitanism' explores such a hybrid perspective between universalism and particularism, aiming to temper "a respect for difference with a respect for actual human beings" (Appiah 2006: 113). Similarly, Seyla Benhabib in *Another Cosmopolitanism* develops an account which emphasizes "the significance of membership within bounded communities" (Benhabib et al. 2006: 2). Postcolonial theorist Homi Bhabha in his 'vernacular cosmopolitanism' is concerned with subaltern agency and those Others who have become part of the cosmopolitan community as a result of modernity's colonial past and future: people living in exile, of the diaspora, refugees, and migrants (Bhabha 2000, 2001). In the educational literature, while economic and political-legal cosmopolitanisms are also discussed, it is certainly the moral and cultural interpretations of cosmopolitanism which have had the most widespread influence.

## Educational Cosmopolitanisms

In recent times, Torill Strand has suggested to distinguish between three distinct usages of cosmopolitanism in philosophy of education: "as a *metaphor* for a way of life; it signifies a many-faceted and contested moral, political and legal *ideal*; it also indicates an outlook or a *perspective* on our common and contemporary social reality" (Strand 2010: 105). In all these three senses, cosmopolitan perspectives have been developed within philosophy of education. There is, however, one robust theme in which the different models developed in the field seem to come together. As David Hansen states, the "notion of educational cosmopolitanism [...] resonates most closely with concerns associated with moral and cultural cosmopolitanism" (Hansen 2011: 11). Also Marianna Papastephanou emphasizes, albeit in a critical manner, that "most educational efforts converge on a crucial point, namely, the primacy of culturalist cosmopolitanism" (Papastephanou 2012: 87). In the following, when looking at different approaches within philosophy of education, even if in an exemplary manner, this predominance of culturalist interpretations will be visible. However, we will find that some authors have also developed convincing arguments for transgressing this obvious, yet nevertheless narrow trend so as to include more strongly politicized understandings of educational cosmopolitanism.

### *Cosmopolitanism on the Ground*

Following, among others, Appiah's rooted cosmopolitanism David Hansen carefully works out a conception of cosmopolitanism "on the ground" (Hansen 2011: 73), taking distance from utopian ideologies and returning to an appreciation of the

generative intersections of the known and the new in everyday life. Taking his inspiration from close-up observations of teachers' interactions with their students, he finds that "in their shared aspiration to get at the meaning of education, and to perform the work well, these educators stand between the universal and the particular, between the global and the neighborhood. They stand between the naïve and the cynical, between the local and the parochial. They stand in a cosmopolitan space" (Hansen 2011: 118). This cosmopolitan space, or as Hansen poetically characterizes it, the 'cosmopolitan prism' is explored from a multitude of perspectives in his work. Spanning a variety of voices throughout history, from Confucius, Socrates, de Gournay, Montaigne to Emerson, Hansen reconstructs a "cosmopolitan lineage of philosophy as the art of living" (2011: 23). Instead of traditionalist reactions to cosmopolitanism, Hansen argues for a creative and responsive engagement with the changing global reality. For him, "cosmopolitanism constitutes an orientation in which people learn to balance reflective openness to the new with reflective loyalty to the known" (Hansen 2011: 1). This philosophical project is not just a theoretically worthwhile endeavor, but also a practical pedagogical project, as Hansen exemplifies in his discussion of curriculum as a cosmopolitan inheritance and in teaching practice.

### *Critical Cosmopolitanism*

In the tradition of Frankfurt School Critical Theory, several authors have taken upon themselves to advance a cosmopolitan perspective in education which retains a pronounced normative dimension. Critical cosmopolitanism as developed by Gerard Delanty, for example, is not so much meant as a critique of other approaches to cosmopolitanism; rather, it deepens the understanding of criticality to mean the world becomes disclosed to us through critique. Beyond a description of an everyday reality this "stronger claim for critical cosmopolitanism" aims to give "an account of social and political reality that seeks to identify transformational possibilities within the present" (Delanty 2012: 38) and defends that a key aspect of cosmopolitanism is "the transformative vision of an alternative society" (Ibid.: 40). Following in this line, learning and teaching has been explored from a cosmopolitan perspective in relation to human rights declarations (Schumann/Adami 2014), in relation to the idea of reification (Schumann 2012) and to the more complex stories of border crossing as portrayed in popular graphic novels (Schumann 2016a, b), and in relation to the idea of reflexive modernity and globalism (Rönnström 2012) and classroom communication (Wahlström 2016).

### ***Conflict and an Agonistic Cosmopolitics***

In some distinction from Hansen's cosmopolitanism on the ground as well as from the critical cosmopolitanisms discussed above, Sharon Todd's *Towards an Imperfect Education* (2009) argues more strongly that before highlighting new forms of everyday conviviality and learning or normative demands on those, we need to shift our focus and put the notion of conflict rather than consensus at the center of our thinking. In her re-conceptualization of educational cosmopolitanism as an 'agonistic cosmopolitics' (Todd 2009, 2010) she proposes a more strongly politicized interpretation which takes as its task to the "facing humanity in all its imperfection" (Todd 2009: 3). In contrast to liberal and humanist idealization, she argues that we need to confront ourselves with "the particular ways humanity is lived and experienced" – not in order to "demolish the working towards more just forms of coexisting" but to reframe cosmopolitan commitments in a way that start from "imperfection as central to humanity" (Todd 2009: 3). Her hope is that this will give us a more realistic view of what is achievable and how we can accomplish the goals articulated in the more normative laden approaches to cosmopolitanism. Todd's emphasis on 'dissonance' (Todd 2010) surely shifts the discussion from examples of successful forms of conviviality across contemporary differences to "the difficulties and imperfections that all interhuman exchange entails as an indelible feature of our cosmopolitan existence" (Todd 2009: 155). Following authors such as Pheng Cheah (2011), Walter Mignolo, and Bonnie Honig, her "agonistic cosmopolitics diverges from cosmopolitanism's view of dialogical models of democracy based on harmony and consensus and from its view of universalism as a non-political, immutable series of claims about rights and humanity. It instead embraces both democracy and universality, but with a strong emphasis on the pluralistic nature of social life" (Todd 2009: 226).

### ***Migration, Mobility, and Eccentric, Ethico-Political Cosmopolitanism***

The influential postcolonial theorist Homi Bhabha criticized Martha Nussbaum's stoic and Kantian interpretation of cosmopolitanism for a provincial universalization of liberal values, and for drawing her cosmopolitan circles in a concentric manner: extending from the self to the family, out to the nation, and finally to the global. His 'vernacular cosmopolitanism' (Bhabha 2000, 2001), in contrast, starts from the margins, the in-between, and the displaced. Following Bhabha's critical intervention, Marianna Papastephanou proposes a revised, eccentric conception of educational cosmopolitanism, arguing that the "established and easily digestible meanings of cosmopolitanism – the most popular being the perception of cosmopolitanism as mobility, border crossing, readiness to live and work abroad, and openness to anything foreign" (Papastephanou 2012: 2) are not demanding enough. The "'eccentric' ethico-political ideal" (Ibid.: 1) she develops forms a counterweight to the "globally enriched self"

(Ibid.) dominating the discussion and makes stronger demands than “tolerance, respect, charity, duty, and moral/legal obligation” (Ibid.). In contrast to pragmatic and culturalist approaches, her re-definition stresses relational over individualistic and diachronic over synchronic aspects of cosmopolitan commitment. With postcolonial sensitivity, cosmopolitanism is here not constructed as the opposite or beyond of the nation-state, but remains complementary with patriotism in the sense of “ethical commitment to locality” (Ibid.: 173). Beyond the liberal understanding of cosmopolitan education as a fostering of respect for human rights and diversity, Papastephanou’s rendering requires a thicker understanding of moral obligation which encompasses questions of redistributive justice arising out of historical and present moral debt as well as environmentalist dimensions as integral to educational cosmopolitanism.

## Summary

How is education in the twenty-first century then to be thought? As a reaction or response to globalization, preparing future citizens for the new mobile and diverse society, or as drawing on historical and contemporary sources for developing a counterweight to existent and growing global inequality and injustice, with an eye not just to human inter-connectedness but also to environmental concerns regarding the relations between human and nonhuman world? While not underestimating the importance of articulating adequate philosophical analyses and responses to recent social, political, economic, and cultural developments, and a critical assessment of the growing influence of new powerful supranational actors on the educational scene such as IMF, World Bank, or the OECD, we also need to be able to retain a critical distance from the acute sense of urgency and novelty which frequently accompanies the appeal to globalization in broader educational discourse. In order to do justice to the complexity of both the reality and ideology of a globalizing world as well as to the philosophical ideal of a cosmopolitan education, we should not naively fall into the trap of conceiving of globalization and cosmopolitanism as mere positive potential or negative threat for education as has happened in the at times polarizing debate. Instead we need to carefully consider the multiple critical approaches and the points of departure for resistance and transformation which have been articulated from ethical, social, cultural, and political cosmopolitan frameworks against the recently prevailing unilateral economic interpretations of current educational challenges.

As Derrida formulated at the beginning of the renewed theoretical interest in cosmopolitanism:

Being on the threshold of these cities, of these new cities that would be something other than ‘new cities’, a certain idea of cosmopolitanism, *an other*, has not yet arrived, *perhaps*.

- If it has (indeed) arrived.
- ... then, one has perhaps not yet recognized it. (Derrida 2010: 421)

If we take Derrida by his still urgent words, the most pressing task of this chapter was to give recognition to the complexity of the on-going discourse on globalization and cosmopolitanism in philosophy of education. The approaches discussed are by no means comprehensive of the vast literature that has emerged on these topics over the last two decades, and the continuing lively academic discussions (Papastephanou 2016; Strand 2015). Nevertheless, the selected authors can stand as hopeful exemplars for the vital multitude of ways in which *other* ideas of cosmopolitanism have been and will continue to be thought since Derrida's reminder that "these new cities [could] be something other than 'new cities'".

# Multiculturalism and Diversity

Judith Suissa

## Introduction

In the following discussion, I will explore how different orientations within philosophy of education are reflected in the ways in which philosophers of education, predominantly those working within the analytic Anglophone tradition, have engaged with multiculturalism. In this context, it seems natural to focus on multicultural education, rather than on the concept of multiculturalism per se. However, it is important to clarify what is generally meant by multiculturalism, not least because the conceptual distinctions, ideas and values underlying any definition of multiculturalism will inevitably inform accounts of what multicultural education is or should be. It is helpful, then, to begin by noting the distinction between the descriptive and the normative sense of the term 'multiculturalism'. While the term 'multicultural' or 'multiculturalism' is often used simply to describe the cultural diversity of a given society, institution or practice, in its normative sense the term reflects a positive evaluation or promotion of such cultural diversity and an acknowledgement of its significance for individuals and groups. In addition to this conceptual point, it is helpful to note the historical and political context in which the term 'multiculturalism' became prominent. As Ali Rattansi notes (2011, p. 12), the term entered public discourse in many Western European states, as well as in Australia and Canada, in the 1960s and early 1970s, referring to "policies by central state and local authorities that [were] put in place to manage and govern the new multi-ethnicity created by non-white immigrant populations, after the end of WW2". In the USA, the term seems to have entered public vocabulary somewhat later, associated with demands for cultural recognition by minority ethnic groups.

While multiculturalism can be used in a general sense to include political demands for rights and recognition by a diverse range of marginalised groups, including women, gays and lesbians, and the disabled, most theoretical work on multiculturalism tend to focus on ethnic and religious minorities within pluralistic states, minority nations within multi-nation states, and indigenous peoples.

This brief account goes some way towards explaining why most of the literature to which I will be referring in the following discussion is situated within a Western context, as well as suggesting significant differences between countries in the ways in which multiculturalism is articulated and defended. Notably, in the USA, where debates around multiculturalism were tied to the battle for cultural recognition that grew out of African Americans' fight against racial discrimination, expanding to include indigenous peoples and other non-White ethnic groups, 'issues of race have always been significant, and sometimes paramount' in these debates. In Europe, in contrast, as Rattansi puts it, "'race' is the elephant in the room" in discussions of multiculturalism (2011, p. 10).

There are a number of ways in which philosophers of education can contribute to clarifying, exploring and defending educational aspects of multiculturalism. Some of this work is oriented towards the body of political theory and philosophy that provides the conceptual framework for justifying multicultural positions and policies, whereas some is oriented more towards the theory and practice of multicultural education. In the following discussion, I will address some central themes within both these approaches that have been illuminatingly developed by philosophers of education. I will end by reflecting on some historical shifts within the discipline, as well as some recurring tensions.

First, a story:

When I was seven, my primary school teacher, in the early weeks of December, distributed brightly coloured squares of paper to the class and told us to "draw something that you would eat at Christmas dinner". I looked around at my classmates and tried to decipher the markings they were busily filling up their paper with, but I couldn't identify anything that I could copy. After a while, Mrs. Bell loomed over my desk and looked down at the blank piece of paper in front of me. "Come on Judith, why haven't you started drawing?" I had never been to a Christmas dinner and had no idea what people ate at them. "I don't know what you eat at a Christmas dinner", I mumbled, to be met with an impatient brush-off from Mrs. Bell: "Of course you know; you could draw a turkey, or a Christmas pudding". My friend Sarah was drawing something vaguely round and brown with a leaf on top of it and she helpfully turned it around so that I could see. I reached for the brown crayon and got on with it.

I like to think that, over 40 years later, children from non-Christian minorities are unlikely to experience similar incidents in a typical English classroom. We live in 'multicultural Britain' (although at the time of writing, the multicultural ideal seems somewhat under threat); a phrase intended here not in its descriptive sense – for the Britain in which I grew up was a fairly diverse place – but in the normative sense captured by the phrase "the acknowledgement and promotion of cultural pluralism..."

from the *HarperCollins Dictionary of Sociology* definition. Yet just what constitutes cultural pluralism, why it should be promoted or celebrated, and what this means for the provision, control and content of education, continues to be a topic of considerable debate.

## **Educational Policy and Political Philosophy**

As philosophers of education, our orientation is both to educational policy and practice, and to the discipline of philosophy. How these two strands are reflected in the work of individual philosophers of education is a matter of considerable stylistic and substantive difference, but when it comes to addressing issues of multiculturalism and diversity, it is within the sub-discipline of political philosophy that most philosophers of education have tended to situate their work. This relationship to political philosophy can take different forms, ranging from drawing on normative political theory in order to articulate and defend specific educational policies, to reflecting on educational reality in order to problematise or challenge some positions within political philosophy. So while political philosophy can provide conceptual resources with which to understand the values underlying versions of multiculturalism, work by philosophers of education has often contributed to this project by problematising some of the relevant conceptual distinctions.

### ***Integration and Assimilation***

The distinction between ‘integration’ and ‘assimilation’ is often seen as central to understanding the shift towards multiculturalism in Western states, conceptualised as reflecting a shift from policies of ‘assimilation’ of minorities and immigrant groups, towards a policy of ‘integration’. Yet Eamonn Callan’s work has problematised the neat distinction suggested by this contrast. In ‘The Ethics of Assimilation’ (Callan 2005), Callan articulates the connection between multiculturalism, diversity and integration, noting how: “A wholesome regard for diversity has been taken to require a wholesale rejection of assimilation” (p. 274). He goes on to discuss just what is involved in assimilation for individuals who may choose to assimilate, and how assimilation may involve “a creative effect whereby the host culture is diversified, not a one-way homogenizing effect” (ibid). After exploring in some detail the complex relationship between assimilation and self-respect, Callan concludes that “assimilation has to be evaluated with a close eye to the variable contexts in which it occurs” (p. 475).

In later work, Callan develops these conceptual connections further, explaining how multicultural policies are often regarded as a corrective measure for past imposition of assimilation measures on minority groups (see Callan 2015, p. 164).

## ***Recognition***

Callan's discussion also draws attention to the concept of recognition, which has been at the heart of contemporary philosophical work on multiculturalism at least since Charles Taylor's influential essay 'Multiculturalism and "the Politics of Recognition"' (1992).

Leonard Waks articulates the connection between multiculturalism and recognition in an educational context: "The term 'multiculturalism' arises in circumstances where there are distinct ethnocultural subgroups residing within the polity, whether on their own native grounds, in immigrant enclaves, or dispersed throughout the population, and making claims for cultural and political recognition (...). In its normative sense, the term denotes recognition of the personal identities and group loyalties tied to these subgroups, and of their claims for differentiated rights, including differentiated educational rights" (2007, p. 28).

Yet while Taylor's own work has explored some educational implications of the politics of recognition, these aspects have been further developed and challenged by philosophers of education. Taylor's central argument is that identity is constructed intersubjectively, and that "a person or group of people can suffer real damage, real distortion, if the people or society around them mirror back to them a confining or demeaning or contemptible picture of themselves. Nonrecognition or misrecognition can inflict harm, can be a form of oppression, imprisoning someone in a false, distorted, and reduced mode of being" (1992, p. 25). One obvious educational implication of this view concerns the way individuals from minority groups are represented in the curriculum. Rene Arcilla (1995) summarises this approach as follows: "Our multiculturalist initiatives in education should be principally concerned with exposing and criticizing images and terms that stunt possibilities for self-definition, particularly for members of cultures that already suffer from a history of discrimination" (p. 8). On this account, a more appropriate educational approach to guide my primary school teacher's interaction with her pupils in the run-up to Christmas would have been one which recognised the existence in the school community of non-Christian children, and allocated classroom time to engaging positively with their cultural and ethnic heritages. Yet Arcilla also questions the implication, emerging from this account, that an appropriate multicultural education can allow students' authentic selves to emerge through encounters with others, and draws on Derrida to suggest that the quest for a definitive form of self-knowledge is bound to fail due to the aporetic and always indefinite nature of the language in which we define ourselves in dialogue with others. The danger, to use this example, would be that such forms of 'recognition' risk reifying neatly defined definitions of cultural, religious or ethnic group identities, thus failing to do justice to the complex, fluid and dynamic sense of self of those who 'belong', nominally, to such groups. For Arcilla, this is not a reason to reject multiculturalism, but rather to embrace an education that celebrates what eludes identification. As Arcilla's work demonstrates, while the idea of multicultural education can be seen, as Dhillon and Halstead (2003) argue, to "flow[s] naturally from the prime liberal values of 'justice,

freedom, and equality” and the liberal principles of “toleration, respect for persons, and in particular the notion of rights” (p. 152), it is not only within the framework of liberal theory that these ideas can be and have been developed.

Other philosophers of education have challenged Taylor’s conceptual link between recognition and multiculturalism. Lawrence Blum (2001) is critical of the way in which Taylor’s account of recognition “ties it intimately to ethnocultural identity” (p. 539). Blum draws on examples of how individual and group identity are expressed and played out in concrete educational situations in order to question Taylor’s account. As Blum puts it, “recognition, as a value in education, has a significance that transcends ethnocultural identities and multiculturalism; and multicultural concerns in education transcend those of recognition” (ibid). Blum argues that “From the point of view of recognition, we must distinguish between an identity feature that is important to the individual himself, and an identity feature that is socially important, or important to a significant reference group outside the individual in question” (pp. 548–49). His analysis is significant not only for reflecting on educational contexts in order to problematise and enrich work in political philosophy, but also for putting concerns about race at the centre of the discussion. Given these insights, it is worth reflecting on the question of whether, in my own example, it was my Jewishness or my whiteness that was the most salient feature of my identity, and how the answer to this question may have been very different in different social and historical contexts. As Blum notes, “the ethno-raciality of people of colour is a much more socially salient feature of their identity than is the ethno-raciality of ‘white’ people [...] Hence it is more difficult for individual persons of colour than for whites to be relatively indifferent to their ethno-raciality” (p. 548). Yet “the thrust of Taylor’s recognition argument appears to be directed toward the individual’s self-identity, not to her socially salient identity(ies)”. Therefore, Blum concludes, “the argument about individual recognition is much less conceptually linked to multiculturalism than Taylor, and most of his readers, have presumed” (ibid).

### ***Group Rights and Cultural Belonging***

In a similar vein, Walter Feinberg’s work has added an important educational dimension to Will Kymlicka’s argument about liberalism and culture. Kymlicka’s work on group rights is of central significance to multiculturalism. Kymlicka (1989) has refuted critiques of liberal theory that associate it with a simplistically individualistic notion of the self, arguing that cultural belonging and community are essential for the development of individuals’ identities and choice, and thus that liberalism demands the recognition of group rights, particularly of cultural minorities. If one accepts this account, then clearly, as Feinberg notes, “liberalism is no enemy to multicultural education” (1995, p. 203). Yet the notion of “learning through culture”, Feinberg argues, is significantly different from the espoused aim of multicultural education as “learning about culture” (p. 204). Whereas the second idea presents no

difficulty for liberalism, the ideal of multiculturalism that suggests that “difference will be celebrated in a way that enables children to learn through their own cultural practice” is harder for liberals to accommodate (pp. 204–5).

A consideration of educational policy and practice in fact complicates the distinction between group rights and individual rights for, as Dhillon and Halstead point out (2003, p. 149) “provision of state funding for religious schools may be claimed as a group right by Catholics and Muslims, but the choice whether or not to send their children to such schools is exercised by parents as individuals”.

### *Liberalism and State Schooling*

I have considered ways in which philosophers of education have reflected on educational practice and policy in order to develop, and in some cases to problematise, the conceptual distinctions and theoretical positions articulated by political philosophers.

Other work offers a more explicit defence of particular education policies on the basis of normative political theory. Before I discuss some of this work, it is worth recalling that at a time when multicultural policies were being adopted in many Western states, in light of growing immigration and demands from minority groups for inclusion and recognition, the dominant body of work in political philosophy was the version of liberal theory associated with John Rawls. It is not Rawls’ *Theory of Justice* that is the most pertinent conceptual framework for theorising issues of diversity and multiculturalism, but his later *Political Liberalism*, where his central question is: “How is it possible that there may exist over time a stable and just society of free and equal citizens profoundly divided by reasonable though incompatible religious, philosophical, and moral doctrines?” (Rawls 1993, xviii).

While Rawls himself had notoriously little to say about education, philosophers of education have contributed significantly to his project by showing how a commitment to the principles defended by Rawlsian liberal theorists can justify particular forms of educational provision and regulation.

Rawls claims that whereas comprehensive liberalism may “lead to requirements designed to foster the values of autonomy and individuality as ideals to govern much if not all of life”; in contrast, “political liberalism has a different aim and requires far less” (1993, p. 199). Yet philosophers of education have challenged this claim, arguing, as Meira Levinson (1999) does, that “insofar as accepting the burdens of judgement requires that people gain sufficiently critical distance from their own conception of the good to realize that theirs is not the only reasonable way of life, Rawls’ political liberalism requires at least a rudimentary level of autonomy” (p. 17). Similarly, Eamonn Callan (1996) points out that “To retain a lively understanding of the burdens of judgement in political contexts while suppressing it everywhere else would require a feat of gross self-deception that cannot be squared with personal integrity” (p. 12), concluding that acknowledging the kind of political education demanded in order for citizens to accept the Rawlsian burdens of

judgement leads to a collapse of the distinction between comprehensive and political liberalism.

A significant body of work in philosophy of education associated with this approach therefore defends the provision and control of compulsory schooling in and by the liberal state. Meira Levinson (1999) perhaps provides the most systematic defence of the conceptual connection between political liberalism, the common school, and multiculturalism. In arguing that political liberalism implicitly invokes autonomy, and that sustaining liberal institutions and values therefore requires a form of compulsory liberal schooling (p. 8), Levinson defends a conception of the common school as a community whose normative structure is “autonomy driven” (p. 61). This position leads her to reject models of educational provision that may seem ostensibly to be in keeping with multicultural ideals, but where school choice and the existence of state-funded faith schools has led to a “divided pluralism” (p. 113); i.e. a “pluralistic national community composed of a number of mutually uninterested monoreligious, monocultural, monolingualistic, and/or mono-economic subcommunities”, where multiculturalism “itself is not treated as a public good” (ibid). Likewise, the French model, where “students’ private commitments and beliefs are excluded from the public sphere of the classroom” is, on Levinson’s view, ultimately illiberal. A “truer form of political liberalism” for Levinson (p. 119) is expressed in the multicultural ideal whereby students from diverse communities come together in the shared public space of the school and, through their teaching, curriculum and encounters with diversity, “embrace the virtues of toleration, mutual respect, and critical reflection” (p. 119). My own example clearly illustrates that many state primary school classrooms in 1970s Britain fell far short of this ideal model of the multicultural, liberal state school. Yet while aspects of multiculturalism are now widely embraced in state school curriculum and practice, we should be wary, as I will discuss further below, of assuming that the common state school is, or indeed can be, a neutral space. Such concerns are in fact more urgent than ever given recent developments in British education policy, such as the UK Government’s Prevent Duty for Schools (Department for Education 2015) and the requirement to promote ‘fundamental British values’.

Rob Reich is another philosopher of education who has considered the implications of liberal theory for questions about the control and provision of schooling in multicultural societies. Reich has argued for what he calls “multicultural accommodations” in schooling as a way of achieving justice for cultural minorities (Reich 2003, p. 318). In discussing the limits of state intervention, he criticises arguments developed by Kymlicka and other defenders of “cultural rights”, on the grounds that “respecting cultural groups [...] may not respect the autonomy of future adults born into the group” (p. 310). This argument is made, like all the above arguments, in the context of a defence of the liberal state which, Reich argues, “should be reluctant to grant rights to separate schooling or to permit broad exemptions from educational requirements such as mandatory attendance. The liberal state should maintain, at the very least, regulatory authority over schooling and attempt to provide an education that aims, among other things, to foster the development of autonomy in children, as well as civic virtues, such as tolerance and civility” (p. 311).

Walter Feinberg has written extensively on the common school and multiculturalism, with a particular focus on religion and faith schooling, defending the ideal of a public school as a “place where one should learn the skills and attitudes required for living together in a democracy” (2003, p. 386). For Feinberg, “A public school must aim to reproduce a public” (ibid). Thus, like Reich, Feinberg is not against liberal state funding for faith schools, but argues that “any support for religious schools must be predicated on the school advancing individual and social autonomy, and that this would require accountability to public as well as to religious bodies” (p. 388).

These discussions illustrate how when central concepts associated with liberal theory, such as autonomy, are considered within an educational context, one inevitably comes up against a discussion of children’s and parents’ rights. For many liberal philosophers of education, the argument for compulsory public schooling in multicultural societies rests on a conception of children’s rights akin to Joel Feinberg’s (2007) seminal account of “the child’s right to an open future”. In the context of debates over separate schools – particularly religious schools – within liberal societies, Walter Feinberg’s argument is that “Children have a right to grow up with a reasonable possibility that they will have opportunities to develop beliefs that are different from their parents” (2003, p. 393). In other words, the liberal principle of respecting individuals, even those with illiberal beliefs, “does not entail the requirement that society aid them in transmitting, through publically supported church education, their illiberal views to their children” (ibid).

## Historical Shifts and Tensions

Questions about the institutional form, control and governance of education have always been at the heart of work in philosophy of education and defences of the ideal of the common school can be traced at least as far back as Dewey. Yet there are interesting distinctions, when it comes to multicultural themes, between some of the work discussed above, and earlier work in the discipline.

### *Theoretical Resolutions*

As the above discussion indicates, many of the questions addressed by philosophers discussing multiculturalism are variations on the classic dilemma at the heart of liberal theory, namely: what should the liberal state do about illiberal communities within it? When it comes to education, this discussion often takes the form of debates as to whether, or to what extent, state schools should or can be ‘neutral’, in the sense so central to Rawlsian political liberalism. In some cases, the discussion is explicitly framed in this way, as in Dhillon and Halstead’s (2003) entry for the *Blackwell Guide*, which notes:

A critical question is whether the state itself should endeavour to adopt a neutral stance with regard to culture, or whether there are any circumstances in which the state can justifiably align itself with the culture of the majority.... (p. 149)

Similarly, McDonough and Feinberg, in the Introduction to their edited collection (2003), note that the contributors are concerned with “the question of the aim of education in societies which want to advance a liberal – democratic agenda, and how those aims might need to be constrained within the context of religious or cultural groups that have a different agenda” (pp. 2–3).

Yet early work that addressed such issues tended to approach them as problems or dilemmas to be resolved, as in the following extract from John Harris’s 1982 paper, one of the earliest papers on this theme to appear in the *Journal of Philosophy of Education*: “Multicultural society cannot hope to treat its citizens as equals unless it is also prepared to show equal concern and respect for their cultures”. Yet,

The problem arises in connection with any culture which does not equally respect its own members. It looks as though a society committed to equality and containing such cultures or sub-cultures within it, is caught in a genuine and uncomfortable dilemma. [...] Are we to respect cultures and thereby endorse the unequal treatment of persons, or insist on equality for individuals at the expense of insult and injury to their culture? Or, is there perhaps some way of dissolving rather than resolving these questions? (p. 224)

The educational questions following logically from such liberal dilemmas are, it is implied, questions to be resolved – or at least dissolved – at the theoretical level, in order to offer helpful guidance to educational policy makers and practitioners. A similar assumption seems to be operating in work that addresses the implications of multicultural commitments for the curriculum. Thus Yael Tamir (1995) points out that given that one of the aims of multicultural education is “to allow minority communities to protect their ongoing existences as distinct communities” (p.503), and given how central language is to issues of cultural identity, the questions arise: “Yet how many languages should a child learn? What should be the curricula for children of mixed cultural–linguistic origins? What kind of language skills should children have in both the minority and the majority language? Is bilingualism (or trilingualism) an intellectual asset or a burden?” (ibid). One response to these questions could be: ‘Which children? Which languages? Where? Bilingualism is surely sometimes an asset and sometimes a burden...’. Yet the idea that one could determine such answers and that they could be used to guide the establishment of centralised curriculum, provision and control of schooling is, I believe, symptomatic of the fact that most philosophers of education are already assuming a state schooling system. This is reflected in the language of Tamir’s paper which is replete with phrases such as “all children should”.

### ***Philosophy and Empirical Research***

A related feature of this early work in philosophy of education is the absence of any concrete examples of educational practice. It is notable that more recent work in the field has engaged much more closely with empirical research. Thus for example

Meira Levinson, in spite of her earlier arguments in defence of the common multicultural school as the best way to realise a pluralistic autonomy-based liberalism, acknowledges in later work that although she herself has argued that “it is hard for students to learn to be mutually tolerant and respectful of other people, traditions and ways of life unless they are actually exposed to them” (1999, p. 114), it is clear that “Merely bringing people together into a common space does nothing to help them get along” without conscientious efforts on the part of educators (2007, p. 630). Levinson cites a range of empirical studies that show that “the more we are brought into physical proximity with people of another race or ethnic background, the more we stick to ‘our own’ and the less and the less we trust the ‘other’” (ibid).

### *Education and Schooling*

In most work in the field, the institution of schooling controlled and provided by the liberal state is an unarticulated and undefended assumption, and most discussions of multicultural education are therefore actually discussions of multicultural schooling. So while discussions of group rights within the liberal state raise questions about the educational rights of parents and children, discussions of these questions tend to revolve around legal issues to do with the establishment, control and provision of state schools. It is important to note, though, that once one takes seriously the insight that the liberal commitment to autonomy means that children have a right to develop into autonomous individuals, one has to at least consider the argument that parents may have no right to pass on *any* of their belief systems to their children. Yet very few philosophers of education consider pedagogical relationships beyond those of formal schooling, such as that between parents and their children. One of the few to do so within the liberal tradition is Matthew Clayton, who in his 2006 book *Justice and Legitimacy in Upbringing* argues that a commitment to political liberalism entails that it is illegitimate for parents to induct their children into a substantive vision of the good. While Clayton does not equate education with schooling, he is still, like most of the philosophers considered above, working firmly within the framework of liberal theory. In the context of debates on multiculturalism, however, it is important to consider work that goes beyond, or even challenges, some of the classic liberal positions discussed above.

### *Critical Multiculturalism*

Philosophers of education have discussed multiculturalism and multicultural education in the pages of philosophy of education journals, books and edited collections. Yet there is also a significant body of literature on multicultural education that, while its authors may not self-identify as philosophers, addresses similar philosophical and political questions. An important shift within this body of work is that

from liberal multiculturalism to critical multiculturalism. May and Sleeter (2010, p. 4) characterise the phase of liberal multiculturalism, prominent in the 1970s and 1980s, with a focus on “getting along better, primarily via a greater recognition of, and respect for, ethnic, cultural, and/ or linguistic differences”. This approach is reflected in work by philosophers of education in this period, which seemed to embody the hope that if schools were the kinds of places where children from diverse groups encountered each other as equals and learned to respect each other’s cultural and other differences, this in itself would lead to a more tolerant society, as reflected in Pratte’s statement: “I wish to suggest that schools can be utilised as vehicles for fostering tolerance and understanding among culturally diverse groups” (1978, p. 114).

May and Sleeter state that “a key weakness” of liberal multiculturalism is its “inability to tackle seriously and systematically... structural inequalities, such as racism, institutionalized poverty, and discrimination” (2010, p. 3). In allowing educational policy, curriculum and pedagogy to focus on the ethnic and cultural histories and practices of minority groups, liberal multiculturalism, in May and Sleeter’s view, “abdicates any corresponding recognition of unequal, and often untidy, power relations that underpin inequality and limit cultural interaction” (p. 4). The period when liberal multiculturalism was at its height in Britain, leading to enthusiasm for all forms of ‘diversity’ in the curriculum, often got translated into what Modood and May (2001) describe as “the welcoming of people of other cultures by encouraging their cultural practices, usually in superficial ways (later lampooned as ‘a multiculturalism of the three S’s’: saris, samosas, and steel bands)” (p. 306).

Recent work by philosophers of education has explored the shifting and occasionally conflicting aims within these different phases of multiculturalism. Thus Robert Fullinwider, in the *Blackwell Companion to the Philosophy of Education*, explores the epistemological positions underlying – or implicitly assumed by – much literature on multicultural education, particularly critical multiculturalism. Fullinwider is very dismissive of what he sees as the central assumption that “when students understand the causes of their beliefs, and whose interest they serve, this is supposed to be liberating” (2003, p. 495), arguing that education ought to provide students with “a platform for assessing the soundness or accuracy of beliefs in the first place”, irrespective of the need to understand the “causal stories about power and interest” behind them (ibid). Ultimately, he concludes, the strength of multiculturalism “has been its unremitting commitment to closing the achievement gap and fostering respect across ethnic, racial and ‘cultural’ boundaries. Its weaknesses derive from its intellectual insularity and limited conceptual tools” (p. 498).

However, I believe Fullinwider misinterprets the educational orientation of critical multiculturalism. It is notable that in the work of Kincheloe and Steinberg (1997) and other theorists in the tradition such as Henry Giroux and Peter McLaren, the prime audience for arguments such as those referred to by Fullinwider is actually not students but teachers (see e.g. Giroux 1992, 1988; Kincheloe 1993). The point they are making is not that understanding the causes of their beliefs and the power structures behind them will *in itself* be liberating for students; rather, the point is that in the absence of an understanding on the part of teachers of how structures of

power operate in society, and where they are situated within these structures, their ability to offer an educationally transformative or liberatory experience will be limited, and they will therefore inevitably end up reproducing the dominant power structures and socio-economic inequalities. The critical multicultural teacher, Kincheloe says, “is a scholar who spends a lifetime studying the pedagogical and its concern with the intersection of power, identity and knowledge” (Kincheloe and Steinberg 1997, p. 29). It goes without saying that the critical multicultural teacher is also committed to rigorous intellectual disciplinary knowledge; knowledge that can provide students with “a platform for assessing the soundness or accuracy of beliefs” (Fullinwider 2003, p. 495); but what theorists of critical multiculturalism are calling for is a pedagogy that goes beyond this. Whereas “Mainstream conservative liberal and pluralist multicultural educators have been relatively uninterested in probing the connections that unite the sphere of politics, culture and the economy with education”, therefore viewing their task as “merely addressing prejudicial attitudes towards women and minorities”, critical multiculturalists acknowledge that “racial, sexual and class forms of oppression can be understood only in structural context” (Kincheloe and Steinberg 1997, pp. 31–32).

An important element of critical multiculturalism, then, is the demand that educators and educational theorists reflect on their own positions within structures of power, privilege and oppression. Some acknowledgement of this point is evident in recent work by philosophers of education, in that it would be a lot rarer today to find philosophers of education referring unreflectively to ‘our culture’ and ‘our education’; phrases that were far more common in the 1960s and 1970s, as in the following extract from the Harris paper referred to above:

We must now return to the issue at hand, to the question of how a culture like our own, which is avowedly and rightly willing to do all it can to show equality of concern and respect to all its citizens and which recognises that it cannot hope to do this unless it is also willing to show equal concern and respect for their cultures, is to cope with the paradox which constituent discriminatory cultures present. (1982, p. 227)

This passage follows a discussion of how

The suppression by Britain of slavery in the last century and the open attacks by the Royal Navy on the slave ships of other nations might well be seen, and was seen, as a flagrant, high-handed and insensitive rejection of the deeply held beliefs and cultural practices of other societies. These societies might well have claimed that they were entitled to the same concern and respect for their practice of slavery as Britain claimed for the rejection of such a practice. (ibid)

Both these quotes illustrate a lack of reflection in the part of the author on his own position of power and privilege, and what it means, from this position, to talk of ‘our culture’. They also betray a historical blindness, well documented by critical philosophers of race such as Charles Mills (2007), who has developed the concept of “white ignorance” to “map a non-knowing grounded in white racial privilege”. A familiarity with important historical studies, such as C.L.R. James’ *The Black Jacobins* (1938), would have revealed to Harris that Britain’s “attacks on slave ships of other nations” were in fact part of a colonial war with the French to gain control

of the strategically vital trade ports of the slave colonies of the West Indies, and that the claim that the British can be credited with bringing about a “suppression of slavery” is dubious, to say the least.

As noted, a great deal of recent work in philosophy of education shows a greater awareness of these issues of privilege and power. Lawrence Blum’s work is notable in this regard, not only for its explicit foregrounding of questions of ‘race’, but for his use of the phrase ‘multicultural concerns’, which I find a more fruitful phrase than the phrase ‘multiculturalism’ or ‘multicultural education’. It suggests that, rather than multiculturalism embodying a set of aims, or leading to a clear set of policy prescriptions, there are multicultural concerns that teachers, philosophers and theorists should be alert to, whatever educational context they are working in; and that these require an attention to specific moral, political and personal aspects of the situation. This requires us to constantly probe and question the different ways in which we understand and experience issues of culture and identity, and to create and nurture educational spaces in which to develop what Jose Medina (2013, p. 7) calls “democratic sensibilities”, that “require free and equal epistemic interaction among the heterogeneous groups that are part of society”.

Recent work by philosophers of education that reflects these concerns is often focused more explicitly on social justice pedagogy than on multiculturalism. A notable example here is the work of Barbara Applebaum, who succinctly articulates the shift to critical multiculturalism in stating: “In order for multicultural education to be successful, individuals from dominant groups, in our case both students and teachers, must be persuaded that they are dominating and must realize that this domination must cease” (1996, p. 186).

Similarly, Walter Feinberg, in arguing that “the act of decentering and coming to terms with otherness” is a central aim of public education in a multicultural society, notes that this is “more difficult and, therefore, more in need of systematic development” for members of the dominant group, “because their behaviour is taken as the norm” (1995, p. 214).

Philosophers have also problematised the simplistic rejection of liberalism often associated with critical multiculturalism, pointing out that liberalism itself, while committed to the fundamental value of basic freedom for individuals, does not entail “a posture of blindness or even hostility to group-based identities and categories” (Macedo 2003, p. 415).

## **Back to School**

Back in Mrs. Bell’s classroom, I am left wondering what, if anything, she could have done differently. The fact that I recall this incident, and my own discomfort, so vividly, suggests that there was something troubling going on; something that perhaps a different form of pedagogical interaction could have avoided. Philosophical work on multicultural education – a term that was becoming familiar amongst educational theorists as I sat staring down at my blank sheet of paper – shows just why

this approach represented significant progress. Theoretical work on recognition, for example, makes sense of the simple point that there is a form of injustice involved in failing to recognise the experience, identity and knowledge of minority groups, and suggests how multicultural education can address this. Yet as the above discussion shows, the concept of recognition on its own cannot address the issues faced by individuals from minority groups within pluralistic educational settings. Had Mrs. Bell been aware of the fact that I was Jewish and begun the lesson by saying, “Now, everyone draw something that you would have to eat at Christmas dinner, or on Hanukkah”, I am not sure that my discomfort would have been eased. We did not pay much attention to Hanukkah in our home, and I wouldn’t have had a clue what you were supposed to eat during this very minor Jewish festival.

In terms of the integration/assimilation dilemma, while I certainly didn’t feel like an immigrant, having been born in England and with English as my mother tongue, it would have been quite useful for me to have learned what people ate at Christmas dinner. Perhaps Mrs. Bell could have simply said “Here are some things people eat at Christmas”, named them, described them, then asked us to produce some imaginative artwork on this theme. As it was, I did not find out until several years later what that brown blob with a leaf on top actually tasted like or how you were supposed to serve and eat it. Had this been explained to me, perhaps I would have felt more equipped to deal with the strange rituals involved in a Christmas dinner, were I ever to be invited to one. But then again, even if Mrs. Bell had taken the diversity of her own classroom into account, there is nothing to say that this would have fostered the attitudes of toleration and recognition that underpin the aims of multicultural education. This is not only because, as Meira Levinson (2007) points out, merely bringing people together is unlikely to achieve these aims, but also because “it is a real danger in diverse common schools that teachers and students become complacent about their inclusivity. They fail to think about whether the groups they choose to focus on because they are represented in the building are the most significant ones for students to learn about” (p. 632).

The fact that children at British primary schools today are unlikely to learn about Christmas without also learning about Diwali, Hanukkah, Eid and Chinese New Year, however problematic the superficial presentation of ‘cultures’ implied here, surely represents progress. Yet while children from minority groups in British schools today are probably less likely to feel confused and alienated by tasks like making festive decorations, this is not to say that they are not still experiencing alienation, disempowerment, systematic disadvantage and discrimination.

Recognising these systematic injustices and inequalities requires a reflexivity about our own position as we try to create and explore spaces for critical education and critical thinking about education. Perhaps Mrs. Bell would have been a more sensitive teacher had she been aware of her own position as a member of a majority group. But I also need to consider why it was that it did not occur to her that I would not know what people ate at Christmas dinner. I expect that part of the reason for this was that I was a white child in a predominantly white Christian context, thereby passing as one of the majority. There was, as far as I remember, one non-white child

in my year at school; a boy from Mauritius called Farhan. I don't know what his teacher asked him to draw in the Christmas decoration class, and I certainly don't think that assuming that because a child is Black or Asian she will not be familiar with certain cultural rituals is any less problematic than assuming that because a child is white, she will. But it is important to remember that, as Rattansi (2011) notes, "The issue of multiculturalism was racialised from its inception. To a large degree, [it] has its origins in responding to the populations that had previously resided in Europe's colonies and which had by and large been regarded as innately inferior races" (p. 9).

The kind of constant vigilance and sensitivity to how issues of diversity and identity intersect with issues of power and privilege has not always been a concern of philosophers, and there is certainly a lot more we can do to address the lack of diversity within our own discipline. In the mammoth 1999 four volume collection *Major Themes in the Analytic Tradition* (Hirst and White 1999), which, as the blurb states, "represents the major ideas and arguments which have come to characterise philosophy of education", out of 91 chapters, only 13 are written by women, and as far as I can tell, all the authors are white. While there is still a long way to go, the field today is definitely more diverse. Yet there are other kinds of diversity, beyond the politically significant ones of race and gender, that perhaps we should be concerned about if we want to nurture the "epistemic friction" (Medina 2013) that is so vital to our discipline and to democracy. Perhaps more diversity in terms of the intellectual traditions and positions we engage with, and the educational settings – particularly those that challenge the dominance of state schooling – we consider, would be a welcome development.

A piece of writing in philosophy of education that incorporates a personal narrative where the author reflects on her own experience and identity would have been unlikely to be published in a mainstream academic publication 40 years ago. So there have been welcome developments in the discipline (although no doubt there will be those who disagree).

My own view is that good philosophy of education has always done what good multicultural education and critical pedagogy do, namely develop and nurture the intellectual resources for exploring and questioning the common-place understandings and assumptions of educational discourse, thus constituting both what Giroux (1988) calls a "language of critique", and a "language of possibility".

# Identity Politics and Belonging

Sheron Fraser-Burgess

## Introduction: Identity, Identity Politics and Culture

Although the term, *identity*, has roots in Western philosophy and more recently in psychology, *identity politics* is a highly contested expression in social science fields, such as in education, in political theory and in philosophy. Bernstein (2005) traced its origin as a formal term to 1979, where social science scholars coined the phrase as a label for the activism of persons with disabilities who challenged prevailing societal views and theorization of their self-perception. Over the next two decades, scholarly sources broadened the term to mean pejoratively a category of collective action that included violent ethnic conflict and activist nationalism (Bernstein 2005, p. 59). Beginning with the semantic and philosophical provenance of identity as it relates to the coining of the term, *identity politics*, this work considers contestations of theory and interpretation about particular identity groups and in opposition to the dominant or majority population. It explores its discursive dependence on the ever-evolving constructions of gender, race or ethnicity, and lesbian, gay, bisexual, transgender and queer (LGBTQ) orientation as discrete identity categories. Primarily in the United States as one socio-political context and to some extent globally, it will be shown that these kinds of petit social movements along the lines of identity prove to be necessary disruptions of the political order. As such, this chapter underscores that associations with identity as specific forms of joint group membership *ipso facto* give rise to political activism in order to bring about social change. For each group, persons in the minority, on the margins of society, or who are less powerful draw on their sense of belonging to an identity group to seek political status and broad recognition for their way of life (Taylor 1994). Throughout

the discussion, higher education and K-12 schools broadly as quintessential democratic institutions of family and society serve to be the context within which citizens and other persons seek redress and legitimation.

## The Identity Concept

Delineating theorizations of the concept of identity assist in representing the genealogy of its meaning as being in discursive engagement with major Western ideas of the self and its relationship to society, community and government. In conflict with different social and cultural understandings of the same, the political differences that arise come to be associated with the emergence of identity politics, which ultimately has educational implications in a multicultural society. In this sense, identity can be subsumed within culture, as an anthropological concept.

Noted anthropologist Geertz (1973) defines culture as the “interpretive in search of meaning” (5). It is “a historically transmitted pattern of meanings embodied in symbols, a system of inherited conceptions expressed in symbolic forms by means of which men communicate, perpetuate, and develop their knowledge about and their attitudes toward life” (Geertz 1973, p. 73). A culture consists of a system of possible beliefs, values and history of a people or social group and can manifest a worldview as a distinctive way of life (Moody-Adams 1997). As members of a cultural community, individual members identify to a greater or lesser extent with its way of life (Wiredu 1996).

In comparison with culture, identity is a variable social construction of the significance of a given involuntary trait or attribute within a designated socio-political and cultural context. Psychological theories of identity (Tatum 1997; Roquemore and Brunsmma 2002) elucidate the specific cognitive and affective process of identity formation as distinctly oppositional in nature, being as much defined by holding in-group beliefs as well as not being in possession of the relevant out-group traits. Among the questions that identity raises in this regard is the meaning of inhabiting the marker (e.g., race/ethnicity, sexual orientation and gender) for those holding the attribute or trait. Additionally, what is the significance of the socio-biological component of these attributes for the political status that they acquire in a given context? Tajfel’s (1978) social identity theory holds that self-association is constituted by emotional attachment to the said group in its representation, valued artifacts, and history as well as participating in a shared knowledge base of significant history, experiences, traditions, etc. Social psychology provides a framework within which identity group membership can be understood as gradational or on a continuum.

While it is not always the case, the social construction of identity can overlap with public issues that influence legislation and federal and state policy (Bernstein 2005; Kymlicka 1995). Political philosopher Amy Gutmann (2003) defines identity groups as “politically significant associations of people who are identified by or identify with one or more social markers. Gender, race, class, ethnicity, nationality, religion, disability, and sexual orientation are among the most obvious examples of

shared social markers around which informal and formal identity groups form” (p. 9). By setting apart a group on a designated basis, identity demarcates a segment of the culture associated with bearing the signifiers of identities (e.g., phenotype, social class, religious beliefs). In fact, from the point of view of the subject, identifying with any of these social groups equates to belonging to this group. Austin (2005) describes this component as the assumptive aspect where the subject self-identifies with a group on the basis of markers that are in-common.

### **Out of the Philosophical Roots of Individualism**

As will be discussed below, conceptual, theoretical and empirical dimensions of identity have considerable political implications in the current American social and historical context. However, identity politics exclusively as political activism is a marked departure from the meaning of personhood in classical political philosophy and theory in which individual agency and self-formation are central. As will be shown, these varying understandings of identity become the provenance of opposing political orientations animating identity politics.

Among the major areas of the discipline, traditional philosophy historically has been concerned with the conditions of rationality, persistence of the self and the nature of being for persons. These areas of inquiry form major domains of the philosophical ideals of the Enlightenment which relate to the ascendancy of reasons over sentiment or sacred texts. Descartes’ (1596–1650) claim to the cogito, as the existent rational self, established the Western intellectual standard of personhood. Another highly influential thinker in this regard was John Locke (1632–1704). In the American, British and some would argue broader Western context, it is difficult to identify a figure who has had greater influence on the founding principles of liberal political society, thought and its institutions including that of education. In work on this modern philosopher, Balibar and Sandford (2013) illustrate the very distinct interpretation of “identity” and “difference” in terms of personhood in John Locke’s *Essay Concerning Human Understanding*. Locke’s individualistic self-formation was consistent with his philosophical worldview in every respect. On this account, identity is the individual mind’s capacity to structure its memories, experiences and thoughts in a bundling that constitutes personhood and that sets one apart ontologically as being discrete and qualitatively unique in mind. It is related to a theory of knowledge where the mind’s apprehension of experiences was the sole basis for the reason and inductive logic of knowledge claims as compared to abstract Cartesian deduction. In the classical political liberalism of the Enlightenment, persons were in possession of individual autonomy and inherent rights that required substantive consent for modification or alternation by the government or any cultural or social group. Therefore, the end of education was to cultivate this capacity for personal liberty through reason and foster the attributes of a citizen who was prepared to carry out the related duties and fully exercise its associated rights.

Locke’s political philosophy, grounded in the grand Enlightenment elevation of individual human capacity to make sense of their world through employing their mental faculties, and its underlying account of personhood, as the identity of the subject, heavily influenced the American education ideal for centuries to come.

Notably this account of identity gave rise to a philosophy of education iconically represented in the notion of ‘educating the man’ in Richardson (2011) work, *Some Thoughts Concerning Education*. Holding that the child’s mind was like a ‘white paper’, the work presented the pupil as an independent learner for whom individual experiences informed the acquisition of all forms of knowledge inclusive of virtues and academics. It was both an important precursor to experience-based education and contributed to the over-emphasis on cultivating reason and logic as one primary aim of education. As would be shown later in Locke’s work to justify the codification of racial inequality in the American colonies, this account of the selfhood implicitly applied exclusively to white males (Richardson 2011). Lastly, it is clear that the male gender bias there incorporated beliefs about the intellectual inferiority of women into the cannon of Western thinking about who was worthy of an education.

The contemporary discourse, in contrast, associates identity with shared traits on the basis of which an individual’s sense of self is held in joint meaning with like others. It explicitly considers the societal and institutional implications of the group marker and the need to seek redress on these grounds where there is perceived bias, racism and injustice. The shift away from the individual understanding of identity to a social sense demarcates the political battle lines that are drawn. It exists between those who advocate for the rights of others on the basis of group membership and those who support the individual rights of Locke’s classical liberalism and in its resurgence in neoliberalism. In education, the politics of identity unfolds along these parameters.

## The Politics of Group Identity

According to Alcoff (2006) in a seminal examination of the concept, *identity politics* asserts the significance of social group membership for the individuals that identify with them in securing political goods. Alcoff maintains that, “The concept of identity politics does not presuppose a prepackaged set of objective needs or political implications but introduces identity as a factor in any political analysis and argues for reflexive analysis of how any given identity may affect one’s actions, beliefs and politics” (Alcoff 2006, p. 147). It is as Omi and Winant (2015) similarly describe as the politicization of the social. Crenshaw (1991) underscores that “identity-based” politics involves both finding strength and solidarity in shared experiences and awareness of systemic oppression. The former refers to the inward-facing or internal aspect that one derives from possessing the social marker in a given way and viewing oneself as belonging to group on this basis.

Identity groups participating in group-based politics also exhibit an outward-facing or external aspect of Crenshaw’s (1991) awareness of the group’s social status. Identity group members are able to recognize that previously isolated and individual acts of violence, bias or prejudice can be part of a systematic pattern of oppression. The external aspect is also relational and intersubjective in that activism

requires a counterpart or opposing identity group in relationships of power (e.g., dominance, sub-ordinance); hierarchy (e.g., social status, social class); difference (e.g., racial, ethnic, gender); or a combination thereof.

Although the term ‘identity politics’ did not emerge in the public square until 1979, according to Bernstein (2005), in the late twentieth century the political activism of two separate constituencies represented the increasing salience of social markers to society and to education broadly conceived. These groups were the women’s movement and the advent of multiculturalism, which would develop into multicultural education. The two influences would later merge with movements for cultural rights, immigrants and sexual orientation into the broad social activism that constituted identity politics in the American political landscape.

### *Gender Identity Politics and Feminism*

The women’s movement is one prominent example of the convergence of political and social factors that historically have animated a politics of identity in the American context. The feminist movement illustrates the philosophical ideas that can be in tension within such movements and their implications for education. Offen (1988) proposed as the basic definition for feminism that there was the “impetus to critique and improve the disadvantaged status of women relative to men within particular cultural situations” (Offen 1988, p. 133). Historically, the American feminist movement sought to secure universal education and suffrage in the early 1900s (Offen 1988). Feminist theory of the last half-century has been framed most clearly and vocally in opposition to patriarchal policies and sources of the oppression of women and, securing “individual equality of rights with men” (Offen 1988, p. 155). To the extent that this activism has sought disparate and distinct political outcomes for women on the basis of gender, it is engaging in identity politics.

Appealing to gender as a justification for a feminist political stance entails ontological and epistemological assertions that run counter to modern philosophy’s transcendent discourse of the idealized rational agent (Bordo 1990). Ontologically, feminist theory makes the claim there are unifying attributes, lived experiences or perspectives that characterize the female gendered category of being in the world. Positively, the unitary feminine identity offers a basis for social solidarity for a given subset of women. Concurrently, there has also been a dialectic internal to feminist theory and scholars to define the meaning and political implications of gender and the basis of the commonality for which political status and equality with males similarly were being sought. Offen (1988) called into question whether political advocacy was seeking to secure freedom, autonomy and range of choices for the individual woman or legitimation of the maternal and relational dimension of being that was more characteristic of women’s lives. Nicholson and Fraser (1990) maintained that any such formal social construction was by its intentionality, arbitrary and heterogeneous and relegated other forms of social location, such as race or ethnicity to the societal margins.

Reframing modern philosophy as a male-gendered project, feminist epistemology maintains that there are different ways of knowing than strict adherence to logic and the linear reasoning of analytic epistemology (Duran 1991). In broad strokes, the Cartesian subject inhabited a privileged positionality that transcended time and space and was therefore able to attain objectivity. In a direct challenge, Duran (1991) argued that feminist epistemology seeks to take into account “the grounded, interpersonal, nuanced manner in which knowledge is acquired” (Duran 1991, p. 155). Similarly, Harding’s feminist standpoint theory made the bold assertion that there is a feminist counterpart to traditional scientific methods that is vying to be a more knowledge-conducive research methodology. This advantage holds because women inhabit a privileged epistemic position by virtue of a history of marginalization in the sciences. Broadly categorized as feminist philosophy of science, Harding’s view was one of a constellation of feminist epistemologies theorizing a situated knowledge discourse (Duran 1991; Ford 2007; Haraway 1988; Belenky et al. 1996).

Educational institutions have been sites of gender identity politics in higher education and in K-12 schooling. Women Studies departments have been primary locations of feminist politics at work. Maher and Tetreault (2001) address this clear relationship among gender, its interdisciplinary study and cultivating gender-based forms of political activism in the classroom. Maher and Tetreault maintain that ‘voice’ is the central concept of feminist pedagogy. Feminist pedagogy is present when the environment is created in the classroom such that students experience a freedom to speak for themselves in this and any public space and to bring the lens of their lived experience and the questions it raises to the courses and the broader society (Subramaniam and Middlecamp 1999). In this way, they are liberated from the putatively silencing, homogenizing and hegemonic discourse of traditional pedagogy. Feminist pedagogy provides the social space for legitimation of these forms of difference. Fisher (2001) proposed a distinct teaching methodology arising from a feminist worldview. Acknowledging many influences in Freire, Dewey and Gramsci, Fisher distinguished feminist teaching as differing from these extant theories in a “political discourse adequate to feminism” (Fisher 2001, p. 28).

### **Pedagogy and Voice**

In K-12 pedagogy, the prominence of voice as a pedagogical aim, can be traced both to the feminist work of Carol Gilligan and to a postmodern theory of education. Gilligan’s (1982) work is said to give “voice” to the projects and priorities of women (Maher and Tetreault 2001). In Gilligan’s view to give voice is to acknowledge the significance of the subjectivities of each person’s experience constituted by personal narratives of oppression and realization of identities. Burnette-Bletsch (1997) discussed the emphasis on identity or social context of the learner that informs feminist pedagogy where students and teachers each “brings a unique perspective to the learning process based partly upon individual experience, race, gender, socio-economic class, and sexual orientation” (Burnette-Bletsch 1997, p. 213). This

approach redistributes the authority in the classroom so that “no one holds a monopoly on knowledge or can claim an objective viewpoint” (Burnette-Bletsch 1997, p. 213).

### **The Intersection of Race and Gender**

Feminism, grounded in counter ontological and epistemological assumptions, is one movement that problematized identity status as a political issue. Crenshaw’s (1991) seminal work proposed that the intersection of race and gender can create an axis of oppression. Its effects in aggregate are not identifiable by appealing to either identity category alone. Hooks’ (1994) conceptualization of intersectionality posited the idea of the double victimization of black women and that as an implication, gender was not the sole determinant of a black women’s identity. True liberation could be achieved through a Freirian critical consciousness fostered in resisting the structural barriers that inhibit subject formation (Delpit 2006).

Proposing that black women’s lives are circumscribed by both gender and race, Hill-Collins (2000) argued that black women had in common shared experiences that were characterized by common themes. This embodied and situated perspective is the distinct standpoint of black feminist epistemology (Hill-Collins 2000, p. 53). A nomenclature of black feminist epistemology provides the language to describe the black female social location and the value of lived experiences for knowledge acquisition. It is a claim to the legitimation of historically based but not delimited black feminist thought and to the demarcation of shared possibilities emerging out of intersecting sources of oppression.

### ***Racial Politics, Identity and Education***

Similar to gender, the meaning of racial identity in American society has unfolded in highly politicized ways that also reveal the social, political and economic axes of identity group conflict. In the ante-bellum period, post-Reconstruction, and through the Jim Crow era, racial conflict animated the American charter, because “Race and racism in the United States have been shaped by centuries-long conflict between white domination and resistance by people of color” (Omi and Winant 2015, p. 3). Comprehensively representing this historical transformation is beyond the scope of the piece (Taylor 2013; Shelby 2005; Ford 2007). Rather, this section aims to chart the emergence of identity politics as one phase in this sordid racial history. Identity politics resists the socio-political dominance of the racial majority and seeks cultural legitimacy for a plurality of racial and ethnic groups. In this struggle for cultural influence, political power and social equality, schools and higher education institutions have been one clear front.

## White Supremacy, Nativism and Pluralism

It is reasonable to situate the discourse of racial identity politics in the United States broadly in terms of stark historical divisions along racial and ethnic lines. In this sense, the present sociopolitical contours of racial categorizations are rooted in centuries of oppression, where blacks lacked the comparable political power of whites to secure their rights and even advance social justice against racism and discrimination in its various forms of structural inequality. Ongoing debates in the public sphere about equal educational opportunity are in this vein.

While racial identity formation in the United States has undergone periods where the definition of race was static rather than being mutable, fluid or socially constructed as it is today, the most salient precursor of the racial categorization in America has been the black versus white racial divide (Omi and Winant 2015). It was reified in slavery and further cemented in Jim Crow laws in the South. Additionally, mid-twentieth century state and federal laws fostered racial animus. Further, housing covenants in the West, Midwest and Northwest advanced a *de facto* segregated society, for almost a full century or more after the end of chattel slavery (Wilkerson 2010). Racial tensions were also manifested at a time of significant European migration in the early twentieth century. Premised on the racial implications of mass immigration, there were at least two opposing views of nativism versus pluralism. On the one hand, there were those who sought to preserve an American way of life that equated to a form of white supremacy. The nativists sought full assimilation of immigrants into American culture and religion. Co-occurring with this ideology in the late nineteenth and early twentieth century were American Indian boarding schools. In being removed from reservations and forcibly immersed into a language and culture that was alien to their own, many Native American tribal members lost touch with their cultural identity.

In contrast to assimilation, philosopher Kallen and Chapman (1956) was one prominent advocate of cultural pluralism in which immigrants would be able to maintain their cultural distinctiveness. Kallen and Chapman (1956) argued for non-interference in the proliferation of discrete cultural and ethnic minorities. As would become evident, cultural pluralism was also a flawed ideology. It was premised on a popular veneration of colorblindness. Presupposing an American ‘melting pot’ as a national ideal, it disavowed race as a significant factor in policy and politics. Indeed it was believed that taking race into account in institutional policies would be counter to democratic axioms of equality and that of a shared American identity (Shelby 2005). Sugrue (2010) describes the paradoxical stance as a “profession and performance of anti-racism” such that, by the late 1960s Americans claimed colorblindness as a response to racism while ostensibly living and functioning in racially segregated enclaves (Sugrue 2010).

On this view, race, as a static and *bona fide* demographic category, according to social science and left and anti-racist political theorists did not pose a *prima facie* challenge to existent social and economic structures (Omi and Winant 2015). Racial activism equated to a bid to participate in this hierarchy on a race-blind basis. It follows that while assimilation explicitly subscribed to *de facto* white supremacist

thinking, pluralism, in a seemingly more benign tolerance for politically inert racial or cultural distinctiveness, also landed there as well (Feinberg 1998; Sugrue 2010). Scholars associate the civil rights movement and the Supreme Court's *Brown vs. Board of Education* (1954) decision as integrationist advocacy of this sort because of their quest for acceptance by a majority white society (Ford 2007; Omi and Winant 2015). Particularly in the ending of *de jure* school desegregation and the passage of the Civil Rights Act (1965), the fight for racial equality was led by high profile spokespersons such as Martin Luther King (1928–1968) and later Reverend Jesse Jackson and Al Sharpton whose protests aimed to promote awareness of the dire economic conditions of poor and working-class blacks in urban areas. In addition, the protests of groups such as the NAACP and Southern Christian Leadership Conference were part of city-by-city black activism that continued into the early 1990s (Sugrue 2010).

### **Education, Multiculturalism and Identity**

Distinct from the internecine racial battles waged on the legal front prior to the 1970s, a sustained effort emerged from the academy to transform K-12 schooling and higher education into more racially inclusive spaces. Although originally gaining prominence in the 1940s in the United States, multiculturalism was notably promoted by Canadian Prime Minister, Pierre Trudeau (1919–2000), in the early 1970s as a label for the kind of society that this nation state sought to exemplify (Fraser-Burgess 2005). Ironically in the United States, the latter emergence of multiculturalism is owed to the Civil Rights Movement as well as the women's movement (Fullinwider 1993). As a label for the targeted effort to counter minority exclusion from the major institutions of American society and culture, it encompassed varied and multiple initiatives in education and became the subject of ongoing debates in the political philosophy discourse. However, ambiguity about the sense of culture upon which multiculturalism was predicated would follow its disciplinary expansion to include sexual orientation and eventually social class, becoming a template for a politics of identity in civic spaces and the broader public sphere.

In the American education context, theorizing multiculturalism initially involved curricular innovations that included the histories, experiences and accomplishments of a broadly representative cadre of ethnicities in American society (Banks 1981). Multiculturalism in the early stages provided curriculum for ethnic studies classes. The content featured the culture and history of select ethnic groups and was intended to promote a more diverse social studies curriculum. Initially its focus was also fostering ethnic pride through offering an anthropologically sound historical and cultural knowledge base for various ethnicities (Banks 1981). This iteration sought to counter the social stigma that was associated with membership in these groups and to encourage the ethnic pride so vilified by Schlesinger (1992) and the like as being a threat to a shared national identity. Feinberg (1998) alternatively crafted a more inclusive account. Conceding that one's membership in cultural or identity group is within the realm of the privacy and freedom of association that liberalism

so values, Feinberg argued that schools have a higher ethical and political task. It is to provide the deliberative and critical space that prepares all students to subject their beliefs to critical scrutiny, holding no belief system as sacrosanct. Like Gutman (2003), Feinberg subsumed cultural identity within national identity.

Multicultural education as an interdisciplinary field of teacher education sought to address the minority versus majority gap in the general school environments, assessment textbooks and culture (Banks and Banks 1993). Although still informed by a multiethnic focus it entered the larger public debate through challenging the achievement gap and the contributing education policies, racism and systemic factors (Howard 2010). To make this case effective, psychology, anthropology and sociology are domains upon which multicultural education drew. The goal was to equip the predominantly white teaching force to engage in culturally relevant teaching in which schools related the curriculum and classroom experience to the background and culture of children of color for their academic success (Ladson-Billings 1992).

In higher education, multicultural education was indicative primarily of a quest for an inclusive Western canon (Fraser-Burgess 2005). It was this movement in the early 1990s, inflected by postmodernist critique of the Enlightenment tradition, and the hegemony of its colonialist roots, that ushered in a social justice dimension to multicultural education (Hyttén 2006). On this view, identity politics was a politics of difference that drew attention to the stigmatization associated with belonging to identity groups that were neither dominant nor in the majority. The activism focused on curriculum or education policies that would empower minorities, women and persons in the LGBTQ community. In this sense, multicultural education not only sought to disrupt the dominant narrative in educational institutions in which minority and black identity remained subordinate to a Western discourse of white supremacy but also to subvert the very notion of mainstream norms that marginalized cultural groups.

The multicultural education movement in education was the genesis for this kind of politicking. In both K-12 and higher education, efforts to promote a more culturally inclusive and broad-minded curriculum have expanded to contemporary movements. Multiculturalism entered the public square as the basis for social activism as the very meaning of identity politics as it openly challenged the white, male, monocultural dominance of American institutions and the perception of their formative and benevolent role in American history (Fraser-Burgess 2005). Activists appealed to claims of multiculturalism in the quest to reverse the historical marginalization of the 'other' (e.g., women, blacks, LGBTQ) from the mainstream culture; affirm the value of deviation from the majority norm; and counter the prevailing view of these differences as deficient in some way. Dhillon and Halstead (2003) allude to the position of multiculturalism in the historical genealogy of cultural pluralism. In its latter form the concept of culture that multiculturalism presupposed conflated the "political, social, cultural, moral, educational and religious in its bid to transform the status of these identity groups" (Dhillon and Halstead 2003, p. 147).

Paramount at this time were social movements promoting multiculturalism such that it became increasingly important in liberal political theory as a consequence of

the educational reforms associated with multicultural education. Political liberal theory in the late twentieth century was clearly engaged with the question of whether its institutions should accommodate the distinctive cultural traditions of minority groups, inclusive of race (Appiah 2005; Gutmann 2003; Benhabib 2002; Macedo 2000; Taylor 1994.). Political liberalism's high regard for individual rights then faced a conundrum. To what extent should individual rights demand accommodation by the associated cultural group. The dilemma arises clearly when the cultural group incorporates values or practices that are antidemocratic or oppressive or if giving pride of place to the group's way of life conflicts with non-group members' individual rights. It is for this reason that identity politics also represents the challenges and benefits that diversity poses for the majority and the democratic citizenship of its members.

Liberal political theorists distinguish between the broad sense of "culture" that this movement implied and anthropologically based distinctions, arguing that there were grounds for accommodation of the latter but, particularly because of the educational implications, the former was more contentious (Fullinwider 2003). Gutmann (1996, 2003) has been one of the political theorists who articulated a distinctively democratic liberal view of privileging civic unity and the role of cultural diversity as it is reflected in schools in a democratic society. Indefensible is multiculturalism as described above that is designed to cultivate 'separatist' cultural, religious, racial or gender identities. These multicultural claims designed to "bolster the self-esteem of students on the basis of membership in a separatist culture" are divisive and fail to promote mutual respect (Gutman 2003, p. 9). A multiculturalism that is compatible with democratic education is one that presents the opportunity to "understand and appreciate the social contributions and life experiences of the various groups that constitute society" (p. 9). While Gutmann (2003) asserts that social markers can contribute to the collective identities of individuals and groups, she maintains that the group identity does not constitute the whole of the individual estimation of the desirable form of life. Cultural identity is fluid and does not characterize the totality of a person. It follows then, in her view, that political liberalism is not obliged to grant recognition to identity-based claims as such.

In support of multiculturalism, Kymlicka (1995) exemplified a strong conception of group difference in proposing that liberal democracy ought to recognize a cadre of minority rights. Kymlicka (1995) proposed the creation of group-differentiated rights that grant privileges to individuals in some identity groups on the basis of this membership. These rights would apply to ethnic groups, national minorities and religious minorities. Giving pride of place to individuals' horizon of meaning as the context within which personal choice and autonomy are framed is a matter of the justice so valued by political liberalism (Kymlicka 1995). For these group members, the freedom of choice that liberal political theory so values is realized in the history, language and culture of one's social location. This line of thinking constitutes a liberal defense for "a wide range of self-government rights" for such groups (p. 121).

For racialized minorities in the United States Kymlicka's proposal has had limited application in that racial/ethnic cultures in American multiculturalism were neither national minorities nor one of many ethnicities that would qualify as a

poly-ethnic group that is present in a nation state through immigration. Indeed Kymlicka, for whom the context of reference was Canada, conceded that African-Americans as an identity groups were outliers in that they were neither voluntary immigrants nor “fit the national minority pattern” (Kymlicka 1995, p. 24).

Thus, it cannot be said conclusively that liberal political theory has reached a consensus regarding the appropriate role of social activism on the basis of membership in an identity group. Rather a curious *détente* manifested in the implied linguistic orthodoxies of referring to ‘others’ has settled on the discourse. Labeled ‘political correctness’ it represents a catchall term for semiotic practices that conform to the self-perceptions of those inhabiting various identities. It is this studious attention of the idioms of identity that can come to represent a tacit acquiescence to the politics of identify. It is the kind of concession that can appear to be either nominal or substantive as it influences the norms of interactions and communication across the major sectors of society (Bucholtz and Hall 2005).

## Conclusion

The identity politics that Bernstein (2005) describes refers to the mobilization of the members of different groups to seek political acknowledgment of their differences from the majority. It is an effort to restructure social institutions so that they instantiate more representative values and incorporate other norms and practices than those of the majority alone. As such identity politics in the American context is an ever-evolving construct and new identity groups reappear and the relative positions of identity groups changes. This ongoing jockeying for social position is true in education as well. Sleeter and Grant’s (2008) work is one example of teacher education text that offered approaches to multicultural education along the lines of gender, race social class, as well as single ethnic group studies. Later texts such as Gollnick and Chin (2013) incorporated sexual orientation and student exceptionalities.

As the field has progressed, multicultural education has broadened its purview to interrogate the cultural homogeneity associated with American culture. Championing forms of difference, it traded in binary oppositions in which the dominance of majority culture oppressed those who did not conform to its mores. It challenged the fact that Western culture was coextensive with high culture while ethnicity equaled that which was exotic and distinct from the mainstream. In conjunction with political debates and education scholarship, multicultural education and its categories of difference continue to shape larger public debate about identity and its political implications.

# Performativity and Education

Ian Munday

## Introduction

‘Performativity’ is a term coined by the French Philosopher Jean-François Lyotard in his most famous work *The Postmodern Condition* (1984). It is an unusual concept in philosophy of education for several reasons. Firstly, given that *The Postmodern Condition* looks at the role and status of knowledge in the university, ‘performativity’, its most famous concept, arises from a work in philosophy of education rather than a work of ‘straight’ philosophy. Lyotard would never have thought of himself as a philosopher of education, but that is beside the point. Second, the term is as popular with sociologists of education as it is with philosophers (see Ball 1998; 2003). Indeed it is arguably the work of the former that has led to the third unusual feature of a term deriving from philosophy of education, namely, that it has become ubiquitous within the study of education per se – it is just as likely to feature in discussions of schooling as meditations on the state of the university.<sup>1</sup> Given performativity’s status within the study of education, it is worth beginning with what, over the last several decades, it has commonly come to mean in that domain.

On the whole, performativity is associated with the measurement of students’ progress through formal testing, which is seen as “the key arbiter of educational quality” (Craft 2011, p. 25). A good ‘performance’ becomes synonymous with a good set of results or ‘outputs’. Stephen Ball, the sociologist most closely associated with the critique of performativity, argues that the activities of the ‘new technical intelligentsia’ ultimately:

---

<sup>1</sup>It should be noted that the discussion of performativity in sociological work by Ball and others is much more nuanced and sophisticated than the common understanding that has followed from it.

I. Munday (✉)  
University of Stirling, Stirling, UK  
e-mail: [ian.munday@stir.ac.uk](mailto:ian.munday@stir.ac.uk)

...drive performativity into the day-to-day practices of teachers. They make management, ubiquitous, invisible, inescapable—part of and embedded in everything we do. Increasingly, we choose and judge our actions and they are judged by others on the basis of their contribution to organisational performance, rendered in terms of measurable outputs. (Ball 2006, p. 151)

As a consequence of this process, schooling has become dedicated to fixing the individual student in regards to her ‘value’. This has led to teach to the test pedagogies that are synonymous with behaviourist control involving rewards and punishments (see Craft and Jeffrey 2008, p. 578). Performativity is also seen as being synonymous with setting measurable targets in regard to the development of skills and knowledge that will lead to economic gains. These developments have taken place at an international level through the activities of organisations such as the OECD.

Though what has just been described deals with part of the picture, in this chapter I argue that it presents an overly simplistic (or vulgar?) understanding of performativity when read against Lyotard’s original account in *The Postmodern Condition* (1984). It is Lyotard’s rendering of performativity that tends to be the focus for philosophers of education. Consequently, it is important to show the ways in which performativity covers concerns that extend beyond a focus on improving exam results and ensuring accountability. This will involve looking more closely at what Lyotard had to say about performativity and putting his work in a philosophical context. The discussion will then move on to some of the ways in which philosophers of education have taken up the concept to try and analyse and understand educational practices and discourses. Given the vast array of work on performativity, providing a literature review of everything that has been published since *The Postmodern Condition* would lead to incredibly thin fare. I have selected five relatively distinct positions into play so as to illustrate what is at stake in regard to thinking about, and in some cases beyond, performativity.

## Lyotard’s Performativity

In *The Postmodern Condition*, Lyotard examines the processes of delegitimation undergone by the grand narratives of modernity, arguing that the postmodern world largely behaves in accordance with a system that has exiled them. The narratives in question relate to the place and role of knowledge in the university. They include the self-legitimising speculative narrative present in the work of Hegel (among others) and the narrative of emancipation: the notion that scientific progress will benefit mankind and improve the lives of individual subjects. Lyotard argues that these narratives have been replaced by the logic of performativity, which has taken hold of knowledge:

The production of proof, which is in principle only part of an argumentation process designed to win agreement from the addressees of scientific messages, thus falls under the

control of another language game, in which the goal is no longer truth but performativity—that is the best possible input/output equation. The State and/or company must abandon the idealist and humanist narratives of legitimation in order to justify the new goal: in the discourse of today's financial backers of research, the only credible goal is power. Scientists, technicians, and instruments are purchased not to find truth, but to augment power. (Lyotard 1984, p. 46)

For Lyotard truth and justice have been replaced by effectiveness and efficiency. The narratives of legitimation that provided frameworks for the former concerns are no longer credible and we have moved from a 'modern' to a 'postmodern' condition. This is what leads Lyotard to issue the pronouncement for which he is most famous: "Simplifying to the extreme, I define *postmodern* as incredulity toward metanarratives" (p. xxiv). It should be noted that the first phrase in the sentence 'Simplifying to the extreme' is usually left out of the citation in the form that has achieved such popularity. This perhaps partly explains why Lyotard is often taken to be the arch exponent or celebrant of the relativism and performativity that the Enlightenment makes room for (or alternatively gives birth to).

This would be a misreading. Lyotard, despite giving his assent to the plurality that accompanies the demise of all-encompassing theories, does not celebrate what has appeared in their place. Bearn presents Lyotard's philosophy in 'aesthetic' terms maintaining that "it is not painted in the slack polychromatic colours of eclecticism" and neither is it "painted the reassuring black of a glorious tragedy". Ultimately, we are told: "Lyotard's philosophy is painted a melancholic grey" (Bearn 2000, p. 232).

Bearn does not say as much, but Lyotard's philosophy cannot embrace 'tragedy'. 'Tragedy' would imply a nostalgia for something substantial that has now been lost. When Lyotard notes the postmodern incredulity to grand narratives he is not suggesting that all-encompassing systems were ever fit for purpose—they simply appeared credible. Consequently nostalgia gets us nowhere in either a philosophical or practical sense. Why then, can we not celebrate the current state of society and education? The problem can perhaps be stated in this way—performativity is a grand narrative of sorts, just a hollowed out one. Performativity 'functions' like a grand narrative: "If a form of knowledge could not be translated into bits of information, it was bound to become more and more invisible to the system. . ." (231). Performativity provides just as overwhelming and brutal a systematic horizon as any grand narrative that preceded it. 'Openness' and 'diversity' are the order of the day but are only deemed acceptable when read against this horizon.

During *The Postmodern Condition*, Lyotard makes a series of predictions regarding the intensification of performativity in the university sphere that may be seen as indicative of quite extraordinary prescience. Michael Peters (2004, p.36) describes it as a 'prophetic prognosis'. In regard to research, Lyotard imagines that a fixation with effectiveness will be accompanied by a vulgar positivism in which large cash investments are required to justify scientific claims: "No money, no proof – and that means no verification of statements and no truth" (Lyotard 1984, p. 45). Consequently, an 'equation between wealth, efficiency and truth' will be established. In this climate, research will become ever more oriented towards producing "technological

applications” (ibid) in which good work is judged in terms of saleable outputs. Lyotard predicts that universities will become more closely aligned with private companies who will also have their own research teams (ibid). This state of affairs is coterminous with the development of digital technologies. These technologies, which started out as instruments for human use, have come to reshape how we view knowledge, namely, as data that can maximise efficiency (44). Technological logic privileges efficiency (conceived of as less expenditure of energy) over concerns with “the true, the just or the beautiful” (ibid). On this account, research that is not ‘efficient’ will gradually disappear from the university scene.

For Lyotard, just as research in the university will increasingly feel the impact of technological and market logics, so will teaching. He argues that the acquisition of knowledge, through its conversion into data, has become exteriorised from the knower and the focus of education turns to ‘skills’ and ‘no longer ideals’ (48). Therefore: “The old principle that the acquisition of knowledge is indissociable from the training (*Bildung*) of minds, is becoming obsolete and will become ever more so” (ibid.). The university will become dedicated to producing technicians who can operate and develop machines (51). What it means to be a student will therefore be transformed. The student population will be divided into a ‘professional intelligentsia’ a ‘technical intelligentsia’ and a large community of adults seeking retraining (48). Lyotard’s most radical prediction in regard to teaching relates to the medium in which it will take place: “To the extent that learning is translatable into computer language and the traditional teacher is replaceable by memory banks, didactics can be entrusted to machines linking traditional memory banks (libraries, etc) and computer data banks to intelligent terminals placed at the students’ disposal” (50). Lyotard sounds the “knell of the age of the Professor” (53) and anticipates the emergence of learning analytics.

We will come back to these predictions at the end of the chapter. In the meantime it is perhaps obvious that performativity, as Lyotard imagines it, does not directly focus on behaviourist approaches to boosting assessment in schools. Indeed, Lyotard had nothing to say about schooling at all, though his points about performativity apply to society at large and this includes school education. It is therefore fair to say that the fixation with maximising the quality of outputs in schooling belongs to the same social condition. This sometimes seems to be missed by educationalists who take performativity in its narrower sense. For example, creativity experts can give the impression that performativity is part of a professional malaise rather than a social arrangement. They look at how performative educational practices in schools are at odds with a creative economy (Robinson 2001; Craft 2011); as though the economy did not behave in consonance with the logic of performativity (see Munday 2014, for a fuller discussion). Lyotard’s understanding of performativity partakes in a philosophical tradition whose members examine something deeper at the heart of culture that is not restricted to professional life. It is therefore, in some ways, aligned with significant philosophical precursors, which will be the focus of the next sections of the chapter.

## Philosophical Influences

Lyotard's performativity diagnosis is not wholly original. What he describes is, in certain respects, analogous to Nietzsche's account of nihilism, Heidegger's discussion of the 'technological understanding of Being' and various distressed discussions of the state of modernity written by the founding members of the Frankfurt School. Let us briefly consider each of these.

Nietzsche writes: "*the highest values devalue themselves*. The aim is lacking, and 'Why' finds no answer" (Nietzsche 1967, p. 9). The collapse of relevance, meaning and truth will bring about a destructive force that will sweep through Europe. The account of nihilism is in part predictive: "What I relate is the history of the next two centuries. I describe what is coming, what can no longer come differently: *the advent of nihilism*.... For some time now our whole European culture has been moving as toward a catastrophe, with a tortured tension that is growing from decade to decade: restlessly, violently, headlong, like a river that wants to reach the end..." (ibid.). The lack of real goals and purposes lets nihilism in. This is due to: "the formulation of value as the opposite of its opposite that Nietzsche—again—saw as the core of nihilism. What do we stand for? We are no longer sure: only that it is not what others represent. We are the reds, which means that we are definitely not the blues" (Blake et al., xii). If there is no overriding aim intrinsic to what we do, success and failure, efficiency or inefficiency are the only imaginable outcomes. This is nihilism. A successful school or university is not a failing one and vice versa.

Following Nietzsche (to some extent) Heidegger sees nihilism as intrinsic to what he calls the technological understanding of Being. In an interview with Brian Magee on the subject of Heidegger's philosophy, Hubert Dreyfus nicely expresses what is at stake here:

We don't seek truth any more but simply efficiency. For us everything is to be made as flexible as possible so as to be used as efficiently as possible. If I had a Styrofoam cup here, it would be a very good example. A styrofoam cup is a perfect sort of object, given our understanding of being, namely it keeps hot things hot and cold things cold, and you can dispose of it when you are done with it. It efficiently and flexibly satisfies our desires. It's utterly different from, say, a Japanese tea-cup, which is delicate, traditional, and socialises people. It doesn't keep the tea hot for long, and probably doesn't satisfy anybody's desires, but that's not important. (Dreyfus 1987, p. 267)

So knowledge has become efficient and disposable like a Styrofoam cup. What does not conform to these criteria and is 'inefficient' (though it may indicate a richer mode of existence) is relegated to the past and becomes somehow quaint. Knowledge as such, and this is a view replicated in *The Postmodern Condition*, has become 'information'. Language as "an instrument of information increasingly gains the upper hand" (Heidegger 1991, p. 124). People become 'thinking machines' that contribute to the 'building of frameworks for large calculations'. However, information is not innocent for whilst it 'informs, that is appraises, it at the same time forms, that means arranges and sets straight'. Information therefore takes on a colonising force that brings everything under control, shaping it in its own image: "As an

appraisal, information is also the arrangement that places all objects and stuffs in a form for humans that suffices to securely establish human domination over the whole earth and even beyond this planet” (ibid.).

Members of the Frankfurt School such as Adorno give a similar account to Heidegger’s. Reason in Western civilisation has succumbed to a fusion of domination and technical rationality. During this process no social subject (proletarian or not) can become the agent of emancipation. In *Minima Moralia: Reflections from Damaged Life* (the title says it all!), Adorno writes:

For since the overwhelming objectivity of historical movement in its present phase consists so far only in the dissolution of the subject, without yet giving rise to a new one, individual experience necessarily bases itself on the old subject, now historically condemned, which is still for-itself, but no longer in-itself. The subject still feels sure of its autonomy, but the nullity demonstrated to subjects by the concentration camp is already overtaking the form of subjectivity itself. (Adorno 2006, pp. 15–16)

The image of the concentration camps as the horrific progeny of modernity is also present in Lyotard’s writing on ‘Auschwitz’ (see *Heidegger and the Jews* 1990), which captures a condition (rather than simply denoting the place). Auschwitz (the place) was, of course, extremely ‘efficient’.

Though Lyotard’s discussion of performativity is not without its influences, its force and originality comes in part from the discussion of the state of the university and the predictions pertaining to what will eventually happen to that institution. Moreover, his position notably differs from those adopted by the aforementioned writers. Both Nietzsche and Heidegger take a backward look to elements of (an imagined?) pre-Socratic culture, so as to reimagine the future. In the case of Heidegger, this can seem nostalgic, whereas Nietzsche’s turn to ‘Tragedy’ is less so. Adorno seems rather cowed by instrumental rationality, whilst Lyotard (certainly in his earlier work) is not quite so gloomy. What fuels hope in *The Postmodern Condition* derives from a surprising approach to the pragmatics<sup>2</sup> of knowledge (the application of linguistic rules that accompany competing accounts of what constitutes knowledge). This involves rather original and, indeed, contentious readings of Austin’s and Wittgenstein’s philosophies of language.

## Why ‘Performativity’?

In the notes to *The Postmodern Condition*, Lyotard acknowledges his debt to the philosopher J.L. Austin, who coined the term—‘performative utterance’. Lyotard writes:

The term performative has taken on a precise meaning in language theory since Austin. Later in this book, the concept will reappear in association with the term performativity (in

---

<sup>2</sup>Pragmatics is a branch of linguistics concerned with language in use.

particular, of a system) in the new current sense of efficiency measured according to an input/output ratio. The two meanings are not far apart. Austin's performative realises the optimal performance. (Lyotard 1984, p. 88)

Lyotard's reference to Austin can be partly explained by the structure and findings of the series of lectures that makes up the latter's *How to do things with Words*. Austin attempts to categorise performative utterances that 'do' things, as distinct from constative utterances that state things. Examples of the former include 'I christen this ship the...', 'I now declare you man and wife' and 'I promise'. Austin notes that to utter such sentences is:

...not to describe my doing of what I should be said in so uttering to be doing or to state that I am doing it: it is to do it. None of the utterances cited is either true or false: I assert this as obvious and do not argue it. It needs argument no more than 'damn' is not true or false: it may be that the utterance 'serves to inform you' – but that is quite different...When I say, before the registrar or altar, etc., 'I do', I am not reporting on a marriage: I am indulging in it. (Austin 1976, p. 6)

By focusing on the kind of utterance that 'does' something, Austin brings attention to an area of language that had been previously ignored by philosophers. When stating that performative utterances do not describe anything, he is trying to show the limitations of the descriptive theory of language. Implied in the notion of the description or statement is the implication of a distance between language and world, between words and actions, whereas the example of 'I do' (said at a wedding) allows no such division – to speak *is* to act, to indulge. In making this point, Austin introduces the binary distinction between performatives and constatives (which can be true or false). Having made this distinction, Austin focuses on performative utterances and is obliged to consider the "constraints or conditions that they operate under which ensure that they communicate or do their work as perfectly as they do, as perfectly as the most unobjectionable true-or-false statements do theirs" (Cavell 2005, 158). Austin argues that the success of performative utterances, though not divorced from questions of truth or falsity, is subject to conditions of infelicity or unhappiness. Infelicity occurs when the performative utterance fails to achieve its intended effect. Failure results from some lack or inadequacy within the 'total speech situation'. An example might be a wedding in which the figure presiding over the ceremony does not have the legal authority to marry the participants. The conditions do not allow for the words to have their intended effect, and the performative utterance is therefore unhappy.

When Lyotard notes the similarity between Austin's performative and his own concept of performativity, the reasons for this seem fairly clear. Neither Austin's performative nor the systematic performativity described by Lyotard are straightforwardly dealing with truth claims. Rather, what is at stake is success measured by internal cohesion; that what actors perform adheres to certain normative procedures that can be measured in terms of success. The effectiveness of a speech act is the measure of Lyotard's performativity.

## Lyotard, Austin and Habermas

So far, I have provided a rather brief and sketchy explanation of why Lyotard draws on Austin's theory of the performative. This account misses something of what is going on, or what is being performed, in Lyotard's allusion to Austin. A deeper explanation is alluded to by Jameson in his foreword to *The Postmodern Condition*. Jameson argues that Lyotard provides "a thinly veiled polemic against Habermas's concept of a 'legitimation crisis' and vision of a 'noise-free', transparent, fully communicational society" (Jameson 1984, p. vii). The significance of Austin's performative to this scenario is that his theory of speech acts and treatment of the performative utterance plays an integral role in the development of Habermas's theory of communicative action.<sup>3</sup>

For Habermas, Enlightenment concerns with reason and justice should not be met with incredulity, but can be reconstructed communicatively (Steuerman 1992, p. 103). If the necessary linguistic conditions are in place then this will revive the possibility for 'critique' that the Enlightenment project engendered. This involves an attempt to reconstruct universals via pragmatics. Habermas therefore "proposes an analysis of the conditions of possibility of communication as the starting point for a critical theory" (ibid.). He believes that the development of 'communicative competence' will lead to mastery of the 'ideal speech situation', a concept he borrows from Austin (Habermas 1970, p. 363). Here there is potential to develop felicitous conditions that can bring about rational consensus in regards to issues around truth and freedom.

Lyotard is troubled by Habermas's project because he believes that 'consensus' is what performativity feeds on. The last thing that is needed is the "regularization of the 'moves' permitted in all language games" (Lyotard 1984, p. 66). To slip (however briefly) out of performativity's grip, we must divert our attention to small micro-narratives or: 'different language games'<sup>4</sup>—a heterogeneity of elements' as: "They only give rise to institutions in patches" (Lyotard 1984, p. xxiv). The response must be a more 'active' form of action than Habermas allows for: "'Traditional' theory is always in danger of being incorporated into the programming of the social whole as a simple tool for the optimization of its performance; this is because its desire for a unitary and totalizing truth lends itself to the totalizing and unitary system of the system's managers" (Lyotard, p. 12). This is why Lyotard petitions for an 'agonistics' to trump Habermas's consensus which will, if you like, work against

<sup>3</sup>This is not fully developed until the publication of *A Theory of Communicative Action* in 1981 and postdates the initial publication in French of *The Postmodern Condition*.

<sup>4</sup>'Language game' is a term drawn from Wittgenstein's philosophy, and it is used to refer to forms of language that are smaller and simpler than the whole of language. The word 'games' refers to the active, lived dimension of language in use and to play a language game is to partake in 'a form of life'. Lyotard's treatment of this issue is rather controversial as his language games are 'islands' partitioned off from the colonising force of performativity Wittgenstein's vision of language is less pure when he talks of "a complicated network of similarities, overlapping and criss-crossing" (Wittgenstein, *para.* 66).

the spirit of performativity that itself relies on consensus. Here: “to speak is to fight” (Lyotard 1984, p. 10). Strategic pragmatic dissonance at a local level might, briefly, fend off the otherwise overwhelming consensual force of performativity.

## Performativity and Philosophy of Education

Having taken something of a detour from issues that are more obviously educational it is necessary to make a case for why seeing performativity in its rich philosophical context is important for educationalists. By presenting performativity as a dominant colonising language game, Lyotard shows us how difficult it is to slip from its clutches. Performativity so often creeps into and dominates educational discourse in spite of academics’ expressed distaste for it. I have often sat through meetings in which talk of effectiveness and outputs has dominated discussions, whilst, at the same time, the participants who spoke this language so fluently would express distaste for target culture and performativity. Moreover, in the performative language games the current predilection with efficiency and effectiveness is presented in stridently positive terms. Think of ‘excellence’, ‘quality’ or the current favourite ‘what works’.

As mentioned above, work emerging from the ‘creativity movement’ (see, for example, Craft 2011) purports to offer a challenge to performativity culture. Ironically, writers in this area seem more concerned with showing how ineffective school cultures are, in both economic and pedagogical ways, than with querying the very notion of effectiveness (see Munday 2014). The version of creativity they advance is entirely in keeping with what Lyotard describes as ‘imagination’, which will be drawn upon to constantly renew and update the system (Lyotard 1984, pp. 51–52). It can sometimes feel as though the educational scene is occupied by Nietzschean doubles who promise a brighter future that transcends performativity, when they are, perhaps unwittingly, its agents. This is beautifully captured by Blake et al.:

But beware the numerous false dancers here ... enthusiastic facilitators and earnest enablers, transferrers of skills and critical thinkers, motivators and school improvers, progressives in various guises, beware find-the-learning-style-that-suits-you-best, the onanism of learning-to-learn.... Beware: as-a- teacher-you-must-plan-your-lessons, you must state clearly the aims of the lesson, specify the learning outcomes, list the resources you will use, describe the method you will use, you must keep the class moving so that the children’s attention doesn’t wander, you must not stray from your plan, and so, with this careful planning, and with the inspection that ensures you are fully accountable, what is taught and what is learned become channelled to predetermined ends. These are highly realistic counterfeits of education. (Blake et al. p. 117)

Seeking better or truer accounts of education has been one of the goals of philosophers of education, and we shall come to these shortly. However, tracing the history of the concept ‘performativity’ within philosophy of education presents a number of difficulties. The fact that it is embedded in a rich philosophical history is a case in point. Philosophers of education who draw on Heidegger’s work on technology (see Standish 1997) or Nietzsche’s discussion of nihilism (see Blake et al. 2000) may

only passingly allude to it, yet they write about very similar, though not always identical, concerns to those discussed by Lyotard in *The Postmodern Condition*. In addition to this, Lyotard's position on performativity evolved in work that followed *The Postmodern Condition*, a point I shall come back to.

Another complicating factor is that a myriad of things have happened in education since the publication of *The Postmodern condition* that can be associated with performativity. Taking a deep breath, these include (a) a fixation with exam grades as the measure of quality/success; (b) the emergence of 'audit cultures' in education and the policing of academics and teachers outputs; (c) league tables for schools and universities; (d) statistical comparison of countries' education systems based on PISA scores, what Gorur (2016) refers to as 'performative statistics'; (e) the growing importance attributed to the 'impact' of research; (f) the fixation with learners and learning (what Biesta (2009) calls the 'learnification' of society) as opposed to a focus on 'children' or 'students' or 'pupils' and the content of what is being learnt; (g) lifelong learning; (h) attributing a higher value to publication linked to large funded projects; (i) the notion that volume of outputs trumps judgement of quality; (j) the emergence of the entrepreneurial academic who hones and monitors their career by devoting considerable time to strategically placing themselves in the public eye via contributions to twitter or blogs so as to maximise personal effectiveness; (k) seeing conferences as networking opportunities in a manner that mimics the commercial sphere; (l) increasingly coming to see knowledge as 'information' or 'data'; (m) the emergence of 'parenting' as a verb and its subsequent establishment within ordinary usage – the word 'effective' can be put before it without blinking; (n) the ubiquity of student satisfaction surveys as a means of 'rating' and quantifying good teaching; (o) the idea that the principal function of universities is to help students become employable; (p) an emphasis on 'methodology' in the humanities and social sciences and its detachment from content; (q) a concern with 'outreach', in which academics go out into the community to effectively influence it in some way or other; (r) an ever growing managerialism; (s) performance related pay in which outputs are measured and teachers and academics are rewarded accordingly; (t) the emergence of 'What Works' centres in universities; (u) the transplanting of methodologies drawn from medical research (such as randomised controlled field trials) across social science domains so as to assess 'what works'; (v) attempts to find algorithms which could ultimately replace teachers due to their better receptiveness to learning needs; (w) predictions regarding the emergence of SMART schools in which teachers become mere technicians ensuring the smooth running of the system; (x) a focus on 'skills' as opposed to knowledge; (y) the playing down of the role of judgement in favour of measurability; and (z) the effect of neoliberal economics on education.

Philosophers of Education have produced critical work that examines these matters and it is pretty much impossible to touch on everything they have covered in the space of one chapter. The way in which these ideas and practices are discussed differs in sophistication and degree of nuance. It encompasses passionate denunciations of the educational system (see Fielding 1999), nuanced discussions of technology, which consider its affordances alongside its more malign aspects (see Burbules and

Callister 2000), and accounts which dispense with a focus on value-laden issues, to ways in which ideas such as ‘quality’ are mobilised (see Simons and Masschelein 2006). These approaches are not part of an evolving dialectic on performativity (no such thing exists) and are radically discontinuous. Given the limitations of space, I believe a more fruitful approach is to bring together five distinctive approaches to performativity by philosophers of education as this will bring out some significant tensions.

## Playing New Games

It is hard to imagine a philosopher of education coming out in favour of performativity. This is perhaps because the wrongness or badness of ‘performativity’ has come to accompany the word through its various iterations; one might as well try and make a case for murder as champion performativity. Though plenty of academics, policy-makers, politicians and practitioners will sing the praises of all manner of things that have come to be associated with performativity (see the above list), they will not employ that term or give voice to the connotations it conjures. Rightly or wrongly, not every killing will be seen as a murder.

As discussed earlier, though Lyotard is no celebrant of performativity, he does not present the state of education as a glorious tragedy. This is because the grand narratives that have been usurped by performativity culture exercised a form of hegemony over the ways which we understand the world and therefore took on a repressive and delimiting power. Though their erosion (Lyotard does not maintain they have been fully eradicated) gives birth to the hollow narrative of performativity, it also makes room for smaller narratives and alternative understandings of the world. The extent to which such narratives are, or will come to be, colonised by performativity is a concern for Lyotard, and has become a focus for work in philosophy of education. Two of the more well known figures in this regard are Richard Edwards and Robin Usher. These authors explore adult education by identifying doubleness in a postmodern condition which, they argue, both constrains and promises freedom. They explore this through an investigation of lifelong learning.

As mentioned above, Lyotard more or less predicts the emergence of ‘lifelong learning’ (he does not use the term), and sees it as part of an educational future characterised by performativity. Once education is no longer seen as an end in itself, higher education institutions will become centres of retraining for adults trying to keep pace with the demand for new skills required by a post-industrial economy. In their discussion of lifelong learning, Edwards and Usher do not want to deny Lyotard’s prescience in this matter: “There is an emphasis on learning oriented to what Lyotard termed *performativity*: learning that seeks to optimize the efficiency of the economic and social system” (Edwards and Usher 2001, p. 279). Moreover, in this spirit educational institutions will “seek to commodify and manage learning by becoming more business-like, corporatist, and consumer oriented”. Edwards and Usher are not looking to celebrate this, but believe that simultaneously (and para-

doxically) it is accompanied by something that we might see in positive terms, namely, the “decentering of knowledge” and “a valuing of different sources of knowledge (including knowledge that would not have been considered worthwhile)” (ibid.). This challenge to a discipline based liberal form of education is presented as a mark of epistemological experimentation in which the “contested and constructed nature” of knowledge is “constantly brought to the fore” (280). Moreover, such experimentation leads to the overturning of traditional knowledge hierarchies in which “experiential, informal, and community based learning” (ibid) become legitimate sources of knowledge. Therefore:

...performativity has the paradoxical result of simultaneously closing and opening possibilities. Performativity therefore, like lifelong learning and the postmodern of which it is an aspect, has multiple significations and significances. It contributes to both the strengthening and loosening of boundaries and to both an economy of the same and to an economy of difference. It is within these interlocking and interrelated economies that the lifelong learner is now (dis)located. (p. 281)

Edwards and Usher see what has happened to the undermining of disciplinary knowledge as a sort of emancipation from the grip (manceps) of a gendered paternalistic ‘liberal’ education. If we have become incredulous to the idea that knowledge can be mastered (they play on the notion of a ‘Masters’ degree), then this is something to be celebrated.

## The University of Excellence

Though Edwards and Usher’s argument is not without nuance, there are reasons for being distrustful of what they have to say. For a start, they seem to believe that the new knowledges they allude to (no examples are provided) are in keeping with Lyotard’s discussion of micro-narratives and language games (282). The idea that they represent the sort of alternative comportment to language that Lyotard has in mind is a little hard to swallow. For a start, the authors acknowledge that such knowledges are bound to performativity. If so, then they are presumably ‘mastered’ by that language game. Moreover, the celebration of the ‘new’ is surely caught up in the nihilistic dialectic diagnosed by Nietzsche – whatever is ‘new’ is not ‘old’, nothing of substance is affirmed.

Whereas Edwards and Usher can seem celebratory about the current state of education, there are interesting contributions which are more in keeping with the greyness that accompanies Lyotard’s understanding of performativity. A rather well-known example of this is Bill Readings’ *The University in Ruins* (1996). Readings describes what he calls ‘The University of Excellence’. ‘Excellence’ here is just the sort of empty signifier that Blake et al. (2000) associate with contemporary nihilism. Despite the inevitable positive connotations that accompany ‘excellence’, nothing of any obvious substance is affirmed. However, Readings does not hark back to some notion of a golden age in which the university was once whole or complete. The idea of the enlightened universal subject, who once embodied the

institution, can no longer appear credible in the light of good work on feminism and on race (Readings 1996, p. 10). However, the gap in this regard, generated by genuine progress, is filled by another subject who does not 'represent' anything, namely, the university administrator. She/he will oversee the performativity targets (p. 8) and keep everyone on track.

Readings has no grand ambitions to resuscitate an older idea of the university, or resurrect it from the ruins. Any such goals are naïve and misguided. However, he is unwilling to give up on the possibility for thought which once, every now and again, may make its self known. Readings imagines the conditions under which this might happen and argues for an 'institutional pragmatism' (18) in which accountability may, however briefly, take precedence over accounting. Transgressive possibilities lie with teaching and obligations that call on the educators to do justice to unexpected utterances that emerge from it: "The transgressive force of teaching does not lie so much in matters of content as in the way pedagogy can hold open the temporality of questioning so as to resist being characterised as a transaction that can be concluded" (19). Teaching therefore becomes committed to justice not truth.

As Bearn notes, Readings' rather desperate vision is perhaps more in keeping with work by Lyotard which followed *The Postmodern Condition* (see Lyotard 1988, 1990, 1991 and 1993). Lyotard ceased to have faith in the possibility for little narratives to upset the apple cart. They are too easily be consumed by the performative 'genre of discourse'. Think here of his essay 'Marie Goes to Japan' in which the protagonist feels victimised by the constant empty imperative to reinvent everything (a good performance must be 'new') and dreams that she is "an underground cavity full of black cold, still water" (Lyotard 1999, p. 5). Lyotard's last bastion of hope comes through an ascetic withdrawal whereby we question/negate everything including thought in the hope that something new to thought will come out of it. That way, we accept the occurrence of what is not yet determined. Lyotard describes such philosophical work in terms of "Peregrinations in the desert" (Lyotard 1991, p. 74).

## An Intense Education

As we have seen, Lyotard's later work and Readings' *University in Ruins* privilege dissonance or negation. In 'Pointlessness and the University of Beauty' (an essay that has been cited several times already), Gordon Bearn offers a way of thinking beyond performativity which exceeds negative terms and discursive boundaries. To do this, he draws upon an affirmative Deleuzian ontology which contrasts with Lyotard's philosophy of absence. For Lyotard, we have meaning on the one hand, which quickly gets incorporated into the performative genre of discourse and, in contrast, "a universal lack of difference, an indifferent blank nothingness" that sits on the other side of language (Deleuze quoted in Bearn 2000, p. 242). Bearn, following Deleuze, argues that the other side of representation should not be thought of as an immense blank, but a swarm of intensities or "non-conceptual differences"

(Deleuze 2004, p. 15). Our experiences of such differences is sensual not rational. Such intensities infuse and make possible our language and thought, yet linguistic differences never fully capture them. Think of the difference between a close up camera shot of a kingfisher and the flash of red and blue that whooshes and whizzes across the water. We may call this the ‘same’ kingfisher, but we do so from this side of representation.

Performativity is blind to the ‘swarm of intense differences’ because it, like any genre of discourse, can only ‘regiment’ intensity and ‘tie it in a knot’. However, though such blindness may stifle us, it can never fully control intensities, which are always threatening to break through. The goal of Bearn’s vision is to release intensities. This release should characterise ‘The University of Beauty’. In keeping with the affirmative thrust of his argument, this will not simply involve a departure from certain activities that are often associated with the culture of effectiveness such as various forms of vocational training. It is not the training that is the problem but the genre of discourse that has tied it in a knot and made our understanding of training anaemic and technical (Bearn, p. 254). All sorts of activities, whether they take place in the humanities or sciences or indeed whether or not they involve training for a vocation, can be diffused through intense particles. What matters is that the fires of the imagination are ignited and burn “with a fire that does not consume” (p. 247). Moreover, the university should be an intensity machine breaking through disciplinary boundaries. This approach should be playful, as this will help us break free of received representational frameworks for thinking.

Bearn does not naively predict the demise of performativity. Rather, he imagines a future in which performativity is more porous than we might think to new and rich ways of experiencing things. For Bearn, to be freed from the constraints of goal-directed thinking requires no subtraction, but must be thought of in terms of what happens in the middle, where we get lost in a swarm of different thoughts, ideas, feelings, worries and enjoyments. Goals (the point of things) do not exactly disappear, but their determining quality is hijacked by the multiplicity of experience: there are an indeterminate number of goals/points. Moreover, there is a general goal that defies teleological boundaries—the goal of becoming intense.

## The Other Performativity

Bearn’s Deleuzian discussion of the possibilities for education is powerful, but it is not the only candidate for a more affirmative approach to performativity. As discussed above, Lyotard acknowledges his debt (as regards the concept of performativity) to the philosopher J.L. Austin. Other writers such as Derrida (1988), Butler (1997, 1999) and Cavell (2005) follow Austin to explore the ways in which the ‘performative’ (in a rather different sense) dimension of language can be affirmed (see Munday 2009, 2010, 2011a and 2011b). Indeed, it is worth noting that readers new to the concept of performativity may quickly find themselves confused if they type it into a search engine. This is because performativity is also a term used in

Gender Studies in which gender is seen as a performance as opposed to something constituted by our biological make-up (see Butler 1997). This understanding bears little resemblance to Lyotard's meaning, though it shares the same influence, namely, Austin's philosophy of language. Anyway, the work of these authors on performativity provides a stimulus for ways of thinking about education that moves beyond a focus on effectiveness and measurable outputs, but does not succumb to nostalgia for authenticity (see Munday 2011a). Given the limitations of space, I will only consider how Derrida's philosophy can be taken up for this purpose (Cavell's discussion is very technical,<sup>5</sup> whereas Butler's work on gender takes its cue from Derrida).

Derrida's most famous treatment of Austin appears in his essay 'Signature event context'.<sup>6</sup> The former finds much to admire in Austin's philosophising. When Austin shows how issuing a performative utterance is not to report on language, but to indulge in it, he appears to recognise the impossibility of adopting a stance that is external to language. This is why Derrida notes that:

As opposed to the classical assertion, to the constative utterance, the performative does not have its referent (but here the word is certainly no longer appropriate, and this precisely is the interest of the discovery) outside of itself or, in any event, before and in front of itself. It does not describe something that exists outside language and prior to it. (Derrida 1988, p. 13)

Derrida argues that Austin has shattered the concept of communication as a purely semiotic, linguistic or symbolic concept. Communication is no longer considered in terms of 'transference of semantic content' or fixed in its orientation towards truth. Rather, we perform the world into being through language. All meaning is textual—there is no outside text.<sup>7</sup> However, Derrida is close to Lyotard when he argues that Austin takes a step backwards by fixating on external contextual factors that must be in place for the performative utterance to be happy—for it to 'succeed'. This ignores the 'iterability' of language (18) and the ways in which words are not bound by context. It is not the case (as Austin might have it) that the context determines the force of words. Rather, words carry their old contexts with them prior to their entry into a potentially unlimited number of possible new contexts. In this sense, words are not at one with themselves and there are countless ways in which they can come to mean and do things differently.

---

<sup>5</sup> See Munday (2009) for a detailed reading of this.

<sup>6</sup> It should be noted that Derrida has been heavily criticised for his reading of Austin. Searle's damning rejoinder 'Reiterating the Differences: A Reply to Derrida' (1977) is perhaps the most well-known critique. These disagreements are deserving of their own chapter and there is no space to rehearse them here.

<sup>7</sup> This is a literal translation of Derrida's famous formulation "Il n'y a pas de hors-texte". As Attridge notes, "this phrase does not mean 'the things we normally consider to be outside the text do not exist' but 'there is nothing that completely escapes the general properties of textuality, différance etc.'—that is, as Derrida goes on to explain, no 'natural presence' that can be known 'in itself'. But it is also true that here is no inside the text, since this would again imply an inside/outside boundary" (Attridge in Derrida 1992, p. 102). The more famous (though less exact) translation is "there is nothing beyond the text".

So much of what constitutes performativity (in Lyotard's sense) is about controlling context so as to assure effectiveness and the measurement of it. We find this in the 'well-made lesson' (Standish 2005) as much as in rigorous adherence to success criteria, whether this applies to marking exam scripts or assessing the 'quality' of publications. The iterability of language thwarts these processes, as something unexpected will arrive to disrupt things. Here is Standish:

Derrida explores ways in which the idea of profession requires something tantamount to a pledge, to the freely accepted responsibility to profess the truth. The professor enacts this performative continually in her work: what she says is testimony to the truth; as work it is necessarily an orientation to a to-come. The academic work of professing must then be something more than the (purely constative) statement of how things are. (Standish 2001, p. 18)

Derrida's argument is subtle; professing<sup>8</sup> the truth is about orientating students towards something that neither professor nor student can necessarily predict in which the constative (truth) will always be performed as the to-come (an aspect of the future) rather than a statement of that which is secure, of the past, somehow originary. The professor's role here is to show "hospitality" (Derrida 1999, p. 51) to what arrives in language, rather than turning away from whatever fails to meet the performance criteria. It is in this that the promise of education in an age of performativity resides.

At a superficial level, Derrida's approach may sound rather like Lyotard's 'per-egrinations'. Though both thinkers advocate a philosophy of absence (there is no talk of intensities that precede and infuse language), for Lyotard if anything comes out of the abyss it will be "incomprehensible: as terrifying as dread or as wonderful as grace" (Bearn 2000, p. 242). In contrast, Derrida's iterability, which implies the ongoing reconstitution of the world, is an ordinary dimension of how words are used. Context cannot control meaning as language is always already out of joint. This is something to be affirmed and a prerequisite for educational experiences infused with hospitality to what arrives.

## Does 'what works' work?

Having considered some largely divergent approaches to performativity by philosophers of education, perhaps we should come up to speed and look at how the focus on effectiveness and efficiency diagnosed by Lyotard is currently staged in the wider educational domain. This is arguably captured in the fashionable 'what works' slogan. In the last 20–30 years, there have been many calls for educational research to move away from 'insular' academic concerns and hone in more directly on practical outcomes (see, for example, Berliner et al. 1997). This has often led to analogies with medicine which is presented as an exemplary instance of an area

---

<sup>8</sup>This account of professing is radically at odds with what tends to count as 'professionalism' today.

which has a strong culture of research-led practice (see Hargreaves 1996). The favoured instrument in medical research is the randomised controlled field trial, an experimental form of quantitative research, where control groups are subject to ‘interventions’ that respond to perceived ‘problems’. In the USA, RCTs have become the dominant method for conducting educational research (see Slavin 2002). In the UK context, RCTs are the favoured approach in the ‘What Works’ Network. This network is made up of 7 independent What Works Centres and 2 affiliate members which together cover policy areas that receive public spending of more than 200 million pounds.

The growing popularity of RCTs raises some fundamental questions for educationalists. According to the rhetoric, RCTs are value neutral and politically innocent. They will provide sure evidence of ‘what works’. Are such claims justified? There have been a number of responses within philosophy of Education to this view. Gert Biesta has written two much cited articles on this topic called ‘Why “What Works” won’t work’ (2007) and its follow-up ‘Why “what works” still won’t work’ (2010). The Educational Research network based in Leuven has also published a book with the title *What Works Doesn’t Work* (2006) containing chapters by prominent philosophers and historians of education. As is perhaps clear, the focus here is not ‘just’ on the wrongness of seeing education in terms of effectiveness. Rather, the authors consider the various ways in which research that is conducted to demonstrate effectiveness fails on its own terms.

A good place to begin considerations of why ‘what works’ may not work is Paul Smeyers’ chapter ‘The Relevance of Irrelevant research: the irrelevance of Relevant Research’ (2006) in which he looks at research on class size in education. Smeyers notes the interesting irony that even advocates of experimental research in this area seem to acknowledge the myriad problems with establishing whether larger classes lead to more effective educational outcomes. For example, he notes the extensive number of obstacles that Goldstein and Blatchford, staunch advocates of this form of research, identify as obstacles to establishing a causal relationship between class size and attainment (Smeyers 2006, p. 101). These include such things as how “the sample population may differ from the target population” and “in the case of randomized controlled trials the expectations about the effects of class size may be partly responsible for observed effects” (ibid). Smeyers attributes the irony at work here to a kind of repression within a research community that has turned in on its self. Finding out ‘what works’ is perhaps not really what is at stake, but “the demand for a particular kind of research within a particular societal climate” (97). The climate in question is the “demand for performativity, which so strongly characterizes present-day society” (106). For Smeyers, this climate is repressive because it invalidates certain lines of enquiry and types of concern that are essential for conducting good research. For example, experimental research cannot, according to Smeyers, really deal adequately with issues such as “the workload of teachers” or “the feelings of happiness of the students’ (102), yet case studies are ruled out as they cannot be generalized (103). For Smeyers issues pertaining to value and judgement are swept away, yet both are integral features of good research. When these matters are ignored, the only people who ‘what works’ research works for are the people who conduct it.

In his discussion, Smeyers draws upon Richard Smith's discussion of judgement (see Smith 2017) to support his argument. Smith looks at what has happened to 'judgement' in our contemporary culture. He maintains that professional life is now so "governed by the application of norms and criteria as a matter of routine" that it is "closed to opportunities for the use of judgement" (Smith 2017, p. 101). For Smith judgement is now taken to be subjective and elitist (102) and has become associated with deviant connoisseurship. This is partly on display through the sort of language that helps to perform the dominant sensibility into being. Here, Smith calls out the popular expression 'judgement call' in the context of "situations where, remarkably it seems, the right course of action cannot in any straightforward way be read off a set of data and applied algorithmically" (105). Two ideas are central to Smith's attempt to resurrect judgement. Firstly, he invokes Aristotle's familiar distinction between *techné* and *phronesis* (106). *Phronesis*, or practical wisdom, has a clear moral dimension which is missing from technical reasoning:

In our judgements we *ought* to be flexible, attentive, alert: the doctor *ought* not to jump to the conclusion that this patient is to be treated exactly like other patients who have the same problem. These *oughts* do not rest simply on the thought that flexibility and so on will lead to more successful outcomes: this is not a disguised form of instrumental reasoning. Rather the demand is to be properly responsive to, or do justice to, the case or person under consideration. In this lies its ethical nature (108)

Alongside, *phronesis*, Smith draws our attention to the importance of the "minor premise or practical syllogism" (ibid.) and points to the ways in which the ordinary, everyday aspects of our lives are spent in a struggle in which we try and fend off self-delusion in the pursuit of seeing things in the right way. He cites Iris Murdoch's project to achieve "a refinement of desire in daily living" (Murdoch in Smith, p. 109) and notes that this cannot be reduced to a skill or technique: "as Plato observed, the skilled doctor makes a skilled poisoner" (ibid).

The sort of practical/moral experimentation that Smith has in mind is occluded from research (of a different 'experimental' hue), which overleaps judgement and the moral dimension inherent to it in favour of a wrongheaded notion of efficiency. A not wholly dissimilar sensibility is at the heart of Gert Biesta's article 'Why "What Works" Won't Work'. Biesta offers a critique of the epistemological foundations of RCTs and looks for an epistemology that "might be appropriate for an adequate understanding of the role of knowledge in professional action" (Biesta 2007, p. 11) He argues that RCTs are in the grip of a traditional 'representational' epistemology in which the world is presented to consciousness. Here the researcher identifies a problem, at a distance, and then seeks a solution.

Biesta finds an alternative 'practical' epistemology in the work of Dewey and argues that the latter's theory of knowing is not premised on the clear separation of knower and known, researcher and researched (p.12). Rather knowing (as opposed to a static 'knowledge') is something dynamic that emerges through acting in the world and is concerned with "the *relation* between our actions and their consequences" (ibid.). This notion of 'knowing' is not just about trial and error but 'intelligent action' (14). Knowledge and reflection come into play when the smooth running of our habits breaks down and we do not know what to do – when we

‘encounter a problem’. However, the problem (rather than the solution) only becomes clear when we act (p.15). On this account, we do not know what the problem is until we have found the solution.

On Biesta’s account, we cannot discover knowledge of “reality; but only the relationship between actions and consequences here and now. We do not learn truths about the world but about what has been possible”. ‘Inquiry’ (Dewey’s term) can tell us what worked, but not what works. If we experiment with different lines of action, then this can help us to address future problems. However, this is not about following recipes but addressing unique problems in a changing world. Whilst old knowledge can guide us, the effectiveness of what we do must be constantly reappraised. This, however, does not mean that we should embrace and begin with a recipe on the proviso that it may not work next times as the means and ends of our activities are connected in ways that researchers are sometimes blind to. We can only evaluate ‘means’ by ends that are attained and the “upshot of this is that neither in our role as researcher nor in our role as professional educator should we accept given problem definitions and predetermined ends” (17). Moreover, we should look beyond whether or not something is achievable and consider whether or not we should achieve it, for action “in the social domain can only become intelligent action when its intrinsic relation with human purposes and consequences – that is when the political nature of inquiry in the social domain – is fully taken into account” (ibid.).

For Biesta, then, RCTs are epistemologically weak because problems are taken for granted as real problems prior to seeking solutions. Researchers simply put an intervention into motion and are not responsive to the ways in which problems themselves might be reframed through ‘intelligent action’. Moreover, as means are separated from ends, researchers make the mistake of thinking that there are simply more or less effective ways of getting to a predetermined ‘positive’ result. Claims about neutrality repress the value-laden aspects of the research leading to potentially damaging consequences.

## Conclusion

During the course of this chapter, I have tried to draw a distinction between a narrow shallow understanding of performativity and a broader deeper one. The latter account, which is in keeping with Lyotard’s discussion, points to a deep-rooted effectiveness culture, which cannot adequately be captured by talk of league tables or teach to the test pedagogies. These things may be manifestations of a particular condition but too much focus on them misses the extent of performativity’s reach. Indeed, the alternatives to performativity in its shallowest sense (provided by the likes of creativity experts) marks either a philosophical deficit or a cynical attempt to present an intensification of performativity as the antithesis to it.

But, let us for a moment, and at the risk of undermining what has just been said, introduce a note of mild scepticism, particularly in regards to Lyotard’s predictions

about university education. Readers may feel that they are too exaggerated or all-encompassing. For a start, talk about ‘the’ university is a problematic move due to the rather inevitable fact that there will be radical differences between institutions within countries never mind across them. Moreover, there is no ‘robust’ comparative research looking at the global manifestation of performativity.

One could argue that there are all sorts of aspects of education, which may appear to jar with performativity. However, it can be easily shown how they have been infected, or, at best, significantly marginalised by it. Though universities will tolerate time spent on academic ‘outputs’ such as this one, work deriving from large scale funded projects is thought to represent the ‘gold standard’ of research. Academics within Humanities departments still write books on Jane Austen and the French Revolution. However, this kind of work may be dismissed as ‘hobby research’ and these individuals may well be required to seek large funding grants and establish links with departments engaged in more ‘useful’ activities that may generate ‘impact’. In the UK context, the REF<sup>9</sup> currently, and ironically given it is obviously bound to performativity culture, still values scholastic achievement. Yet who would feel confident that the growing emphasis on the ‘impact’ of research will not eventually overwhelm the research culture. Partnerships with commercial companies and professional bodies may not be compulsory, but it ‘is’ the sort of thing that is likely to make the average university manager salivate. Though Professors are still being employed, it is worth noting the growing popularity of online MOOCS and universities across the planet are committed to developing students’ digital literacies. Whilst students in the Social Sciences will continue to study theory, entire courses are dedicated to the more pressing priority of developing research ‘skills’ and handling data. The retraining of mature adults has become commonplace within universities, and this sits alongside the notion that universities are becoming ever more concerned with employability. Last, but not least, the logic of effectiveness and efficiency has come to permeate university life to such an extent that almost everything academics do is monitored, measured (how many outputs have you produced this year?) and judged to make sure that they are maximising their time and potential.

In a similar vein, schooling, one may argue, has not been fully colonised by performativity. Yet, whilst students will study subjects like literature, their ‘learning’ in this area will be conceived of in terms of developing literacy skills (potentially useful for economic development) rather than becoming literate. Whilst there has been ever-growing emphasis on inclusion in schools, how often is this conceived of in technical, instrumental terms? The emergence of such things as dyslexia toolkits (Reid et al. 2013) is revealing here. Whilst teachers are still being employed, as we speak, tech wizards are trying to create algorithms that will eventually replace them or augment them anyway (Williamson 2015).

---

<sup>9</sup>The REF stands for Research Excellence Framework. It was first carried out in the UK in 2014 and is undertaken by the four UK higher education funding bodies. The REF is a review process carried out by selected senior academics who review institutions in accordance with judgements regarding the quality of “outputs”, “impact” (the ways in which research influences the world beyond academia) and the research “environment” present in each centre.

In spite of all this, the most interesting work on performativity does not express defeat and gives reason for limited hope. It does this whilst being neither naively optimistic nor anachronistic in its ambitions. Authors such as Readings, Bearn and Standish push against the borders of the performative language game and find it porous. By showing how ‘what works’ does not work, Smeyers, Smith and Biesta give us reason to wonder if performativity may one day be devoured by irony.

# Bildung Versus Assessment

Heikki A. Kovalainen

## Introduction: Varieties of *Bildung*

Are there concepts that are basic to educational theory? According to the German educational theorist Jürgen-Eckardt Pleines (1989, pp. 63–78), *Bildung* is such a term, alongside education (*Erziehung*) and teaching (*Unterricht*). But what is *Bildung*—and why use the term in an English setting? Hoping to gain an overview of the main meanings, we can trace two main strands of how *Bildung* has been conceptualized. In the first place (and often in contemporary discussions), *Bildung* refers to an individual process of character development aiming at perfection of one's personality. In this sense, the term connotes the ideal of attaining one's full humanity, with varying emphases on interaction with other human beings. The second usage (found through a critical reading of history) centers less on personality than on acquaintance with the surrounding reality. Thus understood, *Bildung* names the ethico-ontological process whereby the individual in her particularity merges with the general or universal, viz. the objective world.<sup>1</sup> The two stripes of *Bildung* will result in different answers to the question concerning the interrelationship between *Bildung* and educational assessment.

In educational philosophy, *Bildung* is classically rooted yet it has much to offer to contemporary education. The ways in which *Bildung* is basic to educational philosophy, however, is a complex issue. The first complexity is tied with language: the term '*Bildung*' figures very differently in the Anglophone and German-speaking worlds of education. In Germany, *Bildung* has virtually always been highly central to educational philosophy. It has a long history reaching from medieval mysticism

---

<sup>1</sup> It is in this sense that G. W. F. Hegel, for instance, contributes to the theories of *Bildung*. Due to lack of space, however, we will not deal with Hegel in the present chapter.

H. A. Kovalainen (✉)  
University of Tampere, Tampere, Finland  
e-mail: [heikki.a.kovalainen@uta.fi](mailto:heikki.a.kovalainen@uta.fi)

to Enlightenment classics as well as twentieth-century critical theory. Some readers of the present chapter will link the term with the tradition of the *Bildungsroman*, which denotes classical texts—Goethe as the preeminent example—about a protagonist setting on a spiritual journey, often with help from exemplary friends, for his true self.<sup>2</sup> This tradition runs parallel to the stripe of philosophy of education in Germany under the umbrella of *Bildung*. In German history of ideas, moreover, the birth of educational theory (*Erziehungswissenschaft*) is congruent with the history of *Bildung*.

In the Anglophone world of education, in contrast, *Bildung* is nothing like the masterterm it is in German. Important general works in philosophy of education, for instance, *The Oxford Handbook of Philosophy of Education* (Siegel 2009) or *The Sage Handbook of Philosophy of Education* (Bailey et al. 2010) make only oblique references to *Bildung*, and neither book counts the term in their indices. But this is not the whole truth. Recently, the notion of *Bildung* has been called to rescue education from the demands of efficiency and measurability. Rebekka Horlacher, for one, records *Bildung* as a “fighting word”, particularly as an argument against the ubiquitous trend of measurement in education, often targeted against the recent dominance of PISA measurements (Horlacher 2012, p. 135).

Assessment, unlike *Bildung*, does not have a unified conceptual history, yet it is tied with different ideas having philosophical underpinnings. It refers to an educational process whereby the students’ achievement of educational standards is evaluated. Historically, the concept of assessment is tied, in particular, with the idea of *measurability*. This is the notion that whatever new knowledge students or learners acquire, its fruits must be visible and hence assessable. In the history of ideas, this notion finds its early modern roots in British empiricism, and it has been developed later by the American pragmatists, and in the twentieth century, in the schools of behaviorism and outcomes-based learning.

The question of measurability leads us into asking what the *empirical criteria* for judging the success of education are. In the first place, the nature of standards to be used in educational assessment must be clarified. Do the standards refer to a body of knowledge to be acquired, or do they also include values or skills? If it is knowledge that the students are to master, how are the respective emphases between different subject areas (i.e., the humanities and the natural sciences) to be placed? Finally, how universal are the standards to be met; are they local, domestic, or international? In today’s education, the contents of the educational standards may also be affected by the increasing demands for efficiency, accountability, and performativity. Depending on how strict the demands for measurability and performance are, educators will set different standards for educational assessment.

In the present chapter, we ask two systematic questions. First, is there an inherent tension between the concept of *Bildung* and the contemporary practices of educational assessment? I argue, on the one hand, that if assessment means primarily

---

<sup>2</sup>The genre of the *Bildungsroman*, with specific text-analytical approaches to works of fiction vis-à-vis the philosophical concept of *Bildung*, would merit a separate study and is only mentioned in the current chapter.

formal and objective assessment, this is difficult to reconcile with the aims of *Bildung*. On other hand, *Bildung* ideals can be harmonized with educational assessment, if by assessment we mean informal or internal assessment. Second, then, we ask how the notion of *Bildung* may be applied to contemporary educational settings so as to accommodate the demands of assessment. To be successful, *Bildung* must use evaluative elements, and this involves both self-evaluation and evaluating others. Furthermore, if educational assessment uses standards that require learning not only knowledge and skills but also attitudes and values, then *Bildung* ideals will be receptive to the demands of educational assessment.

A note on translation: As regards the English equivalents of *Bildung*, a dictionary suggests terms such as ‘education’, ‘culture’, ‘formation’, and ‘cultivation’, but none one of these capture the full range of meanings of *Bildung*. In contemporary philosophy of education, there has been some discussion regarding the affinities between *Bildung* and *liberal education*—and the parallelism is justified *prima facie* by the fact that one meaning of *Bildung*, classically speaking, is education in the liberal arts. The differences between liberal education and *Bildung*, however, are just as remarkable as the similarities, and they will be discussed below. If we look at translations of *Bildung* in different languages, we only rarely find close equivalents. Swedish is an exception, since we find *bildning*; in Norwegian, the closest equivalent would perhaps be *formasjon*; in Danish, *dannelse*. In the Romanic languages such as Spanish and Italian, we have *formación* and *formazione*, respectively. An intriguing example among the Scandinavian countries is Finnish, which belongs to a different language family, and translates *Bildung* as *sivistys*. In what follows, we will use the Finnish school system as a test case of how the demands of *Bildung* and assessment may be synthesized.

## Paradigms in the History of *Bildung*

The senses of *Bildung* are not solid through history. In order to gain proper insight into the multiplicity of the term, a brief history of *Bildung* must be presented. The term rises to prominence in the eighteenth century—through the work of Herder, Goethe, and von Humboldt, in particular—yet its usage originally stems from medieval mysticism. One can trace at least three different paradigms in the history of *Bildung* (the fourth one will reach to the present day).<sup>3</sup>

The first phase involves the term’s original usage and dates back to Meister Eckhart. Etymologically, *Bildung* stems from althochdeutsch ‘abbilden, Bildnis’ (to build/form, an image) and ‘Gebilde, Gestalt’ (a building/construct, a form). In Eckhart’s usage, *Bildung* refers to *imago dei*: becoming like the image of God. This is a philosophically complex idea whereby we receive God’s presence in our being—we are formed and made *of* God and allow Him be present in our soul. This

---

<sup>3</sup>In tracing the historical transitions in the different usages of *Bildung*, I am indebted to the *Historisches Wörterbuch der Philosophie* (for bibliographical details, see the references).

etymology is noted, with important additions, in the Brothers Grimm's classic *Deutsches Wörterbuch*, where the word is given four meanings, indicated by the Latin expressions (1) *imago*, (2) *forma* (3) *cultus animi, humanitas* and (4) *formatio, institutio*; that is (1) image, (2) form (3) cultivation of the soul and (4) formation (cf. Nordenbo 2002, p. 341). These translations already suggest the multivalence of the term *Bildung*. It connotes both a process whereby something is formed as well as the final product. To begin with, *Bildung* refers to the process of self-cultivation whereby the individual person attains to full humanity. At the same time, the term refers to the liberal arts (*humanitas*)—viz. the content of what is to be learned through the process of *Bildung*.

Should we consider the interrelationship between *Bildung* and educational assessment vis-à-vis the original senses of *Bildung* just delineated, a simple observation can be made. If *Bildung* is taken to refer to the *liberal arts*—or more specifically, to a list of things to be learned—it follows that whether or not a person may be taken to have succeeded in *Bildung* is, at least in principle, a matter of checking whether she knows what she is supposed to know. This is only one side of the issue, however. We come to a different conclusion regarding the measurability of *Bildung*'s success, if we understand the term as the process of an individual person striving to attain her full humanity. There is no given mold for anyone's humanity: what some person may be or become is up to her to define, and this could be difficult to assess.

The second historical phase involves the thorough transformation of *Bildung* from a religious/classical concept into a secular, humanistic, and pedagogical notion. After early modern appearances in Klopstock, Leibniz, and Pestalozzi, *Bildung* is more elaborately developed by Johann Gottfried Herder (Ritter 1971, p. 923). For Herder, *Bildung* is virtually synonymous with *Kultur*—which (as we note in passing) English readers will readily translate as self-culture.<sup>4</sup> In Herder's hands, *Bildung* becomes the masterterm of his anthropologico-hermeneutical philosophy of life (Ritter 1971, pp. 923–924). Herder's contemporary Goethe broadens the usage of *Bildung* from the humanities to the natural sciences—and he may be counted as the inventor and the father figure of the *Bildungsroman*. Goethe's concept of *Bildung*, indeed, is both an anthropological and an organicist notion. In the *Metamorphosis of Plants*, Goethe talks about “the animal and human *Bildung*” (*thierische und menschliche Bildung*) (Goethe 1790, p. 18), suggesting there to be no stark division between man and nature.

In the Enlightenment period, Wilhelm von Humboldt (1767–1835) stands out as the key classic on *Bildung* not least because he establishes general education in Germany both in theory and in practice. As a Prussian diplomat, von Humboldt was once responsible for the Prussian education service, organizing everything from elementary schools to universities, along neo-humanist principles (Nordenbo 2002, p. 347). Man's true purpose, for Humboldt, is “the maximum formation of abilities and skills into a harmonic whole” (Humboldt 1981, pp. 64, Bd. I). Humboldt places

---

<sup>4</sup>Self-culture, indeed, is the English equivalent of *Bildung* often used by commentators working in Anglophone contexts. The term was also used by Ralph Waldo Emerson, to whose work we shall return.

remarkable emphases on the freedom of the *Bildung* process—which goes to explain his stress on university autonomy as well. An enlightened reader will easily recognize the Humboldtian *Bildung*-ideals as the bedrock of modern academia, yet the same reader easily forgets that Humboldt’s treatment of *Bildung* is not confined to the humanist ideals of self-development *qua* anthropocentrism. Quite the contrary, *Bildung*’s ultimate aim is “to appropriate as much world as possible and to unite himself as closely as he can with it”, or in other words, to “[join] our ‘I’ with the world” (Humboldt 1981, pp. 235–236, Bd. I). Self-cultivation is successful, then, if and only if it happens in a thorough-going interaction with the world:

The ultimate task of life is to endow the concept of ‘humanity’—in our person, both in our lifetime and beyond it through the traces we leave behind by our activity—with as rich a content as possible; this is only done by associating with the world in the most comprehensive, lively and free interplay possible. (Humboldt 1981, pp. 235–236, Bd. I.)

Is the *Bildung* tradition confined to Germany?<sup>5</sup> In the introduction, we noted the culturally bound character of *Bildung*, yet the question should be asked as to whether international figures may be included within the tradition. In my view, we may count international figures who were influenced by *Bildung* classics, and who, in turn, leave their mark on the subsequent *Bildung* tradition.<sup>6</sup> One such a figure is the American essayist Ralph Waldo Emerson (1803–1882). Emerson notes the difficulty of translating *Bildung* into English, and the difficulty is not only a linguistic matter: “Culture—how much meaning the Germans affix to the word & how unlike to the English sense” (Emerson 1965, p. 303). Throughout his career, the essayist develops a philosophy of self-culture, ranging from his early Unitarian sermons to the 1841 essay ‘Self-Reliance’ as well as the important later essay ‘Culture’ (1860). Emerson paraphrases both Humboldt’s emphases on versatility of interests as well as the need to appropriate as much of the world as possible. In “Culture”, “Our excellence is facility of adaptation and of transition through many related points, to wide contrasts and extremes” (Emerson 1860, p. 73). Second, take a journal entry from 1851 titled “End of Culture, Self-Creation”: “In some sort, the end of life, is, that the man should take up the universe into himself, or, out of that quarry leave nothing unrepresented, and he is to create himself” (Emerson 1975, pp. 440–441; cf. Emerson 1884, p. 131).

The third historical phase in the treatments of *Bildung* extends from the last decades of the nineteenth century to the first half of the twentieth century, involving critical commentary on the term from authors such as Nietzsche, Adorno, and

---

<sup>5</sup>In principle, this question could be broadened to concern any varieties of education or self-cultivation to be found in different cultural traditions, including Eastern thought. In this chapter, however, I have decided to confine my treatment of *Bildung* mostly to its explicit appearances—not because talking about other traditions would not be helpful, but because I have wanted to keep the terminology as clear as possible.

<sup>6</sup>In some texts in philosophy of education, appeals are made to John Stuart Mill as an exemplar of *Bildung*. We have some reasons, however, for resisting an appropriation of Mill into the *Bildung* tradition, since his closest allegiances (British empiricism and utilitarianism) as well as some of his followers (e.g., the American pragmatist William James) suggest that he is writing in a different tradition.

Horkheimer. Within this tradition, *Bildung*—or false varieties thereof—is subjected to criticism rather than viewed as desirable. To be sure, the borderlines between this stripe of *Bildung* and that discussed above are blurry, since authors from Goethe to Emerson also present criticisms of deficient *Bildung*. In Emerson’s wording, to take one example, “Our culture is not come ... none are cultivated” (Emerson 1965, p. 470). Analogously, in “Culture”: “Very few of our race can be said to be yet finished men” (Emerson 1860, p. 88). Nietzsche was much indebted to Emerson, and he inherits from the American essayist not only the affirmative vision of life but also the observation that human beings as they are not spiritually liberated. Nietzsche adopts the same strategy with regard to *Bildung* as with Christianity: he voices fierce criticisms of both while suggesting that a true and authentic version of what he criticizes may still be found. ‘Commonly shared *Bildung*’ (*die gemein gewordene Bildung*) represents for Nietzsche ‘prelude to barbarism’ (*Vorstadium der Barbarei*). He voices charges of “Halb-Bildung”, “Bildung-Philistertum”, and false “Gebildetheit” as “the enemy of ‘true Bildung’” (*als Feind der “wahren Bildung”*) (Ritter 1971, p. 927.).

Finally, we should mention Theodor W. Adorno (1903–1969), who inherits Nietzsche’s concepts of *Halbbildung*. Adorno, indeed, is one of the authors who poses the question as to whether *Bildung* is possible in the (post)modern world. *Halbbildung*, for Adorno, means that people shy away from ‘truly cultural’ objects. Why is this? According to Adorno’s diagnosis, people are unwilling to be engaged with real experiences, which prevents them from encounters with authentic culture. Real experience, to the contrary—and borrowing a phrase from Goethe and Hegel—involves *self-externalization* (*Entäußerung*), experiencing the ‘Non-I’ in the outer reality, and only this experience makes the development of individuality possible. However, amidst the mass culture dominated by the products of the cultural industry, people fail to reach out toward the outer reality of the “Non-I”, rather contenting themselves in the easy familiarity of stereotypes (Stojanov 2012, p. 130).

## ***Bildung* in Contemporary Philosophy of Education**

The fourth phase of the *Bildung* traditions has its roots in the latter half of the nineteenth century while coming to full fruition in the twentieth century.<sup>7</sup> In Germany, this phase involves the systematic establishment of didactics as “theory of *Bildung*” (*Didaktik als Bildung-Lehre*), brought about by authors such as Otto Willman, Wilhelm Dilthey, and Paul Natorp (Ritter 1971, p. 928). Against the historical background, an important paradigm shift takes now place, since *Bildung*—from now on—will be grounded not only in classical sources but also scientifically. To be sure,

---

<sup>7</sup>On my interpretation, all the historical senses of *Bildung* delineated in this chapter have some contemporary representatives as well, and it would be an oversimplification to claim that the traditions are by now dead. The appearance of new paradigms of *Bildung*, then, does not presuppose disappearance of the old.

*Bildung* still connotes the philosophical crux underlying the problem of culture. But alongside this meaning, the term now comes to epitomize the scientific grounding of what the German-speaking world of education terms *Pedagogik*. In this setting, *Bildung* names the systematic study of the laws of human development, and this discipline lays the groundwork for practical didactics in different subjects. When philosophers of education, then, seek to compile *Allgemeine Pedagogik* in the second half of the twentieth century, they turn to *Bildung*.

In this context, however, a terminological caveat must be presented. German educational discourse often adopts the word *Bildung* as a synonym for *education*. This choice is made perhaps because educators want to preserve a link to the historical *Bildung* tradition, yet it possibly clouds conceptual differences. Horlacher (2012, p. 145) notes that the debates of the OECD and the World Bank on *education* are translated into German as “*Bildung*”. The former documents, however, are much concerned with the efficiency and measurability of education, while the latter tradition stresses different things. Thus, Horlacher (2012, p. 145) suggests that it would be worth examining “whether these are two contrary models that can hardly be brought into agreement or whether this is merely a case of education policy rhetoric aiming to make standardized empirical research issues palatable to the German public”.

In order to understand something of the tension between *Bildung* and assessment in Germany, we must here briefly review the country’s stand against standardized testing and how this has changed in response to the mediocre test results by the German students. As Neumann et al. (2010, p. 545) explain, the emphasis on *Humanistische Bildung* had been so strong in Germany that it was believed that individuals carry the desire to develop within themselves—with no need for standardized testing. Given the alarming test results in the 1990s, however, a reform of science education was initiated, whereby the traditional German notion of education would be replaced by the notion of *scientific literacy* (Neumann et al. 2010). This term denotes, according to the PISA study, “the capacity of the students to apply knowledge and skills in key subject areas and to analyze, reason and communicate effectively as they pose, solve and interpret problems in a variety of situations” (OECD 2001, p. 20). While the notion of scientific literacy does not consider the social or ethical aspects of *Bildung*, it may still be seen as an attempt to broaden the horizons of *Bildung* from the humanities to the natural sciences, so as to succeed better when the learning results are assessed.

Can we find *Bildung* on the shores of contemporary Anglo-American educational philosophy? Here the rise of liberal education must first be addressed. Paul Standish (2007) documents the challenges brought against progressivism by the advocates of liberal education in the second half of the twentieth century. In particular, R. S. Peters (the UK) and Israel Scheffler (in the USA) criticize progressivism for its inherent child-centeredness. For Peters, child-centered education concerns itself too much with the *manner* and too little with the *matter* of education (Standish 2007). His idea, in a nutshell, is that placing too much emphasis on the interests of the children—and how they can best learn at schools—undermines the importance of *what* is to be learned. In lieu of this, Peters offers his stripe of liberal education,

with freedom reinterpreted so as to give real content to the students' well-being and experiences of happiness (cf. Degenhardt 2010). Here we have a vision of education placing emphasis on the students' personal experiences of well-being, which suggests a similarity to certain aspects of the *Bildung* tradition.

How does the *Bildung* tradition relate, more precisely, to this history of liberal education? Certainly, there are important similarities, and among them, we may count at least the *prima facie* fact that one meaning of *Bildung* is education in the liberal arts. As far as content of education is concerned, both traditions (with Peters's liberalism as my example) underscore cultural initiation and development of mind; in a word, education or *Bildung* understood as partaking in the conversation of mankind, viz. culture (see Standish 2007). Liberal education, like the *Bildung* tradition, takes freedom to mean that the mind should function in *as rich a way as is possible*—and this is the way to avoid lapsing into conservatism, a passive reception of what has been previously said.

Finally, a word on the differences between *Bildung* and liberal education. A critic of liberal education might note, first, that stressing the students' personal happiness or well-being are admirable aims in education, but they are different from the holistic development of one's humanity underscored in the *Bildung* tradition. Another key difference between *Bildung* and liberal education emerges from the ways in which these respective traditions relate to the objective world around us. The characterizations we have given of liberal education lack the insistence on generality and universality—let alone familiarity with the objective world—that one finds in the *Bildung* tradition. In my view, this is the most important difference between the two traditions that should restrain us from a simple synthesis between them. Finally, there is a minor point of disagreement in the timing of the respective origins of the two traditions: liberal education, somewhat surprisingly, is often timed to begin with Isocrates, a Greek thinker of the fourth century BCE (Degenhardt 2010, p. 125), while the history of *Bildung* usually begins with the first medieval appearances of the term.<sup>8</sup>

## ***Bildung* and Assessment: Tension or Harmony?**

How does *Bildung* relate to assessment, if we probe the question vis-à-vis contemporary educational practices? Let us begin by clarifying the basic terminology and state-of-the-art concerning educational assessment. Following Halliday (2010, p. 370), in 10 years one may find more than 25,000 publications on assessment, with more than 10,000 articles in refereed journals and over 3000 books, and 5 English language journals are devoted to the theme. In these texts, distinctions are made between *informal* and *formal*, *formative* and *summative*, as well as *internal*

---

<sup>8</sup>This is surprising inasmuch as the phrase 'liberal education' inevitably carries not only the classical idea of freedom but also the newer idea of political liberalism. It goes without saying that this complicates further the relationship between *Bildung* and liberal education.

(sometimes termed relative) and *external* (sometimes termed absolute) assessment. One gains a different picture concerning the relationship between assessment and *Bildung* depending on the type of assessment one has in mind.

The title of the present chapter suggests a certain antithesis between *Bildung* and assessment, so allow me first to explain what is at stake in this. If we understand assessment as an objective and formal procedure carried out at the end of a course, through a final test with clear correct answers for example, this seems antithetical to the aim of personal character development inherent in the idea of *Bildung*. Similarly, if assessment is done externally, following, for instance, national standards, this procedure is ill-suited to assessing the individual, cognitive, and affective development of the students. How about if broach the relationship between assessment and *Bildung* vis-à-vis contemporary challenges faced by the latter? Pressed by the increasing demands of accountability and efficiency in today's education, educators and educational institutions sometimes adopt a narrow definition of *Bildung*, whereby the term is reduced to mastering certain contents of knowledge, rather than presenting *Bildung* as a free choice (cf. Horlacher 2012). This danger is manifest, as Horlacher (2012) notes, in recent books such as *Bildung: Alles was man wissen muss* (Schwanitz 2009) or *Die andere Bildung: Was man von den Naturwissenschaften wissen sollte* (Fischer 2011).

*Bildung* and assessment, however, may also be harmonized through a more flexible interpretation of assessment. If instead of formal and summative assessment, we turn our attention to informal and formative assessment, it becomes easier to see how the aims of *Bildung* and assessment can be synthesized. If a high school teacher, for example, requires from her students a learning diary written during their attendance on a given course, the teacher will be able to respond not only to objective learning standards but also to individual aims—and original ways of completing the diary—in her course-work assignment. The same goes for offering spontaneous feedback to the students in day-to-day teaching environments; assessment *qua* responsive attention to the students is something a good teacher engages with in any event, so in this sense there need not be a fundamental tension between *Bildung* and assessment either.

What are the standards of learning to be used in educational assessment, then, if we reinterpret the term as compatible with *Bildung*? Instead of 'knowledge', we may turn to 'competency' or 'skills', which have been recently suggested, indeed, as alternatives to the very idea of *Bildung*. Stafford A. Griffith (2008) adds the important remark that the standards may also include *values and attitudes* that are of increasing importance in today's world. As examples, he mentions "character building, patriotism, a service perspective, tolerance, non-violence and respect for human rights and human life" (Griffith 2008, p. 101). These values involve such a broad scale of different attitudes that they may be seen to approach the ideals of *Bildung*.

To conclude this section, if we understand standards of learning involving not only knowledge but also attitudes and values—and assessment, in turn, as the evaluation of whether these standards have been met—we may synthesize *Bildung* with contemporary practices of educational assessment. Taken in this sense, educational

assessment may involve subjective (and intersubjective) elements; it is part of *Bildung*, for instance, understood as individual development of character, that one does not know in advance how *Bildung* will play out. Evaluating such phenomena involves not only objective but also subjective criteria, and self-evaluation may play a role in the process.

## Assessment with *Bildung*: Test Case from Finland

How about a concrete example of the synthesis between *Bildung* ideals and assessment practices? We will now turn to a test case from the educational system of Finland—having gained remarkable international attention during the last few decades and the new school curricula having been adopted in August 2016. Let us examine two documents, *The Fundamentals of the Finnish High School Curriculum for 2016* and *The Fundamentals of the Finnish Primary School Curriculum for 2015* (both published by *Opetushallitus*, the National Board of Education). These documents contain elaboration on the subject-specific learning standards, in particular, objectives of what is to be learned. The high school documents are followed by all the schools nationwide, while the primary schools will have the possibility of creating their local curricula alongside the national curriculum. These documents serve as an example of how the Finnish *Bildung* system meets the demands of educational assessment today—although their newness as such does not suffice to explain the international attractions of the Finnish educational system.

Before we look at the documents, they should be set in a historical context. Since we are dealing with *Bildung*, we must first make recourse to the father figure of the Finnish school system: the philosopher and statesman J. V. Snellman (1806–1881) who played a crucial role in laying the groundwork of Finnish culture. Swedish by birth, Snellman wrote his works in Swedish, but he made his name in Finland and contributed decisively to the birth of the Finnish nation-state. In the present context, Snellman is indeed a fitting figure since one of his masterterms is *bildning* (in Finnish, *sivistys*)—which would translate as *Bildung*—and which Snellman interprets, in a Hegelian vein, as historically evolving engagement with truth. Snellman reads *bildning* (again following Hegel), as the constant struggle between different views, and he considers both the study of philosophy and natural science crucial for *bildning*. He also stresses that the fruits of *Bildung* must be borne in the world outside rather than in one's solitary thoughts.<sup>9</sup>

In Snellman's lifetime, the initiative was made in Finland by Uno Cygnaeus, in 1861, of a grammar school system accessible to all Finns, regardless of their social class or gender. Today, Finland counts itself among the rare countries where all teachers, including primary school teachers, must complete a master's degree,

---

<sup>9</sup>J. V. Snellman has been abundantly studied in Finland but not so much in international settings (or even in the English language). For one English work on Snellman, however, see Snellman-Institute 2006.

which means that the country makes remarkable investments in the education of not only students but also teachers. When teacher education was established (first in the University of Helsinki in 1947 and then in the Universities of Turku and Oulu), philosophy of education was dominated by empirical-experimental educational research. This was a period of behaviorism and outcomes-based learning, and these schools of thought influenced Finnish teacher education in its early days. From now on, teacher education—and analogously, work at schools—was to be based on top-notch scientific research. At present, the days of behaviorism are over, yet the trend of fusing research with teacher education still persists, with contemporary teacher education in Finland drawing, among other things, from neuroscience, and social and cognitive psychology.<sup>10</sup>

How do the national curriculum documents read, then, in the light of the remarks on Finnish educational philosophy just presented? Let us first take a look at what the curriculum documents term their ‘value basis’. I will maintain the Finnish word *sivistys* in the text; as we have noted, the term translates as *Bildung*:

The value basis of the Fundamentals of the High School Curriculum is provided by the Finnish *sivistys*-tradition, according to which studying and learning are ways of renewing society and culture. *Sivistys* consists of skills of problem-solving, both by individuals and communities, using ethical reflection, setting oneself in another’s position and using deliberation based on knowledge. Part of *sivistys*, moreover, lies in the skill and will to deal with conflicts between human aspirations and the prevailing reality, searching for solutions in an ethical and compassionate way. *Sivistys* manifests itself as care-taking, open-mindedness, versatile grasp of reality and in the commitment to act for positive change. The *sivistys*-ideal of the Finnish high school means striving for truth, humanity and justice. High school teaching develops value-based skills by dealing with the tensions between explicitly stated values and reality. (Opetushallitus 2015, p. 12)<sup>11</sup>

Reading through the quotation, one is struck by the fact that they maintain at least as much of Snellman as of contemporary educational research. *The Fundamentals of the Primary School Curriculum* contains almost the same wording, but it also includes some additional phrases forging further links to *Bildung*. “Primary teaching supports the student’s growth toward full humanity, which is described by search for truth, goodness and beauty—as well as justice and peace” (Opetushallitus 2014, p. 15); note how this text contains not only the *Bildung*-ideal of attaining to full humanity but also the Platonic trinity of truth, goodness, and beauty as well as the more modern emphasis on justice and peace. Secondly, “The perspectives offered by ethics and aesthetics guide in the meditation of what is valuable in life... Part of *sivistys* is the attempt at self-regulation and taking responsibility for one’s own development and well-being” (Opetushallitus 2014, p. 16).

---

<sup>10</sup> It must be noted, however, that the last decades in Finnish education have witnessed increasing emphasis on policy-making, assessment, and accountability. In a sense, there is some distortion of perspective if we study national curriculum documents, since those documents are commissioned by the National Board of Education—which is also a political actor in the field (with close ties to the Finnish government).

<sup>11</sup> All the translations of the Finnish documents are mine.

If the value bases are thus lofty, how about the sections on assessment? *The Fundamentals of the Finnish High School Curriculum* begins the section on assessment by stating: “Evaluation of students’ learning aims at furthering their learning” (Opetushallitus 2015, p. 228). The high school document highlights how “the students should understand what they are supposed to learn and how they are being evaluated. Through assessment, the students are encouraged to set their own goals and choose appropriate working methods. Providing feedback and carrying out evaluation during the studies are part of the student-teacher interaction” (Opetushallitus 2015, p. 228). In comparison, *The Fundamentals of the Primary School Curriculum* reads: “According to the law concerning primary schooling, the aim of student evaluation is to guide and encourage learning and to create better preconditions for self-evaluation. The students’ learning, working methods and their behavior are to be evaluated in versatile ways” (Opetushallitus 2014, p. 47).

Admittedly, these texts are removed from the lofty value bases quoted above, but they are not entirely distinct from *Bildung* ideals. Both documents underscore self-understanding, active initiative, setting one’s own goals, self-evaluation, and versatile assessment—all of which may be seen to figure, amidst the varieties of *Bildung* discussed above. Certain texts under assessment are even more in line with *Bildung* ideals: “The school plays an important role in determining what kind of conception of themselves the students will form as learners and as human beings” (Opetushallitus 2014, p. 47). Here, the discourse on one’s conception of humanity contains echoes of *Bildung*. Finally, the documents stress how assessment is a tool not only for the students but also for the teacher to “carry out self-evaluation and reflect on their own work” (Opetushallitus 2014, p. 47).

## Concluding Remarks

In contemporary discussions on philosophy of education, assessment and *Bildung* are often seen as antithetical, but we have looked at some ways in which they might be harmonized. While we have thus offered a synthetic approach to the relationship between *Bildung* and assessment, the case is not thereby closed. The practices of educational assessment are under constant evaluation in contemporary societies, and while the fact *that* assessment of educational process is needed will probably not change, the *what* and *how* of assessment will continue changing. This means that the interrelationship between assessment and *Bildung* will also undergo changes depending on how assessment practices are reconciled with society’s demands.

Secondly—and in spite of any synthetic interpretations—*Bildung* remains a complex concept that cannot be applied to contemporary settings without leaving some questions open. With the hope of doing justice to the polyphonic voices within what has been written and still is written on *Bildung*, I will end with three points of disagreement in the contemporary literature on the topic:

1. What role, if any, does the world—or the objective world—play in the project of *Bildung*? Is *Bildung* ultimately about bringing us in touch with the world or ourselves—or both?
2. Is *Bildung* possible in the postmodern world? And if it is, will it have to be a-teleological, or are there some ways in which a teleological vision of *Bildung* can be kept alive?
3. Can *Bildung* play a role in a world dominated by the demands of efficiency, accountability, and measurability?

With regard to the first question, a student of *Bildung* will find authors, on the one hand, understanding the term primarily as having to do with character development (e.g., Løvlie 2002; Lysaker 2008), while on the other hand, there are authors stressing *Bildung*'s engagement with the objective world (e.g., Nordenbo 2002; Kovalainen 2010). Respecting the latter point, it should be noted that classical authors as diverse as Humboldt, Emerson, and Adorno underscore the importance of world-acquaintance in the process of *Bildung*. For Adorno, contact with the world means, among other things, contact with real cultural works—which sounds like an idea concrete enough to provide tools for evaluating *Bildung*'s success. In general, if contemporary *Bildung* theorists manage to give concrete content to the ways in which the process of education should be in touch with objectivity, that content should also help in setting standards for educational assessment.

The second question, in turn, makes us ask questions about the worldviews of contemporary societies. Various authors there are, for instance, Reichenbach (2002) and Gur-Ze'ev (2002) who seem to think that teleological *Bildung* is an ideal of the past. On Gur-Ze'ev's view, *Bildung* presupposes transcendence and religiousness, which is no longer possible in a disenchanted world (Gur-Ze'ev 2002). Following the same author, however, *Bildung* may yet be possible if it is to be understood as a *negative utopia*, educating individuals, "in the face of a spiritless world, to revolt, to become [quoting Horkheimer] 'people who will be able to revolt even against their own group in which they were raised'" (Gur-Ze'ev 2002, p. 403). Thus a rearticulated critical theory can become today's *Bildung*, challenging any educational alternatives whose overt or covert aim is to buttress the present societal order.

Finally, we will end with a few remarks concerning the third question. In the remarks aimed at formulating a synthesis between *Bildung* and assessment above, we have leaned on the example of the Finnish educational system. The picture presented is perhaps too clean, and we have had no space for addressing the increasing demand for assessment and accountability in education in today's Finland. To respond to this deficiency, we might turn to Pasi Sahlberg, an influential educator and policy-maker in Finnish education, who has sought to explain Finland's success in the PISA studies. One of his observations is that Finland has, from early on, replaced *test-based accountability* at schools with *trust-based accountability* (Sahlberg 2011). Sahlberg's idea is that standardized testing will not generate trust between teachers and students (or within either group), while creating an atmosphere of mutual trust will contribute to better learning results. Moreover, national standards *combined with* local freedom of teachers to choose their working methods

has produced good results in Finland. The example shows that investing in humanist ideals can also improve learning results. Whether such practices will apply to countries other than Finland remains a question for present educators and researchers of education to solve.<sup>12</sup>

# Nature and Nurture

Koichiro Misawa

## Introduction

It is tempting to ask questions such as ‘Do genetic factors outweigh environmental factors or vice versa?’ and ‘To what extent are the features of human life and differences between individuals attributable to our genes or to the circumstances in which we grew up and live?’ The debate over the relative importance of nature and nurture in our lives, especially during our development, dates back at least to antiquity in some sense; currently, however, the debate is increasingly rendered obsolete. Although the question of how much weight ‘nature’ or ‘nurture’ carry with regard to certain human behaviour and characteristics continues to receive scientific and public attention, few people within and outside of academia would deny the mutual dependence of the two. One might say, therefore, that there no longer exists such thing as a nature-nurture controversy: the so-called nature-nurture debate is a pseudo problem. Does it follow that the age-old issue has been resolved leaving only further detailed scientific (e.g. genetic) studies on specific human traits and features, and that no further questions remain for philosophers to address?

It is unsatisfying to conclude that the case is already, or can shortly be, closed by the continuing advancement of natural-scientific investigations; moreover, the advances made do not ensure that philosophical enquiry can only give way to such empirical approaches of the natural sciences. Unless what is most at issue in that long-running debate is fully appreciated, the near-consensus view—that nature and nurture interact—does not even make clear sense. This chapter thus aims to show that what is really at stake in the nature-nurture debate is *human nature* and that the question of whether human nature is nearer to nature or nurture is fundamentally misplaced. The real difficulty of this perennial issue lies in appreciating the sense in

which human beings are *natural animals* in a *normative environment*, a viable understanding of which necessitates thinking of a *philosophical* kind.

This chapter first sketches out the current framework of the nature-nurture debate that is dominated by natural-scientific investigations (section “[The natural-scientifically inspired nature-nurture debate today](#)”) and then maps in a very broad outline the shifting conception of nature in Western thought, from which the modern sense of nature and accordingly what we call the natural sciences sprang (section “[A brief history of the nature-nurture issue as an educational concern](#)”). After providing a brief overview of attempts in philosophy of education to resist such a natural-scientific domination (section “[Approaches to the nature-nurture issue within the philosophy of education](#)”), the chapter attends to the Aristotelian conception of ‘second nature’, which has become widely known mainly through the work of the contemporary philosopher John McDowell, in order to recast the nature-nurture controversy from the perspective of what does or does not make us the beings that we are, in and in relation to the realm of the natural and the realm of the normative (section “[Nature, nurture and second nature](#)”). Spelling out some tenable and untenable ‘educational implications’ of the notion of second nature (section “[Lessons from second nature for philosophers of education](#)”), this chapter concludes with some thoughts on the justification and future development of the detailed analysis of the idea of second nature, which illuminates a linkage between nature, education and the human condition (section “[The future of the philosophical study of nature and nurture](#)”).

## **The Natural-Scientifically Inspired Nature-Nurture Debate Today**

Evelyn Fox Keller (2010) claims that “the particular form in which we (at least in the English-speaking world) today tend to frame discussions of the roles that nature and nurture play in development” is “specific to a time and a culture” (pp. 15–16). The time is the late nineteenth century; the culture is Anglo-American.

According to the standard view, this particular historical moment was marked by Francis Galton’s *English Men of Science: Their Nature and Nurture* (1874). In that book, Galton *disjoined* nature from nurture and declared: “how small has been the influence of nurture; the child had developed into manhood, along a predestined course laid out in his nature” (p. 15). The influence of his cousin, Charles Darwin, is plain to see. Although Darwin was much more careful and perceptive than his supposed followers (e.g. Midgley 2011), it seems hard to deny that since the appearance of Darwin’s theory of evolution through *natural* selection and random genetic variation, the pendulum between the separate domains of nature (considered innate or, more recently, genetic in origin) and nurture (considered acquired or, rather ambiguously, environmental) has swung to the ‘nature’ side.

This does not necessarily indicate that the nativist idea that nurture acts on nature has defeated all attempts to proclaim the independent influences of nurture in terms

of the importance of (say) social, cultural and educational elements, but that the nature-nurture debate is now commonly considered the exclusive subject of natural-scientific investigations. So much so that the nurturist view that nature turns on nurture to be actualised is also often offered against that background. The remark of the influential science writer Matt Ridley (2004) typically represents the nature-nurture issue so framed:

Somehow the adherents of the ‘nurture’ side of the argument have scared themselves silly at the power and inevitability of genes and missed the greatest lesson of all: the genes are on their side. (p. 6)

This chapter is not intended to diminish what the experimental psychologist Steven Pinker (2002) calls “[n]ew ideas from four frontiers of knowledge—the sciences of mind, brain, genes, and evolution” (p. 31); yet it aims to suggest that room remains for a lively alternative to the natural-scientific ways of shaping the nature-nurture issue. Pinker (2002), who vigorously condemns the analogy of the mind as a blank slate, further argues that those sciences of our time “are breaching the wall [between biological nature and cultural nurture] with a new understanding of human nature” (p. 31).

To shed light on how human nature fits in nature and/or nurture, however, would require a historical study of the very notion of nature, which is itself one of the most challenging concepts in philosophy. A cursory sketch suffices to reveal that the conception of nature that makes the above dispute between the nativist and the nurturist an ‘in-house’ dispute is also specific to a particular time and culture, thereby enabling us to reconsider what it means to be and to become a human being and how (best) to educate our children.

## A Brief History of the Nature-Nurture Issue as an Educational Concern

Long before the rise of the ‘natural’ sciences in the modern sense, nature had been a fundamental topic of philosophical enquiry, and reflection on the concept of nature at times involved deliberating about its associated concept, nurture. Keller (2010), albeit with reservations, writes:

Indeed, we often see the nature-nurture debate traced back to ancient Greek discussions about *physis* (timeless nature, what *is*) and *nomos* (law, custom, culture); about *sumphuton* (innate, internal, or native) and *epikteton* (adventitious, artificial, or acquired); sometimes the debate is even linked to Confucian and neo-Confucian discussions about *hsing* (often translated as nature or innate) and *hsui, yang, or chih* (various expressions for nurture, cultivation, or culture)... (p. 15)

In the course of Western thought, the complementary usage of the two concepts, nature and nurture, can be found in Plato’s dialogues—for example, in the words of Protagoras (*Protagoras*, 351A). In the *Meno*, Plato put forward a somewhat polarised usage of the two concepts by opening the dialogue with Meno’s question, “Can you

tell me, Socrates, whether virtue is something teachable? Or is it not teachable, but something that comes from practice? Or is it something neither from practice nor from learning, but something that comes to human beings by nature, or some other way?" (*Meno*, 70A). Plato had Socrates, as usual, set aside the question of whether virtue can be taught in favour of centring on the question of what virtue is.

Aristotle took a different tack. At the opening of Book II of the *Nicomachean Ethics*, he claims that virtue is of two kinds: "that of the intellect and that of character" (*Nicomachean Ethics*, 1103a14). The former is closely tied up with 'teaching' and the latter with 'habituation':

Intellectual virtue owes its origin and development mainly to teaching, for which reason its attainment requires experience and time; virtue of character (*ēthos*) is a result of habituation (*ethos*), for which reason it has acquired its name through a small variation on '*ethos*'. From this it is clear that none of the virtues of character arises in us by nature. For nothing natural can be made to behave differently by habituation. ... So virtues [of character] arise in us *neither by nature nor contrary to nature*, but nature gives us the capacity to acquire them, and completion comes through habituation. (*Nicomachean Ethics*, 1103a15-25, emphasis added)

There is nothing occult or mysterious about the last sentence quoted here; it states that we are born, not with virtues of character, but with the faculty to gain them, implying that they are something *acquired*, and yet once acquired, they operate in our life as if they were something *natural*. As discussed further in "[Nature, Nurture and Second Nature](#)", John McDowell captures this "acquired-but-fixed" (Gaynesford 2004, p. 54) feature by invoking the concept of "second nature", which, according to McDowell (1998), "is all but explicit in Aristotle's account of the acquisition of virtue of character" (p. 184) and which, in his view, extends beyond the ethical character towards rational-conceptual capacities in general.<sup>1</sup> Nonetheless, as McDowell (2000) acknowledges, the concept of second nature is "only implicit in Aristotle's thinking" (p. 107); not because Aristotle missed the significance but rather because he had no need to care about it, as the significance arises only in the *modern* sense of nature. McDowell (2000) contends that "the concept of second nature acquires a philosophical significance in the context of a temptation to suppose that *whatever is natural is as such empty of meaning*" (p. 107, emphasis added).

No doubt the appearance of such a 'natural-scientific' conception of nature has brought a new dimension to the way we think about nature and nurture, and its influence has been pervasive and unparalleled from the age of the so-called Scientific Revolution onwards. Bruce Aune (1995) pithily summarises the emergence of such a new notion of nature: "The impact of empirical discoveries on the classification and identification of natural objects has resulted in a new view of nature that is profoundly different from those of the ancient Greeks, the medieval schoolmen, and the rationalist metaphysicians of the eighteenth century" (p. 350).

Alongside this gradually developing understanding of nature there arose, out of the context of the philosophical dispute between rationalism and empiricism, a

---

<sup>1</sup> McDowell (1996) argues: "Moulding ethical character, which includes imposing a specific shape on the practical intellect, is a particular case of a general phenomenon: initiation into conceptual capacities, which include responsiveness to other rational demands besides those of ethics" (p. 84).

famous metaphor that has repeatedly served the interests of many proponents of the ‘nurture’ argument. That metaphor is usually associated with the following passage in John Locke’s *An Essay Concerning Human Understanding* (1690):

Let us then suppose the mind to be, as we say, *white paper*; void of all characters, without any ideas: —How comes it to be furnished? Whence comes it by that vast store which the busy and boundless fancy of man has painted on it with an almost endless variety? Whence has it all the materials of reason and knowledge? To this I answer, in one word, from EXPERIENCE. In that all our knowledge is founded; and from that it ultimately derives itself. (Book II, chap. 1, emphasis added)

Often called the ‘blank slate’ view of the human mind, this has been taken as the doctrine that the mind is a *tabula rasa* or blank slate—that is, a blank sheet of paper waiting to be written on by experience. Locke used this metaphor, however, not in the context of the nature-nurture debate, but in the context of epistemology, as an empiricist counter to the rationalist view that our concepts and knowledge can be gained independently of sense experience. In this respect, the question of whether ‘innate ideas’ (like those of God and mathematical rules) are reachable a priori without the help of sense experience was actually outside the context of the nature-nurture issue.

It is worth noting, however, that the implications and overtones of the blank slate metaphor have extended far beyond the epistemological background and have pervaded a range of scholarly and practical discourses on, say, politics, ethics and education. For example, the notion of a blank slate can appear to lend credence to democratic ideals rather than hereditary privilege, to adaptive flexibility rather than innate tendencies. Important and influential to the subsequent discussions related to education was, among others, Jean-Jacques Rousseau’s view that “children are born as a moral blank slate” (Winch and Gingell 2008, p. 143). With his admiration for Nature “which never lies” in opposition to fellow men “who are liars” (Rousseau 1984, p. 79), the Rousseauian image of children as a moral blank slate laid the path for child-centred or progressive education, which has since exerted a lasting influence on educational thought and practice.

However, such a Rousseauian analogy between human moral development and the course of nature came under attack by more ‘scientifically minded’ intellectuals in later periods who were doubtful of the view that casts conforming to nature and being natural as right and good and who were doubtful of the view of nature as divine, which is often associated with deistical beliefs. In the nineteenth century, for instance, John Stuart Mill (1874) wrote an essay entitled ‘Nature’ and discredited in it the Rousseauian idea (e.g. p. 10, p. 51), considering it “silly” to “expect common human morality from nature” (p. 28). For Mill, unlike for Rousseau, nature “cannot be a proper model for us to imitate” (ibid.); therefore human nature is likewise to be regulated and ameliorated, “the duty of man is the same in respect to his own nature as in respect to the nature of all other things, namely not to follow but to amend it” (p. 54).

Mill’s observation that nature or conformity to nature has nothing whatever to do with right or wrong has a close affinity with the theory that Darwin developed in *On the Origin of Species* (1859). Darwinism, Ernst Mayr (1997) writes, “by supplying a mechanism for evolution while at the same time denying any finalistic or vitalistic

view of life [i.e. any cosmic teleology], became the foundation of a new paradigm to explain ‘life’” (p. 13), and the paradigm still dominates the intellectual scene as a prominent natural-scientific theory. From such a theory, however, Darwin’s supposed followers have generally drawn the conclusion in the opposite direction to that endorsed by Mill<sup>2</sup> with regard to the relative importance of nature and nurture in human life and development—that is, in the direction of the ‘nature’ side.

The most radical move in this direction was, as mentioned, made by Francis Galton, who popularised the alliterative expression ‘nature and nurture’ as a pair of exclusive alternatives. Galton (1874) was confident to afford decisive priority to nature over nurture: “In the competition between nature and nurture ... *nature certainly proves the stronger of the two*” (p. 16, emphasis added). Grounded in this conviction, Galton opened the way towards what he coined ‘eugenics’ (the literal meaning of which is ‘good birth’ and yet the connotation of which gave rise to the attempt to exterminate, based on distorted thinking, certain diseases, disabilities and ethnic groups). We should never forget the horrific history of the eugenics movement in the real world (e.g. the programme of Nazi Germany in the early half of the twentieth century), which has made us take a strongly negative attitude towards eugenics.

Of course, eugenics policies must be out of the question. But the ‘natural’ sciences, despite some ethical restrictions on their research subjects and practices, have continued making tremendous progress to a stage at which no one seriously involved in the issues regarding nature and nurture today can ignore such natural-scientific achievements, including those individuals that take sides on ‘nurture’. The continuing advancement and flourishing of such fields as evolutionary biology, genetics, behavioural genetics, cognitive psychology, neurosciences, genomics and epigenetics, all of which in some way or another tell us much about ‘human nature’ in terms of, for example, the formation of human traits and behaviour as well as of heredity, has forced those who are engaged in education to reconsider how (best) to educate our children and philosophers of education in particular to ponder again the human condition in ways that clarify how the subject matter of philosophical enquiry includes, or differs from, the achievements of those natural-scientific investigations.

## **Approaches to the Nature-Nurture Issue Within the Philosophy of Education**

Appeals to discoveries in the natural-scientific disciplines can easily be found in the field of education, both in practice and in research. Nowadays, as Volker Kraft (2012) describes, “concepts like neuropedagogy or neurodidactics raise no

---

<sup>2</sup>Mill (1874) prioritised ‘nurture’, maintaining: “It is only in a highly artificialized condition of human nature that the notion grew up, or, I believe, ever could have grown up, that goodness was natural: because only after a long course of artificial education did good sentiments become so habitual, and so predominant over bad, as to arise unprompted when occasion called for them” (p. 46).

eyebrows” (pp. 386–387); rather, for instance, the newly established journal *Mind, Brain, and Education* (launched in 2007 jointly by interested biologists, educational researchers, and cognitive and developmental scientists) has earned a high ‘impact factor’—higher than, say, *Journal of Philosophy of Education*.<sup>3</sup> Such a tendency has apparently come to entrench even the educational disciplines that are commonly seen as distant from the latest natural-scientific research. For example, the esteemed historian of education Richard Aldrich (2014) claims that “current developments in the neurosciences and in technology have rendered the traditional nature-nurture debate obsolete and that historians of education have a duty to engage in the shaping of possible, probable and preferable futures” (p. 852).

This current state does not indicate either that the nature-nurture debate is now over by celebrating new scientific findings as a panacea for education or that nothing remains for philosophical—i.e. non-empirical—enquiry to illuminate central educational issues. But what is it that philosophy can actually do?

Philosophy is a characteristically non-empirical intellectual enquiry, and education, however defined, is a characteristically normative enterprise. It should not be surprising, therefore, that philosophers of education have, by and large, resisted the idea of incorporating the nature-nurture issue completely into the topic of natural-scientific understanding, a resistance to the culture of what is often termed in philosophy ‘scientific naturalism’.

John White (1974), for example, argues: “The ‘nature-nurture’ issues cannot be settled by empirical research” (p. 50). How much sense does it make to say or even ‘prove’, for instance, that 70% of one’s intelligence is determined by nature (one’s genes) and 30% by nurture (the environment)? White questions the assumption that he takes to be built into the empirical research (such as in many twin-studies), the assumption that a high correlation between the IQs of monozygotic twins who were reared apart in different ways by different people demonstrates that their genetic make-up overrides their environments. White (1974) conceives this assumption as unjustified:

[S]uppose, to make the issue more clearcut, there is even a correlation of 1.0: each twin has exactly the same IQ as his [*sic*] co-twin. This in itself would not support the genetic case. For suppose one twin from each pair were given intensive coaching in answering intelligence tests and as a result, when both these twins and their co-twins were retested, the coached twins scored on average 20 IQ points above their co-twins. This would, of course, significantly reduce the correlation between IQs. (p. 49)

White is, of course, correct in that it makes no sense to quantify the relative contribution of nature and nurture to a particular individual’s intelligence. But, as Brian Yapp (1989) states: “the real issue is about quantifying the factors that lead to the *differences between people*” (p. 319, emphasis in original). That is, it does make (natural-scientific) sense to examine, for instance, what percentage of the *variations* existing among the population arises from genetic factors. A great deal of more

---

<sup>3</sup>As of 2018, the impact factor of the *Journal of Philosophy of Education* is 0.805 and that of *Mind, Brain, and Education* is 1.271.

recent natural-scientific work may further discourage this philosophical complaint. Drawing on the evidence available, Pinker (2002) asserts:

The effects of differences in genes on differences in mind can be measured... Identical twins are far more similar than fraternal twins, whether they are raised apart or together; identical twins raised apart are highly similar; biological siblings, whether raised together or apart, are far more similar than adoptive siblings. (p. 47)

Has the time long gone when philosophers could ‘intrude’ on the work of natural scientists, for instance, with respect to epistemological assumptions regarding particular methods and empirical evidence? Given the continuing development of methods, tools, techniques, processes, experiments, etc., in the ever-growing natural-scientific investigations (into nature and human nature), ‘scientific naturalism’ certainly seduces philosophers away from their purely armchair ‘methods’.

Although ‘naturalism’ has its variants and is used in a variety of senses, the scientific naturalism in question is that which is “the current orthodoxy, at least within Anglo-American philosophy” and which has the following two themes: “*An Ontological Theme*: a commitment to an exclusively scientific conception of nature” and “*A Methodological Theme*: a reconception of the traditional relation between philosophy and science according to which philosophical inquiry is conceived as continuous with science” (De Caro and Macarthur 2004, p. 1; p. 3, emphasis in original). It is plausible to see that such a naturalisation of central philosophical concepts and domains has put considerable distance between general philosophy and philosophy of education. For example, W. V. Quine’s ([1969] 1985) highly influential declaration of naturalised epistemology—that “[e]pistemology, or something like it, simply falls into place as a chapter of psychology and hence of natural science” (p. 24)—has never been the central object of attention and enquiry among philosophers of education, for this naturalistic picture leaves little room for normative deliberation (Misawa 2013, p. 41). Rather than being preoccupied with the human subject as a natural—i.e. physical and biological—phenomenon, philosophers of education have been gripped more by the lines of thought that attend to different social, historical and cultural contexts that surround us in our everyday life.

Along these lines, many philosophers of education have turned their backs on the natural-scientific understanding of nature and human nature, the understanding that no longer places human beings outside of *nature*’s order: the species *Homo sapiens* is part of nature through and through. In this way, philosophical approaches to questions about, specifically, human nature as favoured in philosophy of education have diverged from their natural-scientific counterparts, neither of which has mutually supportive commitments. Pinker (2002) makes the rather broad observation:

During [the 20th-century] the doctrine of the Blank Slate has set the agenda for much of the social sciences and humanities. ... The social sciences have sought to explain all customs and social arrangements as a product of the socialization of children by the surrounding culture... (p. 6).

Philosophers of education have rarely employed the naïve idea of a blank slate itself; nonetheless, a tendency has certainly existed in the discipline to suppose that

‘nature’ and ‘human nature’ are also social products. Michael Bonnett (2012) illustrates the discipline’s inclination: “In recent times under the influence of post-modernism, ideas of nature and a natural order ... have become regarded by some simply as social constructs...” (p. 287). More recently, Sune Frølund (2016) echoes the point: “A dominating trend today... is to see concepts like nature and naturalness as social constructions and even constructions serving ideological purposes” (p. 655).

Of course, it is of grave importance for philosophers of education, as Bonnett’s and Frølund’s treatments of nature and naturalness exemplify, to continue producing the work that does full justice to distinctively human phenomena, thus addressing the meaning of nature and our relationship to it in a way that natural scientists normally do not; furthermore, it is of immense help, as Bonnett and Frølund again demonstrate, to make philosophical points about the shifting conception of nature (and, connectedly, of human nature) with particular attention to philosophical traditions other than Anglo-American analytical one, such as continental philosophy and non-Western schools of thought that are far less ‘contaminated’ by scientific naturalism. Equally, to challenge and undermine the presuppositions on which natural-scientific investigations bloom is in effect what is and will be expected of the philosopher of education, as seen in the work of Andrew Davis (2004) and Paul Smeyers (2016).

The remainder of this chapter, however, attends to the Aristotelian conception of second nature that McDowell has re-invigorated to meet the challenge head on (from within contemporary analytical philosophy)—the challenge raised by the seeming separation between the two (i.e. natural-scientific and philosophical/normative) approaches to nature and human nature that stand in the way of a deeper understanding of the human being as a natural animal in a normative environment. The idea of second nature has begun to make its way into the field of philosophy of education and has been brought to wider attention most recently by the collected papers from the symposium entitled, ‘Second Nature, *Bildung*, and McDowell: David Bakhurst’s *The Formation of Reason*’, which appeared in an issue of the 50th anniversary volume of the *Journal of Philosophy of Education* (2016).

## Nature, Nurture and Second Nature

As we have seen, the nature-nurture issue makes little sense without due recognition of what nature means and of its relation to human nature. The development of modern science and its understanding of nature have given rise to a troubling dualism between the experiencing (*norm-laden*) subject and the disenchanted (*natural*) world, producing accordingly a number of misleading problems. The nature-nurture dichotomy can be cast as one of those problems, *disjoining* nature from nurture and thereby making the concept of *human nature* resemble an oxymoron. Thus, although McDowell hardly pursues matters of education, his proposed Aristotelian notion of

second nature,<sup>4</sup> which is invoked to exorcise the pseudo picture of empirical content—i.e. of the place of minds in the world— can not only serve to dispel the wrong dualism of nature and nurture but also give us a better clue as to how we understand nature, nurture and human nature more comprehensively.

The modern dualisms, the source of which is the conception of nature that surfaced only with the advent of modern science, have entailed and bifurcated the two kinds of intelligibility. In his ground-breaking book *Mind and World*, McDowell (1996) argues:

Modern science understands its subject matter in a way that threatens, at least, to leave it disenchanted, as [Max] Weber put the point in an image that has become a commonplace. The image marks a contrast between two kinds of intelligibility: the kind that is sought by (as we call it) natural science, and the kind we find in something when we place it in relation to other occupants of ‘the logical space of reasons’, to repeat a suggestive phrase from Wilfrid Sellars. (p. 70, note deleted)

These contrasting kinds of intelligibility have unavoidably introduced “the problem of ‘placing’ or ‘locating’ normative phenomena in the scientific image of the world” (De Caro and Macarthur 2010, p. 2), thus shaping the form of questions such as ‘What place can one find for the normative in the natural world?’ and ‘How can minds be in touch with the (natural/outside) world?’ McDowell aims to make these questions less appealing by rejecting the equation of the realm of natural-scientific intelligibility with the logical space of *nature*, thereby making it possible to combine *freedom*—capacities of ‘spontaneity’, to use Kant’s term, that are not bound by what is made intelligible by natural science—with *naturalness*. McDowell (2000) claims that “there is no tension between freedom and nature, even though we have to recognize a tension between freedom and conformity to law” (p. 100).

The tempting and virtually accepted equation that McDowell rejects can be lessened by the notion of second nature that nearly comes to the fore in Aristotle’s account of the formation of ethical character. McDowell (1996) expounds this:

We cannot credit appreciation of [the rational demands of ethics] to *human nature* as it figures in a naturalism of disenchanted nature, because disenchanted nature does not embrace the space of reasons. But human beings are intelligibly initiated into this stretch of the space of reasons by ethical *upbringing*, which instils the appropriate shape into their lives. The resulting habits of thought and action are *second nature*. (p. 84, emphasis added)

As noted, McDowell (1996) generalises this point to hold all rational-conceptual capacities, and, as an antidote to scientific naturalism or “a naturalism of disenchanted nature”, sometimes calls his own position “a naturalism of second nature” (p. 86). McDowell (2008) articulates the sense in which human beings live not merely as evolved, physical and biological organisms but also as minded, sentient and thinking beings, at one and the same time, without any threat of incoherence:

---

<sup>4</sup>It is to be noted that the notion is Aristotelian, not Aristotle’s: “No term corresponding to that of ‘second nature’ appears in Aristotle’s works” (Gubeljc et al. 2000, p. 41). In addition, from Augustine to Rousseau, the notion “had primarily a negative connotation”: “Until the end of the eighteenth century the term ‘second nature’ is predominantly used to signify the corruption of (first) nature” (ibid., p. 41).

Consistently with being *non-natural* in a sense that connects with their belonging to freedom, conceptual capacities can be seen to belong to *our second nature*. And though sensibility is natural in a sense that belongs with its being something we share with non-rational animals, the operations of our sensibility can be informed by capacities that are distinctive to our nature. (pp. 219–220, emphasis added)

In McDowell's view, conceptual capacities are actualised in perceptual experience as a (passive) receptivity,<sup>5</sup> which is made possible by the acquisition of our second nature mainly through initiation into our first language, which makes human beings inhabitants of the space of reasons composed of the *sui generis* character of responsiveness to reasons. The inhabitant of the space of reasons is a perfectly natural animal. There is nothing spooky about this and the 'What Place?' questions are to be dissolved.

It is tempting to read 'educational' dimensions into the conception of second nature by appeal to which McDowell accommodates 'the natural' and 'the normative'. The temptation may well be reinforced, for example, by McDowell's favoured use of the term *Bildung* and his account for the process of acquiring a second nature as a rather dramatic "transformation": "[Human beings] are born mere animals, and they are transformed into thinkers and intentional agents in the course of coming to maturity" (McDowell 1996, p. 125).

Yet, McDowell himself avoids—indeed, abhors—constructing any positive theory or doctrine from here. There seems a lot more going on, however, in McDowell's discussions of the notion of second nature (and its related ideas) than his own premise about the distinctive qualities of human beings such as mind, reason, personhood, normativity and our second nature, all of which cast philosophically thought-provoking light on the nature-nurture issue in question and the conception of education itself more generally. Indeed, as mentioned earlier, the idea of second nature has come to receive renewed attention from the philosophy of education community, even if that perspective is not McDowell's own focus.

## Lessons from Second Nature for Philosophers of Education

David Bakhurst's work (e.g. Bakhurst 2011, 2012) has stimulated reflection on McDowell's philosophy in ways that make connections with issues of education. While acknowledging McDowell's reluctance to develop a theory of second nature, Bakhurst (2011) seems to open such a door:

... I do not think [McDowell] believes that, having made room to acknowledge the importance of *Bildung*, the philosopher must simply step aside and leave it for the psychologist, linguist and cognitive scientist to make good on the notion. (p. 10, note deleted)

---

<sup>5</sup>This thesis is not without controversy. Whether perceptual experience has conceptual content is one of the major topics of interest across the contemporary philosophical world.

Lifting the notion of *Bildung* and its kindred notions like second nature out of the context from which McDowell never departs is a task that needs to be done (by philosophers of education) if we want to reformulate the nature-nurture issue in the light of human second nature.

In order not to rest satisfied with some superficial or superfluous ‘educational implications’ of the idea of second nature, however, we must mark off right from wrong lessons to be drawn.

First, to cut first nature off from second nature is a wrong lesson to take from the idea of second nature. That is, it is not correct to see first nature as belonging in the realm of natural-scientific intelligibility and second nature as belonging in the space of reasons. Refusing to offer a unified conception of ‘nature at large’, McDowell (2000) claims:

[T]he idea of second nature belongs on both sides of the distinction I am chiefly concerned with, between what can be made intelligible by placement in the space of reasons and everything else. The distinction cannot be equated with a division between first and second nature. (p. 99)

McDowell (2008) actually “regrets” the labels he used for what he wants to say with the idea of second nature—the labels such as “naturalism of second nature” and “Aristotelian naturalism” (p. 216). McDowell (2000) emphasises that: “The only use to which I put the idea of second nature in *Mind and World* is to affirm that responsiveness to reasons as such is natural too” (p. 98). The real lesson is that the concept of ‘first nature’ has only a restricted sense of nature and much of first nature is given some meaning in the logical space of reasons wherein second nature to our human species abounds. This is not to deny, of course, that a particular individual’s genetically heritable ‘first nature’ which is inborn causes, independently of her second nature acquired after birth, some physical and biological symptoms, as in the case of Huntington’s disease and cleft lip. But much of what is considered as ‘first nature’ actually figures as a projection from an aspect of the space of reasons (as in the case of many psychological traits like intelligence, personality and resilience); second nature tacitly informs first nature as it figures in the space of reasons. That is, the nurturist idea of ‘nature via nurture’ is correct not only in the natural-scientific context of how genes are expressed in a changing environment, but also in the deeper context of how the second-natural light draws over the first-natural propensities.

Second, to appreciate educational possibilities of the transformative process is a right lesson to take, the process through which we acquire rational-conceptual capacities that enable us to live in the space of reasons whose structure is *sui generis*. Many reject this as incoherent, however. For example, Alasdair MacIntyre (1999) is highly sceptical of this process and tries:

to undermine the cultural influence of a picture of human nature according to which we are animals and *in addition* something else. We have, on this view, a first animal nature and in addition a second distinctively human nature. The force of the ‘and’ is to suggest that this second nature can, at least in the most important respects, only be accounted for in its own terms. (pp. 49–50, emphasis in original)

In the similar vein, Sebastian Rödl (2016), against Bakhurst's McDowellian thinking, objects that "the idea of a change from animal to person is incoherent" (p. 84). Yet, as seen, our second nature never disfavours our first nature; human beings living in the *sui generis* character of the space of reasons are *natural animals*.<sup>6</sup> Remember that first nature (awaiting actualisation) is never cut off from second nature, at least for the most part.

## The Future of the Philosophical Study of Nature and Nurture

This chapter has focused on the Aristotelian concept of second nature as a key that can stop us from adhering to a particular (natural-scientific) way of understanding nature and nurture, thereby challenging us to reconsider the linkage between nature, education and the human condition. Much more remains to be said on this point, and further enquiry should be encouraged on (at least) the following three grounds.

First, the idea of second nature enables and requires us to address the scope of the natural-scientific understanding of nature, which is an urgent but neglected matter.

Second, the idea can be approached from a variety of intellectual traditions, including non-Western cultures, some of which may reveal second nature to be rather thin. For example, the East Asian tradition of Confucianism, in which the author of this chapter is embedded,<sup>7</sup> has potential sources that can engage with Western debates about second nature, which, much to my regret, this chapter could not explore in detail.

Finally, examining how and how far the notion of second nature does or does not extend beyond McDowell's sense is a necessary task for philosophers of education.

---

<sup>6</sup>For more on this, see Misawa (2014a, b).

<sup>7</sup>This is not a correct description, however. For, the Japanese context in which the author grew up and lives is a complex mixture of the views of Confucianism, Buddhism, Shinto, Christianity and many others through historical and current borrowings and interchanges with 'other' traditions. We thus need to avoid drawing a grossly oversimplified picture of 'Confucian thought' or 'Japanese thought'. It is worth noting as an example, however, that 'Japanese thought' could offer a sharp challenge to the widespread assumption of the traditional 'Western' view of nature (and accordingly nurture) delineated in this chapter. Akira Yanabu focuses directly on the issue of the sameness and difference between 'nature' and '*shizen*' (自然), the former of which is generally taken to be the source of meaning and contemporary usage of the latter. Based upon a detailed analysis of their relations, he draws the conclusion that 'nature' and '*shizen*' are *not* equivalent in meaning, arguing that the meaning of the latter ultimately and unconsciously relies on the implicit association of the traditional use of the term with the translation of 'nature' in the nineteenth century. Among the differences between them, for example, while "nature" is taken to be an object of knowledge, "*shizen*" is not, for the latter implies that there is no clean break between the Self and the Other (Yanabu, 1977/1995, p. 58). For more recent and educationally relevant philosophical discussions about the East Asian traditions of learning, development and education, see the special issue of *Educational Philosophy and Theory* 48, no. 1 (2016) on 'the Confucian Concept of Learning'. The 'Introduction' by Duck-Joo Kwak, Morimichi Kato and Ruyun Hung is a useful guide to grasp a broad picture of non-Western thoughts.

McDowell (2008) resists the idea that “second nature includes an evaluative and normative level in the reality that human beings confront” (p. 223), conceiving nature as ‘partially enchanted’ (rather than ‘fully enchanted’). Such an analysis will not only help us extricate ourselves from the simplistic—and indeed outdated—binary opposition between nature and nurture but also better understand the *social* and *natural* beings that we are.

# Becoming Virtuous: Character Education and the Problem of Free Will

Johan Dahlbeck

## Aims of Character Education: The Cultivation of Virtue

In recent years, character education and virtue ethics have undergone a form of renaissance in the philosophy of education (Sanderse 2015). Virtue and character are Aristotelian notions that amount to key components of an ethical life according to Aristotle. The Aristotelian conception of the highest good to strive toward (in life as well as in education) is expressed through the notion of *eudaimonia*. *Eudaimonia* is commonly taken to denote a form of happiness in the sense of a life well lived or a flourishing life. The path leading up to *eudaimonia* is a path laid out along the virtues. In this sense “it is impossible to achieve *eudaimonia* without being morally good – without actualizing the moral virtues” (Kristjánsson 2007, p. 15). If we can become virtuous – that is, if we manage to live according to the virtues – we will become happy in the *eudaimonistic* sense. Accordingly, the premier aim of Aristotelian character education may be taken to be the cultivation of ethical virtues in children and students. What, then, is it to be virtuous more specifically?

Aristotle construes ethical virtues as intermediary states balancing between deficiency and excess. The art of living a well-balanced life is kept in check by the desire to strive for acting on virtues placed between two extreme poles, both of which are equally undesirable. For instance, the virtuous person will strive to always act generously, avoiding both the deficiency of greed (personified by the miser) and the excess of wastefulness (personified by the wasteful and careless person). To live guided by ethical virtues such as generosity is to live a flourishing life. To achieve this kind of life is an end in itself, which is why *eudaimonia* is conceived as the highest good to strive for. This means that *eudaimonia* is desirable for itself and not for the purpose of attaining some other good and, correspondingly, that all other

---

e-mail: [johan.dahlbeck@mah.se](mailto:johan.dahlbeck@mah.se)

goods are desirable for the sake of *eudaimonia* (Kraut 2014). This makes *eudaimonia* the ultimate end (*telos*) of human life, and to be able to strive for this kind of perfection is what distinguishes the human being from other forms of life naturally incapable of this kind of intellectual happiness.

Traits such as generosity, honesty, and courage are instrumental for the realization of a flourishing life, but in and of themselves they are merely parts of a greater machinery geared at “the formation of somebody’s character, which accommodates a whole range of virtues and in which cognition and emotion ideally form a unity” (Sanderse 2015, p. 383). This implies that the virtues are simply expressions of a kind of wisdom of life and that they may be understood in terms of “particular rational responses to the various temptations, trials and tribulations characteristic of human life” (Carr 1991, p. 33).

David Carr suggests that “virtuous agents are those who respond at the right time, to the right objects, towards the right people, with the right motive and in the right way” (2003, p. 219). A person who does this has acquired a virtuous character. This, however, requires training, and so it would be fair to characterize Aristotelian character education as “a form of moral education focusing on the development of virtues” (Kristjánsson 2015, p. 2). The notion that a virtuous character hinges on the ability and determination to make sound moral choices (as is implicit in Carr’s claim above) is central for many contemporary accounts of character education. As such, to be moral is to be able to make moral choices (i.e., to have moral agency), even when the moral choice is the most difficult and least readily available option. To be able to make moral choices, in turn, seems to require a capacity to choose freely.<sup>1</sup> At least this is what most people assume is what makes us morally responsible for our actions. If we did not have the ability to choose freely between a moral and an immoral way of responding to any given situation, it is difficult to see how we could be held morally responsible for our choices.

This leads us up to one of the most acute challenges of contemporary character education. It can be formulated in the form of the following question: how can we reconcile the fact that in order to act virtuously we appear to need to refer to the concept of a free will, while, at the same time, there are convincing philosophical arguments (aligned with a contemporary scientific understanding of natural causation) discrediting any viable notion of an unconstrained or uncaused will?

---

<sup>1</sup>Correspondingly, to be able to make choices is generally taken to be what constitutes being free. For a choice to be genuinely autonomous, in turn, it is generally required that one is the cause of one’s choice. Accordingly, in the context of educational theory, Kenneth A. Strike offers the following three conditions of freedom:

1. “A person must be able to do what he chooses. This includes possessing relevant abilities and skills of execution as well as not being prohibited or physically prevented from taking a chosen course of action.
2. A person must possess those reasoning skills which enable him to evaluate various courses of action. This is a matter of having learned to apply those criteria relevant to making various sorts of judgments.
3. A person must be psychologically constituted such that it is possible for the exercise of such reasoning skills to become the actual determinates of choice and action” (1972, p. 274).

Taking its cue from this important question, this chapter will proceed along the following lines. First, I aim to substantiate the link between contemporary character education and the concept of the free will so as to illustrate the interdependency between the two. This assumed interdependency is informed by a broader overlap between the metaphysics of free will and central educational concerns.<sup>2</sup> Having done so I will scrutinize the concept of a free will, raising some philosophical concerns about its validity in a contemporary educational context. This involves looking at the philosophical stakes involved in proposing a unique capacity to intervene with the causal order of nature. At this point, I will suggest that there is a way out of this conundrum, and I will continue by proposing a radically different understanding of the will, offered by the seventeenth-century rationalist Spinoza. Spinoza's naturalistic notion of the will is not of an uncaused and unrestrained will, but of a form of understanding, acceptance, and affirmation of the causal order of nature. The chapter will close by looking at some of the practical consequences of grounding contemporary character education in a Spinozistic conception of the will.

As the chapter outline above illustrates, the focus of this chapter is limited to discussing a western philosophical tradition of virtue ethics and its role in shaping the understanding of free will in contemporary character education. It should, however, be noted that there are indeed other virtue traditions with a long and rich history that offer different points of view on the question of free will and character formation. Two notable examples of such traditions are Confucianism and Buddhism. Both Confucianism and Buddhism represent broad (and varied) traditions of thought furthering theories of virtue as a point of departure for their ethics. From a Buddhist perspective, "a Mahayana meta-ethics supports those who argue for greater attention to perception, emotion, and imagination in programs of moral education, in contrast to the more usual exclusive emphasis upon will and deliberative reason" (Vokey 1999, p. 105).<sup>3</sup> From a Confucian perspective, the goal of character education is primarily to make students consistent in their desires, not to have them practice on decision-making. Accordingly, "the task of Confucian mind can be posed in terms of knowing as being aware, rather than choosing. Thus, we can say that learning in the Confucian sense is not concerned with deliberation for a choice, but with recognition" (Kwak 2016, p. 18). In many ways, this is aligned with ancient Greek traditions of self-cultivation insofar as it eschews the modern inclination toward deliberation of the will.<sup>4</sup> In the context of moral education, this means that "...the education that Confucius had in mind is primarily *moral* education, as his goal was to help his students to become virtuous persons" (Huang 2011, p. 141).

---

<sup>2</sup>Stefaan E. Cuypers, for example, contends that "[t]he complementary issues of manipulation and autonomy in the metaphysics of free will cover, to a large extent, the same domain as that of indoctrination and authenticity in the philosophy of education" (2009, p. 124).

<sup>3</sup>For a helpful discussion on how the four cardinal western virtues of prudence, justice, fortitude, and temperance correspond to Buddhist virtues (identifying both similarities and differences), see Keown (2007, pp. 101–104).

<sup>4</sup>For an informed discussion on the relation between (and, to a degree, convergence of) Socratic and Confucian senses of self-cultivation, self-knowledge, and ethics of learning, see Kwak (2016). For a brief comparison of the Confucian ethics of virtues and Aristotelian ethics, see Chen (2002).

While it is difficult to assess the impact of Confucian and Buddhist virtue ethics on western models of character education, it may be argued that what has been termed ‘the postsecular turn’ in contemporary education – describing “a turn towards integrating previously separated spheres of knowledge acquisition within new paradigm of secular-spiritual synergies” (Wu and Wenning 2016, p. 553) – coincides with a revival of eastern traditions of thought in education.<sup>5</sup> This may be explained in part by the fact that these traditions of thought can open up for “a form of yearning, searching, and enlightened attitude about the shortcomings of both religion and secularity” (p. 566). In this chapter, my aim is to trace the western conception of the free will in character education – from an Aristotelian understanding of moral agency to a Kantian notion of the free will – and to trouble this tradition from within, as it were. I will therefore contrast the dominant understanding of the free will, not with eastern traditions of wisdom, but with Spinoza’s rationalistic and naturalistic understanding of the will, a concept of the will that follows from his commitment to causal determinism.

## Challenges of Contemporary Character Education: The Free Will Problem and the Question of Moral Responsibility

Aristotle’s conception of moral agency and responsibility – as laid out in Book III of the *Nicomachean Ethics* (*NE*) – is not immediately recognizable as corresponding with the commonsensical notion of the free will, signifying that we are free to do as we choose. In fact, Aristotelian ethics have undergone a radical transformation so as to accommodate a version of the free will that was not prevalent in classical Greek philosophy. This transformation is generally attributed to Aquinas – and other Christian thinkers – who, in the thirteenth century, sought to reconcile Aristotelianism with a (largely Augustinian) concept of the will to which all vices could be causally related (Kent 1995).<sup>6</sup> Contemporary character education owes much to this transformation, and personal decision-making is central for many models of character education drawing (however loosely) on the Aristotelian cultivation of virtue (Ravven 2013, pp. 1–55). This transformation may be summarized as moving from a naturalistic understanding of the will – where decisions follow naturally from the character of a person – to an understanding of the will as a capacity setting humans apart from the rest of nature (while bringing her closer to God) insofar as it grants her the ability to intervene with natural causation.

---

<sup>5</sup>For a brief overview of the shifting historical role and the recent revival of Confucianism in Chinese public education, see Wu and Wenning (2016, pp. 559–565).

<sup>6</sup>Accordingly Carr writes: “The Christian idea of the will as something which operates as an independent source of motivation and choice and which is open to the influence of good or evil is quite different in these crucial respects from Plato’s *thumos* and probably makes its first entrance into western thought with St Augustine” (1991, p. 37).

Despite the naturalistic elements of his understanding of the will, Aristotle is generally recognized as having offered the first theory of moral responsibility (Eshleman 2014).<sup>7</sup> To be free, on Aristotle's account, is to be the cause of one's actions. When we are the cause of our actions, we are morally responsible and we can choose to act virtuously or not. Aristotle (1984) writes:

For where it is in our power to act it is also in our power not to act, and *vice versa*; so that, if to act, where this is noble, is in our power, not to act, which will be base, will also be in our power, and if not to act, where this is noble, is in our power, to act, which will be base, will also be in our power. (*NE*, Book III, 1113b)

To become morally responsible for one's actions, insofar as we acquire the power to act and the power not to act, is part of one's moral development. This requires understanding how we function and how we are constrained by things that are external to us. When we understand this clearly, we will be in a position to make moral choices, and we will be able to act virtuously. As Carr puts it, for Aristotle "moral wisdom of knowledge is a knowledge of how to make right moral choices" (1991, p. 59). There is a sense, then, in which we might find the seed of a free will argument in Aristotle. What is important for Aristotle, however, is not whether we always make the right decisions or not. Good decision-making is merely the natural outcome of having developed a virtuous character. The main objective of moral education, from a classical Aristotelian point of view, is to have students cultivate a virtuous character, and they will cultivate their character by increasing their understanding of themselves and the world. This means that "once character is set, people cannot do otherwise than they do" (Ravven 2013, p. 169), a conclusion that makes Aristotle into a naturalist insofar as "human beings act necessarily according to their character and that natural (including mental) processes operate by necessity" (*ibid.*).

As indicated above, however, many contemporary models of character education are less focused on the cultivation of a virtuous character (in the Aristotelian sense) and more focused on learning how to act. This action-oriented form of moral education is commonly taken to be informed by Kantian ethics, oriented around identifying patterns of acting that correspond with moral principles. Heidi M. Ravven notes that "in the American context, the Aristotelian notion of personal character has been reshaped through the lens of free will", in the sense that "character educators use a (Kantian) model of choosing actions that accord with principles (or virtues) to which children have freely committed themselves, rather than a model that involves training behavior" (2013, p. 44). The focus on personal decision-making, Ravven claims, reveals the "foundational nature of the free will perspective in America" (p. 51). It also shifts the focus from the formation of students' characters to the setting up of an educational framework of praise and blame. Moral choice, in this tradition, is not so much a matter of acquiring a virtuous character as it is a matter of the individual orientation of the will in a natural world where we have the freedom to act for good or for evil.

---

<sup>7</sup>Cf. Aristotle (1984), *NE*, Book III, 5.

What, then, is the problem with grounding character education in the assumption that humans have free will in this latter sense? This question may be approached from at least two, equally relevant, perspectives. It may be approached in terms of a philosophical problem, and it may be approached as an educational problem. From a philosophical point of view, the notion of a free will is problematic insofar as it relies on an understanding of human freedom where to be free is to be exempt from natural causation. That is, if freedom is understood in terms of freedom from constraint and the subsequent understanding of the will is understood as being uncaused or spontaneous, then we come up against the philosophical problem of having to explain how it is that humans have the ability to act contrary to laws or regularities that bind the rest of nature. From a Kantian perspective, for instance, being 'a transcendently free person' ultimately means that one "stands outside the realm of natural laws" (Giesinger 2010, p. 517) insofar as it concerns a kind of freedom that "cannot be attributed to any natural human sentiments or dispositions but [that] can be attributed [...] to the noumenal self which lies beyond any empirical knowledge we may have of our inner phenomenal nature" (Carr 1991, p. 80).<sup>8</sup> There are, however, conceptions of human freedom that do not introduce this kind of tension with a naturalistic understanding of the world, and so one way of coming to terms with this problem would be to appeal to a different concept of freedom.

From an educational point of view, the notion of a free will is problematic as it appears to render all aspects of moral education into matters of personal choice and, in extension, because it makes moral education almost exclusively concerned with the question of praise and blame. The most obvious problem with this, from an educational point of view, is that it risks rendering moral education into a paternalistic form of conditioning (primarily driven by the child's fear of being blamed) and "as mere training as opposed to authentic education"<sup>9</sup> (Cuyper 2009, p. 135). There is also a deeper underlying tension between free will and education in the sense that for a free will to be genuinely free, it needs to be uncaused and spontaneous, and for education to be effective, it needs to assume that actions and thoughts can be externally influenced (and willfully manipulated). Johannes Giesinger frames the free will problem in terms of a pressing educational paradox:

It seems that what he [the learner] thinks, what he wants and how he acts can never be truly *his*, since it is brought about by education and other factors beyond his control. *On the other hand*, if we consider the learner as endowed with a free will, then it might seem impossible to educate him at all. (Giesinger 2010, p. 515)

---

<sup>8</sup>Similarly, Allen W. Wood offers the following helpful explanation of transcendental freedom: "When we think of ourselves as appearances, we are determined, but when we think of ourselves as moral agents, we transport ourselves into the intelligible world, where we are transcendently free" (2008, p. 135).

<sup>9</sup>Authentic education, on Cuyper's view, is conceived as "opposed to indoctrinative education" insofar as it "consists of necessary educational interferences that are conducive to the attainment of the primary educational aim of transforming children into morally responsible agents" (2009, p. 135).

That is to say that “if his [the learner’s] present and future actions stem from a will that is genuinely free, then they will be independent from any educational influence” (ibid.). In order to escape this dilemma, Giesinger proposes “a reason-based understanding of freedom” (p. 525) where “a person is free if she acts on reasons she accepts as valid” (p. 520). This assumes a weaker concept of freedom (than the one given above) in the sense that the learner’s reasons “are not (yet) part of his identity” but that through education “those reasons that one is prompted to accept become *one’s own* in a strong sense” (p. 522). Education, in this context, concerns the process by which “the child’s basic freedom can be cultivated to become full-blooded autonomy” rather than the process by which “an unfree object can be transformed into an autonomous subject” (p. 525).

To act freely on this view is not simply to be able to make a choice, but to be able to make a choice *for the right reasons*. Whereas everyday choices are frequently made out of habit or as direct results of one’s social milieu, an autonomous moral choice is taken to be the end result of a deliberate educational process. As Stefaan E. Cuypers puts it: “For that reason, the ‘free man’ not only is a free chooser but also possesses an authentic code of conduct in the light of which he chooses” (2009, p. 126). Being informed by R. S. Peters, Cuypers goes on to propose that “a choice (or decision) is autonomous if and only if its agent both has control in making it and is authentic with respect to it” (ibid.). To be authentic with respect to one’s choice, on Cuypers’ account, means that one’s choice “causally issues from antecedents springs of action, such as beliefs and desires, which are ‘authentic’ or ‘truly the agent’s own,’ as opposed to being inauthentic or alien” (ibid.). That is, for a choice to be considered authentic in this sense, the moral agent needs to be its true cause. For a choice to be caused entirely by the moral agent, however, the moral agent would seem to need to be placed “outside the realm of natural laws” (Giesinger 2010, p. 517) insofar as things that abide by natural laws are always necessarily caught up in, and at least partially determined by, natural chains of causation.

The relevant educational concern related to the issue of authenticity is of course the problem of indoctrination. If a child is manipulated into holding certain values, in what sense can these values be labeled authentic? Cuypers offers the example of religious practices being habituated early on in the child’s life as an illustration of this problem:

The child [...] may not be able to refrain from a certain religious practice – her relevant actions would express choices stemming from unsheddable, antecedent causal elements that are not truly the child’s own – because of the way in which the religious training took place. (2009, p. 127)

The problem with this explanation, of course, is that it is unclear how one distinguishes between the “causal elements that are not truly the child’s own” and those that are. For Kant, for instance, being morally autonomous means being unconditionally free where genuine freedom is grounded in a transcendental and non-empirical realm and where one’s moral reasoning is therefore necessarily untouched by the phenomenal world of appearances.<sup>10</sup> As Giesinger (2012, p. 777) points out,

<sup>10</sup>Cf. Kant 1999, A532–58/B560–86.

however, this raises an educational issue insofar as it is not entirely clear if and how the noumenal self can be educated given that it is construed as being necessarily unaffected by external empirical influences. Assuming that a person's character can in fact be molded through education, it appears difficult to draw any sharp line between inculcating moral values (that the child will come to be the true cause of over time) and manipulating the child into adopting someone else's values (that the child will never be the true cause of). This amounts to what R. S. Peters calls 'the paradox of moral education' where he stipulates (paraphrasing Aristotle) that children "can and must enter the palace of Reason through the courtyard of Habit and Tradition" and that the most pressing problem facing the educator concerns how to inculcate good habits "in a way which does not stultify the development of a rational code or the mastery of the 'language' of activities at a later stage" (2015a, p. 52). Peters' response to this paradox is to propose a distinction between habits that are mere automatized responses to external stimuli and habits that are, in Cuypers' words, "*rationally* permeated tendencies to act", meaning that "they have reasons behind them, and although they usually operate automatically, we are at liberty to stop them" (2009, pp. 128–129). As Cuypers remarks, however, the question remains as to what the conditions of "the initial instillment of these prerequisite elements of adequate moral habits" (underpinning our reasons for acting) are (p. 129)?

In response to this question Cuypers (and Haji and Cuypers 2004) proposes a future-oriented and "relational view of authenticity" where it is claimed that "although pertinent psychological elements instilled in the child during the prenatal stage are not authentic per se, they can be authentic with an eye toward future moral responsibility" (Cuypers 2009, p. 134). Going back to the core problem of where this authentic moral ability comes from, it remains difficult to explain the seemingly supernatural tendency underpinning the notion of the free will insofar as it is conceived in terms of an unexplainable self-caused thing (*causa sui*) in a world of otherwise externally caused things. This brings us back to the related problem of moral responsibility. As Cuypers goes on to argue, it becomes problematic to assign moral responsibility unless we can determine that a particular action *A* "stems from psychological antecedents that are constituents of *S*'s [*S* = a normative agent] authentic evaluative scheme" (p. 135). Given that determining the causal origin of an action *A* as being within *S* appears to require circumscribing the regularities of natural causation, it is questionable whether a convincing account of moral responsibility will hold sway in the face of a naturalistic (scientific) understanding of the world.

This brings us right up to the enduring determinism-indeterminism debate in which the problems of free will and moral responsibility are both ultimately couched. Very briefly, determinism (*qua* causal determinism) refers to the philosophical view that there is only one possible future which follows from the assumption that everything that happens is determined by prior causes to act and behave in certain determinate ways (van Inwagen 1986). Indeterminism, in contrast, refers to the view that there is more than one possible future and that things are therefore not predetermined by prior causes to act and behave in certain determinate ways; in other words things could have been otherwise than they are. Indeterminism thereby

“suggests the absence of lawfulness in human activity” (Gavin 1992, p. 126). As is clear from the above, determinism leaves little room for anything uncaused and spontaneous, whereas indeterminism allows for uncaused actions and spontaneity in nature.

Besides the seemingly unbridgeable divide between determinism and indeterminism, there is also the well-known debate between the compatibilist and the incompatibilist view on moral responsibility. Compatibilism refers to the view that causal determinism and free will are not mutually exclusive but that a person may be held responsible for actions even if she is causally determined like anything else in nature. Incompatibilism, on the other hand, holds moral responsibility and causal determinism to be mutually exclusive insofar as moral responsibility entails being the causal origin of one’s conduct.

In metaphysical terms to be the cause of oneself (or at least of some of one’s actions) is required for moral responsibility to make sense. If my behavior is caused by something external to me, it is difficult to see how I can be held responsible for it. For someone to be the complete cause of his or her actions is, however, very difficult to conceive as this appears to require a kind of self-determination that natural things are not generally attributed with. This line of thinking relies on what Galen Strawson refers to as the Basic Argument stating that:

- (1) Nothing can be *causa sui* – nothing can be the cause of itself. (2) In order to be morally responsible for one’s actions one would have to be *causa sui*, at least in certain crucial mental aspects. (3) Therefore nothing can be truly morally responsible. (Strawson 1994, p. 5)

There is an interesting tension between the fairly straightforward and simple claim that no one can be the complete cause of him- or herself (insofar as we are all to some extent products of our heredity and our upbringing) and that no one can therefore be the complete cause of his or her conduct, and the commonsensical view that morality requires moral responsibility in precisely this sense. Carr, for instance, writes: “In fact I hold the common-sense view that most of us are for most of the time quite responsible (in the sense that, amongst other things, we could have chosen to do something other than what we actually did) for the wrong-doing we commit [...]” (1991, p. 17). Without actually disputing the truth of the Basic Argument, Carr turns to a commonsense view so as not to undermine the central place of moral responsibility within western traditions of moral philosophy. The question is, however, if the question of praise and blame is as crucial as one might be led to believe that it is. In order to clarify, the point at stake is not whether we have the capacity to act so as to prevent bad things from happening but whether it makes sense (philosophically) to blame someone for not acting in a morally acceptable way. Carr puts it succinctly:

- If ideas of this sort are taken completely serious then it may well be appropriate to constrain the individuals in question, to submit them to psychiatric treatment, to re-educate them out of the attitudes they have acquired in vicious environments or even to try to eradicate whatever might be understood to have caused the delinquent behaviour in those environments, but it is really not to the point to blame or hold agents responsible for actions concerning which they could not have known better. (1991, p. 34)

On Strawson's view, the question of moral responsibility turns out to be not so much an issue of what is true or false in a logical sense, but of the importance of *the experience of choice* as such.<sup>11</sup> In order to illustrate, Strawson describes a scenario where a person is walking up the steps leading to a shop with the intention of buying a cake. When, at the door of the shop, this person is being intercepted by someone presenting the opportunity of investing the same money in charity instead, Strawson argues that the experience of having a choice is strong enough to make us disregard the logic of the Basic Argument telling us that we can never be truly morally responsible for our actions. He argues that "[l]arge and small, morally significant or morally neutral, such situations of choice occur regularly in human life" and that "[t]hey are the fundamental source of our inability to give up belief in true or ultimate moral responsibility" (1994, p. 10). Accordingly, "they are the fundamental rock on which the belief in true moral responsibility is founded" (p. 11).

Returning to the context of contemporary character education, it is obvious that the tension between a strong belief in free will and moral responsibility and the strong logic of the Basic Argument remains largely unresolved. While it is difficult to conceive of children and students as being the true cause of themselves, it appears to be equally hard to abandon the notion that children and students have free will and that they are (to some extent at least) morally responsible agents. It is a paradox that refuses to be settled because if one were to accept the Basic Argument, one would also need to accept the fact that "[i]t is exactly as just to punish or reward people for their actions as it is to punish or reward them for the (natural) colour of their hair or the (natural) shape of their faces" (p. 16). And this, it seems, is no easy thing to have to accept.

The force of the Basic Argument, on Strawson's account, is that it really doesn't hinge on whether we accept determinism or not. From the perspective of compatibilism – where determinism and free will are taken to be compatible – it may be argued that a person is considered responsible for an action as long as he or she is not constrained by alien influences such as acting under threat, under post-hypnosis suggestion, or being afflicted by mental illness, etc. At bottom, however, regardless of how we conceive of the particular circumstances surrounding our decision-making, the question remains as to how the compatibilist understanding of responsibility can assist in grounding actions in a person as its true cause. As Strawson concludes in response to the compatibilist position: "One does what one does entirely because of the way one is, and one is in no way ultimately responsible for the way one is. So how can one be justly punished for anything one does?" (p. 17). From the perspective of incompatibilism – where the assumption is that free will exists and that therefore determinism is false – the question of moral responsibility is still not answered in a satisfactory sense. As Strawson asks: "If my efforts of will shape my character in an admirable way, and in doing so are partly indeterministic in nature, while also being shaped [...] by my already existing character, why am I

---

<sup>11</sup> Similarly, Young Pai concludes that "[t]he feeling of being able to act contrary to his [the agent's] character may be nothing but an illusion, but it is a psychological fact" (1966, p. 143).

not merely lucky?” (p. 18). Strawson’s conclusion is that the notion of moral responsibility cannot be sufficiently defended from either of the two perspectives:

In the end, whatever we do, we do it either as a result of random influences for which we are not responsible, or as a result of non-random influences for which we are not responsible, or as a result of influences for which we are proximally responsible but not ultimately responsible. The point seems obvious. Nothing can be ultimately *causa sui* in any respect at all. (p. 19)

To the extent, then, that contemporary character education still relies on this problematic notion of moral responsibility insofar as “character educators use a (Kantian) model of choosing actions that accord with principles (or virtues) to which children have freely committed themselves” (Ravven 2013, p. 44), there appears to be a need for a serious discussion on the possibility of a coherent character education that does not rely on the notions of free will or moral responsibility without at the same time lapsing into complete value nihilism.

In the context of moral education, the unwillingness to seriously consider the plausibility of moral responsibility and free will may be attributed to a fear of legitimizing what R. S. Peters calls “a universal get-out” (2015b, p. 70), rendering any vice permissible and morality itself redundant. Peters refers to the tendency to attempt to escape from moral accountability as *a social malaise*, closely related to a fashionable and opportunistic referral to causal determinism insofar as it concerns “a denial of responsibility coupled with a story about the causes of actions and standards” (p. 60). People who succumb to this tendency, Peters claims, “justify, or excuse, their failure to take responsibility for their own lives by an appeal to causes” (ibid.). Fearing the spread of this social malaise, Peters paints a dystopian picture of a world without moral responsibility:

If the word goes round that people cannot help doing things because of their class or their upbringing, their conditioning in the carry-cot or some such thing – then they may tend to sit about like angry young men, blaming everyone but themselves, but doing nothing about their condition. Their plight illustrates neatly the contention with which I began: that a social malaise can be the product of half-truths and of intellectual confusion. (p. 63)

At this point it is important to remind of the metaphysical prerequisites of a free will in terms of the demands it places on our understanding of nature. While a naturalistic understanding assumes that all things are explainable in terms of the same basic kind of regularities, the free (uncaused) will requires a kind of bifurcation of nature. That is, while most known things abide by the same regularities (such as efficient causation), certain things (such as the human will) are attributed the ability to circumscribe these (otherwise universal) regularities and, by so doing, indicate the existence of a parallel world where different rules apply. The problem that this gives rise to is that it becomes difficult to explain these different rules and that they therefore appear as entirely exceptional and supernatural. While the exceptionality of the human will is commonly referred to, there are seldom explanations for this alleged exceptionality. For example, when Peters states that he “would want to distinguish carefully between causes proper such as movements of the body and brain, and things like deliberating, deciding, having reasons, understanding truths, etc.,

which are often also called ‘causes’” (2015b, p. 66), he fails to provide any rational explanation for this distinction, making it a brute fact.

Disregarding the lack of explanation behind this bifurcation of nature, we might still fear the practical results of denying free will and, for this reason, agree with Peters’ appraisal concerning the social malaise of irresponsibility. The important question, then, is whether Peters’ dystopian image is the likely result of denying spontaneity in nature. Would the denial of a free will lead to social collapse and the end of morality? On the other hand, if, as David Gordon concludes, “[a]ny teacher who sets himself the task of getting all his pupils to freely decide to do what they in fact ought to do, has set himself an impossible task” (1975, p. 415), the question is: what paths of inquiry remain open for character education? Is there no way to conceive of a coherent form of character education without at the same time assuming the existence of a free (uncaused) will?

Returning to Aristotle, we saw earlier that the Aristotelian will may be conceived in terms of a naturalistic understanding of the will, where decisions are taken to follow naturally from a person’s character. The will, in this sense, is not free insofar as it is always the outcome of a person’s character disposition. At the same time, Aristotle (1984) construes justified praise and blame as being conditioned by voluntariness (*NE*, Book III, 1114b). For an action to be voluntary, it needs to be caused by the agent performing it, and it needs to be not caused by ignorance. For an action not to be voluntary, in contrast, it needs to be caused by something external to the agent or by ignorance. Character education, from a classical Aristotelian point of view (as well as from the point of view of Confucianism and Buddhist virtue ethics), therefore focuses on formation of character, where a person’s choices are conceived as the natural outcome of his or her character. If a person makes bad choices, it is either because he or she was forced in the direction of that choice (by external causes) or because of lack of knowledge. To amend this lack of knowledge would therefore be the goal of character education.

Contemporary western models of character education, being clearly influenced by a more Kantian understanding of the will, have tended to focus less on the cultivation of character and more on the individual student’s ability to make the right choices. This has accentuated the problematic aspects of the concept of a free will in a way that classical Aristotelian ethics largely avoids. Since Aristotle’s ethics rely on pre-modern notions such as the *telos* of human existence, where every human being is believed to be naturally predisposed to strive for “their true or most fully realised form” (Sanderse 2015, p. 393), in a sense which is clearly not compatible with a post-Copernican worldview, it begs the question of whether the modern Kantian amendment to Aristotelianism is the most viable alternative for contemporary character education.

It is to this end that I would like to conclude this chapter by turning briefly to Spinoza, being both a virtue ethicist and a causal determinist (as well as a necessitarian), in order to investigate the currency of such an alternative. What is particularly interesting about Spinoza in this context is his refusal to adapt his ethical theory (as well as his metaphysical framework) to the modern yearning for a free will that can act as a guarantor for moral responsibility while still being firmly grounded in a western Enlightenment tradition of thought.

## A Spinozistic Approach to Character Education and Virtues: Understanding and Accepting Natural Causation

Spinoza's *Ethics* (1985a) may be read as a general guide to the formation of a good character where a good character is characterized by an adequate understanding of natural causation. It begins with an overarching metaphysical system establishing that everything that exists is an expression (mode) of nature (substance) and that what define these things is the striving to persevere and flourish in being (E3p7<sup>12</sup>). All things are the same in this regard. Spinoza moves on to his account of the human mind (being another thing determined to strive for perseverance) in order to establish a path to human freedom and happiness. By conceiving of the human mind as a finite mode, he equates it with the mind of any other finite mode, albeit relatively more complex than most other known minds. For Spinoza, there is nothing exceptional about a human being that would warrant an elevated status from the perspective of nature *qua* substance. This has led some commentators to label Spinoza an anti-humanist (Melamed 2011). This is not to say, however, that Spinoza is uninterested in matters concerning human well-being, quite the opposite, but it serves to highlight the fact that he refuses to adjust his account of the human being according to popular fictions and superstitions. This is evident from the fact that Spinoza's account of the affects follows his general metaphysical outline. Accordingly, he states that he will "consider human actions and appetites just as if it were a question of lines, planes, and bodies" (E3pref), illustrating that rationality and ethics are inseparable concepts for Spinoza.

Freedom, for Spinoza, is not opposed to determinism. On the contrary, Spinoza defines freedom as follows: "That thing is called free which exists from the necessity of its nature alone, and is determined to act by itself alone" (E1D7). In a letter to G. H. Schuller, Spinoza remarks that: "So you see that I place freedom, not in free decision but in free necessity" (Letter 58, S: p. 909<sup>13</sup>). On Spinoza's view, total freedom entails total self-determination. The only thing that is self-determined in this sense is substance (E1p14), being both self-caused and self-sustained. Everything else is necessarily caused by something else and is dependent on other things for its existence (E1p28). This means that human freedom is necessarily limited by external causes and that the human will is just as causally determined as anything else in nature. Accordingly, Spinoza's definition of the will corresponds with his definition of appetite (except in relation to the mind only), as the striving to persevere (E3p9s). The act of willing something for Spinoza is not understood as a spontaneous act or an uncaused choice, but as an instantiation of the desire to persevere in being conditioned by specific circumstances (precluding any real sense of

<sup>12</sup> Passages in Spinoza's *Ethics* will be referred to using the following abbreviations: D(-efinition), p(-roposition), s(-cholium), and pref(-ace). Hence, E3p9s refers to the scholium of the 9th proposition of Part 3 of the *Ethics*. All references to the *Ethics* are to Curley's (1985a) translation.

<sup>13</sup> References to Spinoza's correspondence are to Shirley's translation in *Spinoza: Complete Works* (2002).

voluntariness). Spinoza concludes: “This, then, is that human freedom which all men boast of possessing, and which consists solely in this, that men are conscious of their desire and unaware of the causes by which they are determined. In the same way a baby thinks that it freely desires milk, an angry child revenge, and a coward flight” (Letter 58, S: p. 909).

To be free, on Spinoza’s account, is therefore to understand the causes of one’s decisions. The more I understand, the more freedom from external causes I acquire. In the context of character education, this would mean that the aim is to help students understand natural causation so that they may come to see in what sense they are determined to act the way they do.<sup>14</sup> This obviously circumscribes human agency severely, and naturalizing the will also renders moral responsibility problematic. Being confronted about his denial of moral responsibility, Spinoza contends: “As to his final remark, that ‘on this basis all wickedness would be excusable,’ what of it? Wicked men are no less to be feared and no less dangerous when they are necessarily wicked” (p. 910). As is evident from this brief quote, Spinoza seems relatively unconcerned by the consequences of his naturalistic conception of morality. In his *Metaphysical Thoughts* (CM), he concludes: “If only those were fit to be punished whom we feign to sin only from freedom, why do men try to exterminate poisonous snakes? For they only sin from their own nature, nor can they do otherwise” (CM II, 8/C: p. 331).<sup>15</sup>

It seems that Spinoza does not share R. S. Peters’ concern regarding the dangers of denying the reality of moral responsibility. Perhaps Spinoza can even offer a way of reconciling the Aristotelian concept of virtue with a thoroughly naturalistic understanding of the will in an educational setting where the cultivation of a virtuous character need not be synonymous with personal decision-making. Instead, a virtuous character, on Spinoza’s view, is marked by an understanding of the natural limitations of a human being, an understanding that in itself may lead to a sense of *eudaimonia*.

*Eudaimonia* for Spinoza is a form of happiness best described as the tranquility of mind resulting from understanding and accepting natural causation. It follows from this that a virtuous character is the result of a life characterized by an affirmation of this understanding. The striving to persevere of the individual may then join with the striving of others so as to form a community founded on reason rather than one held together by superstition and fear. The construction and maintenance of such a community would be the goal of a Spinozistic character education, and as long as the free will is construed as a supernatural force intervening with the common order of nature, it poses a threat to the well-being of such a community.

<sup>14</sup>For an in-depth discussion of Spinoza and moral education, see Dahlbeck (2016, 2017).

# Well-Being and the Upbringing and Education of Children

Doret de Ruyter

## Introduction

The present and future well-being of children is a central concern of parents and teachers. Parents hope, for instance, that their children will be healthy, have a care-free childhood, will find a good partner and a job, be happy and live in a peaceful society. These generally phrased hopes are most likely held by all parents, although their specific hopes will be influenced by the culture and circumstances in which they live as well as their own views on what it means to live a good life. For instance, what is characteristic of a good partner can range from being caring, being able to make a decent income, to coming from the correct religious tradition or a good family. Typically, teachers do not only see their work as a way of making a living but also want to do good with their work: they want to contribute to their pupils' possibility to lead a good life by enhancing children's knowledge and understanding, skills and dispositions and like to see children doing well in their classrooms.

It is therefore not surprising that philosophers of education have analysed aspects of and developed theories about upbringing in families and education in schools or similar institutions in light of the (future) well-being of children. Certainly, not all use the term 'well-being' and they defend different concepts and conceptions of children's well-being. Plato, Aristotle, Pestalozzi, Rousseau, Herbart, to mention a few influential thinkers of the past, used different words and developed diverging (educational) theories, but these were based on views what it means to live one's life well. Which ideas or theories can or cannot be regarded as a conception of well-being depends on the connotation and denotation of the concept 'well-being'. If it is accepted (as I do) that it refers to ideas ranging from subjective positive evaluations

of one's life (which might be the primary conception of well-being that people have in mind) to living or functioning well as a person, then many educational theories are included (maybe most). For instance, R.S. Peters' explication of the educated person or Dewey's aims of democratic education could be regarded as conceptions of well-being. Or think of the recurring call for *Bildung* and identity formation in schools to overcome the one-sided attention on knowledge transmission and the teaching of skills. Of course, we should be careful not to bring everything under the concept well-being, because that would turn it into a vacuous term and make discussions muddier than clearer. Thus, I will confine myself in this contribution to the views that are explicitly presented as conceptions of well-being.

Philosophers of education are not the only academics interested in this issue; philosophers, psychologists and sociologists also investigate (children's and adults') well-being. In the past decades, the attention to well-being has increased in these academic disciplines as well. This is particularly true for theoretical and empirical research into happiness, which might not be surprising given the enormous increase in wealth and material circumstances in the Western world since the Second World War and the findings of empirical research that the feelings of happiness or satisfaction with life have not increased to the same extent. This gave an impetus to new paradigms like positive psychology and new research lines like happiness studies in sociology to empirically investigate the state of happiness of people and peoples and also to develop theories about the ways in which these states can be improved, for instance, through education.

This contribution begins with an overview of three clusters of theories of well-being. I will then focus on issues discussed within philosophy of education. Well-being features in discussions on education in primarily two ways: (a) well-being as an aim of education, which first explores the characteristics of an adult who has well-being and then asks the question what the role of educators should be or how education can contribute to realising well-being of future adults; (b) the well-being of children when they are children, which begins with defining 'childhood well-being' (which is also influenced by a conception of childhood) and then explicates what is beneficial or detrimental to the well-being of children.

Parents have the prime (legal) right and duty to meet the needs of their children and to raise their children in such a way that they can live well in the future, but the state also has responsibility for the (future) well-being of children. This is visible in the laws against child labour, child protection services and compulsory schooling that many countries have since the turn of the nineteenth century (which, to be sure, were not ratified for the benefit of children only but also society at large) and acknowledged by the Convention of the Rights of the Child (CRC) that has been ratified at the end of the twentieth century by most countries in the world (except for the USA). What the role of the state should be is primarily a political (philosophical) question, but philosophers of education can contribute to the evaluation of the content (or intent) of policies of the state. This is the topic of the final section.

## Theories of Well-Being

This section describes three clusters of well-being theories that are defended by philosophers (of education) and can be found in other academic disciplines as well, namely, subjective, objective and mixed theories (see, for instance, Huppert and So 2013 for psychology and sociology). These theories provide not only a definition of well-being, for instance, that well-being means that a person's desires are satisfied, but also make normative claims about the way in which people can best enhance their well-being<sup>1</sup> or in our case what educators best do to enhance the well-being of children.

### *Subjective Well-Being Theories*

We can distinguish two main types of subjective well-being theories, namely, ones that focus on positive feelings or emotions and ones that focus on the interests of people.

Hedonism is an example of the first normative theory. It suggests that people should pursue a positive state of mind, for instance, being exhilarated, or deeply satisfied. The unqualified version of hedonism, which does not make judgements about the grounds of one's happiness, is subject to serious criticism (e.g. Noddings 2003). Firstly, it reduces people to one-dimensional beings and can justify practices that aim to enhance enduring positive feelings by diminishing other human potentials, for instance, by drugging them or keeping them innocent. Secondly, it reduces desires to pleasure, and people also have desires that do not (immediately or constantly) lead to positive feelings, but that contribute to their well-being, such as the desire to study or work. Thirdly, people also have desires that do not enhance their well-being in the long term, like the desire to smoke or to have sex with a stranger while one does not have sufficient protection. Therefore, the satisfaction of desires simpliciter is not a sufficient account of well-being.

Proponents of recent positive emotion theories of well-being have acknowledged these criticisms and defend that people will only be truly happy if their positive emotions are the result of activities that require high-quality human capacities (but see also J.S. Mill 1863). This view is, for instance, defended by the positive psychologists, who, as we shall see, are object of many concerns of philosophers of education. Its founder Martin Seligman in his later work (e.g. Seligman 2010 and Seligman et al. 2009) departed from his more simple theory of happiness to a richer account and replaced 'happiness' by 'flourishing' (although positive emotions are still the final aim), suggesting that there are five elements of well-being, namely, Positive emotion, Engagement, positive Relationships, Meaning and Accomplishment (PERMA).

---

<sup>1</sup> See Haybron (2008) for a clear distinction between a descriptive, psychological interpretation of happiness and both subjective and objective theories of well-being.

A subjective theory in which human well-being does not have these hedonic connotations is the informed desire theory. There are two characteristic aspects of this theory. Firstly, people need to fulfil the desires that benefit their interests. This requires reflection on the present desire(s) taking into account all the other desires she has and can predict she will have as well as willpower to fulfil the desire beneficial to her interests. Secondly, the desires include longings that are not related to an appetitive state or whose fulfilment does not give psychological satisfaction. For instance, the desire of parents to look after their chronically ill child and give up their prospects of a career or a rich social life may contribute to their well-being, while it does not make them particularly thrilled. The informed desire theory is almost a type of objective theory, for it suggests that people weigh their desires against a non-subjective standard. Griffin (1986), the originator of the informed desire theory, in fact suggests it might be better to give up the distinction altogether.

### *Objective Well-Being Theories*

According to objective theories, persons live a life of well-being if they realise goods that are deemed to be objectively good for all people (Arneson 1999) or if they develop or have developed their human capacities to the full. Central to these theories is the idea of optimal functioning, the pursuit of excellence or the best in oneself (see, for instance, Kraut 2007; Kristjánsson 2015). Of course, theories about what constitutes optimal functioning or the pursuit of excellence may differ.<sup>2</sup>

According to neo-Aristotelian virtue ethics, which is currently the most dominant objective theory within philosophy of education, “to flourish is to fulfil one’s potential as a human being” (Kristjánsson 2015, p. 13). Kristjánsson describes flourishing as an ongoing activity that constitutes the realisation of human excellences, i.e. virtues of character and thought. Virtues are constitutive of human flourishing, but not sufficient as persons also need luck. Satisfaction or positive emotions are not regarded as necessary for flourishing: while being a virtuous person may be accompanied by positive emotions, these are “the icing on the cake”, as Kristjánsson suggests; they do not constitute “the true essence of flourishing” (2015, p. 13).

### *Mixed Well-Being Theories*

Mixed theories of well-being combine an objective standard as proposed by the objective theories with the subjective theories’ claim that satisfaction with one’s life is a necessary condition for well-being (see, for instance, Badhwar 2014).

---

<sup>2</sup>This observation is in fact one of the main criticisms against the so-called ‘objective list theories’.

Mixed well-being theories can be developed from a subjective theory and add objective criteria as an improvement. For instance, John White defends a particular version of a desire-fulfilment theory (2011, p. 92), in which the values on which well-being rests are intersubjective. He defines well-being or a flourishing life as “a life spent in whole-hearted and successful engagement in worthwhile relationships and activities” (e.g. 2011, p. 124). White rejects the informed desire theory of well-being on the basis that people may be mistaken in their beliefs of what they should desire. Even if people fulfil desires that are wholeheartedly felt, autonomously chosen and reflected upon on the basis of the relevant information, and feel happy, they still may not live flourishing lives. White suggests that well-being depends on the satisfaction of desires that are deemed to be valuable by a collection of people who form – in a loose way – a social practice. What is valuable or worthwhile is what this collection of people believes to be of value and what they desire (2002, p. 452).

One can also take an objective theory as one’s departure. My view on well-being (de Ruyter 2007, 2015) begins with the assumption that human flourishing requires the actualisation of goods, among which health and social relations, intellectual, creative and physical pursuits. However, these objectively identifiable goods are general and therefore require a personal interpretation. To be able to give a personal interpretation, a person needs to optimally develop her human potential, e.g. her physical, cognitive, emotional, social, moral and creative capacities. However, if flourishing is regarded as a conception of well-being, I suggest that it is necessary that people are satisfied or content with the life they live: the way in which they express their capacities has to be worthwhile and meaningful *to* them. This does not mean that they are happy (all the time), but they are in general or overall content with their lives.

## Education and Well-Being

As said, I will address two questions with regard to the relation between education and well-being: well-being as an aim of education and the enhancement of the well-being of children by educators. For this, I will use the theories just described. This is one way in which well-being in relation to the upbringing and education of children can be explicated. Another way would have been to explore philosophical, cultural or societal influences on the conceptions of well-being and concomitant views on activities of parents and teachers. It can, for instance, be expected that theorists who defend a liberal conception of (the aims of) education propose different ideas than those who adhere to communitarian philosophies. Similarly, parents and teachers living in individualistic societies will have different views on what it means to live one’s life well than those who live in collective societies. Furthermore, these views are influenced by religious and cultural traditions. Such an analysis and evaluation of ideas about well-being, upbringing and education would also have been illuminating, but I had to choose and wanted to stay close to the theories of well-being as explicitly discussed within philosophy of education.

## *Well-Being As an Aim of Education*

The theories of well-being lead to different ideas about what parents and teachers should do to assist the development of children towards a happy or flourishing life. Furthermore, a difference can be made between the upbringing by parents and the education of teachers. Parents are regarded as having the primary responsibility for children's well-being and entrance into the world (to use an Arendtian phrase) and for the development of children's dispositions and their acquisition of values. In most societies, teachers are primarily given responsibility for furthering the knowledge and skills of children, although there is increasing call, also of philosophers of education (for instance, Biesta 2010), that teachers do not only have responsibility for the qualification of children, but that they should also contribute to children's socialisation into culture and morality as well as the identity or subject development of students. It is argued that education in schools concerns the whole child and thus should include all aspects that make possible that children will be able to lead a life that is good for them.

I will give a very concise description of the main characteristics of education for well-being following the well-being theories, acknowledging that it is a formal and rather simple typification and that diverse more specific ideas can or have been developed.

Positive emotions theories propose that parents and teachers need to discover which qualities children should develop that will give them the most happiness as adults. These are the qualities that allow them to do well so that their positive feelings dominate. For instance, according to positive psychologists educators should help children to discover their character strengths and assist them to develop these strengths and to find a path in life that is not only meaningful but also makes possible to best express their strengths – in work, choice of partners to become a happy person.

Informed desire theories suggest that the responsible adults need to assist children to become good choosers, who are able to decide what (course of action) is in their long-term interest. This presupposes that educators have responsibility to assist children in becoming persons who are knowledgeable, can critically reflect on the information that is being provided by others (be it the media, peers, their parents and teachers), are able to make autonomous choices and have willpower and determination to fulfil the desires that serve their long-term interests.

Neo-Aristotelian virtue ethicists argue that parents and teachers should enhance the flourishing of children by habituating the virtues, thereby forming the character of children. They suggest that parents and teachers need to be wise mentors in assisting children in the habituation of virtues and the development of fine emotions. Presenting exemplars of virtuous persons (or of course being one oneself) helps children not only to understand what it means to be a virtuous person but also helps to ignite a desire to become a virtuous person themselves.

Following the mixed theories that White and de Ruyter have proposed, educators have to introduce children into the objective goods, by presenting them with knowledge and the opportunity to experience good relationships and worthwhile activities,

present a framework of values to children with which they can evaluate what is worthwhile to pursue, assist the development of capacities and dispositions (that could be called virtues), and to discover which values they can underwrite and which activities and relations are satisfying to them by giving them freedom to explore.

It should be noted that there is certainly overlap in the educational ideas and practices that can be or are developed on the basis of the theories of well-being, particularly when one would ask defenders for a complete description of upbringing and education practices. For instance, neo-Aristotelian virtue ethicists focus in their publications about education for flourishing on explicating what character education consists of, but they do not deny that acquiring knowledge and skills is necessary to develop into a flourishing person (see Kristjánsson 2015). There are also shared assumptions, for instance, that the basic needs of children need to be met. Children need safety and security (in their relationship with their parents as well as their environment), they need food and proper clothing for the environment in which they live.

The same seems to be true for the proposals on the education in schools. For example, Noddings (2003) argues that schools should have a curriculum that aims for personal happiness (leading a good and meaningful life), happiness at home as well as in public life. This requires a wide range of knowledge, skills and various dispositions, also with regard to the well-being of others – she explicitly rejects an individualistic conception of happiness. The new curriculum for happiness should, for instance, have subjects like home economics, nature study and spirituality education, replacing current subjects that aim for higher-order levels of knowledge that are not necessary for living a happy life (like higher-order algebra), and current subjects like English, maths or biology should be reconceived in light of the new aims. White (2011) and Reiss and White (2013) also believe that the curriculum needs a fundamentally new design to equip each child to lead a life that is personally flourishing and to help others to do so too (2013, p. 1). They suggest that these aims should be the starting points instead of the subjects. For instance, children need to learn how they best meet their basic needs, should be offered (imaginary) activities to discover which worthwhile activities suit them most, need to learn how to form good relationships, and they should receive civic education and education for work. To achieve these aims, children also need to acquire background knowledge and to develop among others understanding, imagination and (altruistic) dispositions.

The proposals to ground the content and design of the curriculum on the aim of children's well-being (see also Seligman et al. (2009) for a positive psychology curriculum) have been criticised by various philosophers of education. It is possible to distinguish two objections, namely, that what is (or should be) taught to children is evaluated by a value extrinsic to school education and that deciding the content of the curriculum on the basis of well-being makes instrumental things that have intrinsic value (as well).

According to the first objection, we should not value the teaching of knowledge, skills and dispositions because they lead to well-being, but because they have intrinsic value (or have intersubjective value). Using well-being as a criterion to decide

what needs to be taught to children means that a criterion is used that lies outside the value of these things in themselves. For instance, paintings or novels have aesthetic value and should be evaluated not on the basis of the joy they bring to the person but on the basis of their aesthetic qualities. The second objection is that if we regard knowledge, skills and dispositions as instrumental to well-being and see well-being as the aim of education, things that are valuable but that do not lead to well-being are taken off the curriculum. If it could not be defended, for instance, that reading novels and discussing their ins and outs in the classroom is necessary or at least conducive to the well-being of people, this practice does not have a necessary place in schools. These objections are often taken together. Cigman (2012), for instance, suggests that the question which knowledge is instrumentally valuable (to well-being) is obscure and possibly meaningless (p. 459). Following Whitehead she argues that schools should teach about life in all its manifestations and see the acquisition of knowledge as an intrinsically valuable aim in which well-being has a central place. Kristjánsson (2015, 2016) and Suissa (2009) have similar objections to the instrumental value given to the development of virtues and moral dispositions.

These objections in my view apply to the positive emotions theory, but not to the objective theories of well-being. The criterion for the positive emotions theory is indeed that we should teach children those things that will make them happy as adults (which does not have to make children as children happy – I will return to this). In this view the content of the curriculum is indeed made instrumental to feelings of well-being and curriculum subjects are evaluated by external reasons. In contrast, according to the objective theories of well-being, well-being is constituted by having knowledge and skills and engaging in activities and relationships that are evaluated by the worth of these activities themselves, not by the external criterion that they make a person happy.

But, does it make sense to defend well-being as an aim of education or is it meaningless as Cigman suggests? There might be two reasons to agree with Cigman. Firstly, the well-being of children in the future is dependent on those future adults (and the circumstances in which they live at that time) and cannot be created by parents or teachers. Therefore, it cannot be achieved by education or upbringing. One can only say that these pave the way or facilitate the possibility that children will be able to live well as adults. However, if one interprets ‘aim’ not in the sense of a goal, but as a final justification of why one educates children and why education has the content it has, then well-being could be regarded as an aim of education. The defender of well-being as an aim of education can agree that the acquisition of knowledge, capacities and dispositions by children is indeed what parents and teachers pursue or aim for, but can argue that if the educators are asked why they do so, they will likely answer that they do so to further children’s future well-being. Secondly, one can agree with Raz, who suggests that there is no “independent force to care about people’s well-being. Given that well-being consists in successful pursuit of *valuable* goals and relationships there is an obvious reason to pursue whatever it consists in, i.e. those valuable goals and relationships. But I could not think of a general reason for pursuing well-being, one’s own or that of others, beyond that”

(2004, p. 292). Thus, again it is not well-being that is the aim of education, but the introduction of children into worthwhile activities and good relations.

I agree with the two points, yet it is convenient to use ‘well-being’ as a shorthand term. However, to avoid confusion and to ensure that well-being theories are not put on one pile, but are each evaluated on their own merits and problems, it would be wise to consistently use the terms happiness for the subjective well-being theories (although for the informed desire theories satisfaction might be more appropriate) and flourishing for the objective and mixed well-being theories.<sup>3</sup> This would make clear, for instance, that the critique of authors like Suissa (2009), Ecclestone (2012) and Cigman (2009, 2012) against well-being as an aim of education is not (necessarily) directed at well-being per se, but at the positive emotions theory. Ecclestone’s criticism, for instance, is a good example of this point. Her greatest concern is that aiming for well-being will lead to an increasing therapeutic ethos in schools. She warns that well-being has been shifted from being “a moral and social enterprise for ‘human flourishing’ to a psychological terrain” (2012, p. 476), which makes possible that moral and political debates are avoided. Philosophers of education like Kristjánsson, White, Brighouse and myself, who defend such practices in relation to their conception of flourishing, would fully agree.

### *Well-Being of Children When They Are Children*

The danger of thinking of well-being as an aim of education is that one might begin to perceive of childhood as a phase of life that is only instrumental to the well-being that one can obtain later in life. This danger does not seem to be present in current Western societies. Parents tend to invest a lot in their children’s childhood and aim to make their lives from early on as pleasant as possible. They also invest in their children’s development, making use of what Gheaus (2015) calls intrinsically valuable qualities of children, for instance, children’s superior ability to learn and their exceptional mental flexibility that gives them better imagination ability. But it would be wrong, according to Gheaus, to see childhood as instrumentally valuable (having value only in light of a stage that one needs to go through to become an adult). According to her childhood has intrinsic value that can be found in the essential (distinctive) characteristics of childhood. These are the just mentioned abilities, coming together in “the ability to conceive of change” (2015, p. 41). This justifies that the goods children need as children, i.e. the goods that “make an important and direct contribution to a good childhood” and that “have some developmental value for children” (2015, p. 36), are given to them.

I agree with Gheaus. However, the claim that children’s ‘childhood well-being’ needs to be fostered by adults is not unequivocal. What it means and implies is dependent on both the conception of well-being and the conception of childhood.

---

<sup>3</sup> It is also an obligation of (empirical) researchers to clearly explicate their conception of well-being (e.g. Suissa 2009; Smith 2009).

While there might be an agreed (though quite general) concept of ‘childhood’, i.e. that children differ from adults, there have been and are various conceptions of childhood, i.e. socially constructed ideas about what is characteristic of children (Archard 2004). As Frijhoff in a historical overview of conceptions of childhood aptly notes, “as a historical category, ‘the child’ is always invention by others, its discoverers or inventors” (2012, p. 12) – children have not discovered themselves. Perceptions about the nature of childhood have changed throughout history, not only (or maybe even not primarily) on the basis of new scientific insights from biology and psychology for instance but on the normative inferences of these insights. Both ‘facts’ and values lead to beliefs about children: what they need, what they are able to do, the amount of freedom that is good for them and the influence they should have on (their own development in) families and schools and society at large (see, for instance, Graf 2015). Currently the views on what is characteristic of ‘the child’ vary from being vulnerable and in need of protection and guidance of adults to being able to make their own decisions and develop themselves. Children are regarded as being unspoiled by culture who should be given their own space and time to develop themselves or are seen as objects of civilisation who need adult control and guidance (Frijhoff 2012).

To give an example how conceptions of childhood play a role, I will use a standard account of the informed desire theory (without evaluating the theory itself). As noted, according to the informed desire theory, well-being requires that a person reflects on the desires she has in the light of her long-term interests. Children cannot serve their well-being in this sense when they are young. As young children are unable to reflect on their desires in light of their long-term interests, adults should make decisions for them with the best interests of children in mind and children have well-being when they follow the wise advice of these adults. This does not have to make children happy all the time, because certain desires will be fulfilled while others are not (for instance, not wanting to go to school, wanting to drink alcohol or smoke), given their long-term interest. Yet, educators who want to serve the well-being of their children will aim to make possible that the desires of children that are not detrimental to their long-term interests are satisfied (so they will be happy often). When children become older, their abilities to reflect on their interests improve, which means that the responsibility of adults should decrease and that the freedom of children to reflect on the preferences they have formed under the influence of their educators and to take independent decisions needs to increase.

This description will sound plausible to most people, because it is based on common sense assumptions about children’s (lack of) abilities and concomitant ideas about the child’s dependence on and relation to adults. And the majority of people defending the just mentioned highly divergent conceptions of childhood might agree, because of the qualification that the well-being of children requires the careful attention of adults to what children are able to decide for themselves, although there will be differences in the way they believe adults should interpret their observations and acts. This is a different matter in case of legislation or other more general measures with regard to the well-being of children. Policies and laws necessarily have to use a generalised conception of childhood and are therefore based on the

(scientific) perception of average children. And here we find the debates about the nature of childhood, the needs of children, the acknowledgement of children's competences: given the responsibility of the state with regard to the well-being of children, which protection, provision and possibilities for participation (the three P's of the Convention of the Rights of the Child) should be available to children?

Returning to the well-being theories. The well-being theory that (again) seems to receive the most profound critique is the positive emotions or hedonic theory that is finding its way in educational theory and practice. Following this theory, parents and teachers should enhance children's positive emotions and ensure that the negative emotions that children experience are minimised or outbalanced by the positive emotions. In *New Philosophies of Learning* (2009), a section is dedicated to these new educational theories (particularly positive psychology). According to Suissa such theories are anti-educational, because they use simplified formulae (for instance, what happiness is) and focus on skills to become happy instead of reflective thinking. Yet, reflective thinking is valuable to discover how complicated it actually is to say that someone is happy. The authors worry that aiming for the happiness of children leads to a curriculum that is too confined. Smith, for instance, fears that activities that are demanding and painstaking will be excluded, because they can have a negative influence on the happiness of children. Activities such as the close reading of world literature or solving challenging mathematical or logical puzzles can, however, be important for the development of children. Moreover, the focus on the happiness of children takes away attention from the things that we accomplish and in which we take pride (not in ourselves). All in all, according to Smith a focus on positive emotions "does no kind of justice to the variety of what we pursue, value and find worthwhile" (2009, p. 199).

The objective theories of well-being, however, could also be criticised. For, don't these theories lead to unjustifiable paternalism by restricting the freedom of children too much in light of their development into flourishing persons and is there not a danger that they lead to too demanding educational practices in aiming for optimal development which might lead to distress in children and loss of the feeling that they are loved for who they are (not what they achieve) (see Rosati 2006 for a defence of the latter)? These are real challenges for those theories, although it should be said that the authors I have presented as defenders of these theories take this potential point of critique seriously and stress the importance of childhood well-being too (see, for instance, White 2011).

## Policy, Governments and Society

The well-being of children during their childhood as well as their well-being in the future does not only depend on the efforts of their educators and themselves, but requires an environment in which they are able to thrive: a safe neighbourhood, caring communities, motivating leisure groups and a safe and just society. Moreover, peers, the media and the consumer industry potentially have more effect on children's

individual (conception of) well-being and their possibilities to live a life as they believe is best. However, I have to confine myself and will focus on the agent that should have the well-being of children in mind, i.e. the state.

Since a several years states increasingly express their concern for the well-being of its population. Against the dominance of economic values, it seems an improvement that governments have followed the example of Bhutan and are now not only interested in the gross national product but also in the Gross National Happiness of their country, i.e. the level of well-being of their citizens and their own contributions to citizens' well-being through their policies. Furthermore, national and international surveys, comparison between countries with regard to the state of the well-being of children and adults (see, for instance, Huppert and So 2013), appear in the media and academic publications. These reports do not only measure the level of positive emotions but also ask for respondents' evaluation about the extent to which objective aspects constitutive of well-being are present in their lives, i.e. autonomy, competence, engagement, meaning and purpose. As such, the reports are based on a mixed theory of well-being. Nevertheless, how should these outcomes be evaluated? – is, for instance, the fact that children in the Netherlands are the happiest in the world a good outcome or should we worry that certain challenging but educative things are missing like Smith suggested? The answer to this question not only requires a careful analysis of the data but of course also depends on the well-being theory one endorses.

Education for future well-being and the well-being of children requires an active role of the state. The state has a legal duty to ensure that children's welfare rights are met (given the CRC). However, what this means and what the policy implications should be is dependent on the conception of well-being. Even rather basic parental decisions, for instance, about how money is being spent in the family, what children eat, how much freedom children are given to venture into a city, a park or forest, are dependent on normative assumptions and therefore subject of discussion. Providing basic information about health and well-being of children and offering upbringing courses that further parenting skills to foster the well-being of their children might seem neutral with regard to conceptions of well-being and are therefore embraced by liberal states, but they are not. This is not to say that offering these courses or even forcing parents to take such courses could not be legitimated on the basis of the well-being of children. However, the conception of well-being underlying the information and courses needs to be justified. And maybe the state should do more. While positive emotions theory seems to have the advantage that it could lead to a relatively neutral state policy giving individuals freedom to live life as they believe to be the best, this may be detrimental to (future) flourishing of many children. For that reason the capability approach developed by Sen and Nussbaum, which is a more minimal account of objective well-being in the sense that it does not describe ideals of well-being or flourishing, but the "central requirements of a life with dignity" (Nussbaum 2006, p. 75), is defended as not only a better conception of well-being underlying state policy but also a more just one.

The state can also contribute to the flourishing of children through (the education in) schools. Funding schools that provide high-quality education to all children is

certainly conducive to the well-being of children. But there are other ways too: states can support schools to provide additional care for children from deprived areas, they can develop policy for the education of talented children and children who need additional support, and states can implement policy that promotes the well-being of all children instead of only those who belong to the wealthy segment or the majority population. The content and justification of the policies require reflection from the perspectives of the well-being theories described (as well as of course an elaboration of theories of justice). This is where the work of philosophers of education, of which I gave several examples, is of import.

Finally, the focus on well-being has been criticised for being too individualistic. It is argued that the general good of society and communities has suffered, which is an increasing worry of many Western states. This evaluation of course depends on the conception of well-being proposed. This is clearly untrue for neo-Aristotelian virtue ethicists; the idea that people can be said to be flourishing persons without being good to others and society is in their view a (conceptual) mistake. Moreover, the examples of most well-being theories (except unconditional hedonism) I have given in this chapter underline that parents and schools should also equip children to help others to live a life that is personally flourishing to phrase it in Reiss and White's terms. This is also true for the positive psychologists, although they do justify being moral on the grounds that it leads to the happiness of individuals. However, states do have to reflect on the conception of well-being underlying their policies and the effects on (young) citizens. Thus, there is still much work to be done in reflecting on conceptions of well-being, the implications for upbringing, education and state policy. Philosophers of education won't be out of interesting and challenging work in the near future. That is certainly conducive to their well-being.

# Care and Justice

**Liz Jackson**

Is it more just to act based on compassionate care, or on the logical application of ethical principles? And which should be taught to young people in a society? Contemporary debates over issues related to care and justice in philosophy of education are rooted in the continuous examination of the roles of emotion and personal relationships in moral reasoning in the history of Western thought. The prioritization and positioning of care versus justice in activities of reasoning and relating to others have significant implications for moral education and related fields such as civic, social, religious, and emotional education, as well as for development of educational policy. Therefore, educators and ethicists have deliberated on care and justice at length in Western philosophy, as well as in Eastern and other international traditions.

This chapter explores the major debate over care and justice historically and today in philosophy of education. First the debate is situated in Western ethics, before turning to contemporary concerns and approaches within philosophy of education. I discuss accounts of justice with a restricted role or no role given to care, emotion, and relation very loosely as ‘liberal framings’, though space only affords for a limited review of some of the most noteworthy and significant elaborations stemming from the liberal or Kantian tradition of ethics and epistemology for contemporary ethical and educational theory. Then I move on to what I describe as ‘care theories’, though I again use this term simply as an umbrella for views that give a more significant role to care, emotion, relationality, and related concerns in ethics and educational philosophy, that offer an alternative to liberalist views. (There is not space here to give a more comprehensive account specifically of care theory.) The chapter then briefly considers international (non-western) approaches

and analyses of relevance, particularly major Eastern traditions, as they intersect and contrast with Western views.

As this exploration demonstrates, the debate over care and justice in philosophy and in philosophy of education is not likely to be resolved to all parties' satisfaction any time soon; indeed, it is likely to remain or become more significant in the future, given the rising popularity of psychological approaches to emotional and moral education, alongside a renewed focus on global citizenship education in the last few decades and other modes of education for intercultural 'living together'. Rather than indicating a preference for one perspective over another in relation to these ethical and educational debates, this chapter aims primarily to lay groundwork for further examinations about the places of care and justice in educational theory.

### **Philosophical Precursors: Justice, Benevolence, and Passion**

Although some educational scholars emphasize the place of 'cold' logical rationalism in Western philosophy, the roles of emotions and relations in moral reasoning have continuously been considered and analyzed as complex by Western theorists. In one sense the history of Western ethics is one of delineating human behavior that is based inappropriately on passionate whims, irrational impulses, and undue self-interest from a more generalizable (and educative) guide to acting morally in society. Stoicism is one of the earliest traditions known for a concern with resisting action based on "passions" (emotional responses and impulses) or personal attachments (or fears) (Batzly 2014). However, the Stoics did observe the value of experiencing good feelings, such as warmth toward others, and they gave a role to emotions, if a limited one, in relation to appropriate rational judgment (Batzly 2014; Nussbaum 2009; Kupperman 1995).

Plato and Aristotle considered the roles of justice and benevolence in individual behavior within an approach that is now known as virtue ethics (Steutel and Carr 1999). In their writings (and in contemporary virtue ethics), benevolence and justice both are considered virtues. The manner in which one acts in accordance with their scalar stipulations (i.e., how to be appropriately just, benevolent, caring, compassionate, fair) is through applying *phronesis*, practical wisdom (Hursthouse and Pettigrove 2016). Moral behavior seems grounded in rationality in this approach, with the roles of compassion and kindness somewhat deemphasized in relation to justice. As *phronesis* is separated from practical skill (*techne*) in developing the independent or autonomous capacity for moral judgment (at least in the bulk of Aristotle's accounts), techniques of modeling and dialogue are considered pedagogies for cultivating *phronesis* and thus for the habituation of appropriate virtues of justice and benevolence (Carr and Steutel 1999).

The place of benevolence versus justice in ethics was also debated in the Enlightenment era, by thinkers such as David Hume and Immanuel Kant, who both identified how these virtues or moral principles could operate in tandem or be in conflict. For Hume, benevolence was regarded as more natural than justice as a

virtue, and he allowed that justice might be superseded by mercy in times of emergency (Hume 1751/1983; Wallace 1999). Good will and justice took priority over benevolence in much of Kant's writing, and Kant grappled continuously with the relationship between feelings (particularly those related to or influenced by dogmatic political and religious instruction) and reason within a just society (Blum 1980; Nussbaum 2001). In his early writings Kant was clearly influenced by sentimentalist approaches (including Hume's) and articulated how a kind of moral feeling was at the base of morality (1797/1996). He argued in relation that people should observe the situations of those who are disadvantaged around them in order to appropriately develop their orientations toward justice (Blum 1980). However, in much of Kant's later work he emphasized the dangers of being overly driven by sympathetic or benevolent feelings, even by what might otherwise indeed be appropriate moral feelings or senses, rather than what he identified as universalizable reason, which he ultimately saw as the proper foundation for moral feelings (for an overview, see Denis and Wilson 2016).

Kant's work on different formulations of the categorical imperative, principles to guide behavior which are justified only as they can be applied universally to all situations (according to the first imperative), became exemplary of deontology, as his imperatives were derived from logical analysis, apparently unswayed by emotions or relations, in order to determine what justice demands. Among Kant's formulations is that one should never use another as a means to achieve his or her own ends, but always treat others as ends in themselves (1788/1996). While this hardly excludes the possibility of care, this claim has a controversial legacy today due to its individualistic approach and basis in rationally derived duty. Analyses of the roles of relational feelings as helpful or detrimental for conceiving best actions and procedures of decision making for enhancing social justice have developed further in recent years.

## **Contemporary Analyses of Care and Justice in Ethics and Education**

### ***Liberal Framings***

Given Kant's influence particularly in the areas of deontological ethics and liberal political theory, Kant (or Kantianism) is frequently interpreted as emphasizing rationality over emotion, and individualizing ethics to the neglect of appreciating the roles of community or relationality (e.g., Noddings 2010). Kant's own writings are complex on these issues, as discussed above. However, a tendency toward rationalism and individualism is clear in much contemporary liberal theory, particularly John Rawls' (1993) *Political Liberalism*. This work laid out another well-known approach to devising ethical principles in a liberal society without relying on feeling or relation, which apparently aimed to adapt Kantian deontological ethics to the

context of the diverse modern nation-state. Under what Rawls termed the “original position”, a person attempts to devise principles of welfare, order, and justice in society while wearing a “veil of ignorance”, which entails being ignorant of one’s own position in society, in relation to other people and to its laws and principles (1993).

Similarly framing concerns with the role of care in human relationships and in the public sphere in terms of duty, Thomas Nagel (1970) articulated and defended benevolence in moral life in terms of “pure rational altruism”, which he regarded as a “rational requirement” to altruistic duty lacking emotional motivations such as benevolence, sympathy, love, or even “generalized affection for the human race” (p. 3). Inspired specifically by Kant (as Rawls also was) in this writing, Nagel emphasized in justifying his work the risks of sentimentality in valuing care and affection for others relationally, over duties toward regarding people as ends in themselves and otherwise aiming to deliberately enhance the positive functioning of society, overall.

There are many significant implications for philosophy of education in relation to such approaches, but of particular relevance to this chapter is that they imply that ethics and justice are not matters of interpersonal relations or attachments, but are ideally developed when seeing people as appropriately self-interested, reasonable individuals, operating autonomously within a public sphere. As Rawls writes in elaborating his view, feelings should not be “reasons in matters of...basic justice”, while what he identified and promoted as *political* virtues and conceptions “must be distinguished from the virtues...appropriate to roles in family life and to the relations between individuals” (1993, p. 190; p. 195). Such principles as are derived from neutrality and impartiality with regard to personal feelings and relations are those that Rawls (2001) claimed should also specifically guide young people’s moral education, according to *Justice as Fairness*. (These claims depart from Kant’s skepticism of the state or mainstream society’s role in developing young people’s conceptions of ethics and reason; Jackson (2007).)

Outside political philosophy, psychologist Lawrence Kohlberg (1981) drew an account elaborating Rawlsian points as a description of the ideally decreasing role of emotion in the development of human moral reasoning, posing basic impulses of fear and self-interest (his “level 1”) and a focus on relationships (“level 2”) as linear developmental precursors to young people’s development of “rational”, “universal ethical principles” (“level 3”) (Crittenden 1999). This notion of natural ethical developmental stages (though not all people would pass all of them, according to his view) became highly influential in thinking about moral development in education. A normative implication of this model (which Kohlberg described as Kantian-inspired) was that impartial rationality is ideal, and that educators and others should therefore make use of interaction and the environment to scaffold or guide youth through these steps (1981; Crittenden 1999). However, although Kohlberg referenced observational studies on cognition in drawing his claims (influenced as well by Jean Piaget’s work on cognitive development), empirical justifications for them, from his own or from other psychological studies, have been quite limited (Crittenden 1999).

These views have met with various criticisms, which will be examined in depth in the next section. However, this thread of ethical and educational thought remains prominent and continues to see significant development in philosophy of education. In particular, Eamonn Callan defends distinguishing and prioritizing rationality in matters of social justice over emergent alternative approaches that emphasize relational care, offering another liberal, individual-based view, in *Creating Citizens* (1997). In this text, Callan first discusses a case where a wife wants to learn to read, and her husband initially forbids her, but finally accepts her wish. Callan suggests here that whether the husband's decision is related to love or his wife's rights should make a difference in evaluating the case morally, as a "fundamental part of our self-conception is a worth we possess that does not depend on the affection of others" (pp. 80–81). He then interchanges this story with one of a slave's request of freedom from a slaveholder, to articulate that a priori rights and duties to protect them should come before caring in social justice, as to be freed out of love would remain degrading (Jackson 2014). Callan's work notably echoes Kantian concerns here, with regarding people as ends as themselves as a foundational ethical requirement over other values such as emotional care.

In sum, normative and descriptive cases have been drawn in historical and contemporary liberal frameworks to articulate matters of ethics and justice as separate from, and limited by, concerns with interpersonal and relational caring and feelings. By implication, education should be about political and rational principles and attitudes, rather than emotional or relational conceptions. The educational goals would be to enhance students as ideally impartial autonomous rational agents who apply objective principles, and to otherwise frame educational policy with reference to such universalizable political conceptions of justice (for more on this, see the chapter on Rawls in this handbook). The next section considers in detail critiques of such frameworks, and alternatively developed recent views that give a greater role to emotion, affection, and relationality, in what are sometimes known as 'care theories', in conceiving of social justice and ethics in education.

## *Care Theories*

Recently ethicists and educational theorists have posed alternative accounts of traditional interpretations of and conceptions within Western thinking about the relationship between justice and care. Relatedly, emergent theoretical framings of the relationship between justice and caring that markedly expand the role of care have influenced contemporary educational theory and practice in significant ways. To start with the former thread, Lawrence Blum (1980) and Martha Nussbaum (2001) read notably Kant differently from thinkers like Rawls and Nagel (and Blum responds directly to Nagel, and his understanding of Kant), to give a more significant place to feeling and interpersonal care in his ethical theorizing and conceiving of justice, while conceding that perhaps he was exaggerated in his concern regarding "dramatic and intense feeling for its own sake" (Blum 1980, p. 153). Nussbaum has

also defended the normative account of social justice offered by Stoicism (2001, 2009), arguing, as Joel Kupperman also has (1995), that most interpretations of the philosophy are overly stony, as Stoicism appreciates the place of emotional feelings such as of kindness and warm toward others in ethical reasoning.

Blum and Nussbaum also share an educational interest in identifying a role for emotion and care in conceptualizing the requirements of social justice, as both argue that when a person has positive feelings toward others, of care, concern, and affection, this can lead to benevolence in line with justice. As Blum writes, “a sympathetic, compassionate person is more likely to act to foster the good of others. This is part of what it means to be sympathetic and compassionate, insofar as these involve dispositions to have certain emotions, and these emotions involve a disposition to act for the sake of the other’s good” (1980, pp. 132–133). He further argues, in explicit contrast with Nagel (and contrary to Callan, as discussed previously), that feelings like sympathy enhance a totality of good that is given through altruistic acts, regardless of duty, or the consequences (or lack thereof) of such acts (1980). Blum references Kant in relation, recalling how Kant argued that one should learn about the experiences others face of disadvantage in society to develop compassion.

Nussbaum similarly defends compassion as a primary motivator of altruism, identifying love and care toward family as “indispensable...for an adult’s ability to do good in the wider world of adult social concern” (2001, p. 321). She also posits (2001) as one implication of her view that people should read multicultural literatures in this case, to develop their productive sense of human relation, empathy and compassion. She elaborates that the cultivation of these emotional experiences of the world are among various capabilities she regards as vital, within a larger framework she has developed for understanding what justice demands in relation to social policy and welfare (1995). Kathy Hytten (2008) has drawn on this work to elaborate compassionate global citizenship education as vital to help students appreciate and work to ameliorate the roots of social injustice rather than merely address their obvious symptoms through such acts as volunteering.

Nel Noddings has also articulated how from both empirical and normative perspectives it is intrinsically good to teach young people in ways that cultivate their capacity for happiness, as it links to justice and as happy people are unlikely to act cruelly rather than with benevolence toward others (2003). Her work developing care theory has also been ground breaking in philosophy of education, as a substantive alternative account of the role of emotions and relations to ethics and justice. This work began with the text originally titled *Caring: A Feminine Approach to Ethics and Moral Education* (1984), changed in 2013 to *Caring: A Relational Approach to Ethics and Moral Education*. In this text, Noddings argues in contrast to liberal framings that human relations of care, rather than ideals of individual agency and autonomous reasoning, should be seen as the foundations of justice.

Noddings’ work on care is partly inspired by Carol Gilligan’s feminist critique (1982) of Kohlberg’s theory of moral development as a descriptive account (Noddings 2010). According to Gilligan, Kohlberg’s theory excludes the experiences of women in moral thinking, which is characterized by care rather than by

separation and independence (1982). Picking up this thread, Noddings emphasizes how in the history of Western thought, ethics has often devalued women's experiences. To justify her view, she observes that Ancient Greeks and Stoics modeled virtue and wisdom with reference to warriors, while Kant dismissed women as moral agents in some writings due to the role of love and care in their activities (2010; p. 173; p. 109). Against this backdrop she articulates that relations of care and interdependence are fundamentally important to human development and flourishing despite being overlooked by philosophers (2002). In her terms, the "one-caring" and the "cared-for" play vital roles in a relationship with each other, recognizing and responding to each other reciprocally (Noddings 1984; for more, see also Verducci, this volume). Caring requires being attentive, responsive, and respectful in Noddings' view, which thus clearly positions emotion and relation as key to justice before any sense of individual agency, autonomy, and neutral or impartial action.

Many major educational implications derive from this perspective that contrast with those undergirded by liberal framings. First, people should learn to care for each other in education, because caring relations at home are foundational to living a good life (Noddings 1984, 2002, 2003). This would warrant changes to most contemporary curriculum, which give a fairly limited (and often hidden) role given to emotional life of students (Noddings 2003). Relatedly, schools should be caring places as institutions, where educators are seen as responsible not just for teaching content but also for caring for and developing caring relations with and alongside students (2002). This means educators should attend to young people's needs, emotional, psychological, and physical, as well as intellectual, in schools. Though Noddings signals that the caring interpersonal one-on-one relation should primarily undergird ethical thought (which echoes in Nussbaum's work, which also argues that compassion begins with direct relations, before branching cross-culturally), Noddings also suggests that "caring-about" distant others around the world may be the "foundation of justice" (1999; Jackson 2014).

In an era when educators have become increasingly concerned with the role of emotions and positive relationships in education, Noddings' relational care approach has been influential within and outside philosophy of education. Daniel Engster (2005) and Sigal Ben-Porath (2008) have further considered global dimensions of Noddings' view, exploring how the relational values of justice of attentiveness, responsiveness, and respectfulness can inform notions of international interrelation and interdependency. Such work thus has implications for curriculum and policy related to education for sustainable development and global citizenship education (Jackson 2014). Theories that further articulate relations in educational theory and in classrooms and interpersonal attention and recognition in student-teacher relationships also stem from a caring and relational, rather than liberal approach to social justice in education (e.g., Bingham, 2008).

Care theory approaches also intersect with and mutually reinforce recent work in psychology, educational psychology, and moral philosophy that articulates a link between justice and individual (relational) cultivation of positive feelings. Such work has considered how emotional dispositions, interpersonal and social feelings,

or virtues enhance people's sense of fulfillment and therefore their capacities for altruism and benevolence. Such feelings include gratitude (Jackson 2016), altruism and compassion, happiness, thankfulness, contentedness, fulfillment, and more. As Noddings (2003, 2010) concedes, the implications of this line of research, which has become popularized in the midst of a Western (particularly American, sometimes neoliberal) embrace of positive psychology (which focuses on good psychological states rather than problematic ones), are difficult to systematically evaluate: It is perhaps impossible to make generalizable causal assessments of the relationships between variables such as different feelings (given different conceptualizations of feelings in use) as they interact with each other in shaping behavior. Nonetheless, philosophers and psychologists continue to draw on each other's work to make descriptive and normative claims in this area regarding how good feelings and feeling good lead to being and doing good (Ahmed 2010).

In addition to critiques of care theory approaches that aim primarily to reassert and/or defend the aforementioned liberal framings (as discussed here, these typically argue that the individual and individual ends and impartiality should come before all else), other concerns with care and relational approaches have been raised. One thread of criticism examines care theory and relational approaches as descriptive accounts. As Nussbaum (2001) and Noddings (2003) both have conceded, developing young people's emotional and relational aspects does not necessarily lead to their becoming good people and serving just ends. People can care too much or inappropriately. Relatedly, one can have good feelings while acting unjustly (Noddings 2003; Carr et al. 2015). Thus, something like wisdom or independent evaluation remains important for cultivation of justice in individuals, even if feelings have a significant role. Some also argue that feelings cannot be controlled and therefore are difficult to teach, as the effectiveness of emotional education is a complex area to research. Noddings (2003, 2010) has considered these possible limitations and challenges and their implications for educational contexts substantively in her later work.

As normative accounts, concerns have been raised that care theory and other relational approaches that emphasize feelings in social justice education can risk inappropriately impacting feelings for instrumental means (Carr 2013). Such accounts suggest it may be immoral to teach for feelings, such as gratitude, to achieve external ends apart from the judgment or desires of individuals (Morgan et al. 2015; Jackson 2016). While this particular charge may find resonance with liberal views, the politics of educating feelings and of telling people how they should feel, purportedly for just ends (including 'one's own good'), has also been theorized from critical angles by Megan Boler and Sara Ahmed. In *Feeling Power* Boler (1999) observes how emotional education has been used over time in ways that may unjustly stifle some young people based on identity factors such as gender and social class. She suggests that such emotional training and related expectations regarding students' emotional expressions may not be in students' best interests or serve justice as they intend.

Ahmed examines the politics of affect in *The Cultural Politics of Emotion* (2004) and *The Promise of Happiness* (2010). Ahmed defends 'feminist killjoys' and 'melancholy migrants' in these works, as groups of people who are informally

socially punished for emotions of care related to injustice based on gender and culture, respectively. Ahmed articulates emotion as affect in her work, as feelings that circulate in communities through relationships. Because all are not equal and people do not share basic interests in terms of social policy in Ahmed's view, expectations that one should be happy and grateful and therefore neglect witnessing and focusing on (i.e., caring about) injustice function in communities to maintain injustice, and make those who are suffering from injustice internalize their sense of harm (Ahmed 2010). This work thus takes a critical view of how feelings and relations are educational, often to maintain injustice. Ahmed particularly objects to the notion that cultivating happiness in relations is for the best, from this view. Relatedly, Barbara Applebaum has suggested that women can care too much within gendered relations, and that any feminist account of care should not regard it as intrinsically good, but should be informed by an analysis of how gendered and other forms of domination can and do also occur in relationships (1998). Such works thus recognize the problems and limitations of relations and relational approaches to justice and education that can be obscured when only their positive potential is addressed.

Related to such criticisms, such notions of care as generally good, as described by work like that of Noddings (and related ideas within Nussbaum's capabilities approach), have been problematized for their distinctive Western cultural orientations, with some thinkers questioning their relevance or resemblance of the theories to the norms of emotional expression and appropriate social relations in other cultures and parts of the world (Noddings 1999; Kang 2006; Okin 2003; Jackson 2014, 2016). These criticisms reintroduce the question of universalizability of any foundational approach to conceptualizing justice, whether from virtue ethics, deontology, or relational accounts. The next section turns to international (non-western views) related to justice and care in education.

## **Non-western Views**

It is not possible to explore fully all of the major international and non-western views of care, justice, and education in the space of this chapter. However, some noteworthy recent work has considered convergences and points of contrast across major Western and non-western threads. This section begins with examining some of the work undertaken to identify relevant Eastern and Western ethical connections before discussing other noteworthy non-western trends.

### ***East-West Connections***

Among Eastern traditions of thought, Confucianism, which continues to have relevance in many Chinese cultures particularly in East Asia today, focuses on relationships as key to justice, in parallel with care theory approaches. Though sometimes known

for their focus on hierarchy (and now with Chinese societies' possible overuse of social networks, *guanxi*, in decision making), Confucian approaches to ethics share with virtue ethics a concern with situational analysis, dialogue, context, and evaluation of various significant values in making independent autonomous judgments about what is the right. (See Sen 1999, for a systematic treatment of the relationship between Confucianism and Western liberal thought.) Articulations of the importance of rationality and critical thinking can be found in works by Confucius and Mencius that focus on moderation in line with contemporary virtue ethics approaches (see Lam 2014; Cheng 2002; Shaw 2014). Criticality toward blindly accepting universal conceptions or principles put down by government institutions is also defended in some Confucian texts, which emphasize relationships stemming from family to community as more significant than abstract rules or social contracts in serving justice (Sen 1999; Shaw 2014).

One possible departure of Noddings' work on relation from Confucianism regards the latter's well-known focus on filial piety (also valued in Chinese Buddhism). Filial piety emphasizes youth's roles in caring for and respecting elders, while Noddings indicates reciprocity of the 'cared-for' and the 'one-caring' (in contrast to there being no role or agency of the 'cared-for'). However, these may be different emphases rather than contradictory approaches, as filial piety seems to assume care on the part of parents and elders. It is not, as is sometimes assumed, a matter of universal law or blind obedience to practice filial piety according to Confucianism, but rather it should be seen as a virtue or value to be considered within a situation. Furthermore, while Noddings' care requires attentiveness, responsiveness, and respect, filial piety (and *guanxi*) ideally incorporates critically reckoning with relations and context in the first instance. Thus, the value of filial piety and related concepts such as *guanxi* in Confucianism seems complementary to care approaches, as relationships of people to each other are held as foundational in both for guiding ethical social practice.

On the other hand, the emphasis on decreasing attachments and strong passions and desires for others in relations is shared cross-culturally in the philosophies of Stoicism and Buddhism. Buddhists are known for the aim of releasing one's desire for material goods and personal affections, in a way of life that emphasizes balance and a holistic sense of oneness with the metaphysical world. Kupperman (1995) relates the two philosophies explicitly in considering ideal conceptualizations and practices of altruism. He argues that neither Buddhism nor Stoicism are stony, cold philosophies, as they are sometimes portrayed. According to Kupperman, both approaches encourage and promote what he describes as a limited, partly emotional altruism, as he relates "*apatheia* with 'spiritual peace and well-being'", to "Buddhist discussion of 'the joy of quietness'" (1995, p. 127). Echoing with Nussbaum (2009) and Blum (1980), Kupperman identifies emotional care and attachment as inevitable, good parts of life and he sees them being incorporated appropriately into the epistemologies, ontologies, and methods of deriving goodness and justice of Stoics and Buddhists.

Peter Roberts also finds much resonance between Western works and Eastern philosophical traditions, particularly Taoism and Buddhism. In *Happiness, Hope,*

*and Despair* (2016) he observes parallels lessons on emotion, moral reason, and education within Hermann Hesse's *Siddhartha*, the Greek classic *The Oresteia*, and the philosophy of Simone Weil. As he notes, all three consider pain, pleasure, and desire as significant in education, regarding education as moral or spiritual cultivation rather than just basic curriculum. In each strand of thought, Roberts (2016) finds an emphasis on striving for focus and attention and enlightenment that is borne out of experiencing pain, loss, and joy, and learning to appreciate the significance of the world of people and things in relation to oneself. Cultivating peacefulness through experiencing the world around oneself and better understanding and appreciating one's relatedness to the world and others is thus seen as key across these traditions, as opposed to busying oneself with rather more small-minded wants and desires.

Other thinkers have considered how caring and moral feelings and affects are shared or contrast across educational contexts of East and West. SoYoung Kang (2006) has explored care theory comparatively across cultural categories of white, black, and Korean. In her analysis, she recommends that educators practice a multicultural form of care theory that recognizes and appreciates significant differences in expressions and relations of care across cultural communities, viewing their understandings of care as significantly different in everyday practice. Furthermore, she argues that intersectional identity markers should be considered, of race, class, gender, and more (as caring may look different based on gender relations in Korean culture, in her view), when it comes to developing caring relations in educational settings. Such comparisons of East-West reveal diversity within cultures as well as similarities across cultures, and the need for nuance in applying care and relational approaches as an educator.

### *Other Non-western Views*

Amartya Sen (1999) observes in comparing Western liberalism with Chinese political theories how both struggle with such issues as private versus public relations and the source of (ethical) authority as individual, community, or politically (nationally) based. Embedded in these debates is grappling over issues including the role of care and emotion in reasoning and decision making. A similar analysis might be undertaken with religious traditions, such as Islam and Christianity, which would reveal the ways that throughout their histories leading thinkers in each tradition pondered over emotional and familial attachment versus rationality and individualism in guiding behavior and creating conditions for justice. For instance, early Christianity history features much wrestling with the appropriate place of marriage and love for a good Christian, as personal attachments were often seen as dangerous distractions from leading a Christian life, as they often are seen today in Buddhism.

Another increasingly well-known non-western approach to social life is the southern African philosophy of *ubuntu*, which is known today for its principle of human interrelatedness as foundational to justice. Like *guanxi* it is being critically

reconsidered by some in southern African societies today, as it has been seen to enable overreliance on clannishness, tribalism, and nepotism in some cases. Yet its primary emphasis on the oneness and interdependency of humanity has gained global attention recently, after US Department of State Representative Elizabeth Bagley (2009) introduced the notion of “*Ubuntu* Diplomacy”, which she argued bridged Hillary Clinton’s “it takes a village to raise a child”, with Desmond Tutu’s statement that *ubuntu* “is not ‘I think therefore I am.’ It says rather: ‘I am human because I belong’”. Often framed as, “a person is a person through other people”, relations of people to each other are primary in *ubuntu* philosophy. In addition, it is often held that *ubuntu* reflects a communitarian spirit of southern Africa, in contrast to an individualistic liberal attitude in relation to social justice (Eze 2010). Arguments regarding how relations of care within communities may be key to justice can also be found in Native American philosophy and in much other Indigenous thought around the world. Exploring foundations and contemporary developments in these and other strands of international philosophies can contribute to new understandings of how care and justice are conceived and reconceived the world over.

## Conclusion: Looking Forward

The role of care in justice has been explored and debated across philosophical traditions for many centuries, and it is likely that it will be continuously explored in the future. As this debate pertains to the proper way of moral reasoning and ethical decision making, it is undoubtedly important for educational policy as well as curriculum in numerous ways. For instance, what social, noncontent based services and skills schools should provide students; whether and how to organize international educational exchanges and service learning trips; how to treat different students and young people at interpersonal and institutional levels; and what it means to be a global citizen or to educate for sustainable development in the future are all issues which must be decided (and reformed, continually, in various contexts...) with attention to whether or not and to what extent relations of care versus individual rights and autonomous judgment are cherished.

Additionally, curricula with moral and emotional components that reflect a caring approach are on the rise today across educational systems. Often informed by positive psychology, such curricula tend to unify and homogenize concerns internationally with student happiness and wellbeing, which are increasingly seen as important alternative indicators of social development and progress, in line with a capabilities orientation. While this particular trend is not very controversial today (as it is regarded as a way to address school-based bullying and violence in much of the West, and student mental health disorders and suicides in East Asia, as examples), it is based in a care theory approach to socialization and education. The limitations and variances of care theory approaches from individualist liberal priorities will likely be seen to merit critical consideration as such movements continue to unfold. (Emotional education, after all, has often been held suspect historically as a form of

indoctrination or brainstorming by many thinkers in the East and West, depending on the social context.)

Furthermore, how to examine and promote individuals' and communities' well-being raises questions about what it means to care and to be well across cultural contexts, as well as questions about in whose interest global curricula of care truly serve (relating the issue back to the nature of justice). As questions over the role of the state and other elites in education, and about what it means to be well, individually and among others are additional intersecting, perennial questions, we may continue to look backward as we consider new circumstances and revisit periodically the relationships of care and justice in education.

# Theorizing Ability as Capability in Philosophy of Education

Ashley Taylor

## Introduction

This chapter traces ‘capability’ as a topic of educational concern and ongoing debate, exploring what is meant by the philosophical concept of ‘capability’ in the international lineage of educational philosophy. Its purpose is first to clarify and situate the meaning of ‘capability’ within historical and contemporary debates within educational philosophy, and, second, to explore the relationship between specific philosophical accounts of capability and the notions of educational equality and social justice in education.

The term ‘capability’ is conceptually rich and linked to considerations of opportunity, ability/disability, agency, and freedom; to be educationally capable is to have an educational opportunity, an educational ability, or an educational freedom. As I will discuss, capability can be distinguished from ‘capacity’, which tends to refer to an intrinsic state of bodies or minds, rather than a learned or acquired state. Beyond its more broad conceptual meaning, the term and concept of ‘capability’ has been used by philosophers of education to refer to a specific theoretical framework for thinking about educational justice and equality. Usually called the Capability/Capabilities Approach or Capability Theory, this framework developed out of the work of Amartya Sen and Martha Nussbaum, and has recently garnered considerable attention within the field of educational philosophy. At the same time, the concept of capability is understood more broadly in terms of the power or potential of individual students relative to the interaction of their individual capacities with educational environments, access, and opportunities. Literature within philosophy of education that considers capability in this latter, more general way looks at the role of educational institutions, structures, and practices as enabling and disabling social

forms and considers the limiting effects of categories of difference related to individuals' perceived and assessed capacities. As I will discuss, these two areas of research are linked by the question of what forms of education enable students of varying abilities to develop the capabilities to live good lives.

## Historical Emergence of and Changes in the Topic as an Educational Concern

In a very basic way, 'capability', or the power or potential to do something, is a most fundamental concern of educators and educational theorists. Through schooling, students develop skills and abilities that enable them to pursue future educational, career, and life opportunities. Ability and capability are therefore linked as concepts through a complex relationship among individuals' bodies and minds and the schooling and social environment in which they develop. Whether a student develops the power to do something is dependent on a variety of factors, including their physical, cognitive, sensory, and psychological abilities at a given point in time, the resources available to them, the beliefs and attitudes of educators and society more broadly, and, certainly, the social arrangements of institutions.

In the field of education more generally, global changes in the legal and policy approach to special education and disability services have begun, albeit often slowly, to bring sustained attention to differences of ability – or disability – as a concept. It is not an overstatement that people understood as having disabilities have been ill-treated and largely forgotten by institutions of education and educational theorists for most of history. Throughout most of the twentieth century, people labelled with disabilities in North America and elsewhere were warehoused in institutions, historically referred to as training schools or asylums (Trent 1994). In addition to the intentions of many to keep individuals with disabilities "out of sight and out of mind", many educational scholars and authorities operated under the belief that individuals seen as having disabilities required separation and seclusion from broader society if they were to grow and develop (Danforth et al. 2006; Danforth 2009). This emphasis on separation finds its more recent extension in special education practices that segregate students labelled with disabilities from their presumed to be "normal" peers (Ferri and Connor 2006; Slee 2001).

The academic field of disability studies finds its roots in the disability rights movement of the United Kingdom, the United States, and Canada, and most centrally features the argument that models of disability that are based in medical and psychiatric epistemologies, and other 'deficit-based' knowledge paradigms, inadequately and harmfully describe the phenomenon and experience of disability and disablement. Disability Studies (DS) scholars posit that disability is a complex *social* phenomenon and ontological experience, and describe a variety of versions of what is called the "Social Model of Disability" (e.g. Barnes and Mercer 2003; Gallagher 2015; Wendell 1996). Working off of the distinction between deficit-based

and medical approaches to disability, the partner field of Disability Studies in Education (DSE) likewise situates disability within social – educational – processes and paradigms. Most centrally, DSE scholars regard traditional special education and psychological diagnostic and treatment practices as not only detrimental to the educational growth and experiences of students identified as disabled or who differ in some way from what is described as the norm, but also as constructive of the phenomenon and concept of disability itself (e.g. Adams and Meiners 2014; Brantlinger 2004; Connor and Gabel 2013; Erevelles et al. 2006; Ware 2004). In other words, they regard disability as emerging *from* educational processes, practices, and other institutional projects. Both DS and DSE seek to disrupt the centrality of normalcy and the sorting mechanisms and hierarchies of society that rely on normalcy. Rather than being regarded as a deficit, disability is here seen as a difference that can be welcomed, incorporated, and even celebrated within the classroom.

Alongside this growth of a field dedicated to the educational study of dis/ability, the concept of disability in particular has historically been either ignored as a field of study by educational philosophers, or treated as a straightforward concept having clear ethical implications for the field of education. The role of dis/ability in education has only recently emerged as a more centralized concern within philosophy of education, owing considerably to the increasingly influential work of DS and DSE scholars whom I discussed as well as changing international attitudes and legal policies surrounding ‘special education’. Those educational philosophers who do discuss disability specifically have focused most on ethical questions surrounding justice and equality for students labelled with disabilities or who experience learning difficulties in relation to physical, cognitive, psychological, or sensorial characteristics. Many of these scholars work from the tradition of analytic political philosophy (e.g. Ahlberg 2014; Cigman 2007; McCowan 2011). This work is often sympathetic to philosophical liberalism, even while it pushes against the challenges that liberalism poses for disabled lives (e.g. Reindal 2010; Vorhaus 2006). For these scholars, some of the primary questions include: What constitutes equality and equal educational conditions for individuals experiencing or understood as experiencing disabilities? What is owed to students with disabilities as a matter of justice? What educational arrangements best facilitate the learning of students with disabilities? The Capability Approach, which I will discuss in more detail below, emerges from this lineage, in particular as a response to existing views about the relationship between resources and substantive equality, and about the promise and adequacy of liberal theory in accounting for ability/disability.

Other educational philosophers are similarly interested in questions of justice, but often work beyond and outside of traditional analytic political philosophy and liberal theory. Many, including Julie Allan (2003, 2005, 2011), Scot Danforth (2001, 2008), Nirmala Erevelles (2000, 2002a, b, 2011), Deb Gallagher (1998, 2001, 2010), Tom Skrtic (1991, 1995), and Linda Ware (2001, 2002, 2008), work out of or in more direct alignment with the field and lineage of disability studies. Some focus specifically on ontological and epistemological questions surrounding ability and disability, while others conceptualize the relationship among justice, equality, and

the broader cultural, political, economic, and social forces of our particular historical era. Significant questions include: How do disabled subjects emerge through historical moments and technologies? How do transnational economic and political processes – such as capitalism, colonialism and racism, transnational migration – work to produce disability and disabled subjects? How does the field of traditional special education reinforce positivist and deficit-based responses to disability?

## **Predominant Approaches in Philosophy of Education**

The concept of Capability has tremendous international significance, both with respect to its philosophical or scholarly reach and with respect to the implications of that scholarship in international contexts. This is so whether one looks at literature considering capability as a broad conceptual matter and as a specific approach. Studying capability as a broad concept in educational philosophy requires being attentive to both the localized peculiarities and tensions of a particular time and place and attending to the role of broad global forces that shape educational opportunities and experiences. As I will discuss here and in the next section, these dimensions form both challenges to and promises of theories of capability.

The most sustained attention to ‘capability’ in philosophy of education has been through work on the Capability Approach (CA). Applications of CA to educational philosophy have not been confined to questions of ability and disability specifically, and yet rich debates have emerged from dialogue around ability and disability in the field, and the framework has clear implications for many of the questions raised by scholars of disability studies and offers interesting points of overlap. As a framework for evaluating justice, CA emerged as a response to a perceived limitation in liberal philosophical work on justice, notably the work of John Rawls. According to Amartya Sen (1979), Rawls’ account of the egalitarian distribution of resources in society neglected an important consideration of how individuals convert the resources they have into opportunities; that is, it neglected that mere access to resources is insufficient to empower individuals to benefit from those resources. Applying this critique to the context of education, some educational philosophers (see Hart 2009; Robeyns 2006; Unterhalter 2009) have argued that the focus on capability more adequately illustrates educational objectives relative to educational equality. Capability frameworks – in their various forms – have evolved philosophically and in their application to concrete educational (and other) problems. A number of philosophers have used (and challenged) CA in considering questions of educational justice for students with disabilities (Ben-Porath 2012; Hedge and MacKenzie 2012; Terzi 2008; Vorhaus 2013).

In his Tanner Lectures on Human Values of 1979 entitled ‘Equality of What?’ Sen argued that equality exists in the space of capability, or the power or freedom to pursue various beings and doings. Scholars of CA begin from the premise that equality is best measured with reference to what individuals can actually do and be with the materials/resources to which they have access, and the freedoms they have

to achieve their valued ends or goals in life. Educational philosopher Ingrid Robeyns (2005) defines CA as “a broad normative framework for the evaluation and assessment of individual well-being and social arrangements, the design of social policies, and proposals about social change in society” (p. 94). As an outcomes-based approach to equality and justice, CA is concerned with whether means – material conditions, access, resources (financial or otherwise), educational conditions, etc. – are present to allow individuals to achieve their desired ends. This focus on ends originates in two important emphases and underlying assumptions of the approach: that human diversity is an empirical fact relevant to the needs persons have and to their abilities to convert resources into advantage/well-being, and that freedom and the ability to choose are central to human dignity.

Regarding the first of these, when we acknowledge that humans have diverse bodies, mental abilities, inhabit a variety of natural environments and social/political contexts (central tenants of disability studies approaches, certainly), we begin to see how this diversity might be relevant to human differences in the way that we use the resources available to us. This ends-based approach involves considering not simply the resources to which we have access – and their quality and quantity – but importantly the process through which one converts these resources, both material and non-material, into individual advantage, a process we can call ‘conversion capacity’. Conversion factors are broad, and include one’s personal characteristics (physical condition, intelligence, metabolism, etc.), the environment one inhabits (climate, geographical location, architectural design, etc.), and the social conditions of one’s political community (public policies, social norms, discriminating practices, power relations, etc.) (see Sen 2009; Robeyns 2005). For example, a child with a physical disability who attends a well-resourced school might nevertheless face difficulty converting these into a valuable educational experience, whether because of the built environment within which they live, because of teachers’ or peers’ attitudes of disrespect, because of a lack of disability-specific knowledge on the part of educational professionals, or because of the child’s own physical limitations. In evaluating this child’s well-being, then, we must focus not only their resource wealth but the range of environmental and social conditions which they can actually access and utilize.

Another significant factor in evaluating equality and the conditions of social justice is a person’s freedom to pursue his, her, or their valued ends/life goals. The focus, then, is on what people are able to do and be, on their quality of life, and on the removal of obstacles to their freedom to live the kind of life they have reason to value (Robeyns 2005, p. 94). It might help to conceive of freedom in two ways: as the real *opportunity* that persons have to accomplish what they value (usually referred to in the literature simply as freedom) and as the *process* of that pursuit (usually referred to as agency freedom) (Deneulin and McGregor 2010). This is the difference, for example, between a man who lacks access to food and is starving and a man who fasts; while both lack sufficient nourishment, only the former lacks freedom and choice (Sen 2009, p. 237).

An important distinction within Capability Theory is between ‘capability’ and ‘functioning’, where the former is concerned with possibilities or opportunities

(freedom) and the latter is concerned with realized activities (achievements). This distinction is of particular importance in the application to education, as I will explain. Functionings are beings and doings such as being literate, being healthy, participating in one's community, voicing one's opinion, and so on (see Robeyns 2005). Goods help us realize our functionings but are not the same as functionings: having access to books *may* be necessary to developing literacy, but is not identical to the functioning of being literate. Further, functionings are constitutive of a person's being – good health, being happy, having self-respect, etc. – and are thus the objects of any assessment of well-being (Sen 1992, p. 39). The distinction between capability and functioning is significant within the framework because it highlights the central role of freedom; the value of one's functionings is measured in terms of one's capability to pursue those activities one wishes to pursue. However, there are some cases in which capability theorists have recognized that it is achieved functionings rather than capabilities that need to be evaluated in order to measure equality; this is most notable in the education of children, as I will discuss further below.

A number of aspects of CA dovetail with central considerations of disability justice emerging from disability studies and elsewhere in educational philosophy. As Lorella Terzi has discussed extensively (2005, 2008, 2010), CA aligns well with the social model of disability because it acknowledges and centralizes disability (or bodily impairment) as a central feature of human life. Further, ethical questions about the just distribution of educational resources are central to theoretical work in special education, inclusive education, disability studies, and disability justice (albeit ethical questions asked and answered differently within these different fields). CA promises to give clear and guiding answers to these questions. Because any version of CA considers the extent to which a person has access to tools she needs to pursue her valued ends, education emerges as a primary concern; education and social development are, of course, the most important arena in life in which the enabling conditions of future opportunity arise. Some, most notably Martha Nussbaum (2006), have posited threshold levels of capabilities that would guide our evaluations of whether equality in the space of capability is present. In one sense, applying CA to the context of education would seem a natural move: the framework guides our thinking about how to deal with children's physical, mental, and social differences, and offers us a way to evaluate our curricula and pedagogy in terms of its role in enabling the development of capabilities.

Lorella Terzi has provided the most comprehensive analysis of CA's application to education and disability thus far. Terzi evaluates CA in relation to existing research in special education, in the United Kingdom and the United States' disability educational rights legislation and in disability theory-informed inclusive education models. She suggests that CA can answer what she regards as unresolved philosophical problems underpinning arguments for inclusion. The problems, according to Terzi, arise because models of inclusive education that emerge from the social model of disability offer arguments that are "underspecified and often confused" (2008, p. 74). In particular, says Terzi, they "over-socialize" disability by emphasizing only the social and cultural modes through which disability is shaped

and ignore the lived reality of impairment (Terzi 2008, p. 58). According to Terzi, we need to specify clear principles of distribution that are defensible both theoretically and politically and that can inform policy decisions about education. It is important to note that, although Terzi's critique is directed towards the work of a number of influential disability studies scholars, it does not directly address the work of other scholars of disability studies in education whose contributions I referred to earlier. In fact, many of these scholars would likely agree with Terzi's critique of the social model's neglect of the lived reality of impairment (e.g. Connor and Gabel 2013; Erevelles 2011), although they would also likely diverge in their perspective on the implications of that critique for research and practice in disability theory and education.

Terzi argues that CA offers a way to define disability that pays attention to both its social and biological elements. In accordance with CA's emphasis on heterogeneity as a fact of human life, it is understood as a normal aspect of human life, arising out of the interaction between a person and his or her environment, including the built or physical world, social institutions, and social norms and expectations (Terzi 2010, pp. 165–166). Says Terzi: "When impairment interacts with circumstantial elements to determine functionings restrictions, it results in a disability. Disability, therefore, emerges from the interaction of personal and circumstantial factors, and relates to a limitation of capabilities, or a capability failure" (2008, p. 99). As an expected part of life, then, disability's presence does not suggest special treatment, but rather consideration consistent with that for all others. Educational rights for children with disabilities are not special rights, then, but duties of justice owed to all (Terzi 2010, p. 167). The capability approach *normalizes* disability. The distribution of educational entitlements to students with disabilities is supported by CA's prescription that societies have an obligation to secure "the social bases of adequate capability to pursue valued ends" (Terzi 2008, p. 100).

Says Terzi, "The capability approach suggests a conception of a fundamental educational entitlement in terms of the equal opportunities and access levels of educational functionings necessary to function and to participate effectively in society" (2008, p. 155). First, looking at capabilities involves looking at the freedoms or opportunities persons have to pursue those things that they value. Just educational arrangements would therefore involve the conditions necessary for children to develop their own conceptions of the good, their own valued ends. Educational conditions might be thought of as the basic enabling conditions that would include providing the 'transformational resources' necessary for persons to become effective participants in society and to form their life plans and goals. But enabling conditions for the development of adult capabilities might involve not just the opportunity to pursue functionings – one's *choice* of functionings – but rather the actual achievement of certain functionings. Recall that CA is centrally concerned with providing persons with the freedom to choose among a range of functionings according to their valued pursuits. Yet, in the case of children, as Nussbaum argues, it will be the achievement of certain functionings that will enable them to develop adult capabilities. It is for this reason that she defends compulsory education (as well as compulsory health care, for example): "Education is such a pivotal factor in opening

up a wide range of adult capabilities that making it compulsory in childhood is justified by the dramatic expansion of capabilities later in life” (Nussbaum 2011, p. 156). Terzi bases her own view of educational entitlements on this logic: the view “highlights the importance of the prospective educational achievements in terms of levels of functionings necessary to participate effectively in society. This implies therefore a threshold level of achieved functionings that educational institutions should promote and foster, set at the level necessary for effective participation in dominant social frameworks” (Terzi 2008, p. 156). While the emphasis on functionings rather than capabilities does appear *prima facie* to enable better educational standards and outcomes for young people, it is the subject of some controversy, as I will discuss in the next section.

## Current and Recurrent Debates

### *Global Differences and Valued Capabilities*

Among the main areas of ongoing tension and debate is whether a focus on capability can account for the existent range of cultural differences in civic and social values that exists globally; that is, how can capability theory be institutionalized and operationalized within local educational policy in a way that does not perpetuate imperialist injustices? This is of particular concern as Capability Theory is aimed at informing and transforming educational and human development contexts around the world.

In a move that has become a source of conflict between Sen and Nussbaum’s versions of CA, Sen argues that CA identifies a relevant space for evaluating capability and functioning, but is silent on how these are to be weighted or ranked within that space (1992, p. 46). For Sen, an indexing or weighting of capabilities is context-dependent – that is, it will vary by the particular cultural and social context in which equality is being evaluated (see DeCesare 2011 for discussion). Sen is opposed, therefore, to a general or “fixed forever” listing or ranking of capabilities, rather than to a list itself (2004, p. 80). What Sen hopes to safeguard in his defence of a context-specific list is not merely the cultural, political, or social context (which in fact may not be worth preserving) but rather the role of democratic decision-making, “the productive role of public discussion, social agitation, and open debates”, perhaps best expressed in terms of agency, that allows persons to make decisions that affect their lives (Sen 2004, p. 80). Thus, Sen does not see his avoidance of such weighting as a ‘theoretical difficulty’ but rather as a strength of his approach.

Nussbaum, however, does present a list of capabilities and sees this list as a starting point for debate, revision, and, importantly, specification of the capabilities relevant to a particular cultural or national context, with the understanding that decisions about which capabilities are valued to be based in what she calls an intuitive idea of human dignity. She claims that Sen’s refusal to list means that his capability theory lacks “bite” by not endorsing a list (Robeyns 2005, p. 106). In fact, this

disagreement between Sen and Nussbaum encompasses a problem for the approach generally: it raises the problem of the appropriateness or usefulness of a list and it raises the ‘indexing problem’, which is essentially about capability rankings or weightings relative to one another. For Sen, this is a question for democratic decision-making. For Nussbaum, her ten capabilities represent the bare social minimum for a just society and allow no “trade-offs” among the capabilities on her list; that is, a society that neglects one capability in the promotion of another is not a fully just society (2006, p. 75).

I have argued (Taylor 2011) that one way to understand the difference between Sen and Nussbaum’s positions is that they disagree not on listing as such, but rather on *when* to list. Where Sen charges Nussbaum as undervaluing cultural context and freedom (see Sen 2004), Nussbaum questions whether a localized capabilities list can be developed without prior understanding of what should be included. This raises a second problem or tension that persists for capability theorists regarding the process of democratic decision-making. What minimal conditions of fair representation would need to be in place for such localized list-making to justly take place? How do existing conditions of inequality affect the process of democratic decision-making and to what extent do these delegitimize any decisions made about which capabilities matter? These are certainly important and globally complex questions.

### *Individual Versus Structural*

Another area of debate within Capability Theory surrounds the question of whether CA is too individualistic, focusing too much on individuals and not enough on social groups and social structures. This problem relates to the first, as it connects with the question of how to avoid cultural imposition of values. Robeyns suggests that this critique consists in, variously, three possible charges: CA fails to see individuals as socially embedded and connected to others; CA doesn’t pay sufficient attention to groups; and CA doesn’t pay sufficient attention to social structures (2005, p. 107). Robeyns argues that the first charge is simply wrong because CA is concerned with ethical individualism, that is, that the proper focus of moral concern is the individual, but not that only individuals exist nor that individuals, *as* the proper focus of concern, exist as disconnected from social groups and structures (Robeyns 2005, pp. 107–108). CA evaluates the equality of individuals *as* socially embedded. All versions of Capability Theory place a great deal of emphasis on capability as relational – that is, as promoted within relationships among individuals and between individuals and their environments.

So, what about the other two possibilities? Severine Deneulin and J. Allister McGregor (2010) offer a comprehensive argument regarding the role of social groups, social structures, and social meanings in CA. These authors argue that CA’s account of individual freedoms and individual well-being fails to sufficiently account for the way that differences in social power influence our social meanings

which in turn affect the way that persons conceive of their own well-being and valued ends. They suggest that a viable CA – that is, one that could inform work in social policy and in practical application to social matters – would need to account for the ways that individual freedoms and individual well-being are *defined* and *realized* – constituted – through our relationships with others (Deneulin and McGregor 2010, p. 503). Where capability theorists, notably Sen, have argued that human beings are fundamentally inter-dependent and influenced by social and group meanings, Deneulin and McGregor suggest that we are in fact *co-constituted* by these norms and concepts (2010, p. 510). It is one thing, they say, to conceive of persons as socially embedded and dependent on one other; it is quite another to understand that our meanings themselves – how we develop an understanding of well-being, how we imagine and reason about our valued ends – are constituted through our often unequal relationships with others and with social structures. The latter has to do with power.

In what I see as an important aspect of their argument, Deneulin and McGregor consider the way that CA has dismissed the use of subjective assessments of quality of life or happiness in favour of objective assessments – whether people have access to and freedom to access conditions that promote health, education, political participation, and so on. As I discussed earlier, the emphasis on objective assessments is a central part of Sen’s earliest work on capabilities. This objectivist focus allows Capability proponents to reveal the problem of ‘adaptive preferences’, the way that persons adapt psychologically to dire life circumstances. Deneulin and McGregor argue that “This position on subjective evaluations flirts with the murky problem of the ‘false consciousness argument’” which has long been recognized within social theory and social sciences as simplifying people’s day-to-day interactions with their environments (2010, p. 506), and indeed has been used to dismiss individuals with disabilities’ accounts of their own quality of life (see Mackenzie and Scully 2007). However, if we are to acknowledge that such conditions of adaptation – to our social, political, and cultural conditions of existence – are a *constant* and *unavoidable* part of life, we might come to see how social meanings always play a part in what we desire, the values we pursue, and so on. The correct measure of analysis in considerations of social justice would then involve a view of the social meanings of a given society and the sorts of relations of power that persist. It is important that Deneulin and McGregor offer this critique so as to improve Capability Theory, rather than to reject it.

### ***The Relationship Between Capability and Resources***

An important area of contention surrounding Capability Theory in philosophy of education is the question of whether a focus on resources – including opportunities and access of those resources – or a focus on capability better attends to educational needs and educational contexts. These debates focus on two central questions: first, does the focus on capability underspecify the opportunities that are needed for

educational flourishing and second, does the focus on capability provide clear standards on how to approach questions of diversity that demand trade-offs in educational contexts.

In their chapter of the edited volume *Measuring Justice: Primary Goods and Capabilities* (2010), Harry Brighouse and Elaine Unterhalter argue that the Approach has much to contribute to thinking about educational policy and pedagogy, but ultimately claim that it requires the support of a Rawlsian framework of primary goods in order to guide reasoning about educational entitlements. A Rawlsian framework can be read as directing us towards a view of education as itself a primary social entitlement (a primary good) because it enables individuals' development of those skills, dispositions, and virtues that allow them to live good lives committed to justice (Brighouse and Unterhalter 2010, p. 203). According to these authors, justice would therefore require basic educational conditions adequate to the development and exercise of such educational results, that require more specification than CA provides. In practice, educators and policy makers are constantly making decisions about what children should learn, and this means that learning trade-offs always occur and a philosophical view of educational justice ought to provide guidance to these authorities. Consider the dilemma surrounding whether schools ought to provide to children from groups that face discrimination an education that provides them with the opportunities to participate in dominant social and economic frameworks, even when these frameworks, and the education to prepare them for participation, undermine their ability to participate in the shared cultural norms of their group (Brighouse and Unterhalter 2010, p. 202). Brighouse and Unterhalter use the example of Black Americans, but I think the example equally applies to Deaf children and children of Deaf parents. A standard is required to aid in making these decisions, and these authors see a Rawlsian-informed view of educational entitlements as more adequately providing that standard.

Another question that arises relative to the question of resources versus capabilities is the role or impact that restrictions to functionings that some students experience, notably students with disabilities, have on their educational experiences. According to Terzi, expectations should not change: children with functioning restrictions are still entitled to the same threshold level of functioning as other children (2008, p. 158). Okay, so how does that work? First, it means the provision of additional resources for children with disabilities must allow them to develop the same functionings as are required of non-labelled children, but does not necessitate the allocation of infinite resources to those with significant disabilities (Terzi 2008, p. 158). CA presents a normative framework that considers individuals' particular well-being as *relational*: that is, there are instances in which balancing of one person's needs in relation to others will involve setting a limit on the resources they receive (Terzi 2008, p. 158). If the allocation of resources to a child with a disability deprives others of the resources necessary for them to achieve levels of functioning to participate effectively in society, then it is unjustified. Further, because the question of distribution is one that governs not just what resources will be provided to students – educational materials, aides, assistive devices, etc. – but also the site in which education takes place, a framework of capability applied to the education of

children with disabilities would need to address the question of whether inclusion in all cases is appropriate. Inevitably, then, CA theorizing returns us to the apparently perennial question for scholars of disability in education: how to defend inclusive education and, indeed, how to avoid the kinds of segregationist patterns that have historically followed from the view that full inclusion detracts from the education of so-called normal or talented children.

### *Normalcy and Inclusion*

One of the hallmarks of disability advocacy, disability rights activism, and of the field of disability studies more broadly is a sustained critique of normalcy. Disability Studies scholar Rosemarie Garland-Thomson writes that “those bodies deemed inferior become spectacles of otherness while the unmarked are sheltered in the neutral space of normalcy” (1997, p. 8). Far too often, schools measure students’ levels of achievement or potential achievement based on a norm, whether it is through standardized assessments, peer comparison, developmental theory, or even informal decisions based on a child’s behaviour (Ferri and Connor 2006). While normalcy is embedded in schooling practice, disability theorists have long argued that this embeddedness is far from inevitable. While the Capability Approach is celebrated as normalizing a view of human diversity, even in relation to bodily limitations and impairments, the view nevertheless faces criticism as reinforcing normalcy, as I will explain.

As I have discussed, both Nussbaum and Terzi argue that in educational contexts it is frequently functionings (beings and doings) rather than capabilities (freedoms) that schools should seek to equalize. This is because the functionings that children acquire through schooling enable future opportunities. In the previous section I discussed the problem of trade-offs and indexing: how do educators decide which functionings are to be promoted and how are capabilities to be ranked relative to one another? However, two further problems arise, one related to normalcy and the other related to the construction of childhood versus adulthood: when are some functionings being promoted because they correspond to views about what is normal or developmentally appropriate, rather than what is most beneficial for the child?

Terzi argues that CA is able to acknowledge the “unusual and atypical” beings and doings (functionings) that disability might entail – the ways that people with disabilities perform tasks differently, move about differently, and so on (2010, p. 167). But, in writing this, Terzi is referring to adults and not children. Since our primary educational contexts are populated by children, I have elsewhere questioned how CA can respond to these diverse forms of functioning, especially as they are reflections of choice (Taylor 2012). Above, I discussed how both Terzi and Nussbaum, as well as Brighouse and Unterhalter, support certain achieved functionings as the goal of education because certain functionings enable the development of adult capabilities. Yet how does this defence of the compulsory development of particular functionings in children fare when we consider that in

most, if not all cases, education takes place within social and cultural contexts that have their own specific sets of norms regarding what is required for effective participation in political and social activities (see Taylor 2012). Certain functionings are quite likely to be valued – as they presently are – over others: for example, oral language is valued over sign-language and children are encouraged to develop the skills of oral language through auditory aids and lip-reading (see Hehir 2002). I have asked how educational contexts will resist this reflection of dominant – and perhaps not *necessary* – norms of functioning (Taylor 2012). In what ways will the emphasis on achieved functionings be a reflection of dominant norms and values?

A second worry concerning the promotion of normalcy has to do with the view of adulthood and childhood conceptualized through CA. While CA emphasizes choice and the freedom to pursue the functionings one has reason to value, in the case of children, it is certain achieved functionings that are promoted, rather than choice. As I have said, this is because children require certain functionings – in addition, perhaps, to a certain level of maturity gleaned through experience – to allow them to develop capabilities later in life. But children do value their own freedom and their freedom to choose and this is, in many ways, a central part of their experience of growing up: gaining more and more freedom, ideally, to pursue those things they value. Some children will value music and art over social and political knowledge. Some will value athletics over knowledge of the natural world. Of course we desire to encourage children to pursue many different values and often they do.

The case of individuals understood as having significant intellectual disabilities raises important further questions surrounding the distinction among childhood and adulthood that is implied within CA's application to educational contexts. Carolyn Baylies (2002), for example, has critiqued Nussbaum's view of individuals with significant cognitive disabilities as relying on a view of human normalcy that promotes particular competencies and functionings as being necessary for a properly human life. According to Baylies, Nussbaum thereby risks setting a problematic standard of normalcy: "Norms or base lines can be too easily and negligently constructed to exclude individuals on the basis of limitations or presumed deviations of physical or mental functionings" (Baylies 2002, p. 734). The worry, then, is that setting educational standards of achievement – even ones based in a view of what is required to live good lives – is itself embedded in normalcy. Consider how standards of effective participation in society may not allow for the full respect of the dignity of those with significant disabilities. Terzi herself asks this question: is focusing on particular educational entitlements – the functionings necessary for effective participation in society – promoting a normalized view of effective functioning (2008, p. 159)? The question here is the attention we would need to pay to the ability of children to choose to pursue the things that give their lives meaning. It's a big question, especially because adults – and especially parents – are all too aware of how this could go badly!

Concerns over social norms and the role of choice are also pertinent to the problem of educational efficiency. When will it be more educationally practical and efficient to 'correct' or 'normalize' things in the child – to insist upon the use of hearing aids, for example – than to support their desired functionings? Indeed, there

is research that indicates that the insistence on normative educational functionings – to the exclusion of alternative ones – can actually impede children’s academic growth (see Ashby 2010; Hehir 2002). These are tensions that remain and are being pursued by a range of scholars. For example, some are asking what can the Capability Approach learn from disability theory and disability research (see Baylies 2002; Burchardt 2004; Terzi 2008) that would challenge the emphasis on normalcy? What can a human or civil rights approach and Capability Approach learn from one another (see Ben-Porath 2012)? These questions productively challenge and advance philosophical work on capability in education.

# Gender and the Philosophy of Education

Carrie Paechter

## Introduction

This chapter is about the relationship of the philosophy of gender to research in gender and education. While philosophy of education has largely ignored gender, work on gender and education, outside of mainstream philosophy of education, has taken the philosophy of gender very seriously. Butler's (1990, 2004) work, in particular, has been used as a theoretical framework for understanding children's and young people's behaviour in and beyond schools. This underpinning philosophical framework, however, has been little interrogated, by those using it, with respect to its origin in adult sexualities. In this chapter I raise some significant questions about how gender and education researchers, including myself, have used Butler's work on the performative nature of gender and her concept of the heterosexual matrix, in relation to children's constructions and performances of gender. I argue that by ignoring the ways in which Butler's framework is underpinned both by the idea of a heterosexual social contract and by questions of adult desire, gender and education researchers may unwittingly make more problematic children's gender expressions in school. While Butler's ideas about gender remain useful tools for researchers studying how children and young people perform gender, it is nevertheless important critically to examine their origins and to be aware of possible consequent effects, both on our thinking and on children themselves.

The concept of gender is of relatively recent origin (Repo 2016), and to fully discuss educational concerns in this area we need to start with those arising from perceived differences between the sexes. These included a long debate about the role and content of girls' education, based on an understanding of girls and young

women as incapable of full rationality and, indeed, with the potential to be physically damaged by hard study (Dyhouse 1976, 1978).

Until the late twentieth century, males and females were considered, in the global North at least, to be significantly different in numerous ways, including their capacity for education. Central to this was a sexual dualism that treated males as the ultimate, eternal subject, with females positioned as a lesser Other (de Beauvoir 1949). Gatens (1991), for example, argues that, from the seventeenth century onwards, conceptions of human nature assumed a unitary and rational male subject whose thought could transform worldly contingencies, alongside a “shadow” female subject who was constrained by place, time, body and passion (Foucault 1978) and, because of this, positioned outside of civil society (Hekman 1990). While such a being had her uses, including allowing her male partner to retain some ties to nature (Rousseau 1762, 1979), she was not considered fully educable. Consequently, while debates about the appropriate education for boys (of different social classes) focused around what might be the best preparation for work and citizenship, those relating to girls emphasised their future roles as wives and mothers, ignoring not just their intellectual potential but the participation of many, especially working-class women, in the workforce. Even the nineteenth-century pioneers of middle-class girls’ education, inspired by the conviction that girls could do the same intellectual work as boys, and believing that women should aspire to a definite role in life, assumed that marriage and a vocation would be mutually exclusive (Summerfield 1987). Schooling for working-class girls at the same period was aimed at producing homemakers or competent domestic servants. Subsequent debates about the appropriate schooling for girls reflected these assumptions. In particular, there was a long-running debate in the nineteenth and first half of the twentieth century about whether there should be a specifically female curriculum. Central to this was the question of the importance of science and, to a lesser extent, mathematics, for girls, and there were significant attempts to construct a female form of science, “domestic science”, to replace physics and chemistry in girls’ schools (Hunt 1987).

Such approaches to girls’ education were underpinned by a deficit model in which girls were assumed to be intellectually unequal to males. This was supported by influential developmental schemas based on studies carried out only on boys. An example is that of Kohlberg, who, prioritising justice conceptions of ethics, argued that women were less capable than men of higher forms of moral judgement (Gilligan 1982; Hekman 1995). Such deficit approaches were also applied to differences in attainment, participation, and subject choice. For example, in the 1980s and 1990s there was considerable emphasis on girls’ relative lack of attainment in traditionally masculine domains such as mathematics and science, with the problem being firmly located in the girls rather than in the approaches or content of the subjects themselves (Paechter 1998). Subsequent concerns, now that girls in the West are equalling or outperforming boys in these subjects, are focused in a similar way on deficit models of particular groups of boys; in this case the position of Other is generally held by specific (and local) ethnic and social class groups.

Until the late twentieth century, these discussions all used the term ‘sex’ rather than gender, with an emphasis on ‘sex differences’, implying that these were generally innate. Although there was a Cartesian legacy of mind-body dualism, with educational discussion only considering the body in specific curriculum areas or in relation to the perceived dangers to girls’ bodies of too much intellectual exercise, after the Enlightenment, bodily formation was expected to correspond to, and, indeed, dictate, roles and behaviour (Laqueur 1990). The introduction, in the fourth quarter of the twentieth century, of ‘gender’ into discourses around the education of boys and girls both elucidated and complicated these discussions. While the emergence of gender as a conceptual framing for this work has allowed researchers to turn away from biological explanations and consider how schools might intervene to encourage students to make less stereotyped choices and assumptions about ability and attainment, it has also reinforced a lack of focus on the body that is in any case a feature of much of school life (Paechter 2004).

## Introducing ‘Gender’

The concept of gender was introduced by John Money in 1955 (Repo 2016), to support his justifications for operations on intersex babies (Money and Ehrhardt 1972). The key idea is that gender identity and its expression are culturally learned rather than innate and have the potential to be divorced from body morphology. The notion that one’s identity and social role could be different from one’s genetic makeup or bodily morphology allowed Money and his colleagues to argue that identity could be manipulated if the body were considered to be problematic, and, in particular, non-conforming. Gender was subsequently used by Robert Stoller as a concept to frame his work with what were then referred to as transsexuals (Stoller 1968), again, allowing the argument that a particular birth body was not necessarily linked to a particular identity. From Stoller the term was taken up by feminists, for whom it was an essential tool in the argument that biology is not destiny, and feminist educational researchers have been using it from the mid-1970s.

This shift from a discourse of ‘natural’ sex differences to one of ‘socially constructed’ genders broadly coincided with a wave of equalities legislation across the affluent countries of the world, including Title IX in the USA in 1972, the Sex Discrimination Act in the UK in 1975, and the Swedish Equal Opportunities Act in 1979. This meant that increasingly girls and boys were offered the same curriculum, and the focus moved from questions of the ‘suitability’ of different school subjects for male and female students to further concerns about differential take-up and attainment. The change in emphasis from sex to gender meant that the questions asked shifted from being about what should be in the curriculum for each gender to how boys and girls might be able to access a common curriculum equally. At the same time, however, the decoupling of identity from the body reinforced the invisibility of bodies in the school context. Laqueur (1990) argues that this tendency of the body to disappear is in any case a side effect of feminism’s embracing of gender,

due to the reinterpretation of bodily differences as themselves cultural. In the context of schooling, where the effacement of the body in all but a few specialised areas occurs as a result both of Enlightenment mind-body dualism and of fears about child and adolescent sexualities (Foucault 1978; Paechter 2006b), the move from a discourse of sex to one of gender further exacerbated this effect, with the result that research into gender and education has only recently begun to take children's bodies into account. Alongside this recent greater interest in children's embodiment within gender and education research has come another shift in focus. Although longstanding questions of differential attainment, uptake, etc. persist, multiply inflected by ethnicity and social class, research now also includes work on sexual violence, on children and heteronormativity, on non-traditional family forms, including LGBTQI+ and polyamorous parenting, and on trans children.

## Philosophical Approaches to Gender: Judith Butler

Since the fading from view of discussions around appropriate curricula for boys and girls, gender has not really been explicitly addressed within mainstream philosophy of education. While some work in gender theory (especially the work of Raewyn Connell 1987, 1995, 2002, 2010) has included consideration of children and young people, and while a few gender and education researchers actively consider and develop gender theory more generally (Francis 2001, 2010; Paechter 2006a, b, 2012; Francis and Paechter 2015), much of this work is sociological in approach; there is little work on gender taking place within the broader framework of philosophy of education.

Despite this, philosophy of gender, particularly the work of Judith Butler (Butler 1990, 1993, 2004), has had a profound influence on sociological research on gender in the context of education. Although in many ways these ideas have been very useful for analysing children's constructions of gender and how gendered power relations operate between boys and girls in classrooms and playgrounds, they have been relatively little interrogated in terms of the extent to which concepts derived from a consideration of adult lives can be applied to children. In particular, their underpinning by ideas about desire and conceptualisations of civil society, and their focus on participating adults, have not properly been considered.

Butler's key move in developing her theory of gender was to take the idea that gender is socially constructed to its logical conclusion. Butler's project is in many ways political: she wants to make it more possible for those people whose sense of their gendered selves does not fit into a normalised masculinity/femininity binary to be able to have what she terms 'livable lives'. To have a 'liveable life', for Butler, involves both some level of stability of identity and that this be recognisable as valid within wider society. As she suggests:

In the same way that a life for which no categories of living exist is not a livable life, so a life for which those categories constitute unlivable constraint is not an acceptable option. (Butler 2004: 8)

Thus, for Butler, the fundamental point of gender theory is to enable the widest possible range of readable and recognisable individuals:

What is most important is to cease legislating for all lives what is livable only for some, and similarly, to refrain from proscribing for all lives what is unlivable for some. (Butler 2004: 8)

Butler's work on gender must, then, be recognised as a political project. It is important to bear this in mind when considering its application within the field of education.

The central message of Butler's work on gender is that gender is not as we mostly experience it, something both constant and fundamental to ourselves and our identities, but an illusion of coherence brought about by performance. Gender is, therefore, not natural or innate, nor tied particularly closely to the body, but fundamentally performative. This is not obvious, however, because the political and discursive origin of gender identity has become displaced onto an illusionary psychological core. In order to preserve our sense of identity, of a constant, stable self, Butler argues, we as individuals have to perpetuate and regulate our performances of gender according to prevailing social norms. Much of her work is aimed at 'undoing' gender in order to undermine these norms and allow a much greater range of identity performances. This illusion of gender stability, perpetuated through performance, means that we are all, all the time, engaged in ritualistically displaying, for ourselves as well as for others, naturalised corporeal styles demonstrating our conformity to gender norms and thereby making ourselves recognisable to others:

As in other ritual social dramas, the action of gender requires a performance that is *repeated*. This repetition is at once a reenactment and reexperiencing of a set of meanings already socially established; and it is the mundane and ritualized form of their legitimation. (Butler 1990: 140)

While these stylised performances come together, she suggests, to give the impression, to ourselves and others, of a stable gender identity, a consistent self, this is in fact an illusion:

Gender ought not to be construed as a stable identity or locus of agency from which various acts follow; rather, gender is an identity tenuously constituted in time, instituted in an exterior space through a *stylized repetition of acts*. The effect of gender is produced through the stylization of the body and, hence, must be understood as the mundane way in which bodily gestures, movements, and styles of various kinds constitute the illusion of an abiding gendered self. (Butler 1990: 140)

It is important to recognise here that gender is performed by the body. Butler's early work in this area was criticised for ignoring embodiment, and certainly it seems to be the case that she does not fully recognise ways in which particular bodies constrain specific, and especially normative, performances. However, because gender is here treated as a matter of performance taking place through the body and as recognised by others, this makes embodiment in some ways fundamental to it. This is, however, not necessarily in the one-to-one correspondence assumed by some earlier conceptualisations of the sex/gender relation: a particular gender does not imply a particular body, nor vice versa.

There are some significant advantages to this way of thinking about gender, for researchers working on gender generally and for those focusing on children and educational contexts. The first is that it de-naturalises gender, and, in consequence, even conventional gendered behaviour. If gender is no longer understood as “a truth that is somehow there, interior to the body, as a core or as an internal essence” (Butler 2004: 212), then we will no longer require particular expressions or performances of gender to reflect this imagined core. Nor is it necessary for performances of masculinity and femininity to correspond to male and female bodies: conceptualising gender as performative is both the logical conclusion of a sex/gender split and a way of dealing with its effects. Butler (2004) argues that there is no need for feminine and masculine to belong to differently sexed bodies, and that opening up what is understood by these terms has the potential to make more lives livable.

Of course such possibilities remain more theoretical than in widespread practice. Francis (2008), for example, points out that researchers in gender and education usually continue to treat all of those with male bodies as masculine, all those with female bodies as feminine, and then to label stereotypically feminine behaviour from boys as a (usually subordinated) form of masculinity (Skelton and Francis 2002). She argues that one result of this is that gender researchers in this context tend to focus on gender-traditional behaviour: non-normative males are not seen as ‘doing femininity’ but rather as performing a failed masculinity. Masculinity and femininity have rarely, therefore, been fully separated out from sexed bodies in education-focused studies, despite the clear potential arising from Butler’s (and Halberstam’s 1998) work. Hegemonic forces naturalising gender difference and aligning it both with physical differences and with traditional enactments (Paechter 2007) make it hard in practice to take up the possibilities opened up by the conceptualisation of gender as performative.

These problems, however, reflect and draw attention to another of the significant advantages of Butler’s theory: that it illuminates the role of power relations in understanding or ‘reading’ gender. Butler argues that “to conflate the definition of gender with its normative expression is inadvertently to reconsolidate the power of the norm to constrain the definition of gender” (Butler 2004: 43). Indeed, such constraint is exemplified in the work of some of the early proponents of the sex/gender split, particularly Money and Ehrhardt (1972), who used the idea that gender was socially constructed to justify both invasive operations on intersex and other babies to align their bodies more closely with perceived norms, and also to insist that the parents of these children model extremely conventional gendered behaviour as part of the process of constructing “appropriate” identities and performances for them (Repo 2016). This insistence that babies’ bodies were surgically altered to bring them closer to an arbitrary physical norm, and then that their gender expression should be moulded to correspond to an arbitrary and parallel psychological norm, is a mobilisation of power/knowledge focused around the authority of the expert (Dreyfus 1982; Foucault 1963, 1979).

Butler’s understanding of gender, as being bound up with a broadly Foucaultian conception of power, suggests that an important political act is to subvert, resist, and

redeploy power, constituting power relations in new and more inclusive ways. One way in which treating gender as performative does this is, Butler argues, to equalise dominant and non-dominant gender norms (Butler 2004). From a normative perspective in which gender is stable and heterosexually focused, non-normative genderqueer forms are treated as copies or parodies of conventional masculinities and femininities. By treating even the latter as performances, as constantly and reciprocally constructed, these differences can be erased: normative forms become as contingent and negotiable as alternatives to these.

A final advantage of Butler's conception of gender as performative is its recognition of the reciprocal nature of gender. Butler argues that becoming gendered "is always, to a certain extent, becoming gendered *for others*" (Butler 2004: 25). This means that the performance of gender is a reciprocal relation between the performer and audience, and its meaning (including as normative or transgressive) will be interpreted in the relationship between them. If this is the case, it has effects in terms of who can count as being gendered in what ways (Paechter 2003). Halberstam (1998), for example, focuses on the ways in which bodies are read and the consequences of this for the legitimisation of gendered performances, suggesting that the power of the reader of the performance to assign gender is an integral part of 'authentic' identification. Francis (2008), however, argues that how an individual identifies has an impact on the way they produce their body, which, in turn, affects the attributions made by a spectator. In this way we are not powerless to affect how others recognise us: one can, for example perform masculinity more effectively if one develops one's muscles by working with weights, because of the association of masculinity with strength. This situation is, however, further complicated by Kessler and McKenna's (1978) work on how gender is attributed: they found, in experimental studies, that a male attribution functions as a default, with femaleness only attributed in the absence of all male cues. Thus, a body will be attributed as male in the presence of only a single male cue, even if it is accompanied by several female ones. This attributional bias has material effects, for example in the comparative experiences of transmen and transwomen. It is important when discussing gender that we do not neglect the gendered body as a lived corporeal experience, in which power relations impose sanctions on transgressors.

There are, nevertheless, unresolved tensions between the idea that gender is performative and the possibilities for people to have livable lives from the point of view of having their own identities legitimated and validated. While it is clear that there is a considerable role for others in the legitimisation of someone's gender through the acceptance of a 'convincing' performance, at the same time it seems simply unjust to give an individual no role at all in legitimating their own authenticity. In my own work I have addressed this by stressing the importance of performing the self, including gender, not just to others but also to oneself. This is particularly important in relation to children, who actively try out identities and performances through fantasy play, putting on and taking off roles like so many costumes (Paechter 2007) as they work out who they are and who they want to be.

A central element of Butler's conception of gender as performative is that performances are constructed and interpreted within and constrained by the 'heterosexual matrix'. She defines this as being

that grid of cultural intelligibility through which bodies, genders, and desires are naturalized...a discursive/epistemic model of gender intelligibility that assumes that for bodies to cohere and make sense there must be a stable sex expressed through a stable gender (masculine expresses male, feminine expresses female) that is oppositionally and hierarchically defined through the compulsory practice of heterosexuality. (Butler 1990: 151)

In addition to the presumption of a stable gender corresponding to a stable and underlying sex, what is important about this is the emphasis on the compulsory practice of heterosexuality. This idea comes, Butler tells us, both from the work of Wittig (1992), who argues that to live in society is inevitably to participate in a heterosexual social contract, and from that of Rich (1980), who points out that, even within feminist writing, heterosexuality is presumed to be the sexual preference for most women. Both these writers suggest that living as a lesbian provides a way of challenging these patriarchal structures. For Rich, this is because it challenges male rights to women. Wittig, on the other hand, argues that lesbians stand outside and refuse a social contract in which compulsory heterosexuality is implicated, with the radical and, as Butler points out, counterintuitive consequence that they are not women (or, indeed, men). Wittig argues that the assumption of heterosexuality is so fundamental to society that the social contract is, in effect, a heterosexual contract: "to live in society is to live in heterosexuality" (Wittig 1989/1992: 40). To stand outside of heterosexuality, therefore, is to repudiate or exclude oneself from the social contract.

Although her conception of the heterosexual matrix is founded in Wittig's work, Butler does nevertheless critique certain aspects of the latter. For example, she points out that it requires a radical distinction between straight and gay that Butler herself does not wish to draw, and notes that Wittig's conclusion, that the heterosexual contract can only be brought down by becoming lesbian or gay, "follows only if one understands all 'participation' in heterosexuality to be a repetition and consolidation of heterosexual oppression" (Butler 1990: 121). While Butler accepts that compulsory heterosexuality does operate with force and violence, she argues that this is not the only way that it operates, and that we can subvert its power in multiply resistant ways. She also points out that the heterosexual contract would have to be underpinned by explicit, rational, choices in the manner of the social contracts of Locke and Rousseau, but that power does not operate in this way: it "can be neither withdrawn or refused, but only redeployed" (Butler 1990: 124). Butler argues, indeed, that a better strategy for gay and lesbian practice would be to focus on "the subversive and parodic redeployment of power rather than on the impossible fantasy of its full-scale transcendence" (124). Finally, she notes that the construction of gay/lesbian identity through a radical exclusion from heterosexuality means that lesbianism ends up requiring heterosexuality in order to exist.

Nevertheless, Butler's concept of the heterosexual matrix is significantly derived from Wittig's ideas about the heterosexual contract. Indeed, it is notable that Butler

characterises Wittig's view of language in very similar terms to her own view of gender, saying that, for Wittig, "language... is a set of acts, repeated over time, that produce reality-effects that are eventually misperceived as "facts"" (Butler 1990: 115). This originary relationship between Wittig's heterosexual contract and Butler's heterosexual matrix needs to be borne in mind when we consider how Butler's work has been taken up by researchers in gender and education. An awareness of the implications of working with a concept that derives both from ideas about social contracts and from theoretical work on heterosexual and homosexual desire is important when we start applying such concepts to analyse how children behave in schools.

## **Gender, the Heterosexual Matrix, Children, and Schools**

The widespread takeup of Butler's work by researchers working on gender in the context of children and schooling has been little questioned. Indeed, it could be argued that the ideas that gender is performative in character, and that this performance takes place within the constraints of a heterosexual matrix, now form the dominant paradigm for thinking about children and gender, inside and outside schools. Research has mainly focused on exploring the multiplicity of children's performances of gender, finding explanations for why particular performances dominate or are subordinated in different contexts, and examining the power relations between individuals and groups with different performative styles. In particular, there has been a focus on categorising different types of performances, using the sexed body to label these as forms of masculinity or femininity. While this has been critiqued by Francis and Skelton both as too simplistic and as maintaining a problematic idea of the body as a fundamental differentiator (Francis 2008; Francis and Skelton 2008), the straightforward applicability, to children, of the heterosexual matrix, as a compulsory social contract, has not generally been questioned (Paechter 2015).

I want now to address two hitherto unacknowledged problems with the application of the heterosexual matrix to children and to their performances of gender. Both lie in the origins of the concept and make problematic its wholesale adoption by researchers working on gender with respect to children and schools (Paechter 2015). The first is the foundation of the concept itself in ideas about the social contract and participation in civil society; a contract and participation in which children are not usually fully included. The second arises from Butler's (1990, 2004) focus on desire in her discussions of the nature of the heterosexual matrix. While I would not at all want to argue here that children do not have sexual desires – there is considerable evidence (Friedrich et al. 1998; Renold 2005; Ryan 2000) that they do – this seems to be a relatively narrow way of conceiving of the way heterosexual forms are enmeshed within social processes, and one which, again, focuses primarily on adult experience.

The social contract, however conceived in detail, has usually been understood as a compact between adults (Prout 2005; Thomas 2012). Even if we follow Butler (1990) in suggesting that the heterosexual matrix does not follow the model of the explicitly chosen social contract of Locke and Rousseau, it is still the case that most common-sense approaches to the question of who is a full participant in civil society focus on adults (Larkins 2014; Lister 2007), or, at least, on individuals who are considered to have an adult, or near-adult, understanding of the world and the consequences of their decisions (Stoeklin 2013). Categorising, or naming, someone as a child (Bourdieu 1991) excludes that person from some or all aspects of the social contract, depending on their age, perceived maturity, and geographical location. For example, children in some jurisdictions are not allowed to participate in paid work until they reach a particular age; they may not be held criminally responsible for their actions or able to consent to sex. While the UN Convention on the Rights of the Child makes provision for their voices to be heard in decisions that concern them, this has the effect of simultaneously positioning the child as a citizen who has a right to express opinions and have these taken seriously, and as someone who does not have full citizenship rights (Paechter 2015).

The general position of children as individuals without full membership of the body politic implies that we cannot automatically assume that they are entirely part of the heterosexual matrix. If this is the case, then using the heterosexual matrix as an analytical frame for understanding children's gender performances is not straightforward and should not simply be taken for granted as an appropriate approach. Butler focuses on the position of adults who, without the constraints of the heterosexual matrix, might be assumed to have an unequivocal and straightforward claim to participate in society. She reminds us that "embodiment denotes a contested set of norms governing who will count as a viable subject within the sphere of politics" (Butler 2004: 28), arguing that we have to rework these norms in order to allow "the otherwise gendered" to have livable lives. This exclusion from political life, however, is already the case for children, which means, arguably, that they do not experience the heterosexual matrix in the same way as do adults. Children may experience it, indeed, as a potentially liberating construct, because it is so bound up with the adult world and participation in adult society. Considered this way, it is possible to argue that children's loyalty to, and investment in, some of the most traditional forms of the heterosexual matrix (Blaise 2005; Davies 1989, 2003; Martin 2011; Renold 2000, 2005) arises out of their desire to be full participants in the world of adults (Paechter 2015).

This is further complicated by the way Butler's consideration of the heterosexual matrix and related ideas is strongly bound up with a discussion of desire (Schippers 2007). When Butler talks of 'compulsory heterosexuality' she does not just mean a requirement to live, to perform one's gender according to particular outward and familial forms, but rather that desire itself is channelled in particular ways, not only towards specific subjects but with a limited set of (reproductive) purposes:

acts and gestures, articulated and enacted desires create the illusion of an interior and organizing gender core, an illusion discursively maintained for the purposes of the regulation of sexuality within the obligatory frame of reproductive sexuality. (Butler 1990: 136)

The performance of gender within the heterosexual matrix is thus, for Butler, intrinsically bound up with desire, with the question of who or what attracts us, and, furthermore, with a requirement that this desire be not only heterosexual but reproductive. While this suggests that resistance to the heterosexual matrix might also involve a heterosexual refusal of reproduction, Butler's seeming fascination with desire, and her extended discussion of it in the context of butch/femme relationships, does leave one wondering how asexual adults figure in her understanding of gender. Furthermore, the desires discussed are so clearly associated with adults that it is hard to see how children have a place in these conceptualisations at all. While children do, of course, have desires, including sexual desires, it is not necessarily the case that these always take the same forms as those of adults, which means that we cannot carry the notion of the heterosexual matrix straightforwardly over and apply it to children.

This is all further complicated by the use of the heterosexual matrix to analyse the behaviours and gender expressions of children and young people in schools. Schools are very particular contexts in which sexuality and bodies are simultaneously ever-present and denied (Foucault 1977, 1978; Paechter 2004, 2006b, 2011). They have a strongly dualistic approach in which the body is effaced in order to focus better on the training of the mind. To this end, children are subject to a variety of body disciplines: expected to wear uniforms; constrain their bodies into often inappropriate seating; deny their physical urges except at particular times and places. This is coupled with a discourse of childhood innocence in which pre-pubertal children are not considered to be sexual at all (Robinson 2008), followed by a contrasting discourse of adolescent rampantness in which (predominantly) male sexual urges are treated as constant and semi-irresistible and therefore in need of strong disciplinary surveillance and control. If we fail to recognise that the heterosexual matrix is not just about how we perform our gender, but, much more than that, how we perform genders that are intertwined with assumed desires, then we will not be aware that in investigating gender in schooling we are, inevitably, investing children and young people with unacknowledged forms of adult sexuality.

When gender researchers working in schools use the heterosexual matrix as an analytical framework, we have to take care that we both remember that it is children's bodies and desires with which we are dealing, and take into account that the heterosexual matrix may have different meanings for them than for adults. It is not clear that, for young children, at least, the heterosexual matrix is primarily associated with sexual desire. Instead, it is arguable that it is bound up with a different, more urgent, desire, to be considered fully part of adult society, even, one might say, to be seen as fully human. One thing we see repeatedly in children's play is their positioning of themselves as actors in adult roles and situations (Blaise 2005; Connolly 2004; Francis 1998; Marsh 2000; Martin 2011; Skelton 2001). In taking these roles children are, however imperfectly, performing adulthood, staking a claim to full participation in adult social and political life. In order to do this they have to engage with the forms required by the heterosexual matrix, and this engagement manifestly gives them pleasure. That does not mean, however, that this pleasure, this fulfilment of desire, is the same as that from which the concept of the

heterosexual matrix is derived. It is important when analysing children's play of this kind, for gender and education researchers to ensure that they do not assume that children's self-inscription into the heterosexual matrix has the same meanings as similar forms when they are enacted by adults. There is a danger, if we make this assumption, that we will unwittingly solidify children's participation in such adult-focused sexualities and gendered forms, potentially making it harder for them to take on more flexible identities should they wish to.

Researchers researching gender and education have found Butler's work in the philosophy of gender to be a significant source of ideas. It is, in many ways, a fertile explanatory framework for some of the things we see in schools. It is important, however, to be aware of its origins, and to critique some of its assumptions, particularly where they relate to adult participation in the body politic. While children are not entirely different from adults, we cannot assume that they are entirely like them, or subject their performances to adult constructions that fail to take into account children's own aspirations and desires.

# Childrearing, Parenting, Upbringing: Philosophy of Education and the Experience of Raising a Child

Stefan Ramaekers

## Introduction

Hardly a day goes by without some kind of ‘parenting’<sup>1</sup> issue being reported on in one of the newspapers. Whether it’s a short report on the latest findings on a particular piece of scientific research,<sup>2</sup> a columnist’s (critical) take on trends in parenting,<sup>3</sup> a parent’s personal testimony about certain issues arising in their relationship with his or her children,<sup>4</sup> or a researcher criticizing the invasion of the parenting expert into the family,<sup>5</sup> there always seems to be something up for discussion in relation to parenting. What’s the best way to raise our children? What kind of parenting style is the best? Should parents adopt such a style anyway? Do parents actually need expert advice on how to raise their children, or are they best left to their own devices? What effect does this overwhelming presence of (different kinds of) advice have on parents? And so on. It’s hard to tell what exactly led to this quite remarkable presence of parenting issues in the media and, more interestingly perhaps, in the lives of parents and parents-to-be in postindustrial, Western societies, but it is hard to deny

---

<sup>1</sup>I am using inverted commas here for reasons I will go into later in the chapter. For the sake of the comfort of reading I will not use inverted commas in most of the following uses of the word.

<sup>2</sup>For example on the long-term effects of involvement of fathers in early childrearing on their children’s wellbeing around age 8–9, cf. <http://bmjopen.bmj.com/content/6/11/e012034> (retrieved March 3, 2017).

<sup>3</sup>Cf., e.g., <https://www.theguardian.com/lifeandstyle/2016/jul/30/attachment-parenting-best-way-raise-child-or-maternal-masochism> (retrieved March 3, 2017).

<sup>4</sup>Cf., e.g., <https://www.theguardian.com/lifeandstyle/2016/aug/01/undue-attachment-to-parenting-gurus> (retrieved March 3, 2017).

e-mail: [stefan.ramaekers@ppw.kuleuven.be](mailto:stefan.ramaekers@ppw.kuleuven.be)

that a concern with parenting is now very much part of the order of the day, or at least much more so than a few decades ago. Clearly, experts and literature on child-care have been around for a long time (cf., e.g., Apple 2006, for more on this), but over the last few decades we have witnessed, at least in Western Europe, Britain, and the USA, a proliferation of advice, manuals, classes, literature, and television programs aimed at parents that more often than not go hand in hand with policy initiatives focused on families and parents. This increasing attention to parenting is also reflected in academic research and scholarship, as is shown, for example, in the notable rise in articles addressing issues related to it in recent decades.<sup>6</sup> Clearly, for whatever reason (or, perhaps, for many reasons) parenting seems to matter to us today.

But what exactly is it that we are talking about when we talk about parenting? And, more importantly for this chapter, in what sense is it addressed in contemporary philosophy of education?

Before continuing, it should be noted that ‘parenting’ is, in fact, a relatively new concept (cf., e.g., Smith (2010) for more on this). As I will try to make clear in this chapter, its emergence expresses an important change in our understanding of what it means to raise children. It is a characteristic feature of our current condition that, at least in Anglophone countries, we now address the ways parents (should) raise their children mainly, and explicitly, in terms of the concept of parenting. This cannot, in a sense quite obviously, be said of non-Anglophone Western European countries such as Germany, the Netherlands, and Flanders (the North part of Belgium) simply because there is no equivalent for the word ‘parenting’; indeed, the word is actually quite impossible to translate into languages such as Dutch and German. In these languages, the same ‘old’ words continue to be used (*opvoeden*; *grootbrengen*; *erziehen*). It should be noted, however, that the conceptual field expressed by these ‘old’ words has shifted (or, I would say, narrowed) in much the same ways as denoted by the shift to the predominant use of the concept of parenting to refer to what it means to bring up children. The essence of this shift, or this narrowing down, is this: the concept of parenting capturing only one, rather specific, feature (or set of features) of the experience of raising a child, or, put differently, of the process of upbringing. I will come back to this below.

---

<sup>6</sup>Granted, the literature search I conducted and that forms the basis of this empirical observation was very minimalistic and limited. But nevertheless it is not uninteresting and is perhaps telling. I simply searched, in KU Leuven’s search engine (LIMO), for the word ‘parenting’ in the title of articles in peer-reviewed journals for three periods: 1988–1997, 1998–2007, 2008–2017, irrespective of discipline, research field, topic, or nature of the discussion (providing evidence of something, e.g., or a critique of the very discourse of ‘parenting’). The numbers of articles produced were, respectively: 896, 3.598, and 8.385 (search conducted March 3, 2017).

## Raising Children and Traditions of Educational Philosophy

Apart from a few recent exceptions within the field of philosophy of education (e.g., Smith 2010; Smeyers 2010; Ramaekers and Suissa 2012), upbringing and the parent-child relationship – c.q. the experience of raising a child – have received only marginal attention as a focus of educational-philosophical analysis *in their own right*. This relative absence of such analyses can be explained, in part, by the predominance of Anglophone schools of thought in philosophy of education. Theoretical reflection here has focused predominantly on the teacher-student relationship and schooling, the nature of teaching and learning, the nature of the school, the implications of new technologies for our conceptions of teaching, etc.

This is different from the Continental tradition of philosophy of education (*Allgemeine Pädagogik*, or *Allgemeine Erziehungswissenschaft*, or sometimes *Philosophische Pädagogik* in German, and *wijsgerige pedagogiek*, or sometimes *theoretische pedagogiek* in Dutch),<sup>7</sup> wherein theoretical reflection on upbringing and the role of parents has been part of the focus since its inception by Friedrich Schleiermacher (1768–1834) (see Thoomes 1989). In his (unpublished) lectures on education (or more precisely: *Erziehung*, in German, which actually covers a far broader area than invoked by the word education), Schleiermacher, who was about the first to *theorize* education/*Erziehung*, sees the changing of generations as the central issue in education/*Erziehung*. For him, the educational (*pädagogisch*) relationship is, first and foremost, an intergenerational relationship. The central questions to be addressed, therefore, are: What does the older generation intend to do with the younger generation? How is the older generation to introduce the new generation into today's world and to 'prepare' it for the world to come? What sense can be given to such introduction and 'preparation'? (Similar questions and concerns have been addressed, much later, by more widely read scholars such as Klaus Mollenhauer (2014) and Hannah Arendt (2006).) Interestingly, and relevant for my purpose, for Schleiermacher the pedagogical concerns of this intergenerational relationship were given shape in and by a fourfold institutional structure comprised of the state, the Church, school, and the family. Schleiermacher gives considerable attention to explaining what specific responsibilities each of the institutions should take upon itself and why, and what their shared concerns are vis-à-vis the new generation. I cannot go into that here. I merely want to point to the fact that it was quite evident that a theoretical/philosophical account of *Erziehung* would include the family as one of the pedagogical institutions that should assume some responsibility for introducing the younger generation into our world, and, hence, would also consider the relationship between parents and their children (and not only between teachers and students) as relevant in the context of such introduction. The family is as much of an intergenerational site as the school (albeit, obviously, with differences);

---

<sup>7</sup>This Continental tradition is, undeniably, broader than indicated here.

that is, a place or space<sup>8</sup> where different generations come together. Parents may (quite obviously, perhaps) not pose the question of how to live together explicitly. But, rather, in a family, the very living together of different generations is concretely manifested on a daily (and nightly) basis.

In this chapter I cannot provide a more detailed historical overview of how the family has been dealt with as a pedagogical institution in the Continental tradition, and address different kinds of analyses and stances towards the family, e.g., how it has been criticized as perpetuating unjustified relationships of authority (cf., e.g., Horkheimer et al. 1987), or how it has been analyzed, from a Foucauldian perspective, as an instrument of governmentality (cf., e.g., Donzelot 1977). My point here only is that, in contrast to the Anglophone tradition in philosophy of education, upbringing and the parent-child relationship have been taken up in the Continental tradition (specifically Dutch and German tradition), for example, by well-known educational philosophers/theorists including Martinus Langeveld (1965, 1979)<sup>9</sup> and Klaus Mollenhauer (2014),<sup>10</sup> to name but two. Nevertheless, it is important to mention here that, in recent decades, Continental educational philosophy has also succumbed to (what I would like to call) the Anglicization of academia and scientific research, which is reflected in a narrowing down of the focus of its reflection and analysis to education as schooling.

### *Philosophy or ‘Pedagogiek/Pädagogik’?*

To further bring out what is at stake in these conceptual narrowings, there is an interesting conceptual distinction that is worth pointing to, which I will outline briefly here, not for the purpose of ‘explaining’ differences in the way upbringing and the family have been treated in traditions of educational-philosophical reflection, but rather in order to offer some conceptual clarification. In today’s internationalized context of academic research *wijsgerige pedagogiek/Algemeine Pädagogik* is translated as, and more or less treated as on a par with, philosophy of education. This is, to some extent, understandable, but not entirely correct. In *philosophy of education*, the central noun of the concept (or its ‘stem’) is *philosophy*, which makes it hard to see *philosophy of education* other than as a derivative of *philosophy*, as if secondary to it; or at least, it makes it seem very natural to think in that order of importance; first *philosophy*, second what it is a philosophy ‘of’

---

<sup>8</sup>I realize that ‘site’, ‘space’, and ‘place’ may not mean the same thing. But I cannot go into that here. I can only say here that I am using these notions in fairly ordinary senses of the words. For nuanced accounts of these concepts, see the work of, e.g., Theodore Schatzki (1996, 2002).

<sup>9</sup>For an overview of the reception of his work, see Levering (2012); see also Ramaekers (2016) for a brief account of the main points of his position on the pedagogical relationship.

<sup>10</sup>For an overview of the reception of his work, see the special issue of *Phenomenology and Practice*, 2014, vol. 8.

(religion, science, law, education). Predominantly, though not exclusively, of course, the movement (or exercise) of thinking at work in philosophy of education starts from philosophy and moves towards education. (As said, this is not strictly so in all cases; I merely want to point out that the very language itself is expressive of a certain understanding of the discipline; for an account that is more nuanced, see, e.g., Ruitenberg 2009.) But in *wijsgerige pedagogiek* (and also in *Algemeine Pädagogik*), the pivotal noun is *pedagogiek*, and *wijsgerige* (or *philosophical*) is predicative of this noun. Put differently – and this is what marks the important difference between the two concepts that supposedly express the same academic work – the backbone of the discipline is not philosophy but *pedagogiek/Pädagogik*. This in itself is a concept that is difficult to translate into English. In its ancient Greek form, the first part of the word, ‘pedagogie’ (without the -k) can be taken apart in ‘agein’ and ‘pais’: ‘leading a child’. Originally, this referred to the process in which someone (usually a slave) would lead a child to school, but it has come to mean something broader than that, i.e., leading a child into adulthood, into autonomous personhood, a process or activity that comprises anything grownups do to help their children grow up to become responsible adult human beings. The -k at the end of the word adds a further, and important, layer of meaning. It denotes the Dutch *kunde*, which is usually translated as ‘craft’ (as in craftsmanship), meaning not so much a skillful knowing how but rather an insightful knowing why. *Pedagogiek* entails a reference to something that is ‘systematic’. It signifies a *logos*, a system of principles. *Pedagogiek*, then, as the *logos* or system of leading a child (helping to grow) into adulthood, is properly understood as the theory of (or behind) this leading of a child into adulthood.

### ***Parents as Pedagogical Figures***

In brief, it would be rather imprecise to lump together traditions in educational-philosophical thinking. From the outset there have been differences in focus, as expressed by the very designations of the disciplines. Within (the Continental tradition of) *wijsgerige pedagogiek/Algemeine Pädagogik*, theoretical reflection (informed by the issue of ‘leading a child into adulthood’) has traditionally covered more than the formal institutions of the school and the university and focused on more than issues of teaching and learning. It has also covered other traditional ‘pedagogical’ institutions, such as the family. Accordingly, it has not predominantly focused its reflection on the role of teachers in leading a child into adulthood but has also considered parents as important pedagogical figures. A good example of the specificity (and perhaps also narrow character) of the main points of attention in philosophical reflection in the Anglophone (and here mainly British) tradition in philosophy of education is the recent Virtual Special Issue of the *Journal of*

*Philosophy of Education*,<sup>11</sup> compiled to mark the occasion of the 50th anniversary of the journal. In the long list of topics it covers, only one title mentions parents (c.q. parental rights – which is, in itself, an interesting selection; see below). The focus predominantly is on education as schooling, which suggests, albeit implicitly of course, that it is only teachers who have a pedagogical responsibility for introducing children to a common world, as if parents are not (or perhaps: no longer?) also pedagogical figures.

## The Parent in Contemporary Philosophy of Education

If philosophical issues related to upbringing and the parent-child relationship are discussed in the research field of philosophy of education [sic] today, this is mainly taken up in indirect ways. By this I mean that what is not directly addressed (or hardly, at least) is the experience of raising a child, as part of the very process of upbringing (as distinct from parenting). Undeniably, ‘the parent’ has been dealt with in philosophy of education. But this tends to be done in relation to the institution of the school, or in relation to issues of schooling, e.g., in the context of its relation to home-schooling (e.g., Merry and Karsten 2010), or via a discussion of discourses of fatherhood/motherhood in relation to public schooling (e.g., Shuffelton 2014). The parent-child relationship has, of course, also been dealt with in philosophy of education but is frequently treated as a subcategory of moral relationships, or as an instance of a tension within political or moral theory, and hence is not considered as a relationship with its own unique ethical and philosophical significance. In other words, when philosophy focuses on parents at all (and it rarely does), it asks questions from *outside* the parent-child relationship. Examples of this are multiple: How do parents’ desires to do the best for their children balance a collective concern for social justice and equality (Brighouse and Swift 2009)? How do parents’ moral commitments to their children conflict with general moral duties (Jeske 2008)? How can the obligations arising from the nature of intimate relationships be accommodated into an account of the self (Helm 2010)? How tolerant should the (liberal) state be in accommodating parents’ wishes for their children’s upbringing? How can the value of autonomy be reconciled with parents’ right to pass on values (Noggle 2002)? Do parents have the right to induct their children into comprehensive doctrines (Clayton 2006)? Do families constitute the best arrangements for bringing up children (Brighouse and Swift 2014)? Do parents have rights over their children and, if so, what kind of rights are they, and on what grounds are they justified (Brighouse and McAvoy 2010)? To what extent is the unequal relationship between parents and children at odds with basic liberal values, and what are the proper limits of a parent’s authority over her children (Arjo 2017)? Do parents have to pursue optimal development and becoming an optimizer as educational ideals in

---

<sup>11</sup> See [http://onlinelibrary.wiley.com/journal/10.1111/\(ISSN\)1467-9752/homepage/the\\_journal\\_1966-2016.htm](http://onlinelibrary.wiley.com/journal/10.1111/(ISSN)1467-9752/homepage/the_journal_1966-2016.htm) (retrieved March 8, 2017).

raising their children (De Ruyter 2012)? To what extent is it possible to simultaneously ascribe to parents a right to a religious upbringing of their children and a duty to avoid indoctrinating them (Hand 2002)? And so on.<sup>12</sup>

### ***‘Parenting’: Psychology and Sociology***

Clearly, these examples all address relevant issues. The fact that the experience of raising a child, as part of the very process of upbringing, has hardly been dealt with *directly*, taken together with the predominant tendency to focus on education (as schooling) and the teacher-pupil relationship, means that philosophy of education hardly had/has a voice in articulating a conceptual apparatus (or in contributing to such articulation) that could serve to critically analyze our current Western understanding of upbringing and the parent-child relationship and the recent shifts in this understanding. Today, our (Western) understanding of upbringing and the parent relationship is largely determined by (and restricted to) the conceptual tools provided by the research domains of developmental psychology, behavioral psychology, and, recently but importantly, neuropsychology. This predominance, evident in society more generally, is referred to as psychologization (De Vos 2012). It has been identified as a crucial and decisive factor in the reframing of upbringing as ‘parenting’ (Ramaekers and Suissa 2012), now widely acknowledged as a ‘turn to parenting’ (Lee et al. 2014; Daly 2013; Furedi 2001; Knijn and Hopman 2015). I will come back to this below, but here I will just note that, currently, the articulation of conceptual tools that could serve as a critical alternative to the dominant (re)framing of the experience of being a parent in terms of ‘parenting’ largely takes place within sociology and in specific fields such as governmentality studies.

In sociology, specifically in the UK, there exists a broad and well-elaborated field of critical-sociological studies of families, parents in diverse contexts, parenting policies, etc., from a variety of perspectives, such as feminism, race/ethnicity theory, and post-humanism.<sup>13</sup> The Centre for Parenting Culture Studies<sup>14</sup> has played a pivotal role in this development of a critique and a conceptual ‘toolbox’ and, thus, has contributed significantly to an understanding of recent parenting policies, the social and historical conditions within which these developed, and their effects on families, parents, and children. Focal points of analysis are the ideology of parental determinism, i.e., the idea that all kinds of antisocial behavior in children are directly linked to incompetent parenting; the normalizing of the idea that parents are in need of education; the uses of neuroscience in the context of parenting (so-called neuro-

---

<sup>12</sup>I’m drawing here on earlier work that I have done with Judith Suissa (cf. Ramaekers and Suissa 2012, in particular pp. 112–113).

<sup>13</sup>See, e.g., the work by Edwards et al. (2015) on how particular cultural groups of parents are constructed and framed as ‘problems’ and ‘targets’ for policy intervention or the work by Daly on parenting support in England (Daly 2013; Daly and Brady 2015).

<sup>14</sup><https://blogs.kent.ac.uk/parentingculturestudies/>

parenting); the cultural construction of different kinds of parents in what is perceived to be a risk society, etc. These analyses share a concern with what is critically identified as a politicization of parenting, i.e., the use of parenting as a tool of social policy (cf. Furedi and Bristow 2008; Bristow 2009; Lee et al. 2014; Faircloth et al. 2013; MacVarish 2016; see also Richter and Andresen 2012). Further conceptual tools have been articulated by governmentality studies and critical discourse analyses inspired by Foucault, Fairclough, etc. Here parenting is investigated as a set of practices that is discursively mediated by the central features of neoliberalism, or today's advanced liberal society, which is understood to encourage very specific modes of self-understanding and primarily recasts parents as learning subjects. The analytical framework here characteristically exhibits a focus on specific forms of subjectivation, responsabilization, and disciplinarization. Parenting is studied here at the level of the discourses that shape the relations between parents and children, parents and schools, and parents and policy organizations (see, e.g., Knudsen and Andersen 2014; Dahlstedt and Fejes 2013; Struyve et al. 2014).

## **Upbringing and the Experience of Raising a Child: An Educational-Philosophical Account**

As stated, in philosophy of education, there have been few attempts to articulate an alternative to the current predominant way of thinking and speaking about upbringing in terms of 'parenting', to offer an account of how this positions parents in particular ways and renders their self-understanding in rather limited ways, and to show how this narrows down our understanding of upbringing. In the remainder of this chapter I will offer such an educational-philosophical account (albeit a much abridged one).<sup>15</sup>

### ***Workshop***

Above I referred to the reframing of upbringing in terms of 'parenting', something that is also more generally addressed as a 'turn to parenting'. There are several dimensions, or layers, to this reframing. One of these is a process of psychologization, referred to briefly above. Another dimension is the idea that parents are somehow in need of education; the predominant understanding of the parent-child relationship today is pervaded by a sense of the need for expertise in this area. Put differently, parents are expected to professionalize themselves in a certain sense,

---

<sup>15</sup>This is largely based on previous work I have been doing together with Judith Suissa (Ramaekers and Suissa 2012) and Naomi Hodgson (Ramaekers and Hodgson 2017). For this account I have also benefited from the many discussions I had with two of my former PhD students, Luc Van den Berge and Philippe Noens.

which we can actually see at work in the very use of the verb ‘parenting’, i.e., parents ‘doing’ something. Taken together, these two phenomena – the predominance of the languages of the disciplines of psychology in conceptualizing the parent-child relationship and what parents should be doing, and the expectation of professionalization – amount to what I will identify here as the scientization of our very understanding of raising children. I will explain this further by means of an (explanation of an) example.

Some time ago I received an invitation (through one of the email lists I’m subscribed to) to an evening workshop, facilitated by a child psychologist and behavioral therapist. The workshop was in Dutch and was announced under the title *Omggaan met te mondige kinderen*. (I will discuss the translation of this in a few steps. Part of the point I’m trying to make is with how the word ‘mondig’ is used here, in Dutch; but part of the difficulty of explaining this is that this word is not easily translated in English.) The workshop is designed to target a certain ‘problem’ behavior in children, c.q. their being too outspoken, disrespectful, speaking when it’s impolite or uncivil to do so, and having a ‘loud mouth’. For the moment I will translate this title as ‘Managing children who have a loud mouth’, but I will qualify this below. Here’s (a translation of) how the content of this workshop is advertised:

Over the last few years children have become more and more [mondig]. This generates new challenges in raising them. What causes this ‘new behavior’ in our children? How can we manage this [mondigheid] in a good way and support them in becoming assertive but also respectful adults? – During this workshop An Coetsiers, child psychologist and behavioural therapists will provide handy hints for (grand)parents and other educators.<sup>16</sup>

I have deliberately left the words ‘mondig’ and ‘mondigheid’ untranslated. It would not be correct to have written it (in the translation) as ‘children have increasingly become more and more outspoken’ or ‘have increasingly become more and more loud-mouthed’. There is an ambiguity in the Dutch word ‘mondig(heid)’ that is important to draw attention to and that would be glossed over in translating it as ‘loud mouth’. More important than missing this ambiguity in this translation, however, is the observation that it is glossed over in the original Dutch version of the (content of the) workshop itself. This is indicative of the very shift from upbringing to parenting that I’m trying to bring out here.

## ***Mondigheid***

The concept of *Mondigheid* (or in German: *Mündigkeit*) as well as its opposite *onmondigheid* (*Unmündigkeit*) has had a particular relevance in our Western understanding of education and upbringing ever since Kant’s use of it in his seminal essay ‘What is Enlightenment’. The well-known opening sentences of this essay read:

<sup>16</sup><http://www.westhoek.be/nieuws/53084/omgaan-met-te-mondige-kinderen> (retrieved March 3, 2017).

Aufklärung ist der Ausgang des Menschen aus seiner selbstverschuldeten Unmündigkeit. Unmündigkeit ist das Unvermögen, sich seines Verstandes ohne Leitung eines anderen zu bedienen.

Though there are different translations of *Unmündigkeit* and *Mündigkeit*, ‘immaturity’ and ‘maturity’<sup>17</sup> seem to best capture what they express here. The Dutch and German entail the word ‘mouth’ (*mond/Mund*), which encapsulates the idea that being grownup, or being mature, means being able to speak responsibly, to make good use of one’s ability to speak. In French, this relation between adulthood and speaking is present in the Latin origin of *l’enfant*: *infans*, meaning ‘mute’ and ‘without eloquence’, and *infantia*, meaning ‘the inability to speak’, ‘lacking eloquence’. The points I want to draw attention to here are as follows. First, ever since Kant’s appeal that we leave our ‘self-inflicted immaturity’ and ‘have the courage to use our own intelligence’,<sup>18</sup> *mondigheid* has been part of our cultural heritage. It is set as a regulative ideal both for individual human beings and for society as a whole. Second, and importantly, since Kant, some form of *mondigheid* has been (part of) what it means to achieve a condition of adulthood, of being mature, and, as such, in our Western European history, it has become an intrinsic part of what it means to raise children. That is, *mondigheid* has been conceived as (one of) the goal(s) of raising children. Thus, raising children is about helping them to move from being *onmondig/unmündig* to becoming *mondig/mündig*, to become ‘able to speak’, to make free and public use of their reason. Maturity shows itself in a person’s commitment to engage in open and free debate, to expose herself to critique from fellow citizens, to enter into a relationship that pivots on the importance of presenting, rejecting, and accepting reasonable arguments. *Mondigheid* is, in short, part of the fabric of our understanding of education and upbringing. Thus, as the ability ‘to use one’s intelligence [*Verstand*, in German] without the guidance of another’, it is an educational goal worth preserving.

### *Scientization of Raising Children*

To return to the workshop I received an invitation for, the scientization of our understanding of raising children, the reframing of upbringing into parenting, can be seen to be manifested in the three following interconnected ways. First, I would like to draw attention to the very fact of the rendering of *mondigheid* in terms of behavior. It is remarkable, I find, to observe that such a rich notion – rich, that is, in pedagogical content – is reduced to the status of behavior in the stroke of a sentence. I would like to suggest that this is, in fact, inherent to what I called earlier, following De Vos, the psychologization of our understanding of raising children. In a more general

<sup>17</sup> [https://www.northampton.edu/Documents/Subsites/HaroldWeiss/Modern%20Philosophy/Kant\\_What\\_is\\_Enlightenment.pdf](https://www.northampton.edu/Documents/Subsites/HaroldWeiss/Modern%20Philosophy/Kant_What_is_Enlightenment.pdf)

<sup>18</sup> [https://www.northampton.edu/Documents/Subsites/HaroldWeiss/Modern%20Philosophy/Kant\\_What\\_is\\_Enlightenment.pdf](https://www.northampton.edu/Documents/Subsites/HaroldWeiss/Modern%20Philosophy/Kant_What_is_Enlightenment.pdf)

sense, psychologization refers to the observation that the ways we relate to and understand ourselves and others, and the ways we are present to ourselves, others, and the world, is determined by ‘psychological vocabulary and psychological explanatory schemes’ (De Vos 2012, p. 1; see also De Vos 2011). Psychologization captures the idea that “the psy-discourses are becoming increasingly hegemonic as they furnish the human being with particular signifiers and particular discursive schemes (assigning particular positions) with which to look upon itself and its world” (De Vos 2012, p. 2). In the example of the workshop, this does not so much show itself in a literal sense, that is, in the occurrence of characteristically psychological jargon, typified by the translation of ordinary human behavior into psychological terms (e.g., see how quickly a lively young child’s (usually a boy’s) behavior is called ‘hyperactive’ and how, after having been thus translated, it is treated as a symptom of one or another kind of disorder (in this case ADHD)). Rather, in the workshop invitation, it is manifest in the reduction of human action to behavior, a process that is expressive of the dominant paradigm of the disciplines of psychology, i.e., the paradigm of causal explanation. Accounts of who we are and what we do are no longer given by reference to our being immersed in a *Lebenswelt*, or full life-world (cf. De Vos 2012, p. 5). We (apparently) seem to have (been) emancipated from such ‘vague’, unscientific ways of rendering our existence and are now able to *explain* who we are and what we do by reference to what causally links antecedents and consequences. (“What causes this ‘new behavior’ in our children?”, the workshop description asks, tellingly.)

Second, it is a workshop [sic], in which educators can *learn* how to manage such behavior, in which they can learn, in short, how to ‘parent’. Put differently, there is knowledge available – ‘explanatory schemes’, to quote De Vos again (2012, p. 1) – and this knowledge is made available by an expert, whose ‘knowing’, to reiterate and link up to the previous point, pertains to causal connections between antecedents and consequences. What defines a good educator (parent, grandparent, etc.) is someone who (learns to) appropriate(s) that kind of knowledge and applies it accordingly; someone who professionalizes him or herself to a certain extent, who acts as the expert would act, or more correctly, who behaves as the expert would behave. Part of the reframing of upbringing as parenting is exactly this: the (now common) assumption that upbringing basically comes down to the right ways of managing children’s behavior – mostly understood in terms of challenges, problems, and milestones, etc. – and that strategies for such managing can be learned, and hence the challenges can be tackled, the problems can be solved, the milestones achieved.

Taken together, the first and second points show that, in the dominant culture of parenting, what it means to raise children is reduced to how parental behaviors relate to, c.q. have an impact on, their children’s developmental outcomes. The main parental ‘task’ is, then, conceived as ensuring optimal conditions for their children’s growth and maintaining a firm grip on their children’s developmental progress and – recently, with the increasing intrusion of neuropsychology into our thinking about raising children – their brain maturation. Consequently, our understanding of what it means to raise children is confined to what can be located in behavioral terms in

the one-to-one-interactions between parent and child – interactions, that is, for which causal links can be shown. Raising children is, then, narrowed down to behavior regulation of both parent and child. As Mary Daly so eloquently puts it: “This is a landscape in which the parent becomes equivalent to a ‘parenter’ – someone who deploys learned skills centring on self and other forms of control” (Daly 2013, pp. 227–228).

This immediately leads into the third, and related, way in which the scientization of our understanding of raising children is manifested. Informed by the ‘psy-discourses’, as De Vos refers to them (cf. De Vos 2012), the parenting discourse implies not only that a causal logic is the only valid one in our speaking and thinking about upbringing, but also it assumes a particular *kind* of goal: upbringing should be understood as a linear-developmental story, the goal of which is (mostly implicitly) formulated as a desirable and achievable outcome that, furthermore, is posited and understood as an endpoint of something, an endpoint that it is presupposed that ‘we all know’, and anything parents do along the way is understood as effecting the next step and as taking us one step closer to reaching this endpoint. In the workshop invitation, this goal is formulated as ‘assertive and respectful adults’. Now, to be clear, I am not suggesting that there is something wrong with helping our children to become assertive and respectful adults. The point I am making is about the very framing of this goal: as an outcome of a process of managing behavior; as an optimal endpoint of raising our children; as a certain kind of state, the achievement of which parents can have under their control by doing certain things; and state, it is assumed, that we all know what it means and agree upon.

### *Closure Versus Open-Endedness*

Put somewhat laconically, one doesn’t have to be a philosopher to ask the pertinent question here: what do we mean by ‘assertive and respectful’? The parenting perspective on upbringing accounts for the aims and goals that parents have (or are prescribed to have) as if these can somehow be unproblematically captured in a neutral, descriptive language set apart from the values parents hold, and as if these are neatly separable from parents’ experiences as individuals within the shifting and dynamic context of their own lives. What such a framing bypasses is that when parents are helping their children in becoming assertive and respectful adults, an important part of that experience is, in fact, the experience that what ‘assertive’ and ‘respectful’ mean is not specifically predefined as something ‘external’, a state that can be reached by executing certain operations, but rather is shaped in the very relationship with their own child, while that relationship is (also) simultaneously situated in a broader societal context of meanings (or, put in a more philosophical way: embedded in (mostly tacit) agreements they enter as competent language users). Whatever goal is implied or posited, this always reflects certain values and normative assumptions about what constitutes being human, living well, living together in a particular society.

The parenting perspective on upbringing, however, suggests the possibility of ‘closure’ or ‘achievability’, whereby one can be deemed to have succeeded as a parent. In distinction to this, what I am seeking to articulate here is the experience of a certain kind of openness – no doubt, an openness that can lead parents to feeling insecure, or even an openness that is sometimes mistaken for ‘not knowing the right thing to do’ – with regard to, e.g., ‘assertive’ and ‘respectful’, both in terms of what these words specifically mean and how these meanings are exhibited in concrete doings and sayings and in relation to whether they could even be achieved at all.

My reading of the workshop is intended to bring out how so much of the experience of being a parent is not actually about ‘parenting’ at all, that is, if parenting is identified with exhibiting certain behaviors that lead to certain developmental outcomes. The hopes, aspirations, and aims we have as parents – the ideas we have about how we would like our children to be today, tomorrow, or at some indefinable time in the future – do not appear as fixed and desirable endpoints associated with potential approaches that, once identified and followed, can be reliably achieved. Rather, they confront us in varied, unpredictable, and subtly changing forms as a constitutive part of the experience of living as a human being who also happens to be the parent of another human being. When do we call something or someone assertive and respectful? What does my wanting my child to be assertive and respectful tell me about my own life? How do I accommodate my hope that she grows up to be an assertive and respectful adult with my other concerns about the complex dynamics of my family life? How do I reconcile instances of being not-quite-as-respectful myself with my pedagogical intentions, in the face of my children reproaching me on this issue? And even: why do we find it important that our children grow up to become assertive and respectful? For whom is not being assertive (enough), being disrespectful, etc. a problem, and why?

These are intrinsically open-ended questions. They also hint at a basic flaw in the ‘parenting’ account of upbringing: there is no straightforward, clearly defined point at which we can step back and assess the success or otherwise of our parenting. Even assuming that we can agree that what we want is assertive and respectful children, and even assuming that we can agree on what that actually means: at what point can we ever say we have achieved it? How can we ever say that our parenting has been ‘successful’? And what would criteria for such success be? Is it when the child reaches legal adulthood? When she leaves home?

This is not to deny that children, e.g., having a loud mouth (or being disrespectful, or etc.), might be a problem (for someone, at some time) or that parents have genuine concerns and insecurities about it. The point is that this cannot be ‘solved’ (in the sense of dissolved; made to disappear) by framing it in terms of a fixed behavioral endpoint that can be achieved by exhibiting a certain approach; it can only be ‘addressed’, by questions such as the ones raised above. Being a parent means being confronted (or being claimed) by (and having to deal with) such questions all the time or, even, by an infinite variety of similar questions that one could not possibly predict in advance; questions that themselves are thrown up by and derive their meaning from the experience of being a parent. In asking them, parents are also asking questions about their own life: its meaning, its value, and

its challenges. Raising children is, then, not just (or perhaps not so much) about behaviors parents are able to effectively encourage in their children but also (or perhaps predominantly) about the world we represent and in which we are raising our children. (I will come back to this in the next section.)

Yet, in the shift to ‘parenting’, this form of questioning is shut down; it is not just the answers but the questions that are given to us in advance. What the relevant questions are and what it is they need to ask and to be looking for are already defined for parents in advance. In the reframing as ‘parenting’, our understanding of raising children seems to be stripped of an evaluative dimension other than in terms of outcomes. There is no room for questions of meaning and value, for ambiguity and uncertainty. The entire purpose, in fact, is to remove ambiguity and uncertainty.

### ***Parental Responsibility***

The shift to ‘parenting’ has important implications for our understanding of a parent’s pedagogical responsibility. In brief, it leads to a narrow, instrumentalist understanding of what that responsibility is, which entails little regard, if any, for the idea of parents as representatives of a human world with values and valuations. In the remainder of this chapter, I will develop this somewhat by drawing on Arendt.

In her famous essay *Die Krise in der Erziehung*,<sup>19</sup> Arendt presents an idea of pedagogical responsibility that situates educators not only in relation to (their) children (and their development) but also in relation to the world they both (i.e., children and educators) belong to. Relationally, educators are to be situated ‘between’ child and world, maintaining a relationship of responsibility to both. For Arendt this is so because of the unique double way in which the child presents herself to the educator: as ‘a new human being’ and as ‘a becoming human being’ (2006, p. 182). In as far as the child is ‘a becoming human being’, basically as any human being is in a process of growing and becoming, the educator has to assume responsibility ‘for the life and development of the child’ (2006, p. 182). But what is unique about the way the child presents herself to her educators, and what differentiates the human species from other ‘animal forms of life’ (ibid.), is that the child also has to be conceived as ‘new’: ‘new’, that is, exactly “in relation to a world that was there before him, that will continue after his death, and in which he is to spend his life” (ibid.). Importantly, this newness is not to be mistaken for some kind of inborn uniqueness or essence, those things that supposedly make a child ‘unique’, ‘his qualities, gifts, talents, and shortcomings’ (1958, p. 179). Rather, this newness

---

<sup>19</sup>The English translation of this as *The Crisis in Education* might be slightly misleading if ‘education’ is taken in a narrow sense, i.e., as pertaining to the formal processes of education as schooling. However, as already indicated above, *Erziehung* first and foremost applies to those informal processes, mostly within the family, by which parents bring up their children. It is important to keep in mind that Arendt speaks about this broader sense of ‘education’.

“is implicit in everything somebody says and does”, meaning: it is not somehow already ‘there’ (e.g., innate), or presupposed, but is to be understood as an inherent potentiality of human beings (i.e., beings capable of speech and action) and is thus something that is to be concretely manifested in speech and action (1958, p. 179). Put somewhat differently, human society is composed of uncountable sayings and doings. When growing up, gradually learning to speak and act, children most of the time ‘take over’ the sayings and doings their educators introduce them to, more or less continuing the ‘normal’ course of human affairs. But sometimes they do not; sometimes they say or do something that has the ‘character of startling unexpectedness’ (1958, p. 178). Of course, it can be argued that every future context in which words are uttered and deeds performed is new, and that, in a sense, everything children say and do is ‘new’. But this may not be exactly what Arendt intends here. There is a gradual difference at work, I suggest, that is important to keep in mind: a difference between, on the one hand, taking over sayings and doings in other (granted, always new) contexts, thereby possibly slightly modifying the sayings and doings as these have been taught or handed over, and, on the other hand, saying and doing something – something with the ‘character of startling unexpectedness’ – that can potentially interrupt, perhaps disrupt, the normal course of human affairs, something out of the ordinary.<sup>20</sup>

Whatever sense (or degree) of newness is involved, it is important to preserve it, as Arendt states, for it is only through renewal that the world can be saved from ruin (cf. 2006, p. 193). It is in relation to this newness of the child that the educator has to strike a delicate balance. The fact that the child presents herself to the educator as new in relation to the world positions the educator simultaneously vis-à-vis this newness and vis-à-vis the world she represents and introducing her child into. Educators cannot bypass the fact that ‘in relation to the young’ they stand “as representatives of a world for which they must assume responsibility even though they themselves did not make it, and even though they may, secretly or openly, wish it were other than it is” (2006, p. 186). Pedagogically, this translates into a responsibility for the existing world, something Arendt describes as a protective stance towards the world, “to keep it from being overrun and destroyed by the onslaught of the new that bursts upon it with each new generation” (ibid., p. 182). This role, and the responsibility that comes with it, imply, minimally, that parents show a willingness to represent the world, and that they have at least some idea of what it means to pass on something of value to the next generation. But the delicate nature of the balance shows itself exactly in the fact that this protective stance does not mean that educators should then also “dictate how [the world] will look” (ibid., p. 189), for this will “strike from the newcomers’ hands their own chance at the new”

---

<sup>20</sup>For this distinction between kinds of newness I’m drawing on Arendt’s account of the new in terms of a miracle. ‘The new’, she says, ‘always happens against the overwhelming odds of statistical laws and their probability, which for all practical, everyday purposes amounts to certainty; the new therefore always appears in the guise of a miracle’ (1958, p. 178). If anything is to be understood as interrupting/disrupting the normal course of affairs, the likely candidate is something akin to a miracle.

(*ibid.*, p. 174). Pedagogically, this, in turn, translates as a responsibility for taking care of the newness of the child, of the “something that has never been before” (*ibid.*, p. 185), such “that this new thing comes to fruition in relation to the world as it is” (*ibid.*, p. 186). Children also, then, need to be protected from the world, meaning: ensuring the possibility that children can act and speak, that they can disclose/reveal ‘themselves’, ‘who’ they are, and thus (possibly) start something (a)new. Taken together these latter two responsibilities, i.e., for the child’s newness and for the existing world, in some balanced way, constitute what Arendt understands by the responsibility ‘for the continuance of the world’ (*ibid.*, p. 182).

Education (*Erziehung*) is, then, in an important sense much more than just a concern for a developing human being. It is also, perhaps first and foremost, this concern for the (continuance of the) world. But there is not much of this, if anything, to be found in the dominant culture of parenting, precisely because the importance of the parent as a representative of some community has been downplayed in favor of the narrow conception of the parent as, in Daly’s terms, ‘parenter’ (2013, pp. 227–228). The burden of parents’ responsibility is the burden of correct execution, of being perfect or good enough performers. In the current climate, the parent-child relationship has been confined to some separate area – an area where parents ‘do’ certain things with their children, ‘interact’ with them – as if that can be neatly cut off from other parts of a parent’s social and personal life. The net effect of this is that our understanding of parental responsibility is increasingly narrowed down to a concern for one’s child’s proper development, to a focus on ensuring the optimal developmental process of one’s child’s capabilities, talents, needs, etc., and to staying in control of that. It is, in Arendt’s terms, narrowed down to responsibility ‘for the life and development of the child’ (2006, p. 182), reducing childrearing to not much more than ‘just a function of life’ (*ibid.*), hence downplaying what makes us distinctly human. Parents are held responsible, that is, for creating a particular kind of child and for the management of a particular kind of pedagogical process. To put this a bit more pointedly: this may in fact no longer be responsibility (in the full sense of the word) at all but rather accountability. Parents are positioned in a very specific way, one in which they are required to be constantly vigilant and alert, as every new day will present new challenges, potential problems, milestones. And it is this state of vigilance and alertness, necessary for the production of end-products already defined for them in advance, for which they are held accountable.

To be clear, this is not to say that parents no longer represent anything. Rather, the point is this: parents are increasingly incapacitated when it comes to having even the possibility of asking the question of what could be meaningful to conserve and pass on, as the ‘ends’ of childrearing are already taken for granted within the very languages that have come to determine their conceptual outlook today. And in as far as they are so incapacitated, what is obfuscated, then, is an important part of what makes up the experience of being a parent as a human experience, i.e., the immensity and moral demandingness of their responsibility in relation to their child’s newness. For the existential burden – some may say anxiety – of having children and having to raise them is precisely the realization of the fact that one’s own speaking

and acting (as a parent) is not just about bringing about changes in the world,<sup>21</sup> but may or may not affect my child's own ability to insert herself into the world (by action and speech). If being a parent is to be more than 'parenting' – more, that is, than a preoccupation with the kind of 'product' a parent is supposed to deliver, or a preoccupation with maintaining the 'right' kind of relationship – then this must have something to do with preserving a sense of being *existentially* burdened. It must have something to do with seeing parents not as finding themselves in an already predefined relationship in which the positions that can be taken and what can be done by whom are already determined, but as finding themselves in a relationship with their children in which things can still start anew.

# The Body in Education

Joris Vlieghe

In this chapter I deal with a topic that only recently became a serious subject of study for educational theory and philosophy, viz. the human body. As a rule, the very fact that learning and teaching are events in which we are involved as bodies, i.e., as people made of ‘flesh and blood’, has been disregarded, if not repressed. If educationalists have paid attention to the physical dimension of human life at all, the body appeared in a stereotypical, negative way. That is, the body is regarded as an object of distrust that should be kept under control by installing harsh disciplinary measures. As of recently, however, a reevaluation of human corporeality seems to have occurred. Increasingly, corporeality is taken to be an important factor to take into account when theorizing education. As such the body has been (re)discovered by educational philosophers, even though in the day-to-day practice of learning and teaching it often remains forgotten.

In the first part I discuss the traditional view on the body within educational philosophy and theory. I go on showing, in the second and third sections, how a more positive attitude vis-à-vis corporeality has gradually emerged, and why it is of potential relevance for education. In the fourth section I return to the question why after all the body has been (and, very often, still is) neglected, suppressed or dealt with in a condescending way. Here, I discuss the most recent research on the body and education, and show how we can take an enduring debate in an entirely new direction. In the last part I zoom in on a case where education and the body are closely intertwined: physical education. The analysis I present here relates primarily to the Western educational and cultural context, and the examples and authors I discuss are to be situated against this background. However, corporeality is an educational issue all societies should deal with, and as such this chapter is more broadly applicable.

## The Body Within the Traditional View on Education

According to a traditional account of education, there are good reasons to assume that the physical side of human existence has no (or only a negative) meaning. This is partly the result of an *intellectualist* view that has prevailed for a very long time. This can be seen, for instance, in the *liberal education* approach, which has been dominant in the Anglo-American world of educational philosophy. In the work of theorists such as Peters and Hirst, education is fundamentally about initiating the new generation into valuable domains of knowledge (and skills related to knowledge) (Hirst and Peters 1970). The criterion to define what is of value regards the possibility of extending, deepening, and refining one's knowledge – and to make connections with other fields of knowledge and science. In that respect, it is a worthwhile endeavor to impart scientific knowledge *about* the body, as it happens during a biology lesson, whereas the body *itself* has no specific educational significance. Learning how muscular tissue is composed, and teaching the biochemical and mechanical processes that explain why we can move our bodies is of educational relevance. We see something new and unexpected. And, we are challenged to relate these insights to Newtonian mechanics, to learn more about anatomy, to make comparisons with locomotion in other species, etc. However, what it means to experience our ability for movement, let alone improving on them (e.g., by excelling in long-distance running or rugby) is of no concern to education (Cf. Barrow 2008).

Obviously, even according to supporters of this view it is important to pay at least some attention to our bodies. After all, the body needs to move, to rest, and to be fed at appropriate times. But, this also means that the body only has a secondary and instrumental role to play. Granted that a healthy body is a necessary precondition for the well-functioning of the life of mind, corporeality still has no meaning in and of itself. Therefore, it makes no sense at all to speak about physical *education*. At most one could sustain that within educational contexts time is spent for physical *training*. In other words, even if it is sensible to pay attention to the physical side of human existence (in the educational realm as well as elsewhere, for example at work), there is *no specific educational reason* to pay attention to the body as such.

To another tradition which has informed continental philosophies of education and which defines education in terms of *Bildung* (Cf. Løvlie and Standish 2002), the body also has no, or only a secondary, meaning. To this view, education is first and foremost aimed at cultivating the properly humane, i.e., at letting flourish that what sets humans apart from the rest of nature. As far as we have bodies, there is nothing which distinguishes us substantially from plants and animals. Nonetheless, thanks to the development of the unique mental capacities we possess, we might elevate ourselves and transcend the order of nature. To the extent that we are physical beings, we are and will remain subject to the laws of nature which are beyond our control. The task of education is to set us free from this servitude and to turn us into truly *free* human creatures. A small example might clarify this.

The need to drink when the body is short of fluids, but also more culturally modeled desires such as hankering after lemonade to satisfy this urge, is caused by

biological and psychological mechanisms that are ingrained in human nature. When I feel thirsty and when the means for me to meet this need are at my disposal (e.g., because a vending machine is available and I have enough change), satisfying this need can hardly be called an act of human freedom. After all, it is not I who has chosen to have thirst in the first place, and the reasons why I prefer lemonade over water are not (necessarily) clear to me. On the contrary, it is only when I would choose not to consume lemonade (out of good reasons, for example, because I believe my money could be better spent to charitable goals or because I don't want to drink what commercials tell me to), that I demonstrate that I am truly a *free* human being: then I verify that I can go against the instincts my body has put me up with. My choice to resist bodily inclinations sets me apart from sheer biological and psychological necessity.

However, for this to be possible education is required. As Kant (1982, p. 11) puts it: humans are the only creatures that can and should be educated. From birth, we are already more than animals, and yet we do not come to full humanity automatically. So, the educator must assume that there exists something in every human being that is not fully subject to the order of nature and that this capacity can be brought to fruition as the result of the right education. More exactly, education should aim at developing the properly humane capacity for self-determination (Cf. Langeveld 1971). As a consequence, a large part of education consists of learning to master our bodies in view of an ideal that has nothing whatsoever to do with the body. Far from being a mere theoretical point of view, this account has underpinned for centuries the day-to-day educational practice, in which the body has been subject to sometimes extreme disciplinary and disciplinary measures (Cf. Rutschky 1997). I will come back in greater detail to this issue later.

## **Towards a More Positive View on the Body**

Since the second half of the last century, this dominant view on the role of the body has started to change fundamentally. This is, first, due to significant societal changes, and especially due to spectacular evolutions in medical science. As a result, our dependency on the realm of nature has changed forever. Hundred years ago, the average life expectancy in the West was about 55 years, breaking a leg brought about a lifelong lack of mobility, having a bad body odor often meant social isolation, and except for those who lived a celibate life pregnancy was an almost inescapable fate. With the exception of a certain death, we have more or less got control over the inconveniences and risks the body has put us up with, and for a majority of people in the Western world living a comfortable life in harmony with the body has become the rule (Juvin 2010).

Alongside these social and cultural changes, we have also come to a more accurate understanding of the processes that support what education is fundamentally about. Whereas the traditional account would argue that genuine education requires a break with the order of nature, it has become increasingly clear that the very

abilities of gaining knowledge and making sound judgments are at least partly rooted in our bodies. It is now generally accepted that neurological processes are a necessary condition for cognitive processes and that moral reasoning presupposes the proper functioning of certain brain areas. For instance, it has been shown that the malfunctioning of the ventromedial prefrontal cortex makes it impossible to respond swiftly and appropriately to moral dilemmas (Damasio 1999). However, it is not just our brains that are of crucial importance. For example, learning abstract concepts seems to be supported by a teacher's physical movements. This happens, for instance, when in order to explain that the heart functions as a complex pump-device, a biology teacher might illustrate this by using her two hands performing the widening and shrinking of the heart chambers (Poizzer-Ardenghi and Roth 2007).

A similar evolution took place within Western philosophy. For a long time, humans were believed to consist of two separate substances, body and mind – the so-called *dualist* account, which goes back to Plato, and which has become very influential especially since Descartes (1996). According to the latter, body and mind have nothing to do with each other. After all, one can grasp parts of the body, whereas the mind remains ungraspable. Also, like any material thing bodies can be split up into parts, whereas our consciousness is one and indivisible. On the basis of these and other arguments, the mind was considered not only as essentially different from the body but moreover as superior to it. This view is fully in line with what I have been calling the traditional view on education, i.e., the elevation of humankind above physical nature.

From many different theoretical perspectives, this long-standing and pernicious depreciation of the body has been heavily criticized. For instance, at the end of the nineteenth century, Freud already argued that large parts of our conscious life are determined by unconscious drives which aimed at bodily satisfaction. And, Nietzsche (1961) contended that the dualistic view of humankind is related to a deeply rooted hatred of and even disgust for our own physicality. Hence, a plea to remain 'faithful to the earth' and to affirm the bodily side of life to the full. During the twentieth century, this reappraisal of the body has been steadily intensified. It would be impossible to give a comprehensive overview of this evolution here, and so I only discuss some important milestones.

Within the Anglo-American world, Gilbert Ryle (1945) has drawn attention to the difference between knowing *that* and knowing *how*. With this distinction, he wants to show that many important things we learn are not a matter of pure knowledge. Much intelligent human behavior does not follow from a cognitive grasp of reality – for example, the knowledge of the rules one needs to take into account during a discussion. Rather, such behavior is dependent upon strongly embodied habits and sensibilities acquired during our education. A 'mindful' participant to a dialogue must know how to respond to others in a quasi-automatic way.

Another important school of thought that originated in the late nineteenth-century American context and that undoubtedly contributed to a reevaluation of the body is *pragmatism*. A basic creed of this movement is that the human capacity to have conscious representations of the world is not some super-natural and exceptional phenomenon that needs to be explained. It is just part of the world we live in.

As James (2007) argued, our cognitive faculties are the result of evolutionary processes, i.e., they are part of making our way in life – in the same sense that all animals have developed specific features in order to survive safely in their natural environment. As such, conscious phenomena should be understood as emerging from natural history and in relation to the context in which knowledge is used and applied. This also means that all knowledge is firmly *embodied*. Pragmatists are therefore strongly opposed to any form of body-mind dualism.

More recently, Lakoff and Johnson (1999) have developed an *embodied cognition paradigm*, which is based on the simple observation that in the practical day-to-day life there are no disembodied minds that are opposed to the mere material reality of the body and the rest of the world. Instead there are only interactions between organisms and the environment. ‘Body’ and ‘mind’ are then only convenient ‘short-hand’ descriptions of two aspects of those interactions. We are however mistaken to regard these descriptions for ontologically separate entities. According to Lakoff and Johnson, our thought is structured with the help of image schemas and conceptual metaphors which are based on recurring bodily experiences. Essential notions such as part and whole or the very idea that processes have beginnings and ends are not imaginable if we wouldn’t have bodies – bodies that have parts themselves and that can make journeys from point A to point B. This also means that pragmatists are not just making the trivial claim that there is no thinking without brains. Rather, our whole bodies are involved in embodied cognition.

Within continental philosophy, the most important theoretical contribution to giving the body its full due is to be found in *phenomenology*. In Husserl (1973) we already find a most helpful distinction between two fundamentally different ways of experiencing the bodily side of human life: there is the objective outsider’s perspective which makes the body appear as a *Körper* (a complex machine in the way Descartes defined it), which is opposed to the subjective insider’s experience of corporeality as *Leib* (the lived-through body). Very often the two are unrelated. The velocity measured by the chronometer is something altogether different from the directly lived swiftness (or slowness) while running on the beach. So, it could be argued that the traditional view which believed that the body could not possibly possess any intrinsic educational meaning is predicated on the erroneous idea that body is mere *Körper* (and therefore mere organic processes that belong to the order of biological necessity). More than anyone else, Merleau-Ponty (1962) has taken up the challenge of arguing that we *are* also *Leib* and of explaining why it is of the greatest importance to take this dimension into account.

He argues that the very possibility for the world to appear as a coherent and meaningful whole to our consciousness is dependent upon a primordial *bodily* engagement with things. Even in areas that seem completely disconnected from the corporeal side of our existence, e.g., in mathematics, the body cannot be let out of consideration. We count to ten because we have ten fingers. Even though there are good reasons to rely on an 8- or 16-part number system (as computers do), we prefer to work with a decimal system. This shows that even abstract activities such as mathematics are ultimately rooted in very practical and physical experiences (e.g., counting on one’s fingers) (Cf. Sheets-Johnstone 1990). More generally,

Merleau-Ponty (1962) maintains that our bodies, before we can start to think, already possess a pre-reflexive grasp of the world. My hand ‘knows’ where to find and grab my pen – without first having to make a mental picture of the desk I am sitting at. Moreover, the body *itself* found all meaningful connections with the world. The way in which the world appears to us is given shape by the characteristics of our being physically embedded in the world. So, for instance, for a toddler the upper side of the table has no meaning: for her it is nonexistent, as due to her small body size, it is a part she never encounters. Corollary, the physical constitution of the adult makes that for her the underside is normally no part of her world – unless of course she is looking for a way to get rid of chewing gum.

## The Educational Meaning of the Human Body

These shifts in the appreciation of the body are closely related to major developments in the world of education itself. Analogous changes are to be found in the work of progressive thinkers who advocated a shift from a teacher-centered to a child-centered approach. This already happened as early as the late eighteenth century with the rise of the so-called *Reformpädagogik* – which was a reaction to the above sketched tradition of *Bildung* in the German-speaking context (Benner and Kemper 2003). Central to this movement was the idea that education should respect the child in the entirety of its being, and therefore that natural and bodily inclinations (for instance towards play) should be taken as learning opportunities rather than as impediments to education. In the Anglophone world, and fully in line with the pragmatist turn in American philosophy, *experiential learning* gained a firm foothold during the twentieth century. For one of its major founders and spokespersons, John Dewey (1981), we should pay heed to the aesthetic, practical, and social dimensions of education. This is, in order to have genuine command over something, our knowledge and skill need to be based on lived experience of the world. People learn by actively doing things in the world, not by sitting still and passively soaking up what a teacher tells them about the world. Moreover, we only learn if we fully understand the practical relevance of the stuff that used to be buried in boring handbooks. Also, learning is never a solitary affair. It happens in the presence of other human beings. As such every educational situation is potentially one of cooperation. The basis of Dewey’s reformist (but by today also very commonplace) ideas is the ‘principle of continuity’: there exists a continuum between organic (bodily) activities and education. Higher cognitive abilities are based on the way the body perceives, moves, and manipulates objects. Also, it is thanks to our embodiment that we are essentially social creatures rather than solitary minds (as Descartes would have it).

More recently, but wholly in keeping with Dewey’s main intuitions, Richard Shusterman (2004) has developed a *somaesthetic* approach. For instance, he argues that aversive phenomena (such as the common abhorrence for mathematical formulae, but also xenophobic fears) are embodied habits that are caused by distressing events in our personal lives, and more exactly events that went together with tight

muscle contractions, and which gave rise to conditioned behavioral patterns of reacting in an inhibitory manner (e.g., to mathematical formulae or people with a different skin color). Educators, so Shusterman claims, should take this lesson, as it should be clear that more needs to be done than merely convincing that formulae are beautiful and that there is no objective reason to fear others because they look differently. Instead, we should offer students the opportunity to *fully* reflect on their feeling scared, which also involves an awareness of the bodily experiences of muscle constriction that go together with their fears. Only then can we retrain, step by step, more desirable habits of conduct.

Another important movement in which the body has been taken to have a major educational significance is the so-called *humanistic* approach to learning, which has its origin in the post-war client-centered psychology and which has found its strongest defender in Carl Rogers (Rogers and Freiberg 1994). Not unlike the *Bildung* tradition, Rogers starts from the idea that education should aim at the fullest possible development of the potential that sets us apart from the animals and that turns us into genuinely human beings (hence the name 'humanistic'). The key mistake, however, is to believe that the bodily side of life would stand in the way of this achievement. Instead, Rogers claims that the body possesses its own 'wisdom' and that we need to learn and trust it again. Education is indeed a matter of regaining something we lost: in the footsteps of Rousseau, Rogers holds that a lot of what goes wrong in modern Western culture directly follows from the suppression of our authentic, and more exactly our bodily human nature.

Obesity, to name just an example, is not so much caused by a lack of education (i.e., because one lacks discipline and cannot resist and rise above physical tendencies). On the contrary, it is brought about by a wrong-headed education. It is part of human nature to look after ourselves and to be concerned with fitness and agility. The fact that so many of us give in to noxious behavioral patterns is the result of having 'learned' that the consumption of large quantities of food equals a satisfied life. Therefore, the main task of the true educator is not merely to teach about the risks that come with an unhealthy diet and about the pitfalls of consumerist culture, but to restore contact with our innate orientation towards a good life, so as to develop more sound and natural standards of what counts in life. Likewise, we are born with an inclination towards seeking contact with other people, towards enjoying and sharing with them. In our society, this natural pro-social tendency gets repressed, again as the result of the existing educational system which promotes individual success and turns us into ruthless competitors (Ibidem). Spontaneous inclinations towards cooperation are suppressed and authentic human relationships are neutralized. This is a good reason for defending physical education in schools, as it offers opportunities for restoring an authentic connection with our bodies, but also for learning to work together. I return to this topic in the last part.

To conclude this section, I draw attention to two more recent perspectives within the humanities and the social sciences which have turned the body into a serious and central object of educational concern: *feminism* and *post-structuralism*. The basic idea informing the latter school of thought is that common ways of thinking and speaking are often based on sharp binary and hierarchical oppositions which, in the

end, are not defensible (Cf. Derrida 1992). The antagonism between mind and body (and the supposed superiority of the mind) is one of those. If we want to change the way our lives are ordered, we should blur these oppositions. Analogously, feminist scholars have shown that so-called essential differences between men and women have little to do with the body in a biological sense. Instead, they draw from our gender identifications, i.e., socially and culturally constructed ideas about being male and female. We come to assume these identifications as the result of an upbringing which prioritizes stereotypical representations of masculinity and femininity over many other possible ways of giving shape to our gender (Cf. Fraser 1989). Therefore, we need to critically deconstruct prevailing gender conventions and give new meanings to our gendered bodies. This would be a challenge for a truly critical education.

It should be noted, however, that these approaches have also met with the critique that they reduce the body to a pure effect of discourse, i.e., something which only exists thanks to our thinking and speaking about it (Cf. Carozzi 2005). Therefore, we lose sight of the body in its full physicality. Nonetheless, some post-structuralist thinkers such as Judith Butler (1993) have stressed the importance of interrupting dominant discourses on (gender) identities in a 'performative' way. This means that we publicly put on display that prevailing constructions of (gender) identity are without any ground. And, we do this by playing with the bodily routines that support these fixed identities (for instance, by gender parodies and cross-dressing). As such the theme of power and resistance has been raised, to which I turn now in greater detail.

## Corporeality, Power, and Resistance

The account I have been giving so far has not taken into consideration one very important observation: although there seems to be a growing awareness of the importance of the body in educational theory and philosophy, in the real-life world of education corporeality remains to be neglected or dealt with in a deprecatory way (Cf. Vlieghe 2014). This is an indication that there is going on more than just the preponderance of intellectualist and dualist prejudice. In order to come to a more accurate understanding of the problematic status of corporeality in educational practice, I turn to another approach which is based on the work of Michel Foucault, and which conceives of corporeality in terms of power, oppression, and resistance.

One of Foucault's central claims is that in the eighteenth century a significant shift took place in the way in which Western societies are organized (Foucault 2010). Before that time social order was based on the power sovereign rulers exerted over death. They could execute anyone arbitrarily. By inducing fear and obedience in this way, social order was ensured. However, all this changed with the rise of *biopolitics*: rather than reigning over death, social order is from now on secured thanks to the government over life. Instead of sacrificing life as a means of deterrence, every human life counts. Or, more exactly, every life should be made

maximally productive. Each individual should contribute to the optimal and smooth functioning of society. As a result, sophisticated control mechanisms meant to ensure optimal contribution of all to society originated. More exactly, the human body became a direct target of biopolitical government. This is because the body is visible and its performance is easy to measure. The body thus became the object of continuous observation, recording and reporting. This, in turn, allowed for large-scale comparative analyses. For the first time in history, the idea that there could exist such a thing as a 'normal' body came to mind. Hence, bodies that were exceptional were termed 'abnormal', i.e., they were seen as a problem and as a threat to the well-functioning of society.

Foucault has further shown how particular institutions such as hospitals, prisons, and especially schools have played a capital role in this exercise of power over life and body (Foucault 1978). At school, the body of young people is drilled to the extent that they are able to function optimally in a productivity-oriented society. The abnormal is detected, mapped, and rectified. All unproductive aspects of physical life are adjusted or get neutralized. The overactive body is tamed, whereas our lazy bodies are encouraged to take up useful work. Bodies that crave for sexual gratification are taught that there are more worthwhile things to do. And our whimsical bodies learn to adapt unassumingly to fixed arrangements such as timetables (Cf. Deacon 2006). At school, everything is put in place to ensure that spontaneous, yet unproductive bodily tendencies get suppressed. In essence, schooling comes down to an unyielding imposition of discipline – instead of being (primarily) concerned with transferring knowledge and skills or with the formation and flourishing of the human person (Cf. Rutschky 1997). The ultimate purpose of going to school is to learn to get up every morning at an early hour, to face wind and rain in order to get to a place where one is not allowed to eat or urinate when one feels the need to do so, and where one is willing to perform repetitive, yet pointless work in a meticulous way. As such 'docile bodies' are created, getting people ready to devote themselves to do productive, but not really engaging work when they reach adulthood.

Furthermore, the purpose of these disciplinary mechanisms consists of making external control over our bodies progressively redundant: schooling is most successful when students no longer need teachers to observe them all the time to sit still and to forgo the impulse to drink whenever they feel thirsty. That is, schooling fulfills its true aims when the disciplining function is internalized to such an extent that one comes to possess maximal *self-control* (Cf. Elias 1994). Not surprisingly, this objective is close to the goal set by the traditional account of education which I discussed at length in the first section – transcending the realm of mere nature to achieve true freedom (understood as the capacity for self-determination).

The traditional account and a biopolitical analysis of the true aims of education are opposed in that to the latter approach the ideal of self-determination through control over the body is a form of oppression. Nevertheless, there is an interesting parallel to be made between these two approaches, which also sets them most markedly apart from the body-centered views discussed in section 'Towards a More Positive View on the Body' and 'The Educational Meaning of the Human Body' (Cf. Vlieghe 2014). To these views – pragmatism, phenomenology, and humanism –

the body is supposed to be in and of itself a source of meaning and knowledge, a resource which can ensure cooperation and harmony between people, as well as the site where genuine freedom can be achieved. Over and against such a view, both the traditional and the biopolitical account of education hold that the body, rather than being intrinsically oriented towards the greater good, is a nuisance which is constantly at risk of interrupting the order of things. It could be claimed that the traditional view on the body in education takes the body more seriously than other views do: it accepts the body in its full 'bodiliness'. This is because it draws attention to the many aspects of the corporeal side of life that are not conducive to the greater good and the well-functioning of society. This is in stark contrast to the humanist, pragmatist, and phenomenological approaches which substitute the real bodies we have with a nonexistent body ideal, i.e., with the genderless body of angels that – as the theological tradition wants it – never get drunk, nor ever need to transpire or defecate (Agamben 2010).

Some authors have tried to give a positive reading to these unruly and nonproductive aspects of bodily life. Following Bataille (1991), it could be argued that there is always something to our bodies that can *never* be captured by any social order – 'rebellious flesh' to use here an expression coined by the Dutch philosopher Henk Oosterling (1989). Our bodies are the container of an ineradicable revolutionary force which, he argues, is the condition of possibility of all social change. I have argued elsewhere (Vlieghe 2014) that occasions during which we entirely coincide with the bodily side of existence, e.g., when we are taken by a fit of laughter or when we make the same (repetitive) movements at the same time (during the exercise of calisthenics), it is no longer possible to define what it means to be together in terms of fixed roles and positions: at those moments we affirm to be fully 'flesh', and this constitutes a moment of radical equality. All existing ways of identifying and positioning ourselves vis-à-vis others become utterly meaningless. These moments are of great importance for education, as they allow for an interruption of an established order of things, and moreover for a new beginning – in the sense that the future is open for unforeseeable ways of living together. Corporeality is thus not only a hotbed of resistance. It also possesses a community-building, democratizing and transformative potential. As Deleuze (1978) – following Spinoza here – suggests, we do not know what a body – or for that matter a collective of bodies – can do. Corporeality thus implies a danger to any societal order, and this might explain why the body has such a problematic status in the word of education as customarily conceived (i.e., as aimed at maintaining the world as it is).

## The Case of Physical Education

To conclude, I would like to zoom in on what is perhaps the clearest crossing point between education and the body: *physical education*. This subject is often not taken seriously. From its very introduction as a compulsory course in schools, physical education has been the object of suspicion. Moreover, it always had to be defended

against subjects that seemed to have far greater educational relevance, such as math, history, and languages (Cf. Vlieghe 2013). This is completely in line with the intellectualist account I discussed at the beginning of this chapter: from this perspective, it is far from clear *what might be educational about physical education*. This negative attitude has been reinforced by the fact that P.E. teachers mostly received a specialized instruction in the medical and biomechanical aspects of locomotion instead of being trained to become educators (Tinning 1997). This, of course, reinforces the dualist prejudice that the mind is substantially different and educationally far more important. Moreover, for many it is not clear why one would organize P.E. at school as oftentimes (and especially since the 1960s) the P.E. curriculum predominantly consists of doing sport. Today, P.E. and *sport education* are habitually seen as synonymous (Cf. Renson 1997). One might argue then that there are numerous (and very often much better) occasions for performing sport outside of school (Barrow 2008).

Together with the emancipation of the body as described in the second and third section, there have been many attempts to come up with an account of P.E. which takes it to be intrinsically worthwhile and to have a proper place within the walls of educational institutions. From a phenomenological point of view, it could be argued that the very term ‘physical’ education is itself a problem: it reduces the body to a mechanical device that needs maintenance (*Körper*), rather than that it would cultivate the lived-through body (*Leib*). As Carl Gordijn (1968) wants it, we should have *movement education* (and not physical education) in schools. And, as Margaret Whitehead (2001) has argued, we should even raise ‘physical literacy’ in our children. To understand this concept correctly, it is important not merely to define it in terms of specific abilities (e.g., running 100 m within a certain amount of time) but more generally (in the sense that alphabetic literacy is not merely about being able to read and write, but to have a whole world at one’s disposal which is lacking to the illiterate). The physical literate possesses a wide and adequate register of movements and gestures for responding to the world, and this contributes to her life quality and sense of self-worth. Furthermore, movement education could instill many important values, such as teamwork, fairness, honesty, courage, endurance, learning to cope with winning and losing in a sane way, but also learning to respond in a tactful way to weaknesses in others (Cf. Kirk 2006; Skillen 1998). As already noted, from a humanist perspective (which takes human being to be a bodily creature through and through), it could be added that physical education is of supreme importance because it can – or must – support the full flourishing of our human potential, and as such it will contribute to a happy life for all (Cf. Hellison 1995). However, this would require a particular P.E. curriculum which prioritizes collaborative activities over competitive ones.

Now, along the lines of the critical reading of schooling in terms of disciplinarization, as expanded on in the fourth section, it could be claimed that many activities that take place in contemporary P.E. are aimed at bringing the body under biopolitical control. It might be clear from history that P.E. has often served the purpose of preparing the bodies of the young for a military career: subjecting them to collective forms of drill (e.g., marching exercises and calisthenics), making them

all doing the same things at the same time and according to a rhythm imposed by the blow of the whistle, bodies were created that functioned mechanically and automatically. As such, people were drilled to blindly obey orders and to become mere instruments of warfare (or for industrial production for that matter) (Gleyse 1997). A lot has changed since the 1960s, with the substitution of sport and games for army-like training schemes. Nonetheless, it could be claimed that P.E. is still about instilling control over our bodies, be it in far less explicit ways: by engaging and striving to excel in sport youngsters are made responsible themselves for controlling their own body, in a sometimes scrupulous and no less harsh manner (Cf. Kirk 1998). External control has become fully internalized. Moreover, Jean-Marie Brohm (2006) argues that today sport has become the new opium of the masses. With this he means that many of us are brought to take an instrumental relation towards our bodies because we strive to be like the sport heroes that are ubiquitous in popular media – people that all possess a perfect, narcissistic body and that seem in full control over it. Therefore, if school sport is a mere copy of what youngsters see happening at the television screen, this is bound to stimulate them not to shun ruthless competition and to measure their own self esteem in relation to the super-human performances of sport celebrities.

Therefore, some maintain that we need a “socially critical physical education” (Tinning 1997), which aims at social and political transformation. This could happen by – among other things – raising consciousness regarding implicit power mechanisms behind certain forms of physical activity, and sport performance in particular. Or, it could be argued that physical education should be turned into a “moral practice” which stimulates respect for standards, authentic (rather than blind) reverence of successful sports(wo)men, and a sound appreciation for competition and striving towards excellence (Kirk 2006). Clearly, these suggestions have the benefit of explaining what is *educational* about P.E., but the risk is here that it is no longer clear what is *physical* about P.E. After all, one can easily (and maybe even more effectively) acquire the aforementioned values during a collaborative geography or history project, and one doesn’t need to be physically active in order to learn and see how an unjust and oppressive societal order is imposed.

Elsewhere I have argued that we might do a service to physical education by going against this tendency to justify it in terms that have nothing to do with the body itself. Instead, we could take P.E. literally, i.e., as a practice that is entirely and uniquely focused on the physical (Vlieghe 2013). In line with what I said earlier in regards with the transformative and democratizing dimension of being gathered as bodies, a case could be made for conceiving again of P.E. in terms of collective movement exercise (during which we fully affirm to be bodies). Even though, as I discussed, this type of activity can be exploited by belligerent and biopolitical regimes, the reverse argument could also be made: when a collective of bodies moves together in time (Cf. McNeill 1995), the possibility of a radical change is present. And, this is felt as a danger to the established order. Hence, the danger is averted by giving collective physical activity a clear (viz. belligerent or productive) destination. Again, at that moment physical education is no longer *physical* education in a literal sense.

This last illustration shows that human corporeality remains to have a problematic, if not unsettling quality to it. In spite of the many good arguments that have been developed to give the body its full due, and in spite of undoubtedly very well-intentioned initiatives to approach the body more positively in the world of education, it seems that a genuine appreciation for the body in its full bodiliness poses an ongoing challenge for future educational theory and practice.

# Philosophical Issues in the Shaping of the School Curriculum

David Bridges

The school curriculum ought, on the face of it, to be a central pre-occupation for philosophers of education or indeed any other kind of educational scholar. This chapter addresses some of the central questions about the curriculum that have interested philosophers over the centuries: what precisely is ‘the school curriculum’ and where is it to be found, how described? How may what is of value (or educational value) to be determined? By whom? Further, how are we to conceive of the curriculum – as a process, by analogy with an industrial production line, perhaps, or a research site? These are the main questions that I shall begin to explore in this chapter.

## The Multi-layered Curriculum

An analytic philosopher is almost bound to observe some distinctions in terms of what exactly we are talking about when we talk of the school curriculum. I have already narrowed the discussion by referring to the *school* curriculum, because obviously there is a wider and significant sense in which life experience more generally provides a curriculum, a set of educational and learning experiences. Indeed there were serious debates in the 1960s and 1970s challenging the elision between education and schooling and urging the ‘de-schooling’ of society. (See, for example, Illich 1973.) Emile’s education involved a teacher but nothing like school attendance as we might recognise it (Rousseau 1762). I am going to focus on the *school* curriculum. But this short excursion out of school points nevertheless to another distinction which is often observed. The very institution of schooling carries

e-mail: [db347@cam.ac.uk](mailto:db347@cam.ac.uk)

messages about, for example custodianship, surveillance, compulsion and control that are largely independent of the any formal or declared statement of the curriculum that a school may offer.

Within the context of the school we may think of the curriculum as encompassing a number of different things, including:

1. The declared programme of study that is planned and most of which is likely to be assessed provided by the school. This typically is described in terms of a set of subjects (mathematics, language, biology, history, geography, etc.) that students will be obliged to study at particular stages or ones which they can choose as options. This may be described and prescribed of course in greater or lesser detail, though the more detailed specification is usually contained in syllabuses.
2. An extension of this declared programme to include other kinds of learning which a school deliberately and explicitly sets out to achieve, though it may do so outside as well as inside the programme of study indicated above. These things would typically include elements of interpersonal and social behaviour, moral education, education for citizenship, etc. – some of what is sometimes referred to as the pastoral curriculum (see Marland 1980 and, for more philosophical analysis, McLaughlin 1982).
3. What is taught and learned through the way in which schooling is conducted and the structures and taken-for-granted practices that are associated with it – learning which is unplanned, perhaps unintended, perhaps even contrary to the declared educational aims and principles of the school, but which is deeply embedded in the system, all of which is sometimes referred to as “the hidden curriculum” (a term reputedly coined by Phillip Jackson (1968), though the concept probably goes back to Dewey and has been a central focus of sociological analysis of schooling from Freire’s (1972) *Pedagogy of the Oppressed* to more recent analysis by Bourdieu and others). Thus, for many years (and no doubt still in certain respects) schools have reinforced gender and racial stereotypes, not as a matter of policy but because these were embedded and not examined critically. Authority structures in schools, discipline and punishment regimes, the balance between cooperativeness and competition in school activity, all that is contained in the notion of school ethos – all of these contribute to what is taught and what is learned.
4. Finally (for current purposes) we need to distinguish between the curriculum which is taught, i.e. the learning which the school intends, more or less explicitly, to take place and the curriculum which is actually learned, i.e. what individual children take from it, which may be something far removed from the intentions of the teachers, because children’s needs, interests, readiness to understand and motivation all enter into their selection from what is on offer, their construction of the meaning of what is on offer, their readiness to understand it and their motivation to remember it. Schools can attempt to influence the ways in which these factors enter into what is learned, but they cannot control all of them all of the time.

These last considerations have of course fed the development of some important educational ideas and practices. First, the attention to dynamics of the student's role in constructing their own educational experience and determining in the end what they learn has informed the notion of the child- or student-centred curriculum in the sense of one that (crudely speaking) is tailored to and developed out of the 'needs and interests' of the student (both contested concepts in the philosophy of education literature – see Dearden 1972 and Wilson 1974). Secondly the acknowledgement of the gap between what teachers intend their students to learn and what they do in fact learn has prompted attention to student voice in research (Rudduck 2002; Rudduck and Flutter 2004) and to classroom action research, interpreted as helping teachers more successfully to align intention and actuality (Elliott 2000).

It is clear from this short analytic excursion that the 'curriculum' can be interpreted as encompassing a wider and a narrower range of learning, intended and unintended. It would be my argument that, although most of the debate about, for example a national curriculum (and arguments about breadth and depth, options and compulsion) focus on curriculum in the narrow sense, schools have to take responsibility for very much more than this, for the actual *consequences* of their actions and the systems they set up and not just for the purity of their *intentions*. This responsibility implies an awareness of what is being taught outside as well as inside the formal curriculum and of what students are actually learning, intended or not.

Whether one takes a wider or narrower definition of the curriculum, however, it is immediately clear that one enters the domain of values and normativity, which has excited philosophical and wider attention throughout history.

### *Values and the Curriculum*

In so far as we ('we' in government, in local administrations, in schools or in the classroom) are deciding on and controlling the curriculum that our students will experience, we are inevitably involved in choices laden with all sorts of values. There are three main points of reference for these values:

*The Good Life* Centrally, what we are offering students is a set of experiences that will open up to them ways of living, activities, ways of looking at the world that they themselves may come to value for their own sake, or from which, at least, they might select what they would choose to engage in for their own sake. These may include forms of working life but are or should not be narrowly restricted. They might choose a life dedicated to family and kinship, to religious devotion, to political action of which work may or may not be a central part.

*The Good Society* The school inevitably represents a microcosm of a larger society and is the route through which young people are initiated into forms of social co-existence. But the school and the school curriculum is typically seen as having a function which goes beyond this, one of equipping the next generation to populate

or maintain what is seen as good in contemporary society or to help build a better society. To this end schools address (not without controversy) issues of education for citizenship; they are urged to encourage enterprise and entrepreneurship for economic competitiveness; they prepare students to take their place in a ‘democratic’ society; they learn patriotic values. One of the burdens that schools carry is the burden of expectation that they will achieve everything to which society aspires and solve almost any problem that society encounters – from an epidemic of obesity to a poor performance by the national cricket team (see Depaepe and Smeyers 2008 and other contributions to the same special issue of *Education Theory* on ‘Educationalisation’).

*The Good Person* Schools have a view of the sort of person that they seek to develop. Some settle for ‘a well rounded’ student; others aim not only to recruit but to produce ‘talented and gifted’ children. In the UK specialist ‘academies’ have been linked to particular areas of prowess, for example in mathematics or sport. Many will focus on moral character. In the history of education such teleological views of human nature and the kind of person that education is forming have featured prominently in philosophical writing. Castiglione sets out to educate the perfect courtier – and the perfect lady (Castiglione 1528). The Confucian concept of a sage offers an ideal model of humanity, a gentleman who can carry himself with grace, speak correctly and demonstrate integrity in all things. A ‘progressive’ educational tradition that has run through the likes of Comenius (1632) and Rousseau (1762) has however emphasised the child as a person of inherent goodness whose nature should guide education rather than some raw material that had to be turned into a pre-specified product.

These three points of reference are, of course, interdependent, and a comprehensive philosophy of education, such as that offered by Plato in the *Republic* (Richards 1966), will address all three and their educational consequences. Nor do they necessarily indicate the same curriculum for all (though perhaps they should). A hierarchical view of society has commonly been taken to justify a differentiated view of the curriculum for people destined for different places in the hierarchy. Plato’s *Republic* required three classes of people: guardians (or rulers), helpers (soldiers) and farmers and workers. He acknowledged that these would in most cases be born from families of their own class – but, with slight embarrassment, thought it necessary to propagate a myth about their different inherent qualities in order to reconcile them to their lots.

We will say, in the language of fiction: “You are without doubt all brothers, but the god who made you put gold into the makeup of those who may rightly be guardians, and into the helpers he put silver, but he put iron and brass into the farmers and the workmen”. (Plato’s *Republic*, Book III,415 in Richards 1966: 66)

And then he asks: “How might we get this fiction to be believed?” (Ibid).

Centuries later Cyril Burt came to his aid with a formally “scientific” analysis of human intelligence which appeared to justify the view that children had inherently different kinds of abilities (Burt 1933). Just as Plato used his myth to justify different

forms of education for different children, so did policy makers in the UK in the 1940s (not in the 1944 Education Act as is sometimes supposed but through subsequent regulations) use Burt's psychology to justify the development of a tripartite system of schooling with a tripartite differentiated curriculum – thus ensuring, as in Plato's Athens, the continuing social reproduction of inequality through education and the curriculum.

By contrast, there are arguments for a “common curriculum”, and philosophers of education have been prominent in defending this concept (see Halstead and Hayden 2008). These tend to rest on both an optimistic view of what all children can achieve (‘no child left behind’!) and what they all need to function effectively in society, along with a commitment to a certain kind of society which provides equality of opportunity and a common or shared foundation of educational experience as a basis for social solidarity.

So, my point is that these three reference points – to the good life, the good society and to the good person – underpin any selection of a curriculum including its differentiation. This observation invites three main forms of inquiry. One is historical: we can explore what values have been expressed through the curriculum over time. The second is sociological or anthropological: we can explore, comparatively perhaps, how different societies and cultures today express their values through the school curriculum (though any such exploration today would have to include the impact of the homogenising forces at work in the global economy). The third is philosophical: we can explore, among other things, the nature of arguments that connect the observation of the essentially normative character of decisions to a conclusion about what form a curriculum understood in these terms should take. In this context it seems appropriate to focus on the philosophical approach.

How might or should we respond the observation that curriculum decisions are essentially normative ones? Let me identify briefly three responses.

*Articulate a coherent case for certain societally framed values and their educational implications*

This is primarily what governments seek to do in establishing a national curriculum, though with lesser as well as greater articulacy and with lesser and greater coherence between their views of society and their views on education. It is not that society's current values are taken uncritically: there may be aspects of contemporary social values that people would prefer to lose. Rather such a logic starts from what is seen as the best in a community, sometimes in historic values that have been lost and should be reasserted (e.g. in societies emerging from a period of occupation, oppression or colonial rule), sometimes in the aspirations of a society for its future development (e.g. for greater harmony between different communities). These observations indicate, however, that the logic of the argument is not a simple move from an ‘is’ to an ‘ought’ (one that philosophers would in any case be quick to unpick): rather, a set of norms, values and aspirations are brought to bear on any description of ‘society’, and it is these that drive provide the impulse for the development of the curriculum.

The difficulty, then, is in elaborating and defending these values – wherever they come from. This is rendered more complicated in states (and this perhaps applies to most states these days) that accommodate multiple societies and cultures. What values should the school curriculum then reflect? The answer to that may be that if the different cultures are equally valued then they all need somehow to be reflected in the curriculum alongside a commitment to valuing and respecting diversity. Countries like Canada, Australia and New Zealand have struggled to reconcile their obligations and loyalties to tradition and to indigenous populations with their modernist aspirations in a global society. In Northern Australia these dual points of societal and cultural reference have been reconciled through what is referred to as the ‘both ways’ or ‘two ways’ curriculum. Harris (1990) defined two-way Aboriginal schooling as: “a strategy to help make the matter of choice real in both worlds; to provide opportunity for the primary Aboriginal identity to stay strong, though changing, and thus continue to be the source of inner strength and security necessary for dealing with the Western world”. He argued that “Aboriginal people today are increasingly interested both in being empowered in terms of the Western world and in retaining or rebuilding Aboriginal identity as a primary identity” (1990: 48). In some countries the different points of societal reference are most vividly expressed through the language curriculum. In Kazakhstan, for example reference to its Kazakh population and national identity, its ethnically Russian population and its desire to position itself in the English speaking international community has resulted in a tri-lingual policy under which the three languages are not only taught but also expected to become the media of instruction for different subjects in all schools (Mehisto et al. 2014). But this reflects a governmental vision of what is good and right for society, and it is by no means one shared by all sections of society, some of which would prefer to see a more whole-hearted focus on their own first language and the culture they identify with by ethnicity or choice.

In the extreme case the normative consensus collapses in the face of values that appear to threaten the very core of the society in which the curriculum is being played out. The UK has recently become alarmed by the way that some schools have apparently endorsed Muslim radicalism, which in some cases is committed to the downfall of the society in which it is located in favour of a different ideal of a society operating under *sharia* law. In this way the liberal premises accepting diversity and allowing (some) schools to follow their own curriculum have broken down, so now the UK government is taking steps to eradicate these “subversive elements” from the schools and to set normative boundaries around what can be taught (see HM Government’s 2011 *Prevent Strategy*).

So, one form of logic in the determination of the school curriculum is to start with the values that ‘society’ seeks to realise and reflect these in the school curriculum widely understood. This logic is, however, put under some strain if there is no very substantial consensus as to what the values and valued things should be. The philosophical question as to what is desirable is one which it is very difficult to resolve under these circumstances and it quickly turns into a political question as to who has the *de jure* authority or *de facto* power to make the decision. We shall

observe several times over how difficulty in answering the question ‘what values?’ leads us instead to the question ‘whose values?’.

*Retreat from affirming any particular set of values and throw the emphasis on individual choice*

A different line of argument has been employed by philosophers in response to the observation of the value-laden character of the school curriculum. A number of modern philosophers and philosophers of education have not felt very confident about taking a normative position on, for example what might constitute worthwhile activities or the good life and hence of constructing a curriculum on this basis.

John White, who has written more extensively about curriculum than any philosopher of education in recent times, began his first expedition into this territory (White 1973) by reviewing various philosophical attempts to show why some activities should be regarded as more worthwhile (and more educationally worthwhile) than others, but he failed to find any of them satisfactory. From this he concluded that: “Curriculum planning should not begin from substantive accounts of what the individual must value for its own sake, in the absence of any valid arguments for these. It must begin in agnosticism and subjectivity” (White 1973: 17). But where does such agnosticism leave us with respect to the curriculum?

One answer to this has been that we should allow young people to choose for themselves what they will study (perhaps even whether they study anything at all), and this (with certain limitations) has been the conclusion drawn – and acted upon – by radical educators such as A.S.Neill in his celebrated Summerhill School. Neill argued that “The function of the child is to live his own life, not the life that his anxious parents think he should live, nor a life according to the purpose of the educator who thinks he knows best” (Summerhill School 2016).

*Move from choice to enabling people to have choice and be choosers ... and hence to universalism*

However, the counter-argument to the idea of giving choice to children is that they are not equipped to exercise such choice in an informed and intelligent way. They need to be prepared for such choices. “We cannot give children freedom”, argued Bertrand Russell, “but we can give them a preparation for freedom; and this is what education should do” (Russell 1955). And this twist in the argument is precisely what White employed to justify a compulsory curriculum:

Non-interference ... may well harm the child by restricting his options. The least harmful course we can follow is to equip him, as far as possible, for the ideal situation – to let him determine for himself what the Good shall be for him. To do this we must ensure (a) that he knows about as many activities or ways of life as possible which he may want to choose for their own sake, and (b) that he is able to reflect on priorities among them from the point of view not only of the present moment but as far as possible of his life as a whole. (White 1973: 22)

Amartya Sen and Martha Nussbaum both employed a not dissimilar argument in their attempts to establish the desirability of certain “capabilities” – knowledge, skills and understanding that people needed to acquire wherever they were in order

to open up the possibilities for choosing and leading the life that they wanted for themselves (Sen 1982; Nussbaum 2000). For Sen these were described in fairly minimal terms; but Nussbaum filled out what she argued to be universal values in ways that have led some critics to question whether what is described is really, as it were, societally neutral, or whether it embodied a set of values and assumptions that was too closely associated with a western liberal democracy.

But is it entirely inappropriate that from a position somewhere (i.e. in our own societies) we may comment critically on what is happening in other societies in a way that suggests that this is inconsistent not only with the values underpinning our own society, but those that should underpin all societies? Is a curriculum or system of schooling that is transmitting, for example gender inequality, racist ideology, worship of political leaders, or violence against those of different faiths merely wrong from a position in a different society that abhors such values but all right in one in which such values are deeply embedded? Or is it simply wrong – full stop? In so far as countries worldwide subscribe to the principle (if not entirely the practice) of universal human rights, does this not give us some purchase on educational values and principles that are shared by – even if they do not actually transcend – different societies? Naïve epistemological and social relativism leads to the dark impasse of ‘post truth’ politics in which not mutual respect for each other’s values (a universalistic principle) but brutal power takes the place of reasonable, let alone rational discussion.

## Control of the Curriculum

I have argued that decisions about the content of the curriculum are inevitably normative in character and that, notwithstanding some attempts to appeal to principles of curriculum selection which transcend particular societies, decisions about what should be included in and what left out of the school curriculum in any particular case remain hotly contested. Such contestation helps to shift the question from one of *what* values should shape the school curriculum to one of *whose* values and where in society the power to determine the curriculum should lie. Again, we are faced with a question that lies clearly within the scope of social and political philosophy. Normative questions still confront us in only slightly different terms.

The options here are very wide-ranging. At one level, one might take the view that decisions about the school curriculum should be taken at national level, if not by government, then by an agency which stands in close proximity to government and is perhaps ultimately under its control. In the UK, for example, the late 1970s and the 1980s saw a movement away from what was close to a curriculum free for all to the development of a national curriculum managed initially through the national Qualifications and Curriculum Development Agency, but with close political attention.

In some contexts responsibility is taken down to school level. Since the 1960s, there has been extensive interest in the notion of school-based curriculum

development. This slightly begs the question, however, as to who speaks for the school: the head teacher and professional staff? the school governors? parents? students? What voice do all or any of these have in school level curriculum development? So what kinds of considerations might lead us to favour one of these centres of power over another?

One set of considerations might be to do with motivation. One might take the view, for example that teachers will work more enthusiastically and with greater commitment if they are teaching a curriculum which they have played a part in designing. This brings us, too, to ethical issues about the place of integrity in teaching and what might be held to be a moral obligation of the teacher to herself and to her pupils to teach only what she honestly believes to be of most value.

A second set of considerations is a pragmatic one associated with the increased social and geographical mobility of populations in some countries and the disruptive experience for children moving from one school to another when there is little consistency or continuity in the curriculum across a country.

A third set of considerations are to do with location of power in a particular society and the ambitions of the powerful. A central government that is trying to drive a country in a particular direction – consolidating national unity; promoting economic competitiveness; establishing peaceful inter-community relationships, etc. – will fairly naturally be drawn to the opportunity provided by a nationally defined curriculum to shape the thinking and values of the new generation. Sometimes the curriculum may be a *response* to the redistribution of power (so that in countries of the former Soviet Union attention shifts from Russian as the main language to a different national language that has previously been marginalised or suppressed); sometimes it is used to help *drive* a redistribution of power, for example by giving new place and new authority to indigenous cultures and languages.

However, the considerations indicated so far mainly invite examination from a psychological or sociological standpoint. The issue of who should control the curriculum becomes more clearly a philosophical matter when it gets linked to questions of people's rights. In practice most of the debate in these terms has focussed on the rights of parents and schools' accountability to this constituency.

There has been a certain amount of philosophical interest in more traditional arguments about parents' rights, paternalistic and non-paternalistic (e.g. Brighouse and Swift 2016), and some discussion by James Conroy (2010) and others of the extreme case of the exercise of parents' rights in the choice which in the context of their work is referred to as home schooling or 'education otherwise' (since the 1944 Education Act in the UK legislated that: "It shall be the duty of the parent of every child of compulsory school age to cause him to receive efficient full-time education suitable to his age, ability, and aptitude, either by regular attendance at school or otherwise").

Consideration of these rights became especially lively against a backdrop of neo-liberal policies associated, in particular, with the Reagan/Thatcher era. With this programme of 'reform' (evangelised across the world by the World Bank) came the construction of an educational market in which schools competed for 'customers' for the most part parents. In such a political climate schools were actively encouraged

to become more diverse in character (you cannot have a market economy if there is only one choice), to publish their results on assessments (like the performance of a company's shares) and to compete against each other for custom (i.e. students) (see Bridges and McLaughlin 1994). There was an important sense in which this ideological programme shifted the discourse from the idea of parents as partners in the education of their children and the development of their curriculum to one in which they were now customers choosing between what others had devised, except that in the UK, to begin with, there was not initially much choice since the same government was specifying in some detail the national curriculum that all schools should follow (see Bridges 2010 for an account of this changing relationship).

Most educational systems today provide for something of a mixture of national and local control of the curriculum, though systems tend to swing one way and then another in balancing these different forces. A lot hangs on the specificity, the granularity or otherwise of the requirements that come from the centre and the scope that this leaves for local, school level initiative and creativity. Recent developments in curriculum policy in Iceland, it has been argued, represent one of the most radical swings in the direction of school level control. Hafþís Ingvarsdóttir describes how six fundamental pillars have been developed which form the foundations for the educational policy: *literacy, sustainability, health, welfare, democracy and human rights, equality and creativity* (Aðalnámskrá/National Curriculum Guide for Upper Secondary Schools, 2011). Schools are given the freedom and power to design their own individual curriculum based on those guidelines. Apart from three defined core subjects individual schools can more or less decide which other subjects to offer and how many credits in each (Ingvarsdóttir 2015).

For philosophers, however, the main focus of discussion has been on the entitlement of the state to regulate the school curriculum, the rights of parents (including their proxy defence of the rights of children), and perhaps some consideration of the role of the teacher and his or her capacity not merely to 'deliver' a curriculum cooked by someone else, but to teach authentically and with integrity what they really believe to be of value.

### ***Knowledge and the Curriculum***

I have focussed so far on the ethical and social questions raised by consideration of the school curriculum, there is, however, another important thread to philosophical consideration of the curriculum and this is rooted in theory of knowledge. Education may not be limited to helping young people to know and understand things, but knowledge and understanding in some shape or form is typically at the core of any curriculum. This prompts not only the evaluative question, 'which knowledge or understanding is of most worth?', but also epistemological questions about the nature, organisation and structure of human understanding and what this might indicate with respect to the nature, organisation and structure of the curriculum.

A lot of questions about the curriculum require some view of what different kinds of knowledge and understanding there might be, a classification of knowledge or what Philip Phenix calls the “architectonics” – “the principles of ordering knowledge into systematic categories” (Phenix 1964:44). Talk of ‘a balanced curriculum’ presupposes a view of what and how many elements are being weighed against each other and their equivalence in terms of the scale of knowledge and understanding involved. Talk of ‘a general education’ implies, similarly, a view of the scope of different kinds of knowledge and understanding that might be encompassed in such generality. Talk of ‘interdisciplinarity’ or ‘curriculum integration’ presuppose some understanding of the different forms of knowledge that might be joined together in either of these ways. In any case, simply to talk about curriculum encompassing ‘knowledge and understanding’ is just too broad and unmanageable: we need to have some way of distinguishing different kinds of knowledge in order to determine what to include and what to leave out and in order to carve up the otherwise overwhelming task of teaching and its time-tabling.

Philosophers through the ages have sought to develop such classificatory systems – and apply them to the design of the curriculum. One structure that was especially influential and enduring (especially as students progressed into higher education) had its roots in Plato’s plans for education in the *Republic*, which evolved as the *Trivium* and *Quadrivium* of the middle ages, which in turn underpinned some of the thinking of the liberal arts tradition in American education where ‘the seven liberal arts’ remain an important point of reference. This provided not just a categorisation of knowledge but also a hierarchy. It took a number of slightly different forms but typically began, at an elementary level with gymnastics, music and ‘letters’; followed by the *Trivium* of grammar, logic and rhetoric; and then the *Quadrivium* of arithmetic, geometry, music and astronomy; from which some continued to the highest level and theology and philosophy.

One modern philosopher of education who provoked especially intense debate about the structure of knowledge and the curriculum was Paul Hirst (1974). Hirst argued that there were certain ‘forms of knowledge’ defined and distinguished by their tests for truth and central or key concepts (Bruner wrote of ‘great organising concepts’). The list of forms of knowledge had a striking resemblance to the list of core subjects to be found in a contemporary, if fairly traditional, school curriculum and was interpreted by some as providing a justification for a rather conservative curriculum based on these categories. There was energetic debate – especially with sociologists of knowledge in the London Institute of Education enthused by the recent publication of Michael Young’s 1971 *Knowledge and Control* – about the standing of these ‘forms’ of knowledge and the extent to which they were in some way necessary and a priori distinctions or, as it were, empirically observable contingent and socially evolved and evolving structures.

Hirst always argued that you could not draw a direct inference from an account of the structure of knowledge alone to a view of how a curriculum should be organised that sought to initiate students into such different ways of knowing. This last step would depend, in particular, on psychological insights into how children best learned such things. Philip Phenix, similarly, warned that “it is not to be assumed

that the architectonics of knowledge is necessarily the same as the architectonics of instruction” (Phenix 1964: 44). There will be a number of different considerations underpinning a list of ‘subjects’ that appear on a school timetable or in a description of the school curriculum, but these will *include* considerations to do with the scope and schematisation of knowledge and understanding.

For some – including some philosophers – categorisation of knowledge and understanding and its division into silos, or ‘little boxes’ as people used to say, became the problem rather than the solution. Knowledge and understanding was not properly conceived in these terms; rather it should be seen as unified, flowing seamlessly from one area to another. Such a view of knowledge and understanding was used to justify “an integrated curriculum” in which subject divisions were discarded; the “integrated day” in which conventional timed periods of instruction were discarded; and the “integrated classroom” through which children could move seamlessly in inquiry that might lead them from mathematics to art to history and via the classroom resources of books, visual aids and equipment on which they would need to draw (Kelly 1982; Bridges 2002).

Richard Pring was among the philosophers who explored the links between philosophical thought and such educational practices. He described one tradition of thought that ran from Hegel via Froebel into philosophy of education and classroom practice, but went on to give fuller attention to the influence of philosophical pragmatism and in particular the work of John Dewey (Pring 1971b).

I am not going to attempt to engage with these arguments here. My point is a more basic and simpler one, which is to illustrate the ways in which philosophically grounded theories of knowledge can shape, and indeed continue to shape, thinking about the school curriculum.

## *Principles of Curriculum Design*

I began by drawing some fairly basic distinctions between different notions of what, more precisely, we are referring to when we talk about the curriculum. Beyond these distinctions, however, there are interestingly different conceptions of a curriculum, each of which carries significant implications for how it might be implemented. While these have been formulated by people who would not necessarily define themselves as philosophers, they represent, nevertheless, philosophies of curriculum understood not so much in terms of aims and content but the character and standing of the prescription. There are many such conceptions or ‘models’, but in this space I shall simply contrast two highly influential but starkly different approaches.

Edward Thorndike’s major opus, *Educational Psychology* published in 1913, brought behaviourist psychology and scientific measurement to bear to programmes of instruction. His view of education and the curriculum reflected the industrial age from which it emanated and its processes of production:

Education is a form of human engineering and it will profit from measurements of human nature and achievement as mechanical and electrical engineering have profited by using the foot, pound, calorie, volt and ampere. (Thorndike 1913:1)

When Winslow Taylor’s scientific theory of management of production (Taylor 1911) was added to Thorndike’s behaviourist psychology, the curriculum became, as William Pinar et al. describe it: “the assembly line by which economically and socially useful citizens would be produced” (Pinar et al. 1995).

This conceptualisation of the curriculum continued to evolve through the twentieth century with contributions including Bobbitt’s (1918) approach to task analysis and was brought together in Ralph Tyler’s *Basic Principles of Curriculum and Instruction* (1949) described by Pinar et al. as “the single most influential curriculum text ever written” (Pinar et al. 1995:148). Basically, what Tyler offered was “a linear, administrative structure for curriculum development” (ibid) with four main steps:

1. The selection and definition of learning objectives
2. The selection and creation of learning experiences
3. The organisation of learning experiences to achieve the maximum effect
4. The evaluation of the curriculum with a view to subsequent revision

Key to the model in its subsequent development and implementation was the expression of what was to be learned in the form of learning objectives and, more particularly, these were to be described in terms of the behaviours that students might demonstrate at the end of the learning process. Benjamin Bloom stepped in at this point to offer an extremely influential “taxonomy of learning objectives” (Bloom 1956), which, notwithstanding pretty devastating critique by philosophers Hugh Sockett (1971) and Richard Pring (1971a) among others, re-surfaces to this day. I most recently re-encountered it in the context of planning for a new curriculum in Kazakhstan (Bridges 2014). Teaching and learning was then, as it were, backward engineered from these behaviours and processes and designed to take students through from the raw material of their current understanding to the end product. Because the end product was expressed in behavioural terms, it was a comparatively easy process then to ‘measure’ how successful the production process had been and to use this evidence to improve the process of production (i.e. teaching and learning).

This concept of the curriculum has been criticised on a number of grounds, most of them challenging some part or another of assimilation of educational processes with those of industrial production. These included the objections that:

- Important learning objectives cannot be expressed as behaviours’ – consequently...
- Not all important learning outcomes can be ‘measured’ in the way supposed in this model;
- What children learn from properly educational experience is – and should be – much less predictable and controllable than this model supposes, and by extension, therefore...

- Evaluating learning simply by reference to planned/ intended outcomes blinds one to other outcomes (desirable and undesirable) that may not have been intended.
- More fundamentally, there is something rather inappropriate and distasteful about conceiving of children and their education as elements of an industrial production line.

Of course, there has been much more to the debate than I have described here, but I hope that this is sufficient to illustrate, first, a distinctive concept of the curriculum, its design and operation, which is independent of questions of the scope of its actual content; and, secondly, the way important philosophical debates – in this case, debates about behaviourism and about the application of technocratic models in educational settings – enter into the question of how we should describe a curriculum.

One important response to the debate about behavioural objectives, etc. was provided by Lawrence Stenhouse (who, incidentally, acknowledged a debt to Richard Peters' philosophical writing about the process of education). Stenhouse was at the time directing a curriculum development project focussed on the teaching of controversial issues in schools, and this was in a context of 'raising the school leaving age' in the UK, so there was a new generation of students who were going to be obliged to stay on at school for an extra year until they were 16. The Humanities Curriculum Project (HCP) as it was called adopted an approach to learning which had (at least) three innovative features:

- Group discussion rather than instruction was to be the medium of learning
- This would be based on a rich range of resources to which students could refer
- The teacher would act as a procedurally neutral chair i.e. he or she would manage the social process of discussion but not seek to direct or lead students to any particular opinion on the matters under discussion.

(Schools Council/Nuffield Humanities Project 1970)

These proposals stimulated much and heated among teachers and philosophers (see, for example, the debate about the neutral teacher running through Elliott (1971), Bailey (1971) and Stenhouse (1972)), which I shall not enter here. My point is that Stenhouse's approach to curriculum development challenged existing models and especially the behavioural objectives model illustrated above. For a start, the 'learning outcomes' from a genuinely free and open discussion were quite unpredictable and likely to be different from student to student. Instead the curriculum designer had to be satisfied with 'aims' (e.g. developing students' understanding of the controversy), a characteristic of which is that they could be satisfied in a variety of different ways. This carried implications for the evaluation of the curriculum, which had to be open to unintended as well as intended effects and which had not only to observe students but to listen to them and their accounts of their learning.

But another and enduring contribution of Stenhouse to curriculum development and teaching was his insistence (often to the irritation of teachers) that he had ‘nothing to recommend’. This was not quite true, but, as Nigel Norris put it: “Curriculum development was, for Stenhouse, quintessentially an experiment and curricula were hypotheses to be tested by teachers in classrooms” (Norris 2008:5). The final arbiter in relation to the acceptability or otherwise of any curriculum development was the teacher, and this implied that the teacher had also to take responsibility for testing, researching and evaluating what actually happened in the classroom and what students were actually getting out of their experience. And this, of course gave impetus to the development of the idea of classroom action research, an element of the Humanities Curriculum Project carried forward as a philosophical as well as empirical research practice by John Elliott, who was one of its members (Elliott 1998).

So if one conception of the curriculum evoked an industrial production line, Stenhouse’s presents the curriculum and the classroom as a research site and one, moreover, in which philosophical reflection about aims, values and procedural principles has a place alongside empirical inquiry. I have no doubt in my mind which better reflects the spirit of a properly *educational* enterprise.

...

‘Curriculum’ is a huge area of educational inquiry and practice, and it is one that draws on philosophical considerations and raises philosophical questions at almost every turn. I have rehearsed primarily the kind of issues that have dominated philosophical inquiry over the last few decades, though my references to Plato, Rousseau, Dewey, etc. indicate that, perhaps the most important questions, especially fundamental questions about how and into what we should bring up the next generation of children, are recycled generation after generation.

Such questions will no doubt remain with us, but contemporary developments will no doubt contribute to the reframing of our answers, and these invite further philosophical consideration. The spectacular developments in the generation, storage, retrieval, management and communication of information of all sorts are already impacting (too slowly perhaps) on the kind of knowledge that young people need to acquire and the skills they will need to handle it: the epistemological bases of the curriculum are surely challenged. Globalisation and the mass movement of populations – and the reaction of populist administrations to these developments – must surely impact on the requirements for young people to acknowledge and accommodate their lives to a dramatic diversity of cultures and challenge traditional identities. And the development of massive industries supporting multimedia online resources for learning combined with easy access to these resources by young people wherever they may be must challenge the situatedness of a curriculum within the context of time bounded school attendance and the possibility of containing this curriculum within any pre-specified frame of reference. We can be assured, I think, that there will remain plenty of philosophical questions to be explored relating to the curriculum of the future.

# The Practice of Educational Research

Alis Oancea

## Background: The Tensional Character of Educational Research

The history of educational research<sup>1</sup> (see e.g. Nisbet 1999, on Scotland; Condliffe Lagemann 2000, on the United States; Richardson 2002, on the United Kingdom; Jover and Rabazas 2009, on Spain) reveals complex and discontinuous relationships with state-funded educational provision, on the one hand, and with institutional arrangements for other areas of inquiry (in particular, the social sciences and the humanities), on the other. The effervescence around the study of education at the turn of the nineteenth century set out the scene for a hybrid, “go-between” field, tensioned by different disciplinary, practical and political interests and “whose emblematic figures are characterized by an astonishing ‘multipositionality’ – that is, simultaneously reformist, manager, expert and scientist” (Hoffstetter and Schneuwly 2004, p. 589). In the United Kingdom, Richardson (2002: 47) argued that the engagement of education researchers with the government had been fraught with political “hostilities”, compounded by internal “fissures” between different intellectual choices about what should count as educational research and what its purposes ought to be.

These complicated relationships are evidenced by the long history of controversy surrounding education research. Critical exchanges about educational research, in the United Kingdom (reviewed in Oancea 2005) and elsewhere, have centred around its quality and rigour, relevance and impact, organisation, ambition and resourcing.

---

<sup>1</sup>I will use the term ‘educational’ throughout this chapter, but see it as an inclusive term, covering both research about education, and research for the advancement and critical challenge of educational activities, settings, relationships and modes of scholarship.

Indeed, there are few aspects of educational research as a field of inquiry and as a university subject that have not been subjected to intense criticism. To some extent, this is a feature that education research shares with other social science and humanities disciplines, whose efforts to explore areas of human experience that are complex and indeterminate have been challenged in global higher education systems increasingly characterised by economic and labour-market indicators and by the effort to quantify research and learning as transactions between providers and consumers of knowledge. There are also more specific drivers for these debates, in particular the relationship between research and professional practice in education, as institutionalised in different forms of teacher education provision, and the malleability of school-based educational provision to government intervention and ideological reframing, which makes it a hot arena for political point scoring.

The United Kingdom is particularly rich in both criticisms of education research (see Oancea 2005) and inquiries into its state, conditions and prospects. The Strategic Forum for Research on Education (SFRE), a national initiative that reviewed educational research across the four countries of the United Kingdom through a combination of commissioned work and stakeholder consultative events, concluded in 2010 that the prospects for research in the four countries were shaped in distinctive ways by their educational, political, social and economic contexts. In England, the report of the Forum (Pollard and Oancea 2010) noted that the large scale of the system, combined with pressures to compete rather than collaborate and with changing political priorities, had created a context in which much of the “collective potential” for productive interactions between research, policy and practice was still “locked” (p. 44). Similar conclusions, although from different premises, applied to other parts of the United Kingdom – and their longer-term implications were yet to “become apparent” (p.17).

One outcome of the SFRE was to highlight the need for a more systematic effort to gather and interpret data that can support a more reflective and mature stage in the development of the field. A working group jointly commissioned by the British Educational Research Association and the Universities Council for Teacher Education (Christie et al. 2012) scrutinised some of the data available and concluded that a combination of demographic trends among education researchers, radical changes in the research funding system, and “destabilising” changes in the organisation of teacher education had created an “especially daunting environment” for educational research, particularly in English higher education institutions (p. 34). The “perfect storm” (p. 9) imagery favoured by the working group chimes with that of Furlong (2013), who noted that recent “seismic changes” in English university-based education research had led to a “particularly bleak” position of faculties and departments of education.

The impact of such changes, should the three reports mentioned above be correct in their judgment, may not have been fully apparent yet in the outcomes of the 2014 Research Excellence Framework (REF), the latest instalment in the quinquennial exercise for the assessment of research quality, impact and environment in UK higher education institutions. The sub-panel report for the field of education (REF 2015) praised the “considerable improvement in research quality” (p. 104) across

the field since the previous assessment in 2008, with 93% of activity judged as being of international standard and above. However, the panel also noted that this outcome had been achieved on the back of contraction in the size of the education submissions to the REF and of concentration of expertise in “small [disciplinary and methodological] pockets” (p. 105), thus showing an “increasingly selective” (p. 103) and “increasingly competitive arena” (p. 113) for educational research.

Oancea and Mills (2015a) looked at historical trends in research capacity and finding in English educational research and noted a consistent drop in both staff numbers and research income, particularly from national government sources. The drop was further highlighted by the comparison with the more stable patterns identified in other disciplines (Business and Psychology). Overall, the report described a field at a “critical juncture” and facing “a period of insecurity, uncertainty and restructuring” (Oancea and Mills 2015b, p. 27). An ongoing joint inquiry by the British Academy and Royal Society (Royal Society/British Academy 2016) builds on this work to explore the opportunities and challenges for education research to transform educational practice and policy, in a context of growing demand but shrinking capacity for research.

Although the national contexts vary, the trends and debates surrounding educational research in the United Kingdom echo those in other systems: they are a symptom of a historical moment more than a geographical pattern. For example, Foss Lindblad and Lindblad (2016) describe Swedish education research in terms of a changing system of expansion and contraction, characterised by increased competition for external resources, intensified research activities, multi-disciplinarity and fragmentation – all in tension with incentives to collaborate. In what they see as “harsher” conditions for academic work, they warn of the risk of “strategic over-adjustment in educational research relative to governing practices” (p. 8).

In Australia, a 2012 report by Seddon et al. used data from the first two rounds of Excellence in Research for Australia, the Australian exercise for the assessment of research quality, to explore “the topography of Australian educational research” (p. 1). The report was triggered by the outcomes of the first two exercises, in particular the overall judgment in 2010 that the performance of research in the field of education was “below world standard” (p.5). The study identified changes in the landscape and ecology of educational research over the past decade, including diversification of purposes, of “knowledge-building practices” (p. 4), and of the institutional organisation of research beyond its historical roots in teacher education-focused faculties in higher education institutions.

Jointly, tensions and controversies such as those outlined above keep educational research under constant questioning within the societal, institutional and disciplinary landscapes in which it is practiced today. What counts as research, and for whom? Is research anything more than a form of labour? What is the role of methodological theory? Is there enough family resemblance among the wide diversity of approaches to inquiry in, and for, education, to give meaning to the notion of ‘educational research’? Does research in education need to be distinctively ‘educational’ – and in what sense? Such questions have led me towards an argument for the consideration of educational research as a form of practice, outlined in the remainder of this chapter.

## Educational Research as Practice

One of the perennial disputes around the value and status of educational research centres on the notion of theory and how it relates to educational practice. These disputes have been particularly lively in the context of reforming teacher education provision. For example, a key aim of the Teacher Education Ministerial Advisory Group in Australia (TEMAG 2014) was to address “the apparent disconnection between theory and practice” (p. 30) that marred some programmes of pre-service teacher education, by identifying “better ways to integrate the theory and practice components of initial teacher education” (p. v). In England, the final report of the wide-ranging British Educational Research Association – Royal Society of Arts review of teacher education noted that “practice” would benefit from seeing research not merely “as a body of knowledge”, but as “a professional learning process” (Furlong 2014: 18). In Scotland, the well-received Donaldson (2011) review of teacher education had also argued that teacher education “require[d] a more integrated relationship between theory and practice, between the academic and the practitioner, between the provider of teacher education and the school”. The US Department of Education warned against practical training as merely an “add on semester after years of instruction in educational theory” (US DoE 2011, p. 7).

Even in the most thoughtfully phrased policy and guidance documents or position papers and reports on teacher education, the case for the key contribution of higher education to teacher education is often made purely in terms of their ability to co-site teacher education programmes and educational research. While there is clear merit to emphasising the importance of the nexus practice-theory, rather than simply positing teaching as a-theoretical, such arguments rest on questionable assumptions.

First, they see educational practice and theory as conceptually and ontologically distinct, as two separate realms, the gap between which needs to be bridged through the mediation work of teacher educators. There is a certain voluptuousness in the hot notion of practice as messy, low, particular, concrete, contingent and embodied action (Schön 1987), particularly when contrasted with a cool imagery of theory as orderly, high, universal, abstract, context-free and impersonal contemplation (O’Connor 1957; Suppes 1974). This contrast rehearses long-standing distinctions between *theoria* and *praxis*, but without the effort that Aristotle and his philosophical followers have put into connecting them together into an account of human rationality, action and flourishing. As Carr (1987: 620) puts it, this oppositional view can be shown to be untenable by breaking down each of its twin implications “that all practice is non-theoretical and all theory is non-practical”.

The oppositional view results in a topography of practice and theory as bounded institutionally: practice is what happens in transactions among teachers and learners, largely occurring in specialised educational institutions (schools, colleges, universities); whilst theory is the specialist work of researchers in centres, institutes and laboratories, many of which are higher education-based. As a consequence, transitional activities such as practitioner research or researcher development are

given an uncomfortable position, which oscillates between being dismissed as neither practical nor theoretical enough, and being hailed as the solution for research-informed educational practice. It doesn't take a lot of effort to see the problems with this division of labour, the potential circularity of definitions aside. Institutional topography is a very limiting device for differentiating between practice and theory and it breaks down easily in the face of the complex entanglements of both with policy and with the wider political, cultural and societal norms, values and ideals that frame their realisation. Despite the generous sentiment behind making a case for the value of research in teacher education in these terms, the 'bridging' (or 'complementarity') metaphor and its associated topography ends up being more divisive than unifying.

Second, even if theory and practice were discrete, many of these arguments make a further questionable assumption in equating educational research to theory and educational activity with practice (and in particular, with *praxis*). In doing so, they operate a double restriction. On the one hand, they elevate research to a realm of abstraction and generalisability shared in different ways by all areas of science and inquiry; but a consequence of this elevation is to limit the potential of research to be "educational" (Whitty 2006) in any way that is comparable to the "educational"-ness commonly attributed to rationally (including morally) defensible teaching activities – i.e., to be intrinsically conducive to growth of experience and to human flourishing (Elliott 2006: 169, describes it as "a form of democratic rationality"). Another consequence is to overlook the diversity of forms of educational research and their varying theoretical aims, from explanation, prediction, understanding or description, to emancipation, change, disruption or subversion, while also brushing over vast swathes of educational research that is deemed "theoretically innocent" (Stenhouse 1981: 110). On the other hand, these assumptions anchor practice exclusively in situational and embodied labour, guided by accepted social norms and technical prescription and by the substance of the other practices into which it helps initiate the learners, but not by systematic understanding of itself – the teacher as a sort of *paedagogus laborans*, to paraphrase Arendt. MacIntyre (in MacIntyre and Dunne 2002) goes as far as referring to teaching as a set of skills in the service of other socially established cooperative activities that, unlike teaching, would be better qualified to be recognised as practices because they have 'goods' or standards of excellence that are internal to that form of activity.

This second set of assumptions thus articulates the distinction between educational practice and educational research in cultural and pedagogical terms, rather than institutional. They imply that the key difference between research (as theory) and practice (as *praxis*) is in their relative epistemological and pedagogical purchase on understanding and enabling education. Unsurprisingly, this way of conceptualising educational practice opens it to challenges that the notion of 'evidence-based practice' is incapable to addressing, partly because the hard dualism theory/practice renders that notion itself artificial and epistemologically weak.

None of the assumptions noted above is particularly new, perhaps with the exception of the stronger policy investment in the notion of evidence-based practice in the last two decades. More recent work attempting to move the debate on includes that

by Biesta (2007), Higgins (2011), Oancea and Furlong (2007), and the contributors to Smeyers and Depaepe (2006), Bridges et al. (2009) or Heilbronn and Foreman-Peck (2015). For example, Biesta (2007, p. 295) notes that questioning and rethinking the relationship between education research and practice may be “an endemic feature of the field of education” and acknowledges that there are different ways in which research may contribute to practice, not only technologically, but also culturally. Higgins (2011) shares with Biesta a strongly sceptical take on notions of educational practice ‘based’ on evidence from intervention research, while arguing for reflective teaching practice and for a notion of education as an ongoing conversation among theorists, practitioners, and theorist/practitioners. Smeyers and Depaepe (2006) also worry about reducing the relationship between research and practice to that between an ‘evidence base’ and its application, while recognising that educational research itself is both a social and a discursive practice.

Such arguments suggest that rather than meander down dualistic paths, it may be more fruitful to start from an acceptance of the polyvalent character of both teaching and research. Both teaching and research join together the reasoned exercise of skill and the normative enactment of virtue, and as such are forms of practice, as well as being sites for the generation and circulation of explanatory knowledge and understanding, albeit realised distinctively in each. They thus meet at the synergy between *theoria*, *praxis* and *poiesis*. The practice of research, like that of teaching, consists of an array of human activities (Schatzki et al. 2001, p. 11) that involve the systematic flexing of thought and language, as well as the reflective use of tools to control the contingencies of everyday activity, and the exercise of virtues in ways that consider other practices and those involved with them. This is a point that has long been recognised in relation to scientific practice; the point of contention in relation to (laboratory) science is often not whether it is a form of practice at all, albeit with multiple component activities, but whether it hangs together as a single practice or as multiple culturally and sociologically definable practices.

### *The Systematic Flexing of Inquisitive Thought*

Key to research as practice are its **socially established purposes**, those of pursuing knowledge for both instrumental and non-instrumental reasons. The articulation of these purposes may vary, with many inclined to defend the value of research as the pursuit of knowledge for its own extension, while others are sanguine about the practical or policy relevance and applicability of research findings beyond the institutional environments of research itself. The language in which we routinely speak of research (in particular, of empirical research) is testament to the teleological understanding we share of it *qua* social practice: the researchers formulate ‘objectives’, ‘research questions’, and ‘hypotheses’, ‘collect’ ‘data’, employ ‘methods’ and ‘instruments’, generate ‘findings’, and achieve ‘impacts’. This language is culturally and historically framed and has become institutionalised in research governance and management rituals.

One of the most cited definitions of education research in Anglo-Saxon contexts is the “minimal” formulation proposed by Stenhouse (1981, pp. 103–111): research is systematic inquiry that is subject to both conscientious self-criticism and collegial critical discourse. This definition makes research a matter of both quest (for something) and question (of something and someone) – both terms sharing an etymological root with inquiry. It places specific demands on the **process** of research; it requires its practitioners to be systematic, that is, to use a strategy patiently and persistently in order to pursue the key drivers of curiosity and desire to understand and act. The expectation to be systematic is often taken in research methodology textbooks in a purely procedural sense, to mean planning and documenting in as much detail as possible the procedures for inquiry, anticipating the operational choices to be made and the decision paths and criteria, as well as applying these plans as consistently as possible across the different instances of research.

This interpretation may, however, be unduly restrictive: it may fit research synthesis and experimental designs, for example, better than it does ethnography or exploratory critical research. What seems to be more important across the different forms of research, above and beyond this thin procedural sense, is being systematic or ‘methodical’ as an epistemic disposition towards both task-at-hand (seeking and asking) and the subject matter: for example, putting sustained effort into clarifying initial beliefs, discarded alternatives, points for suspending judgment and pre-theoretic epistemic attitudes; making an active attempt to give due consideration to the multiple facets, elements and depths of a problem; considering different forms of testimony and evidence and the grounds for taking them on board with different levels of confidence; being meticulous in describing to others the paths taken and the reasons for making specific choices wherever a fork in the path became apparent to you, thus exposing your choices to judgments about whether they were reasonable or well-made in that particular situation. As epistemic disposition, being systematic is amenable to propositional formulation and doxastic justification, and open to epistemic evaluation.

Stenhouse also emphasises a “sceptical temper of mind sustained by critical principles” (1981, p. 103). His notion of conscientious self-criticism is both epistemic and ethical: it again points to a disposition that goes above methodological specifications to counter “temptations of interest” (p. 109), abuses of power and abstruseness of jargon. But research requires also a cultural community that can subject it to public criticism and scrutinise its empirical testing, forms of evidence, and argumentation. Following Gramsci (1967), Stenhouse places his faith in collegial criticism as a defence against dilettantism, prolixity, improvisation and declamation. For Ryle (1949, p. 41), the value of collegial checks resides not in any prior theoretical agreements about what counts as (good) research, but in the practically formative role of criticism and example. Others place that faith in collegial scrutiny informed by agreed principles or standards. Current debates around the quality and trustworthiness of peer review, for example, seem to have prompted increased efforts to articulate and agree not only demarcation criteria between research and other forms of scholarly and educational activities, but also criteria and rules by which to arrive at fine-grained judgments about the extent to which a particular

piece of research fits some **standard** of ‘good practice’ and ‘good’ output and outcome of research. It is easy in this aspiration to let the reasoned quest for consensus overshadow the intuition of value in diversity. This was one of the tensions that underpinned the work reported in Oancea and Furlong (2007, p. 16) and led us then to argue forcefully for a move away from “purely managerial and instrumental frameworks” towards “ongoing conversations about modes of knowledge and rationality”.

Looking back at MacIntyre’s (1981) notion of practice, a further feature of research (not only in education) transpires. A strong tradition of research, particular in the sciences, has seen it as an internally coherent self-regulating activity, driven by distinctive epistemic motivations and dispositions, and realising intrinsically worthwhile knowledge ‘goods’ that were internal to itself and in accordance with its own standards of excellence – in other words, as a practice in MacIntyre’s sense. This tradition is one of the sources of disquiet about educational research, a large part of which is externally (albeit not necessarily instrumentally) oriented. Smith (2003) responds to a similar challenge levelled at teaching by pointing to the purposiveness of all educational activity as a distinctive feature of its internal standards of excellence. The same argument can be applied to educational research: the suffix ‘-al’ is not a demarcation criterion to separate educative from non-educative inquiry, but a marker of a **hospitable attitude towards educative purposiveness** in research.

### *The Reflective Use of Tools*

The recent ascension of assessment technologies in the governance of research comes with a strong push to redefine its standards of excellence in the light of an externally determined notion of ‘performance’. The notion of research performance rests on the treatment of research not as a social practice in the sense outlined above, but as a form of labour (in a nod to this discourse, the term “research labour” is used in Seddon et al. 2012, p. 4, for example). Researcher *laborans* is expected to deliver a certain number of ‘outputs’ that are deemed to be over a ‘threshold’ of ‘quality’ determined through ‘metrics’ and ‘indicators’ such as the journal impact factor or the personal h-index (both widely seen as crude measures of academic popularity). In many systems, performance along these measures is linked to financial and other forms of reward (such as promotion, recognition or even permission to survive and practice in a resource-thirsty and competitive environment). Not only do technologies of performance of this kind incentivise the instrumentalisation of research practice in the service of externally defined objectives, but through the accretion of artificial indicators they also operate a rupture between internal and external standards of excellence in research practice. The various reports discussing the implications of assessment exercises for educational research, mentioned in the introduction to this chapter, often signal the problems of reconciling internal accounts of good practice (which, for example, can emphasise the nexus between research and

teaching in education faculties and department, the relationship with teacher education, and the professional exchanges with teachers) with the outcomes of an assessment process that combines publication ratings and a selection of environment and impact indicators but largely excludes the pedagogical value of research for an institution's own staff, students and graduates.

There is, however, an additional sense in which technique matters in educational research, which references the methods and instruments deployed in its conduct. The conclusions of research can be well or poorly grounded in the evidence considered, and strongly or weakly warranted by the inferences made from it (see Bridges et al. 2009). How that evidence was generated and used and how the inferences were drawn matters to both the level of confidence to be placed in these conclusions and claims, and the practical consequences of investing credence in them. There is thus an important technical core to educational research as a practice (both empirically and non-empirically) that deals with the **reasonableness, trustworthiness and rigour** of all its procedures, and with the refinement of the skills necessary to carry out and innovate these procedures. The researcher depends on her reflective mastery of these skills and on her knowledge of the rationales for carrying out specific procedures in order to control the contingencies of the particular situation in which she carries out her craft.

The account of research as practice I have offered so far has left open the question of the role of the theory of research – its philosophy, sociology and methodology. Ryle (1949) makes the observation that “efficient practice precedes the theory of it” (p. 31), rather than being its “client” (p. 30). By that token, **methodological theory** (and indeed other forms of theorization about research) has an iterative relationship with the practice it purports to summarise and systematise. As such, it is partly dependent on the pre-theoretical and a-theoretical elements of that practice, and partly on ongoing, live theorization of it. Induction into research practice, thus, is both a matter of methodological and philosophical training, and one of acculturation and practicing (in the mundane sense of repetition and exercise) through intelligent apprenticeship.

### *The Considerate Exercise of Virtues*

Stenhouse's definition of research places demands not only on the procedures for conducting inquiry, but also on the attitudes and qualities which its practitioners are expected to exhibit, including being open, transparent and humble (see Pring 2001). These qualities – or virtues – are the preamble of critical engagement with research, both internally, as deliberation relative to the standards of research as a practice, and externally, in conversation with others' purposive interpretations of it. The practice of research is thus **deliberative** and **conversational**.

But the exercise of epistemic (such as openness) and ethical (such as integrity) virtues is itself bounded by the normative context within which practices unfold and are recognised as such. Rather than being simply repetitive or routinized patterns of

behaviour, practices are **normative** (as both Wittgenstein 1953, and Heidegger 1963 may tell us); they involve the constant making of judgments and invoking of standards on the background of culturally grounded and temporally fluid forms of life. I mentioned above the controversies around the notion of ‘good research’: these controversies arise from the culturally grounded and changing character of the norms for correct (or not) research practice and for its appropriate (or inappropriate) appreciation that may be shared by research practitioners and their conversational partners within and outside their immediate scholarly communities. Thus normativity is constitutive of practices, as they play out and are interpreted and reinterpreted responsively *qua* practices, through consideration of not only internal norms, but those of other practices. What counts as an instance of research and what is valued as an instance of good research is a matter of interpretation by specific agents situated in particular cultural, temporal and political contexts.

Virtuous educational research practice is thus not only research that extends growth or enables human flourishing by sanctioning actions that accord with its internal standards of excellence. It is also research that is **considerate** of other practices – like teaching, learning, educational policy, other forms of inquiry – and of their norms of educative-ness. Being considerate of other practices is both a blessing and a curse: education research puts itself constantly at stake, and in so doing it creates the conditions for both keeping itself in healthy check, and inviting potentially destabilising controversy.

## Conclusions

In this chapter, I have sketched out a notion of educational research practice as an array of human activities which combines the *systematic flexing of inquisitive thought*, the *reflective use of tools*, and the *considerate exercise of virtues*. This notion of practice is intended to strike a balance across discussions of theory, methodology and action in education that have been divisive and restrictive for far too long, while acknowledging that it’s more of a case of equilibrium than one of ontic or conceptual unity. A key point about this notion of research practice is that it is not fixed. The internal standards and external cultural framings and social expectations for educational research and for its cognate practices, including educational practices, change over time and across space. The tools and instruments of research are also subject to change, for example through technological development but also through shifts in the ethical and political milieux within which these technologies are deployed. The normative fabric against which judgments are made and conversations are struck in research may also fold and fall in different ways. Although it’s fair to speak of ‘traditions’ given the history of educational research in different contexts, those traditions do not hold it captive.

As argued in this chapter, the socio-historical, disciplinary and political make-up of the field of educational research thus account for its tensional character, spanning: academic vs. professional aims; social scientific vs. humanistic epistemological

or ontological affinities; mono- vs. multi- disciplinary forms of organisation; and attributions of low vs. high professional status. These tensions may seem particularly marked within the ethos of contestation that characterises today's neoliberal democracies, but have surrounded the development of education as a field of study from its early days (Oancea 2014).

Many of the inquiries into the status and the future prospects for education research mentioned in this chapter end with a note of caution about the challenges facing the field in the medium term, such as: retrenchment, due to tighter and more concentrated funding and to the weakening of the traditional supply and demand relationships underpinning teacher education; fragmentation, due to the ascension of performance-based governing of research; and trivialisation, due to pressures towards politically defined relevance. But the scenarios of doom don't always take into account the notion that, as a practice, educational research is not static, but flexes and adapts itself to changing educational, societal and geopolitical circumstances; and it does so systematically, reflectively and considerately.

# Rival Conceptions of Religious Education

John Tillson

## Introduction

In this chapter, religious education will be understood in the broadest sense as formative influence with respect to religious beliefs and attitudes on the one hand and beliefs about religion and attitudes towards it on the other. Religious education in this broadest of senses is ubiquitous, taking place in the home, in formal education (whether as part of a discrete school subject or diffused across the curriculum), and in the wider public arena (such as through media representations). It is important to note that influence of this sort can be systematic, ad hoc, aims-based, aimless, outcomes-focused, process-focused, incidental, intentional, unintentional, and much else besides. For the purpose of this chapter I will narrow the scope to a concern with the deliberate and sustained formative influence on children with respect to religions. Such influence could be anti-religious, pro-religious, or (so I will contend) neutral about the value of religion. For anyone at any time in which there exists at least one religion, it is possible for them to be influenced with respect to that religion. In this domain, the most general normative question is this: how ought children to be influenced with respect to religions? Call this the ‘Basic Question’.

We should distinguish between answers that can be given to the Basic Question on the one hand, and how answers are to become turned into policy on the other, call this the ‘Procedural Question’. The Procedural Question asks what decision-making methods we should have for deciding and establishing policy. For it is always possible that there is an ideal answer to the Basic Question that some magistrate knows, but that they might use illegitimate means to establish that answer as enforceable public policy. The sorts of answers to the Procedural Question that one ought to weigh up are forms of democratic decision making, and forms of deference to established experts. In this chapter we, for reasons of space restriction, must bracket the

Procedural Question and instead discuss the forms that the Basic Question can take and the sorts of ways it might be answered. More fundamental still than the Basic Question is the question of what counts as a religion at all. Call this the 'Foundational Question'.

In order to give sense to the 'religion' part of 'religious education', the section of the chapter entitled 'What is a religion?' considers a variety of approaches to the Foundational Question. This includes surveying a variety of definitions, as well as doubts as to whether producing a definition is either possible or desirable. The section entitled, '[Religion as an international phenomenon](#)' discusses how religion, as understood on any of the definitions considered, must be regarded as an international phenomenon. The section entitled, '[The aims of religious education](#)' argues that while the Basic Question can be posed in any human society at any time, different issues are raised by the question for different kinds of societies. The sections entitled, '[The aims of religious education in homogenous theocracies](#)' and '[The aims of religious education in pluralist, liberal democracies](#)' consider the differences in the kinds of issues that arise in asking the question within homogenous theocracies on the one hand and those that arise in asking it within pluralist, liberal democracies on the other. The section entitled, '[Debatable aims of religious education](#)' begins by distinguishing between three kinds of debates regarding the Basic Question. The first concerns what sorts of religious education ought to be legally permissible and which if (any) ought to be legally impermissible. The second concerns what sorts of religious education (if any) are morally impermissible and which if (any) are morally obligatory. The third concerns what sort of religious education, if any, ought to be funded or provided by the State.

The rest of the chapter focuses on questions of moral entitlement. The section entitled, '[Debatable aims of religious education](#)' considers some answers to the basic question as the question arises in pluralist liberal democracies. The section entitled, '[The possibility of a religiously neutral upbringing and education](#)' turns to discuss the vexed question of whether religiously neutral upbringings are possible, defending the view that they are. The sections entitled, '[Against learning from, in favour of learning about religion](#)' and, '[Religious education without aims](#)' then return to the task of appraising answers to the Basic Question. '[Against learning from, in favour of learning about religion](#)' critically discusses the popular aim of 'learning from religion'. It is contended that taking religions to be a source of knowledge is too epistemically contentious to presuppose in any primary or secondary educational learning objective. Finally, after critically discussing an array of outcomes based on answers to the Basic Question, '[Religious education without aims](#)' considers the possibility that religious education need not aim at any particular outcomes. The chapter finishes with a summary of topics discussed and a short description of six additional topics of interest which could not be discussed for reasons of length.

## What Is a Religion?

How are we to discern between religion and non-religion? What makes for the appropriate subject matter, or object of study within religious education? Could Marxism, Maoism, Scientology, Spiritualism, or Jediism be included, for instance? At the start of Lecture II in *The Varieties of Religious Experience*, William James seems to suggest that an essentialist definition cannot, in principle, be provided to capture the range of phenomena that are claimed to be religious:

the very fact that there are so many [definitions] and [that they are] so different from one another is enough to prove that the word 'religion' cannot stand for any single principle or essence, but is rather a collective name [...] Let us not fall immediately into a one-sided view of our subject, but let us rather admit freely at the outset that we may very likely find no one essence, but many characters which may alternately be equally important in religion. (James 2008, p. 28)

Paradoxically, he follows this up with a quite promising essentialist definition at the start of Lecture III.<sup>1</sup> However, some contemporary philosophers, including David E. Cooper, Michael Hand, and Brian Leiter, have offered informative and plausible definitions of religions that I shall discuss below. Others have tried to argue that religion resists succinct and elegant definition and is best understood as a family resemblance concept in the way that Wittgenstein understood the concept of 'game'. Encouraging us to 'look and see' (2009, *PI* 66), Wittgenstein's *Philosophical Investigations* convinced many people that, on inspection, the concept of 'game' failed to have necessary and sufficient conditions of application (concluding that none existed when none were found). Applying this Wittgensteinian understanding, Peter Byrne, Benson Saler, and Ninian Smart have all attempted to give family resemblance analyses of 'Religion' (Smart 1973; Saler 1993; Byrne 1998, 1989). Partially sympathetic to their view, Timothy Fitzgerald conceded that any "essentialist definition of religion such as 'belief in God or gods'" must be "too parochially tied to Judaeo-Christian theistic origins of the word", and that a Wittgensteinian family resemblance analysis promises "a distinctive role for religion as a universally applicable analytical concept" (Fitzgerald 1996, p. 215). However, he objects that on such an analysis the concept of 'religion' "becomes so indefinite that the word ceases to pick out any distinctive aspect of human culture" (Ibid). He recommends that we do away with the term religion and look to other more universal anthropological categories. Wittgensteinian analysis would yield motley kinds, disjunctive definitions or tick lists (as mental health checklists do), but any such analysis would indicate that our concept had not locked onto a very basic or interesting phenomenon at all. However, we should indeed follow Wittgenstein's advice and 'look and see' whether a decent essentialist definition may be forthcoming before concluding that one does not exist. I will now survey some promising options but will not attempt or pretend to decide between them.

---

<sup>1</sup> There he says: "Were one asked to characterize the life of religion in the broadest and most general terms possible, one might say that it consists of the belief that there is an unseen order, and that our supreme good lies in harmoniously adjusting ourselves thereto".

It has been suggested that we can select definitions ‘for specific purposes’ and vary them depending on the aims of our study. Such a strategy would amount to stipulating a definition. As Anil Gupta observes, such a strategy merely “imparts a meaning to the defined term, and involves no commitment that the assigned meaning agrees with prior uses (if any) of the term” (Gupta 2015). While one might quite innocuously baptise a previously unnamed concept, when used as an alternative to analysing some prior use of a word, stipulation looks suspect. It becomes a blatant misappropriation of a word and multiplies senses beyond necessity. One concept becomes proxy for another under the name of the original, risking intellectual oscillation between them, total conflation, or substitution to the neglect of the concept originally of interest. One does better to invent a term, rather than arrogate it from common usage, but then it is plain that one has neglected the concept that had originally been of interest. While we might provide an essentialist analysis of some concept which does act well as proxy for religion in one or other of its senses, it is more appropriate not to call it religion. Besides, we cannot be sure just how far it does become proxy for religion without an essential characterization of that concept.<sup>2</sup> Stipulation then is not a promising alternative to seeking out an essence of an interesting concept.

American philosopher and legal scholar, Brian Leiter defends a two-part definition of religion. On his view at least *some central beliefs* of a religion: (1) “Issue in categorical demands on action” (i.e. “demands that must be satisfied no matter what”) and (2) “are insulated from ordinary standards of evidence and rational justification” (Leiter 2014, pp. 33–34). While this has some plausibility, it has the questionable consequence that were the Nicene Creed to be experimentally confirmed to express true claims, then the forms of Christianity to which it is central could no longer be regarded as religions. Indeed, many philosophers regard their religious beliefs to be well supported without any deviation from ordinary standards of evidence and argument and without at all wanting to say that their beliefs were not religious (Plantinga 2011, Swinburne 1977, and Craig 1979). All the same, Leiter could contend that such philosophers manifestly do move beyond what ordinary standards of evidence and argument permit them to say, and allow that were they to prove their religious contentions, they would no longer be religious contentions, but simply part and parcel of the deliverances of rational enquiry.

For philosopher of education, Michael Hand, a religious person “must hold the [the god or] gods she believes in to have *some positive relevance to her life*” (e.g. that they be ‘worthy of worship’, ‘receptive to supplication’, or ‘moral authorities’; ‘any of them is sufficient’) (Hand 2006, pp. 98–99). We may immediately recall the familiar objection that while Buddhism appears to feature no deities, “to deny that Buddhism counts as a religion [...] would surely be a bizarre consequence” (Clack and Clack 1998, p. 3). However, Hand quite convincingly responds that firstly, “it is not unusual to hear people deny that Buddhism is a religion and describe it instead

---

<sup>2</sup>I want to clarify now that by the ‘concept of religion’, I have in mind more a term, which may act as an umbrella for manifold concepts, one corresponding to each sense of the term religion should there be more than one sense of the term.

as a philosophy or a way of life, precisely because they take the crucial element of belief in a divine being to be missing” and secondly:

a great many Buddhists manifestly *do* believe in gods or something very like them. For schools of Buddhism in the Mahayana tradition, the heavens are richly populated with Buddhas and Bodhisattvas, ready to help human beings along the Eightfold Path to Enlightenment. (Hand 2006, p. 96)

Hand concludes that “Buddhism is a philosophy in some of its forms, and a religion in others” (Ibid). Persuasive as this might be, David E. Cooper also offers a powerful definition of religion. Cooper’s suggestion is that there are two necessary and (jointly) sufficient features:

The first is the conviction of the religious person that there has to be some, as it were, measure of human lives; something that our beliefs and values answer to beyond human practices and conventions ... The second aspect I think is this: you’ve got to think that what our lives are answerable to isn’t just part and parcel of the natural observable world ... For the religious person there’s got to be an element of mystery, of something beyond the natural world. (Cooper 2012)

Let us return to the Foundational Question as to how we are to discern between religion and non-religion. While some suggest that no essentialist definition can capture the range of phenomena that are claimed to be religious, in denying that religion has any particular nature, religious education practitioners make it rather hard to decide what if anything could appear within their section of the curriculum. Moreover, it would make the selection seem all the more susceptible to bias towards the interests of dominant groups. This would equally be true of the further alternative that religion is an unanalysable concept, as, for instance, Timothy Williamson takes the concept of ‘knowledge’ to be (Williamson 2000, p. 33). Some have tried to argue that religion is best understood as a family resemblance concept. However, as Fitzgerald observed, any such analysis “becomes so indefinite that the word ceases to pick out any distinctive aspect of human culture”. While it has been suggested that we can select definitions ‘for specific purposes’ and vary them depending on the aims of our study. However, such a strategy looks suspect, since it deploys concept A as a proxy for concept B under the name of concept B. It thereby risks intellectual oscillation, total conflation, or substitution to the neglect of the concept B. However, it seems that we do in fact have succinct and powerful analyses of ‘religion’. In light of these promising analyses, it seems that essentialism has been too briskly dismissed in recent years and rather than suffering a poverty of plausible options, essentialism boasts an embarrassment of riches. Insofar as the competing analyses have the same extension (worldly applications), but different intension (conceptual content), it is an interesting question as to which gets at the phenomena in the right way and so ought to be regarded as the true analysis.

## Religion as an International Phenomenon

So much for what religion is. I want now to emphasize its international prevalence. From this it follows that questions about the aims of religious education are (at least in principle) also ubiquitous. According to a report by the Pew Research Center on Religion and Public Life (2017), in 2015 the worldwide percentage of adherents by Religion, from largest to smallest, was as follows:

Christianity (31.2%); Islam (24.1%); Unaffiliated (16%); Hinduism (15.1%); Buddhism (6.9%); Folk religion, including African traditional religions, Chinese folk religions, Native American religions and Australian aboriginal religions (5.7%); Other religions, including the Baha'i faith, Jainism, Sikhism, Shintoism, Taoism, Tenrikyo, Wicca and Zoroastrianism (0.8%); Jews, or "people who self-identify as Jewish when asked about their religion on national censuses and large-scale surveys" (0.2%).<sup>3</sup>

There is almost no corner of the world untouched or unpopulated by religious people; during times of religious oppression, such as China's Cultural Revolution (1966–1976), religious belief and practice is, at most, pushed underground. Let us imagine that there was once a time in which there lived a group of people that had no religion, that had never heard of or been exposed to a religion, and that had never imagined that there could be such a thing. This imaginary society need not be homogenous – perhaps it could boast a plethora of diverse, non-religious life modes and belief sets. All the same, it seems reasonable to say that religious education is not an option for those people. Some would suggest that such a society, of human beings at any rate, is unimaginable, others that it is merely wildly unrealistic, and that wherever there are human beings so too will there be religion. It then seems to be a question for everyone at all times as to how children ought to be influenced with respect to religion.

## The Aims of Religious Education

Debates about the proper aims of religious education (for children) are questions about how (if at all) children ought to be influenced with respect to religion, that is to say, they are forms of the Basic Question. As I say, such questions are relevant internationally, and only fail to apply in the case of the hypothetical society that we considered above. We may recall the charges on which Socrates was put to death, namely, impiety and corrupting the youth: "you say that I do not myself believe in gods at all and that I teach this unbelief to other people" (Apology 26c, in Plato 1966). According to his accuser, Meletus, Socrates' alleged atheism was particularly pernicious because he was thought not content to keep it to himself. It

---

<sup>3</sup>I wish to add that although the Pew Research Center on Religion and Public Life take the trouble to qualify the category of 'Jew' with the rider or "people who self-identify as Jewish when asked about their religion on national censuses and large-scale surveys", this rider is equally appropriate to many of the other categories with which respondents may have identified culturally rather than religiously (i.e. they lack religious beliefs, but participate in elements of the culture).

was a question for the Greeks, and one that they had answered: the Greek pantheon of Gods are to be believed in, belief in them is to be promoted among the youth, and disabusing the youth of their belief is punishable by death! While the same question (as to how (if at all) children ought to be influenced with respect to religion) can be posed in any human society at any time, different issues are raised by the question for different kinds of societies. We shall consider the issues raised by asking the question within homogenous theocracies, contrasting these with those raised by asking it within pluralist, liberal democracies.

### *The Aims of Religious Education in Homogenous Theocracies*

Consider a hypothetical maximally homogenous theocracy in which it is mandated that every citizen be initiated into the State endorsed religion by the family within the home, by teachers within formal education, and by society at large within the wider social experience. Suppose that alternative religions are not known to exist, but that permutations of the orthodox faith are readily imaginable, and indeed implied by the specifications of the orthodoxy, and by disciplinary measures: e.g. the stipulation that they believe in exactly *one* god, and the religious cum political law that apostasy be punished by death. What specific forms might questions about how (if at all) children ought to be influenced with respect to religion take in such a society? First let us specify someone to whom the question occurs: an individual parent. Suppose that while they privately regard the religion as false and socially damaging, they profess and demonstrate allegiance due to the harsh penalties for not doing so. They might think that no child ought to be initiated into the State's religion, but find that that this is a view which can have little to no impact on the society at large. However, more within their control in light of their views about the dominant religion, the parent might ask themselves another question: how ought I to influence my child with respect to this orthodox religion? While they might regret their child's being raised in such a context, they might worry that were they to convince their child that the religion is false, that would expose them to the risk of harsh punishment for non-belief. They might think that while the world would be a better place without that religion at all, in these non-ideal conditions, they had a moral obligation (motivated by a concern for their child's safety) to initiate their child into it.<sup>4</sup>

For a particular case, see Martin Scorsese's film, *Silence* (2016), and Shūsaku Endō's 1966 novel of the same name on which it is based on. Set in the late seventeenth century, the story concerns two Jesuits priests who, concerned for the soul of their spiritual mentor, travel to Nagasaki to investigate reports that he has renounced

---

<sup>4</sup>Imagine they favoured an altogether rival religion professed in a text they happened upon and secreted away on their home, one which anticipated damnation for non-believers, the parent might then regard earthly punishment as preferable to eternal damnation and initiate their child into that faith. I hope that these stories strike the reader as realistic and they feel some sympathy with the imaginary parent in these situations, some variations of which undoubtedly have happened under various religiously oppressive reigns.

Catholicism. While attempting to nourish the faith of the Kakure Kirishitan or 'Hidden Christians' whom they meet on their journey, the missionaries discover the depth of sadistic and murderous intolerance with which their faith was treated by the reigning shogunate. They begin to question whether or not it is indeed acceptable for them to spread their faith to a populace who will be punished for their belief.

The Basic Question is waiting to be asked always and anywhere that at least one religion exists. In the cases discussed so far, one may reasonably think that at the level of societal structure, a wrong answers have been given to the Basic Question. Such circumstances as we have discussed warp the form the question takes and the sorts of answers that can be given. Were it the case that the orthodox religion were true and good, and in everyone's interests to believe, the policing of religious belief would still not seem satisfactory as we recall John Locke's reflection that:

Although the magistrate's opinion in religion be sound ... if I be not thoroughly persuaded thereof in my own mind, there will be no safety for me in following it. No way whatsoever that I shall walk in against the dictates of my conscience will ever bring me to the mansions of the blessed. (Locke 1966, p. 143)

Moreover, some argue, not only is the policing of religious belief not the job of the State, but there should be an even more exhaustive divide between Church (or religion more broadly) and State. In the case of the United States, the anti-establishment clause of the first amendment to the Constitution prohibits government, including taxpayer-funded public schools, from *establishing* religion:

Congress shall make no law respecting an establishment of religion, or prohibiting the free exercise thereof.

General motivations for such a law have to do with the justification of States and the uses to which they put their powers of influence and coercion. Consider, for instance, Locke's view of the State:

The commonwealth seems to me to be a society of men constituted only for the procuring, preserving, and advancing their own civil interests. Civil interests I call life, liberty, health, and indolency of body; and the possession of outward things, such as money, lands, houses, furniture, and the like. (Locke 1966, p. 128)

On Locke's view, it is the protection of these interests that justifies the State and its uses of coercion. Any extension beyond this remit would be unjustified.

### ***The Aims of Religious Education in Pluralist, Liberal Democracies***

In pluralist, liberal democracies things are not like they are in the hypothetical homogenous theocracy just discussed. Insofar as they are that way, it will be the exception rather than the rule, existing within isolated pockets of believing

communities.<sup>5</sup> Such societies counsel and enforce tolerance between faiths, perhaps for the familiar Rawlsian reason that, from behind a veil of ignorance, we would want to have the freedom to live in accord with our conscience even if that contradicts the conscience of others. According to political philosopher John Rawls, for societies to be justly ordered, the principles by which they are ordered must such as would be “chosen behind a veil of ignorance” wherein nobody would know what place they will come to occupy within the system that they design. By not knowing what place they will come to occupy, nobody could “design principles to favor his particular condition”, and so “the principles of justice are the result of a fair agreement or bargain” (Rawls 1999, p. 11). From behind a veil of ignorance, what Rawls also refers to as ‘the original position’, people would, Rawls argues, choose equal liberty of conscience to be among the principles by which society should be ordered for the reason that:

They cannot take chances with their liberty by permitting the dominant religious or moral doctrine to persecute or to suppress others if it wishes. Even granting (what may be questioned) that it is more probable than not that one will turn out to belong to the majority (if a majority exists), to gamble in this way would show that one did not take one’s religious or moral convictions seriously, or highly value the liberty to examine one’s beliefs. (Rawls 1999, p. 181)

Liberal democracies might also counsel tolerance for three now familiar reasons given by English political philosopher, John Stuart Mill in his classic Work, *On Liberty*. Firstly, nobody has a monopoly on truth, and, for all that one knows, those religions that one despises might have gotten things right after all. Secondly, the opinions one seeks to silence might have a slither of truth and the opinion in ascendancy might have a slither error and “it is only by the collision of adverse opinions that the remainder of the truth has any chance of being supplied” (Mill 2006, pp. 60–61). Thirdly, even where the opinion in ascendancy is the complete and undiluted truth, unless ‘vigorously and earnestly contested’, the majority of its subscribers will lose any sense of its meaning and rational grounds (Mill 2006, p. 61).

## Debatable Aims of Religious Education

Due to the promotion of religious toleration, the Basic Question becomes more widely accessible and more easily debated within liberal, pluralist democracies; societal level answers can be proposed without fear of persecution, accepted at one time, and later rejected in favour of another. In these circumstances, a wide range of ‘ought’ questions begin to unfold from the Basic Question. Let us consider three such further questions that open up to public contestation. First, what sorts of religious education ought to be legally permissible and which if (any) ought to be legally impermissible? Second, what sorts of religious education (if any) are

---

<sup>5</sup>My thanks to Daniel Moulin-Stozek for this qualification.

morally impermissible and which if (any) are morally obligatory? Third, what sort of religious education, if any, ought to be funded or even provided by the State?

The question of what sorts of religious education might be morally impermissible and which might be morally obligatory seems to turn on the benefits and burdens of education, and how it compares with the benefits and burdens of alternative strategies. For instance, it might be very bad for children themselves not to know about the one true god, if one true god there be, and we might owe it to them to tell them so long the burdens of doing so are not too onerous, and it does not come at some more weighty opportunity cost. Alternatively, it might be good for society at large that they know about the one true god and so owe it to society to be told, if the burdens of being told are not too onerous. That is to say: religious education could constitute a private or a public good, or both.

But the question of what is morally best should be separated from the question of what should be rendered permissible or impermissible by law; and it is different again from the question of what sorts of education the State should provide for or provide. And so while something might be morally impermissible, it ought not necessarily become legally impermissible. And while something might be morally obligatory, it ought to not necessarily become legally obligatory. Indeed, something's being good does not imply that the State ought to provide it, or provide for its implementation. These questions of what the function of the State ought to be, and what the function of the law ought to be, is one that I will put to one side. Instead, I will choose, for reasons of space restriction, to focus on questions of moral entitlement, but since that bears on the answers to the others, I will sometimes have occasion to weave those in as well.

### ***Religious Initiation***

In pluralist, liberal democracies, adults are freer to speak their mind and to act in accordance with their conscience. Furthermore, the societies are less homogenous, and a wider range of religious and non-religious life modes are available options for people to avail of as their conscience dictates. However, even in such societies, parents and guardians are in a strong position to promote in their children those beliefs which they think are true and those modes of life which they think are best. Indeed, some regard part of the proper domain of this religious freedom of conscience the freedom to raise their children in their own faith. It is often thought that parents ought to have a choice about the character of the school that they send their child to, and ideally, to send their child to one that replicates the values and beliefs that are held in the home. Indeed, in this connection it is often complained that, in Ireland, 96% of State-funded schools are under church control. In this special case, for most parents there is little choice as to whether the school that they send their child to is of a religious character or not, or which if so.

Those who contend that parents ought to have a choice to send their child to a school that replicates the values and beliefs that are held in the home divide over

whether this is to be regarded as a claim right or a privilege right. A claim right to X entails having a claim over others to facilitate one's having X: perhaps through funding schools of a religious character with taxpayer money.<sup>6</sup> A privilege right consists in the absence of anyone's having a claim to prevent you from obtaining X, and does not entail that you have a claim over others to aid you in obtaining X. Others, however, have questioned whether parents really ought to avail of their power to raise their children to share their religious beliefs.<sup>7</sup> All the same, while they might regard parents as wrong to do so, they might regard any prohibition on the practice as practically unenforceable under present conditions, and indeed they might think that any attempt to break up families for breaking the prohibition would be a cure worse than the disease.

These points notwithstanding, Eamonn Callan (1985) has contended that parents wrong their children by bringing them up within their own faith. For him the problem turns on the idea that initiation into a faith damages children's autonomy. More expansively, Matthew Clayton (2014) has contended that it is a moral wrong for parents to initiate children into any comprehensive doctrine whatever: that it would constitute a wrongful act of coercion similar to the wrongfulness done to citizens by States where they coerce faith (be it through threats or through persuasion). Just as States should take an anti-perfectionist stance in governance, and not recommend any contentious views as the right, the good and the true, so parents should take an anti-perfectionist approach to upbringing and not recommend any contentious views as the right, the good and the true.

Arguing in the opposite direction, Michael Hand and Terence McLaughlin have contended that parents do their children no wrong in so bringing them up, or at least no significant wrong (Hand 2002, 2004a; McLaughlin 1984, 1985, 1990). For McLaughlin, children's autonomy is not hindered by a religious upbringing since by observing (and practising) religion 'from the inside', so to speak, they are more informed about religion's nature and are thereby better able to decide whether to be religious or not. For Hand, families benefit from sharing a common religious identity, parents and children inclusive, and that children's rationality is in no way harmed as they believe on the strength of the perceived intellectual authority of the parents, which is easily overcome with maturation. Here the idea is that it is *permissible* for parents to bring initiate their children in their own faith. No religious beliefs are presupposed in their arguments, but they are at least judged to be at least ambiguous in their value: they are not judged to be unambiguously bad. Hand's arguments might appeal to the parent who does not want to indoctrinate their child or harm their powers of rationality; McLaughlin's might appeal to the parent who is concerned about damaging their child's autonomy. Here Hand and McLaughlin (respectively) argue that rationality and autonomy are compatible with a religious upbringing. Indeed, there may be limits on how free from influence children will

---

<sup>6</sup>Here I understand the central case of a school of religious character to be a school which has a religious ethos, is run according to religious principles, and selects children of parents who subscribe to that ethos and which initiates children into its religious vision.

<sup>7</sup>Eamonn Callan (1985) and Matthew Clayton (2014) among them, as we shall see.

allow themselves to be. Michael Hand recounts an amusing conversation with his eldest son:

A month or so ago, Alex asked me what religion we belong to. I bristled at the implication that children should be seen as belonging to the religion their parents happen to subscribe to. So I gave him a lengthy lecture on the importance of coming to his own, independent view on religion as and when he'd been able to give the matter appropriately careful thought. He nodded sagely and asked:

"Well, what religion are you, Daddy?"

"I'm an agnostic", I replied, "which is someone who thinks there isn't enough evidence to say whether or not there's a God".

"OK", said Alex. "And what religion is Mummy?"

"Well", I said, "I think she's probably an agnostic too".

"I see", mused Alex. "In that case, Daddy, I've thought carefully about it and I've decided to be an agnostic".

From the outside, liberal perspective, liberal citizens would want to see that no harm comes from religious initiation, that it comes at no opportunity cost (such as being able to seek a lifestyle which better suits the individual concerned), and that any other claim rights of the child are not violated. Indeed, they are apt to regard damage to rational faculties and failure to develop into an autonomous being as high costs indeed.

It is a further question as to whether the goods of rationality and autonomy are compatible with religious schooling, as distinct from a religious upbringing in the home. Hand argues not since he regards teachers as failing to have the perceived intellectual authority of the parents in religious matters, and concludes that in the absence of any compelling reasons to accept that religious propositions as true, any attempt to initiate children into accepting them must be indoctrinatory (Hand 2003). However, Hand makes the strong claim that religious schools ought to be abolished for attempting to initiate children into religious beliefs, rather than simply that they should not be funded by the government, say. For a critical appraisal of Hand's arguments, see Groothuis (2004). In general, what these matters turn on are the relative strength of the interests of the child, the interests of the parent, and the interests of the State and the possibility of an objective standpoint from which to evaluate these, or at least that is what they turn on from the point of view of the interest theory of rights. These are questions we must to some extent bracket, but will return to later.

### *Religious Education and Truth*

We have discussed whether or not it is permissible for parents and schools to initiate children into religious faiths. One need not think that the religious initiation of children is morally permissible in order to think that religions' claims to truth should not be discussed with children in formal educational settings. It certainly seems an important question as to whether any religious belief set is true or any religion

represents the best way to live. For if what we want children to have is the truth and the best way to live, it would then seem that such a religion is precisely what we would want for them. Indeed, Michael Hand has offered what he calls the possibility of truth defence of religious education. Hand argues that a discrete, compulsory, non-directive subject focused on the critical examination and evaluation of religious beliefs should form part of pupils' education. The argument is this: some religious propositions (about God, salvation, life after death, and so on): (A) 'are sufficiently well supported by evidence and argument, as to merit serious consideration by reasonable people', (B) 'matter, in the sense of making some practical difference to people's lives', and (C) require 'a facility with distinctive kinds of evidence and argument' in order to evaluate their plausibility appropriately. Hand concludes that children are entitled to an education, enabling them to make rational judgments about the truth or falsity of these propositions (Hand 2004a, b). That is to say, the premises motivate a curriculum element whose aim is to enable children to make rational judgments about the truth or falsity of religious propositions, a curriculum being 'a planned programme of learning' (Hand 2010, p. 49).<sup>8</sup> It is reasonable to think that a planned programme of learning delivered by subject experts is precisely what would be required to enable one to make rational judgments about the truth or falsity of religious propositions. Andrew Wright has been particularly critical of all approaches to religious education which bracket the question of truth. For him, whatever else might be studied about religions, children ought to be brought to reflect critically on the rational credentials of religious truth claims, which could potentially have a transformative effect.

the dangers of raising [the human sciences] to the status of metadisciplines at the expense of more fundamental philosophical and theological investigative tools. (Wright 2004, p. 212)

This approach opens the way for a range of attitudes about religions to be considered by students, including those anti-religious attitudes of Freud, Marx, Feuerbach, and Hume. Some have gone further and suggested that some non-religious views ought to be considered in their own right alongside religious views.

Previously I have argued that were educators in England and Wales to take the name of the compulsory discrete school subject 'Religious Education' seriously, this would preclude studying non-religious views in their own right; for to extend the subject matter of religious education to religious and non-religious views would be to extend the subject matter to the absurdly panoramic scope of 'views'. All the same, I argued that religious views and *some* non-religious views ought to be taught alongside each other in variety of contexts: in ethics education, where a range of religious and non-religious answers to the question how ought one to live ought to

---

<sup>8</sup>This formulation has the benefit of acknowledging the similarity of all courses of learning and the similarities between the sorts of ethical considerations that could motivate their existence, whether they be news programmes, programmes of learning for citizenship tests for immigrants, rehabilitation programmes for criminal offenders, or educational television series like Planet Earth (BBC 2006) and The World at War, written by Anthony Hughes (1973). It also acknowledges the variety of vehicles of provision which programmes of learning can be facilitated by.

be appraised; in social studies, where a range of religious and non-religious lifestyles represented in one's country ought to be learned about alongside one another as a part of citizenship education (Tillson 2011). One question of international significance concerns the range of religious and non-religious lifestyles and belief systems that curricula ought to encompass. Whether those expressed locally, nationally, or internationally. On the epistemic dimension of religious education discussed above, it would seem that those religions which are most credible are those which ought to receive the most attention, irrespective of where they are practised. On more social motives, there could be reason to set one's sights beyond one's local community to religions represented internationally. For instance, it could be studying ways of life very different from those lived locally could enrich students' understanding of humanity's possibilities. Before moving on to discuss whether a religiously neutral upbringing is a coherent possibility, I want to note that there are at least three anti-epistemic approaches to challenging Hand and Wright's argument. One is to argue with Pascal that we can have non-epistemic motivations to believe that something is true; another is to argue that, for instance, religious language is non-propositional anyway. While I leave these controversies safely to one side here, I would refer the readers to J. L. Mackie (1982) for a persuasive critical discussion of both approaches. A third is advanced by Matthew Clayton and David M. Stevens due to considerations of political morality. For them, "education policy must be regulated by principles that are acceptable to reasonable people" (forthcoming). 'Reasonable people' are those who are committed to social unity and to treating each other as free and equal. Since epistemic judgements about the truth or utility of religion are disputed by reasonable people (in this political sense of the term), no such judgements – not even the judgement that the matter of their truth is an open question – may form the basis of an educational aims or content.

## **The Possibility of a Religiously Neutral Upbringing and Education**

Bracketing the question of the normative value of religions (either truth value or social utility), we might undertake a disinterested survey of the various kinds and instances of religion and spirituality that have arisen throughout history, and across continents, considering how they emerged and developed and how they interacted with other social phenomena. However, some are wont to respond that there are no neutral forms of initiation (e.g. Cooling 2012; Hession 2015; and Thiessen 1993). Instead, they regard the failure to initiate children into a religious perspective as initiating them into a substantive, non-religious perspective. This objection can be posed equally against the different kinds of non-confessional educations advocated by myself, Hand, and Clayton and Stevens, and so each of us would need to respond to it no matter whose position was ultimately the most satisfactory. In order to respond, I must now discuss some terms that are often used as if they were interchangeable, but which ought to be distinguished. I have in mind the concepts of

neutrality, impartiality, objectivity, unbiasedness, and balance. What have these concepts to do with one another? First, we should distinguish between their being used to characterize (a) methods of inquiry, (b) the presentation of issues, and (c) the State of one's opinions or allegiances. Methods of inquiry are procedures which one uses to come to one's decisions. The presentation of issues is to be understood as, for instance, how journalists report on, or how teachers teach, topics, events, and disputes. The State of one's opinions or allegiances is made up of one's propositional and relational attitudes. Let us start by discussing the term 'neutrality' and which terms are in fact interchangeable with it.

### *The Nature of Neutrality*

The word 'neutrality' (as distinct from siding with a disputant or deciding on an issue) may be used to characterize one's opinions and allegiances but also how issues are presented – that is as to whether issues are taught 'directively' or 'non-directively' (Hand 2007, 2008). It is better, I think, to use the terms 'directive' and 'non-directive' to refer to how topics are taught than the term 'neutral', since those terms can only apply to how topics are taught. It is better, too, to reserve the term 'neutral' for characterizing the State of one's opinions, and that is the sense in which I shall discuss it beneath. This sense of term is interchangeable with 'non-partisan', which is to be contrasted with 'partisan'. It is also interchangeable with 'uncommitted', which is to be contrasted with 'committed'.

Some people claim that neutrality is impossible. However, I take neutrality to be a State of indecision between options, and it would be absurd to say that indecision were a decisive State. Hess and McAvoy claim that "[educational] aims are never neutral" (Hess and McAvoy 2014, p. 76). While it is true that aims, and people, cannot be neutral *tout court*, or neutral about everything, they can be neutral on particular matters, or neutral between other States. And, once this is admitted, it must be acknowledged that questions, aims, and people can be neutral on some matters (even while they cannot be neutral on all matters).<sup>9</sup>

Why might neutrality be unattainable? One might say 'whoever is not for us is against us' and conclude that someone neutral between, say, the allied and the axis forces, such as Switzerland, was thereby an enemy. But this is also absurd: an enemy opposes one's ends, rather than simply fails to support them. One might suggest that neutrality is a commitment in itself, that it is a position to be taken. In the case of Switzerland's role in the Second World War (or lack of it), we can reasonably say that Swiss State took a policy: that of refusing to take sides. In this case, they were committed to non-commitment to both the allied and axis forces. That is to say, their commitment was of a second-order kind. While this preserves the notion of neutral-

---

<sup>9</sup>Consider the question 'in what sense, if any, does music have meaning?' That question itself is decided (or committed, or partisan) on the following matters, that there is a fact of the matter, that it is worthwhile to know, that music exists, and that meaning can be had in more than one sense.

ity, a second order of commitment is not required to understand the notion of neutrality. As an illustration of this, we may regard Burden's ass as being neutral on which bale of hay to eat from first, on account of simple indecision between those options, not because it prefers not to commit to either option. Whether due to a decisive refusal or a state of indecision, neutrality is clearly possible, meaning either a failure or refusal to take sides. We might thus say that there are two kinds of neutrality: decisive and indecisive neutrality. A refusal to take sides seems more specific to practical courses of action, or siding with disputants, than to resolving theoretical questions about whether or not a proposition is true. Indecisive neutrality seems equally applicable to siding with one or another disputant and coming to an intellectual decision.

Bearing these distinctions in mind, let us consider the question of the existence of God. The attitudinal options are often presented as being just three: God exists; God does not exist; I am unsure whether or not God exists.<sup>10</sup> One might allow that degrees of confidence can be had, but basically one must be a little inclined to bet for or against the existence of God, and where they are unable to decide which of the ontological options (namely of God's existence of non-existence) to bet on, they can be said to be *neutral*, non-committal, or non-partisan, between those options. Even still, some might doubt the practicality of non-directive teaching, especially if the teacher is not neutral between options themselves.

### ***The Possibility Non-promotional Commitment***

I contend that teachers (and parents) can have an opinion about something without either wanting or trying or acting so as to steer their pupils (or children) towards sharing that opinion. Indeed, one might even think that they ought not to steer children towards that opinion. Some people think that this is either impossible in practice because one cannot bracket all of one's opinions away (especially in framing issues for discussion), or they believe that it is undesirable to do so. These are the sorts of considerations cited in favour of promoting what it is that one believes to be true or good.

As argued above, we ought to concede that global neutrality is indeed impossible for rational agents. It is almost inconceivable that there should be a conscious person with no attitudes or beliefs. Nor do I think it is desirable that there should be. There are many beliefs and other kinds of attitudes which it is rational, and entirely proper, to have. However, it does not follow from having an attitude or belief that one should systematically promote it in others. It does not follow from having a

---

<sup>10</sup>Actually there are other possibilities: one doesn't know that it is even an issue, or one fails to understand what the issue is that one might have an opinion about. Indeed, one might hold that question does not make sense. For instance, in any dispute about whether square circles might exist, I am tempted to say: the proposition is incoherent and could not be the sort of thing which could have evidence in favour of or against. These possibilities come one stage before neutrality.

belief that one must either withhold or disclose it. Indeed, it is often hard for pupils to tell where teachers sit on certain issues, partly because teachers are capable of playing roles, for example, playing devil's advocate.

A quite different worry is whether disclosure of this kind is even compatible with non-directive teaching, for, arguably, announcing one's views *just is* a form of steering. Sometimes, the teacher's disclosure seems equivalent to directive education; consider the teacher's endorsing views, or consider their asserting those views. In particular, consider their using universal and prescriptive language, such as 'we believe that' and 'it is true that' or 'certainly', or failing to qualify assertions, e.g. by not adding 'Muslims, like me, believe that' to the claims like 'There is no god but God. Muhammad is the messenger of God'. Alternatively, however, they could stress their own subjectivity in confessing/disclosing their personal views, namely, by stating: I believe that, or it seems to me that. One can also use less emphatic language: it seems that, or arguably, or one reason to think x is that. On topics that one aims to teach non-directively, when, if ever, should teachers withhold or disclose their views? At first blush, there is a tension between saying on the one hand "I don't want to steer belief" and on the other "I believe this". However, there is a difference between disclosing one's beliefs and promoting them.<sup>11</sup> Consider the difference between these expressions, 'I believe that there is no god but God', 'We believe that there is no god but God', (where the 'we' refers to the children in the class) and 'There is no god but God'. Call these 'I Frame', 'We Frame', and 'Open Frame' formulations. The I Frame formulation looks to be more of an assertion about the teacher's own belief set, the Open Frame formulation seems to be an assertion about the world (thereby putting an onus on the listener to accept their testimony). The We Frame formulation makes a statement about the students' belief set, and presumably of the normative sort, indicating to students that this is what they *should* believe (perhaps in virtue of their parentage, or where they go to school).

It is true that one's actions will sometimes reveal one's attitudes; training children to swim shows at least that I think it worth my while teaching swimming to children, and doing so unenthusiastically may reveal the opposite. It may also indicate that I value swimming itself and think that it's worth the children's time. However, it is often possible and desirable to withhold one's views and often possible and desirable to reveal one's views. Disclosing one's views need not entail any more than that; by simply disclosing them, for instance, one need not state one's reasons for belief and one need not defend one's view against objections, and certainly one need not allow one's view to become the focus of the class. To the extent that children neither opted in, nor can opt out of such a class, this could be reasonably described as forcing one's private views on pupils, especially to the extent that one denies children scope for dissent. Indeed, the privileged position of the teacher can in itself make dissent less easily voiced anyway. In the case of spending time doing something, it must be admitted that one cannot live and yet not spend time doing anything. In the case of doing worthwhile things, religiously committed educators must engage in activities which can be considered worthwhile from within their

---

<sup>11</sup> I borrow the terms 'withholding' and 'disclosing' from Hess and McAvoy (2014).

religious outlook, but they need not initiate children into these activities, or encourage them to see them to accept religious justifications for those activities. In the case of belief about whether or not a proposition is true, one can be neutral; one can genuinely not have an opinion on the matter. That may amount to living as though there were a negative answer to the question, but that's not a reason to initiate children into a faith. There is still room for commitment without advocacy. To tease out the implications of this view, I now propose to critically discuss the aim of 'learning *from* religion', much emphasized in religious education literature, policy documents, and teaching materials.

## Against Learning *from*, in Favour of Learning *About* Religion

How can we make sense of the expressions 'learning *from*' and 'learning *about*'? We can learn *from* (among other things) our mistakes, the past, and other people. It seems that to learn 'from X' is to identify X as the *source* of our learning. We can learn *about* (among other things) books, other people, and the past. It seems that to 'learn about X' is to identify X as the *object* of our learning. Clearly in religious education, it is important to learn about religion; in fact, it would seem to be the very *raison d'être* of such a subject. It can comprehensibly be urged that to deserve the name of 'religious education', religion might not be the *object* of understanding at all, but perhaps the student, or the world in general should be. Instead, religion would be the source of knowledge, shedding light on the student, and upon the world in general. However, that presupposes religions to be a source of knowledge on these things, but that seems too epistemically contentious to presuppose in a learning objective. As to which sources we should learn about religion from, that seems to be a further (albeit very important matter), that in no way conflicts with what the subject matter of religious education is. One might reasonably suggest that children should learn about religion(s), from religion(s), on the grounds that each religion is *an* authority on itself. There is no guarantee that religions are the *best* authorities on themselves, but it seems reasonable to suggest that particular religions should be able to speak for themselves where they are the object of learning (even if they are not presumed to have the final word on themselves).<sup>12</sup>

When we speak of learning from religion in the sense of learning from a religious source, we still need to specify what lessons should be taught. It is not enough to say that children should learn from religion. It is important to specify *what it is* that children should learn from religion. Should the various religions teach children about the

---

<sup>12</sup>Caution might sometimes be in order here: careful consideration would be required to decide whether it would be appropriate to allow violent, extremist religious outlooks to speak for themselves, since one may legitimately worry about the possibility of their having a corrupting influence. On the other hand, if it is important to understand those outlooks, it seems that hearing what they have to say for themselves is an important part of that. Furthermore, if one were reasonably confident that these views would be heard anyway, it might be well to subject them to critical scrutiny in the controlled environment of the classroom.

world as they see it, or should they merely teach children about how they see the world (together, perhaps, with what are their aspirations and practices)? For instance, should children learn from Christians that Christ died for their sins, or should they learn that Christians think that someone special was born (whom they call the Christ) who died for what they regard as mankind's sins? This latter option seems less contentious where it is admitted that the epistemic credentials of religion are less than intellectually compelling. During a public panel discussion entitled 'What Is the Place of Faith in Schools?',<sup>13</sup> Richard Dawkins contended that people have nothing to learn from religion(s). That is to say, according to Dawkins, any uniquely religious content is false. While you can learn kindness from religious sources, you can learn kindness from non-religious sources. While you can learn what Christians believe from Christians, you can learn this from non-Christian sources. While it is admitted that good and true things can be learned from religions, Dawkins contends that all of the teachings *specific* to each religion are false. If Jesus *did in fact* rise from the dead on the third day subsequent to his execution, *you could learn this* from Christianity, but (again, according to Dawkins) he did not, and so you cannot. On this view, it is a mistake to suppose that religions are to be learned *from* in the respects that they are unique. One need not hold that every religion's teachings are demonstrably false to share Dawkins' reservations. Instead, it is enough to hold that none of that content which is specific to religions is so well demonstrated that we may presume to promote its belief among children. It ought not to be an educational aim that children should come to assent to any specifically religious content (even if it may not be an educational failure if they did come to do so).

It may reasonably be objected to the foregoing line of argument that it is not only truths that one might think we stand to learn *from* religions, but also the value of cultural practices.<sup>14</sup> Many things can indeed be learned from religious exemplifications: focus from Tibetan monks or charity and selflessness from St. Elizabeth of Hungary who gave away all she possessed in order to serve the poor (New Advent). However, as with propositional content, it may always be objected that those lessons which may be learned from religions may equally be learned from non-religious exemplars, since focus and selflessness are hardly the preserve of the religious. The challenge for this line of response is to propose a lesson that can uncontentiously be learned by all, but that is best taught by religious examples. Meditation, in its various forms, as practised in various religions, is a particularly good example of cultural practice, the value of which might be thought, with relatively little contention, to be learned from religion. However, the reasons that might be offered for why it is valuable are liable to take a specifically religious and thereby epistemically contentious form. We have critically discussed an array of educational aims for religious education. In the next section I want to consider the possibility that religious education need not have any aims.

---

<sup>13</sup> 22 February 2012, 'What's the Place of Faith in Schools?' Westminster Faith Debates, featuring James Conway, John Pritchard, Richard Dawkins, and Robert Jackson. AHRC/ESRC Religion & Society Programme.

<sup>14</sup> I thank an anonymous reviewer for bringing this line of objection to my attention.

## Religious Education Without Aims

David Aldridge distinguishes between *text* and *subject matter*. The term ‘text’ is understood very inclusively as ‘object of study presented to the student by the teacher’. It seems that Aldridge uses the term differently from how I have above: objects of study in his sense are more a stimulus than an object about which we students are to learn. In religious education, one may presume that the texts to be presented are for the most part religious texts, including, but by no means limited to, passages from scripture, places of worship, ceremonies, artworks, and music. For Aldridge, the *subject matter* of religious education is what emerges in the interaction between student, teacher, and text, so understood. In contrasting the views of prominent religious education theorists Robert Jackson and Andrew Wright, Aldridge observes that whereas Jackson would have the “student building an interpretation of religion (the whole) from an encounter with the parts (individuals, texts, communities)”, so that religion is itself the subject matter, for Wright, “the ‘subject matter’ of RE is not religions but the transcendent reality about which religious communities make truth claims” (Aldridge 2015, p. 183). Whereas religions constitute the subject matter for religious education for Jackson, they constitute the input material for Wright.

For Aldridge, “any attempt to fix in advance the subject matter for dialogue constrains the possibilities for that dialogue, and the ways in which truth might emerge” (Ibid, p. 185). Here Aldridge defends something like a ‘great texts curriculum’ in which a range of intrinsically worthy objects of study are presented to students, and free reign is given to the students to make of them what they will. The difference for Aldridge would be that the texts presented need not be intrinsically worthy of consideration. On Aldridge’s model, children are presented with a religious artefact, perhaps, and they are to make of it what they will. One might reasonably expect to constrain the sorts of things which children come away believing about the object of study. Indeed, in some cases it seems reasonable to give students both text and subject matter: to say ‘what we want you to think about today is ...’, or ‘what we want you to come away knowing today is ...’; specifying these aims in advance. The sort of model for how children ought to be influenced with respect to religions that Aldridge elaborates specifies the method, but does not specify the learning outcomes, and while it is not likely to be the whole of the picture, it plausibly ought to be considered part of it.

## Summary

This chapter’s aim has been to elucidate a number of important philosophical questions about religious education and consider a range of ways to answer. Equally important was the task of mapping these questions and answers onto one another as well as onto wider, political, moral, and philosophical debates. In particular the

chapter has aimed to elucidate the Basic and Foundational Questions. Any introduction of this sort will be necessarily selective with the thinkers that it draws on, the questions that it emphasizes, and the range of answers that it considers. For that reason no claim is made to have provided an exhaustive account of the field and relevant debates. In order to stimulate, rather than to persuade the reader, as well as to and to avoid a bland neutrality, I have developed a central line of argument showing how a range of considerations can come together to form a particular approach to the Basic Question. Some of the choices about what topics to exclude have been hard to make. I wish to mention six of the most salient to conclude.

*Student Choice:* Should formal religious education classes be compulsory, and, if not, should the optional aspect consist in children having the ability opt-out, or else the ability to opt-in? Predictably, whether participation or non-participation is the default option will make a big difference to the number of students studying it. This is not a special question for religious education: whether education should be in some sense student directed is much debated and very important topic quite generally. Eamonn Callan (1988) has argued that almost all of schooling ought ideally to be driven by student curiosity rather than by pre-decided school curricula and schemes of work. However, some think that there are special reasons to make religious education optional. For instance, they might argue that learners or their parents have a right to protect themselves or their children from what is being said in class where what is said might endanger their immortal souls. It is important to note the creeping in of parental claims over what their children should study in the last sentence, for if the curriculum content ought to be driven by student curiosity, that would mean it ought to be protected somewhat from parental preferences.

*Truth Versus Utility:* How are the reasonable aims of promoting social utility to be weighed with the tasks debating matters of truth? For instance, young earth creationists might object to having their views opened up to critical scrutiny. It might be thought that reflective discussion of the most cherished beliefs of students or of their parents, those beliefs which could be said to form a central part of their identity, might be a cause of social strife or might damage children's wellbeing by undermining their self-conceptions. For a discussion of these matters in the context of higher education, see Callan (2016), and for discussion in the context of schooling, see Cooper (2008).

*Devolution and Centralization:* At what level should decisions about education be made: the national, local, school, or teacher level? Among the kinds of costs and benefits to be weighed up here are the tendency for centralization to inhibit experimentation, the power of centralization to make quality assurance easier, and the double-edged sword that sees centralization ensure that bad decisions adversely affect more people on the one hand, but, equally, that good decisions affect more people on the other. Further considerations turn on the degree of autonomy that it is proper to extend to localities and schools with distinctive identities, histories, and missions or to individual educators themselves.

*Universality Versus Local Specificity:* Should the content of religious education be universal or local? That is to say, how far do religious education providers from disparate geographical locations have reason to converge in their aims, methods provision, and subject content? If they had a great reason to do so, then even though it might be proper to devolve decisions making away from the centre, it might still be the case that religious education offered in diverse setting ought to converge to a great degree.

A Discrete or Diffused Curriculum Presence: Finally, and some might have thought least philosophically, we can ask whether religious education should constitute a discrete curriculum subject, as in the UK, or should instead be diffused across the curriculum as in France. Kevin Williams argues that a danger in distributing religious education across the curriculum is that of failing to explain the momentous importance which religious faith plays in the lives of believers (Williams 2007).

A truly comprehensive philosophy of religious education will be composed of ethical, political, metaphysical, or theological and epistemological parts. It would offer answers to the foundational Question, the Basic Question, and the Procedural Question all identified in the introduction. It would also provide answers to the dilemmas sketched in this closing paragraph. Armed with the references listed beneath together with the map of the territory sketched above, you the reader should now be well placed to develop your own views on these fascinating and important questions.

# Ecology and Environmental Education

Michael Bonnett

## A Backdrop: The Emergence of Environmental and Ecological Issues as Matters of Educational Concern

While there is a longstanding tradition of attending to the environment in the sense of the natural world in education in the West – for example in the ‘nature study’ that was once prominent in early years education – it was the rising sense of all not being well in this natural world that led to a more focussed and urgent attention being given. This paralleled the environmentalism that awoke in the 1940s (e.g. Leopald 1949) and burgeoned in the 1970s onwards where the extent of the disastrous impact of human action on the natural environment was becoming recognized, accompanied by foreboding concerning the implications of this for the future of humanity. The effects of large-scale anthropogenic environmental pollution (including climate change), depletion of natural resources, habitat destruction and species extinction, all were becoming only too apparent. As something that increasingly confronts citizens of the twenty-first century, it became clear that this situation was one that education needed to address. The term ‘environmental education’ appears first to have arisen in official language at a meeting of the International Union for Conservation of Nature and Natural Resources held in Paris in 1948.

What form such environmental education should take remains a matter of ongoing debate, but it soon became clear that the implications of responding to what became termed our ‘environmental crisis’ were very extensive, threatening to impinge not only on everyday lifestyles, but potentially on the economic bases of Western society and its political institutions. Antipathies between finite and rapidly diminishing natural resources and the idea of perpetual economic growth are not hard to discern, while one commentator (Ophuls 1977, p. 3) alerted us to a threat to

the idea of liberal democracy resulting from so-called ecological imperatives that arise from the perceived seriousness and urgency of our environmental situation encouraging the establishment of an authoritarian technocracy. Resonances of this latter antipathy are reflected in the school context in a tension between an approach that focuses on modifying behaviour in ways that have been officially prescribed as environmentally friendly and a fear of bypassing students' personal understanding and critical evaluation of underlying issues (that might lead to a rejection of some of this behaviour) (Jensen and Schnack 1997). Clearly, serious pedagogic issues are raised here.

In tandem with the awakening concern over the state of the environment was the rise of the science of ecology. At its kernel ecology postulates and explores the biophysical interdependence of all living things as communities of organisms embedded in their environment. In turn, such local 'ecosystems' are considered to be nested in more general regional and global systems that ultimately constitute our planetary ecosystem or 'ecosphere'. Here, a holistic systems thinking approach to environmental issues is advocated – a central point being that the organism and its environment are often considered to be an integral system that constitutes an indissoluble ecological unit. Hence through the interactions of such units with each other within a shared environment with its numerous feedback systems, the conditions of the existence of each is ultimately a product of the interplay of all such units. Exploring what are taken to be the implications of such radical interdependencies for human attitudes and behaviour led to the rise of 'ecologism' and 'Deep green' perspectives that locate humanity firmly within these biophysical systems. These found general expression in, for example, the work of Arne Naess (1989) and James Lovelock (1979), and philosophical exposition in, for example, Freya Matthews (1994) and Paul Taylor (1986).

While the above account sketches the emergence of the topic as an educational concern in more recent times, it is worth noting that there were important historical antecedents for seeking to bring education into close relationship with the natural environment. In one sense the idea of environmental education goes back at least as far as Rousseau who in *Emile* advocates learning through direct observation and physical activity in nature in the early years of a child's life. Through such experiential (as opposed to abstract) learning nature becomes Emile's teacher. This more positive affiliation with nature in which pleasurable acquaintanceship, relatively unfettered curiosity and a sense of wonder feature strongly remains an important counterpoint to an environmental education that is focused on redressing anthropogenic ills in nature and that can emit a somewhat repressive ethos with its emphasis on self-restraint, and sometimes guilt (Louv 2010; Postma and Smeyers 2012).

This positive attitude is found in the long tradition of outdoors education that views engagement with the natural world as character-building in terms both of developing physical dexterity and aesthetic sensibility, and also the self-reliance required in dealing with the exigencies that occur unbidden in the natural environment. The ways in which late-modern culture tends existentially to distance itself from nature, and what he takes to be the moribund effects of this, are developed by Louv (2010) in his notion of 'nature deficit disorder'. This theme, that previously

had received powerful expression in the views of the Romantics, raises the issue of our relationship with nature as one of considerable educational significance. To recall Wordsworth's famous lines:

Getting and spending, we lay waste our powers,  
Little we see in nature that is ours,  
We have given our hearts away, a sordid boon!

Here, he articulates what he sees to be a diminution of human being that is occurring with an increasing preoccupation with the mercantile and the instrumental – both of which, arguably, have gained the ascendance in the thinking that informs many areas of public education since his time. David Orr (1994) makes the point that environmental concern raises not simply problems *in* education, but the problem *of* education – that is, conventional Western education that increasingly focuses on producing students who are effective operators in a global market economy premised on perpetual growth. For Orr, students so equipped, lacking ‘ecological literacy’, perpetuate – indeed render ever more rapacious – an economic system that is a heavy contributor to our current environmental predicament in terms of the strain placed on our planetary ecosystem. This then raises a general point concerning the character of the aims of environmental education: they are not necessarily such as to sit comfortably within or alongside existing taken for granted educational practice.

Reflecting the anthropocentrism implicit in conventional education, when large-scale environmental concerns arose, initially the educational response tended to be scientific and technocratic (Robottom 2005). The emphasis was placed on the dissemination of what was regarded as relevant scientific information and the modification of behaviour designed to serve long-term human self-interest, such as recycling and reduction of energy consumption. This top-down “environmentalism” (Elliott 1999) came to be contrasted with more democratic approaches that attempted to root environmental education in the everyday experience of students and their local communities.

A good example of this latter approach arose out of the ‘action research’ movement: the long-running OECD *Environment in Schools Initiative* that attempted an ‘ecologization’ of schools by placing environmental issues at the heart of the curriculum. The underlying aim was not the acquisition of pre-specified subject organized knowledge, but critically reflective environmental action framed in the context of students’ own life-worlds and understandings. In this context students became as much generators of knowledge as recipients. This approach was viewed by those involved as radically ‘transgressive’ in the way that it disrupted many boundaries that structure conventional education, such as those between childhood dependency and adult responsibility, knowledge users and knowledge producers, knowing and acting, facts and values. It was argued that the inherently complex, contextualized, frequently controversial, and often piece-meal occurrence of environmental issues in real-life situations precludes a traditional school curriculum and requires students to participate in shaping “the social and economic conditions of their existence in society” (Elliott 1999).

This highly dynamic model of environmental education provides a powerful example of the extent to which environmental education has the potential to impact upon conventional views of pupils, teachers and educational institutions.

Harking back to an earlier point concerning the significance of the idea of nature to the topic of environmental education, another important influence on the ways in which environmental issues became viewed, both generally and in the particular context of education, has been the rise of postmodernism and poststructuralism. Views emanating from these broad cultural/philosophical movements led to a fundamental questioning of traditional and scientific understandings of nature: its status as an external reality, a given, was heavily undermined by claims that, rather, nature is socially constructed. Hence, with regard to the burgeoning domain of socio-cultural studies, Ursula Heise observes:

More broadly, the basic goal of work in cultural studies for the last 20 years has been to analyze and, in most cases, to dismantle appeals to 'the natural' or the 'biological' by showing their groundedness in cultural practices rather than facts of nature. The thrust of this work, therefore, invariably leads to skepticism about the possibility of returning to nature as such, or of the possibility of places defined in terms of their natural characteristics that humans should relate to. (Heise 2008, p. 46)

This has radical implications for the character of environmental education both from the point of view of the significance of experience located in natural settings and the status of scientific ecology. In addition, issues arise from the cultural relativizing of the values that run through the identification of environmental problems and appropriate responses in international contexts.

Finally, there is another cluster of ideas concerning the scale and locus for considering environmental issues: ideas of the global, the local and 'place'. While not necessarily in conflict, the emphasis that each of these invites can produce significant tensions as when, for example, global 'solutions' that are based upon abstract international knowledge come up against local traditions based upon intimate acquaintanceship with a particular locale.

## **Indigenous Perspectives**

The account that I have given so far has reflected what might loosely be termed a Western perspective. In very general terms there are perhaps two alternative perspectives that should be acknowledged: 'Eastern' and those arising from indigenous cultures. With regard to the former, certainly it would be as wrong to assume a homogeneity of view as it would be to claim it in the case of the West, but there are examples where a distinctive orientation can be found: for example, Daosism's emphasis on a life that reflects the flow of nature in its creative spontaneity. Undoubtedly, there is much to be gained from an engagement with Eastern approaches. Heesoon Bai (2012) has drawn on Asian philosophies to develop an approach to moral aspects of environmental issues, and notions of 'mindfulness' have been employed to extend our understanding of perception of the natural world and what it has to offer (Pulkki et al. 2016). While such contributions are beginning

to make their presence felt in environmental education debate in the West, indigenous perspectives have long been acknowledged as offering a radical alternative that deserves attention.

An analysis of traditional ecological knowledge provided by Reid et al. (2002) notes that such knowledge has a number of salient features. It is the result of an historical continuity in resource use practices built up over generations living in close contact with natural systems. It is unique and local, having developed around the specific conditions of a group of people indigenous to a particular biogeographic area and therefore contrasts with the international knowledge generated by universities, multinational business corporations, etc. It is dynamic in nature, bearing the imprint of an ever-ongoing responding to the minutiae of local change and is integrative of the life of the community, forming the basis for natural resource management, agriculture, food preparation, health care, education and so forth. Importantly, it is handed down by cultural transmission, often orally and through ritual, thus reflecting the knowledge of the body as well as the mind. These features resonate with a recent “insider” description of North American indigenous cultures given by Four Arrows (2016), who adds an acceptance of life’s mysteries and learning from virtues claimed to be observable in nature, such as generosity and courage.

This account of the indigenous perspective is nicely illustrated by, but also in part extended by, the sub-Saharan African concept of *ukama*. Lesley Le Grange (2012) describes this concept as referring to a sense of relatedness to the entire cosmos and as embodying an inseparable oneness between both past, present and future generations and with the natural world. Here nurturing the self is inextricably bound up with both one’s social community and community with nature (often expressed in terms of identity and kinship) such that healing/development in one results in healing in all three dimensions, so suffering too is transversally witnessed in all three dimensions. On this view care for non-human nature is built into the notion of human dignity.

Overall, the high degree of identification with the local natural world and regarding it as a source not merely of material sustenance, but of wisdom and spiritual sustenance – and therefore as a key player in the process of education – is something that, arguably, needs to be reinstated in educational debate. As, also, is the importance placed on knowledge derived from first-hand experience and intimate acquaintanceship compared with that deduced from ‘objective’ abstract theory. One consequence of postmodernism is that we can no longer feel confident in simply dismissing without further reflection views that can be marginalized and made to look archaic by particular high-status ways of thinking in the West.

## **Environmental Education, Sustainability and the Philosophy of Education**

Approaches to understanding the topic in philosophy of education can be considered to have been structured in two ways: first, by some key orientating ideas that have permeated education with regard to the environment; second, by broad

philosophical perspectives or ‘methodologies’ adopted as ways of explicating and evaluating these ideas and for identifying the educational issues that they raise. In what follows I will outline the most influential ideas that have emanated from environmental concern in education, indicating the kinds of philosophical analysis to which they have been subject or that they have invited. I will give something of the history of the debates that have arisen and identify ongoing issues.

Perhaps the most longstanding environmental notion in education is that of not simply learning about the environment, but learning *through* and *in* the environment by direct observation and physical activity, that emanated from Rousseau. This received philosophical scrutiny in the long established topic of learning through free experience that constituted an important part of the larger debate over child-centred education that arose in the 1960s and 1970s. Robert Dearden’s analytic critique of the notion is a characteristic example of this kind of work. It sought to reveal the limitations of the approach in educational terms – for example, that experience unstructured by a teacher would be a chancy and inefficient way of achieving educational goals, and that the acquisition of abstract concepts, that by their very nature cannot simply be directly observed, would require a level of instruction (Dearden 1968, Ch. 6). Nonetheless, the value of relatively unfettered direct experience has continued to have its adherents in education. It remains an important element in the advocacy of the Forest School movement, wild pedagogy and outdoor learning in general (see, for example, Payne and Wattchow 2009; Jickling 2015). And certainly contemporary interest in embodied learning and criticisms of the Cartesian dualism that is taken to structure experience in terms of separated subject and object domains remains a legacy that has claimed the attention of philosophers of education (see Bai 2009; Barnacle 2009; Doddington and Hilton 2007).

However, with the previously mentioned narrowing of focus in environmental education onto what are perceived as environmental problems, without doubt, the ideas that have received most attention in the literature have been those of ‘sustainable development’ and ‘sustainability’. I consider each of these in turn.

The term “sustainable development” was first introduced in *The World Conservation Strategy* (IUCN et al. 1980) and perhaps received its most influential articulation with the publication in 1987 of the report of the World Commission on Environment and Development, *Our Common Future* (Brundtland Commission 1987). Here sustainable development was defined as “a development that meets the needs of the present generation without jeopardising the ability of future generations to meet their needs”. This definition was consolidated as an educational concern at the Earth Summit Conference held in Rio de Janeiro in 1992, attended by delegates from over 170 countries and whose centre-piece agreement was *Agenda 21* (UNCED 1992) which included the proposal to introduce ‘sustainable development’ into the educational programmes of signatory nations. Thus it found its way (at least notionally) into the core curriculum of many nations, giving rise to the idea of education for sustainable development. It was lent further impetus by the decision of the UN General Assembly in December 2002 to launch the Decade of Education for Sustainable Development 2005–14. The strong appeal of this notion derives from the appearance of combining two desiderata: development in the sense

of having more or better, and sustainability in the sense of maintaining what is valued (including this development). It is precisely this appearance that has received critical attention by philosophers of education.

For example, it has been argued that in the context of modern Western culture the attempt to meld the idea of sustainability with the idea of development results in an oxymoron (Shiva 1992; Bonnett 2002) that frequently serves to authenticate or veil practices that are far from 'green'. In the Western context, development frequently becomes equated with economic and material growth. Here, nature is viewed exclusively as a resource to be exploited and this instrumentalism is necessarily incompatible both with what is taken to be a core meaning of sustainability – preserving things in their own nature – and with living within nature's economy rather than one that is imposed and destructive of this (Shiva 1992). Amongst other things, it is claimed that it is precisely the attitude of focussing on anthropocentric values and what become ever expanding human 'needs' that lies at the heart of the Brundtland definition of sustainable development that has led to our current environmental predicament. With increasing technological power and the previously mentioned economic pressures characteristic of a free market system, there has developed an unprecedented aggressiveness towards the natural world (such as huge scale deforestation and the decapitation of mountains for coal extraction), which excludes the potentially moderating effect of being open to intrinsic values in nature. Helen Kopnina (2012) has explored how as the idea of sustainability becomes applied to an increasing range of anthropocentric desiderata there is a loss of focus on nature.

The nature, power and consequences of this anthropocentrism continue to receive attention in the philosophy of environmental education and are a matter to which I will return. For the moment, it is worth noting that it is frequently seen as representing the opposite pole to the influential eco- or bio-centrism espoused by 'deep green' theorists who place the integrity and value of the natural world (of which humanity is conceived to be one part) as the central consideration. This seeks to combat the great divide between humanity and the rest of nature that historically has dominated Western thinking – from the Greek and Judaic thought that saw nature as profane or put there to serve humankind, to the rationalism of Aquinas that elevated man above nature in the Great Chain of Being, and Descartes' radical separation of man from mechanical nature through his possession of an incorporeal mind. When nature is projected as a vast machine ultimately constituted of inert atomic particles whose motion is the result of a variety of external mechanical forces, it is set up for classical experimental science to extract its laws and "secrets" without restraint – for example, by highly interventionist and invasive experimental methods – especially when joined by an Enlightenment vision of unimpeded human progress (Merchant 1992).

In contrast to the interpretation of sustainability that occurs when it is recruited to the idea of sustainable development, 'sustainability' has re-emerged as a critical response to the domination of the latter in educational policy and practice. It has been argued that there is much to be gained if we move the focus from trying to formulate a grand policy implicit in the idea of sustainable development to attending to the qualities of a frame of mind – or way of being – that constitutes sustainability

as an outlook (Bonnett 2002; Postma 2006). Once established, this frame of mind would enable individuals to respond to environmental issues in a way that expresses a deeper sense of sustainability, as and when need arose in their everyday lives. This is taken to counter the aggressive anthropocentrism found in the most influential formulations of the policy approach and circumvents some serious epistemological and ethical problems inherent in the latter, such as the frequent inadequacy of our current state of knowledge to predict long-term outcomes in the context of the scale and complexity of natural systems, and the differing cultural and geographical perspectives on what the most pressing problems are and what would count as acceptable solutions. In addition, the idea of sustainability as a frame of mind has led to some interesting arguments that are taken to go to the heart of education as a whole because they raise issues concerning the character of human being, its relationship with nature, and the broad socio-cultural factors that shape and influence this. For some, the true character of the environmental crisis is not only – or even chiefly – material, but deeply spiritual (Ashley 2006; Bonnett 2007). It is a matter of how we conceive our relationship with the natural world and our place in the cosmos. Arguments of this kind have been taken to have fundamental implications for our understanding of education, pedagogy, and the character and culture of educational institutions.

Previously it was noted that the reality and authority of traditional ideas of nature have been heavily criticized from socio-cultural and poststructuralist perspectives. Far from being an underlying given, ‘nature’ is posited as socially constructed, culturally and historically variable, and ideological – frequently incorporating or authenticating suspect power relationships (Haraway 1991; Stables 2001). However, a number of counterarguments have arisen in response to this growing orthodoxy. From a phenomenological perspective, it has been pointed out that while our concepts of nature – in common with all other concepts – have been socially produced, we *experience* nature as something that precisely is *not* socially produced. Rather, it is quintessentially non-artefactual. In this sense, nature is transcendent and “self-arising” (Bonnett 2004; Crist 2008). Furthermore, it is claimed that phenomenological analysis reveals such self-arising nature to exhibit a number of key properties that include: otherness, epistemological mystery, integrity, agency, normativity and intrinsic value. Clearly, this portrayal of nature conflicts not only with poststructuralist accounts, but also with those of classical physical science, and debate over the plausibility of each continues. But if the phenomenological account of nature is taken seriously, a number of issues arise that have important educational implications. For example, if nature is conceived as transcendent and normative, if knowing it involves participating in the “being” – living presence – of things (Abram 1997; Bonnett 2015), this demands a modality of perception that is fully multi-sensory, bodied as well as cerebral, and open to an integrity and values that are intrinsic. It valorizes more directly engaged ways of being towards the world – ways that involve many potentialities for openness of our being as a whole. Hence environmental education informed by a concern for nature becomes something that should condition the idea of education itself. For example, it would involve attending to the development of the whole person as an embodied, sensual, emotional, willed, as

well as intellectual being. Education becomes ontological in the sense of having a concern for the nature of a person's being and what a person is becoming.

In addition, by exhibiting a concern for the pupil as a self that is always a self in relationship with its environment, some have seen this to raise afresh and in a forceful way the issue of "place": the importance of locale to the significance of action, our sense of identity and our sense of responsibility towards the environment (see, for example, Gruenewald 2009; Ontong and Le Grange 2014). It has been noted that nothing we do is unplaced. In this sense humans are always and already geographical beings (Casey 1997). This has led to an exploration of the application of notions of "cultural density" and "habitus" to natural and other learning environments (Waite 2013). In a recent discussion of place-conscious education, David Greenwood (2013) speaks of the need for a "decolonization" of places such that the often contestable nature of the dominant beliefs and motives that inform our perceptions of them can be revealed, enabling us to re-inhabit them in a deeper and more open manner.

Related to these issues is that of the significance for moral education of sensibility to normativity in our experience of nature. By affirming knowledge by acquaintance in which all the senses are in play including sensitivity to integrity, agency and values present in the natural world, such a position invites exploration of an idea of moral education that founds the idea of moral agency on that of poetic receptiveness. In doing this it intimates an enlarged sense of moral agency: one that is less pre-occupied with the model of an autonomous rational agent (e.g., Bowers 2012) and that seeks to sensitize us to possibilities of an enabling passivity on our part that properly recognizes the contribution of non-human agency to the character of the places in which we live. Clearly, this presents a radical challenge to the traditional conception of ethics that holds moral obligation to exist only within a social contract between rational agents.

Extending this theme, questions of the following kind arise: What responsibilities do we have to non-human nature? What responsibilities do we have to future generations? Regarding the first of these questions, recently Peter Kemp (2015) has argued that humans and animals are equal partners as corporeal beings but not as temporal beings, and that as humans alone *conceive* of love and care as a state of being they are responsible in a general sense for the welfare of animals. On the second question Dirk Willem Postma (2002) has explored a number of issues that arise for Rawlsian liberal morality from the impossibility of there being reciprocity with future generations, and also the difficulties that such anthropocentric theory has in properly comprehending environmental issues because of its focus on the private sphere.

In more general terms, these issues connect with work that has been done on the question of what constitutes being "green" and the creation of "green" citizens in a liberal democracy (see, for example, Bell 2004). C. A. Bowers (2002) has argued that there is a pressing need to address the socio-political consequences of current values and practices. He has developed the notion of an 'eco-justice' pedagogy that has three main foci: (a) to develop an awareness of the environmental racism and class discrimination involved in the way that the deleterious environmental impacts

fall disproportionately on ethnically and economically marginalized groups; (b) the recovery of non-commodified aspects of community through a reversal of an ever-increasing dependency on meeting life's daily needs through consumerism rather than through self-reliance within the family and within networks of mutual support within communities; (c) to develop a sense of responsibility towards future generations and a corresponding self-limitation by an expansion of non-consumptive relationships and opportunities to develop personal talents and to enrich the community. Bowers claims that central to this enterprise is the identification of root metaphors embedded in language that shape the way that we engage with the world: currently, metaphors that underlay the industrial revolution such as 'individual' and 'linear progress'. He argues that these systematically undermine the value of tradition and therefore the intergenerational knowledge and continuity that are necessary for ecological wisdom and are so central to indigenous perspectives. Also they conflict with the root metaphor underlying an eco-justice pedagogy which is 'ecology' and that 'foregrounds the relational and dependent nature of our existence as cultural and biological beings'.

This is one example of a broad concern for the curriculum and culture of schools that has been awakened by environmental issues (see, also Chapman 2007). Others include how understandings of nature that focus on the spontaneous being of natural things in their otherness have led to foregrounding dialogical learning/pedagogy and the idea of a curriculum of emergent engagements rather than one of pre-specified connections determined by academic disciplines (Foster 2002; Bonnett 2007). Somewhat in tension with this, Stables and Scott (2002) have defended a discipline-based approach to environmental education. They argue that it would be a mistake to attempt to conceive of environmental education as some holistic cross-disciplinary element, implying, as it would, that there is, some single totalizing environmental grand narrative to be conveyed. Here there is the danger of an eco-fascism that would subvert the integrity of the disciplines.

However, it has been claimed that the atomistic understanding encouraged by a traditional curriculum inevitably both externalizes relevant factors and lacks cognisance of the greater whole: it is unable to convey its organic nature. In his influential *Steps to an Ecology of Mind* Gregory Bateson (2000) argues that what is desperately required is a systemic wisdom that transcends the narrow purposive frameworks through which consciousness selectively samples events and processes. But how is the greater whole to be understood? What are the appropriate metaphors? Debate on this has considered numerous candidates that include: a created realm, a blind causal system governed by abstract laws, an energy or information system, a domain of dialogical encounters attended by mystery, Gaia. The helpfulness of any or some combination of these remains a matter of ongoing debate – as does the dilution of the boundary between self and other that some of these views expound (see, for example, Matthews 1994).

Yet in many ways, concerns are raised most powerfully for the culture of the school – for example if "success" is portrayed in terms of the values of market production and consumption, and the sense of community embraces only humankind (Bowers 1995). It seems clear that if we are to enable pupils to address the causes

of environmental problems rather than the symptoms, we must engage them in those kinds of enquiry that reveal the dominant underlying motives, metaphors and interpretations that are in play in society and invite them to participate in shaping practices that are informed by the understandings that emerge. Here the focus moves to an examination of the underlying versions of human flourishing and the good life that are implicit in the ethos of the school as a community and how they connect with life more generally.

## Conclusion: Emerging Issues

A number of the views considered in this chapter suggest that ultimately the topic of ecological and environmental education will require an examination of motives that are inherent in our most fundamental ways of thinking about ourselves and the world – that is to say it will involve *metaphysical* considerations. Some of the most significant concerns of this kind are briefly outlined below.

One important issue to arise is the disclosure of the extent of scientism in education and an examination of its impact both on our ability to think both about environmental issues and the nature of human being (Abbs 2003, Ch. 2). The incompatibilities of pre-specification, modularization and micro-management with free exploration of the environment and an emergent curriculum raise deep philosophical questions regarding the enervating influence of scientism in education. This influence has been understood as an expression of a growing “metaphysics of mastery” that seeks to set up everything to be on call for the exercise of the human will (Bonnett 2013).

Another radical line of argument is that because of the intentional, ecstatic, and therefore *environmental* nature of consciousness, there is an important sense in which human being is ineluctably involved in sustainability. Drawing on Martin Heidegger’s portrayal of reflective consciousness as the place where things *occur* – show up, are beheld – it follows that they show up most fully – are most themselves – when the receptivity of such consciousness is as open as possible. This is to say that it is the essence of consciousness to allow things to be, and in this sense to *sustain* them (Bonnett 2004). A frame of mind that enables things to presence in the richness of their manifold being (which includes their inherent otherness and mystery) is itself enriched and receives inspiration. Such allowance of things themselves was portrayed by Iris Murdoch (1959) as a form of love that lies at the heart of human flourishing. It seeks actively to listen for and discern the call of individuals in their otherness – which will include the difficult task in the age of the metaphysics of mastery of clearing an appropriate space for things to occur in this way. Considerations of this kind have led to an exploration of the character of educational institutions as places that promote deep cultural change through their location, architecture, culture and ethos (e.g. Blenkinsop 2012).

Overall, it is clear that pursuing the issues that are raised by environmental concern leads to broad issues of considerable educational importance. Perhaps one of

the most fundamental of these arises from the radical challenge to anthropocentrism implicit in much environmental debate and that has resulted in questioning the cluster of ideas that constitute the modernist humanism that has been so influential in educational thinking. Consider, for example, the high profile given to rational autonomy as an educational aim and the high status given to abstract disciplines that either objectify reality or instrumentalize it, or both. It has been claimed that we now live in a period of ‘post-ecologism’: a simulation in which beneath widespread green rhetoric, unsustainability is inherent and is tacitly accepted. Here “the discourse and policies of ecological modernisation and sustainable development function to simulate the possibility and desirability of environmental justice and integrity without genuinely aiming to address, let alone reverse, the fundamental unsustainability of late-modern society” (Bluhdorn 2002, p. 66). This covert attitude, consistent with the metaphysics of mastery, represents another reason for exploring the possibilities of a post-humanism in which non-anthropocentric impulses and a more intimate and attentive relationship with the natural world is valorized.

Finally, there is now a growing interest in the idea that philosophy of education itself needs to be “ecologized” (see, for example, Jickling and Stirling 2017; Affifi et al. 2017). Philosophical examination of environmental concern and environmental education discloses profound issues that invite us to review a range of ideas and assumptions about the nature of knowledge, learning and human well-being – and hence, education as a whole. In the light of this it is argued that the philosophy of education needs more fully to recognize the significance of ecological and environmental perspectives and their implications both for the topics that receive attention and the kinds of thinking used to address them.

# Vocational Education

Gerard Lum

## Introduction

The subject of vocational education has increasingly come to engage the attention of philosophers of education in recent years. Yet there is a longstanding tradition – one which dates back to the philosophers of ancient Greece – of a disinterested attitude towards vocational education, an inclination to see it as devoid of the kind of philosophical implications which from Plato’s time have been associated with mainstream education. It has been said that Plato “refused to regard it as ‘real education’” (Lodge 1947, p. 249). Aristotle, not unlike Plato before him, afforded pride of place to *theoria*, knowledge deemed to be of intrinsic rather than extrinsic value and characterised precisely by its *lack* of practical application. As Aristotle put it, to know theory is to “know things that are remarkable, admirable, difficult, and divine, but *useless*” (*Nicomachean Ethics*, §1141b6, my italics). Indeed it could be said that this same disinterested stance was in evidence with the emergence of modern philosophy of education in the mid-1960s, there being a hint of it in R.S. Peters’ assertion – Peters was one of the originators of modern philosophy of education – that the concept of education is “philosophically interesting in ways in which engineering is not” (1977, p.139).<sup>1</sup>

---

<sup>1</sup>Peters overlooks the important sense in which we might distinguish engineering on the one hand, and learning to be an engineer on the other. As Peter Winch (1965) rightly notes (albeit in a rather different context) there is a fundamental difference between “an engineer studying the workings of a machine” and “an apprentice engineer who is studying what engineering, that is, the activity of engineering is all about” (p. 88). While there is a sense in which the former *might* be said to be philosophically uninteresting, the same could certainly not be said of the latter.

In this chapter we will see that, to the contrary, the whole subject of vocational education is shot through with philosophical implications, profound questions about what it is a person must know in order to perform effectively in an occupation and the nature of the processes required in order to bring this about. My intention here is to map some of the key philosophical debates that have arisen in connection with vocational education in recent years: from dissensions provoked by new developments in vocational provision and assessment through to wide-ranging epistemological disputes about the nature of knowledge or expertise. While these debates are sometimes centred ostensibly on UK/European policy or practice, the issues raised are almost invariably of international relevance having implications for vocational and professional education in any context. In what follows I trace the evolution of recent thinking on these issues and point towards some possible resolutions. But we begin here with considerations arising from the way in which, in the middle of the last century, some philosophers of education came to adopt a distinctive yet ultimately highly questionable view of the vocational.

## Of Skills and Competencies

Around 50 years ago, analytic philosophers of education – so called because they saw their task as one of analysing ‘concepts’ – believed that one way of getting clearer about ‘the concept of education’ was to compare or contrast it with other concepts such as ‘skill’ and ‘training’, concepts ordinarily associated with vocational provision. While ‘education’ was portrayed as something rich and profoundly life-enhancing, notions such as ‘skill’ and ‘training’ were routinely depicted in such a way as to emphasise their epistemological and cognitive vacuity. The idea that “training” “lacks the wider cognitive implications of ‘education’” (Peters 1980, p. 94) was taken up by a good many analytic philosophers of education (see Lum 2009). Similarly with the concept of “skill” which was taken to imply that there is “very little to know ... it is largely a matter of knowing how rather than knowing that, of knack rather than understanding”, a kind of knowledge exemplified by such things as “riding bicycles, swimming or golf” (Peters 1980, p. 95; see also Peters 1966).

Of course, skilled engineers, builders, technicians and the like who have personally undergone extensive training might rightly balk at the suggestion that they possess mere ‘knack rather than understanding’. But such analyses were never meant to add to anyone’s understanding of vocational education; what they *were* intended to do was protect mainstream education from vocationalising tendencies. For Peters, and many other philosophers of education of the 1960s, being educated meant mastering “forms of thought and awareness which are not harnessed purely to utilitarian or vocational purposes” (1973, p. 9).<sup>2</sup>

---

<sup>2</sup>Peters was by no means alone in his approach to such concepts; indeed there is evidence that he was quite influential on this score, with similar analyses to be found in the work of a good many other philosophers and educationalists from the 1960s through to the present day (see Lum 2009).

In hindsight the strategy of attempting to protect mainstream education by effectively disparaging the concepts ordinarily associated with vocational provision can be seen to have failed on a number of counts. The fact that we commonly refer to ‘vocational *education* and training’ automatically renders the education/training distinction less feasible as a means of differentiating general and vocational provision. Moreover, any threat to vocationalise the school curriculum comes not from the suggestion that schools should teach children the ‘knack’ of things like golf or cycling but from the idea that schools should prepare children for employment. And the suggestion that abilities of this kind are comparable to the abilities required for employment was manifestly implausible. Added to which, there were reasons to question the methods and ‘objectivity’ of these analyses, there being more than a suspicion that such ‘concepts’ were contrived in such a way as to bolster prior educational predilections and snobberies of social class.<sup>3</sup> Although certainly never having any *direct* influence on vocational policy or practice, it might be said that many of the assumptions implicit in these analyses were ultimately to have a bearing not merely, as we shall see, on vocational provision, but also on the wider educational enterprise. Today, mainstream education in the UK and many other countries is awash with “skills talk” (Blake et al. 1998, p. 56) with all manner of educational aims, from primary school to university, being styled as ‘skills’, seemingly because the term gives licence to assume a kind of endeavour that is more simplistic, straightforward or uncomplicated than it actually is.

Philosophical interest in vocational education and training (VET) *per se* can be traced to the 1980s when governments began to take a more significant role in shaping vocational policy and practice. The history of vocational preparation for a great many occupations throughout the twentieth century can be regarded as one of ever-increasing state or quasi-official involvement with a concomitant tendency towards standardization and bureaucratization. That which was previously tacit and passed informally from master/practitioner to apprentice/trainee became increasingly formalized and explicit. Early in the last century the American philosopher John Dewey aptly noted the modern “disposition to make explicit and deliberate vocational implications previously tacit” (1966, p. 313; c.f. Lewis 2013). With burgeoning official interest in such things as ‘occupational standards’, ‘benchmarking’ and national and international qualification frameworks, it was perhaps inevitable that increasing state involvement would ultimately raise fundamental questions about the precise nature of the skills, capabilities or knowledge at issue.

In the UK the 1980s saw the introduction of the ‘competence-based’ system of National and Scottish Vocational Qualifications (N/SVQ). The approach had an obvious political and instrumental appeal, centred as it was on the ‘competencies’ required for occupational performance. With the focus ostensibly on demonstrating competence, such things as the facility to pass exams or the kind of training a person had had could be regarded as being of little or no consequence – what mattered was

---

<sup>3</sup>For a fuller account of the role of analytic philosophy of education and conceptual analysis in relation to theorising about the vocational see Lum (2009).

whether they could ‘do the job’. Indeed, since N/SVQs could be awarded to workers on the basis of competencies they already possessed, the approach seemed to offer a convenient remedy for the UK’s poor showing in international league tables of qualifications.

Although these developments provoked some critical attention, it was not until competence-based education and training (CBET) threatened to spread downwards into schools and upwards into Higher Education that the approach started to receive widespread philosophical attention. Initially, in the manner of analytic philosophy, critics focused on ‘the concept of competence’, thus somewhat naively vindicating CBET’s arrogation of the term and arguably misperceiving their substantive target (see Lum 1999). Criticism centred on the idea that the concept of competence was flawed, that the term suggested a mere sufficiency, a limited understanding and so on. Such interpretations were, of course, on all fours with the conceptual analyses of ‘training’ and ‘skill’ two decades earlier with their dismissive references to such things as ‘know how’ or ‘knack’. Often the implication was that while the concept of competence might be sufficient for vocational purposes, it was inappropriate in the context of schools or universities (c.f. Barnett 1994; Pring 1995). For some, it was the indeterminacy of the concept that was problematic, the fact that “competence” seemed to be an “El Dorado of a word with a wealth of meanings” (Norris 1991, p. 331). Others set about devising various competing concepts of competence with a view to demonstrating that it was the type of competence employed that was problematic (see Hodkinson 1992). In some quarters the welter of criticism was such that the very term ‘competence’ fell into disrepute – so much so that some of CBET’s chief proponents began to speak of ‘outcomes’ rather than ‘competencies’.<sup>4</sup> Importantly, there was nothing about CBET’s methodology which implied any special or unique connection with ‘competence’ other than the fact that it evidently involved attempting to specify the capabilities at issue in statement form. Indeed, given CBET’s preoccupation with constructing precise *statements* to specify requisite performances, “competence-based” might be said to be something of a misnomer, the approach perhaps being more accurately described as a “statement-based” approach (Lum 1999).<sup>5</sup>

Seen thus, the approach raised questions about the feasibility of capturing in sufficiently precise language the abilities at issue. Michael Polanyi, writing in the 1950s (see Polanyi 1962), famously had drawn attention to the fact that so much of

---

<sup>4</sup>Compare, for example, Burke (1989) with Jessup (1991). One apparent advantage of the term ‘outcomes’ over ‘competencies’ is that ‘outcomes’ seems to lend itself more readily to non-vocational contexts.

<sup>5</sup>The first Director of the UK’s National Council for Vocational Qualifications, Gilbert Jessup, unwittingly provided a more exact characterisation of the so-called competence-based S/NVQs when he proclaimed that:

statements must accurately communicate their intent. ... a precision in the use of language in such statements will need to be established, approaching that of a science. The overall model stands or falls on how effectively we can state competence and attainment. (Jessup 1991, p. 134)

what we know is simply not amenable to being expressed in language, a point reiterated in his later *The Tacit Dimension*:

We know a person's face, and can recognize it among a thousand, indeed among a million. Yet we usually cannot tell how we recognize a face we know. So most of this knowledge cannot be put into words. (Polanyi 1983, p. 4)

Similarly, in the 1980s Donald Schön (1987, 1996) took up Polanyi's notion of 'tacit' or 'personal' knowledge to demonstrate its significance for 'reflective' professional practice. Whether or the extent to which such ineffability poses a problem for the competence/outcomes strategist is a moot point. It might be said that even if it is not possible to describe the knowledge or ability at issue, it is nonetheless possible to determine whether a person can or cannot do the thing in question. However, one apparent upshot of this is that it causes a shift of attention away from the person and their abilities towards ontologies more amenable to precise description. To take a typical example: a competence statement to the effect that an engineer should have the ability to 'maintain engineering assets' has an appropriate focus but is unhelpfully vacuous. Accordingly, sub-statements might be added by way of explicating, not the abilities required, but rather, the 'engineering assets' to be maintained – quite literally a list of machines, devices and equipment. How such a list could properly serve as an educational specification or convey what it is the engineer needs to know and understand is another matter (see Lum 2004).

When eventually philosophical attention turned to CBET's methodology two main strands of philosophical concern began to emerge: first, the complaint that the approach was unduly reductionistic and that something of the essence of occupational expertise was lost in the process of breaking a performance down into discrete competencies amenable to tick-box verification; and second, and perhaps more serious, the accusation that the approach was "intrinsically behaviouristic" (Hyland 1997, p. 492) and thus neglectful of knowledge and understanding.<sup>6</sup> There are perhaps two reasons why the charge of behaviourism failed to gain purchase. First, it might be said that *any* form of assessment must be based on behaviour or a performance of some kind – and as proponents of CBET are wont to point out, CBET is first and foremost a means of assessment. Second, there is arguably a basic sense in which a person who can produce the requisite performance *must* have the knowledge and understanding necessary for that performance. A common response from CBET's critics was to suggest that the knowledge and understanding required to perform in one context might not be sufficient to perform in a different context. But advocates of CBET needed only to adopt the strategy of testing competence across a range of contexts to leave critics with no apparent grounds for complaint. Certainly there is little evidence that these concerns did anything to deter the spread of CBET, although it is not without significance that in the UK many employers and awarding bodies have been reluctant to abandon traditional arrangements such as formal examinations and minimum requirements as regards the length of training programmes, etc., retaining such checks in parallel with competence-based assessment.

---

<sup>6</sup>See Hyland (1994) for a comprehensive critical survey of the competence debate.

In recent work I have suggested that the presumed ontological opposition between outward behaviour and inner knowledge and understanding – a distinction made much of by CBET’s critics – is *not* the distinction that is substantively at issue and that the matter more properly turns on the kind of judgement employed when assessing a person’s capabilities. Elsewhere (see Lum 2012, 2013a) I have argued that our informal judgements about what other people know can be seen to be of essentially two distinct types. On the one hand, it will often suit our purposes to make simple judgements of *identity*, when we simply have an interest in whether a person can or cannot respond or perform in a specific way. On the other hand, we often employ what I have referred to as judgements of *significance* whereby we draw upon any or all available evidence, assigning significance to such evidence as we see fit by way of construing a ‘picture’ of a person and their capabilities.<sup>7</sup> It is significant that whenever it is imperative for us to have the fullest indication of what a person knows we instinctively adopt the latter form of judgement. Importantly, these two forms of judgement can often be at odds: a person might successfully respond or perform a pre-specified way, yet engender evidence which betrays their limited knowledge or understanding of the matters in hand. Conversely, they might fail to perform in the requisite manner but give every indication that they have the wherewithal to do so. Colloquially, we are prone to couch the matter in ontological terms, as a distinction between the ‘outer’ and the ‘inner’, between how a person behaves and what they ‘really’ know or understand. In fact it would be no exaggeration to say that this perceived opposition between behaviour/performance and knowledge/understanding has been a continual source of dispute over the past few decades. As traditionally conceived, it is a choice between either verifying ‘objectively’ that a person can perform in the requisite manner or indulging in ‘subjective’ and tentative inferences about inner knowledgeable states. But our manifest lack of access to other minds indicates that the operative distinction *cannot* be that of inner knowledge as against outward behaviour, but rather, a distinction relating to the two different stances that might be taken towards the *evidence* we have of a person’s abilities. Seen thus, the choice is between arrangements which confine the assessment process to pre-specified evidence and arrangements which facilitate drawing on the widest range of evidence so as to arrive at the best estimation of a person’s capabilities. One upshot of this is that it suggests a very different interpretation of the anxiety that is so often associated with the use of ‘behavioural outcomes’, an anxiety better understood as an implicit recognition that an assessor restricted to applying judgements of identity to pre-specified behaviours would, on being presented with the requisite behaviours, be duty-bound to attribute knowledge even in the face of countervailing evidence.

The design of any formal assessment process would seem to necessitate choosing between these two kinds of judgement and hence between two logically distinct modes of assessment – what I have dubbed as ‘prescriptive’ and ‘expansive’ modes, with the latter being such as to allow the assessor to take an expansive view of the

---

<sup>7</sup> Donald Davidson (2001) has noted the important sense in which we are able to “assemble such material into a convincing picture of a mind” (p. 15).

evidence and thus provide the best estimation of what a person knows. The UK's system of N/SVQs, to the extent that it is centred on pre-specified behavioural outcomes, would seem to have the characteristic features of assessment in the prescriptive mode – which explains its limitations and the concerns of many critics (see Lum 2013a). In contrast, the purposely 'holistic' and 'integrated' conception of competence outlined by the Australian philosophers of education, Paul Hager and David Beckett, suggests a very different approach. With the emphasis on integrating "key tasks" with personal attributes such as "knowledge, skills, attitudes, values, etc." (Hager and Beckett 1995, p. 2), the integrated approach suggests the broader and more open-ended consideration of evidence characteristic of assessment in the expansive mode. Although a good many countries around the world today would claim to have 'competence-based' systems, it is at present a moot point as to which of these two approaches have been adopted in which countries.

The advent of the European Qualification Framework (EQF) has raised still further questions about the notion of competence and its role in vocational provision and assessment. Intended as a means by which qualifications in one country might be "translated" into their equivalents in other countries, the EQF has been described as a "competence framework" (Brockman et al. 2009, p. 788). Yet scrutiny of this framework has revealed wide variation in understandings and interpretations of 'competence', not only between different countries but also within them.<sup>8</sup> At one level such variations might be associated with differences in the occupational groupings of skills or different arrangements for VET provision. No two countries are identical in the latter respect: Germany, with its concern for curricular inputs is at the opposite end of the spectrum to the UK's now largely outcomes-based approach, with other European countries occupying positions variously inbetween.<sup>9</sup> Still more problematic, though, are the profound conceptual and linguistic difficulties:

The linguistic and conceptual situation is particularly confusing. First there is an intralinguistic complication: there are different and often disputed interpretations of what competence means in English. Second, superimposed on this, there is an interlinguistic complication: we cannot assume that the correlates of 'competence' in, for example, French (*compétence*) or German (*Kompetenz*) necessarily mean the same as all, some or any of the competing usages available in English. It cannot be assumed either that the same thing is understood by the word 'competence' in the translation of the EQF into each respective language or that 'competence' can be readily translated into its cognate in another European language because the realities to which the term refers are not the same. (Brockman et al. 2009, p. 788)

Of course such difficulties are by no means unique to 'competence' for much the same could be said of terms such as 'know how' and 'skill' and their respective cognates. Such differences not only point up the considerable difficulties involved in attempting to achieve parity between national qualification systems but throw into stark relief fundamentally divergent theoretical understandings of vocational knowledge and expertise.

---

## A Question of Knowledge

One manifestation of this divergence in the Anglophone world is to be found in debates surrounding the distinction between ‘knowing how’ and ‘knowing that’ where the techniques of analytic/ linguistic philosophy continue to influence the framing of epistemological debates. The distinction, brought to prominence by Gilbert Ryle in the late 1940s, continues to divide the ‘intellectualists’ who argue that propositional knowledge is fundamental to expertise, from those who, like Ryle, regard ‘know how’ as foundational. Ryle’s purpose in *The Concept of Mind* was to debunk the ‘intellectualist legend’ according to which intelligent performance can ultimately be assimilated to knowing *that*, i.e. knowledge of propositions, rules, precepts and so on.

To do something thinking what one is doing is, according to this legend, always to do two things; namely, to consider certain appropriate propositions, or prescriptions, and to put into practice what these propositions or prescriptions enjoin. (Ryle 1949, p. 29)

On Ryle’s view, the idea that intelligent performance necessitates some prior mental manipulation of rules or precepts, that the agent “must preach to himself before he can practise” (*ibid.*) is patent nonsense. The intelligent operations of the expert chef, for example, are not preceded by a mental rehearsal of recipes and instructions. Indeed, it might be said that such prior resort to rules or precepts is a mark of the novice rather than the expert.<sup>10</sup> Suffice it to say then that, for Ryle, intelligence consists primarily in knowing how to do things. What has generally gone unremarked upon is the fact that although clearly influenced by Ryle’s use of the distinction many early analytic philosophers of education chose to *reverse* Ryle’s emphasis, choosing – as we have seen – to portray knowing *that* as the wellspring of intelligence, reducing knowing how to ‘knack rather than understanding’.

The dispute between intellectualists and anti-intellectualists has come on a pace in recent years and there is now a burgeoning literature on knowing how and knowing that, both in mainstream philosophy and in philosophy of education.<sup>11</sup> On one side, intellectualists such as Stanley and Williamson (2001; see also Stanley 2011) argue that know how ultimately comes down to knowing *that* such and such is the way to do something. Others, with Ryle, have been at pains to put the case for knowing how as distinct from knowing that. And it hasn’t gone unnoticed that Ryle’s formulation of the distinction with its apparent diminishment of the role of propositional knowledge is of a piece with CBET’s emphasis on performance at the expense of knowledge and understanding (see Hyland 1994; Winch 2009; Lum 2009). What is more to the point, however, is that there are perhaps reasons for scepticism about claims to the effect that one ostensible form of knowing should be regarded as temporally or causally prior to the other. Such claims usually can be seen to adopt one

<sup>10</sup> See Dreyfus and Dreyfus (1986). Important here is the question of the *kind* of rules at issue. In Lum (2009) three distinct kinds of rules are identified that have different roles in relation to occupational expertise.

<sup>11</sup> For a useful survey of the issues see Bengson and Moffett (eds.) (2011).

or both of two strategies: either appealing to the contingent facts of grammar or ordinary language use (c.f. Rumfitt 2003), or employing a kind of ontological sleight of hand whereby, depending on an author's purposes, a term such as 'ability' will be assumed to imply *either* an inner cerebral capacity, thereby privileging knowing how – *or* some manifest behaviour, which leaves the way open to prioritise knowing that as a state of mind.

In the context of VET the matter quickly extends to the notions of theory and practice: on one side the view that theory or propositional knowledge is the fountainhead of intelligent action, on the other, the view that practical ability is what matters and there is little point in learning "bucketfuls of facts" (Wolf 1989, p. 41).<sup>12</sup> Assumptions such as these can have profound implications for VET provision. In the UK the widespread implementation of competence-based strategies has meant that a good many occupations have seen a decided shift from 'off-the-job' to 'on-the-job' learning. More recently even the role of teaching has come to be regarded as requiring mainly practical as opposed to theoretical knowledge, potentially diminishing the place of formal teacher training. When a new Masters degree for teachers was mooted, a senior figure at the Institute of Education in London was reported as saying that the degree should be "practical" so as to avoid "filling their heads full of educational theory" (cited in Lipsett 2008). As we have seen, when the emphasis is in this direction inevitably there will be concerns that practitioners do not have the knowledge and understanding substantively required for practice.

Yet the shift might equally be in the opposition direction. Nurse education in the UK, which has undergone radical reform in the last two decades, is a case in point. Whereas previously trainee nurses would be attached to a hospital school and trained through an apprenticeship type system, today nursing is a degree-level profession and provision has moved out of the hospital ward into the university. Those in favour of such developments stress the fact that nurses today are involved in providing increasingly complex treatments – although the more cynical might harbour more than a suspicion that these changes are at least partly about positioning nursing as a 'profession' rather than just a vocation. Yet again there are concerns that provision falls short of providing what is required for effective practice, and much publicised scandals of hospitals failing to provide adequate patient care have added a sense of urgency to these concerns. It is not without significance that those who voice such concerns often find it difficult to say exactly what it is that is lacking. It has been said that the new generation of nurses are not sufficiently "street-wise" or able to deal with "difficult situations" (NHS Confederation cited in UKCC 1999, pp. 40–41). Some put the matter down to attitude: there is a worry that the new generation of nurses are "too posh to wash" (Hall 2004; c.f. Beer 2013), that nurses with degrees are averse to providing the basic care that patients need. As one commentator put it "Reforms in the 1990s were supposed to make nursing care better. Instead, there's a widely shared sense that this was how today's compassion deficit began. How did we come to this?" (Patterson 2012). Yet calls to abandon

---

<sup>12</sup>Wolf borrows the phrase from the Higginson Report on the reform of 'A' levels.

university provision provoke understandable bafflement: “It is extraordinary that some may believe nurses are too well educated” (Beer 2013, p. 4).

The concepts of theory and practice have a particular resonance in nursing where there has long been a preoccupation with the notion of a “theory-practice gap”, something recognised as “an issue of concern for many years” (Hewison and Wildman 1996, p. 754) and frequently referred to in the nurse education literature. The issue is generally perceived to be one of closing the gap, a matter of “integrating theory in praxis” (Ekebergh et al. 2004, p. 622). I have suggested elsewhere (Lum 2007) that perhaps one reason for the persistence of this problem is that it can be seen to conflate two distinct issues. On one reading, to speak of a theory-practice gap is to make a claim about the sufficiency of provision, to suggest that what is taught falls short of what is needed in order to perform effectively in the workplace. There has been official concern that “newly-qualified nurses... do not possess the practice skills expected of them by employers” (UKCC 1999, p. 4). Yet note how an ambiguity in the use of the word ‘practice’ conveys an extra, rather different meaning: that what newly qualified nurses lack are specifically *practical* as opposed to theoretical capabilities, a point more evident still in the words of a theatre sister:

More clinical experience is required pre-registration than is currently being provided – there appears to be an over-emphasis on the academic area at the expense of clinical experience. A good nurse should be able to use her hands as well as her brain. (UKCC 1999, p. 39)

Again, a concern about the sufficiency and suitability of provision is intertwined with deep-seated assumptions about the kind of knowledge substantively at issue, couched variously in terms of academic-clinical, theory-practice, mind-body, thinking-doing, education-training and so on – precisely the kind of dualisms that were recognised by John Dewey a century ago as being so “deeply entangled ... with the whole subject of vocational education” (1966, p. 307). This epistemological bifurcation of things, the assumption that knowledge is of essentially two different kinds, can be traced back to ancient Greece and the Aristotelian notions of theoretical and practical reason; it has parallels in Descartes’ stark separation of mind and body in the seventeenth century, and comes to the fore again in the mid-twentieth century with the Rylean distinction of knowing how and knowing that.

## **Beyond Theory and Practice?**

If there is a case for rejecting this dichotomous view of knowledge, then at least some explanation is needed as to why this dual conception of knowledge persists in thinking about the vocational. I have suggested that one reason for this is that the distinctions of theory/practice and knowing how/knowing that can be seen to have a useful role in describing the “inputs” and “outputs” of learning, what I have called the antecedent and consequential conditions of knowledge (Lum 2007). It often suits our purposes to characterise modes of provision as either theoretical or practical – there is clearly a difference between learning from a textbook and learning by

means of a practical exercise. Similarly, the knowing how/knowing that distinction is useful when we want to convey the consequences of a person's learning and in so doing convey more clearly what it is they know. It allows us to distinguish someone who knows lots of facts about cycling from someone who knows how to ride a bicycle in a way that would not be clear if we said simply that they 'know about' or 'have knowledge of' cycling. Similarly, we sometimes talk about knowing 'the theory' or knowing 'the practice' of things. Our making this kind of distinction helps us to distinguish between knowing one thing and knowing another. Yet none of this, I want to suggest, entitles us to assume a corresponding *epistemological* distinction, to assume that we carry around in our heads two fundamentally different *kinds* of knowledge.

It is not without significance that many instances of knowing evade being categorised in this way. Opinion will be divided as to which category of knowledge would be implicated in, say, writing an essay, planning a project or solving a problem. And the same goes as regards categorising provision as either 'theoretical' or 'practical'. Often the most imaginative and effective teaching can be seen to employ strategies which straddle the theory-practice divide: 'theoretical' provision conceived so as to engage the learner actively in their own learning, and 'practical' provision designed to promote knowledge and understanding rather than perfunctory performance. But the more crucial thing here is the way in which our attachment to dichotomies of this kind leaves us utterly incapable of accounting for the very essence of occupational expertise. By way of example, consider the following far from uncommon scenario:

A factory production line is in full swing when suddenly the machines grind to a halt. Alarm bells ring and warning lights flash; a maintenance technician arrives and makes his way to one of a hundred electrical control panels each interconnected perhaps with several miles of cabling. He opens the control panel, takes a screwdriver from his pocket and makes a small adjustment to just one of several hundred components. Closing the control panel he presses some buttons and the production line bursts into life. The question is, how is it possible to account for what the technician knows? His performance did not require the conscious manipulation of propositions or facts – and neither did it require any particular physical dexterity. (Lum 2009, p. 56)

Here is a kind of expertise which would require a considerable educational investment, and yet it is simply not amenable to being couched in terms of theory and practice or knowing that and knowing how. Importantly, to persist in specifying knowledge in these terms is invariably to run the risk of those twin hazards of vocational curriculum design: theory that lacks relevance and practice devoid of understanding. Talk of closing 'the gap' between theory and practice is of no help here. And the difficulty is not remedied by seeking some mythical "golden mean" of theory and practice, some supposedly perfect proportion of theoretical and practical provision, still less by abandoning one form of provision in favour of the other (see Lum 2007, 2013b).

By way of an alternative to this dichotomous scheme of things we might conceive of the technician's expertise as being first and foremost about being able to make sense of a particular 'world' of meanings and involvements – meanings and involvements that are inextricably related to the priorities and purposes of a particu-

lar occupation. The technician's expertise consists in his being able to see and interpret things in appropriate ways such that he is able to make sense of and find his way around the world of machines and equipment in which he is required to operate. On this view, both the facility to act skilfully *and* the facility to manipulate facts, theories or explanations should properly be regarded as secondary to and derivative of this more fundamental understanding.

This way of thinking about occupational expertise is clearly at some remove from the kind of analyses which have preoccupied analytic philosophers for the last 50 years, yet it is very much in accord with the phenomenological and hermeneutic traditions of continental philosophy. Of particular significance on this score is the work of Martin Heidegger, in particular his 'analytic of everydayness' with its focus on *Dasein*, the 'there-being' of human existence, essentially constituted by the phenomenon of 'Being-in-the-world'. With Heidegger the focus shifts from epistemology to ontology, from what the expert knows, to what the expert *is*, or more properly, what a person becomes in the process of having a world of meanings revealed. There are today a small but growing number of philosophers of education concerned to explore the relevance of Heidegger's work in relation to occupational expertise and vocational education.<sup>13</sup> And these same philosophical traditions have also taken a hold in the context of, for example, nurse education where it has become almost *de rigueur* for qualitative researchers to reference such philosophical underpinnings by way of providing an 'interpretative' theoretical 'lens' through which to view qualitative data relating to the lived experiences of practitioners.<sup>14</sup>

## Conclusion

None of this is to say that future philosophical work on vocational education must confine itself to these particular philosophical traditions for it is possible to locate complementary strands of thought in a variety of theoretical perspectives. As I have demonstrated elsewhere (Lum 2009), there are substantial and significant parallels to be found in such diverse areas as social constructivism, philosophy of language and empirical research in psychology of perception – ways of thinking which similarly point towards a richer theoretical understanding of vocational knowledge and capability. Some philosophers have begun to open up fruitful lines of enquiry in relation to pragmatist thinking: variously drawing on Dewey's notion of the embodied knower to propose "an epistemology of the hand" (Brinkmann and Tanggaard 2013), or exploring how Rorty's neo-pragmatism with its notions of solidarity and edifying conversation "engages with workplace knowledge and learning" (Gibbs 2013a, b, p. 165).

---

<sup>13</sup> See, for example, Standish (1997), Neilsen (2007) and Gibbs (2010, 2011).

<sup>14</sup> Particularly influential here is the work of Patricia Benner (1982, 1984, 1994). Although research in this area is certainly to be welcomed, there may be cause to question the integrity of the philosophical underpinnings of some nurse research (see Koch 1995).

Such work not only has the potential to provide a more coherent account of what it is to be skilled, competent or capable and thus point ultimately towards more viable modes of vocational provision and assessment, but at a time when the wider educational enterprise is under increasing political pressure to incorporate supposed 'employability skills' a clearer articulation of what it is that properly constitutes a *vocational* education could help to indicate more precisely what might be at stake in venturing to displace forms of education intended to serve other ends.

# Knowledge (as a Contested Terrain)

Emma Williams

## Ways of Knowing

“It is uncontroversial, pre-philosophically, that education aims at the imparting of knowledge; students are educated in part so that they may come to *know* things” (Siegel 2010, p. 284). One does not have to be reading an international handbook on the philosophy of education to come by the claim that knowledge is an integral concept within education. What a philosophical discussion of this connection might distinctively call to attention, however, is the *contested* status of knowledge – the idea that there are many different ways in which we might be said to know, and many different things which we might be said to know about.<sup>1</sup>

Philosophers traditionally see knowledge as dividing into three main types: ‘knowing how’, ‘knowing that’ and ‘knowing by acquaintance’. The first two types have been the focus of a number of debates within the history of (the philosophy of) education. This chapter will begin with an outline of knowing how and knowing that, and follow this with an overview of some central debates pertaining to these conceptions. It will then critically reflect on the views about the nature of knowledge that such debates often implicitly – and sometimes explicitly – presuppose. Doing so will work to call into question too-stringent (and too-easy) conceptions of the distinction between the different ways of knowing. At the end of the chapter, a conception of the lesser-attended-to notion of knowing by acquaintance will be sketched.

---

<sup>1</sup> That there are different forms and ways of knowing is somewhat masked by the English language, which only has a signal term for ‘knowledge’. In other languages, however, discernment between the different types of knowing can be more readily recognized. In German, for example, a different term is used to describe knowledge of a person (*Können*) to that which describes knowledge of facts (*Wissen*).

E. Williams (✉)  
Centre for Education Studies, University of Warwick, Coventry, UK  
e-mail: [E.Williams.1@warwick.ac.uk](mailto:E.Williams.1@warwick.ac.uk)

In ways that build on existing work elsewhere in the philosophy of education, the purpose of this section will be to bring into view a richer account of knowing than often predominates in education today.

## Knowing That and Knowing How

Knowing that is usually defined as *propositional* knowledge: knowledge that such-and-such is the case. Propositional knowledge is typically consciously representable: it is explicit and articulated. It is articulated in declarative or assertive sentences ('propositions'), simple examples of which could include: 'Cows are herbivores'; 'The battle of Waterloo was fought on the 18th June 1815'; and 'The social structures of marriage is a theme of Austen's *Pride and Prejudice*'. It is worth registering the present-tense structure of propositions, as well as their (apparent) abstract and objective nature. What this means is that, as Charles Taylor has suggested, statements of propositional knowledge do not usually make reference to the speaker: when stating that something is thus and so, *my* situation is left "indeterminate" (Taylor 2013, p. 76). It is not surprising that this kind of knowledge is therefore sometimes equated with factual knowledge and knowledge of information. In philosophy, propositional knowledge is the main focus of the tradition of epistemology. We return to epistemology below.

In contrast with knowing that, knowing how is usually construed as *practical* knowledge. It is knowledge in the form of skill or ability. Knowledge of this kind might not be made explicit in assertive or declarative propositions – it is instead sometimes spoken of as being *tacit*. Procedural knowledge is said to be manifest in the use of a skill or the doing of an action. Thus, for example, riding a bike would be classed as a mode of knowing how, since to do this I do not need facility with certain propositions or concepts but rather need to possess the relevant skills or technical abilities. Other candidate examples of knowing how include playing musical instruments and speaking foreign languages. The concept of knowing how is sometimes related to the Ancient Greek conception of *techne*, which was considered to be the kind of knowledge demonstrated by craftsmanship or art. It is also related to the Aristotelian conception of *phronesis* (practical judgement). We return to the Aristotelian tradition below.

## Knowledge and Education

Questions pertaining to knowledge that and knowledge how have historically come about in education in connection with debates about the content and structure of the school curriculum. When examining what *kinds* of knowledge schools should be seeking to impart, a decisive matter has often been the *value* candidate forms of knowledge are seen to have. As David Carr has put it, "some philosophers have

thought that the obvious starting point for curriculum reflection is with questions about the epistemic status of this or that form of knowledge or skill” (2009, p. 281). The overview of knowledge and curriculum theory that Carr himself goes on to provide explores the position of “traditionalism” (p. 284). Generally speaking, this is the view that “knowledge affords insight into an order of reality that is not of our own making and that is therefore apt for discovery and appreciation ... via the grasp of objective (mind-independent) criteria of rational coherence and truth” (p. 284). For Carr, traditionalist conceptions have their philosophical heritage in Plato, and particularly in the Platonist idea(l) that the kind of knowledge it is educationally valuable to learn is that which promotes wisdom and does not have (mere) practical utility. For Plato, valuable knowledge makes us better: morally, socially and politically.

Carr suggests that such a view was refined and developed by the early proponents of a liberal education in the nineteenth and twentieth centuries. An exemplar case in England was Matthew Arnold, who defined education as the “transmission of culture” – “culture being a pursuit of our total perfection by means of getting to know on all the matters which most concern us, the best which has been thought and said” (1963 [1869], p. 6). Arnold’s ideas at that time were influenced by the changes to society that had been brought about by the Industrial Revolution. Particularly, Arnold viewed England to be in a state of general moral decline on account of increasing fixations on wealth. His theories about education and culture were thus an attempt to bring values back into society; Arnold wanted to extend the cultural opportunities for the so-called working classes in order to make their lives more enriched. For better or worse, Arnold’s views have come to be associated with exalted notions of the ‘life of the mind’. Such views tend to posit knowledge as the intellectual pursuit of objective truths. Versions of this have been espoused in various ways throughout history, but they are perhaps most often associated with the Enlightenment, when a newfound faith came to be placed in the powers of human reason to uncover truths about the world – be they scientific, ethical or aesthetic.

Carr suggests that ‘epistemological traditionalism’ continued in education, albeit in new ways, during the curriculum debates of the 1960s and 1970s. In the Anglo-American world, this was a time in which philosophy of education was in its heyday. In the work of thinkers like Richard Peters, Paul Hirst and Robert Dearden, “epistemological concerns were seen to be of the first importance for curricular decision making” and “the pursuit of knowledge was [seen to be] for the good of the mind” (Davis and Williams 2003, p. 253). There is clearly some connection to the traditionalism exemplified by Arnold in such views, yet Peters, Hirst and Dearden also sought to restate the idea of a liberal education in a way that significantly *broadened* understandings of the kinds of knowledge that could contribute to the “determination of the good life” (p. 253). At this time, it became fashionable for theorists to propose accounts of different “realms of meaning” (Philip Phenix) or “forms of knowledge” (Paul Hirst). In this way, curriculum theories sought to do justice to the “diversity of the forms that human knowledge and understanding can take” (Hirst 1973, p. 260). Nevertheless, there was a question of whether such theses retained something of an *academic* slant: the different forms of knowledge were sometimes

portrayed in terms characteristic of the *propositional*. Indeed (although he later came to develop a broader conception of knowledge) Hirst himself suggested that all the logically unique forms of knowledge shared the “general character” of “being expressible in public symbolic forms with which are associated objective tests of some sort” (1971, p. 11). Underpinning the restated liberal conception of education, then, there seems to remain the idea that knowledge was the “rational grasp of an essentially objective order of truth or reality” (Carr 2009, p. 286). The problem with this, as Carr suggests, is that it appears to correspondingly *devalue* “more utilitarian practical or vocational forms of school learning that most pupils are likely to require for useful and responsible lives” (Carr 2009, p. 286). In other words, there is the worry that overly academic conceptions of knowledge retain a certain privilege for *theoretical* and *intellectual* pursuits – thus positioning the acquisition of certain content and information (such as a particular canon of texts and ideas) as the highest goal for education.

Despite such concerns attempts to revive more ‘traditionalist’ conceptions of the school curriculum have gained some credence in recent years. An exemplar case in America is the work of conservative educational theorist E.D. Hirsch. Hirsch argues that there is a core body of knowledge – which includes knowledge about particular concepts, sayings and literary works – about which ‘every American needs to know’.<sup>2</sup> For Hirsch, it is the duty of education to impart such knowledge in a highly organized, structured way, for without this we do a disservice to those who would otherwise not get access to the forms of cultural enrichment such knowledge can bring. Hirsch’s ideas were utilized by the educational policy of the 2008 Coalition government in England, and particularly by the (then) education minister Michael Gove. Gove proposed a “back to basics” approach to curriculum content, which would prioritize “hard facts” over “soft skills” (Abrams 2012) – thereby seemingly to hark back to a more traditionalist and authoritarian understanding of knowledge, in contrast with (what is suggested to be) the ‘dumbing down’ of educational content that had come as result of the ‘practical turn’.

## The Practical Turn

It is often claimed that, as well as aiming at the imparting of (propositional) knowledge, education should develop the skills and capabilities young people need to flourish as autonomous individuals in society. At least since the 1980s, this view has gained currency in the Western world, bringing with it a renewed interest in alternative forms of knowledge within education. Yet interest in ways of knowing which go beyond a traditionalist focus on knowing that itself has a long pedigree. In Europe, it can be traced back at least as far as the ‘negative schooling’ presented in Rousseau’s *Emile* and, in America, to the pragmatism of John Dewey. Dewey’s philosophy of

---

<sup>2</sup> ‘Cultural Literacy: What Every American Needs to Know’ is the title of Hirsch’s well-known book, first published in 1988.

education has been variously drawn upon and interpreted, but perhaps one of his central aims was to elaborate a conception of education that would make a difference to our ordinary living and re-orientate us towards the *practical* – a term which in Dewey means something quite distinct from the notion of ‘practice’ often invoked in educational thinking today.<sup>3</sup> More generally, for Dewey, education should be thought about in terms of “growth” and the cultivation of “functional autonomous persons” who will “do by choice what in infancy they do by nature, which is to grow and adapt” (Riley and Welchman 2003, p. 106). Dewey’s thinking came to be associated with progressivist theories of education, which were at that time arguing for child-centred approaches to learning in America. In England, progressivist conceptions of education assumed particular significance in the 1960s with the publication of the Plowden Report. By the 1980s, conceptions of civic and vocational education were also gaining currency and, in connection with these, special interest in the notions of knowing how and practical knowledge has developed in educational theory, policy and practice.

One area in which the notion of knowing how has assumed a particular significance in educational practice is the sphere of Vocational Education and Training (VET). This is an especially interesting sector to consider given the cultural differences that appear to exist between the ways such educational provision is conceived. For example, Brockmann et al. (2000) have pointed out that Anglo-Saxon conceptions of VET are often centred on notions of skills and competencies, which are themselves rooted in craft-based understandings of apprenticeship. In other words, VET in England is modelled on a conception whereby an apprentice is expected to learn “certain task specific-skills on the job, with little theoretical underpinning” (Brockmann et al. 2000, p. 551). The National Vocational Qualification (NVQ) system – developed in England during the 1980s as an alternative pathway to the traditional academic curriculum – is a representative example of such an approach. NVQ courses typically focus on training individuals to acquire a set range of narrowly defined skills and competencies in practical activities that are directly required to carry out a task to a certain standard. Assessment is often observational: the assessor checks whether an individual can perform the set range of tasks against specified standards and criteria. There is little attention in the training period given to theoretical knowledge, or to civic or general education. As a result of this, something of a limited picture of VET is operative in Anglo-Saxon countries.

Yet as Brockmann et al. point out, in other European countries (such as the Netherlands and Germany), there is quite a different picture. Here, a much more holistic conception of VET is at work. In Germany, for example, VET programmes aim to prepare young people for *Beruf*: a dual system “combining work-based training underpinned by theoretical knowledge and general education” (Brockmann et al. 2008, p. 557). VET programmes are accordingly conceptualized as “an overall occupational capacity, as opposed to a bundle of knacks or skills specific to particular tasks” (Winch 2009, p. 99). Part of what is at stake in such programmes is a rich

---

<sup>3</sup>I return to discuss differing conceptions of practice and practical knowledge later in this section, but in relation to Dewey on this topic see in particular Nako Saito (2006).

conception of the notions of skills and competence, which is itself underpinned by the cultural inheritance of these countries. For example, unlike the Anglo-Saxon term “skills” that connotes “mastery of a narrow range of tasks”, *Fertigkeiten* in German are “an integral part of a broad occupational field, importantly underpinned by theoretical knowledge” (Brockmann et al. 2008, p. 551).

Before reflecting on the significance of this further, it is worth considering two other areas in which conceptions of knowing how have come to gain currency in contemporary education. The first is in relation to the discourse of ‘transferrable skills’, which now seems to be a permanent fixture within descriptors of aims and learning outcomes for a wide range of educational courses at all levels. In England, this kind of ‘skills-talk’ proliferated in the schools context with the appearance of both the 2004 National Curriculum and the 2005 White Paper on ‘14–19 Education and Skills’. A particularly interesting aspect of this literature is its usage of the notion of “thinking skills” – a loosely defined concept, which was seen to encompass abilities that ranged from information-processing skills; reasoning skills; enquiry skills; creative thinking skills to evaluation skills (QCA 2004, p. 22–23). These forms of “active cognitive processing” were represented as making for “better learning” and thus as holding the key to raising standards of education in the UK (McGuinness 1999, p. 3). Yet concerns have also been raised about the way such discourse turns thinking into a kind of “technology”: “a means-end instrumentality” and a “series of techniques that can move us from one space to another” (Peters 2007, p. 352).

The second area worthy of reflection is what has happened to teacher education in recent years. Indeed, it has widely been recognized that teacher education in a number of countries has shifted towards the notion of ‘evidence-based practice’, which draws upon empirical and scientific evidence to produce a highly technical conception of ‘what-works’. Such a conception tends to go hand in glove with competency-based approaches to teaching and teacher training, understandings of which are not unlike those at play within the Anglo-Saxon VET sector. As Gert Biesta puts it, the way ideas of ‘competence’ tend to be implemented in teaching often lead to ‘an emphasis on performance, standards, measurement and control’, one example of which is the current vogue for constructing long, detailed lists of teacher ‘proficiencies’ and ‘competencies’. Yet this turns teacher education into an instrumental, “a tick box exercise” that is purely focused on establishing whether trainee teachers have managed to “achieve everything on the list” (2015, pp. 29–30).

What these discussions work to highlight is the way conceptions of practical knowledge and knowing how can easily become reductive if they are not handled with adequate care. In recent years, a range of work in the philosophy of education has served to highlight this problem and propose better alternatives. Literature in this field has drawn upon various philosophical sources and traditions. One notable approach has been to invoke Gilbert Ryle’s well-known treatment of the distinction between knowing how and knowing that in *Concept of Mind*. On a superficial reading, it might seem as though Ryle’s claim that knowing how is a logically distinct category from knowing that is in danger of leading us into a reductive (and behaviouristic) conception of knowing how – like the ones we have seen at work in certain

areas of educational practice. This perhaps explains why Ryle has been challenged from ‘intellectualists’ such as Stanley and Williamson (2001), who seek to claim, *pace* Ryle, that knowledge how is in fact only a sub-species of knowledge that. Yet there have been alternative readings of Ryle in the philosophy of education that suggest a more nuanced understanding of knowing how, which also avoid falling back into the “intellectualist legend” (see for example Winch 2010; Standish 1992; Williams 2016). What is particularly significant about these ‘anti-intellectualist’ arguments are that they work to put into question any easy distinction between what we call, on the one hand, ‘theoretical’ and what we call, on the other, ‘practical’ knowledge. Thus Christopher Winch, for example, seeks to argue for a conception of knowing how that recognizes the role of intelligence (broadly defined) within practical activity itself. This is an account that is attentive to the way that, as Winch puts it, “[t]hose who know how to do something do not ... just know how to practice a technique, they also know how to carry out the act that they wish to perform in the circumstances in which they have to perform it” (Winch 2010, p. 559).

The interesting question now becomes how precisely should we understand the kind of intelligence being invoked here: “the intelligence ... with which that technique is practiced” (Winch 2010, pp. 559–560). Winch follows a number of philosophers of education in turning to the notion of *judgement* within his discussion. As stated above, accounts in this direction have been developed through a number of different trajectories, but a prominent approach has been to draw upon the Aristotelian tradition. Gert Biesta, for example, has suggested that Aristotle’s conception of judgement can be utilized for providing a richer conception of a ‘good’ teacher (as opposed to a merely ‘competent’ teacher). In particular, Biesta suggests that teachers need two kinds of Aristotelean judgement: *poiesis* and *praxis*. *Poiesis*, Biesta claims, relates to the production or fabrication of things: for this we need “*techne*” or “knowledge of how to make things” (Biesta 2015, p. 39). *Praxis*, on the other hand, is the kind of judgement that pertains to human action and interaction. For this, we need *phronesis* (practical wisdom): judgement not (just) about *how* something is to be done but about “*what* is to be done” (p. 39). While Biesta claims good teachers require both kinds of judgement, he also suggests that *phronesis* has priority.<sup>4</sup>

Biesta is not alone in attributing a special significance to *phronesis*. Indeed, philosophers of education have explored the import of this notion in a number of illuminating ways (see for example Dunne 1993; Smith 1999). Rather than rehearse accounts that have more than adequately been made elsewhere, in the remainder of this chapter I should like to take an alternative route. This is one that builds on the tradition we have just been outlining – but rather than focusing on *phronesis* it invokes the notion of *knowing by acquaintance*. Sketching this will serve to offer a line of extension to existing debates in the field, and continue to put into question too-stringent (and too-easy) divisions between different kinds of knowledge.

---

<sup>4</sup>Notably, however, Richard Smith has argued that the Aristotelian concepts of *techne* and *praxis* “do not translate into our language and world without bringing certain distortions with them” (1999, p. 327).

## Mediationism and Technicism

There is a big mistake operating in our culture, a kind of operative (mis)understanding of what it is to know, which has had dire effects on both theory and practice in a host of domains (Taylor 2013, p. 61)

To begin developing our account, it will be helpful to first say something more about the conception of knowledge it seeks to work *against*. This is the “operative (mis)understanding of what it is to know”, which Charles Taylor suggests in the above quotation has dire effects on our thinking. We should recognize at this point, then, that while attempts *have* been made to offer richer conceptions of knowledge, such attempts largely remain in the *margins* of educational thinking today. More reductive conceptions, such as those we have eluded to via our discussions of educational practice and policy in this chapter, still very much hold sway. This section seeks to bring out the implicit – and sometimes explicit – (mis)understandings of knowledge at work in such accounts, so as to open a way forward.

Following Taylor (2013), we might say that the misunderstanding can be traced back to two problematic topologies: ‘mediationalism’ and ‘technicism’.<sup>5</sup> Although these can be posited as *two* topologies, it is perhaps more accurate to say that the latter emerges out of the former. These started to take hold during the Early Modern period and via Descartes’ philosophy in particular. What we are talking about here pertains more specifically to Descartes’ *correspondence* theory of knowledge: the claim that I am said to know when the idea I have in my mind accurately reflects the reality that is independently out there. Taylor terms this a ‘mediational’ picture of knowledge: the view that human contact with the (*outer*) world is always and only *mediated* by something (that is *inner*). Now, for Descartes, the mediating element was *ideas* – mental representations. Of course, Descartes’ theories were widely refuted in the epistemological traditions that came after him, and it is rare today to find epistemologists speaking in terms of ‘mental representations’ or the specialized Cartesian notion of ‘ideas’. Instead, they often speak in terms of ‘beliefs’ that are expressible in ‘propositions’ (indeed, we characterized conceptions of knowing that in precisely such terms above). Crucially, however, Taylor suggests that the general topology of representationalism remains *intact*, despite these changes. This is because, for Taylor, the contemporary epistemologist’s notion of ideas or beliefs or sentences held true operate just like representations or depictions did in the Early Modern theories – *as the means through which we have knowledge of an outer, external world*.

A certain picture of the world, the human mind and the relation of mind to world is hereby allowed to continue, unchallenged. The world comes to be divested of meaning; there is an “objectification of the material” (Taylor 2013, p. 70). The mind, by contrast, is seen as something that is *disengaged* from the world (in Descartes of

---

<sup>5</sup> It is not possible to give an exhaustive analysis of these typologies in the present chapter, for the background story here may be cast in many ways. In what follows, I will utilize Taylor’s discussion in his recent chapter on *Retrieving Realism* as a representative example of the way the development of these notions could be charted.

course the mind could be ontologically separated from the body). The relation between mind and world, meanwhile, comes to be construed as the detached, neutral grasp. To know the world, in other words, we need to adopt a ‘third person’ perspective, that is, to think like an outside observer. This enables us to see certain conditions in the world as giving rise to certain experiences in the mind. The flipside of this is the ‘first person’ perspective: one that focuses on the way things are subjectively *felt*. While these perspectives might have a role to play in other areas of human life (the creation of art perhaps), they should not have a place in the pursuit of knowledge. Hence a divide between the ‘emotional’ and the ‘rational’ aspects of the human being starts to take hold or, perhaps more accurately, a new construal of what is at stake in both reason and emotion begins to emerge (where reason is associated with clear, transparent thinking, while the emotional and affective states are vague and obscure).

Out of this mediational picture of mind and knowledge comes a further effect: ‘technicism’ as the newfound faith in methods and methodology as a means to knowledge. From the perspective of the external observer we can no longer rely on our vague or intuitive sense of something. Hence we need to locate formal and clearly formulated rules or procedures by which we can reach knowledge. For Descartes of course, this meant checking our inferences at each stage in the thought process to ensure that our beliefs are held together by an indubitable series of deductive links. This, the task of “geometrizing” thinking, works to construe rational thought as “the progress of the mind through a series of successive, self-evident steps” (Warner 1989, p. 11). It is a kind of thinking that acts in accordance with explicit and formal rules that can be publically observed and ratified. Such an approach proves unprecedentedly successful in its application within science, where such methods enable us to produce “law like explanations” with “predictive value” that allow us to know and control the world around us through the production and implementation of new technologies (Dunne and Pendlebury 2003, p. 196). And why not apply such methods outside the realm of science, too? That is, why not set about “searching for the same kind of regularities in human functioning – and hence the same basis for prediction and control – that had been found in the material universe” (p. 196)? Here emerges what Dunne and Pendlebury term the “triumph of technical reason”: the lure of “clearly formulated, publically agreed procedures” that confer objectivity, generalizability, replicability and accountability (pp. 195–196). If such terms are reminiscent of ideas we previously saw at work in the realms of VET, teacher education and discourses of ‘transferable skills’, this is not incidental. Indeed, the point being made here is that the pictures from educational practice are themselves a symptom of a more widespread topology, which begins in the mediational picture of knowledge, and extends into a technicism about human thinking, knowing and acting.

There is certainly more that could be said about all this. In particular, we might want to explore the ways that a number of philosophers of education have come to see notions of representationalism and technicism at work in contemporary educational policy and practice, and the instrumentalist conception of rationality that seems to predominate there (see, for example Blake et al. 2000, 2007). Such discussions are profound and complex. Yet instead of taking this route what I should

like explore in the remaining part of this chapter is the beginnings of a way *beyond* this picture. To do so, I want to return us to the notion of knowing by acquaintance.

## Knowing by Acquaintance

The conception of knowing by acquaintance offered here will be developed in relation to key tropes presented by the phenomenological philosopher Martin Heidegger. Heidegger's thinking is certainly not the only resource for such an account, but it does provide a helpful entry point for this chapter.<sup>6</sup> Indeed, the 'phenomenological turn' instigated by Edmund Husserl and developed in a particular direction by Heidegger was itself an attempt to move beyond the distortive assumptions about human beings' relation to the world that had been created by epistemologically driven philosophizing and the mediational picture of knowledge, as outlined above. Notably, to enact such a move, phenomenological philosophers seek to return philosophical attention to what is given in an experience *as it is given* – as Maurice Merleau-Ponty puts it, in phenomenology "all ... efforts are concentrated upon re-achieving a direct and primitive contact with the world, and endowing that contact with philosophical status" (Merleau-Ponty 1962, p. vii). But let us explore further.

Heidegger's phenomenological analyses lead him in *Being and Time* to draw a contrast between two ways in which human beings encounter things in the world: as *present-to-hand* (*Vorhandenheit*) and as *ready-to-hand* (*Zuhandenheit*) (Heidegger 2005 [1927] p. 97). While the former represents a contemplative, theoretical mode of understanding (like the detached observation of a thing as an object), the latter refers us to the ways we encounter things in our everyday dealings with the world. To give a straightforward illustration, when I am engaged in the task of hanging a picture-frame above my fireplace, the hammer I am using to drive the nail into the wall is encountered as *ready-to-hand*. When I pick up the hammer and use it, I do not for the most part think about the hammer, unless the head comes off or is loose or something goes wrong. To give another example, when I switch on the light in my living room, I don't think about where the switch is or how to do it. I just do it. Yet the same hammer and switch could also be viewed in abstraction from this activity – I could attend to its attributes or essence as an object, for example – and in doing so I would encounter the hammer as something *present-at-hand*. Usually, as I have suggested, this happens when something interrupts the everyday working of my relation with the hammer or a light switch. It might be tempting to read Heidegger's contrast here as simply a re-statement of the classical philosophical

---

<sup>6</sup>The arguments I draw upon here presents one example of a tradition that works to move beyond classical conceptions of knowledge. There are other traditions that might be drawn into this discussion, such as feminist, post-structuralist, Indigenous, African critiques of dominant conceptions of the nature of knowledge. For discussion of these issues see for example Ruitenberg and Phillips (2012) *Education, Culture and Epistemological Diversity: Mapping a Disputed Terrain*. I explore the relation between phenomenology and post-structuralist thought in *The Ways we Think* (2016).

division between propositional and the practical types of knowledge. Yet to do so would be a mistake – for through this distinction Heidegger in fact works to challenge the very basis these conceptions of knowledge are built upon.

To explain this more fully, let us first reflect more on what is at stake in encountering something as *Zuhandenheit*. Heidegger suggests that, in this mode, things in the world show up for us as ‘equipment’ – as things that might be used ‘in order to ...’. Thus the hammer reveals itself to me as a tool that I might use to hammer this nail into the wall in order to hang up my picture. Yet we might want to ask: what makes it possible for things to show up for us like this in the first place? More particularly, how do I come to relate to a hammer as something that I can use ‘in-order-to’ drive a nail into a wall? Heidegger’s answer is that such an encounter presupposes a certain *familiarity* with the hammer. Put more fully, it presupposes familiarity with a matrix of involvements, cultural meanings and significances, which constitute the hammer’s being what it is. Moreover, I could not come to apprehend the hammer as a tool for driving a nail into a wall *without* these structures: they are a *precondition* for my being able to encounter the hammer as I do *in the first place*.

Crucially, what Heidegger is suggesting here is not supposed to be confined only to things like hammers. It is at this point that we start to see why Heidegger’s distinction takes us beyond the classical understandings of knowledge outlined above. For, by paying careful attention to the nature of *Zuhandenheit*, Heidegger works to reveal something about the conditions of possibility of human beings’ knowing and relating to the world *more generally*. Rather than seeing knowledge as what mediates a relation between what stands on the one hand as an (inner) subject and on the other as an (outer) world, then, Heidegger instead suggests that human knowing always already takes place from a position that is *engaged* and *involved* with the world. “We are” as Charles Taylor puts it “always and inevitably thinking within such taken-as-there frameworks” (Taylor 2013, p. 75); our thinking, as Heidegger himself puts it, takes place within a “background”.

Through his exploration of *Zuhandenheit* then, Heidegger not only works to reveal a way of relating to the world (an engaged state) that can be differentiated from *Vorhandenheit* (an abstract disengaged state). His discussion in fact *cuts deeper* – for it attempts to *reposition* human knowing in a way that serves to problematize too-stringent (and too-easy) divisions between practical and propositional types of knowledge. Indeed, Heidegger’s account of background is supposed to hold as much for our practical engagements with the world as for our *theoretical* modes of comportment. This is something that is easily overlooked by readings of Heidegger that tend to focus on *Zuhandenheit*, but miss the wider significance of this discussion for the very nature of our thinking and knowing the world in general. For following Heidegger’s discussion contemplative detachment itself comes to be understood as a certain kind of *praxis* – one that is determined by its own mood and circumspection. We can no longer maintain a strict separation between the theoretical and the practical then, for as Heidegger himself puts it, knowing as the contemplative grasp of the thing “has sense only on the basis of an *already-being-involved-with*”, and is thus itself “a *founded way of being-in-the-world*, a way which is always

possible only on the basis of a non-cognitive comportment” (Heidegger 1992 [1925], p. 162–164, emphasis in the original).

Of course, much more needs to be said about the nature of the non-cognitive comportment invoked by Heidegger here. Charles Taylor denotes it in terms of a “larger context of presumed contact with reality” (p. 76). Yet I wonder whether the notion of *knowing by acquaintance* might be instructive at precisely this point. This is not, notably, to hark back to the classical conception of knowledge by acquaintance proposed by Bertrand Russell – viz. “a direct cognitive relation to the object, *i.e.* when [the subject is] directly aware of the object itself” (Russell 1910, p. 108 as quoted in IEP 2016). Such a conception is still too focused on knowledge in its traditional *cognitive* and *propositional* form. What I am looking to invoke, more particularly, is a more general way of knowing the world that is itself a *precondition* for such propositional – and practical – modes of knowing.

How might such a conception of knowing by acquaintance be sketched? One illustration is to be found in Heidegger’s own later writings. In *What Is Called Thinking?* Heidegger explores the kind of knowledge modelled by a cabinetmaker’s apprentice.<sup>6</sup> Significantly, Heidegger suggests that such knowledge does not come from “facility in the use of tools”, or from theoretical knowledge about the forms of cabinets and their structure (Heidegger 2004 [1954], p. 14). While propositional knowledge and skills might well be necessary to becoming a cabinetmaker’s apprentice, they are certainly not *sufficient*. What they leave out, Heidegger claims, is a mode of “relatedness” to wood itself (p. 14). Now, such a notion need not be understood in any romanticized kind of way. Rather, it appeals to the way that structures of receptiveness and responsiveness to different kinds of woods, to its material and its shapes, are involved in the work of the craftsman. For the apprentice to learn such relatedness, it is a matter of learning, for example, what kinds of wood will work well for a TV cabinet, or what kinds of wood will work well for a kitchen cabinet, and so on. Yet all of this, crucially, is something that is learned *by way of the wood itself*. Put otherwise, because the wood already *lends itself* to use in particular ways, we learn what works well by being *attentive* to the way the wood shows itself. The knowledge we have here, then, is not in the form of a theoretical and disengaged grasp of some material. Neither is it a matter of implementing some generalized, technical procedure. It is, rather, a way of knowing that emerges through a co-dependent relation between the wood and myself. And such a relation could not take place without an experience – or what might better be called an ‘acquaintance’ – with wood and with the world of craftsmanship in general.

How might we see this account of knowing by acquaintance as working in educational practice? There are multiple ways, and yet there is a problem in that these are easily obscured by the ways in which we have grown accustomed to thinking about teaching and learning. The emphasis on transparency and on learning objectives being made explicit, and the encouragement of a self-conscious awareness of the processes of one’s own learning (with the supposed sophistication of metacognition and identification of learning-styles), all work to hide those more tacit and in

some respects sensuously direct aspects of educational experience; they make it impossible to recognize how fundamental these are. So let me provide three examples in order to illustrate the importance of knowing by acquaintance more convincingly. First, there is the logical point that some aspects of education – specifically, central aspects of aesthetic education – do not make sense without direct acquaintance with works of art. Students may well acquire knowledge of, say, Alice Walker's *The Colour Purple*, including knowledge of its plot and themes as well as of divergent lines of criticism, and also the competence to write about these things, and they may do this in a manner sufficient to enable them to write successful answers in the examination – without their ever having read the book! Yet it is a logical point that aesthetic appreciation requires direct experience of the art-work in question. So, in spite of their apparent success, they have not been aesthetically educated at all: they may in fact have been miseducated about what art and appreciation are. Second, it is strikingly the case that teachers of subjects such as engineering or hairdressing acquire a feel for the context within which they work and for the materials that they work with; one might say the same for the chemistry teacher, for whom familiarity with the laboratory, with its Bunsen burners and sinks, and with the Table of the Elements on the wall, is part of the way they understand themselves and their commitment to what they teach: it is in part this feel for the subject that they seek to inculcate in their students. Third, there is the moving story of a class of 10-year-old children who, on the return from their holiday, were asked to write a short piece about what they had been doing. One boy wrote in faltering bare sentences of the fact that during the holiday his grandmother had died, stating the simple facts of the visits of the doctor and the preparations for the funeral. The teacher's response had been: 'That's very sad. But no describing words'. Apart from the extraordinary insensitivity of this, the poverty of thought is manifested in the teacher's inability to see beyond the grid of expectations of learning outcomes. Good writing at Key Stage 2 must include describing words. Never mind the fact that the child had something to say.

It is not possible to go too much further with our discussion of this here. Yet even from these brief insights we have perhaps been able to glimpse a way that would move us beyond the mediationalist and technicist pictures of knowing examined above. Moreover, and in doing so, we can also come to see how making such a move would enable us to overcome reductive conceptions of knowing that and knowing how, which themselves produce too-stringent (and too-easy) understandings of our ways of knowing. Such conceptions continue at the expense of the possibilities of both our engaged and our cognitive ways of knowing the world. As we have seen in this chapter, certain traditions within contemporary philosophy of education have taken up the challenge of articulating ways of knowing that go beyond this. Such accounts need to resist narrow conceptions of practice as much as they need to combat over-intellectualized pictures of the cognitive. What we have proposed in this chapter is that this kind of richer picture might itself be sketched via the lesser-attended-to mode of knowing by acquaintance.

# What Can We Learn from Learning Technologies? Technology, Digitization, and Education

Anna Kouppanou

## Introduction

The term *learning technology* suggests that there are particular technologies that allow learning, and which are used accordingly, whereas there are also technologies which are of no use to learning, teaching, or thinking for that matter. At first glance, this appears quite logical; tools are after all made for specific purposes and not all tools are designed to assist learning, while others, like the pencil or the book, are destined to do precisely that. However, we are at the same time incapable of denying that we know this much at least – namely, that some of the most foundational learning technologies, like the alphabet or the Internet, have not been developed or even used at their initial stages of development or adoption with any specific educational purpose in mind. In fact, we can infer the reverse – that is to say, that these technologies contributed to the formation of the possibilities for schooling and are at this point in time considered to be not simply indispensable for learning, but also an important formative factor for entire knowledge domains, methods of research, modalities of teaching and learning, whilst being themselves access points for the theoretical investigation of human thinking. Such a realization suggests that learning technologies, and technological artifacts on the whole, constitute something more than mere means, and it also points to the possibility that technologies condition human endeavors in unexpected ways; indeed, ways not intended by their human designers and producers. Such an insight is strangely and distortedly echoed in both technophobic and evangelistic interpretations of technology, but this does not mean that it lacks philosophical import. Indeed, this chapter aims to illuminate by means of a historical and critical discussion the ways that different schools of

thought have tackle the question of technology by seeking to answer either the question ‘What is a technological thing?’ or ‘What does a technological thing do?’.

The aforesaid distinction might appear frivolous, but it does implicate Western philosophy’s own unfolding and, as a matter of fact, its shift from an anthropocentric view, which conceptualizes the human being as the center that controls and uses *everything*, to a more postmodern and anti-subjectivist theorization, which imagines the human being as merely one of the many contributing factors instantiating synergetic relationships with other things and forces and participating to the emergence of beings. This shift is not to be taken as a deterministic linear trajectory, since, as it would soon become clear via a special focus on the thought of German philosopher Martin Heidegger and French philosopher Bernard Stiegler, each theoretical position concerning technology can hardly be considered as a one-dimensional theorization. Similarly, the thought of these philosophers reflects each time these different perspectives of philosophy. On the basis, however, of the aforementioned shift, some very important questions having to do with the nature of the technological being, the human being, and their interaction would come to light. What’s more, the nature of the questions themselves suggests that any answer beyond the mere instrumental –‘technology is a means to an end’ paradigm – is bound to have deep implications for our conceptualizations of all the terms involved in such questioning and their respective relations. Still, we need to answer at least preliminarily one more question: ***Indeed, how are learning and education implicated in this discussion?*** As I will show, any investigation of technology moving beyond the instrumental paradigm reveals something important about the ontologies of technological artifacts, and these ontologies are characterized by their procedural relatedness to the human being. Technological things do something, and they often do it to the human beings that use them. This kind of influence is bound to have an effect on being and thinking, as it is quite evident from the educational literature responding to the various theoretical perspectives presented here. In view of this perspective, this chapter will also attempt to address the question: ‘What is learning and what is learning technology?’, by attending to the different tendencies of technology, and in fact technology’s current dominant trend of digitization, and by relating these characteristics to educational matters.

## Early Questionings of Technology

Platonic philosophy and the respective Aristotelian critical response to it have established a mainly dichotomous metaphysical system that understates the importance of technology in contrast to the natural world but also to the world of thinking. Plato’s belief in the realm of ideas, for example, allowed the prioritization of the ideal, the immaterial, and the universal, much to the demise of the sensuous, the particular, and the actual. Indeed, Plato’s *Allegory of the Cave* (2014) is based on the premise that things around us constitute derivative material copies of their respective original and universal originary *Ideas*. A tree, for example, is a copy of the

original idea of *tree-ness*, while things like statues and paintings are copies of copies, namely, representations and illusions of an originary essence. On the basis of this Platonic analogy, it appears that ancient Greek thought conceived *τέχνη* (*technē* – art, craftsmanship, or technology) in terms of imitating nature and in any case as something derivative.

Aristotle (2004), nonetheless, offers greater detail in his discussion of technology, since in the *Nicomachean Ethics* he discusses various types of knowing like *epistēmē* (contemplation or scientific thinking), *technē* (art or craftsmanship or production or technology), and *phronēsis* (practical wisdom) and makes the following judgment; namely, that

contemplation is both the highest form of activity (since the intellect is the highest thing in us, and the objects that it apprehends are the highest things that can be known), and also it is the most continuous, because we are more capable of continuous contemplation than we are of any practical activity. (X II77 20–25)

Aristotle (2004) then moves on to differentiate between *technē* and *epistēmē*, arguing that the former operates ‘in the sphere of the variable’, that is, ‘[w]hat can be otherwise’, since *technē* does not obey any eternal or essential rule, whereas epistemic knowing looks to uncover the eternal that is driven by ‘necessity’ (II4oa 2 and II4oa 23, footnote, I, p. 149). Aristotle adds that even though “[e]very art is concerned with bringing something into being” that which is brought into being “is capable either of being or of not being, and the cause of which is in the producer and not in the product” (II4 oa 11–14, p. 149).

Such theorization of production has many different implications for the understanding of both the technological thing and the human being, since the former is presented as random, derivative, and inessential, whereas the latter is seen as the source of the artifact. In other words, the producer is responsible for the artifact’s production, which is accordingly thought in terms of the actualization of an idea. This idea has in any case preceded the existence of the artifact, the producer, and the material used for the production. The implications, however, are not exhausted here, since Heidegger (1977) argues that by singling out the human producer as the unique cause for production, Aristotle establishes the anthropocentrism that is characteristic of Western philosophy. In order to understand this reproach, we need to take into consideration that for Aristotle there are four types of causes of change, movement, or *genesis* (emergence, bringing forth). *Causa materialis* refers to the matter that is used in order to create something, *causa formalis* refers to the form that the matter needs to take, *causa finalis* denotes the end or the purpose for which the product was created, and *causa efficiens* points to the producer who receives the idea of the object in their mind and moves on to produce it. Heidegger, however, comments that the producer is neither the single nor the most important cause, since all four causes ‘belong-together’ and are ‘co-responsible’ for bringing something forth (p. 7). Nevertheless, Aristotle’s neglect of the other causes is translated into the metaphysical neglect of materiality, leading to the conceptualization of artifacts as neutral means that can be used at will and regardless of their own constitution. Webster F. Hood (1983) explains this in the following terms:

The goal of *technē*, its work or product –the article of clothing, the house, or whatever– which the activity of making posits as its object, is strictly instrumental to something else from which it receives its complete justification. And this “something” else is the use to which it is put –wearing the article of clothing, living in the house– for the sake of some activity that ultimately is its own end, namely moral or intellectual activity. Accordingly, technology is subordinate to practical wisdom, to moral and intellectual activities which are their own justification. (p. 349)

Like so, ancient Greek philosophy is solidified on a firm distinction between these different modes of knowing and accordingly distinguishes between its own modes of investigation, namely, ontology (what something is), epistemology (how we know), and ethics (what we should do). This kind of compartmentalization formed, in consequence, the type of questions philosophy could ask and the kind of divisions it forged. If, for example, tools are neutral beings, then there is no need to investigate them in connection to processes of knowing, learning, or ethical demeanor. The deeper consequence of this distinction for philosophy is, however, the fact that philosophy is instantiated as a field through its own juxtaposition to technology. Bernard Stiegler (1998) comments:

At the beginning of its history philosophy separates *tekhne* from *episteme*, a distinction that had not yet been made in Homeric times. The separation is determined by a political context, one in which the philosopher accuses the Sophist of instrumentalizing the *logos* as rhetoric and logography, that is, as both an instrument of power and a renunciation of knowledge (Châtelet 1965, p. 60–61). It is in the inheritance of this conflict –in which the philosophical *episteme* is pitched against the sophistic *tekhne*, whereby all technical knowledge is devalued– that the essence of technical entities in general is conceived... (p. 1)

The belief in the supposed neutral or even derivative nature of the technological artifacts, which can be used with no effects on the actions that involve them, is still distortedly reflected in common sense understandings of technology, since according to David Lewin (2013): ‘It would seem bizarre to imagine that devices could have subjectivity, desires, or could determine their own ends’. As a result, different discourses emanating from the field of educational technology present certain tools like the computers as “neutral means of accessing ‘information’ that will somehow automatically bring about learning” (p. 174). Other discourses, according to Neil Selwyn (2011), support that “the *de facto* role of the educational technologist is understood to be one of finding ways to make these technology-based improvements happen and –to coin a phrase often used in the field– to ‘harness the power of technology’” (p. 713). In this respect, the instrumental and neutral understanding of technology is maintained along with a belief in its essentially beneficial effects on learning and with a certain conviction about the technological conditioning of thinking.

Before moving on to the next section of this chapter, I need to add here that it would be misleading to assume that the ancient Greek theorization of technology is one-dimensional, since this first philosophy of technology affirms, on the one hand, that *technē* falls into the realm of imitation, representation, and illusion, but, on the other hand, Aristotle states in *Physics II.8* (Aristotle 1985) that “generally art in some cases completes what nature cannot bring to a finish, and in others imitates

nature” (199a9-199a19 p. 32). This small comment opens up the possibility of rethinking the boundaries of nature and technology while allowing us to think of imitation in distinction to representation. Indeed, in *Poetics*, Aristotle (1922) argues that “imitation [is] one instinct of our nature” that allows us to learn. Through the contemplation of resemblances and images (*εἰκόνας*), we can relate our experience to other things and thus find ourselves “learning or inferring” (III.IV.6). *Technē* is therefore conducive to contemplation and learning in general.

This is surely a step beyond the instrumental understanding of technology, and this differentiation is in a way also found in Plato’s *Phaedrus* (Plato 2014), in which text a contradictory discussion of writing is in place. Indeed, at the beginning of the dialogue, Socrates gives an instrumental account of writing by saying that its value depends on its use, but at some point he recounts the myth of the invention of writing that is quite distinct from this instrumental theorization. According to the myth, the Egyptian God Theuth presents writing to King Thamus arguing that his invention will be the cure for human memory. Thamus, in contrast, responds that writing is the exact opposite, since it will weaken memory by making people depend on it. Jacques Derrida (1981) notes, however, that Thamus remarks that writing is good for “*hypomnēsis* (re-memoration, recollection, consignation) and not for the *mnēmē* (living, knowing memory)” (p. 91). In this way, technology is referred to as representation and illusion, but is also considered as potentially harmful. Derrida, of course, undoes this distinction not only in this essay but throughout his deconstructive work by presenting the supplement (writing) as constitutive of that which is thought to be originary and self-affected – in this case, the human memory. Nonetheless, the distinction alone suggests that technology has an effect on thinking, and in what follows, this will be explicated further.

## Technology’s Reinvention and Philosophy’s Rebirth

Carl Mitcham (1994) notes that: “Technology, or the making and using of artifacts, is a largely unthinking activity. It emerges from unattended ideas and motives, while it produces and engages with unreflected-upon objects” (Mitcham 1994, p. 1). Martin Heidegger (2008), however, diving deep into this unreflective structure, accomplished one of the most reflective accounts of technological artifacts. Indeed, in *Being and Time*, Heidegger studied the way time presents itself to the human being and unveiled a structure of temporal relatedness that he called *care*, when referring to people, and *concern*, when referring to things, adding that: “Circumspective concern decides as to the closeness and farness of what is proximally ready-to-hand environmentally. Whatever this concern dwells alongside beforehand is what is closest...” (Heidegger 2008, pp. 141–142/107).

The ready-to-hand that Heidegger mentions refers to anything to which we relate nontheoretically in-order-to-do something. The doorknob, for example, is something always already in my hand. It is close. I use it in order to open the door, but I do not think how to use it or how to use my hand; the doorknob is always already in my

hand, and, similarly, I am always already out of the door and in my way to my car. The ready-to-hand contributes, in this way, to the constitution of my moving forward, both literally in space and metaphorically in time, while this enacted spatiotemporality is called *nearness*. Because of their ability to refer to something else, tools are constituted through the framework of the networks that they create. Tools are discovered in these networks laden with intentions, references, and significances. Therefore, Theodore Kiesel (1993) explains that: “The field of objects which yields the original sense of being is that of the *produced* object accessible in the course of usage” (p. 264). Tools constitute our *already-there*, namely, a milieu in which we find ourselves thrown. While using the word processor, for example, I am already conditioned to sit in a specific way, on a chair, near a desk, typing at a specific speed, articulating my thoughts with a specific rhythm, and choosing my actions according to the software’s limitations and affordances. These are mostly actions I perform without thinking or, better yet, I am conditioned to think and act in specific ways, which I do not need to choose. For this reason, Hannah Arendt (1998) asserts that: “The human condition comprehends more than the conditions under which life has been given to man. Men are conditioned beings because everything they come in contact with turns immediately into a condition of their existence” (p. 9).

The realization that the human existence is conditioned existence and indeed conditioned by technology led to the undoing of anthropocentrism and the deconstruction of all the derivative dichotomies that made up the Platonic metaphysical universe. A paradigmatic exposition of this discourse comes from Heidegger’s famous essay *The Question Concerning Technology*. In this essay, Heidegger (1977) argues that the “essence of technology is nothing technological” (p. 4). It is rather *Gestell* or Enframing, namely, a framework that conditions the way we think about the world or, to put this in different terms, the way the world is revealed to us. Existence is conditioned by technology’s way of thinking, and this increasingly becomes the only way we experience the world. Heidegger describes this as a phenomenon taking over every aspect of being, since: “Everywhere everything is ordered to stand by, to be immediately on hand, indeed to stand there just so that it may be on call for a further ordering” (p. 17).

Andrew Feenberg (2006) calls Heidegger’s approach substantive and indeed essentialist, since it ascribes a specific core to technology which he sees functioning as “an autonomous force separate from society, a kind of second nature impinging on social life” (p. vii). Such conceptualizations of technology are clearly opposed to any ideas concerning technology’s instrumental and neutral nature and, instead, see it as inherently good or bad. This is not completely true for Heidegger, since he, on the one hand, sees modern technology, with its exact computational and information systems, to be distinctly different from ancient Greek art and craftsmanship (*technē*), but on the other hand, he understands this essence as a revealing mode that implicates the human being in various ways. In any case, Heidegger departs from instrumentalism, which media theorist, Marshall McLuhan (2009), characterizes as a form of ‘somnambulism’, saying that:

Suppose we were to say, "Apple pie is in itself neither good nor bad; it is the way it is used that determines its value." Or, "The smallpox virus is in itself neither good or bad; it is the way it is used that determines its value." Again, "Firearms are in themselves neither good nor bad; it is the way they are used that determines their value." That is, if the slugs reach the right people firearms are good. If the TV tube fires the right ammunition at the right people it is good. (p. 11)

McLuhan, like Heidegger, believed that every great technological change introduces deep changes in human experience. Technology makes up a new reality that becomes the human being's new way of being. This reality cannot in any case be set under control by human will or be manipulated. Therefore, McLuhan argues that "the medium is the message", because it is the medium that shapes and controls the scale and form of human action (p. 9). In a certain respect, both Heidegger and McLuhan are right: specific changes of technology do at times have such immense implications for human life that they simply cannot be perceived via localized studies of individual technological instances, their respective uses and particular contents. For instance, we can say with certainty that the world changed with the industrial revolution; indeed, the need for the term *industrial revolution* suggests deep organizational transformations at the political, economic, and social realms that reveal new ways of being for users and citizens. To describe this phenomenon by a single focus on the steam engine, however, would not have been enough.

Similarly, a discussion delineating the great effects modern technology has both on teachers and learners can be traced in the literature of philosophy of education. These accounts offered by Paul Standish (1997) and Lynda Stone (2006), for example, describe modern technology's tendency to eliminate difference and to turn things and people into resources, by sketching images of assimilation, effected by ready-made curricula that simply do not address the needs of individual learners, and pictures of standardization relating to testing, teaching methodologies, and research approaches. These accounts, however, just like the philosophical perspectives from which they emanate, leave the specificity of each technological object, its content, and specific mechanisms unquestioned.

Grounding itself on the realization that technologies have effects on human life, essentialism ascribes a specific content to this conditioning principle, but ends up denying any specificity as to the way specific objects are designed, produced, and ultimately employed within complicated social and political systems. What's more, these conceptualizations of technology fail to capture the complicated relationship existing between technology, society, and politics – either at the individual or at the communal level – while they can even end up "transposing an inadequate concept of agency from human beings to technology itself" (Lewin 2006, p. 519). For this reason, Andrew Feenberg (2006) proposes a critical theory of technology that fuses elements from instrumentalism with elements from substantivism and takes into consideration insights from social constructivism. This last take sees "technology as a dimension of society rather than as an external force acting on it from an epistemological or metaphysical beyond" (p. 10). Feenberg thus asserts that technologies need to be understood as cultural artifacts, that is, as objects participating in a complicated process of design, production, and consumption,

during which different social actors come together, taking part in accommodating and antagonistic relationships. Social constructivism, however, has, according to Feenberg, overplayed the role of society, while disaggregating “the question of technology as to deprive it of philosophical significance. It has become a matter for specialized research” (p. 12). He therefore argues that:

The problem is to find a way of incorporating these recent advances in technology studies into a conception of technology’s essence rather than dismissing them, as philosophers tend to do as merely contingent social ‘influences’ on a reified technology ‘in itself’ conceived apart from society. The solution to this problem is a radical redefinition of technology that crosses the usual line between artifacts and social relations assumed by common sense and philosophers alike. (p. 201)

Feenberg’s own suggestion is a critical theory of technology that maintains an essentialist character, by admitting the dominant trends and ideologies of technology, but also by affirming technology’s multiplicity, as instantiated in various and particular artifacts, which are employed in various and specific environment. This variation, or to use Feenberg’s term, this ‘ambivalence’ of technology, is a remnant of instrumentalism, but it is also the very element that he sees allowing the opening up of the necessary space for political action, agency, and democratic participation. Feenberg therefore detects certain stages during design or production, at which technologies are ‘decontextualized’ and thus undetermined, and some other stages, at which technologies are fully determined. This take, however, suggests a certain easiness as to the ways societal and technological factors either disengage from each other or come together and, in consequence, creates the need for further investigation concerning the nature of the actual synergies taking place and, in fact, forming technology, economy, society, and politics. Such an investigation needs to unfold through a deconstructive lens that allows the incorporation of non-dichotomous thinking concerning human beings and technological artifacts and, indeed, human beings as artificial and artifacts as acting beings.

## **The Lives of Humans and Other Things**

As already pointed out, there is a need for a reconceptualization of both things and humans and, in fact, as to the ways they interact with each other at the individual and at the communal level. Such a reconceptualization of things takes us back to the realization that technology is an object of philosophical investigation but also an integral part of the ways we come to think about thinking, that is, of the specific ways through which philosophy conducts itself as theory. By this, I mean two things: First, that technology is part of the milieu in which humans live, and it therefore influences the way we think about this milieu. Second, that technology has often functioned as a metaphor of the way the world works. This phenomenon, however, does not simply mean that we project our understandings of technology

onto the world, but that the world often becomes a perceptible unity by way of our use or understanding of technologies. Such a case, if indeed true, complicates further the theorization of actual technologies, their design and production, but also the theorization of knowing, of the human mind, and of thinking (Friesen 2010; Kouppanou 2011; Kouppanou 2017). The diverse conceptualizations of the technological artifact and its effects on the conceptualizations of the human being are discussed next.

### ***The Thing That Things***

Any venture to describe the lives of things appears destined to have a poetic, metaphorical ring, inviting us not only to transcend theoretical traditions that maintain clear distinctions between concepts, but also to overcome the metaphysical language that mediates these concepts. Later Heidegger (1977) proceeded to such an account, arguing that: “The thing things. In thinging, it stays earth and sky, divinities and mortals” (p. 177). Because of space restrictions, we cannot let all the controversy surrounding this discussion unfold here, but I will attempt to relate this utterance to Heidegger’s earlier work and associate it with new theorizations of things and their role.

What Heidegger mentions as the *thinging of the thing* is an attempt to expound on the way things exist independently from human will and intention. The *thinging* is thus understood as a movement that allows the elements of earth, sky, divinities, and mortals, namely, what Heidegger calls the fourfold, to come close and to respond to each other. The fourfold is perhaps Heidegger’s most contested concept, but it does underline a new way of approaching things, which points back to his earlier notion of *nearness*. Things, Heidegger seems to assert, can be understood not as objects existing idly across active subjects but as processes that involve these subjects. A thing is a crossroad at which different forces meet and transformatively react to each other so that something new will emerge but in such ways as not to obliterate each element’s unique contribution. It appears then that Heidegger’s description of the fourfold could be a reinscription of the mutual co-responsibility and indebtedness of the four Aristotelian causes that take part in the creative process of bringing things forth. In this respect, the human being is not the creative origin or the Aristotelian efficient cause. On the contrary, the human being is but one of the forces participating in this process of emergence.<sup>1</sup>

An artifact toward which Heidegger turns in order to account for this new ontology of things is the common bridge, namely, “a thing of its own kind” that “gathers the fourfold in such a way that it allows a site for it” (Heidegger 1975a, p. 154). In fact, Heidegger explains that the bridge is a location and only such a thing can

---

<sup>1</sup>This is echoed in various new materialist philosophies of individuation, often inspired by Gilbert Simondon (2012), purporting that the individual is not the origin of reality but rather that individuation is a process that allows human and nonhuman beings to individuate themselves.

“make space a site” (ibid.). This means that “[t]he location is not already there before the bridge is”, but, on the contrary, “a location comes into existence only by virtue of the bridge” (ibid.). In simpler words, we could say that a thing, especially a complicated aggregate of a thing like a bridge, establishes or allows the synergy of forces and therefore the emergence of new realities. A bridge changes our being in a certain space by allowing certain possibilities of connectedness and by prohibiting others, transforming in this way our being in space and time.

Similarly to Heidegger, Langdon Winner (1980) resorts to bridges in order to show how artifacts do things. In his essay *Do Artifacts Have Politics?*, he discusses a type of a highway bridge, built in several places in Long Island, which was too low for public buses. As a result, bridges prevented certain groups of people, who depended on public transportation, from frequenting specific parts of the city. Winner therefore argues that technology is affected by social relations and embodies ideologies that become part of the social reality that they help to create. His discussion, however, is more concerned with the way technology is socially determined, rather than with the way technological artifacts become loci for the interaction of forces, either by allowing or by preventing things to happen, and in this way, he disaggregates the technological artifact into a set of social relations and therefore equalizes it with the social realm. To say, however, that social relations are constructed does not also explain the ways through which these relations are constructed and mediated by technology.

Bruno Latour (1999), reacting to this type of constructivism, says: “Yes, society is constructed, but not socially constructed. Humans, for millions of years, have extended their social relations to other actants with which, with whom, they have swapped many properties, and with which, with whom, they form collectives” (p. 198). Delving deeper into the seemingly impermeable way *things thing* means to give accounts of the interactions taking place between the natural, the individual, the communal, and the technical realms of being and of all the ways these are entangled. Latour detects different symmetries between the human and the technical when discussing the networks constituted by these realms. Let us take, for example, the specific type of network that is constituted by a gun and a human being. In this case, Latour argues that both the human being and the gun are transformed when they come close, since the human being is transfigured into a being that can potentially fire a gun, and the gun is transformed into a potentially firing gun. He therefore argues that both the technical and the human being are capable of acting, concluding that: “It is neither people nor guns that kill. Responsibility for action must be shared among the various actants” (p. 180).

Such formulations complicate the notion of mediation, agency, and ethical responsibility. Still, one could object, paraphrasing Latour himself, that human beings make guns but guns do not make human beings. Why should responsibility be distributed? And, how is responsibility to be distributed to inherently messy domains that involve each other? The purpose of this chapter is not to solve these problems, but to point to the fact that revised ontological theses concerning technology have decisive effects on the epistemological and ethical realms. However, before addressing the connection of this phenomenon to education, I have

to note here that this critique has constructivist, materialist, and inventivist connotations,<sup>2</sup> which have indeed affected educational theory, by making researchers more aware of the role that technological objects play for the organization of daily teaching and learning practices, the construction of knowledge, the implementation of policies, and the conducting of research (Adams and Thompson 2011; Fenwick and Edwards 2011; Waltz 2004). It has also turned educational decision-making into an impossible task, since even if it is the case that artifacts have values and politics, decisions made by humans in education still need to serve the learners' interests and not technologies' conditioning effects.

### *This Being That Is Not Only Human*

Philosophies of technology, coming after Heidegger's disruptions of subjective ontologies and following Derrida's (1997) deconstructive critique of writing, have affirmed the interconnectedness and the mutual indebtedness that define the technological thing, the human being, and their interaction. Through the account of the fourfold, Heidegger presented the human as the being that interprets the world but is also interpreted by it, while Derrida's account of the supplement made any notion of origin inconceivable; the human being is a drifting being endlessly moving through the flows of signs, which themselves lead to other signs and never to an ultimate signified. French philosopher Bernard Stiegler (1998), engaging with the thought of both aforementioned philosophers, decisively disrupts the standard signification of the human (the who) and the thing (the what), asserting that: "The relation binding the 'who' and the 'what' is invention" (p. 134). Discussing then "[t]he invention of the human", he asserts that the genitive is in any case ambiguous, suggesting that if there is something like an invention via technics and if it is in fact understood to be originating from the human, then this process of inventing is producing the human and at the same time eternally postponing the possibility of origin, either for the technical or the human being (ibid.). In accordance with this perspective, human historicity does not constitute a developmental process that allows the unfolding of an essence but a technological contingency that produces different versions of humanity. The human results from an adjustment of this organism's organization taking place in correspondence to the organization of inorganic matter.

The implications of this reconceptualization of the human are indeed great, leading to the realization that the human being's constitution is accidental and dependent on its interactions with technology (Stiegler 1998). According to this notion, we can also move thus far as to infer that we have never been human in terms of self-contained, auto-affected, natural subjects that handle, manipulate, and control inert matter, but we are instead historical, posthuman, material, prosthetic, and

---

<sup>2</sup>As De Boever et al. (2012) explain: "While constructivism focuses on the cultural construction of reality while remaining sceptical towards the claims of the natural sciences, inventivism seeks to think the natural processes involved in any and all constructions" (p. x).

enculturated beings. This realization allows Stiegler (1998) to wonder: “And if we already were no longer humans? For if nothing supports our saying that what is called the human is finished today, we may in any case set down as a principle that what begins must finish” (p. 136).

The end of the human is possible. It is after all a presupposition of its having no origin and no absolute beginning. Still, each formulation of posthumanity is determined by that which we think is most determinative of our being human. Katherine Hayles (1999), for example, presents how the presumed immateriality of our way of thinking led the first wave of cybernetics and the inaugural stage of the Artificial Intelligence program to assume that information was “a kind of bodiless fluid that could flow between different substrates without loss of meaning or form” (p. xi). In consequence, this allowed scientists like Hans Moravec to assert that the “human identity is essentially an informational pattern rather than an embodied enaction. The proposition can be demonstrated, he suggested, by downloading human consciousness into a computer, and he imagined a scenario designed to show that this was in principle possible” (p. xii). Such a perspective of the posthuman “privileges informational pattern over material instantiation”; it theorizes consciousness as an epiphenomenon and as a specific historical stage in evolution and considers the body as “the original prosthesis we all learn to manipulate, so that extending or replacing the body with other prostheses becomes a continuation of a process that began before we were born”. Finally, the posthuman, envisioned from this perspective, tolerates “no essential differences or absolute demarcations between bodily existence and computer simulation, cybernetic mechanism and biological organism, robot teleology and human goals” (pp. 2–3).

Different philosophies of technology and indeed different conceptualizations of the posthuman are continuously renegotiated according to that which we deem to be the human, the technical, and the potential emergences of their creative meetings. At times these different strands of thought appear to be settling on the deconstructive critique of subjectivity that foregrounds the distributed, versatile, and supplemented nature of cognition, but at others they seem to reflect the Platonic and Cartesian dualisms – still strong today – that refer to the immaterial realm of ideas or the disembodied consciousness that lives in isolation from material beings, attempting to reach them by miraculously transcending the big gap of their separated existence. In this respect, theories of the posthuman also serve an epistemological role by revealing our assumptions concerning the way we think and construct our theories of what we could be. This element of potential awareness is however present, to a greater or lesser extent, in all of our conceptualizations of human-technology interactions and also in theorizations of thinking, teaching, and learning.

Opinions, like Robert B. Kozma’s (1987), for example, that assert that “[t]o be effective, a tool for learning must closely parallel the learning process; and the computer, as an information processor, could hardly be better suited for this” tell us much more about technology’s influence on the conceptualization of thinking than on thinking itself (p. 22, cited in Friesen and Feenberg 2007). Indeed, according to Friesen (2010), “different technologies—such as the clock, camera, and the

computer—have provided powerful means specifically for understanding the mind” (p. 83). This phenomenon, which is called ‘tools to theories heuristic’ by Gerd Gigerenzer, refers to the fact that: “technologies which, at a given point and time in history, are widely used or are otherwise conspicuous have the tendency to inspire theories about the nature of the mind, memory, thinking, or learning” (p. 84). To be more specific, this implies that any technology, which is at some point widely used, has a certain effect on learning not simply because it affects its users, but also because it inspires a model of human learning, and this can result to this tool’s ferocious application in education, since it is believed to be able to procure and enhance learning. However, if we take into account that technological artifacts are themselves cultural products selectively incorporating values, ideologies, cognitive and social functions, and modes of synthesis that by no means exhaust the range of the human experience of being and thinking, then we can easily ascertain how this practice can end up creating circuits that lock teaching and learning in one-dimensional beliefs concerning the human being, the technological artifact, thinking, and education in general (Kouppanou 2017). In light of the co-inventive relation that exists between the human being and technology, we can also conclude that the decisions concerning the tools we use influence greatly the kind of human beings or educational, societal, and familial systems we aspire to co-invent. More than that, we can surmise that in the educational context the consideration of human learning has been marginalized in favor of the supposed urgent need for the incorporation of technologies that are purported to ameliorate the very learning which remains unquestioned. These inadequacies in questioning technology could easily explain why computers and hypermedia applications have failed their educational purposes (Dillon and Gabbard 1998). As a matter of fact, we can side with Jan Derry (2008) who argues that: “In the rush to achieve results too much has been taken for granted about the way in which students learn” (p. 507).

In view of this discussion, we can infer that the term *learning technology* is problematic, to say the least, because technologies always already impact the way we think and learn; indeed, to such a profound level that we could claim that all technologies have a learning component, either because we learn to use them through the interiorization of their modes of associations or by receiving and creatively projecting the kind of memories they selectively contain (Stiegler 1998). For this reason, these technologies will continue to have effects on us even when they are said to be serving educational purposes. However, this would also be true but perhaps in a lesser degree for technologies explicitly designed for educational purposes, since even if these technologies contain the memories, which are deemed appropriate for a specific educational goal, the modes of their synthesis will probably imitate the ones of prevailing technologies. Therefore, what is urgently needed is a constant and simultaneous investigation into the things that both the technological artifacts and the human beings can do and into the things that they aspire to be. In light of this, I turn now to digitization as a dominant characteristic of our current sociotechnological milieu.

## The Question of the Digital Thing

Digitization appears to have brought another shift in terms of technological change; indeed, one deeply seated in the tradition of disembodied information. Michael Eldred (2009), for example, supports the idea that digital things are immaterial, placeless, effortlessly duplicated, entities and that this “digital dissolution of beings” constitutes the consummation of the calculative tendency that Heidegger understood as the essence of modern technology (p. 9). Our daily dealings with digital technologies, however, tell a different story, indeed, one revealing that these interactions are quite similar with the ones we have with tangible technologies, affording us in fact the possibilities of meaningful engagements in the dwelling places that they create (Kouppanou and Standish 2013).

In order to understand the twofold nature of the digital tool, let us examine at this point the use of the Global Positioning System (GPS) by imagining someone travelling in an unknown land and having this tool at their disposal. At first glance, this type of travelling would appear quite different from the one that features a traveller using maps, notes, and bits and pieces of previous knowledge. This latter type of a traveller is the one who takes their time exploring, making mistakes *en route*, stopping, and asking for information. If we look closer, however, we can also see the GPS using traveller interacting with this tool as a ready-to-hand implement that allows nearness to other things and people, just like maps and notebooks allow. Still, it could be argued that interacting with digital maps is nothing but a disembodied kind of action, which unfolds in abstract, mathematical space, but of course this could also be said to be the case with the traveller who uses maps, road signs, and any other kind of spatial representation. Of course, soon another objection would emerge; indeed, one concerning the fact that the digital system of navigation turns the traveller into a positionless being and the travelling space into meaningless stretches of virtual extension. In fact, the GPS traveller sees themselves represented as a moving dot within this space, and in some specific way their experience is quite different from the respective ones allowed by older navigation and transportation systems. The traveller is currently a datum that is produced by the system itself. In some other way, however, travellers that do not use digital systems of navigation are also constricted by the limitations and affordances of public transportation systems and their constitutive elements, like the bridges of Long Island are thought to have done for certain groups of the population. What’s more, even if someone argues that there is a certain kind of limitation in terms of automation of thinking and travelling – the GPS using traveller need not make decisions for the route, they just need to choose the point of destination – it could also be argued that this has always been the case with public means of transportation and that as soon as the traveller reaches her destination, namely, this virtual space in which she imagined her future self to be, she will be free to openly engage with the meaningful possibilities this space has to offer, which are themselves possibilities formed by the new space’s specific constitution.

According to this analysis, the digital navigation system is quite similar to other processes of navigation and tools, since the GPS can be something ready-to-hand that is used unproblematically in order to formulate the user's spatiotemporality. It could even be added that the GPS elicits embodied responses from the user even though of a different type from the ones afforded by a map. A digital map requires, after all, tabbing and scrawling instead of turning pages and following lines. What's more, and perhaps even more importantly, this digital tool is connected with other places, tools, and people and is able to afford closeness through movement in networks. In this case, the GPS is found in a network constituted by satellite and information systems, selections of memories, systems of transportation, semiotics of travelling, and material spaces. Martin Heidegger (1975b, p. 165), however, saw this closeness as a type of "uniform distancelessness" that is able to bring things close but also to keep them afar by demolishing meaning and the possibility of differentiation (Heidegger 1975b, p. 165).

Bernard Stiegler has expressed similar concerns about modern media, dreading particularly the absolute postponement of *différance*, which he sees rooted on the technological realm, and furthermore attributes this possibility to modern media's specific selectivity of memories (Kouppanou 2015). This is because memory is quite important for Bernard Stiegler's (1998) understanding of the technological artifact, which he sees containing inscribed memories and therefore appropriately calls "mnemotechnics", that is, technics of *mnēmē* (memory) (p. 217). The memories found in technologies like books, films, and USBs constitute the milieu in which people find themselves and through which they envision who they are and who they want to be as individuals and communities. Institutions like the media industries, educational systems, and even families rely on this exterior support in order to create circuits in which their members individuate themselves by accessing these selected memories and by appropriating them as their own (see Stiegler 2010, 2011). This reliance on selectivity becomes the filter that recapitulates the past and forms the anticipation for the future, the attention through which we form our projects and alliances. Above all, this interconnectedness is understood in Stiegler as *mathēsis*, namely, a type of learning that is formative of the state of being human. Inventing the human is learning to be a certain human.

Yet, according to Stiegler's critique, media industries are currently dominating this process by choosing the memories being offered to users. This selectivity actually results to the formation of users, and in this light, media industries function antagonistically to educational systems in that they prioritize certain types of memories instead of others and form different types of attention from the ones necessitated by educational institutions (see Stiegler 2010). Along these lines, media products become learning technologies outside of schools, in the respect that they are part of children's situatedness and thus a configuring factor of their process of becoming individuals. Stiegler, for example, discusses Wikipedia in the following terms:

Everybody knows that Wikipedia changed completely the scene and the relationship between teachers and students. This is extremely important and needs to be studied. But the first question is the transformation of knowledge as such by the digital. For me the digital is a new kind of writing which is industrial, mediated by apparatuses and devices, working at the speed of light and using computation at a very high level, and this modifies completely the objects of physics, mathematics, linguistics, history, geography, all types of disciplines. For example, today our languages are completely transformed by automatic translation which is not really automatic but a type of built up translation. (Kouppanou and Stiegler 2016)

Stiegler (2002), however, also detects a pharmacological possibility in digitization, namely, its possibility to function curatively and not simply as a poison, arguing that the digital image, namely, “*l’image de synthèse*”, is a type of representation made of discrete elements, allowing thus the selection of memories and their respective reappropriation and resynthesis by the individual user (p. 148). For me, however, the turn toward the element of synthesis proposes something more substantial. It is in a way a call to revisit human synthesis and indeed understand human thinking, attention, and imagination better, and this is precisely what education should intend to do. In the next section, I clarify this point.

## Conclusions

The thoughtless incorporation of tools in learning contexts has in many cases failed the purposes education has set. The example of the application of the computational model of thinking in educational settings is a testament to this failure. In the case of digital technologies, however, things, both literally and metaphorically, appear to be different. These technologies rely on their networking, discrete, and synthesizing character, and this means that any philosophy attempting to understand them should not see them in isolation from other tools or from the human being. It rather needs to see them as digital bridges that bring distinct domains, different modes of knowing, and modalities of connectedness closer to each other and study the ecologies they create. Constructivist and cognitivist approaches to educational technology acknowledge the interaction of human and technology, but they continue to approach these elements dualistically, a brain and a machine working in similar terms but not truly responding to each other and forming each other. This is, however, what needs to be urgently addressed.

Heidegger’s and Stiegler’s philosophies can at times appear one-dimensional, the former attributing a singular way of revealing to modern technology, and the latter giving way too much emphasis on memory and selectivity. Technologies, however, are not mere keepers of memories but also ‘metaphoric machines’ that instantiate specific types of memory synthesis (Kouppanou 2016). In other words, technologies are exteriorized thinking processes, and we therefore need to return to basic questions concerning the situated, distributed, embodied nature of human thinking in order to really understand what it is that is happening to us and to technologies when we use them. Research in philosophy of education that returns to these

questions either by illuminating the embodied nature of all technology's usage (Mangen 2016; Vlieghe 2016) or technology's constitutive role for our subjectivities as users and learners is an appropriate response to this need (Burbules 2016; Fulford 2016; Hodgson 2016).

Digitization, despite some of its current effects on thinking, learning, and human formation in general, might offer us the possibility to reshape our social worlds, within the constraints of the classroom, and even allow the emergence of new educational spaces. This complicated interaction between technology and education appears at times to be unfolding on its own, but it is in fact demanding serious decisions concerning the future of the human being (Stiegler 2010). Indeed, if the human is something always in the making, then this making necessitates both an epistemological assessment concerning the modalities and modes of knowing and an ethical assessment concerning our possible (post)human future. If this role is not taken up by education, specific technologies, economic interests and agendas could end up making them and in fact essentializing the human and the technical being. However, the non-dualistic, materialistic framework we have discussed here denotes that: "The living thing is an individuation that has no choice but to *continue* its invention, or face dissolution" (Massumi et al. 2012, p. 30). This connotes that technologies used in educational contexts could indeed be learning technologies, but they are also technologies that contribute to the formation of the individual, and therefore should keep opening spaces for further, differential, and imaginative individuations rather than limiting them.

# Philosophy for Children and Children for Philosophy: Possibilities and Problems

**Viktor Johansson**

When considering philosophy's relation to and engagement with childhood, one can see at least three strong trends. First, there is philosophical thinking about childhood, call it philosophy of childhood; second, there are questions about teaching philosophy to children or doing philosophy with children, call it philosophy for children; and third, there is children's own philosophizing. Of course, how we think about any one of these areas will affect our position on the other. Our views on childhood will have an impact on how we conceive of children's philosophizing, and, if we consider it to be philosophizing at all, their philosophizing can change our view of philosophy itself. In turn, acknowledging and attending to children's philosophizing can disrupt the way we think about childhood (philosophically). Likewise, attention to children's philosophizing can disrupt and affect the way we do philosophy with children or construct (adult) philosophy for children. The way we do, and think about doing, philosophy with children, however, is also a result of our understanding of, and discourses on, childhood. Conversely, our philosophical activities with children and our construction of philosophy for them can impact both how we understand childhood and children's philosophy, if for no other reason than because such activities in themselves raise questions about childhood, and unavoidably involve encounters with children's philosophical thinking.

When considering the contemporary possibilities and problems in the field of philosophy for children today – as a pedagogical practice, in terms of its scholarly position in philosophy of education, and wider scholarship on children's philosophizing – it is crucial to consider how our positions and thoughts in these areas relate to one another. This chapter begins by illustrating the role of children in

philosophy, and how childhood may impact philosophy, by turning to the work of Stanley Cavell. In particular this chapter focuses on his idea of philosophy as a confrontation with our culture's criteria, but read in the light of Pierre Hadot's understanding of philosophy as a way of life. It goes on to consider how the philosophy for children movement has developed through three generations of thought and practice. To illustrate how these generations have emerged, the chapter surveys differing views of the use of picture books in children's philosophizing and philosophy. Going on from the third generation's criticism of how the philosophy for children movement's use of picture books has been insufficiently aware of its own assumptions, limits, and borders, the chapter concludes by showing that the critical moves from one generation to another in the field itself can be seen as a philosophical way of life, a way of life that involves philosophy for children confronting its own criteria, by emphasizing and questioning not only the boundaries of the content but also of the places where philosophy with children happens.

## Children in Philosophy and Thinking About Childhood

Since antiquity, philosophers have engaged with childhood in various ways. Many of Plato's dialogues are conversations with teenagers, for example. Philosophy, as Plato practised it, was clearly an educational practice, which prepared the young for certain kinds of life through dialogue and other exercises. However, Plato also advanced some of his main ideas by considering children's thinking, most famously in *Meno* where he expresses his views of innate knowledge by having Socrates give an example of a slave boy's innate ability for reasoning about geometry (Plato 2010: 82a–85d; see also Matthews 1998: 13–15). Similarly, John Locke starts to develop his own empiricist epistemology by considering children's growth to knowledge. His view of human understanding is based on the idea of the child as a blank slate that is filled by experience throughout the child's life (Locke 1975: II. i. §§ 2–24). We find similar turns to childhood in as differing philosophical writings as Rousseau's account of politics and contract theory in *Emile* (1979) and *The Social Contract* (2006), in John Stuart Mill's (1985) utilitarianism and account of morality and politics, in Agamben's (2007) history of experience and infancy, and Wittgenstein's (1953) examples of language games as a tool for philosophizing (see also Savickey 2011),<sup>1</sup> to name just a few examples.

In other, perhaps less discursive, forms of philosophizing, the figure of the child is given a slightly different role. For example, in Augustine and Rousseau's confessions as well as in Mill's autobiography, they (re)turn to childhood and show how their philosophy grew out of their lives and became part of their exercise in living. They turn philosophy towards their own childhoods in order to understand themselves.

---

<sup>1</sup>For an overview and discussion of these and other philosophers' views on, and use of, children and childhood, see Turner and Matthews (Eds) Turner and Matthews 1998.

The contemporary philosopher Stanley Cavell gives several rich accounts of these roles of children in philosophy. In *The Claim of Reason* (1979) ideas about social contracts, meaning, and morality are all related to childhood. In his later works, these issues are turned towards his own life as a child and with children (Cavell 1994, 2010; Marrati 2011). Moreover, *The Claim of Reason* also illustrates how children speak back to philosophy by forcing adults to engage with their own culture's criteria. For example, at a pivotal point in the book, Cavell writes:

But if the child, little or big, asks me: Why do we eat animals? or Why are some people poor and other rich? or What is God? or Why do I have to go to school? or Do you love black people as much as white people? or Who owns the land? or Why is there anything at all? or How did God get here?, I may find my answers thin, I may feel run out of reasons without being willing to say "This is what I do" (what I say, what I sense, what I know), and honor that. (Cavell 1979: 125)

These are questions that children may implicitly or explicitly ask. They are difficult to answer. For Cavell, such questions involve a confrontation with our culture's criteria. Such confrontation invokes a philosophical examination of those criteria. Allowing children's questions to confront our culture, and being attentive to such confrontation, can become a form of philosophizing in the Socratic sense. To philosophize is to question oneself. As Pierre Hadot puts it, philosophy as an exercise of life emerges from "the feeling that we are not what we ought to be" and "this feeling comes from the fact that, in the person Socrates, we have encountered a personality which, by its mere presence, obliges those who approach it to question themselves" (Hadot 2002: 29–30). In Cavell's child's question, we meet such a Socratic figure. In a sense, it is an encounter with philosophy that brings adults to the limits of their ability to give reasons for their life in their own culture. Children's philosophical questions, then, become a form of 'education of grown-ups', moments to think again, or to think about what we have stopped thinking about, moments of remembering childhood (Cavell 1979: 125).

The questions raised by Cavell's child can confront our own culture because they put our social contract in the foreground. Cavell thinks Rousseau's social contract is something we discover. The child's questions can disclose the culture we have been initiated into and raise further questions of our consent to it. In this sense, the questions can remind adults of their own childhood. Learning to speak and act in a culture means accepting "what my 'elders' do as consequential" (Cavell 1979: 28). I give tacit consent to the social and cultural world I inherit. Still, it also means that my elders "have to accept, even applaud, what I say and do as what they say and do" (ibid.). The child's questioning of, or just wondering about, the conditions of our social contract is an encounter with the self-re-evaluation of philosophical criticism. Remembering and encountering childhood is, for Cavell, a way of doing philosophy.

In *The Claim of Reason*, Cavell later returns to childhood in order to investigate how words and thoughts acquire generality, that is, how we can use general terms such as 'bird', 'mother', 'love', and 'fight' to speak about, or do, particular things. The turn to childhood becomes a turn to what it means to learn a word. When we attend to childhood and children learning language, we realize that it is very difficult to tell when and what is learnt. When we teach words, children learn much more

than what is taught, and teaching does not always lead to learning (Cavell 1979: 171; cf. Kohan 2014: 39). They not only learn to use the word ‘love’ in appropriate ways that we accept but also just as much what love is (Cavell 1979: 177). Learning a word is becoming a part of a form of life. Encountering children learning language is, in this sense, a confrontation with moral and ontological questions.

These examples from Cavell show how thinking about childhood transforms how we think about philosophy. While these early examples are influenced by Cavell’s interactions with children (see, e.g. Cavell 1979: xxii), they become more alive in his later autobiographical work. There we find Cavell the philosopher examining his own life with children, but primarily his own childhood (see Cavell 1994, 2010). In a sense, Cavell’s encounters with childhood illustrate and bring to life the Socratic and perfectionist self-questioning aspect of his philosophy. Consider the following example from his account of his mother’s funeral:

When the rabbi at my mother’s graveside dismissed the company of several dozen people in attendance [...] Ben refused to leave as I took his hand. He insisted, “The coffin is still here.” I replied that since Rabbi Epstein had dismissed us he must have his reasons. Ben still would not be moved. He and I, and the rabbi, and two workmen standing aside holding shovels, were the only ones left by the grave. I glanced at the rabbi, who motioned to me to remain. “The child is right. The service is not over, but we have fallen into the custom of dispersing those in attendance as we lower the coffin and cover it with earth.” This admired and distinguished old man had begun walking around to us on the other side of the open grave, and pulling a shovel from the place it had been stabbed into a neat pile of soil, invited Ben to put his small hands on the shovel’s handle between the rabbi’s large hands. Thus enabled to assist one another in wielding the large implement, they repeatedly, as the coffin was lowered, together sent small clumpy showers of earth down surprisingly softly tapping upon the coffin’s lid in accompaniment to the rabbi’s completing the chanting of his canonical prayers. Afterward, as Ben and I held hands to walk over and rejoin the withdrawn gathering of participants, I was, I suppose undisguisedly, pent with uncomplicated yet mysterious elation at witnessing this inspired, lucid linking of generations before and beyond mine. (Cavell 2010: 467–68)

Like the questions in the first passage from Cavell’s work, Ben interrupts his father’s acceptance of the new conventions for the funeral. It is not only Ben’s words that push Cavell to encounter his self-understanding of the situation, however; Ben’s refusal to move pushes the philosopher to the limits of his ability to give reasons. He has to rethink the situation. In the enigmatic encounter, the dead mother and grandmother, Ben, Cavell, and Rabbi Epstein are creating a way to approach and live with the death of a beloved, a way to express respect and grief. They create their own grammar of burying, or grief, in their common response to the situation.

If philosophical questions push us to the limits of the criteria on which we base our reasons, then much work on these questions will consist in such creation of ways of living with them that are beyond our current ways of living. Philosophy becomes an untaken way of life (Cavell 1990: 61–62; Johansson 2014: 70–71). That is what childhood can do for philosophy, but also, as we shall see, what can happen when children are allowed to philosophize. Philosophy, or rather philosophy as a perpetual self-examination, becomes a way of living, and a way of living with children. As is emphasized throughout Walter Kohan’s work on philosophy with children, childhood speaks philosophically and to philosophy (Kohan 2014: 20, 41, 64).

## Looking Back at Philosophy For and With Children

Children have had a role in philosophy since antiquity. It is clear both that they have had a voice in philosophy and that philosophy at times has been investigating childhood. Just as the attention to the philosophy of childhood and philosophy of children has varied in different periods and among different philosophers, so too has the question of teaching philosophy to children. A large part of the activity of the four Athenian schools of philosophy – Epicureanism, Stoicism, Platonism, and Aristotelians – consisted in teaching their particular philosophical practice to younger generations. These schools developed exercises for the participants to cultivate themselves to live philosophical lives. Later, as the Roman Empire grew and formed its own institutions for educating the young, proponents of philosophy, such as Marcus Aurelius, created institutions for the public teaching of philosophy to the young, inspired by the schools in Athens that had made philosophy part of the official curricula and schooling of youth (Hadot 2002: 146–49). Moreover, as Lipman, Sharp, and Oscanyan remind us, “early philosophy was not for specialist, not for a technical elite or a monastic minority” (1980: xiii).

The ancient idea that philosophy, philosophical questions, and exercises are not limited to professors or an elite, but are a part of the everyday life of the common people, can be understood as the point of departure for our contemporary discussion about the role of philosophy in schools, philosophy in childhood, and considerations about children’s philosophizing. In the field of philosophy with and for children, these considerations have taken at least two directions. Beginning in the late 1960s, Matthew Lipman started to develop ways to do philosophy with children in schools that involved training teachers in methods to lead philosophical dialogues with children (Lipman 2003; Lipman et al. 1980). Inspired by Lipman, Gareth Matthews (1980, 1984, 1996) began to explore ways in which children think philosophically. Whereas Lipman’s focus was on doing philosophy with children in a school environment, Matthews’ was simply to show how and when children philosophize.

As Lipman and Matthews, together with Ann Sharp, began to think about what philosophy could be in childhood, and what doing philosophy with children could mean, they returned to the ancient idea of philosophy as an activity rather than seeing philosophy as theories about certain kinds of problems. Hence, they turned to the idea of children doing philosophy rather than learning theories to apply to particular problems. Of course, in Matthews we find plenty of examples of children having theories about knowledge, morality, life, death, and a range of other issues (Matthews 1980, 1984, 1996). Likewise, many of Lipman’s suggestions for how to do philosophy with children involve them discussing or developing their own theories. Still, as Hadot repeatedly points out about ancient philosophy, from the perspective of seeing philosophy as a way of life, a spiritual exercise, the theoretical discourse of philosophy will be in the service of exercising and living philosophy, of the activity of doing philosophy (Hadot 1995, 2002). Thus, we see that as Matthews and Lipman attend to children doing philosophy, our view of philosophy is transformed. We turn from the academic discourse of philosophy as theory, which

characterizes a lot of philosophy today, to something more akin to the ancient view of philosophy as an activity that transforms the subject through philosophical exercises (e.g. Hadot 2002: 4–6; Gregory 2012: 32).

Lipman et al. forcefully argue that incorporating philosophical inquiry in the school curriculum involves not only a turn in our conception of philosophy but also a change in how the curriculum and pedagogy are perceived. Matthews similarly shows how his turn to children's philosophy challenges both everyday and scholarly established views of childhood and children's ability to think (see, e.g. Matthews' responses to Piaget's developmental psychology in Matthews 1980: 37–55; 1984: 113–119; 1996: 31–67).

Although we can perhaps see the beginning of a rethinking of philosophy and childhood in the work and practices of Lipman and Matthews, there are problematic tendencies in how they, and in particular Lipman, develop programs of philosophy for children. For example, those inspired by Lipman and Matthews' early attempts to rethink what philosophy and childhood can be may wish for a more radical transformation of our cultural criteria for thinking about philosophy and childhood.

The limitations of what have been called the first generation of scholarship on philosophy for children (Vansieleghem and Kennedy 2012; Reed and Johnson 1999), of which Lipman and Matthews are representatives, can be exemplified by considering how literature and stories have been used to engage children in philosophy. Lipman wrote several novels and stories with accompanying instructional manuals to support teachers to engage in philosophical dialogues with children.<sup>2</sup> Let us consider how Lipman speaks of the role of literature in thinking and philosophy for children practices. The following are excerpts from his book *Thinking in Education*:

In philosophical literature fictional children can be offered to the live children in the classroom as a model of philosophical inquiry. Contrast this with the traditional elementary school pedagogy, which claims that the teacher serves as a model for the students. One can test this claim by considering the important philosophical tactic of questioning. The students may be inclined to presume that the teacher who questions wants answers, not further questions. It is likely, therefore, that many children prefer fictional children, as models, to live adults. (Lipman 2003: 96)

Literature can model practices of philosophical inquiry. When we read about philosophizing protagonists, we are shown examples of how to think, what questions to raise, what issues to inquire into: “We learn the procedure in literature; we practice it in life” (Lipman 2003: 134). Children can find models to emulate in literature. Moreover, Lipman thinks that literature can illustrate what concepts mean: “This is the value of literature: It provides a surrogate context that helps us figure out what the term in question is doing in that context” (Lipman 2003: 143). A classic example is that we can learn to think about jealousy, and even deepen our understanding of the concept of jealousy, by studying Shakespeare's *Othello*.<sup>3</sup> Great

<sup>2</sup>See, for example, Lipman (1982) and Lipman et al. (1984).

<sup>3</sup>See Gibson (2008: 84–101) for a discussion of the complexities involved in the claim that we can learn something about jealousy by studying fiction, which gives support to Lipman's assumption.

literature not only offers models and arenas for conceptual inquiry, “great literature ... [can also] interfuse critical and creative thinking with the tender passion ...” (2003: 261). For Lipman, it is a mistake to believe that thinking is distinct from emotion and passion. Using literature in philosophy with children helps us to overcome and counter tendencies to focus on thinking as a passionless “argumentation, with deduction and induction, with form, structure, and composition” (Lipman 2003: 261).

It is clear that, for Lipman, literature is used as a tool to create a context for philosophical inquiry with children. Whatever other values literature may have in Lipman’s philosophy for children program, it has a didactic end in providing the means to think philosophically. It is about the process of philosophical thinking, not the content (Lipman in Haynes and Murriss 2012: 56). Lipman has quite a determined view of what is trained in the philosophical dialogues that ensue from literature, however. Literature models philosophical inquiry and philosophical questioning by turning children’s attention away from the teacher as a model, towards literature and their own imagination. Thus, when meeting thinking in literature, children are provided with a model that calls them to think for themselves, rather than to think as the teacher does.

The second generation of philosophy for children follows Lipman’s idea of literature as a model only to a certain extent. As Joanna Haynes and Karin Murriss point out, Lipman’s good intentions to help the teacher to facilitate philosophical dialogues using literature by giving them meticulously constructed instruction manuals limit children’s ability to respond to the literature (Haynes and Murriss 2012: 57–58). The instruction manuals give the teacher a view of what philosophy can be, in order to ensure that philosophical dialogues actually take place. Thus, there is little room for children and childhood to actually speak back to philosophy and to transform philosophy, to attend to the social contracts of the particular dialogues in particular classrooms, or to the many other things that the children may be learning when exploring concepts. One might wonder what happens to all the questions that do not fit the mould of the manual’s picture of philosophy. This limitation of Lipman’s program may be due to his focus on philosophy as facilitating training in thinking rather than cultivating experiences of perplexity and interruption of established practices of thinking (Haynes and Murriss 2012: 57).

The alternative to Lipman’s program or, perhaps how it is further transformed by those who inherited it – the second generation – is an even closer attention to “what [children] can bring to academic philosophy as a discipline” (Haynes and Murriss 2012: 61). This means that doing philosophy with children involves an openness to go beyond adult assumptions about philosophy into a practice where both the child and the adult are perplexed by their encounter with the philosophy that can happen in the reading of literature. As Walter Kohan, also representing the second generation of thought, points out:

... to understand philosophical thought as a set of abilities or tools condemns it to the mirrored repetition of the same – if not of the same content, at least of the same model of thinking. Philosophical thinking is not an ability, but an event; not a tool, but an experience. (Kohan 2014: 40)

The first generation of philosophy for children emphasizes that philosophy is a pedagogical activity, but leaves little room for children to question and develop that activity themselves. Nevertheless, this further emphasis, in the second generation, on the open-ended nature of philosophy, and what children bring to it and take out of it, leaves the field open for further forms of critique. Whose philosophical encounters and experiences are we talking about here? If encountering philosophy in reading picture books leaves open what is experienced, learnt, and taught, how shall we deal with the truly disruptive experiences in literature, of racism, sexism, bigotry, cruelty, etc.?

I have followed Nancy Vansieleghem and David Kennedy (2012) as well as Ronald Reed and Tony Johnson (1999) in speaking about a first and second generation of philosophy for children. However, it is possible to discern a third generation of philosophy for children emerging. It consists of scholars and practitioners that are bringing new perspectives to the area that are distinct from earlier generations by their furthered critique of the field of philosophy for children. These thinkers and practitioners demonstrate ways in which both the scholarship and practice of philosophy with children, at least on occasion, have been racialized and have sidestepped hard questions of privilege, gender, and class in the practice of philosophy. To be clear, these are generations in lines of thinking about philosophy for children, not necessarily a generation of people in the field. Some scholars and practitioners can be thought of as moving between generations. For example, we see a turn towards post-humanist forms of engagement with philosophy for children in Karin Murriss' (2016) recent work that goes beyond first and second generational thought.

Darren Chetty's (2014) critique of Haynes and Murriss' (2012: 156) suggestion to use the picture books *Elmer* and *Tusk Tusk* can begin to illustrate this third generational move. Haynes and Murriss (2012) emphasize how literature, specifically picture books, can initiate philosophical dialogues about controversial issues. They warn against censoring books and subjects, and suggest that reading and discussion of literature, without too strong assumptions about philosophy, creates a questioning and philosophical environment. In contrast, and without denying such possibilities, Chetty argues that literature and picture books are just as able to establish as to challenge prejudice and cultural norms:

In *Elmer* and *Tusk Tusk*, the absence of culture, geography, power imbalances, indigenous and non-indigenous, religion, language diversity, history and racism leads to allegories of racism that have simplified to the point of falsifying. Indeed we could argue that the two books constitute a form of ideology, in the sense of being fables that conceal reality. Though it does not necessarily mean that this has been unnoticed, those who have advocated using these books have not made reference to how the books fail to depict racism as, for example, inequality or as the power to exclude. The limitations of these books as starting points for philosophical enquiry into racism should, I would argue, be a central consideration for all P4C practitioners. (Chetty 2014: 24)

Just as Haynes and Murriss identified limitations in Lipman's program, in both the choice of texts and how they are used to facilitate philosophical dialogue, Chetty shows that if we think about issues of race, specifically through the eyes of racial minorities, our choice and use of literature can also limit how we think about the

text (2014: 23). Nevertheless, Chetty acknowledges that even though *Elmer and Tusk Tusk* depict race from the perspective of a white author giving a white experience of a coloured person's experience of race, the story can be read against itself (2014: 25–26). This involves questioning the assumptions about race that the story is based on. This is a lot to expect from both the philosophizing children and their teachers. Even if we do not have an explicit manual for the discussion, we carry a tacit manual in our own prejudiced assumptions about what philosophizing about race and tolerance is. Living philosophically with race in philosophy for children practices, then, becomes a deeply challenging way to confront our cultural criteria.<sup>4</sup>

Chetty's criticism is an interesting illustration of the deeply disruptive power of doing philosophy with children that involves culturally problematic topics such as race, gender, religion, sexual orientation, or a range of politically problematic topics. The sensitivity of a topic is, of course, dependent on cultural contexts, but the awareness of how we present, or even avoid, such topics is crucial. It demands of the philosophy for children practitioner sensitivity not only to what understandings, assumptions, and prejudices the children bring into the conversation, but also to what understandings, assumptions, and prejudices the teachers carry and that emerge out of the material (e.g. picture books) used in the philosophical investigations. The third generation of philosophy for children authors are critical not only towards the programmatic tendencies of the first generation but also to how any form of philosophical engagement can carry problematic assumptions.

These examples of the different generations of thought in philosophy for children scholarship are given not primarily in order to criticize earlier generations. Rather, they illustrate growing tensions in the field and different ambitions and expectations of the field and the practice of philosophizing with children. If philosophy can be conceived as a way of living in confrontation with our culture's criteria, as Cavell (1979: 125) suggests, or a matter of remaining in the question, as Kohan (2014: 106) puts it, then such tensions, and the perpetual return to its own practices of thinking, are themselves a mark of how alive philosophy is in the philosophy for children discourse.

## **Becoming Philosophy for Children and Children for Philosophy**

If the criticism of the assumptions in philosophy for children practices and scholarship leads to confrontations with our cultural criteria, it also opens the way for further encounters between philosophy and childhood that make us see beyond the

---

<sup>4</sup>It should be clear that the issue of race and privilege has been an important part of the philosophy for children movement for some time. Philosophy can be seen as an exercise in social, as well as individual, transformation as it raises issues and asks questions that are outside of the established tacit curricula of the privileged. For interesting examples, see the work in Brazil in Kohan (2014).

borders of what philosophy for children has been. Philosophy for children discourse has its own borders and criteria, and the third generation forces us to look further beyond them.

One way of looking at children's philosophizing beyond the influence of traditional philosophy for children is to consider where children's philosophy is happening. In almost all cultural contexts where we find something like, or directly influenced by, the philosophy for children movement, by and large the discourse is concerned with philosophy in school settings, i.e. in the classroom. There are good reasons for this. One of Lipman's main purposes was to give philosophy a place in pre-college formal educational institutions. From that initiative we today find organizations that promote philosophy in schools, such as SAPERE in the UK, the Federation of Australasian Philosophy in Schools Associations in Australia, or SOPHIA in the EU. In some parts of the world, philosophy has a place in the curriculum or as an extra-curricular activity, and in others the question of children's philosophy is not alive at all. We also find examples of how children's philosophical thinking is promoted without connecting it directly to the philosophy for children movement. The worldwide influence, primarily on early childhood education, from the educational endeavours in the Reggio Emilia municipality in Italy is a telling example of how the importance of children's philosophical thought has been emphasized without direct influence from the philosophy for children movement.<sup>5</sup> In Gareth Matthews' writings, however, we can already find plenty of examples of philosophy happening far from schools and classrooms, in encounters between parents and children by the kitchen table while reading together, in children's play, or in bedside conversation while getting children to sleep (see, e.g. Matthews 1980 especially chapter 2).

What happens when the place of philosophy changes? In schools or other institutions of education, philosophy easily becomes an instrument for training things like thinking skills or moral virtues. In fact, when philosophy for children is evaluated, the focus is often on the result of the, often programmatic, practice of introducing philosophy to children in schools (see, e.g. Trickey and Topping 2004; Gasparatou and Kampeza 2012). If we think of philosophy not as part of a curricular practice, with the goal of training children in particular skills (though it can certainly be that too), philosophy for children can promote for its own sake. Philosophy for children is interesting simply because children philosophize. Let me conclude by exemplifying this through Nancy Vansieleghem's philosophical experiments with children in Cambodia.

Rather than setting up dialogues in classrooms or educational settings, Vansieleghem took long walks with children. It was not just walking, however; it was walking between Angkor Wat and the homes of the children, in a place without apparent significance, a dry place of dust and garbage. Those conditions and the heat also made the walks exhausting, so eventually: "Less and less attention was paid to maintaining the usual forms of politeness, to keeping up appearances. The

---

<sup>5</sup> There are examples of how both the Reggio Emilia and philosophy for children movements influence each other. See, e.g. Murris (2016).

growing exhaustion made everyone more honest, more direct and more quiet” (Vansieleghem 2012: 155). Moreover, the language they shared was a sort of ‘tourist language’ – the expressions of exchanges between tourists and locals. The significance of these circumstances is that here Nancy and the children are both lost. None of them know what to do or say in this situation. There are no experts or teachers. Some would say this is not an ideal situation for complex thought. But, it may be ideal for philosophy to begin. ‘What I am doing here?’ or ‘What are we doing?’ may express exactly the sickening wonder (*Thauma*) in which Socrates claims that philosophy begins (Plato 1928b: 155c–d). After a while, the walk became unbearable for the children, and they asked to go back to school, where they were asked to make self-portraits.

Drawing on Foucault (2005), Vansieleghem describes this philosophical experiment as a spiritual exercise, or *askesis*, preparing for *parrhesia* (2012: 165–166). That is, the walk is a repetitive, rhythmic activity without a specific method, goal, or purpose, without meaning, which “enables us to expose things as they are ... and not the way we think they are or wish them to be” (2012: 66). To speak in such a practice becomes a way to single oneself out. To affirm one’s self to one’s self by speaking and acting beyond established ways of speaking and acting.

Vansieleghem’s walking experiment can be read as showing a way in which these children speak back to philosophy. It is a reminder that philosophy, in a certain sense, is not taught, but is a way to live and move outside our cultural criteria, confronting and challenging them. Then, philosophy does not need a classroom, or a program, or established rhetoric, or a certain set of concepts. It does not need knowledge. Philosophy needs courage. The view of philosophy that emerges in experiments such as these is as a way of life that constantly challenges itself. This view of philosophy can also inform how we understand the movements in the philosophy for children discourse. They are movements arising from the discourse being challenged and provoked by children’s philosophizing and, thus, are a sign of its turn from and to itself. Thinking back to Cavell and his son, the question is not what children bring to academic philosophy, but what the particular child brings to the particular academic philosopher – Cavell’s son Ben to Stanley, for example. This shifts the emphasis to the importance of the philosophical experience in the encounter between the child and the adult. That is where philosophy happens; sometimes at a funeral, sometimes with a picture book, sometimes taking a seemingly pointless walk.

When we think of philosophy for children not as a particular discourse, but as something that can happen in our lives of and with children, as an encounter with the particular child provoking and being provoked by our cultural criteria, philosophy becomes, as Vansieleghem has put it, “a gift, as something exceptional, as something extraordinary” (2005: 33). This is a gift of thinking. It comes unexpectedly, as we are, or the child is, struck by a philosophical experience (Bøyum 2004), by the question we don’t even know how to begin to answer, by the expression of an idea we never heard of, by the child trying to find ways to express something never said before. Indeed, this requires what, in Reggio Emilia discourses, is called pedagogical listening. But to even start to listen to children’s philosophy requires a belief that

children have something to say, that they can speak philosophically. The philosophy for children movement can be seen as promoting such a faith in the child, and these different generations of scholarship can be read as continual attempts to renew that faith in the child's voice in philosophy: a faith in living philosophically with children.

and Claudia Ruitenberg

# Introduction: Section 4 – New Areas and Developments

**Kai Horsthemke**

The section *New Areas and Developments* presents essays on relatively new topics and concerns that have attracted the interest of philosophers of education in recent years, as well as novel approaches to philosophy of education. To date, emerging issues that have garnered considerable media attention, such as cyberbullying, school shootings, or radicalization, have been addressed predominantly from psychological and sociological perspectives. By contrast, the essays in this section focus on the philosophical questions that emerge from a study of these phenomena. Other topics, such as academic freedom or the question of non-human animals, are not exactly new but appear to be generating new work within philosophy of education. Finally, the increasing interdisciplinarity of academic departments and institutions, and of academic work generally, arguably requires that philosophers of education examine the boundaries of their field. A few of the essays in this section are concerned, explicitly or implicitly, with the need to address these boundaries and the connections with contiguous fields.

‘Educationalization’ refers to the general tendency to behave as if interpersonal problems could be solved by educational means. Educationalization trends present a tangle of social issues that range from debates about curricular mandates to the responsibilities of teachers for fostering democratic citizenship and environmental sustainability. Lynn Fendler presents historical and philosophical perspectives poised to highlight assumptions about educationalization that have become naturalized in practice.

There is an ongoing discussion about ‘learnification’, about the meaning and importance of the very notion of learning itself for the theory and practice of education. In contradistinction to Plato’s well-known philosophical cave parable, Jan Masschelein offers an educational cave story referring to the event of ‘school’. It is an exercise in educational thought to resist the actual learning discourses and

---

K. Horsthemke (✉)  
KU Eichstätt, Eichstätt, Germany

policies not by criticizing them but, so Masschelein suggests, by trying to ‘repopulate the desert of our imagination’.

Naomi Hodgson explains the notion of the ‘entrepreneurial’ self in terms of how changes that have taken place at the level of government – for example, towards open competition, public participation, performance management based on outputs and feedback – require us to understand and conduct ourselves in particular ways. In recent years it has come to feature in the way we understand the purposes of education, and ourselves in relation to it (for example, as parents, citizens, and as researchers), in particular ways, and thus has become a focus of educational philosophy and theory.

Alexander Sidorkin examines the notion of cumulative versus non-cumulative knowledge as it applies to financial literacy. He contends that mass public education programs may have a tendency to curricularize knowledge, which means shifting knowledge from cumulative, descriptive kinds closer to non-cumulative or normative kinds. Moreover, he emphasizes the need to know not only how institutions operate in the real world but also the likely unintended consequences of the curricularization of knowledge.

In his discussion of the overlaps and distinctions between therapy, philosophy, and education, Paul Standish responds to concerns that education has become too concerned with students’ self-esteem and general mental well-being, to the detriment of more properly educational aims. He considers the ways in which therapy may become miseducative and, conversely, in which education can induce moral distress. He also asks what kinds of happiness education and therapy should foster and when these might be at odds with each other. These points are addressed in the light of historical shifts in the conceptualization of therapy, philosophy, and education and in the understanding of the relationship between these notions.

Until recently, little attention has been paid in the school classroom to creationism and almost none to intelligent design. However, creationism and intelligent design appear to be on the increase and there are indications that there are more countries in which schools are becoming battlegrounds over them. Michael Reiss contends that the ‘worldviews’ perspective on creationism indicates the difficulty of using the criterion of reason to decide whether an issue is controversial or not. It also suggests that standard ways of addressing the diversity of student views in a science classroom may be inadequate.

Education is a fertile ground for neuroscientific applications. However, at the academic level this has predominantly been addressed by cognitive psychology and the emerging field of neuroeducation. Although in its very early stages, there is now also a nascent interest by philosophers of education with respect to the intersections of neuroscience, education, and research. Clarence Joldersma provides a critical analysis of the kinds of philosophical questions and problems that can be posed with regard to the application of neuroscientific considerations to education, as well as of how philosophy of education might be enriched by engagement with neuroscientific research.

Terri Wilson foregrounds the philosophical concerns and tensions involved in the phenomenon of charter schools (USA), free schools (UK), and similar schools that

give students and parents greater choice within public school systems. Wilson focuses on the questions about the purposes, aims, and values raised by autonomous schools of choice along two broad dimensions: (1) rights, pluralism, and autonomy, and (2) democracy, justice, and equity. She concludes by sketching out implications for choice policy and practice, and some recommendations for employing philosophical frameworks in the analysis of these policies.

Zdenko Kodolja distinguishes between the freedom of the university as an institution and academic freedom, the freedom of academics to teach, research, publish, and otherwise make known their considered opinions. Such an understanding of academic freedom is now under challenge from a wide array of critics. In the last three or four decades, both academic freedom and university autonomy have also been considerably diminished in many countries through the implementation of neoliberal politics, one consequence of which has been the increased demands for administrative control and accountability of universities.

The notions of autonomy, authority, and public or community are of renewed interest in new, technology-enabled schooling and learning spaces. In *Social Media, Digital Technology, and Education* Heather Greenhalgh-Spencer draws attention to the ways in which these philosophical ideas emerge within personalized learning contexts.

Videogames have flourished economically and culturally in the first two decades of the twenty-first century, and their educative possibilities have concomitantly been both lauded and claimed to be elusive. Yet, a fairly scant literature to date examines videogames through philosophical lenses. In light of the increased attention paid to videogames in the past two decades in educational theory and research, Jennifer Jenson and Suzanne de Castell focus on fundamental ontological, epistemological, and ethical questions and problems related to video games and learning generally.

Children and young people can be regarded as fully functioning consumers. The intimate connection between children's lives and consumerism is reflected not only in how children spend their free time, but also in the educational environments provided for children and young people. In his contribution, Bruno Vanobbergen focuses on the various ways in which we write and talk about children as consumers, which arguably provides an insight into the various meanings of 'child', 'parent' and 'parenting', as well as children's subjectivity and rights.

Students, teachers, workers, bosses, spouses, and even countries often find themselves on one side or the other of a bullying relationship. This, however, poses the question what exactly bullying is and where it fits in the democratic landscape. Along with defining bullying, discussing its many motivations, and suggesting a path forward, Ron Jacobson also argues that bullying is but one iteration of the eternally contentious case of the 'other'.

The notion of 'trigger warnings' has been used in university discourse to refer to prefatory comments from instructors, warning students that texts and/or classroom discussions may be disturbing to some students. Ironically, trigger warnings are also offered to professors in classrooms where guns may be present. Both kinds of trigger have been viewed by some as at odds with free speech, and by others as necessary for genuinely free speech to prevail. Amy Shuffelton and Samantha Deane

contend that because the language commonly used has material consequences, democracy demands that instructors adopt new metaphors to describe the kinds of arguments that make classrooms places in which education can happen.

Policy makers in all Western and some non-Western countries are giving educational institutions a central position in their public safety agenda against extremism. Yet, whatever research in the field where 'intelligence' and 'security' meet 'education' has been carried out has tended to be preliminary and hypothetical. By analyzing and reconsidering the definition of radicalization for educational purposes, identifying the different dimensions of this growing research domain, and reflecting upon possible educational responses, Stijn Sieckelinck's chapter raises philosophical concerns pertaining to education against extremism.

Maria Victoria Costa argues that the most useful way to draw the distinction between patriotism and nationalism focuses on their respective objects of loyalty. Patriotism is loyalty to a country, whereas nationalism is loyalty to a people. The essay also introduces a number of alternative educational proposals that aim to avoid some of the difficulties faced by patriotic and nationalist strategies. These alternative proposals aim to encourage good citizenship while taking into account new challenges generated by the political, social, and economic conditions of an increasingly globalized world.

Fairly little has been produced on the ethical treatment and status of animals within philosophy of education, apart from the odd reference to humane education. By contrast, environmental education has received wide coverage, not only by philosophers but also by other social scientists, natural scientists, and politicians. Kai Horsthemke's contribution attempts, at least in part, to fill this gap. Among other things, it examines whether anti-racist and anti-sexist education logically entails anti-speciesist education.

Some of the views and analyses offered in this section respond to the standard expectations of a handbook of philosophy of education more tidily than others, that is, those chapters that are perhaps less concerned with providing an overview of the key ideas and arguments within a given topical field or focus area. Because the latter contributions express particular tendencies and personal orientations, they are more likely to be controversial, to stimulate debate about the relevant area and/or development. Either way, the questions and concerns raised and discussed in this section indicate how philosophy of education might be taken into rich new directions.

# Educationalization

Lynn Fendler

## The Concept of *Educationalization*

In 1997 educational historian Marc Depaepe introduced the term educationalization as a “key concept in understanding the basic processes in the history of Western education” (p. 1). In the process of puzzling out the complex relationships between education and their respective social contexts, Depaepe called upon the German concept of *Pädagogisierung* to capture an historical trend in which education was transformed from a medieval practice of spiritual devotion to a modern mechanism of social melioration. Educationalization began as a concept of historiography and has since been extrapolated into educational philosophy, sociology, and theory to highlight particular discursive trends pertaining to educational systems, educational policy, and educational research.

Depaepe (1997) characterizes educationalization as being commensurate with sociopolitical efforts toward civilization and normalization in modernity. In his analysis, educationalization is a concept that allows us to understand a pattern in the role of schooling relative to historical—social, political, cultural, linguistic, economic, and scientific—contexts. In particular, Depaepe describes educationalization as an “ongoing modernization process” (Depaepe 2012, p. 167) in which social problems were shifted away from economic, political, and ethical discursive frameworks and gradually absorbed into educational discursive frameworks.

The concept of educationalization can be clarified by contrasting it with other historical epistemes. Poverty, as a case example, has been understood differently in different historical eras. In feudal times, poverty was understood as a function of birthright; nobility were entitled, and commoners were not entitled, so education had no relevance to poverty. In the sixteenth century poverty could be understood in

e-mail: [fendler@msu.edu](mailto:fendler@msu.edu)

Calvinist theological terms; wealth was an indication of God's blessings for righteousness, and poverty an indication of God's disfavor with sinfulness. In that case, devotion to the Protestant ethic had more relevance to poverty than education had. Enlightenment thinkers tended to explain poverty as an early stage in the process of natural development toward civilization; poverty would be reduced as nations progressed toward civilization. The civilizing process may have included expansion of educational opportunities, but civilizing usually had more to do with organizing governments in a European rational and Western principled way than with educational processes. In modernity, it became possible to understand poverty in terms of agency, meritocracy, and individual effort; it became possible to imagine that one could deliberately work one's way out of poverty. During modernity, some degree of Enlightenment belief in the power of a rationally organized society persisted alongside beliefs in individual meritocracy, which forms the basis for modern institutionalization. When poverty is understood as a product of individual skills and capacities within a rationally organized society, then it is easy to see how education could be seen as a promising mechanism for addressing the problems of poverty. In addition, education has been regarded as a minimally coercive social mechanism that allows for individual autonomy, which is consistent with a modern worldview. As this example shows, when we take note of historical changes in the discourses of poverty, it is easier to grasp the particularities of the concept of educationalization as a pattern that describes historical changes in modern times.

Since Depaepe's (Depaepe 1997) historically elaborated theorization of educationalization, the concept has been deployed also by educational philosophers and sociologists to shed light on ways education has become a political hot-button issue. The issues associated with educationalization have been taken up by scholars from an array of diverse political positions who tend to believe that schools are not the appropriate mechanism for solving social problems. For example, right-wing think-tank contributor Charles Murray agrees that educationalization is a key concept for understanding modern social relations. Murray's position on race and intelligence is famously objectionable (Herrnstein and Murray 1994), and at the same time, Murray's statement about education shows that educationalizing trends are recognized not only by critical intellectuals but also by writers from conservative and neoliberal ideological positions:

Education is becoming the preferred method for diagnosing and attacking a wide range [of] problems in American life. The No Child Left Behind Act is one prominent example. Another is the recent volley of articles that blame rising income inequality on the increasing economic premium for advanced education. Crime, drugs, extramarital births, unemployment – you name the problem, and I will show you a stack of claims that education is to blame, or at least implicated. (Murray 2007, p. A21)

Educationalization as a concept has appeared in educational history, philosophy, and theory to call attention to historical shifts in the assumed purposes of schooling and educational policy in which education is assumed to be the vehicle by which social problems may be ameliorated. Educationalization is aligned with modern rationalization and scientification of society. The concept is used and understood similarly by theorists from a broad range of political perspectives who are critical of

trends that shift responsibility for social problems from governments onto educational systems.

## **Educationalization in History**

School systems around the world were expanded throughout the nineteenth century as a constituent element of modernization. The expansion of schooling occurred as an attempt to manage demographic shifts, industrialization, and sociocultural changes brought on by developments in travel, communication, technology, and infrastructure. Schools are now ubiquitous and schools belong to everybody. In this set of circumstances, governments and corporations have turned to schools as institutional mechanisms for advancing particular kinds of knowledge, skills, and dispositions. Different stakeholders advocate different purposes of education: corporations want skilled workers, cultural reformers want critical thinkers, social conservatives want self-regulated citizens, parents want happy children with opportunities for advancement, democratic political activists want equity and social transformation. As educational stakeholders proliferated, the purposes of education diversified accordingly and contributed to the growing acceptance of educationalization. This section is organized topically to introduce major themes in the history of educationalization.

### ***Educationalization in the Context of the Twin Agenda of Social Sciences***

The history of the social sciences makes apparent the twin agenda of scientific research in relation to social policy, including educational policy. From the rise of social sciences as a discipline in the late nineteenth century, there have been implicit and explicit debates about whether it was the proper role for social science research to provide scientifically neutral and objective facts or to identify and provide solutions for social problems (see, e.g., Furner 1975; Hatch 1988; Heilbron et al. 1998). The pattern established in the early days of the discipline is sustained to some degree in current debates that constitute educationalization trends: Should the aim of educational research be to generate neutral scientific information or to provide normative guidance for policymakers? When social sciences are understood as tools for solving social problems, the role of educational research in the social sciences is perceived not as disinterested scientific inquiry, but rather as purposeful engineering: applied problem solving that ought to address perceived problems in the functioning of schools.

Various stakeholders promote educational reforms with slogans such as No Child Left Behind, Race to the Top, and Learning Today for A Better Tomorrow. The ‘America COMPETES Act’ [*Creating Opportunities to Meaningfully Promote Excellence in Technology, Education, and Science*] is an example of educationalization insofar as it formalizes the assumption that education is the mechanism that will

serve to advance national agendas. The stated purpose of America COMPETES is: “To invest in innovation through research and development, and to improve the competitiveness of the United States” (American Innovation and Competitiveness Act, 114th Congress, 2015–2016). It was enacted in 2007 and reauthorized in 2011. These current educational policy reforms are instances of the social-meliorationist agenda of contemporary social sciences.

### *Educationalization and the Construction of the Child*

When school systems were established in the nineteenth century, and the institution of the school became more socially acceptable, children began to be seen as students and understood in terms of educational categories such as grade level, aptitude, and normalization. A historical context of educationalization circumscribes what it is possible to think about childhood and the child.

Depaepe and Smeyers (2008) argue that the processes of educationalization constructed a child in the manner of a “secularized Christianity” (p. 380). When education is held to be the mechanism for solving social problems, the purpose of education is to ‘save’ the child from antisocial behaviors and immoral dispositions. This educational mission of salvation has two major implications. First, the child is constructed in terms of dependency. The child is no longer seen as a pure or noble savage, but rather as a helpless entity without agency that must be trained in a way that will advance social development. Second, the child is constructed in terms of pathologies. Abnormal children are diagnosed and distinguished from normal children. Education then becomes the process of therapeutic intervention designed to rectify abnormalities and normalize children in accordance with conventions of a regulated citizenry (Foucault 1978).

In the course of educationalization, childhood has been constructed as a period of dependency and pathology. ‘The Child’ has been made into a target of intervention for purposes of rational and scientific advancement of civilization, which includes socialization, normalization, and moral correction.

### *‘Failing Schools’ Movement As an Instance of Educationalization*

In the twenty-first century, educationalization appears in popular discourse in the context of educational reform debates. For example, it is common for policymakers to portray schools as failing and to point to the failures of schools as the cause of social ills. Tomlinson (1997) argues that the Education Act of 1993 (UK) contributed to the codification of the idea of ‘failing schools’. The ‘Failing Schools’ movement is an expression of educationalization insofar as schools are held accountable for crime, poverty, and inequality (Tomlinson 1997).

In the United States, the idea of failing schools was brought to public attention in 1983 with the No Child Left Behind (NCLB) report. NCLB was followed by Race to the Top in 2009, both of which were designed to blame failing schools for poor performance on national and international test scores.

## **Why Is Educationalization So Widely Accepted?**

Multimedia education reporter Sarah Gonzalez (2016) reported the central debate about educationalization in the succinct question: “Do you fix education to cure poverty, or do you cure poverty to fix education?” (Paymon Rouhanifard quoted in Gonzalez 2016 online). In a theoretical sense, the relationship between educational achievement and poverty is that of chicken and egg. However, in practice, sociopolitical trends around the world have adopted a unidirectional and linear view of the relationship, namely, that we ought to fix education first in order to cure poverty. That linear framing of the problem—we should fix education to cure poverty—is the foundational assumption of the historical process of educationalization.

The cyclical chicken-and-egg relationship between education and poverty is one of the conundrums of educationalization. Another difficulty is that it has been proven time and again that education is a very weak institution, neither designed for nor capable of solving social problems. So if education is so notoriously ineffective for solving social problems, why would policymakers and commentators continue to expect schools to serve as the mechanism for solving social problems? This section offers five perspectives that may be relevant in considerations about why educationalization is so widely accepted in spite of its unsuitability to the task. In the face of consistent evidence to the contrary, why do societies continue to behave as if educational institutions had the potential to cure poverty, crime, chronic disease, inequality, and environmental pollution?

### ***Educationalization Makes Intractable Social Problems Seem Manageable***

Educationalization may seem acceptable because all other approaches seem impossible. As Tomlinson (1997) writes, “It has become easier to blame schools than to re-structure the economy” (p. 95). Poverty, social injustice, and environmental degradation are endlessly complex problems that have been articulated and interpreted from an array of competing ideological standpoints. One ideological standpoint is preordination; ideologies (religious or secular) that assume some degree of predetermination tend to adopt the stance that poverty and social inequalities are preordained (divinely or biologically) and indicative of salvation/survival or damnation/extinction. From that stance, it is not within human capacities to cure

poverty. Within the standpoint of predetermination, the purpose of educational institutions is to uphold and provide validation for the allegedly fore-ordained order of things. Another standpoint is meritocracy; ideologies that assume social status is earned tend to adopt the stance that poverty and social inequalities are logical consequences of individual effort and willpower. From that stance, the assumed approach to curing poverty is to provide incentives for productive participation in a capitalistic world order and disincentives for opting out of the production economy. A third standpoint is social welfare; ideologies that assume society's purpose is to provide basic human needs unconditionally for all people tend to assume that people are endowed from birth with inalienable rights. From that stance, the assumed approach to curing poverty is the creation of legislation and policy that redistributes resources more equitably. These various ideological stances are present to greater or lesser degrees in most modern societies; the stances are fundamental, intractable, irreconcilable, and impervious to modification by reason or argument. These competing agendas make it seem impossible that we would ever be able to solve social problems through social mechanisms. In contrast, educational institutions, which are already well established and pervasive, may appear as the most likely mechanisms with potential to solve social problems.

Because societies are comprised of stakeholders with incommensurate ideological stances, advocates from various perspectives tend to talk past one another, which thwarts communication and debate. At the same time, modernization entails the belief that human intervention can manage problems and improve society. If it is not possible to engage in debate across ideologies, then social problems appear to be intractable. However, even in the context of competing stakeholders, it is still possible to target educational systems as the most promising site for advancing one or another ideological stance. Educational systems are ubiquitous, the vast majority of people in the world are compelled to enroll in schools, and there is a widespread belief that everyone who has attended school is thereby qualified to determine how schooling might be improved. Such a diversity of viewpoints has yielded non-commensurable ways of thinking about causes of social problems; but regardless of one's ideological position, education systems are handy targets for criticism and reform (Funicello 1994).

Ladd (2012) argues that education policymakers tend to buy into educationalization practices because they do not have any influence over socioeconomic conditions:

The observation that low SES is highly predictive of poor educational outcomes by itself provides little guidance for education policymakers who have little or no control over the backgrounds of the students, at least in the aggregate, within a community. (p. 17)

Educationalization may appear to be the only, or at least the most promising, approach for addressing perennial social problems such as poverty, inequality, and environmental degradation, which have remained impervious to solution by other means.

## ***Educationalization Feels Like Doing Good***

Many people object to ways schools are run, and some argue that education should not take the form of schooling. Nevertheless, virtually everyone agrees that education is a good thing. Because education enjoys such a positive normative reputation, it is virtually impossible to find anyone who argues that we should abolish education, or that less education would be beneficial for people. To be educated is universally desirable. Therefore, to appeal to education systems as a means for social improvement feels like a beneficial act of goodwill that appeals to the broadest possible constituency. Whereas stakeholders from competing ideological positions may disagree about legislation or taxation, they are unlikely to disagree about the need for education. From that perspective, educationalization seems like a virtuous path toward progress, growth, and development.

Education feels like a good thing also because it is regarded as a means of empowerment. From the early days of the American Social Science Association (founded in 1865), education and social improvement have been conjoined. Cruikshank's (1999) work calls our attention to ways educationalization is a project of empowerment. She analyzes the ways empowerment works to produce citizens, which is widely advocated as a fundamental purpose of modern education. If we take her analysis and substitute *educators* for *citizens*, then we gain some critical purchase on the appeal of educationalization as a means of empowerment:

Like any discourse, the discourses of empowerment are learned, habitual, and material... It is quite natural to seek the cause of political problems in order to prescribe a cure. It is my hope that readers...will find it harder to pin a political problem on the lack of *education*. I hope that in its stead we will interrogate what there is in the will to empower, the technologies of *educationalization*, and arts of government by which the various kinds of *educational systems* we have are constituted. (Cruikshank 1999, p. 123; italicized words added in place of the original *citizen*, *citizenship*, and *citizens*)

Cruikshank (1999) sees empowerment as yet another kind of discipline: "I link the operationalization of social scientific knowledge to what Theresa Funciello calls 'the professionalization of being human' or what Foucault called 'bio-power'" (Cruikshank 1999, p. 20). From this point of view, the appeal of educationalizing trends becomes apparent. Educationalization is desirable because it is perceived to empower people and not to patronize them or enable helplessness.

## ***Educationalization Raises the Status and Profits of Education Professions***

Educationalization's widespread acceptance is also bolstered by the agendas and priorities of professionals in the broad field of education. Academic, corporate, foundation, and cultural educational institutions accrue status when education is regarded as the primary means by which social problems may be ameliorated.

For academic grant-funding applications, it is relatively easy to provide compelling warrant for an educational study when the rationale for that study is the potential reduction of endemic poverty, and not just the raising of standardized test scores. University researchers and teacher educators may be seen as highly qualified experts in the efforts to improve society when education is regarded as the primary means by which social problems might be solved. Academic educational professionals stand to gain in status in the historical context of educationalization. Hodgson (2010) argues that educational researchers, even in their attempts to analyze the term, have ironically contributed to the durability of the concept of educationalization:

The reduction to the sub-field of education policy sociology arguably represents the educationalisation of educational research itself. Educational research is governed – indeed governs itself – according to the dominant discourses of education policy, the field of education policy sociology representing the operationalisation of key concepts in pursuit of solutions. (Hodgson 2010, p. 139)

Not only university educational professionals' agendas but also educational corporations' agendas are advanced when education is perceived as the means to address social problems. Corporations that develop and market educational tests have profited enormously in the last decades by the increased reliance on educational mechanisms as the pathway to progress and social advancement. The 'Big Three' educational testing corporations—ETS, College Board, and ACT—have enjoyed record gains: "The Big 3 Testing Companies enjoy average profit margins that are 62% larger than the 5 largest American nonprofits" (Americans for Educational Testing Reform 2012, online). The educational testing industry has expanded greatly in the twenty-first century, and that expansion is supported by the widespread acceptance of educationalization trends.

A third group of education professionals includes governing bodies, elected and appointed government officers at national, state, local, and school-board levels. In the United States in 1979, the structure of national-level cabinets was reorganized. The Department of Health, Education, and Welfare was split into two different cabinets: the Department of Education and the Department of Health and Human Services. Beginning in 1980 then, the Department of Education was constituted separately from the Department of Health and Human Services. This reorganization of cabinet departments may have served to bolster educationalization trends by institutionalizing the separation of education from human services. As long as education is perceived as the crucial institution for addressing social problems, experts in the field of education—including government, policy, corporate, and academic professionals—stand to gain in status and financial advantage.

### *Educationalization Aligns with Neoliberal Social Policies*

It has been well established worldwide that student test scores are correlated with socioeconomic status: the poorer the school district, the lower the test scores (see, e.g., Ladd 2012). This correlation has been called "The Volvo Effect"

(Sacks 2000); if you count the number of Volvos in a neighborhood, you can predict with considerable accuracy the standardized test scores of that school district. When socioeconomic status is correlated with educational test scores, it is easy—if not accurate—to slip into an assumption of causality. In that case, it appears as if we might be able to raise people's standard of living if we can just prepare them educationally to attain high scores on standardized tests. This chain of reasoning (however faulty) is an example of the alignment of educationalization with neoliberal social policies insofar as the potential solution for social problems can be framed in terms of individual competitive efforts and success in terms of capitalistic performativity (Fendler 2008).

Simons and Masschelein (2008) analyze the ways educationalization is aligned with entrepreneurial imperatives of neoliberalism. To improve education is to advance employability and thereby to serve the interests of a neoliberal capitalistic productivity agenda. They argue that the purpose of education in modernity has been to cultivate adaptation to the entrepreneurial imperatives of a neoliberal society:

The entrepreneurial self experiences learning as the force to guarantee a momentary emancipation in environments through delivering useful competencies. Learning, therefore, is experienced as a force to deal with the 'mancipium' or the hold of the environment (such as limited resources or needs). Hence, for the entrepreneurial self, living and learning become indistinguishable. (Simons and Masschelein 2008, p. 409)

The policies and practices associated with educationalization align with neoliberal ideologies of individualism, productivity, competition, and capitalistic profit. The contrasting ideological stance—namely, that we should eliminate poverty to fix education—would be less compatible with neoliberalism insofar as eliminating poverty through political, economic, and legal action could be seen as social welfareism, which is anathema to conservative ideologies that subscribe to Protestant-ethic moral precepts. Within an episteme of educationalization, schooling becomes the work one does to earn basic rights and social services, which aligns with neoliberal worldviews.

## Critiques of Educationalization

For the most part, educationalization has intensified over the past century not as an explicit goal of policy or government, but rather as a gradual process of political, legal, and cultural developments. Many scholarly treatments of educationalization consist of non-normative historical descriptions. That is, histories are primarily descriptive accounts of the ways educationalization has operated across various social sectors. However, educationalization has also been the object of critique on the basis of its infantilizing effects, its impracticality, and its promotion of privatization agendas.

### ***Educationalization Is Patronizing and Infantilizing***

Gruber (2004) argues that educationalization has had the effect of making people more stupid [*dümmer*]. In other words, subjectivities are constructed differently depending on whether social problems are construed as political or educational. When social problems are construed as political and/or economic, the amelioration of those problems is accomplished through legislative and policy reform. However, when social problems are construed within discourses of education (i.e., educationalization), the amelioration of those problems is accomplished through pedagogical intervention. Schooling has been influenced by developmental psychology and child-centered pedagogy, which contribute to infantilization when they construct children as incomplete adults (see, e.g., De Winter 2003).

Similarly, Depaepe and Smeyers (2008) point out that educationalization can be regarded as working in opposition to freedom or emancipation:

educationalization could easily be read in oppositional terms, over against autonomy, liberation, and independence—due to increased dependence, tutelage, patronization, mothering, infantilization, pampering, and so on—it looks, also in this respect, rather similar to ‘medicalization’. (p. 382)

The educationalization of social problems has been critiqued for the degree to which it constructs educational subjects that are helpless and dependent, rather than emancipated and autonomous.

### ***Education Is a Weak Institution***

While politicians and popular media tend to blame failing schools for increases in social problems, most educationalists take the position that education is a weak institution. Schools have had relatively little effect—for better or worse—on the economy, culture, crime rate, social mobility, or quality of life. In spite of rhetoric to the contrary, historical analyses have repeatedly shown that schooling has not contributed significantly to one’s ability to climb the social ladder or escape from poverty. As Labaree (2008) wrote: “the effort to educationalize social problems in the United States has been enormously successful even though educationalization has been a failure at solving these problems” (p. 453).

Sociologist Tomlinson (1997) argues that educational institutions neither caused social problems nor are capable of fixing them: “Structural changes in the economy, not failing schools, have led to the need to ensure, for the first time in Britain, that all students are educated to higher levels than hitherto” (p. 95). Similarly, Boudon (1974) argues that increased access to education and improvements to education have not had the effect of reducing social inequality or decreasing poverty. In his chapter ‘What the Data Tell Us About Mobility’, Boudon remarks on the ironies of educationalization: “the lower classes *must* demand more education. In making such demands, however, they will only be preventing the reduction of the chances

of moving intergenerationally upward; their chances of achieving upward mobility will not become greater” (p. 183).

There is simply no research indicating that educationalization of social problems has been effective in meeting the challenges of poverty, social injustice, inequality, and environmental degradation. Education overall is a weak institution, ill equipped and incapable of accomplishing the tasks set for it by educationalization reformers.

### ***Educationalization Promotes Privatization***

When social problems such as poverty are regarded as educational issues, then the solution to those problems is educational improvement, often through school reform. The perceived need for school reform opens the door to market-based approaches, which appeal to conservative and neoliberal political orientations, and is the target of critique by most academics and educational researchers. Tomlinson (1997) critiques the privatization trends in education when she describes the 1992 and 1993 Education Acts in the United Kingdom:

The legislation concerning school failure and the creation of Education Associations was political in origin and was designed as a way of making more schools in urban Labour-controlled authorities become grant-maintained.... The new framework was ... a continuation of the policies for a diversity of schools set in train by the 1988 Education Act... This diversity was intended to remove control of schools and school admissions policy from local education authorities, as was open enrolment – the policy of allowing schools to expand and for parents to ‘shop around’ for the best schools. (Tomlinson 1997, pp. 85-86)

The educationalization of social problems can be aligned with school privatization trends; however, critics argue that the characterization of schools as failing is a product of educationalization, rather than the cause of social problems.

## **Implications of Educationalization**

Educationalization is a broad discursive social trend and as such is implicated in an array of social domains. In the history of education, educationalization has had influences in educational policy, teaching, and curriculum.

### ***Implications of Educationalization for Educational Policy***

Biesta (2009) uses the term “learnification” to describe the transformation of educational language into the language of learning:

This rise of what I have called the ‘new language of learning’ is manifest, for example, in the redefinition of teaching as the facilitation of learning and of education as the provision

of learning opportunities or learning experiences; it can be seen in the use of the word 'learner' instead of 'student' or 'pupil'; it is manifest in the transformation of adult education into adult learning, and in the replacement of 'permanent education' by 'lifelong learning.' 'Learning' has also become a favourite concept in policy documents. (Biesta 2009, p. 39)

For Biesta, the implication is that educational policy debates no longer question the purposes of education, but rather discuss education in the relatively technical terms of learning. This narrowing of focus for discourses of educational policy has had the ironic effect of further impoverishing educational institutions. Misguided efforts to justify education on the basis of measureable progress have had the effect of reducing the focus of educational policy to the most trivial of pursuits, namely, raising test scores.

In a parallel argument, Simons and Masschelein (2008) document the shift in educational policy language from functions to competencies. They highlight especially the alignment of educational policy with employability in the context of educationalization:

Competencies refer in fact to the intersection between schools (and learning) and the requirement of employability—that is, they represent employable learning results. From a managerial and educational/instructional viewpoint, not just professional labor but also life as such is regarded as a competency-based performance. (Simons and Masschelein 2008, p. 401)

The educationalization of social problems has had the effect of shifting the focus of educational policy away from broad ethical and philosophical value judgments and onto narrow, technical, and instrumental concerns such as how to raise scores on particular standardized tests for particular populations.

### *Implications of Educationalization for Teachers*

In the context of educationalization, when education is held to be responsible for solving social problems, teachers are seen as major players in efforts to reduce poverty and inequality in the world. Educationalization has had the effect of intensifying accountability measures for teachers. The culture of monitoring and assessment is apparent in the development of standards for teaching and teacher education, and in the increase of teacher evaluation instruments.

Current mechanisms for regulating teachers include the expectation that teachers will buy into educationalization assumptions by engaging in professional development to improve their teaching:

In order to guarantee the employability of teachers, the government has identified and disseminated a set of basic competencies. However, the government also stresses that in order to remain a professional, it is important for teachers to take care of their ongoing professional development. (Simons and Masschelein 2008, p. 402)

In conjunction with the “failing schools” movement (Tomlinson 1997), teachers have been subjected to heavier demands to improve their pupils’ test scores. In spite of the fact that socioeconomic status is the best predictor of student test scores, the context of educationalization tends to shift responsibility for student test scores from conditions of poverty and inequality to teachers and teaching methods.

### *Implications of Educationalization for School Curricula*

Just as the American Social Science Association combined purposes of intellectual inquiry and social reform, a Problem-Based Learning (PBL) approach to curriculum combines intellectual pursuits together with applied solutions to everyday problems. The combination of intellectual and practical domains is characteristic of professionalization trends. In this way, discourses of relevance, motivation, and utility combine with science (a conflation of science and engineering) to render a particular professionalized worldview, for better or worse. As a result, it has begun to make sense to look at the world in terms of problems to be solved. When we see the world in terms of problems to be solved, then knowledge pursuit must be justified in terms of applicability and utility. Applications for grant funding increasingly require an answer to the question ‘So what?’ which means ‘What good will this do us?’. Some scholars regard this applied professional approach to curriculum design as a helpful and effective approach; others regard applied professionalism as overly technical.

This current educationalizing trend of investigating the world in terms of problems to be solved may appear to be an expression of utilitarianism. However, the current version of utilitarian thinking has diverged dramatically from that of John Stuart Mill, and the difference signals an ethical quandary in education. Mill, for example, supported Comte’s distinction between the concrete and abstract sciences. For Mill scientific development meant a progression toward mathematics and away from social governance concerns. Mill explicitly argued against an approach to research that is oriented toward solving problems:

How few ... of the discoveries which have changed the face of the world, either were or could have been arrived at by investigations aiming directly at the object! Would the mariner’s compass ever have been found by direct efforts for the improvement of navigation? Should we have reached the electric telegraph by any amount of striving for a means of instantaneous communication, if Franklin had not identified electricity with lightning, and Ampère with magnetism? (Mill 1865/2005, online version)

Problem-Based Learning, then, illustrates a particular way educationalization works in research and schooling these days. Justified on the basis of its scientific relevance and professional utility, PBL represents a radical departure from earlier notions of science and utility. The PBL approach also circumscribes what counts as knowledge and reinforces the attitude that education ought to be about engineering: solving existing problems.

## Conclusion

Educationalization began as an historiographical concept that highlighted broad historical shifts in the role and purpose of education relative to more general social developments. Philosophers, theorists, and sociologists have used the concept both to describe larger social trends and to critique oppressive social technologies. There is no research that suggests educational systems are capable of addressing social problems, and yet the educationalization of social problems shows no signs of diminishing in intensity.

Educational sociologist and historian David Labaree (2008) argues that educationalization and its failure are understandable features of the inherent qualities of liberal democracies:

[E]ducation accomplishes what we want rather than what we say. We ask it to promote social equality, but we want it to do so in a way that does not threaten individual liberty or private interests. We ask it to promote individual opportunity, but we want it to do so in a way that does not threaten the integrity of the nation or the efficiency of the economy. As a result, the educational system is an abject failure in its ability to achieve any one of its primary social goals. It is also a failure in its ability to solve the social problems assigned to it, since these problems cannot be solved in a manner that simultaneously satisfies all three goals. (Labaree 2008, p. 456)

Historians, philosophers, sociologists, and educational theorists have recognized the educationalization of social problems as a feature of modernity. The persistent failure of educationalization to solve social problems is also widely recognized by researchers and policymakers. Nevertheless, the inherent contradictions of liberal democracies and the professional interests of educational researchers and policymakers seem to guarantee the continuation of the educationalization of social problems for the foreseeable future.

# An Educational Cave Story (On Animals That Go to ‘School’)

Jan Masschelein

“...the eye was not always intended for contemplation...”

M. Foucault

Today, both at the level of educational discourses and of actual educational policies, it is all about ‘learning’. As a ‘learning-intensive society’, we have to look for ways to maximize the learning gains and investigate how we can do that efficiently and effectively (cf., e.g., Miller et al. 2008). Meanwhile, there are many voices that critically address this focus on learning. They question not only the implied capitalization and instrumentalization of learning but also the relevance of the very notion of learning itself for the theory and practice of education. Indeed, they reemphasize the notion of education itself, either by focusing on the aspect of ‘teaching’ or by reevaluating the notion of ‘study’ (Biesta 2013; Blacker 2013; Lewis 2013; Simons and Masschelein 2008). While very sympathetic to these critical voices, this essay rests on the conviction that in order to resist the learning discourses and policies and to reclaim the notion of education, it is worthwhile also to reconsider our understanding of ‘school’, thereby not reducing it immediately to a normalizing and/or functional institution. Instead we can approach it rather as a particular chronotope or time-space of an *animal educabile*: bringing people and world into each other’s company in a particular way while performing specific operations (suspension, profanation, attention formation, see further) and actually enabling education to happen. In other words: to reconsider ‘school’ implies trying to give the notion a different flavor. We began this attempt in *In Defence of the School. A Public Issue* (Masschelein and Simons 2013), and here the aim is to further this endeavor by

offering an *educational cave story* that refers to the event of ‘school’ and the emergence of the pedagogue, a story that is distinguished from the famous and still very powerful *philosophical cave fable*. I am aware that we should not lose ourselves in oversimplified binary oppositions, such as between a ‘philosophical’ and an ‘educational’ view. Not only can each be understood in very different ways, but also the relation between them is intricate and complex (e.g., Kohan 2014; Larrosa 2011). My aim here, however, is not to engage in a ‘proper’ argumentative discourse or analysis, but rather to assume in some sense what Tyson Lewis has called the ‘fabulous character’ of educational thought,<sup>1</sup> its “precarious location between ... truth and fiction”, which it has to acknowledge if it is “to testify to the difficulties of education as practice without surefire answers” and to “reopen us to the experience of education” as one of indeterminate potentiality (Lewis 2012, pp. 340–341). Therefore, I hope the reader will not mistake what follows for a statement of ‘philosophical truth’ or a claim to a true history (e.g., of the school, the pedagogue) – even if I will relate to some philosophical arguments or historical ‘facts’ – nor for simply a fictitious story. It is fiction, for sure, but not falsity. It is not lying, as Rousseau states (and Lewis reminds us). It is fiction also in the sense that Jacques Rancière understands it: using common linguistic powers “in order to make objects visible and available to thinking” (Rancière 2000, p. 116). With this fable or story, combining narrative and image, then, I hope to contribute to an *educational* thinking of ‘school’ (and ‘pedagogue’). It is an exercise in educational thought to resist the actual learning discourses and policies, not by criticizing them but by trying to populate our educational imagination with a different cave story. One that might help us to approach and conceive of education and school, both theoretically and practically, in a slightly different way.

## The Philosophical Cave Story

Philosophy and education, including ‘philosophy of education’, have at least one clear connection to caves. Indeed, to the present day, Plato’s famous cave story is recalled and discussed time and again in various philosophy and education texts and courses.<sup>2</sup> Plato’s story offers a particular fabric of enlightenment, education, and liberation, including the image of ‘conversion’ as a (re)turn to the (sun)light. It continues to haunt not only our philosophical but also our educational imagination.

---

<sup>1</sup>I deliberately don’t use ‘philosophy of education’ or ‘educational philosophy’. Both seem to imply that ‘philosophy’ is the central issue. Although I am very much ‘into’ philosophy, I want to emphasize education as the central issue. In German and Dutch, there exists also the notion of *Pädagogik* or *pedagogiek* which can be said to be ‘general’ (*allgemein*) or ‘philosophical’, general and philosophical being describing adjectives of *Pädagogik* or *pedagogiek* as (being the) substantive. I suggest to translate these notions as educational or pedagogical thought (not theory).

<sup>2</sup>In an ‘Excursus on the cave’, Hans Blumenberg (1993) recalls various other connections to the cave as metaphor or ‘real’ place, from Cicero to Montaigne, Bacon, Descartes, Jean Paul, and Nietzsche.

Notwithstanding the sometimes radical critiques that have been addressed at Plato’s claims, the powerful imagery of education as liberation from the darkness of the cave to discover, individually and with others, the freedom that may come if we travel into the light remains very attractive both to philosophers and/as educators (Burch 2011). This imagery includes the ‘duty to return’ to the cave precisely to liberate those captivated by the shadows. I propose to call Plato’s fable<sup>3</sup> the *philosophical* story of the cave, which affirms the role of philosophy and, especially, the necessity of the presence of the philosopher as master educator, without whom it would be impossible to get out of the cave. This liberating role of the philosopher is something that (s)he takes up as a heroic duty. As Heidegger (1933/2001) famously said in his commentary on Plato’s story: the philosopher who returns exposes him/herself to (the risk of) death.

In Plato’s fable, the cave is valued negatively. He is not thinking about historic or prehistoric cave dwellers. The cave is not a refuge, but a prison. The word ‘cave’ is in fact the summary of a concrete condition of limitation and insufficiency, the indication of a ‘fallen’, inauthentic, joyless, insufficient, unsatisfactory life.<sup>4</sup> For Plato, this condition is the normal or common one; the people in the cave are no ‘atopoi’, but are all people (Blumenberg 1993, p. 37). It is no ‘natural’ or unchangeable condition, however, but an effect of negative influences (decline or oppression or oblivion). It is precisely the ascending and converting movement, the movement of ‘paideia’, that is the true ‘nature’ of humans. This movement brings them to contemplation – a capacity that seems to be human’s ‘natural’ capacity<sup>5</sup> and true destination. Humans are creatures whose destination it is to be philosophers. Hence, Hannah Arendt called the allegory of the cave a “kind of concentrated biography of the *philosopher*” (Arendt 2005, p. 29).

From the story it is clear that ascending out of the cave requires an external force to break the chains and initiate the conversion. Everything refers to above and outside, and the philosopher’s descent into the cave is itself also forced and has the heroic objective of liberating the others. Fundamentally, the story offers a scene of impotence, of a lack and of necessary transcendence: humans’ legs and necks chained in darkness, “frozen, chained before a screen, without any possibility of doing anything or communicating with one another” (ibid., p. 31). They can only see

---

<sup>3</sup>As Barberà (2010, p. 105) states: “the well-known image of the cave, εἰκὼν, reveals an astonishing and intriguing variety of interpretations of this image: ‘allegory’, ‘myth’, ‘fable’, ‘parable’, ‘simile’ and ‘comparison’, to cite but a few”. Since he emphasizes especially the element of creation of the ‘image’ besides the ‘narrative’, the notion of fable seems adequate. I will use both fable and story without going now into a discussion about their difference.

<sup>4</sup>For a more positive and rich analysis of the meaning of the cave in ancient Greece, see, e.g., Bachelard (1948).

<sup>5</sup>Compare: “Of this very thing, then”, I said, “there might be an art, an art of the speediest and most effective shifting or conversion of the soul, not an art of producing vision in it, but on the assumption that it possesses vision but does not rightly direct it and does not look where it should, an art of bringing this about”. Plato, Republic Book 7, 518d. Plato in 12 Volumes, Vols. 5 & 6 translated by Paul Shorey. Cambridge, MA, Harvard University Press; London, William Heinemann Ltd. 1969. <http://www.perseus.tufts.edu/hopper/text?doc=Perseus%3Atext%3A1999.01.0168%3Abook%3D7%3Apage%3D518>. Accessed 25 July 2017.

what is before them, unable to relate to each other, trapped in mere appearances. They are beings who, as philosophers or at the hand of the philosopher, have to (be) turn(ed) around and ascend to the light. The conversion is, then, a return to the world, out of which humans had fallen into the darkness of a disastrous condition. This philosophical cave story, told within the context of a search for the ideal, just state, is basically a story about the conversion of the soul as an enlightenment that maintains the transcendental sovereignty of Being and, in particular, that declares and affirms philosophy and the philosopher as what and who is needed to lead the human being from the darkness to the (sun)light (and back). One commentator wrote that Plato's story is an allegory, which, according to him, is one of the ways in which philosophy detaches itself from mythology (Verhoeven 1983). It implies, as we mentioned before, that Plato is not writing about another world, but rather elaborates a different way to look at this world that we all are living in (even if his way includes making a distinction between the world of the cave and the world of ideas).

In Stanley Cavell's inspiring reading of Plato's story, the cave "represent[s] primarily a familiar place from which to locate the full beginning of what we understand philosophy to aspire to be ... A perception of [the moral life] as moving from a sense and state of imprisonment to the liberation of oneself by the transforming effect of what can be called philosophy" (Cavell 2005, p. 317). He writes about "guiding [the self] to a path of enlightenment" (*ibid.*, p. 321). Although philosophy "does not speak first" (*ibid.*, p. 324) but rather responds, this response is "the gesture of descending", marking "the violence of mature judgment in assessing the life of others. ... We are, after all, telling them that they do not know what they are saying" (*ibid.*, p. 326). Cavell is adhering to the "idea of philosophical progress not as from false to true assertions, or from opinions to proven conclusions (say theses), or from doubt to certainty, but rather from darkness of confusion to enlightened understanding, or say from illusion to clarity, or from being at an intellectual loss to finding my feet with myself" (*ibid.*, p. 328). I do not intend to go into a discussion with Cavell, whose reading of the story is much richer and varied than I can render here,<sup>6</sup> but let me just point to the fact that Cavell seems to continue, at least to an important extent, the omnipresent philosophical story that assimilates the cave with an image of imprisonment, despair, ignorance, darkness, confusion, illusion, and intellectual loss. Cavell himself refers also to "the torment, the sickness, the strangeness, the exile, the

---

<sup>6</sup>I am not able and do not intend to deal here with the mass of interpretations and readings of Plato's story (such as the recent wonderful one by Latour interpreting it as the staging of a tragedy-comedy; see Latour 2016). Let me just refer to the study by Bartlett (2011), which offers a very 'sophisticated' rereading of Plato's corpus, relying on Badiou, including the cave fable, and makes the strong claim that Plato's work is just about education and more specifically about 'education by Truth'. However, like many 'philosophers', he is forgetting or neglecting the relation between 'education' and 'school' and building his interpretation on the difference between opinion and truth (and between the philosopher concerned for Truth and the sophist concerned only with interests and profits). The cave story I will propose here suggests rather that education is not primarily about 'truth' and/or 'opinion' and that the sophists are not relevant for educational thinking because of their concern for 'interest', but maybe because they acknowledged first of all the human being as 'animal educabile', as an erring being without destination (and orientation). See Jaeger (1973/1933).

disappointment, the boredom, the restlessness” (ibid., p. 329) as a condition from which we don’t have to escape, but that we have to judge with regard to “the degree to which these conditions must be borne and maybe turned ... constructively, productively, socially” (ibid., p. 329). Philosophy, then, is related to a “sense of disappointment with the world” and “our entrapment in false necessities” (ibid., p. 328).

Let me, in contrast to this *philosophical* view, now propose a *pedagogical* or educational view that can open to an alternative cave story or fable, one that invites us to reconsider the way we conceive of education and philosophy, that questions the fabric of enlightenment, education, and liberation that constitutes Plato’s philosophical story. This educational fable does not justify and affirm the primary need for a ‘liberator’ or philosopher; it does not conceive of education as conversion, but rather entails some suggestions concerning the emergence of the *school* and the appearance of the *pedagogue* as the one who leads to school. This pedagogical fable of the cave is the story of the beings that enter the cave and leave traces on its walls, offering a scene of the education of the human being as a scene of potency and immanence. This fable is not about ‘enlightenment’ in the sense of moving (returning) from opinion to truth and/or from illusion to clarity, but about the light that enables the beginning of something while exploring, disclosing, and exposing the ‘world’ by imagining it, by making images (as inscriptions). It is the story of the beings that find themselves in this world of shadows in the company of the sketches, imprints, inscriptions that they have made themselves with their hands, that open up their lives, and also make them dream. This liberation, however, is not pointing to transcendence but to immanence, it is no conversion or return but an *erring* as I will now further elaborate in what could be called maybe also first of all a story about the emergence of ‘school’ or the fable of the ‘animal that goes to school’.

## The Pre-sent (Main-Tenant) of the Cave: The Gift of ‘World’

If we were to trace back the elements in this educational fable, we would have to point to a variety of (scientific) observations, reflections, comments, and interpretations related to the findings on and studies of all kinds of tracings (drawings, paintings) on cave walls around the world. Indeed, these have received attention not only from paleontologists, archeologists, anthropologists, and speleologists but also from novelists, artists, and ... philosophers. The story, therefore, knows many versions,<sup>7</sup> but the versions that interest me, here, are those that do not overlook the phenomenology of the cave, that is, the spatial and temporal experiences related to entering a

---

<sup>7</sup> See, e.g., the reflections by George Bataille who maintains that it is precisely through these wall paintings, which were most of the time, but certainly not exclusively, paintings of animals (and, thus, not just of themselves), that ‘men’ emancipated from their animal nature (Bataille 1988, p. 262). Or the very influential comments of André Leroi-Gourhan who relates the paintings to the appropriation of the caves as religious sanctuaries and understands them first of all as spiritual symbols (e.g., Leroi-Gourhan 1965). This approach is very dominant today and very present in the work of one of the most famous French experts on Paleolithic art in general and cave paintings more particularly, Jean Clottes (see, e.g., 2008).

cave and dwelling in it as *particular milieu* or chronotope. Those that pay attention to the *gesture* of the act of tracing itself, as well as to the difference between the way in which a text and an image speak to us (because seeing is not the same as reading and listening, and an image can share without being a ‘message’, but simply by ‘facing’ us). These are versions that don’t reduce the caves *immediately* to established symbolic places and don’t trace the activities carried out within them *immediately* to cultural or religious practices and rules. The versions that interest me acknowledge the entering of the cave and the tracings themselves primarily as movements and gestures. Moreover, I am interested not only in the beautiful paintings of animals as being the beginning of art but also, and primarily, in the images of ‘hands’ (found in many caves all over the world and dating from a vast range of time periods)<sup>8</sup> and in the stripes, striations, dots, and spots, in the sketches, scratches, tracings, and drawings that often are not figurative and superposed. I will, in what follows, refer briefly to the writings of John Berger and Jean-Paul Jouary, but I will rely in particular on the work of Marie-José Mondzain, who elaborates the earlier, brief but very interesting ‘musings’ of Jean-Luc Nancy on the images of hands on cave walls.

Whereas Nancy refers almost exclusively to the traced hands found in the Cosquer cave discovered near Marseille in 1991, Mondzain bases her *fiction* mainly on the findings related to the discovery of the Chauvet cave in the French Ardèche region in 1994. This cave contains some of the oldest wall paintings yet discovered (dating from approximately 32,000 BC), paintings that are extremely well conserved and of an extraordinary beauty.<sup>9</sup> As she states it herself, Mondzain constructs a ‘phantasia’ (2007, p. 26), which is not telling the story of a return of humans to the light of eternal truth that is shining from behind them. The ‘human being’ of the Chauvet cave enters the cave instead of fleeing it and produces light with its own hands and on its own hands. These enlightened hands, according to Mondzain, will reveal their power or capacity to make an image, including precisely an image of the hands, an image of a being that becomes at once the spectator of the work of its hands, not simply as an object or tool, but as an image, thereby inaugurating the human gaze on the human being and on the world. As Max Horkheimer stated: “The facts which our senses present to us are socially preformed in two ways: through the historical character of the object perceived and through the historical character of the perceiving organ. Both are not simply natural; *they are shaped by human activity*, and yet the individual perceives himself as receptive and passive in the act of perception” (Horkheimer 1937/2002, p. 200, italics mine). This is echoed in

---

<sup>8</sup>The recently initiated Spanish *HANDPAS* project is precisely focused on documenting and exhibiting the Paleolithic hand representations in Europe. See <http://handpas.eu/en/project/>. Accessed 25 July 2017.

<sup>9</sup>A beauty that is rendered in a fascinating way by Werner Herzog in a documentary called ‘The Cave of Forgotten Dreams’. The title resonates interestingly with another of his films, ‘Kaspar Hauser’, who is said to have been locked up in a cave (not unlike the prisoners in Plato’s cave) and to have had no dreams until some time after his release from the cave. It suggests that in order to have dreams, and that means also in order to have the possibility to relate to what happens and not just be absorbed by it or enclosed in it, we are in need of some kind of (re-)presentations. Equally interesting is that, in this movie, just before Kaspar is taken out of the cave, he learns to *draw/write* on a piece of white paper.

Foucault’s remark that “the eye was not always intended for contemplation” (Foucault 1984, p. 83). Nancy and Mondzain, then, suggest that human eyes were not from the outset destined for considering, thinking, and regarding. It is to these images, made by the hand in the cave, so this story goes, that we owe our having eyes that open themselves to the world in an incomparable way; it is to these images that we owe the experience of being able ‘to (be)hold’ ourselves and the world, making us into beings that (can) commence (anew). Or to state it differently: our capacity to regard (to look, but also to respect, consider) emerges out of our hands discovering the ability to make images. Looking at it in this way, we can further clarify the specific register of representation, the specific gesture of ‘monstration’ (which is the term used in the English translation of Nancy’s work for the French ‘monstration’, which refers to the act of exposing, displaying to the eyes of a public), and the specific experience that we would overlook if we related the images directly to religious or ritual practices that have to be ‘understood’.

Considering the painting of the hands on cave walls, Mondzain (2007, p. 21–58) distinguishes three acts, or operations, none of which is about return or conversion.<sup>10</sup> The first act is the being-becoming-human stretching its arm, which both leans on the wall and separates itself from it in the same movement: the measure of an arm that is indeed the first distancing of oneself from the plane on which a bond will be composed through contact. It is no longer as it is outside, in the sun, where its eyes can look much further than its hands can touch. Under the sun, its eyes are tools of its watching out, its foresight or providence; they measure a distance to be covered or installed (taken). Outside, its eyes have a distant horizon that it scrutinizes. The horizon is the experience of a gap that awakens a dream of mastery, provokes the desire for conquest, or inspires (paralyzing) awe. The horizon’s inaccessibility meets with the imaginary figures of transcendence. But in the cave, the horizon is no further than the modest proposition of an arm’s length. It is the immanence of a body-to-body or body-to-wall. The outstretched arm, the hand placed on the wall to maintain a distance. To maintain refers to the French ‘maintenue’, which comes back, as Mondzain and Nancy state, in the ‘main-tenant’, i.e., the French word for ‘now’ or ‘present’. This ‘maintaining’ is at once a meeting, an ‘entre-tien’ (‘holding between’) in the sense that the human being is holding itself – in French: ‘se tient’ – before the wall, which forms the plane and constitutes the horizon (without horizon) of the gaze and has its own stance (tenu(r)e or holding).

---

<sup>10</sup>Hannah Arendt writes that the parable or the allegory of the cave “unfolds in three stages, each of them designated a turning point, a turning-about, and all three together form that ... turning about of the whole human being which for Plato is the very formation of the *philosopher*” (Arendt 2005, p. 29, italics mine). These three turnings are freeing from the fetters that chain the future philosopher, which Arendt calls the turn of the scientist who “turns around to find out how things are in themselves, regardless of the opinions held by the multitude”. He turns away from “their *doxai*, what and how things appear to them”, from their position. The second turning is when he is not satisfied with the fire in the cave and finds an exit from the cave and an access to “the ideas, the eternal essences of perishable things and of mortal men”, from where he “must return (the third stage) to the cave as his earthly home”, where he can no longer feel at home (Arendt 2005, pp. 29–30). As I will indicate, Mondzain also distinguishes three acts, but neither of them is to be conceived as a turning.

And what will arrive between them is ‘in the hands’ of the human being. The eye is subjugated to the order of the hands. This gesture of distancing and binding constitutes the first operation.

The second act concerns the pigments. On the cave walls, the hands create an image of themselves, presenting them to the eyes – not by shaping and folding them to tools, but either by directly immersing the hands in the paint, posing them on the wall, and pressing them for some time, creating what are called positive hands. Or, it is assumed, by taking the paint in the mouth and spitting it at the hand pressed against the wall, creating so-called negative hands. A new gesture thus emerges, that also literally marks a distance – the arm length’s – that is holding (in) the hand as a gesture of ‘monstration’, *showing* the hand at a distance. This gesture implies that the purpose and the use of the hand has changed; it performs neither acts of survival (fishing, hunting, agriculture) nor of making love, or of making objects or tools. The hand has ceased to be a hand that grasps, hews, carves, or even caresses, and the mouth has ceased to be a mouth that bites, tears, and swallows. The uses of the mouth and the hand are no longer the prehensile, possessive, feeding, or predatory, nor of caring and love, but rather establish a double movement of *reaching out*, with the hands and the mouth. The human being breathes on her hand, which holds nothing, but that ‘maintains’ that being in a relation with the wall. She inhales, exhales, she receives the paint and then passes it on.<sup>11</sup> The moment of expulsion, an exit of liquid, is the *mise-en-scène* that makes an outside on the wall into (a) ‘work’. As Nancy states, the French ‘maintenant’ means holding by/in the hand; but the hand is not a stable place, suggesting that it will be released, that the now is between holding and releasing or letting go (Nancy 2016): “The hand posed, pressed against the wall, grasps nothing. It is no longer a prehensile hand, but it is offered like the form of an impossible or abandoned grasp. A grasp that could as well let go. The grasp of a letting go: the letting go of form” (Nancy 1996, p. 72).

The third act is withdrawal. The hand has to withdraw. The body has to separate itself from its support. But it is not its hand, the one covered with pigments, that the human being is looking at. Rather, before its eyes an image appears, its image, which it can now see it as its hand is no longer there. This hand as image, so Mondzain states, has none of the powers that the maker of tools would recognize. In the suspension of its manual powers, however, the *image* indicates the capacity or potency of the gaze that ‘looks’ at it, regards it. It is a ‘work’, a making that indicates a foundational capacity of the subject to compose its first gaze in the trace of its withdrawal. To withdraw oneself is to produce one’s image and to give it to the gaze of the eyes, as a living trace, but separated from oneself. As Mondzain further explains, the human being had already seen its hand, but not its hand as resembling an image of oneself that keeps itself outside oneself on the unanimated wall. This hand, born out of the shadow, is now shadow itself. What comes to us from this

---

<sup>11</sup> Let me make a side remark to refer to Tim Ingold indicating that it is “with our entire being – indissolubly body and soul – that we breathe”. He refers to Merleau-Ponty’s essay ‘Eye and Mind’, stating “there really is inspiration and expiration of Being” as the “essence of perception” (Ingold 2015, pp. 67–68).

interaction is the work of *a separation and a bond*, which this sign composes with that from which it separates itself. To see oneself is always to see oneself at and from a distance. In the cave, however, this seeing is not seeing oneself reflected in the mirroring surface of the water or the eye of the other.<sup>12</sup> The wall is a 'mirror' of the human being, though not a specular mirror, and this hand is the non-specular self-portrait of the human being. And the same goes for the world: it is given to the gaze of the eyes but is separated from itself, *at a distance*. To see the world is always to see it at and from a distance, but here the seeing is not that from the top of a mountain, from the tracks in the forest, or on the plain. It is seeing images on a wall.<sup>13</sup> Images of animals, images of the hands, produced *autonomously by the hands before the eyes*, as pre-sent, as a *prae-esse* that maintains a relation and, therefore, is also a possible inter-esse.

In this wonderful 'phantasia', as told by Mondzain and Nancy, the cave as a limited, walled space does not appear as a prison, offering a scene of impotence and transcendence. Instead it offers a scene of potency and immanence, of liberation, in a particular sense. Let me indicate some further characteristics of this site and scene.

First of all, the caves in which the paintings are made – often very far from the entrance and on difficult spots on the uneven walls – are not family homes. There are no traces of habitation. But they should also not be too readily seen as religious sanctuaries, which immediately give the painted images and the site itself a meaningful place within a cult. There is, indeed, as Nancy writes, no reason to lend the images

any other sense than *the sense without signification of the exposition* ...: not a lost sense, nor one that is distanced or deferred, but a sense given in the absence as in the most simple estranged simplicity of presence – *being* without being or without essence that founds it, causes it, justifies it, or sanctifies it. Being simply existing. ... its whole exercise is to exceed itself, not being itself anything but the absolute detachment or distancing of what has no foundation in the property of a presence .... Image, here, is not the convenient or inconvenient double of a thing in the world: it is the glory of that thing, its epiphany, its distinction from its own mass and its own appearance. The *image* praises the thing as *detached from the universe of things* ... (Nancy 1996, 72–73, first and last italics mine).

The cave is a site of separation, departure, distancing, and suspension. Departure from a world of daily living, separation from the eternal cycle of life and death, from the cycle of the changing seasons, from the variations of temperature and of the rhythm of day and night. A site of suspension: images of the hands, of humans, of animals, of objects. The hands no longer tools, the animals no longer prey or predator, removed from the cycle of reproduction and survival, 'naked' and beautiful. The image is not the concept horse or bison or hand, but an image that is made and that contains a profanation and is a (temporary) suspension of the 'horse' or 'bison' in its natural or social environment (released, presented, exposed), a suspension of the

<sup>12</sup>In the pupil of the eye as a little doll, as Plato suggests in the Alcibiades I. 133a.

<sup>13</sup>John Berger writes: "Traditional Chinese art looked at the earth from a Confucian mountain top; Japanese art looked closely around screens; Italian Renaissance art surveyed conquered nature through the window or door-frame of a palace" (John Berger, 'Past Present').

regular power of the hands. John Berger writes: “Step outside the cave and re-enter the wind-rush of time passing. Reassume names. Inside the cave everything is present and nameless” (Berger 2002). The images ‘show’ something and that means to set it aside “at a distance of presentation, to exit from pure presence” (Nancy 1996, p. 70), implying and offering the possibility for regarding and exploring new relationships to the self, others, and the world, *at a distance*. Not the kind of distance from a top of a mountain that evokes reverence for the greatness of the world or that sparks the imagining of conquest, but an *arm’s length* distance (at hand, within reach). The hand “opens a distance, that suspends the continuity and the cohesion of the universe, in order to open up a world” (ibid., p. 75).

It is the place of another spatial and temporal experience, a particular chronotope or space-time milieu (including temperature, air, soil, smoke, smells, silence, sounds, darkness, etc.). It is a *real place* but also one without place in the regular order of places, a place without place. It exists in real time but out of regular time, a time outside time. Nancy calls it also ‘additional time’ (ibid., p. 74). Similarly, ‘place without place’ and ‘time outside time’ were phrasings used by Foucault to describe the heterotopia and the heterochronia (Foucault 1986). Within the *enclosed* singular space and the *dark* singular time of the cave, the human being becomes master of the light, master of day and night, since it has the charcoal torch that it enflamed with its own hands and that is throwing flickering light on the walls. As Mondzain suggests, the being that becomes human is not to be seen as fallen from the light of heaven and subjected to the powers of others or the Other, larger than itself and defining itself as impotent, incapable, and weak. It is rather a being that enters the cave to shape its own definition, at once creating itself and being created through the work of its own hands. Theology, she adds, prefers to make human beings come from the hand of a divine potter. The human of the cave fabricates its horizon and gives birth to itself by holding out its hands to an irreducible and vivifying strangeness: its own (hands). This ‘art’ as a making of images – which, as I suggest, is crucially also first of all a ‘trying’, ‘exercising’, ‘sketching’ that is not directed by a predefined end or projected accomplishment but always *erring* – *makes* the world visible or perceptible (i.e., makes it become apparent) in a new way. It makes ourselves perceptible in a new way: “... the monstration of ... self outside of self, the outside standing for self, and he being surprised in face of self” (Nancy 1996, p. 69).

This being transforms a relationship of force, where the ‘real’ crushed it, into a literally imaginary relationship through what we could call a spatialization as grammatization: making images, tracing sketches.<sup>14</sup> There is no longer only time for living and time for working and loving, there is now time for attention and contemplation too: “the staging of a scenography in which attention is focused on one set of dramatized inscriptions”, to displace the words of Bruno Latour (1986, p. 17).<sup>15</sup>

<sup>14</sup> See also the very illuminating remarks of Vilém Flusser (2011) on the removal from the world of objects through the act of image-making.

<sup>15</sup> Let me, in this context, briefly recall an early text of Bruno Latour (1986) on visualization and cognition, in which he points toward a thinking with eyes and hands and where he invites us to not

Here, the relationship in which the human is bound by the power of a specific reality transforms into a relationship that offers the possibility to relate to the self and to the world and to start interacting with that world. As Nancy states: "... the eye, which until then had done nothing but perceive things, discovers itself seeing. It sees this, that it sees. It sees that it sees *there*; it sees there where there is something of the world that shows itself" (Nancy 1996, p. 79). It offers this being the capacity for (re-)birth, to have the experience of (be)holding, of having at (the distance of the) hand, the experience of a 'main-tenant', of a now or 'pre-sent' that allows this being to become the cause of itself, to come to the world and enter with the world into a relationship. This being (be)holds itself in front of a rock wall, in the opacity of a face-to-face in confrontation with this wall as horizon (without horizon), massive, mute, and without gaze. Facing a wall onto which the being itself casts light; not sunlight or divine light but the light of the torch held in its hands. The wall as a "setting aside and the isolation of a zone that is neither a territory of life, nor a region of the universe, but a spacing in which to let come ... all the presence of the world" (ibid., p. 75). Present can also mean gift. This present, or now, is a gift, given: "I am given, *Es gibt* or *Es ist mir gegeben* ... it is given to me ... the opening of time that is not within time" (Nancy 2016, p. 2).

It is also important to mention that this being enters the cave *willingly* and that it has to find *the courage* to enter the cave (which is even darker than the darkest night, and so is uncomfortable, preventing any foresight). This being makes a *vital effort*, as the paintings are often very far from the entrance and in difficult to reach places. It is not moved by distortion or confusion; it enters the cave, *groping the way*, *thrilled*, out of *curiosity* and, as John Berger wrote after his exceptional visit into the Chauvet Cave in 2002, out of 'the need for *companionship*'. Thus, it is not looking first of all for truth but for *encounter*. Berger remarks that inside the cave there is a *balance between fear and a sense of protection*. In life, he says, most of the animals depicted on the walls were ferocious, but in the cave the relationship is that of '*respect, yes, a fraternal respect*' (Berger 2002). Moreover, the images on the wall inaugurate not only the human being as a monstator and spectator but also a community as a public of spectators: a contingent collection of whichever singularities happen to occupy the space of the cave, the chamber where the images are made on the wall. A community not constituted by shared identity or belonging (to a family, a tribe, a religious cult), but by a relation to something on the wall, by a presence in a particular place. A chamber potentially populated by whichever others happen to occupy the space, near or next to each other, as contact. The images have no pre-defined or definite addressee or response; they are the vestiges of human presence, and the collectivity of the spectators is not based on psychological identification with the producer of the images and his or her desires, but relies on being in contact as monstators and spectators of the world.

---

relate the specificity of modern science to the existence of cultural differences or to the happy existence of special minds, but to explanations that take into account the hands and the inscriptions that they trace on flat surfaces creating an optical device (re-)presenting the world before the eyes.

## The End (Without End): On Animals That Go to ‘School’

Let me now give an additional twist or torsion to this cave fable starting from four observations. First, in his reflections on the cave paintings, Nancy also writes that the “traced figure is this very opening, the spacing by which man is brought into the world, and by which the world itself is a world: the event of all presence in its absolute strangeness. Thus, the painting that begins in the grottos ... is first of all the monstration of the commencement of being, *before* being the beginning of painting” (Nancy 1996, p. 70, italics mine). Second, in his book *Préhistoire de la beauté. Et l’art créa l’homme (The Prehistory of Beauty. And Art Created Men)*, which mainly focuses on cave paintings, Jean-Paul Jouary suggests that it was not already given (innate or acquired) human capacities (e.g., of imagination) that allowed the cave paintings to be made, but rather it was the evolving practices (and the accompanying technologies) that allowed such capacities to emerge and develop. He further elaborates the idea that it is not because we are human that we experience aesthetic pleasure or longing for it, but rather it is because we created (i.e., exercised!) that such feelings and perceptions could emerge and that we became and continue to become ‘human’. He adds that this art, or these exercises, ‘produced’ writing, numbering, mythologies, and several forms of knowledge (Jouary 2001/2012). Third, the gesture that most attracts the attention of Mondzain and Nancy is precisely that of making the image of the hands by pressing them to the wall, which is seen as the first gesture, and is art only in a very general sense. It is not yet (the art of) painting, but the gesture that children still make today. Fourth, the location, i.e., the particular chronotope, is of course crucial in various ways for this story of the being-becoming-human. If ‘art’ created ‘men’, as Jouary suggests, then the evolvement of this art became possible in this enclosed place without place, this dark time without time, where the lifeworld is displaced.<sup>16</sup>

From here, I think we can call this story, without forcing it too much, the educational cave story and we can give this location the name ‘school’. It has been often suggested that Plato’s cave is also the paradigm of the cinema. And investigators of the prehistoric cave paintings indicate that some have been made in such an ingenious way that in the flickering light of the torches they actually appear as moving images (Azéma 2011). But if we take into account the operations of separation, suspension, and profanation, the time outside time, the place without place, the creation of an attentive, regarding public, the physical conditions and technologies involved, together with the *exercises* of the hand and the eye, which are still unsure and do not know yet what it makes or sees (the sketches, the dots, the striations) so that the ‘human’ is forming itself in a vital effort based on curiosity (i.e., looking for company and not in the first place for ‘truth’) and courage (which is not for conflict, but for encounter and exploration), it seems that we can also suggest that she bears

---

<sup>16</sup>There are of course very old wall paintings to be found outside caves (e.g., the famous Bradshaw paintings <http://www.bradshawfoundation.com/index.php>. Accessed 25 July 2017), but as Nancy states: “the painting that begins in the grottos (but also the grottos that painting invents) ...”.

witness to the event of school,<sup>17</sup> as the way in which a being without natural destination, without end, an erring being, is shaping herself and her *regarding* (in various senses, including considering, looking, gazing, concerning, being concerned, respecting, paying attention, relating to) of (the) world through technologies, exercises, and practices that she invents or uses, but that also, in turn, create that being and its ‘arts’, that open it up and expose it to a world that is given or presented to her.

The being-becoming-human/pupil is an animal that goes to ‘school’. That is, an animal that not only becomes initiated and socialized but also discovers at ‘school’ its potency to shape itself and the world, a being without natural or projected destiny (i.e., it is undefined). A being that experiences the ‘main-tenant’, the present that we could maybe also call, with Arendt, the ‘gap between past and future’, which is not awakening the dream of mastery, but the experience of being able to begin: the ‘commencement of being’, as Nancy wrote. A being that we can imagine to (begin to) exercise, to consider, to think, and maybe also to dream. It takes its relationship toward the world and itself into its own hands without this becoming a dominating, seizing, grasping, or exploitative act, but rather an act of regard. Experiencing the sharing of a world to which it can relate and about which it can speak, or by which it feels invited or even urged, provoked to speak. Experiencing a shared beginning with the world and the possibility of being part of a public of spectators and mon-strators that shares the place, shares the tracing exercises, shares the walls and what appears on them, shares the exposition, and has the possibility to communicate. The walls offer a space and create a milieu as a hole in regular time and environment.

The educational cave fable – and it is a fable, as was Plato’s according to his own words, a ‘phantasia’, to use Mondzain’s phrase, to populate our imagination – is not the biography of a being becoming philosopher in Plato’s sense, but maybe that of a being becoming an artist, in the very general sense that Jacques Rancière understands everybody to be an artisan, i.e., a handler (‘un manieur’) (Rancière 1987, p. 110) and that the Oxford Dictionary indicates as “a follower of a pursuit in which skill comes by study or practice”. This story does not call for a philosopher who leads the way out of the cave and into the light of a transcendent world and who tells us that we don’t know what we are seeing and saying. But the story does suggest that we could find some help from the *pedagogue*, who goes along the way *to* the cave and offers support in this effort (of the will) that demands a certain degree of courage, as the cave is not home and is always a bit uncomfortable. Recall that *pedagogue* was the ancient Greek name for the slaves who brought the children to school, taking them out of the house, the *oikos*, and out of society, the *polis*. And we can imagine the teacher as not only the one who projects images on to the wall but also the one who introduces or incites words, naming the world such that a world is made available to a being that is also made available to itself – available, that is, for contemplation, study, and exercise, for (self-)education. A teacher who, as Rancière states about the emancipating schoolmaster, stays at the door to make sure that one

---

<sup>17</sup> Comparisons have often been made between caves and cinema, but surprisingly little between caves and classrooms, or if so, these were mostly in line with Plato’s fable of the cave as prison. Michel Serres’ (2015, pp. 202–209) reading is a notable exception.

does not avoid the effort and discipline necessary in order to be attentive to the world, to study, and exercise the hands and the eyes (Rancière 1987).

The educational fable is also about world-disclosure and world-renewal. This is conceived neither as a return nor as a conversion, but rather as a re-beginning that continues our erring without destination. As Michel Serres writes: taking up “the begetting and birthing of a child *anew*” (Serres 1997, p. 49, italics mine). Belonging, departing, and becoming. Education is not primarily dealing with truth and opinion; it is not so much about ignorance and illusion. Education is about the issue of ‘companionship’, being in company with others and with things (i.e., opening and disclosing the world), about enabling and exposing. The fable offers a different scenery of the (self-)education of the human being, affirming a belief in the absence of any pre-existing order and any human ‘nature’ or destination. It is not about ‘enlightenment’ by the sun, but about the little light that enables something to begin and that lets us attend to something in the dark (cave) that helps us to navigate, to make and find a way. According to Michel Serres, it is no longer the bright light of the sun, but the little lights of a starry night that offer a good image of what our ‘knowing’ and our existence are about. The bright light is, rather, more akin to a metaphor for ideology (Serres 2014, p. 319).

In line with Plato’s cave fable, there seems to be a philosophical approach to education that, in fact, starts from the experience of adults expressing “a disappointment with the world” (Cavell 2005, p. 3) and of conducting “a life that calls for transformation or reorienting it” (ibid., p. 11). Philosophy therein is conceived, as Cavell writes, as leading “the soul, imprisoned and distorted by confusion and darkness, into the freedom of the day” (ibid., p. 4). Cavell himself sees it clearly when he calls philosophy in this sense an “education of grown-ups” (Cavell 1999/1979). The educational cave story, however, which takes the cave *not* (or not only) as a metaphor but as a *real place*, offers a *pedagogical* approach to education that does not *start* from the (adult) experience of disappointment, confusion, or distortion, but from the (childish) experience of being able to commence, of being curious and attracted to enter the cave out of the joy – joy being the signature of the event *par excellence*<sup>18</sup> – of the exercise-production-discovery of a new degree of freedom *and* (attachment to) a new world. Maybe this is related to philosophy in the sense of exercise – *epimeleia* – and, for sure, Cavell turns also to this experience. But the important thing is that, as *starting point*, such exercise is all about the discovery, disclosure, company and care of world and not so much about the care of the self or the art of living.<sup>19</sup> And education is, at first, not about telling the others that they are wrong, “telling them that they do not know what they are saying” (ibid., p. 326), but rather presenting (the) ‘world’, outside and beside themselves, telling them that they should attend and try. That seems to be what is at stake for animals that go to school.

---

<sup>18</sup> Cf.: “La joie, pourrait-on dire, est la signature de l’événement par excellence ... Joie du premier pas, même inquiet” (Stengers 2013, p. 142).

<sup>19</sup> As Arendt (2006, p. 192) states, “school is not about the art of living”.

# The Entrepreneurial Self

Naomi Hodgson

## Introduction

We are used to being addressed as consumers, being encouraged to get the best value for money, to go online to search the best deal, to switch utility suppliers, and so on. There is a distinction to be drawn at the outset of this chapter, between the general shift to positioning citizens as consumers that has taken shape over recent decades and the particular mode of subjectivation described by the notion of the entrepreneurial self. It has become the norm not only to manage our economic or domestic affairs in this way but also to apply this logic to all areas of our lives – education, health, social life, exercise, raising children, political participation. This shift is evident in a language that is now taken for granted, of unleashing potential, of being the best *you* you can be, and so on. From the classroom to the boardroom, the kitchen to the bedroom, in our social and leisure time, today we are all called upon to invest in ourselves, or in our children, to ensure potential is realized, and no one is left behind. As will be shown in this chapter, the notion of the entrepreneurial self describes how changes that have taken place at the level of government – towards open competition, public participation, performance management based on outputs and feedback, for example – require us to understand and conduct ourselves in particular ways.

Entrepreneurship as such is not new, of course. It has long existed as a general term that refers to establishing new business, the initiative required, and the risks involved. It comes with connotations of having an eye for these things, being able to spot a gap in the market, and knowing how to fill it for maximum – if short-term – profit. In recent years it has come to feature in the way we understand the purposes of education, and ourselves in relation to it, in particular ways, and thus

has become a focus of educational philosophy and theory. To be clear, however, the term entrepreneurial in the entrepreneurial self comes not, or not only, from critical educational and social theorists. It is the language of policy itself; we are explicitly addressed as needing to be entrepreneurial. As the abstract of the European Commission's Entrepreneurship Competence Framework (EntreComp) reads: "The development of the entrepreneurial capacity of European citizens and organizations is one of the key policy objectives for the EU and Member States" (Bacigalupo et al. 2016, p. 5).

EntreComp represents the latest effort by the European Commission to embed entrepreneurial skills and dispositions throughout education and training (e.g., see also the Strategy for Education and Training 2020 (OJEU 2009)), not only for the purpose of business development directly but also for personal development and social participation:

EntreComp defines entrepreneurship as a transversal competence, which applies to all spheres of life: from nurturing personal development, to actively participating in society, to (re)entering the job market as an employee or as a self-employed person, and also to starting up ventures (cultural, social or commercial).

It builds upon a broad definition of entrepreneurship that hinges on the creation of cultural, social or economic value. (Bacigalupo et al. 2016, p. 6)

The focus of this account of the entrepreneurial self is, in a similar vein to Ulrich Bröckling's (2015) account, to describe "not what those who are subjected to the regime and who constitute themselves as subjects via this subjugation in reality say and do, but rather a regime of subjectification. The question is not how much effective power is possessed by the imperative to be enterprising, but rather by which means the latter exercises this power" (Bröckling 2015, p. xiii).

The notion of the entrepreneurial self is closely related to the demands of late neoliberal capitalism. While the processes of deregulation, opening up of markets, and the changing role of government in line with privatization and, more recently, austerity are clearly visible in our educational institutions (and public services more generally), the notion of the entrepreneurial self draws attention to, provides a way to understand, not only the effect of such large-scale political changes on individuals but how 'the individual' him/herself is understood otherwise. A changed constitution of the state entails, then, new objects of governance, including the particular form of individuality it requires and produces.

Due to the relationship between the constitution of the entrepreneurial self and the prevailing mode of governance, this chapter will draw largely on educational-philosophical and related accounts derived from governmentality studies, following the work of Michel Foucault (Foucault 1991). While the examples derive from the European context, they will resonate, I hope, beyond this context.

The particular focus of this chapter is not, then, with the entrepreneur as a particular description of a career and the education required to achieve this or with the entrepreneurial self as an identity one might assume when pursuing such a career. Rather, the focus here is on the entrepreneurial self as a particular form of subjectivation (or subjectification, as Bröckling has it) operative today. That is, the notion

of the entrepreneurial self refers to particular discourses and practices according to which we are governed and govern ourselves. This self-understanding is constituted not only in and through formal educational institutions but also through many facets of our daily lives, as will be discussed. To illustrate this, we will draw attention to certain shifts in the way we speak about the individual, education, and the relationship between the individual and the state, indicative of shifts in the political rationality according to which late neoliberal societies are governed.

## From Government to Governance: Shifting Language

To contextualize changes in the relationship between individual and state that have taken place in late neoliberal societies over the past 30 years or so, two particular political shifts are important to note here, as they will frame the discussion that follows. The first is a general shift from government to governance (Rhodes 1997). As Femmy Thewissen summarizes this distinction:

‘Government’ is generally understood as the system by which traditional nation-states are governed, forming an integral aspect of representative democracy. ‘Governance’ can be described very roughly as “a new mode of governing that is distinct from the hierarchical control model, a more cooperative mode where state and non-state actors participate in mixed public/private networks” (Mayntz 2003, 27). (Thewissen 2015, p. 7)

As we will see below, the shift from government to governance involves purposeful reform of the hierarchical, bureaucratic model of modern nation-states, to a more devolved, participatory arrangement involving public, private, and voluntary sectors. Second, and commensurate with this, we have seen a shift from state as provider to state as facilitator (cf. Hodgson 2012). These two shifts can be described in spatial terms as a shift from a vertical organization, founded on hierarchy and authority, to a horizontal one, constituted by networks, audit, and feedback loops (cf. Rosenau 1995), referred to by Simons and Masschelein (2008) as ‘environmental’. What this means in practice will be illustrated with examples later in the chapter.

Thewissen has drawn attention to a further shift, hinted at in the quote above, from representative to participatory democracy (Thewissen 2015). Again, what this means in practice will be illustrated later. It is important to note at this stage, however, that these terms do not operate in their traditional political theoretical sense, but are reshaped by the accompanying shifts in governmental rationality. Such reshaping is evident in the policy examples given above: entrepreneurship is given a broad definition, not a purely commercial one; it is a set of competences we should all seek to be developing; doing so forms part of wider strategies not only of economic competitiveness but also the development of personal, cultural, and social domains. Indeed, as Thewissen notes, “‘governance’ puts our received understanding of politics, of political power, of society and of our role as citizens therein under strain” (Thewissen 2015, p. 8). There is more to it, then, than saying that words

mean different things than they used to; rather, the use of terms within the language of governance requires us to ask what they do mean, what they do, and what we do and who we are when we understand ourselves according to those terms.

In the discussion that follows of the constitutive discourses and practices of the entrepreneurial self, we will see how traditional terms such as citizenship, participation, agency, and so on have been recast by the shift from government to governance. The way in which this shift not only constitutes but also requires the entrepreneurial self will be outlined with reference to three examples, or three figures of the entrepreneurial self: the parent, the citizen, and the researcher. At the end of the chapter, we will turn to consider new aspects emerging in this constitution that ought to concern educational philosophers today and in the near future. First we will consider in more detail the changing mode of government, before moving on to look at how this reshapes the domain of education.

## **From Welfare to Responsibility: Changing Modes of Government**

The notion of the welfare state was subject to reform beginning in the late 1970s. The welfare state was subject to critique from a number of perspectives for, variously, its top-heavy bureaucracy, elitism, conservatism, gender imbalance, and so forth. But the rationale and impetus for reform came largely from those who can be loosely characterized as the New Right (Clarke et al. 2000, p. 3), who saw it as an impediment to the economy and as fostering a culture of dependency. As Tuschling and Engemann summarize this:

Especially in the realm of social welfare, new arrangements were sought where individual action is increasingly invoked to ideally foster both individual chances and collective good. The new modes of organization—frequently labelled as neoliberal—seek to relate the conduct of one's own life to the performance of the state. (Tuschling and Engemann 2006, p. 452)

Care for the 'collective good', then, no longer referred to universal welfare provided by state-centred, publicly-funded institutions but to individuals each taking responsibility for their own welfare – or, more accurately today, wellbeing – and being able to and actively wanting to choose how and whether to do so from a number of options facilitated by the state. This is evident in the changes of terminology. In the UK, for example, what was called Unemployment Benefit is now referred to as Jobseekers' Allowance. Thus, a source of support provided to those unfortunate to find themselves without or unable to work is reframed as a temporary provision permitted to those in the process of actively looking for work (and providing evidence of doing so). The New Right rhetoric created a stigma around those 'on benefits', seen to be getting money for nothing. The reformed system introduced responsibilities to be fulfilled in order to earn such rights.

The reforms introduced entailed two forms of ‘privatization’: introducing the market into public services and giving increased responsibility to the individual and the family for aspects of life previously taken care of by ‘the welfare state’ (Tuschling and Engemann 2006, p. 452). As Clarke et al. (2000) write:

In part, this was justified as the process of placing choice in the hands of ‘individuals and their families’ (e.g. in parental choice of schooling). In part, it was a means of making the family the site of responsibility for issues ranging from childhood delinquency to care for elderly or disabled kin. Together, these privatizing shifts both diminished the scale and significance of public provision and celebrated the value of the private (in both senses) over the public. (p. 3).

While these shifts have often been understood in terms of a rolling back of the state (see e.g. Hood et al. 1988), it is not accurate to suggest that there has been less government going on. Rather, these changes introduced a different form of government, characterized by what has been termed New Public Management: a shift away from the bureaucracy and hierarchy of traditional public services and the distinction between public and private towards a form of governing concerned with efficiency, outputs, quality, choice, and value. The alternative name for New Public Management was ‘entrepreneurial governance’, characterized by the following principles: promoting competition; empowering citizens, by shifting control from bureaucracy to communities; measuring performance based not on inputs but on outcomes; being driven by goals or ‘missions’ not by rules and regulations; redefining clients as customers and offering them choices; preventing problems before they emerge, rather than just offering services afterwards; earning, not just spending, money; decentralizing authority in favour of *participatory* management; and catalysing public, private, and voluntary sectors into action to solve their community’s problems (Osborne and Gaebler 1992, pp. 19–20 cited in Du Gay 2000, p. 63).

In Osborne and Gaebler’s account, the focus is on the reform of public services according to the model of the commercial enterprise. Such forms of privatization are often understood in terms of the consumerization of citizens; while this consumer disposition does form part of the entrepreneurial self, this understanding posits these reforms in terms of encroachment of the economic on the social. As Maarten Simons argues, however, “within this configuration of entrepreneurial government and self-government the distinction between the social and the economic (as two different domains, each requiring their own government) becomes obsolete” (Simons 2007, p. 110). The implications of Osborne and Gaebler’s characterization are that this mode of governance requires participation at multiple levels in order to function – empowering citizens, giving choice to customers, encouraging participation, spurring communities in to action, for example; an entrepreneurial mode of governance therefore requires an entrepreneurial disposition of those it seeks to govern. Not only consumption, then, but also investment. As Graham Burchell puts it, this entails the generalization of an ‘enterprise form’ to all forms of conduct, from that of governments, to organizations, to individuals (Burchell 1993, p. 275 cited in Du Gay 2000, p. 65).

In the shift away from management in terms of rules and regulations to output-based performance measures and goal-setting, two further significant developments

emerge: new forms of accountability and the decentralizing of responsibility. The increased emphasis on individual responsibility in governmental rationality in recent years has been referred to as ‘responsibilization’ (Rose 1999). The post-welfare state governs in terms of individual freedoms and choices and thus does not see its primary function as the provision of care, inclusion, and so on, but rather facilitates the environment in which choice, inclusion, and so on, and the audit of its quality, are possible. Such facilitation involves ensuring transparent measures of accountability in the form of, for example, league tables, benchmarks, and consumer reviews and scores, which are as prevalent today in the education, health, and care sectors as they are in the commercial sector.

These changes reshape not only how organizations and institutions function, then, but also how the roles and responsibilities of those working within them are understood. This is reflected in the call for ‘culture change’ in the UK civil service in the late 1990s, in the White Paper *Modernizing Government*. As the New Labour government sought to embed the new entrepreneurial mode of governance, criticizing the old, bureaucratic mode as ‘resistant to change’, it called for a thorough revision of “core competencies for staff and appraisal systems to reflect the qualities we seek” (Cabinet Office 1999 p. 56 cited in Du Gay 2000 p. 76) and “qualities of innovation, responsibility, responsiveness, creativity, and enterprise” (Cabinet Office 1999 p. 61 cited in Du Gay 2000 p. 76). Such qualities, and the redefinition of professions in terms of core competencies, would become characteristic of entrepreneurial governance and the focus of numerous education and training strategies and career development profiles.

## **Education and Governance: The Shift to the Learning Society**

We have seen so far the shift in political rationality to entrepreneurial governance, which ushered in the discourses and practices that have come to characterize late neoliberalism: facilitation of competition, and the means for communities, and the private and voluntary sectors to participate, to have choice, and to provide feedback. These shifts were also framed briefly in spatial terms: from the horizontal hierarchical structure of the bureaucratic institution to the vertical, networked, distributed structure of the governance environment.

In order to compete with and as knowledge economies, knowledge – in the form of high levels of graduate level education, innovation, intellectual property, data – and the transferrable skills that enable it to continually be put to use became the currency. Education, or learning, became central to strategies for societal development, illustrated by the establishment of, for example, the European Research Area (ERA) and the European Area of Higher Education (EHEA) as part of the Bologna Process within the European Union. Such formations drew on shared assets and traditions of member states – higher education – and then standardized particular aspects (e.g. length of courses, level of qualification, unit value of courses) in order to render these systems compatible, comparable, and competitive:

Building on our rich and diverse European cultural heritage, we are developing an EHEA [European Higher Education Area] based on institutional autonomy, academic freedom, equal opportunities and democratic principles that will facilitate mobility, increase employability and strengthen Europe's attractiveness and competitiveness. (Ministers responsible for Higher Education in the countries participating in the Bologna Process, London Communiqué, May 2007; p. 2)<sup>1</sup>

As the passage above indicates, the rationale is clearly economic, rather than educational. Education rather is the means by which to facilitate mobility, employability, competitiveness, and so on. Note that governance is referred to here in terms of facilitation: responsibility for the achievement of these goals lies with national governments, institutions, and the individuals that constitute the higher education sector. We will look in more detail at what this means for the figure of the researcher later in the chapter. As indicated earlier, then, the entrepreneurial disposition is required at all levels, from governments, to organizations, to individuals.

The development of the learning society refers not only to reform of traditional education sectors, such as universities, in line with entrepreneurial governance, however. The concern today is not with education per se but with learning. 'Lifelong learning' in particular became central to the understanding of the entrepreneurial self, as seen in the European Commission's report on Quality Indicators of Lifelong Learning:

Lifelong learning is an overarching strategy of European co-operation in education and training policies and for the individual. The lifelong learning approach is an essential policy strategy for the development of citizenship, social cohesion, employment and for individual fulfillment. (European Commission 2002, p. 4)<sup>2</sup>

As seen in relation to the Bologna Process above, learning here becomes central to the understanding of what is required for citizenship, cohesion, employment, and individual fulfillment. The shift of language from educational institutions to learning environments – a term applied to the classroom, the library, the museum, to 'virtual learning environments' and so on today – marks a shift from an understanding of education as a fixed linear trajectory that takes place in age-related institutions to a lifelong, permanent process of investment and review (cf. Simons and Masschelein 2008). While the identification of social problems as educational problems is not new (cf. Smeyers and Depaepe 2008), casting social, economic, and personal problems as learning problems requires a particular permanent, investing attitude towards oneself. As Simons and Masschelein put it: "A whole range of human activities, from childrearing, having sex, eating or communication to travelling or using free time, being a citizen and an employee, are regarded as competence based. It is therefore felt that they require a prior learning process" (Simons and Masschelein 2008, p. 191). The entrepreneurial self is a subject for whom learning appears "as a fundamental force to position and reposition oneself in society" (p. 200). In the current mode of governance, learning appears as a form of capital, which should be

---

<sup>1</sup> <https://www.coe.int/t/dg4/highereducation/EHEA2010/London%20Communique%20-%2018-05-2007.pdf>

<sup>2</sup> [http://cordis.europa.eu/docs/publications/5663/56630421-6\\_en.pdf](http://cordis.europa.eu/docs/publications/5663/56630421-6_en.pdf)

managed and for which we should take responsibility (*ibid.*). This is not a matter of a top-down control of how we act, think, and feel but the conduct of our conduct (cf. Foucault 1991): we are governed in terms of our freedom to be self-determining individuals, not only able to, but invited to, choose our life course and to choose to change it in response to unstable conditions (cf. Barry et al. 1996).

Reformed, competitive, facilitating, post-national forms of governance such as the EU not only sought to become “the most competitive, dynamic knowledge economy in the world”<sup>3</sup> but also to address the democratic deficit associated with hierarchy and bureaucracy: accountability and transparency became central to the discourses and practices of governance, in the form of voice, choice, and participation and the evidencing of this through multiple league tables and feedback mechanisms. As Stewart Ranson describes this shift: “Since the late 1970s such regimes of public accountability have been strengthened systematically so that accountability is no longer merely an important instrument or component within the system, but constitutes the system itself” (2003, p. 459). This is tangible today in the practices of permanent review, audit, publication of results and leagues tables, open access to reports and data, and so on. Hence, governance of the learning society has become constituted by devices and “techniques that allow the alignment of governmental interventions with self-regulative capacities of individuals, simultaneously spawning and utilizing them” (Tuschling and Engemann 2006, p. 451). Put differently, this means that entrepreneurial governance requires the fostering of not only entrepreneurial skills and the knowledge that produces a highly educated workforce but also the disposition to engage with that knowledge and the world in particular ways: as lifelong learners, as participating citizens, as those who give feedback on the goods they buy and the services they access, and as those who respond and adapt productively to the feedback they receive. In this context, the entrepreneurial self appears as one who participates in the provision of feedback (completes online surveys, leaves reviews for companies she has used and places she has visited), checks reviews when making choices, seeks feedback herself (in her personal and professional activities), and responds to it by investing further in herself, identifying problems as learning needs and opportunities.

To illustrate the constitution of the entrepreneurial self in more detail, we turn now to consider the figures of the citizen, the parent, and the researcher. These terms are not new, of course, or even distinctive to the present time. But the specific discourses and practices according to which they are given shape today entail particular forms of responsibility, accountability, and investment. As Lawn (2003) writes:

Education and skills are indispensable to achieving economic success, civic responsibility and social cohesion. The relation between citizenship and lifelong learning, now bound together within the European lifelong learning area, is expressed in the metaphor of the passport. It is the passport which defines citizenship and signifies power...The passport to mobility and into active citizenship will be education and lifelong learning. (Lawn 2003, p. 332)

---

<sup>3</sup>[http://www.consilium.europa.eu/en/uedocs/cms\\_data/docs/pressdata/en/ec/00100-r1.en0.htm](http://www.consilium.europa.eu/en/uedocs/cms_data/docs/pressdata/en/ec/00100-r1.en0.htm)

Thus learning, and individual responsibility for one's own learning and self-development, is now directly connected to the economic and social health of society. In the next section, we will consider in more detail how the idea of citizenship is reshaped by entrepreneurial governance and self-governance.

## **The Entrepreneurial Self: The Figure of the Citizen**

As indicated earlier, what was traditionally meant by citizenship, since the modern period, as legal rights and residence or birth in a sovereign territory, no longer accurately describes the way the relationship between individual and state has shifted in recent decades. As what it means to govern has undergone significant shifts in terms of privatization, accountability, participation, and so on, the object of that governing has also shifted. We have seen above how education and learning have become central to strategies of societal development: entrepreneurial governance requires entrepreneurial citizens. As indicated earlier, however, this is not only a matter of the encroachment of economics into social and political domains; these are not strictly separable. Furthermore, in the shift to entrepreneurial governance, the notion of what societal development is in the West has also been challenged. The traditional measure of GDP has been decreed no longer fit for purpose as a measure of societal success: beyond a certain point, more wealth does not make people happier (cf. Layard 2003). Wellbeing has become a new benchmark by which individuals are governed and govern themselves (see Layard 2006; Almunia 2007). This change in the object of government entails new measures of success and new aspects of ourselves in need of learning investment.

In the 'post-national' globalized context, citizenship became a renewed focus of attention for both policy and research due, as Claudia Ruitenberg notes, "to low voter turnouts and concerns about civic disengagement, increasing cultural diversity and concerns about social cohesion" (Ruitenberg 2015, p. 2). Following the creation of the European Union – and the new category of European citizenship – in 1992, the European Commission launched a number of initiatives to foster a sense of European identity among its citizens. But these, in many ways echoing the symbolic measures taken in the formation of nation-states, e.g. the flag, the currency, the anthem (Shore 2000), were insufficient to engender the shifts in orientation to state, work, education, ourselves, that the increasingly globalized, mobile, knowledge economy required. In seeking also to address the democratic deficit associated with bureaucratic government, accountability and transparency were central, including evidencing the active engagement of individuals as entrepreneurial, learning citizens (cf. Hodgson 2016a).

This understanding of citizenship as requiring an entrepreneurial attitude and as able to be quantified and measured as verifiable skills and competences is concretely illustrated by the development and use of Active Citizenship Competences

Indicators (Hoskins et al. 2006<sup>4</sup>) by the Centre for Research on Lifelong Learning (CRELL) at the Joint Research Centre of the European Commission. Active citizenship relates to a particular concern with participation as a central indicator of democratic citizenship. The CRELL report reads:

The research project on ‘Active Citizenship for Democracy,’ coordinated by the European Commission’s Centre for Research on Lifelong Learning (CRELL), has produced the following definition of ‘Active Citizenship for Democracy’ (Hoskins et al. 2006):

Participation in civil society, community and/or political life, characterised by mutual respect and non-violence and in accordance with human rights and democracy.

Active citizenship is partially overlapping with the concept of social values concentrating its interest mostly at meso- and micro-level. Thus, active citizenship is understood in the very broadest sense of the word ‘participation’ and is not restricted to the political dimension. It ranges from cultural and political to environmental activities, on local, regional, national, European and international levels. It includes new and less conventional forms of active citizenship, such as one-off issue politics and responsible consumption, as well as the more traditional forms of voting and membership in parties and NGOs. The limits of active citizenship are set by ethical boundaries. People’s activities should support the community and should not contravene principles of human rights and the rule of law. Participation in extremist groups that promote intolerance and violence should therefore not be included in this definition of active citizenship. (p. 11)

The definition developed is derived from social capital theory (p. 9) but this needed to be operationalized, that is, made measurable, in order to build the composite active indicator:

Towards this end we identified measurable and distinctive elements in the definition of active citizenship, which we designated ‘dimensions of active citizenship.’ The dimensions are: participation in Political Life, Civil Society, Community Life and the Values needed for active citizenship (recognition of the importance of human rights, democracy and intercultural understanding). (p. 11)

‘Political life’, here, refers to involvement with political parties in the form of participation, membership, donation, volunteering, or working and to voting in national or European parliamentary elections. ‘Civil society’ refers to political non-governmental participation, with sub-indicators relating to “protest, human rights organizations, environmental organizations and trade union organizations ... Protest includes activities such as signing a petition, taking part in a demonstration, boycotting products and ethical consumption” (p. 12). ‘Community life’ refers to “activities that are less overtly political and more orientated towards the community – ‘community-minded’ or ‘community-spirited’ activities” (p. 12). As with the previous two categories, degrees of participation are gauged in relation to ‘questions of participation, volunteering, membership and donating money’ (p. 12).

The rationale seen in this rendering of citizenship is not a standard, as such, but rather a way to benchmark the political wellbeing of countries, regions, cities, etc.

---

<sup>4</sup>[https://ec.europa.eu/jrc/sites/jrcsh/files/jrc-coin-measuring-active-citizenship-2006\\_en.pdf](https://ec.europa.eu/jrc/sites/jrcsh/files/jrc-coin-measuring-active-citizenship-2006_en.pdf)

What this understanding of active citizenship looks like in practice is illustrated by what was termed ‘the Big Society’ by David Cameron during his UK General Election campaign in 2010. Illustrative of the shift from government to governance, and from welfare to responsibility, the Big Society referred to the empowerment of communities to run local interests, such as post offices and libraries, through volunteering or philanthropy. Without evidence that local communities wanted these services and resources, whose future was threatened by a lack of profitability, their closure could be justified. Hence, we can see that the provision of public services such as these, as traditionally understood, is no longer assumed: individuals and communities must evidence demand for them and their willingness to participate in their maintenance. To participate in this way requires a particular attitude on the part of individuals, not only to be inclined to or able to take on such responsibilities but also to remain aware of the need to do so in today’s mode of governance.

There are two aspects here that are key to the notion of the entrepreneurial self as citizen: first, the very fact that citizenship is rendered in terms of observable, measurable activities and competencies and second, the activities that count as ‘active citizenship’. To be a citizen is no longer the starting point of political community but an investment of oneself into one’s community in specified ways. Political life, here, refers to positive contributions or, at the very least, voting. Protest, for example, is not political or governmental but part of ‘civil society’. The unit of measurement here is the individual; the degree of participation is a measure of individuals taking up of their democratic responsibility. Such a rendering of citizenship has been referred to as depoliticized. As Gert Biesta writes, the “strong emphasis on personal responsibility, on individual capacities and abilities, and on personal values, dispositions and attitudes ... runs the risk of depoliticizing citizenship by seeing it mainly as a personal and social phenomenon” (Biesta 2008, pp. 49–50; see also Ruitenberg 2015). Although it is individualized, however, it is not anti-social: our relations to others – participation in the community, being sociable, networking – form part of those aspects of herself with which the entrepreneurial self is concerned. As Masschelein and Simons (2002) note, “relations towards one’s friends and loved ones come to be seen as useful, indeed crucial – for personal happiness, for social effectiveness, for the well-being of nations” (p. 596).

The entrepreneurial self is a particular form of individuality, “something to be mapped, evaluated, described and documented in all its respects” (Masschelein and Simons 2002, p. 596). As citizens, then, this means investing ourselves into our communities as an investment in ourselves. Our positive relations with others are seen as assets, parts of our distinctive individuality. As noted earlier, then, citizenship rendered by entrepreneurial governance as ‘active citizenship’ marks a shift in our use of language: from something one is to something one does; something that is of value will lead to greater success, profit, quality, outcomes, and so on. We can see a further instance of such a shift when we consider the figure of the parent in terms of the entrepreneurial self.

## The Entrepreneurial Self: The Figure of the Parent

Research in a number of fields in recent years has drawn attention to the discursive shift that has taken place to addressing ‘parents’ and, more specifically, their practices of ‘parenting’ (cf. Hoffman 2008). This identifies, and responds to the fact, that to speak of ‘parenting’ is not just to rename ‘childrearing’ but to frame it as a specific set of practices and skills, to change what we do, how we relate to children, and how we understand ourselves (cf. Faircloth and Lee 2010). In critical parenting studies, the verb ‘parenting’ is seen to refer to a particular culture of discourses and practices (Lee et al. 2014). In line with the accounts of the learning society more generally, research on the discourses and practices of parenting from a governmentality perspective sees this shift to a focus on parents’ individual skills as a responsabilization of parents (Fejes and Dahlstedt 2013). However, this refers not only to giving or acknowledging responsibility to parents for their own children but a particular form of responsabilization, in the sense referred to above – simultaneously individualizing (or privatizing) and normalizing – that casts parenting as a matter of maximizing learning outcomes and competitive potential. Parents’ responsibility is made explicit, but at the same time what it means to be a parent is reframed.

Thus, in line with mode of subjectivation of the entrepreneurial learning society, there is no longer a ‘norm’ that sets the parameters of good and bad, normal and abnormal. The norm today is that we ought to invest in the learning outcomes of our child and seek appropriate expertise to maximize our skills and strategies for doing so. These discourses do not, or not only, address those children and their carers who are at risk, but have become normalized as a way of understanding the parent-child relationship (cf. Ramaekers and Suissa 2012). The shift to the discourse of parenting has been understood in terms of the shift from a normative account of how one should raise a child, based on an account of what is ‘normal’ (and therefore abnormal), to a more inclusive account that recognizes changes in family structures, cultural diversity, and moral liberalism. This ‘inclusive’ move to the term ‘parenting’ entails a reduction of the parent-child relationship and the process of raising children to a set of skills: an economized, instrumentalized set of investments in one’s child’s future and in our own success. Parents are positioned as needing to seek guidance from experts, which they can choose from a variety of approaches, and so as indicative of wider change in how individuals are governed (Vansieleghem 2010).

This is evident in this recent BBC News report from the UK on a new research project, with the headline “Parents in the north of England should learn from their pushier counterparts in the south to help their children get top grades, says the children’s tsar”.<sup>5</sup> The tsar is reported as saying:

As northern parents, we need to be aware of these inconsistencies and variations in secondary schools and push hard for our schools to show how they are improving and helping our children to achieve.

---

<sup>5</sup> <http://www.bbc.co.uk/news/education-38207685>

One of the real drivers of improvements of schools in London has been the demand for good school results from parents and children. There is much we northern parents can learn about this parent power.

Ms Longfield told the newspaper that although the ‘tiger’ parents of London and the south-east had been mocked for their emphasis on extra homework and music lessons, there was something to be learned from the way they demanded more from teachers and schools for their children.

Leaving aside the socio-political history of the so-called north-south divide in England, the notable point here is that so accepted is it that the aim and purpose of parenting is to gain competitive advantage for one’s children, that ‘northern’ parents (here assumed to be a homogenous group) are seen as in need of intervention for not taking sufficient (active, evidenced, e.g. by exam results) responsibility for this. Parents who demand more are seen to be taking up their responsibility – and their right – to ensure the best outcomes for their children. Northern parents are called upon to ‘learn’ from this and to follow suit.

The idea of the tiger mother may be an extreme example, or at least one that is restricted to a particular middle-class milieu. But the fact that the notion of the tiger mother, as a style of parenting, has passed into our vernacular since the publication of Amy Chua’s 2012 *Battle Hymn of the Tiger Mother* points to the existence of a choice of parenting styles and a market place in which they are promoted (cf. Suissa 2013). Some sample book titles illustrate this: *Parenting Styles: The Ultimate Tips On Parenting Styles For Raising Children In The 21st Century By Applying Parenting With Purpose Driven Styles!* (Davis 2016); *Helicopters, Drill Sergeants and Consultants: Parenting Styles and the Messages They Send* (Fay 1995). More familiar examples might be Gina Ford’s *The New Contented Little Baby Book: The Secret to Calm and Confident Parenting* (2006) or William and Martha Sears’ *The Attachment Parenting Book* (2001).

What is new here is not that (new) parents need or seek advice, but that anxieties over doing our best or doing it right are directed towards particular forms of expertise and to finding solutions for everything from sleep problems, to tantrums, to eating, to brain development, illustrative of the ‘privatizations’ that Tuschling and Engemann (2006) articulate. All of these are natural sources of anxiety for any parent; and all are part of the complexity of raising children. But today we seek solutions for them, ones that optimize future outcomes, in ways that not only reposition parent and child in relationship to each other, but also reposition the parent as the traditional source of authority. The ways in which the self-understanding of parents is shaped according to their relationship to expertise and lay knowledge in this context are seen to produce a ‘proto-professionalism’ (Vandenbroeck et al. 2009). As the titles of these books suggest, the expertise in question here is drawn predominantly from psychology and, increasingly, from neuropsychology. This points to a shift that has been constitutive of the (self-)governance of the entrepreneurial subject: the general process of psychologization and the shift from psychologization to neuropsychologization (de Vos 2012, 2015). We will return to this at the end of the chapter.

## The Entrepreneurial Self: The Figure of the Researcher

Knowledge is now a commodity, the free movement of which is a measure of societal progress. In the university, as in government, there is an emphasis on efficiency and outputs over process and craft. The university today is no longer oriented to the highest development of the nation-state, as during the modern period, but rather to innovation and sustainability according to resources and demands in its immediate environment. Hence it requires a researcher who also understands herself in these terms. The skills and competencies of the excellent researcher have, therefore, been a focus for policy in recent years. It is now commonplace to find ‘doctoral schools’ or ‘doctoral training centres’ within universities, indicating the specific attention being given to the training needs and professional expectations of this level of education, and the need to make distinct and visible the presence of research within the institution.

The visibility of research, as a measure of the institution and the individual, is a requirement of research in general today, in the sense that it must be both discoverable by search engines and able to be evidenced, either quantitatively (number of publications, impact factor, Altmetric data, ‘star’ rating, in the case of the UK Research Excellence Framework) or qualitatively, in the form of ‘impact narratives’, a way of accounting for the social, economic, or cultural (i.e. not academic) impact of a department’s research. It is in this accountability as visibility that we see distinct aspects of the entrepreneurial self in the understanding of the researcher.

Writing on the impact of managerialism on the identity of university researchers, Jenny Ozga notes the ways in which entrepreneurial governance reshapes discourses and practices in the university. But she also notes:

it is possible that entrepreneurial modes of research act seductively on the researcher. The public process of bidding, the negotiation with significant others, the pleasure of being ‘chosen’ all give researchers the feeling of being close to power. There is elation in success against the odds, and the research production process is so demanding that it produces its own momentum and its own satisfactions. Indeed, research is an example of ‘just-in-time’ production process, where flexibility in response to rapidly changing specifications is absolutely necessary. The capacity to succeed under pressure is privileged, perhaps at the expense of independent judgement about the quality of the process or product. It is also surprisingly easy (and I speak from experience) to be drawn into ways of redefining the projects in ways that better suit the sponsor, and/or produce a result that may form the basis for a preferred course of action. (Ozga 1998, pp. 147-148)

An uncomfortable truth, perhaps, but one that reflects the way in which, as Tuschling and Engemann put it earlier, governmental strategies work on the “self-regulative capacities of individuals, simultaneously spawning and utilizing them” (Tuschling and Engemann 2006, p. 451).

The self-regulative capacities of the researcher (by definition, perhaps, highly motivated by success and meeting criteria) are concerned today with being excellent at activities beyond those traditionally associated with study or scholarship. In order to illustrate how the researcher is understood today, we will focus on the example of the Vitae Researcher Development Framework. This shows not only the skills and

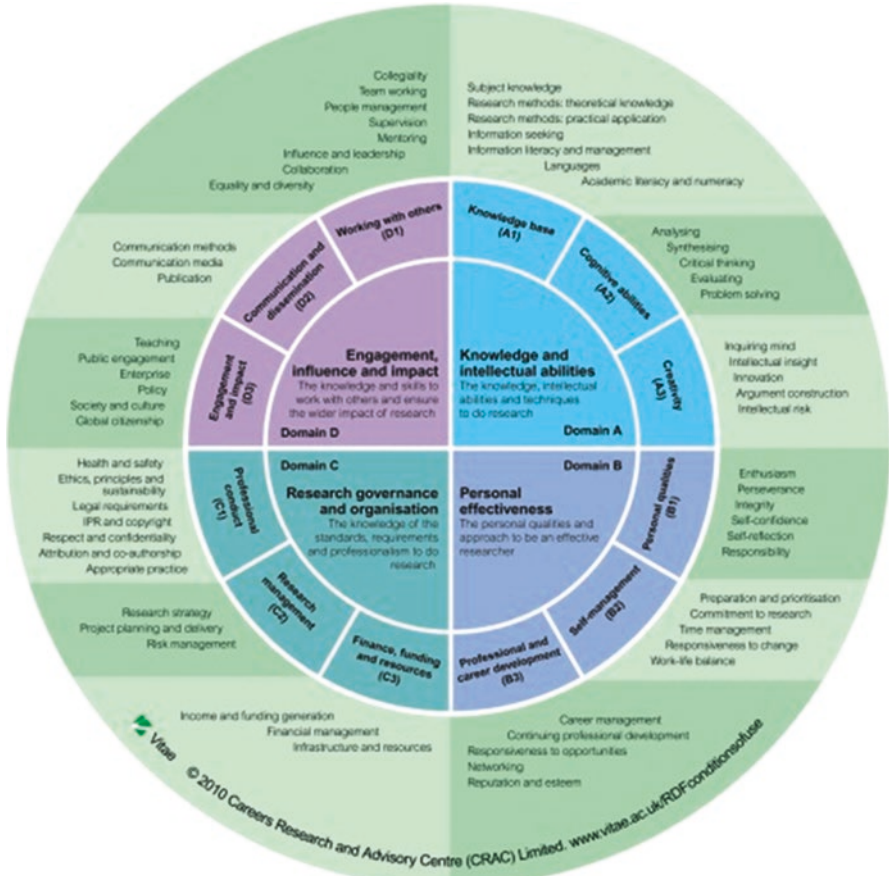

Fig. 1 The Vitae Researcher Development Framework

qualities that constitute the excellent researcher but also the ways in which she is asked to work on these aspects of herself.

The Researcher Development Framework (RDF) identifies the ‘characteristics of the excellent researcher’, based on empirical data from interviews with researchers, and is designed “to enable researchers to identify the areas in the framework they want to develop further” (Vitae 2010).<sup>6</sup> It not only articulates very clearly the terms according to which the researcher understands herself but also provides the means by which to work on these particular aspects of herself. It has a visual form (see Fig. 1), but works digitally, as well as being supported by physical training and networking events.

<sup>6</sup> <https://www.vitae.ac.uk/researchers-professional-development/about-the-vitae-researcher-development-framework>

The RDF is developed by the organization Vitae, based in the UK, but is being trialled in a number of other countries. As Vitae describes the RDF:

The RDF is a professional development framework for planning, promoting and supporting the personal, professional and career development of researchers in higher education. It articulates the knowledge, behaviours and attributes of successful researchers and encourages them to realise their potential. (Vitae 2010, p. 1)

The characteristics of the excellent researcher are referred to as ‘descriptors’:

The descriptors are structured in four domains and twelve sub-domains, encompassing the knowledge, intellectual abilities, techniques and professional standards to do research, as well as the personal qualities, knowledge and skills to work with others and ensure the wider impact of research. (Vitae 2010, p. 2)

In addition to the standard academic requirements concerning subject knowledge, analytic skills, and an inquiring mind (Domain A: Knowledge and Intellectual Abilities), as well as governance and administrative knowledge and skills, such as copyright, research ethics, and managing research funds (Domain C: Research Governance and Organization), other aspects ordinarily associated with academic work, such as publication, are classified under Domain D: Engagement, Influence, and Impact, and aspects not distinctive to academic work are classified as essential to the excellent researcher, as in Domain B: Personal Effectiveness. The way in which the device functions also facilitates a further requirement of the researcher, not only to continually seek feedback and undertake ongoing professional development in response but also to make visible this attention to oneself.<sup>7</sup> As seen in the figures of the citizen and the parent, one’s active participation in pursuing these competences must be demonstrated. To not do so is read as evidence of a learning need or a lack of engagement, and thus as an individual problem and responsibility.

The RDF is aimed predominantly at researchers in universities where, as elsewhere, an individualized, responsabilized figure must participate in her own and her institution’s sustainability through maximization of research outputs and their value, and successful application for external research funds. As the descriptors of the four dimensions of the RDF and the way in which it is designed to be used as a form of permanent feedback indicate, to be entrepreneurial is built into the understanding of what it means to be a researcher: it is designed in a way that is constitutive of that very mode of subjectivation. Not only in the language that it uses – innovation, collaboration, responsiveness to change – but also in the practices these involve in order to ‘count’, to be measurable and visible, and, furthermore, in the way it can be used: digitally, enabling ongoing feedback, mobility, and personalization.

---

## Contradictions and New Developments

There is a risk in accounts such as this, that the effects of a particular discourse appear totalizing. The purpose in the above has been to show the ways in which the entrepreneurial constitutes “a grammar of governing and self-governing” (Bröckling 2015, p. xiii), conducting our conduct in the direction of profit, success, improvement, competition, and so on, but that does not mean such a regime is without flaws or contradictions. We will briefly consider here, to borrow a phrase from Simons and Masschelein (2008), the ‘dark side’ of this focus on entrepreneurial self-investment, while also considering more recent aspects of it that require further attention within the field of educational philosophy.

The entrepreneurial self is an individual whose very individuality is a matter of monitoring and investment. Citizenship, parenting, learning, and research are all rendered in terms of skills and competences. The political dimensions of these, then, are sidelined. The demand for evidence, visibility, and transparency is focused on particular aspects of ourselves and our experience, such that other aspects – as we saw in the vignette on parenting – are hidden from view, not acknowledged, or are not included in what it means to be a good citizen, good parent, excellent researcher, and so on. For Simons and Masschelein, the ‘dark side’ of this entrepreneurial self-understanding is the permanently shifting benchmarks by which permanent monitoring and assessment takes place today. The entrepreneurial self is aware of her unique traits, characteristics, and skills; everyone is different, everyone has potential. But our exceptional natures are subject to permanent monitoring and assessment and judgement by shifting criteria. There are no longer standards by which norms are set, which constituted their own exclusions; today, benchmarks shift according to performance. Think, for example, of the researcher who is not successful in her funding application: it meets all of the explicit criteria; it is judged as exceptional on all counts by the reviewers. And yet it is not successful. There was a large volume of applications, and so additional criteria had to be used in order to make a decision; we cannot afford to fund all of the research. Which proposals offer the clearest outcomes? Which have the clearest methodology? Which are likely to have the greatest impact? Which applicants have a good track record of research? The application is, then, judged in relation to the others – not only against the explicit criteria – others whose research may be in a different field (perhaps one more likely to have measurable impact and a clear methodology, and so on.) As Simons and Masschelein put it:

In a sense, judiciary power and legislative power are being mixed up. Consequently, and drawing upon the ideas of Agamben (1997), within an environmental arrangement of time and space one is increasingly handed over to or at the mercy of sovereign power. This type of power does not make judgements based on criteria or rules that were formulated earlier on, but establishes these criteria and rules in the very act of judgement. (Simons and Masschelein 2008, p. 701)

The self-directed learner is seen as empowered by being encouraged to seize upon her individual strengths and characteristics; but the permanent yet shifting assessment by which that learning and development is judged always finds us wanting.

In governance terms, individualization is a matter of empowerment, of inclusion, as we see, for example, in individual learning, or healthcare, or exercise plans: they are specifically tailored for our needs. And in political philosophy, of course, autonomy and self-reliance are important political and educational ideals. But as we saw in relation to citizenship, the form of individualism of the entrepreneurial self denies important aspects of political community: what's in it for me rather than what principles do I want to defend for the sake of the polity or the next generation? Networking, socializing, and volunteering, as we saw in the definition of active citizenship indicators, become evidence of one's individual good citizenship, something one might put on a CV rather than do for its inherent value.

The increasing ubiquity of digital devices adds a further dimension to these processes of individualization. Today it is more accurate to speak of personalization: this points to the increasingly molecular level of information on the basis of which our choices and aspirations can be governed, facilitated by the data we generate in our use of digital devices. Educational philosophy is only beginning to take account of the ways in which 'data' have agency in themselves in the governance of education. As Ben Williamson writes, while digital systems have long been part of the background of policy-making and educational management (Williamson 2016, p. 5), there are pressing questions about how the algorithms, architectures, and the visualizations and feedback these provide reshape the very understanding of the individual, the personal, and what it means to educate and be educated. The agency of technological and material devices has gained increasing attention through the popularity of sociomaterialism in educational research (e.g. Fenwick and Landri 2014), but the agency of data itself is rarely acknowledged in the field (but see Decuyper et al. 2014).

The entrepreneurial self, then, is a form of individualization specific to this point in history, required by a form of neoliberal democracy constituted through inclusion, participation, competition, accountability, transparency, and so on. It is, however, a regime that is exclusive – of those unable to compete, of aspects of experience that are not visible, of the political dimensions of that experience, of a concern with process rather than outputs and goals, and of a sense of the human that can never be fully accounted for. It is constituted largely through knowledge derived from branches of psychology, predominantly today, positive psychology, behavioural economics (the interdisciplinary combination of behavioural psychology and economics, from which much of the research on happiness and wellbeing derives), and neuroscience. As we saw in the vignettes of the citizen, the parent, and the researcher, this narrows down considerably our sense of what these things are and so too the basis on which we make decisions on how to undertake these roles. In terms of the entrepreneurial self, these are things that we do – they are a matter of behaving in a particular way, evidencing particular skills, producing successful outputs (a community, a child, a peer-reviewed article) – not things that we are. The figure of the entrepreneurial self requires us to continually ask who we are, not only in terms of investigating the 'how' of power but also by articulating those aspects of our experience that constitute who we are but that are not visible or audible within entrepreneurial modes of accounting for ourselves.

# Financial Literacy and the Curricularization of Knowledge

Alexander M. Sidorkin

## Are Financial Literacy Programs Effective?

Do financial literacy programs really affect people's behavior? Empirical evidence, insofar as it is at all compelling, tends to suggest a negative response to this question. For example, a meta-analysis of 137 papers (Fernandes et al. 2012) finds that “these interventions explain 0.1% of the variance in downstream financial behavior”. The World Bank is one of the global champions of the financial literacy programs. Ironically, its own researchers had to conclude that “financial literacy and capability interventions can have a positive impact in some areas (e.g., increasing savings) but not in others (e.g., reducing loan defaults) (Miller et al. 2015)”. ‘Can have’ is not necessarily a ringing endorsement, and the conclusion follows the meta-analysis of 188 papers on the subject. Yet, the World Bank member countries continue spending millions of dollars trying to affect how people make financial decisions.

This could have been a simple story of the foolish insistence on an ineffectual neo-liberal agenda. However, the story is much, much more interesting than that. The story may tell us something about the paradoxes and dangers of contemporary education as such; the kind of massive, state-organized education with the broad agenda for social change. It is also a story of what happens to knowledge once it becomes curricularized. Without a doubt, mass education has been one of the major achievements of the global civilization over the last century. As all such achievements, this one has costs beyond the staggering monetary one. In this chapter, I will show that one of the unintended consequences of expanding education is expansion of the domain occupied by normative, noncumulative knowledge that may, in certain circumstances, lead to the spread

of the paranoid consciousness. The hope to encourage more rational behavior through expanding curriculum may be misplaced. It becomes more misplaced with the rapid advent of social media and democratization of reasoning.

Why do policymakers so desperately want to make people behave more rationally with their finances? One does not need to look too far to understand. All financial crises, including such devastating one as that of 2007–2008, can be explained, in part, by irrational behavior of consumers of financial services. In the developing world, many obstacles to economic growth can be traced to people's inability to make rational economic decisions on investment, savings, and current consumption. Americans save too little, borrow and spend too much. Chinese save too much, borrow and spend too little. Russians do not invest and refuse to take even the minimal risk with their money. If only people learned to be a little more rational, enlightened – the reasoning goes – all could have been different, and the global economy might have been spared the deep crises and enjoyed growth that is more robust.

Everyone involved understands the limits of financial education. After all, the investment bankers who invented and then sold the same derivatives repeatedly to different entities did not lack financial literacy skills. Quite the opposite, they are some of the most sophisticated financial minds. No one is calling for sending financial firms' executives to a re-education camp; governments prefer to regulate rather than educate them. Yet where it comes to the population at large, governments want to educate it into rational economic beings all the same, because even small changes can, in theory, lead to significant consequences. The consumer confidence index is considered one of the major indicators of the overall economic health. Nevertheless, it is what it sounds like – the mood of many people. It is so intangible that the temptation to manipulate it through the available social policy instruments is almost irresistible.

Behavioral economists tell us that humans tend to choose poorly, often against their own interest (Kahneman and Tversky 1979). *Homo economicus* is shown to be fictional. Financial literacy is an attempt to change that, and therefore, to superimpose a norm on reality. To be fair, a norm by definition does not coincide with reality; it describes where we ought to be, and therefore it cannot describe where we are. Also to be fair, any education is an attempt to make something out of people that they are naturally not. It is always an imposition of an ideal on human beings. Without such an aim, education does not have a reason to exist. The problem I want to address is not about the intent of the financial literacy programs and not even of its efficacy. It is a case of the expansion of normative knowledge through the means of curriculum, which in turn is a likely consequence of the mass education as an instrument of social policy.

## **The Noncumulative Knowledge: The Freewill Clause**

In his 2007 encyclical letter, Pope Benedict XVI (Ratzinger) has laid out an epistemological theory of ethical and scientific knowledge made distinct by the principle of cumulativeness.

Let us ask once again: what may we hope? And what may we not hope? First of all, we must acknowledge that incremental progress is possible only in the material sphere. Here, amid our growing knowledge of the structure of matter and in the light of ever more advanced inventions, we clearly see continuous progress towards an ever greater mastery of nature. Yet in the field of ethical awareness and moral decision-making, there is no similar possibility of accumulation for the simple reason that man's freedom is always new and he must always make his decisions anew. (Benedict XVI 2007, 24)

The distinction between cumulative and noncumulative knowledge was probably first made by C. Brinton (1984), who described the difference between scientific knowledge and that in arts, literature, and philosophy. Brinton reminds that humans have achieved greater control of the nonhuman environment, but have not done much of a progress on human behavior. However, Benedict XVI had first explicitly applied the notion of noncumulative knowledge to ethics and gave an explanation to the root cause of the noncumulativity of certain knowledge: freedom. The argument is as simple as it is convincing:

These decisions can never simply be made for us in advance by others—if that were the case, we would no longer be free. Freedom presupposes that in fundamental decisions, every person and every generation is a new beginning. Naturally, new generations can build on the knowledge and experience of those who went before, and they can draw upon the moral treasury of the whole of humanity. But they can also reject it, because it can never be self-evident in the same way as material inventions. The moral treasury of humanity is not readily at hand like tools that we use; it is present as an appeal to freedom and a possibility for it (Benedict XVI 2007, 24).

We are not free to reject the cumulative knowledge of science, because it has the implied reliance on verifiable evidence. However, with ethics, the free will is not bound by the rules of evidence; otherwise, there is no free will. In effect, all normative knowledge is noncumulative, while descriptive (positive) knowledge is cumulative. The distinction becomes useful to us for the analysis of financial literacy education. Let us pick it up from here, for neither Brinton nor Benedict XVI seems to elaborate on the concept of noncumulativity.

## Curricularization

Benedict drew the border between cumulative and noncumulative knowledge between material and ethical knowledge. It worked just fine for the purpose of his letter, but it is not enough for my purpose. I will show how the borders between the two kinds of knowledge can be redrawn and how curriculum can be the bridge that allows for crossing.

Let us consider criteria on which the World Bank ranks countries on financial knowledge:

1. Percent of adults with understanding of inflation
2. Percent of adults with understanding of simple interest
3. Percent of adults with understanding of compound interests

4. Percent of adults who can think in real monetary values (money illusion)
5. Percent of adults correctly calculating a simple division
6. Percent of adults with basic numeracy skills (to identify better bargains)

And are the criteria for behavior and attitudes:

1. Budgeting: Making a plan for spending money and keeping to the plan
2. Not overspending: Not spending money on nonessentials or nonaffordable item
3. Living within means: Not borrowing more than affordable or for essentials
4. Choosing financial products: Having chosen the financial product on his/her own
5. Attitude towards the future: Focusing on the future rather than on today
6. Nonimpulsiveness: Not being impulsive (The World Bank 2016)

What kinds of knowledge do these two lists represent? The first one is clearly descriptive and cumulative. Indeed, we know what inflation is, and there is little normativity about that knowledge. Inflation can be good for you if you are obtaining a mortgage. On one hand, a sudden jump in inflation rate can allow you to pay off your mortgage much sooner than otherwise would be possible. On the other hand, it can be bad for you if you are an investor. Before investing into a business, you would have to make sure its profits are higher than the inflation rates. We know that double-digit inflation is generally bad for country's development, because it deters investment, but very low inflation or deflation also deters investment. Those are all more or less descriptive and cumulative claims, which can be fine-tuned or even eventually disproven, but do not require an act of free will or an ethical choice to accept or reject.

However, in the second list we see the signs of implied normativity. The claims are not in the explicitly normative form yet, but normativity is easy to deduce. You *should* make a spending plan and stick to it, without splurging beyond your means. You *should* not borrow too much. You *should* think about your financial future. This is an example of the new quasi-morality, the new and expanding normativity. In the educational discourse one may find other instances of the same phenomenon: Thou shall eat healthy food, thou shall recycle and care for the environment. Thou shall be tolerant and accepting to people from other cultures and with disabilities. In some cases, the new commandments simply did not exist in the old religious and ethical systems, but in some cases they directly challenge and attempt to replace them. For example, Jesus has directly argued against financial literacy "Therefore I tell you, do not worry about your life, what you will eat or drink; or about your body, what you will wear" (Matthew 6:25–34). The Quran contains explicit prohibition against charging interest, which presents a problem for contemporary market economy. The conflict resulted in the entirely new ethical system of Islamic finance. Of course, in still other cases, the new commandments simply restate, expand, or reinterpret the old ones (tolerance is the prime example here). Together, they constitute the new canvas of normative claims, in complex relationship with each other.

It is very important to note that the two World Bank lists are not independent of one another. They are connected as means and ends. We teach people about inflation in hope that the descriptive knowledge *becomes* the normative, that people will

learn to choose financial services wisely because they understand what is inflation and can calculate simple and compound interest. The descriptive should lead to the normative, make the latter easier to accept. Of course, there is nothing automatic in transition from the former to the latter. One can calculate well and still take huge gambles. One can argue that any normative, noncumulative knowledge depends on certain descriptive, cumulative knowledge. For example, to choose not to harm other people, a child first learns that hitting or biting someone else hurts.

The distinction between the normative and the descriptive is not absolute, and the border is penetrable. For example, we may teach school kids to count to ten as a part of anger management program. It is an attempt to support the ethical knowledge (rejection of violence) with regular descriptive knowledge about a certain technique. Of course, a child still has the free will and can choose not to use the technique and resort to violence. Moreover, the lack of knowledge about the counting to ten technique can also limit the free will of the child, unable to cope with his or her emotions. Therefore, the distinction is not always clear, but the connection between the two kinds of knowledge does seem to exist. Cumulative knowledge is necessary, but not sufficient condition for noncumulative knowledge.

The practice of education is not homogenous in this respect: in some areas, we simply give people descriptive knowledge without a clear normative aim. For example, we teach someone to solve quadratic equations with only the broadest hope that it will help one to become a productive member of the society. However, in other areas, the normativity cannot be plausibly separated from descriptivity. For example, history curriculum is impossible to take out the patriotism vs. multiculturalism value divide. Financial literacy education seems to be a case where we actually have a choice – to keep it completely descriptive, and more or less stick to the first list, or expand it to include the second list. This makes it an interesting case. Financial literacy education is not as objective as math, and yet not as value-saturated as history. It is in between and can go either way.

In the pragmatic sense, we may not have much of a choice on the matter. Any expensive intervention needs to be evaluated. Such a condition makes the expansion of normativity almost inevitable, or at least, very difficult to resist. Could the World Bank simply stick to the first list of criteria? I theory yes, but in practice its member countries want evidence of real change in people's behavior. Otherwise, competing demands for funding will easily win the attention. The demands for accountability will make educators lean toward normativity, because descriptive knowledge itself does not change behavior. Only normative, noncumulative knowledge moves and motivates. If I am evaluated by how much people in my care change, I will definitely try to change those people. Therefore, I will tell them what I want them to do, and thus present a normative claim. Just presenting facts does not seem ever enough. As a clever educator, I can hide my real intentions really well. However, as long as I remain an educator, I have aims about my students, and denial of my aims is nothing but a sophisticated manipulation. In one way or another, I will have ethical or quasi-ethical commandments up my sleeve.

In general, epistemology is not independent of funding. This may sound odd, but it is simply an extension of pragmatist thinking. The ways of socially mediated

knowing have direct effect on truth claims. Much of epistemology has evolved from the model of an independently wealthy gentleman thinking, not burdened by the way social institutions and economies operate. In that mode of thinking, justified true belief may be perceived as not dependent on the availability of pecuniary resources. Yet embeddedness in massive (and therefore expensive) educational practices requires that the knowledge has impact. Cost drives accountability, and accountability, in turn, drives the drift toward normativity of knowledge. First, we try to measure whether education programs have effect. Next, we reshape programs in such a way that behavioral change becomes the direct aim of education.

The scope of this chapter does not allow developing a full argument on pragmatist epistemology in its interactions with the institutionalist thought. To get a sample of such an argument one may consider Shane Ralston's (2010) work. My position is very simple: institutions such as education do affect the characteristics of knowledge that is embedded in them. In our particular case, the institute of education seems to facilitate the drift of cumulative, descriptive knowledge toward noncumulative normative knowledge.

I will borrow a useful term 'curricularization' coined by Reijo Kupiainen. He describes a Finnish Children and Media Program that attempts to "map the required developments in children's media environment and to promote media education and media education projects. Most of these projects have been implemented outside school". He calls this "some kind of curricularization of leisure and everyday life" (Kupiainen 2010, 337). He pointed out only to the phenomenon of education 'seeping' into nonschool environments. I think, however, that the phenomenon is larger and includes the reverse flow of certain subject matters from noneducational to educational setting. Curricularization is shifting certain kinds of knowledge from the cumulative to noncumulative realm through the means of expanding curriculum.

## The Paradox of Cumulativity

When we pull knowledge from the descriptive into the normative, the intent is to increase its potency as a regulator of human behavior. Again, intervention programs seek to demonstrate their impact. However, the unintended effect is that with normativity knowledge also acquires another quality of noncumulativity. It triggers the free will clause and its acceptance becomes a matter of choice. In our attempts to increase the effect of such knowledge, we in fact *reduce* such effect. It is almost as if trying too hard in education has the opposite effect. It is one thing to teach someone about the differences between simple and compound interest and ignore how one uses this knowledge. It is quite another thing to teach someone to avoid high risks and put away some money for retirement. Suddenly, the knowledge loses all the potency of evidentiary support and becomes a matter of personal choice. Knowledge becomes belief. Beliefs may be strong because they can move us, but they are also always weak because we do not have to accept them.

Choice is a powerful instinct, with its own built-in immune system, capable of radical reframing of any question. Any direct or implied 'you should' statement is interpreted as an attack on one's freedom of choice. Once a claim is presented in a normative form, a person will measure it up not so much against the evidence, as against one's own desires and other beliefs.

In other words, normative claims will evoke an entirely different reference system, and make it overall less likely that the person will behave in accordance with the claim. It is also complicated with desires. How do we know what we want? Most people, especially young people do not know exactly what they want. We do not have access to knowledge about our desires independent of prior similar experiences. A young person presented with a choice through a normative claim has very little knowledge of oneself to go on. That creates a situation of random choices that lock a person into a position. Moreover, once I make a choice within certain system of beliefs, it will predict my future choices, because of the drive for the internal consistency.

For a Christian who takes Jesus' call for not caring about the future literally, any new claims encouraging him or her to save and to consider personal financial future will make very little impact. One danger of curricularization is the conflict with normativity in other domains. The broader an array of normative claims, the more likely they are to conflict with each other; this is simply a matter of probability.

However, the further problem is that shifting knowledge into the normative, non-cumulative domain has the domino effect on all the descriptive knowledge associated with that area of normative knowledge. In other words, noncumulativity is contagious. It devalues evidence all the way down. Consider the case of climate change denial. Presented with a normative claim (thou shall reduce emissions), a part of the population will inevitably reject it. In fact, it is clear that many climate change deniers dislike the stated or implied solutions much more than the facts supporting the claim. It is the slowing down of economic growth that they hate, not the statistics on weather patterns. The refusal to accept the choice at the end of reasoning provokes people to rationalize their refusal by questioning the beginning and the middle of the reasoning chain.

Where it is a matter of choice, the multiplicity of outcomes makes it inevitable. It is so not only because of the natural variations within the population. The very fact that you have chosen A makes me more likely to choose B, because I am a different person and I value my identity as distinct from yours. So, there will be a group of people who reject the notion of global warming, even to be different from those who accept it. To justify their choice, they have no choice but question the host of descriptive claims that support the normative one. In their eyes, the painstakingly accumulated descriptive knowledge of climate change will become invalidated. We make normative choices first and accumulate evidence to support them later. To invalidate evidence, one seeks new evidence of bias or conspiracy those who find and present the evidence on climate change. This is another example of the pragmatist and institutionalist thinking. Indeed, some epistemologists will argue that nothing like this should happen. If we have hard, verifiable fact, it would make the adoption of the justifiable belief easier. I am, however, trying to show the opposite:

the acceptance of belief is in reality an action independent of the evidentiary foundation. It, in turn, corrupts the evidentiary base. We philosophers may not wish it to be so, but if we wish to remain relevant, we have to acknowledge the reality. We must see how the paranoid consciousness is born and sustained.

## The Rise of the Paranoid Consciousness

In an influential *Harpers* essay, historian Richard Hofstadter (1964) paints a broad historical picture of what he calls ‘the paranoid style’ in American Politics. Apparently, it has been around for a long time, before the American Right has appropriated it. He cites the panic about Bavarian Illuminati, the anti-Masons, the anti-Catholics (and anti-Jesuits especially), the populists, the alarmists about Mormons, the White Citizens’ Councils, and Black Muslims. Hofstadter names three beliefs of the right-wing thought contemporary to him: in conspiracy culminating with the New Deal, in Communist infiltration into the American government, and in the network of agents in mass media, education, religion, undermining the American will to resist.

Today’s contemporary paranoid theories may be less grandiose; they are more fluid, and perhaps shallower but broader. Hofstadter described the fringes of American politics, but now the paranoid consciousness has moved toward the very center of it, capturing the highest office in the USA and threatening to do so in several European countries. It is happening, in part, because instead of one big, coherent conspiracy, we deal with many small, vague, incoherent, yet still clearly related to each other beliefs: that liberals are somehow out to weaken America, that Hillary Clinton has committed treason, that global warming is a Chinese hoax, that Obama is a Muslim born in Africa, that vaccination brings autism, that Orlando shooting was staged, that the Twin towers were blown up by FBI, etc. We have no objective way of measuring either the depth or the breadth of the paranoid thinking, but it is fairly obviously not in retreat. Why is that? We live in the most educated societies ever, with secondary education becoming universal, and higher education undergoing a new wave of massification. The populace has never been as educated, but it is no less paranoid.

What interests me in Hofstadter theory is the relationship between the paranoid consciousness and education. His own hypothesis is partly psychoanalytic and partly epistemological. I will not argue with the psychoanalytic part, but the epistemological argument is flawed. He claims “They see only the consequences of power—and this through distorting lenses—and have no chance to observe its actual machinery”. In other words, making politics more explicit and allowing more groups access to politics would help. That is obviously wrong, for many of the contemporary paranoiacs are in the legislative bodies or close to them. They know how politics is made.

Hofstadter believes the paranoid ‘resists enlightenment’, and that by implication, more enlightenment would help. But that claim clearly contradicts his own observation:

The higher paranoid scholarship is nothing if not coherent—in fact the paranoid mind is far more coherent than the real world. It is nothing if not scholarly in technique. McCarthy’s 96-page pamphlet, *McCarthyism*, contains no less than 313 footnote references, and Mr. Welch’s incredible assault on Eisenhower, *The Politician*, has one hundred pages of bibliography and notes. The entire right-wing movement of our time is a parade of experts, study groups, monographs, footnotes, and bibliographies. (Hofstadter 1964)

The paranoid mind is nothing if not enlightened. It analyzes commonly available claims, employs critical thinking, seeks evidence, evaluates it according its own standards, and makes own conclusions based on that evidence. In other words, the paranoid mind is exactly what we want an educated person to be. No, the paranoid is not uneducated. If you have a reason to doubt, please check any of the major conspiracy sites and forums. You will find there massive depositaries of evidence, of irrefutable arguments and unassailable logic. If you go bottom up, from basic facts to conclusions, these piles of evidence and argument are very weak. If you look from the tops down, from conclusions to evidence – they are very strong. To build these massive towers of paranoid knowledge, one needs educated authors and readers. Education, if not careful, may provide the building blocks for these towers.

I believe that the recent perceived widening of the paranoid consciousness across much of the world can at least partially be explained by the creeping curricularization of knowledge. Or, to put it differently, the large-scale public education agenda had led to appearance of many more quasi-ethical constructs, which in turn devalued the evidentiary, cumulative knowledge. While the populist backlash is obvious, its mechanisms are poorly understood. I think the epistemological mechanism of the paranoid consciousness is close to what I have described as the curricularization.

Education may trigger paranoid consciousness. Teaching people to look for evidence and apply critical thinking can actually make their conspiracy theories stronger and their paranoid beliefs firmer. Those who believe that the answer to the paranoid consciousness is simply more education may be mistaken. Education itself may be a partial culprit here, because its natural tendency is to curricularize knowledge unintentionally reduces the realm of cumulative knowledge. Specifically, financial literacy education may actually damage the cause of the rational financial behavior, because it presented its content as normative claims, and thus triggered resistance.

The consequences of paranoid consciousness are serious. They may not affect education itself that much, but in the political realm, these consequences wreak havoc. The always quite narrow field of mutually comprehensible rational political discourse may become even narrower. Representatives of different political parties become trained in rejecting the pillars of evidence, supporting normative claims significant for the other party. What used to be descriptive statements in need of further evidence are gradually becoming articles of faith. Consider, for example: ‘The government is too big’, or ‘We must cut taxes’, or ‘Education is a civil right’,

or 'Poverty can be reduced through education'. Fifty years ago these might have been simply hypotheses, mostly in the realm of the descriptive, cumulative knowledge. Now the same statements firmly belong to the realm of the normative, the noncumulative ethical knowledge. They no longer require support, and if evidence for or against them is presented, the opposing political side will turn on the conspiracy theory thinking to destroy the uncomfortable evidence. I could never imagine myself writing this, but here we go: education can be a threat to democracy. It is not the only, but an important, contributor to the curricularization of knowledge.

## The Curricularization Hygiene

Obviously, this does not mean that all education always produces the expansion of normative knowledge. It is this particular historical form of publicly funded, socially constructed education that tends to do that. Just because certain drug has side effects does not mean it should not be taken. Similarly, the many great public and private benefits of mass education are simply beyond doubt. The economic benefits of educated populace alone make the thought of reducing the scale of education unthinkable. However, it would be prudent to consider the down side.

Unfortunately, this is not the first time the humanity is making the error. All world religions have experienced the same or similar problem. They created large sets of normative knowledge in hope of influencing people's behavior. The larger the set, the more the free will clause, formulated by Benedict XVI, is applicable. They inadvertently have made knowledge more questionable, more arbitrary, and stopped its accumulation. As a consequence, all universalist religions first suffered endless splintering, and loss of relevance in significant parts of the developed world. The temptation of curricularization is difficult to resist.

What are possible ways of containing the curricularization of knowledge? The problem I point to is implicitly understood in the so-called social norms approach (Berkowitz 2004). Although somewhat controversial, the approach influences human behavior by presenting knowledge in strictly non-normative forms. For example, most university freshmen overestimate the percentage of their classmates that engage in binge drinking. The approach is simply to tell the objective truth: only a very small portion of other freshmen drink in binges. However, the approach simply does not work when the majority of the population is in error. For example, prior to 2008, a very large group of Americans thought that real estate markets could go only up, and bought houses and second houses at inflated rates and with unsustainable mortgages. Those who saw the danger of the situation could not resort to pointing out at the majority's behavior, because the majority was wrong. The social norms approach, even if it works, presents a limited solution. And it highlights another side of the same dilemma: the descriptive knowledge is not powerful enough to influence behavior.

No matter how tempting, education is a pretty poor instrument of public policy. It cannot nudge people's behavior in any meaningful sense. Let us consider the financial crisis of 2007–2008. As the reader might guess by now, I do not believe education could have prevented it. If someone before 2007 tried to do the financial literacy intervention with certain normative emphasis, it would trigger the noncumulative contagion and, potentially, the paranoid consciousness. "They are saying these things because they want to keep all the money to themselves". In other words, credibility of such a program would be damaged and unintended consequences result. No financial literacy program would have made any difference. To the contrary, it might have made it worse.

However, in the example above, an early intervention by regulators could possibly have deflated the housing bubble or at least soften its bursting. The US Federal Government could have tightened requirements for lending and limited the sales of derivatives. Of course, regulation is also an imperfect policy instrument, for if excessive, it tends to dampen development. The philosophical analysis of regulations is beyond the scope of this chapter, but one can intuit that regulatory regimes can also trigger the paranoid consciousness and have unintended effects.

With education, however, our best bet is, whenever possible, to specifically stop just short of normativity, even when it would jeopardize our ability to evaluate or increase effectiveness. As I argued above, the curricularization is an unintended consequence of accountability. I have nothing against accountability as such and consider it necessary for any publicly financed interventions. However, it would be foolish to ignore the systemic negative consequences. The only solution that presents itself is careful regulation of education itself, with an explicit prohibition of normative claims. School curriculum should be stocked with incomplete pyramids of knowledge, stopping short of ethical implications. The public interest is to protect the large area of cumulative knowledge and vigorously defend it against the expanding normativity that leads to devaluation of evidence. It is in public interest to keep the realm of noncumulative knowledge very small and contained, and prevent it from spreading.

Another implication is for pedagogy. In contemporary education, common are methods where students are asked to take a stand and defend their position. I myself used them for many years and found them engaging and productive. However, now I wonder if teaching students to withhold judgment is much more important. Perhaps, we can think of special efforts to teach young people to turn normative claims back into descriptive ones.

## Conclusion

The case of financial literacy demonstrates that massive public education programs may have a tendency to curricularize knowledge. When certain claims cross the border from cumulative, descriptive realm into the noncumulative, normative realm,

such claims become vulnerable to rejection, and may compromise large bodies of cumulative knowledge that support the normative claims. We should use the pragmatic and institutionalist epistemological thinking to prevent this from happening. We must know how institutions operate in the real world and what are the likely unintended consequences of the curricularization of knowledge.

# Therapy

Paul Standish

In a world facing environmental despoliation, overcrowding, new forms of poverty, and political threats of diverse kinds, and at a time when, at an unprecedented pace, technology forces and shapes human social adaptation, there is the widespread sense of a new crisis in mental health. Older, more stable communities have been increasingly displaced by new social structures and forms of interaction, while specific developments have become the cause of a more general sense of social pathology – witness concern over such matters as the ‘Prozac generation’, the over-prescription of Ritalin, and so-called toxic childhood.<sup>1</sup> A part of the response to these changes can be seen in the burgeoning industry of counselling, psychotherapy, and positive psychology, while hopes of breakthroughs with the psychological problems that arise are raised by rapid advances in neuroscience. All this has been felt in socio-political reverberations especially through Western culture, seen in the emphasis on responsibility for lifestyle choices, in the preoccupation with happiness and wellbeing, and in the rapid development of confessional and reality television.

Such ways of thinking have influenced and become manifest in education in ways that are easy to discern. Classes in happiness or ‘mindfulness’ have been introduced in a range of contexts, from elite private and state schooling to military training, and these have been advanced with claims regarding both their instrumental and their intrinsic value. Notions of self-management have been apparent in approaches to classroom control, the organisation of study practices, and career planning, as well as with regard to the regulation and development of one’s emotional life. A new ‘science’ of parenting has arisen, such that what it is to be a parent is re-conceived and perhaps mis-conceived (see Ramaekers and Suissa 2012).

---

Similarly, pedagogy has come to be shaped by technical-therapeutic principles and strategies, with a new emphasis on the structuring of learning according to students' 'learning styles', with changes in assessment practice, and with the reconstruction of concepts of success and failure – typically to emphasise students' positive achievement and to minimise the experience of failure. Even research now comes with a health warning: Frank Furedi gives the example of the “Vicarious (Secondary) Trauma Workshops for post-grads participating in the university's ‘Social Sciences Research and Skills Training’ programme” offered at Oxford University as a symptom of the wider medicalisation of the language and terms in which the university has come to understand itself (Furedi 2017). In these and other respects, educational practices have both been shaped by wider forces and themselves contributed to the perpetuation and intensification of therapeutic ideas of these kinds.

Against the groundswell of this change, however, it is sometimes objected that educational policy and practice have become too concerned with such matters as students' self-esteem and general psychological wellbeing, and that such preoccupations can subvert more truly educational aims. Indeed, this is sometimes capped with the thought that a more truly educational emphasis in the provision of schooling would avert those problems that therapy comes in to address; for sure, this would not prevent all such problems, but it would correct the cultural current that has, for so many, pathologised ordinary life. All this may seem a purely contemporary concern, but to raise this criticism is in effect to draw on a connection or contrast between education and therapy that has been there, in one way or another, for as long as human beings have reflected on their situation: on what it is to be educated and what it is to live well, contested as the former term undoubtedly is and with all the ambiguities that the latter phrase inevitably carries. Hence, there is every reason to proceed to a more directly philosophical engagement with these matters.

The questions that thereby arise are indeed compelling, and they have raised antagonisms in excess of what therapy's apparently benign image might lead one to expect. Thus, from the side of therapy, it might be asked: what is one to make of educational practices of a kind that cause moral distress, including the assimilationist practices of so much schooling? Conversely, as educators will sometimes wonder, when does therapy become, in fact, mis-educative – perhaps by encouraging a tranquilisation of experience rather than the bracing challenge that education and the quest for the good life require? When it comes to happiness also, it is quite likely that the parties to the discussion will differ over what it is exactly that happiness consists in. What kinds of happiness should education and therapy foster, and when might these be at odds with each other? Difficulties of definition abound here. Hence, the wisest course seems to be to identify and describe some of the particular influences and trends that have shaped practice and debate.

In 1981 in *After Virtue*, Alasdair MacIntyre identified 'the Therapist' as one of three archetypes of the modern age. The others were the Manager and the Aesthete. Of these two, the former is relatively easy to identify, possibly even more so now than was the case in the early 1980s, because the figure is a personification of what has come to be thought of as managerialism. This is a figure in whom instrumental reason predominates and whose moral philosophy, such as it is, will be uncompro-

misgivingly utilitarian. He – and in its classical incarnation it will most probably be ‘he’ – will be the ideal agent of performativity. The Manager, thus conceived, has surely become a dominant feature of our age. The Aesthete is at first sight a less familiar figure. This archetype is intended to suggest not the person of sophistication and discernment in matters of art, in the manner that is commonly associated with the term, but something strikingly different: it brings together ideas of a life dedicated to comfort and ease, pleasure, and material welfare. Such a conception of the good life is surely a hallmark of the neoliberal societies of today (notwithstanding the irony of the fact that ‘comfort and ease’ are at least in tension with the high-stress, relentless busyness of the lifestyles such societies demand). As an understandable expression of a naturalistic worldview, where the good is to be reckoned in terms of desire and satisfaction, this is a conception that has parted company with more exacting and, in a sense, nobler possibilities.

While both the Manager and the Aesthete warrant some explanation, the Therapist is impossible to miss. The past three decades have seen an unprecedented growth in explicitly therapeutic practice. A visit to the local bookstore will reveal shelves heavy with self-help guides of diverse kinds, while online evidence of such practices burgeons as never before. In similar fashion, a visit to a local school in many parts of the world will very likely show the growing influence of therapeutic preoccupations and techniques – with interventions to alleviate difficulties, whether to control problematic behaviour or to manage stress, as well as more proactive initiatives such as the provision of classes in happiness or mindfulness. The truth of that judgement has certainly been borne out in the rise, since the year of *After Virtue*'s publication, of therapeutic practices of various kinds. This can be seen in respect of the care of the body – from dietary practices to physical fitness regimes – and in the growth of holistic forms of medicine. It is evident at a more obviously psychological level in the increased attention given to the ‘management’ of the emotions and, above all, to happiness and wellbeing (cf. Goleman 1995; Layard 2005).

MacIntyre diagnosed the emergence of these three types in terms of a background of decline. The decline was in those structures of meaning sustained by communities and manifested most obviously, though by no means exclusively, in varieties of religious practice and belief. The opening of *After Virtue* sets out the book's major thesis, which is that we live in an age in which our moral vocabulary has become a mere shell of what it was because of the hollowing out of the substance of communities that gave it its former life. The consequent inauthenticity of the life that is then sustained in relation to these terms is a facet of the nihilism of the age, a nihilism that Nietzsche had diagnosed a hundred years earlier in terms of the old values having devalued themselves. While MacIntyre's response was to seek a revaluing and rebuilding of those earlier possibilities of community, Nietzsche's was expressed in the vision of the *Übermensch* (inadequately translated as ‘the Overman’) – in a sense, in a new vision of the human or, to phrase this in its most recent terms, of the post-human (Nietzsche 1961).

While there is no doubt that educational institutions have seen a rise in therapeutic practices, it is also the case that they have been encroached upon by managerialism. This can be seen in aspects of neoliberalism that have had impact on education in

many countries of the world. Evidence for this is to be found in three main respects (see Blake et al. 2000; Staddon and Standish 2012; Standish 1991, 2012). First, there is a culture of accountability that is reliant on high-stakes testing and the promotion of competition – within educational institutions, between them, and between countries. Second, there is the rise of performance measures, with the concomitant instrumentalisation of education. Third, there is the commitment to quality assurance with its concomitant aversion to risk. This manifests itself in a suppression of the exercise of judgement on the part of teachers and a tendency to micromanage educational processes. A significant aspect of this aversion is what might be called a denial of negative experience. In other words, an over-emphasis on achievement makes it impossible for students, as well as for those who teach them, to acknowledge ways in which things do not go well in the course of a human life; and this avoidance leads to a kind of repression. Certainly, there is reason to believe that such changes have inflicted stress on children: the experience of a child at school in a progressive, child-centred environment some decades ago was very different from that of the child in the achievement-driven, heavily-tested school environment today; and the strains do show. It is partly in response to these pressures that therapeutic interventions are introduced. Thus, in these respects, the school is a microcosm of the wider neoliberal culture. Such an account, however, which pitches the rise of managerialism and therapy as complementary responses to a loss of the sense of value in the modern world, certainly seems to reinforce the diagnosis offered by MacIntyre. The point can be given a more contemporary accentuation by saying that in neoliberal societies this incipient nihilism reaches a new low.

But why, we need to ask more directly, is this a problem for education? One answer is to be found in the trenchant critique provided in *The Dangerous Rise of Therapeutic Education* (2008) by Kathryn Ecclestone and Dennis Hayes. The authors, themselves drawing in some degree on the broader social critique advanced by Furedi (2004), claim that therapeutic education both reflects and exacerbates a profound crisis of meaning. Measures to address emotional literacy, inspired in part by the work of Daniel Goleman, as well as curriculum interventions to promote self-esteem, confidence-building, and stress-management, and to deal with the problems of bullying and harassment, have deflected education from schooling's proper concerns. They apply the label 'therapeutic education' to any activity that focuses on perceived emotional problems and aims to make educational content and learning processes more 'emotionally engaging', suggesting that this somewhat sentimental and partly tranquilising approach erodes faith in human potential, resilience, and capacity for autonomy. It replaces this faith with a cultural script that reinforces the sense of human beings as vulnerable and needing support so that 'appropriate' emotional responses can be engendered. That script has its characteristic lexicon of 'at-risk students', 'disaffected learners', 'fragile identities', and 'complex needs', with a growing catalogue of institutionalised classifications. This is a picture of human beings as diminished selves, in contrast with which a well-balanced self is posited. All this is an expression of cultural disillusionment with ideas about human potential, and it replaces real commitment to education with forms of social engineering.

Such a critique has much going for it, but it needs to be understood in relation to the problem of performativity. Performativity is manifested in part in terms of a concern with procedure over substance – itself a reflection of managerialist thinking (Standish 1999). The emptiness of this is sometimes not appreciated, partly because performativity can readily adopt a vocabulary of ‘standards’, where standards look like the hallmark of quality in education. But this is deeply deceptive. It is a further means by which educational policy and practice are deflected from their properly educational concerns, and, in a sense, it is an exemplification of the problem that MacIntyre diagnoses. In his Prologue to the 2007 edition of *After Virtue*, he writes:

My explanation was and is that the precepts that are thus uttered were once at home in, and intelligible in terms of, a context of practical beliefs and of supporting habits of thought, feeling, and action, a context that has since been lost, a context in which moral judgments were understood as governed by impersonal standards justified by a shared conception of the human good. (MacIntyre 2007, p. ix)

MacIntyre is writing explicitly about matters of morality, but morality and virtue are not to be understood in narrow terms. The good of education falls within their range. The questions of what it is to be educated and what it is to live well cannot otherwise be appropriately addressed. So the parallel to be drawn is that terms such as ‘standards’ and ‘quality’ have become shadows of what they once were. In MacIntyre’s terms, they have become hollow because they are no longer embedded in the kinds of contexts of practical belief and action that gave them meaning. In Nietzsche’s, as we saw, the higher values have devalued themselves: church attendance and expressions of belief had become a matter of keeping up bourgeois appearances, and this was why God was dead. Beyond these terms, however, it is also appropriate to acknowledge the particular forms that the dominance of risk-averse technical rationality takes where the culture of accountability prides itself on ‘data-rich’ practices sustained by computing (see Blake et al. 2000). This is a further channelling and perversion of the discursive force of these words.

In a number of texts, Paul Smeyers, Richard Smith, and Paul Standish have taken these matters on, while their *The Therapy of Education* (2006) turns explicitly to the confluence of these factors with new manifestations and new understandings of therapy and education. Similarly, Ruth Cigman and Andrew Davis’ collection *New Philosophies of Learning* (2009) takes up related topics and helps to cast light on specifically pedagogical developments. In a different idiom, the journalist Julie Burchill once remarked that counselling is the opposite of socialism,<sup>2</sup> a remark that might suggest that the culture of therapy has involved a new delineation of the public and the private, and in effect a privatisation of emotion – a privatisation that has more to do with a reduction of the public sphere than with a genuine respect for privacy, as confessional television shows such as *Oprah Winfrey* or *Dr Phil* make abundantly clear.

---

<sup>2</sup>Burchill writes: “Counselling is the exact opposite of socialism; no wonder it started to be so eagerly proffered by every last agent of social control just at the same time as union rights were being destroyed” (Burchill 2001).

But the interweaving of therapy and philosophy has ancient roots, as is indicated most obviously in Socrates' expression 'care of the self', found especially in the *Alcibiades* and the *Apology*, where philosophy is understood fundamentally as a working on oneself. There are lines of thought that lead from this in the direction of stoicism and the steadying of desire and emotion. But other directions of thought – closer to Socrates' articulation of the idea – focus on the supreme importance of personal engagement, in forms of moral perfectionism that bring together the good of the person and the society in recognition of the fact that, as is said in *The Republic*, our city is a city of words. It goes without saying that, in the course of more than two millennia, the sense of the concepts of philosophy, therapy, and education, as well as of their mutual relationship, has shifted. An outstanding guide to these changes is provided by the late series of lectures that Michel Foucault gave at the Collège de France in 1981–1982 (Foucault 2005). His discussion in the course of these lectures is lengthy, detailed, and highly insightful, and it is impossible here to do justice to its complexity. But it will be worth attending to aspects of his discussion.

The Greek phrase, *epimeleia heautou*, around which Foucault's exploration revolves, is translated as 'the care of the self', and – with reference to Plato's *Alcibiades* in particular – he shows this to be "the justificatory framework, ground, and foundation for the imperative 'know yourself'" (*gnothi seauton*) (p. 8). This is to make connections from the start between subjectivity and the nature of access to the truth, in respect of not only self-knowledge but knowledge of things in general. Foucault phrases the central problem in pointedly first-person terms: "What is the price I have to pay for access to the truth, what fashioning of myself must I undertake, what modifications of being must I carry out to be able to have access to the truth?" (p. 189). He gives much attention to the problematic reflexivity of the ideas of self-knowledge and care of the self, where the self seems to occupy both subject and object positions, and this raises questions about both what the self is and what it is to know something. In the Greek literature, the self is to be understood as the soul, and the soul is seen less as some kind of ethereal substance than as a capacity and responsibility for action; but neither is the soul reducible to the body, for the "soul, the breath, is something that can be disturbed and over which the outside can exercise a hold" (p. 47). With regard to what we do and say, Foucault writes: "the subject of all these bodily, instrumental, and linguistic actions is the soul" (p. 55). But he immediately questions the idea of instrumentality here on the grounds that the subject that 'uses' that body is already embodied in and partly constituted by that body.

A further important factor here is that in Socrates' thinking this responsibility is tied to membership of the *polis*, the meaning of a human life being inevitably dependent in some significant degree upon its part in this wider society. Yet this is far from a recipe for conformism, as Socrates' own life and death demonstrate in a supreme way. In the writings of the post-Socratic philosophers and in those of the Roman world, there is, by contrast, a growing sense of the care of the self as something that may be separated from direct dependence on the concerns of the community. The 'therapy of desire', to borrow the phrase that is the title of Martha Nussbaum's celebrated book (Nussbaum 1994), invites thought of a life of something more like self-containment, through which one's responsibility would lead one to avoid the

mistakes that others make in various forms of excess and bad judgement: it would involve a kind of resistance against the pressures to be drawn into problems, or otherwise to distort oneself, that one faces from society or as a result of the excitation of unruly desires. What is achieved thereby is a kind of self-sufficiency, in the sense not of the independent autonomous person, an ideal more familiar today, but rather of someone whose self-containment is manifested in a kind of stillness or steadiness in themselves. One thing to notice is that such a relation to the self would not be narcissistic or purely egocentric in kind. Another, however, is that what is envisioned here is quite other than the self-renunciation that emerged with the advent of Christianity. It would enable one to find and to speak in one's own voice: the *parrhesia* that is thereby realised is a kind of frank speaking, where one is ready to expose oneself in conversation and dialogue, especially in circumstances of education.

With regard to the subject's relation to knowledge, it is worth considering also a change that comes especially with the modern world, for which it is convenient, although somewhat simplistic, to name the Cartesian revolution as a key turning point. For the pre-moderns, the knowing of something was not to be separated from the manner in which it was known: in other words, to come to know something was to be changed by it – not in the minimal and trivial sense that this was an increment to the existing sum of what one knew, but in that one was affected somehow in one's soul. In the modern period, with the new prominence and prowess of scientific knowledge, there is a severing of this relationship: in philosophy, this is exemplified by epistemology's focus on the calculus of truth conditions, while in popular experience, it is figured powerfully in the technology of the computer with its indifference to the data it processes. Now it is certainly true that the knower should care about 'getting it right' – that is, care about accuracy – but this is sometimes cast in terms of qualities such as independence, detachment, and 'objectivity', all of which tend to muffle or downgrade the significance of the ways that the learner is affected. This separation turns subject-object relations into a dichotomy understood in metaphysical terms, and this gains a hold on the way we think.

All this is crucial for education. In the pre-modern conception, as we saw, the self or soul was understood dynamically. The task was to find what you were about, and here the idea of an aim becomes pertinent. But this would not be an aim directed towards a fixed telos: it was rather a matter of finding out what it was that mattered to you, the principles according to which you might live. As in archery, such an aim was to be focused through a kind of steadying of thought where the siren voices of distraction were quietened and where you might attend to what it was that did matter; and, again as we saw, this would be a matter not of narcissistic self-regard but rather of attending to the way you saw the world and, that is, attending to the way that the world was. Foucault makes direct reference to the Japanese tradition of archery (*kyudo*), where the taking of aim involves a stilling and focusing in which the self is concentrated, body and soul (p. 222). The modern turn divides body and soul with the result that new therapies arise to put them back together again, but then with the danger that these therapies themselves become technical means to the overcoming of the problem, interventions whose very nature surreptitiously reinforces precisely the thing that they set out to correct.

The various lines of thought that have emerged in the present discussion can be brought together in terms of the relationships between the concepts in question – education, therapy, and philosophy – and different ways in which these relationships might be cast.

First, then, what happens if we see *education as therapy*? This may be to make the mistake of reducing education to the demands of socialisation, where the aim is acquiescence in the status quo. A way to understand this is to recognise therapy as a medicalised concept, where the aim is normal healthy functioning. Although there are differences of opinion about what constitutes normal healthy functioning, the differences here are relatively small in scale. Health is a contested topic, but it is far less a matter of controversy than what good education is. Differences do emerge where the stances of health professionals take an ideological turn, but for the most part there is tacit agreement about what constitutes normal healthy functioning. Understood on this model, then, education would seem to have ends that are relatively easily defined – in terms of fitness for society, conceived as a continuation of the status quo. One model here would be to take the natural child as standing in need of civilisation, a moulding of behaviour and character to fit existing roles. Another more sophisticated and more prevalent articulation of principles along these lines would be the identification of a clear and realisable conception of the good life, understood in terms of wellbeing. This would provide the substance of the good life, including good physical and psychological health, for which the child should be prepared.

Such ways of thinking have their attractions, but the main problem with them is that they may stand in the way of the realisation of fundamentally important aspects of human life and education. What may be more important is the adjustment of the learner to possibilities yet to come and as yet unforeseen. This is not just to ready the learner for the natural contingencies that they may in the future confront. Rather it is to recognise that they are agents of that future, with the capacity to shape it in original ways. As, in 1954, Hannah Arendt writes in ‘The Crisis in Education’, “Basically we are always educating for a world that is or is becoming out of joint, for this is the basic human situation, in which the world is created by mortal hands to serve mortals for a limited time as home” (Arendt 1977, p. 192). When she refers to the ‘natality’ of the child, she is stressing this newness that each child brings to the world. We do not know what the child will do or where their life will lead, other than that we know that it will be unique. This is not an added complication in the rearing of the young; it is the very means through which a new world can come into being, a new society be developed – and this will perforce be dynamic and ongoing in kind. To think this way is to conceive the aims of education as open – that is, as not reducible to tidy formulation in a manner that can simply be cashed in terms of a checklist for the good life and any tidy set of learning outcomes. It is to think of the aims of education more in terms of a steadying of experience in which what matters can come better into view, where the ways the student is affected by what they come to know are of paramount importance.

Second, what sense might there be in the idea of *philosophy as therapy*? Most obviously, this would be to endorse a line of thinking associated especially with the

later Wittgenstein, where the task is to dispel false theorisations and to resist the kinds of questions that might lead us into talking nonsense. Wittgenstein's images for this are compelling, and the following passage from the *Philosophical Investigations* is particularly instructive:

For the clarity that we are aiming at is indeed *complete* clarity. But this simply means that the philosophical problems should *completely* disappear.

The real discovery is the one that makes me capable of stopping doing philosophy when I want to. – The one that gives philosophy peace, so that it is no longer tormented by questions which bring *itself* in question. Instead we now demonstrate a method, by examples; and the series of examples can be broken off. – Problems are solved (difficulties eliminated), not a *single* problem.

There is not a philosophical method, though there are indeed methods, like different therapies. (Wittgenstein 1953, #133)

This explicit connection of philosophy with therapy is followed later in the text, and elsewhere in Wittgenstein's work, by many expressions that are peculiarly evocative of the difficulties in thinking that we get into – expressions that are themselves therapeutic in the release they provide from this. Thus, "What is your aim in philosophy? To shew the fly the way out of the fly-bottle" (#309). Or later the parenthetic comment: "(A whole cloud of philosophy condensed into a drop of grammar)" (p. 189).

Wittgenstein is critical of philosophy itself in that it has sometimes tied thinking up in theoretical knots, where those knots are harder to untie than they were to tie in the first place. And on the whole he is suspicious, notoriously so perhaps, of the 'young science' of psychology. In psychology, he writes, "The existence of the experimental makes us think we have the means of solving the problems which trouble us; though problem and method pass one another by" (p. 197). If this remark is taken in combination with those quoted above, it can readily be imagined that Wittgenstein would have been opposed to contemporary systematic approaches to curriculum planning and assessment, and to the conceptualisation of stages of development, as ideas that hold us captive (#115). In the face of such temptations of thought, Wittgenstein's advice is recurrently "don't think, but look!" (#66).

The so-called therapeutic reading of Wittgenstein takes the remarks above very much as its guide, combining these with the thought expressed in the earlier text, the *Tractatus Logico-Philosophicus*, that sometimes our thinking involves ascending a ladder but that the ladder can be kicked away once we have reached the top: this can be done because, from this new vantage point, we can now recognise that the questions we have been asking in making the ascent are in fact nonsensical (Wittgenstein 1922, 6.54). Therapeutic reading of Wittgenstein displays an aversion to any kind of questioning for which it is not clear what would count as an answer and, thus, a desire to expunge any inclination to run up against the limits of language. Yet there are aspects of Wittgenstein's writings that pull against this. Consider the following remarks, made by Wittgenstein in 1929:

I can very well think what Heidegger meant about Being and Angst. Man has the drive to run up against the boundaries of language. Think, for instance, of the astonishment that anything exists [*das etwas existiert*]. *This astonishment cannot be expressed in the form of*

*a question*, and there is also no answer to it. All that we can say can only, *a priori*, be nonsense. Nevertheless we run up against the boundaries of language. Kierkegaard also saw this running-up and similarly pointed it out (as running up against the paradox)... But the tendency to run up against *shows something*. The holy Augustine already knew this when he said: "What, you scoundrel, you would speak no nonsense? Go ahead and speak nonsense – it doesn't matter!" (Wittgenstein 1930, p. 68)

There is no doubt that his thinking changed in the decades that followed. Yet there is also reason to believe that he continued to hold to something like this. Why else, in his later writings, did he let the fly out of the fly-bottle only to let it back in again? Why does he lead the reader to a state of peace only to disturb that peace again, almost compulsively, so it seems? What seems likely is that there is in Wittgenstein a recognition of the fact that the human being has the tendency to call its own nature, its own circumstances, into question, and recurrently to be troubled by this, and that this is a tendency he continues to respect. This would be to take his later writings – with their multiple voices, parenthetical asides, and the dialogical play of pondering, faltering, and assertive remarks – as a dramatic expression of the human condition. If this is right, if, that is, this disturbance is part of the reality of the human condition, there is further reason to contest the over-systematised, risk-averse approach to the curriculum manifested in performativity and managerialism, as well as the over-determination found in some contemporary specifications of the aims and objectives of education.

Third, in what sense might we think of *therapy as education*? Stepping outside schools and other educational institutions, we can ask in what ways therapeutic practices might themselves be rightly understood as educational? Might it be that the best therapy involves a kind of education? To the extent that this is the case, it would suggest, amongst other things, that – across a wide range of cases – such therapeutic approaches as cognitive behavioural therapy and, for that matter, primarily drug-based treatment cannot be enough and that they may not be appropriate at all. It might suggest a need also not for looking into oneself but rather for turning outwards in a new way. This brings us back to what was said earlier about the idea of the care of the self in late antiquity: that it involved an attention to things in order to discover how one stood in relation to them, what mattered, and how this might affect one's life. All this was to be understood as dynamic, as to be realised in action; and, in the context of progressive awareness of one's aim or principle, one was to live in a steady orientation governed by this. One consequence of these thoughts is that the best therapy and the best prevention of illness may be provided by good education! It is in relation to such a thought that the present discussion will end.

Before this, however, it is worth considering one further pairing, a fourth, and this is to be found in the idea of *philosophy as education*. In the contemporary academy, the idea of philosophy as a science has considerable influence, and this is a conceptualisation that seems to legitimate a semi-technical approach across significant stretches of the discipline. It often generates the kind of theorisation that Wittgenstein came to disparage, and certainly there have been many leading philosophers who have been at odds with such a conception. But for present purposes, the contrast to be drawn is not to be achieved just by reclaiming the subject as one

of the humanities, especially at a time when the humanities have themselves sometimes been colonised by more technical methodologies and theoretical perspectives. The particular emphasis that is needed is on the importance of the subjectivity of the learner to what comes to be known, where this involves attention to what the content of study presents and acknowledgement of the necessity and importance of the learner's response. As we saw before, this is not only a matter of how much the learner has understood but of how far she is affected by what she has learned, how far this strengthens or refines her sense of what matters to her and why.

The present discussion has progressively intimated the importance of the humanities in education, as the prime, though by no means the exclusive, arena within which this outward-turning concern with what one learns and where one stands takes place. That this will be agonistic should be clear enough, as should the fact that it will involve negative experience. As we saw earlier, in a culture of achievement couched in reductive terms of assessment and dominated by performativity, there is a denial of such experience. This makes it impossible for students, as well as for those who teach them, to acknowledge ways in which things do not go well in the course of a human life. This effects a repression, the harmful consequences of which therapy is expected to address. But the pathology is not the preserve of just a few unfortunate individuals: it seeps into people's lives in ways that can pass unnoticed, hidden behind a veneer that is polished rather than scratched by the culture of transparency and student satisfaction.

Re-engagement with the humanities – taught in ways that open up possibilities for self-examination and struggle, as well as for a steady and growing confidence in where one is in relation to what one learns – offers the most obvious, though not the only, way in which education might be realised. It is through this also that its relations with philosophy and therapy might be better understood.<sup>3</sup>

# Creationism and Intelligent Design

Michael J. Reiss

## The Importance of Creationism and Intelligent Design for Schools

Creationism and intelligent design raise issues for education that are both conceptually interesting and practically important. These issues include how we arrive at reliable knowledge, what the aims of schooling are (or should be), and how schools should deal with controversial or sensitive issues.

Creationism exists in a number of different versions but, depending on the country, from as few as 5% to over 50% of adults reject the theory of evolution. Instead, they believe that the Earth came into existence as described by a literal (fundamentalist) reading of the early parts of the Bible, the Qu’ran or other scriptures and that the most that evolution has done is to change species into related species (Miller et al. 2006; Reiss 2011). For a creationist it is possible, for example, that the various species of squirrels had a common ancestor, but this is not the case for the various species of squirrels, gazelles and cats – still less for monkeys and humans, for birds and reptiles or for the blue whale and the banana (Reiss 2011).

Allied to creationism is the theory of intelligent design. While many of those who advocate intelligent design have been involved in the creationism movement, to the extent that the US courts have argued that the country’s First Amendment separation of religion and the State precludes its teaching in public schools (Moore 2007), intelligent design can claim to be a theory that simply critiques evolutionary biology rather than advocating or requiring religious faith. Those who promote intelligent design typically, but not always, come from a conservative faith-based position. However, in their arguments, they make no reference to the scriptures or a deity but argue that the intricacy of what we see in the natural world, including at a

sub-cellular level, provides strong evidence for the existence of an intelligence behind this (e.g., Behe 1996; Dembski 1998; Johnson 1999). Natural selection, acting on its own from inorganic precursors, is held to be inadequate.

Until fairly recently, little attention has been paid in the school classroom or the philosophy of education literature to creationism and almost none to intelligent design. However, creationism and intelligent design appear to be on the increase, and there are indications that there are more countries in which schools are becoming battlegrounds for the issue. For example, while the USA has had several decades of legal battles about the place of creationism and (more recently) intelligent design in schools (Moore 2007), school-based conflicts over these issues are becoming more frequent in a range of other countries (Graebisch and Schiermeier 2006; Blancke et al. 2014). There was consternation in the UK science education community when, in December 2009, many secondary school and higher education libraries received a complimentary copy of the book by Stephen Meyer et al. titled *Explore Evolution*, which, in the words of its website, sets out:

to examine the scientific controversy about Darwin's theory, and in particular, the contemporary version of the theory known as neo-Darwinism. Whether you are a teacher, a student, or a parent, this book will help you understand what Darwin's theory of evolution is, why many scientists find it persuasive, and why other scientists question the theory or some key aspects of it.<sup>1</sup>

Such events have led to a growth in the educational literature examining creationism and/or intelligent design (Jones and Reiss 2007; Williams 2008; Laats and Siegel 2016).

The school classroom, of course, is not the only place where creationism and intelligent might be addressed. There are the beginnings of a literature on the way that natural history and other museums present the issue of evolution (Bennett 2004; Scott 2007; Trollinger and Trollinger 2016), and many of us also learn about evolution, creationism and intelligent design through radio and TV programmes, by reading popular science books and by other means. Nevertheless, there is a particular need to address the issue of whether, and if so how, schools might address the issue of creationism, particularly for the age range of students for whom education is mandatory.

## **Are Creationism and Intelligent Design Controversial Issues?**

It may seem somewhat surprising to ask if creationism and intelligent design are controversial issues given the furore that regularly surrounds them in many countries in the courts, in the media and in schools, but the answer is a useful one because there is a considerable literature on how controversial issues might be addressed in

---

<sup>1</sup>[http://www.exploreevolution.com/about\\_the\\_book.php](http://www.exploreevolution.com/about_the_book.php)

education. Much of the recent academic literature in education on controversial issues hinges on the work of Robert Dearden (1981/1984).

After, somewhat uncontroversially, rejecting logical positivism as a basis for curriculum design, Dearden points out that “what is ‘controversial’ may itself be a matter of controversy” (Dearden 1981/1984: 85). He then goes on, as is well known, to propose an *epistemic* criterion of the controversial in which “a matter is controversial if contrary views can be held on it without those views being contrary to reason” (p. 86). He points out that several possible kinds of controversial issue may be distinguished: “cases where we simply have insufficient evidence to settle the matter, though in principle there is no reason why it should not be settled as more or better evidence becomes available” (*ibid.*); “where consideration-making criteria are agreed but the weight to be given them is not” (*ibid.*); “where there is no agreement even on the criteria as to what will count” (*ibid.*) and, finally, “where not just individual criteria but whole frameworks of understanding are different” (p. 87). This fourfold categorisation has been valuably extended with specific reference to the teaching of controversial issues in school science by Ralph Levinson (2006).

However, Dearden’s epistemic criterion of the controversial is not the only one. Indeed, standard works on the teaching of controversial issues (e.g., Wellington 1986; Claire and Holden 2007; Hess 2009) provide broader, often fuzzier, definitions. Here, for instance, is one from the opening chapter of *The Challenge of Teaching Controversial Issues*:

In general terms a controversial issue is one in which

- the subject/area is of topical interest
- there are conflicting values and opinions
- there are conflicting priorities and material interests
- emotions may become strongly aroused
- the subject/area is complex. (Claire and Holden 2007: 5–6)

There is, of course, a long tradition of writing in education on controversial issues and examining precisely what it is that makes an issue controversial (e.g., Stradling 1984; Bridges 1986; McLaughlin 2003). Michael Hand (2008) has defended and extended Dearden’s epistemic criterion. There is much in Hand’s position that is attractive. He argues that “What distinguishes teaching-as-settled from teaching-as-controversial (or directive from nondirective teaching) is not a pedagogical method or style, but the willingness of the teacher to endorse one view on a matter as the right one” (Hand 2008: 213) and points out that “The English word ‘controversial’ means simply ‘disputed’, and the existence of dispute is an unpromising criterion for what should be taught nondirectively” (p. 214). Hand then proceeds to critique curriculum materials, even guides, that take too broad a view of ‘controversy’. For example, he points out topics such as bullying and racism are frequently described as controversial which hardly fits with standard advice given in such material and guides that teachers should teach controversial issues in a balanced manner, giving equal weight to opposing views.

And yet I am not entirely persuaded by Hand's arguments (Reiss 2011). He relies on the premise that "that the central aim of education is to equip students with a capacity for, and inclination to, rational thought and action" (p. 218). This seems to me quite a narrow view. I cannot here review all the arguments as to the aims of education (cf. Marples 1999) but Hand seems to privilege rationality. With John White, I prefer an emphasis on human flourishing (Reiss and White 2013). In any event, unless one is prepared to define 'controversy' at a particular moment in time and place in space and for a particular audience, it is clear that any attempt simply to divide issues into 'controversial' and 'non-controversial' is unlikely to succeed for all but the most mundane points of possible contention: there are degrees of controversy and, as Hand and many others acknowledge, what is controversial for one group may not be controversial for another. Indeed, creationism provides a useful illustration of this point as it is controversial neither for scientists nor for creationists – though for opposing reasons.

The scientific understanding of biodiversity is far from complete but the narrative is a powerful one. By 3.5 billion years ago, probably earlier, life had evolved on Earth. By the time of the earliest fossils, life was unicellular and bacteria-like. Over the next three and a half billion years, the workings of natural selection, possibly aided by other mechanisms (genetic drift, etc.), eventually resulted in the ten million or so species, including our own, that we find today.

The scientific worldview is materialistic in the sense that it is neither idealistic nor admits of non-physical explanations (here, 'physical' includes such things as energy and the curvature of space as well as matter). There is much that remains unknown about evolution. How did the earliest self-replicating molecules arise? What caused membranes to exist? How key were the earliest physical conditions – temperature, the occurrence of water and so forth? But the scientific presumption is that these questions will either be answered by science or remain unknown. Although some scientists might (sometimes grudgingly) admit that science cannot disprove supernatural explanations, scientists do not employ such explanations in their work (the tiny handful of seeming exceptions only attest to the strength of the general rule).

Whereas there is only one mainstream scientific understanding of biodiversity, there are a considerable number of religious ones. Many religious believers are perfectly comfortable with the scientific understanding, either on its own or accompanied by a belief that evolution in some sense takes place within God's holding, whether or not God is presumed to have intervened or acted providentially at certain key points (e.g., the origin of life or the evolution of humans). But many other religious believers adopt a more creationist perspective or that of intelligent design (Reiss 2008a).

Most of the literature on creationism (and/or intelligent design) and evolutionary theory puts them in stark opposition. Evolution is consistently presented in creationist books and articles as illogical (e.g., natural selection cannot, on account of the second law of thermodynamics, create order out of disorder; mutations are always deleterious and so cannot lead to improvements), contradicted by the scientific evidence (e.g., the fossil record shows human footprints alongside animals supposed by

evolutionists to be long extinct; the fossil record does not provide evidence for transitional forms), the product of non-scientific reasoning (e.g., the early history of life would require life to arise from inorganic matter – a form of spontaneous generation rejected by science in the nineteenth century; radioactive dating makes assumptions about the constancy of natural processes over aeons of time, whereas we increasingly know of natural processes that affect the rate of radioactive decay), the product of those who ridicule the word of God, and a cause of a whole range of social evils (from eugenics, Marxism, Nazism and racism to juvenile delinquency) – e.g., Baker (2003), Parker (2006) and articles too many to mention in the journals and other publications of such organisations as Answers in Genesis, the Biblical Creation Society, the Creation Science Movement and the Institute for Creation Research.

By and large, creationism has received similarly short shrift from those who accept the theory of evolution. In a fairly early study, the philosopher of science Philip Kitcher argued that “in attacking the methods of evolutionary biology, Creationists are actually criticizing methods that are used throughout science” (Kitcher 1983: 4–5). Kitcher concluded that the flat-earth theory, the chemistry of the four elements, and mediaeval astrology “have just as much claim to rival current scientific views as Creationism does to challenge evolutionary biology” (p. 5).

Many scientists have defended evolutionary biology from creationism (Selkirk and Burows 1987; Good et al. 1992; Interacademy Panel on International Issues 2006). The main points that are frequently made are that evolutionary biology is good science since not all science consists of controlled experiments where the results can be collected within a short period of time; that creationism (including ‘scientific creationism’) isn’t really a science in that its ultimate authority is scriptural and theological rather than the evidence obtained from the natural world; and that an acceptance of evolution is fully compatible with a religious faith.

## Worldviews

In *World Views: From fragmentation to integration*, Diederik Aerts et al. (1994) write: “A world view is a coherent collection of concepts and theorems that must allow us to construct a global image of the world, and in this way to understand as many elements of our experience as possible” (p. 17). Of course, this does not mean that a worldview is correct; indeed, alternate worldviews are not infrequently incommensurate. In science education the notion of worldviews (whether one word or two) is increasingly being employed. For example, in the edited volume *Science, Worldviews and Education* (Matthews 2009), a number of philosophers, scientists and science educators use the thinking behind worldviews to explore a range of issues including whether science itself is a worldview and whether science can test supernatural worldviews.

I aim to explicate the notion of ‘worldviews’ in the context of creationism and intelligent design by considering the film *March of the Penguins* (Reiss 2009). *March of the Penguins* is a 2005 National Geographic feature film. It runs for

approximately 85 min and has been an exceptional success. It won an Academy Award in 2006 for Best Documentary Feature and has been the most financially successful nature film in American motion picture history. The reasons for its success are no doubt several: the photography is phenomenal; the emperor penguin's story is extraordinary; the adults are elegant; the chicks are irredeemably cute as they look fluffy, feebly wave their little wings and learn to walk; the way in which the birds survive the Antarctic winter is awesome; the plaintive cries of mothers who lose their chicks in snow storms are heartrending. But one perhaps unexpected reason is that the film has been a great success among the Christian right.

For example, if one enters “march of the penguins” Christian’ into Google, at the time of writing (24 April 2017) one finds 187,000 hits. Third of these is a review of the film by Mari Helms (n.d.) on [ChristianAnswers.Net](http://ChristianAnswers.Net), which describes itself as “a mega-site providing biblical answers to contemporary questions for all ages and nationalities with over 45-thousand files” (<http://christiananswers.net/>). After a fairly detailed summary of the subject matter of the film, the review goes on to discuss the lessons that the film has to teach about love, perseverance, the existence of God and friendship/commraderie (sic). An extended quotation from the review illustrates the presuppositions of the author:

‘March of the Penguins’ has lessons to teach about:

‘LOVE’: According to the film, the penguins take this tremendous journey for ‘love’ and to find a mate and reproduce. The dedication, cooperation, and affection are exemplary between the pair.

PERSEVERANCE: We could learn a lot about perseverance from Emperor penguins. I was quickly reminded of the [ant](#) in Proverbs 6:7–8 “It has no commander, overseer or ruler, yet it stores its provisions in summer and gathers its food at harvest.” No one is reminding these penguins what to do; they know what to do, and they do it. They are prepared, persistent and committed, much like we are called to be as [witnesses](#) for [Jesus Christ](#). 1 Peter 4:15 “Always be prepared to give an answer to everyone who asks you to give the reason for the hope that you have.”

The penguins endure treacherous conditions, yet they continue on their journey, focusing on what lies ahead (new life). It may be a bit of a stretch, but I thought of what we, as Christians have to endure to get what lies ahead for us ([eternal life](#)). Philippians 3:14 “I press on toward the goal to win the prize for which God has called me heavenward in Christ Jesus.”

THE EXISTENCE OF GOD: One year in the life of an Emperor penguin is a great indication of the existence and character of God. Romans 1:20 “For since the creation of the world God’s invisible qualities – his eternal power and divine nature – have been clearly seen, being understood from what has been made, so that men are without excuse.” He is absolutely perfect! Every detail has been taken into account, and every provision has been made. Witnessing all the love and care that He must have put into creating the penguins is small compared to what He put into creating us. Matthew 6:26 “Look at the birds of the air; they do not sow or reap or store away in barns, and yet your heavenly Father feeds them. Are you not much more valuable than they?” Leaving the theater, I was more in awe and in love with my [Creator](#). (Helms n.d.)

The reason for this long quotation is not to subject it to theological or scientific critique – which would be easy. Rather, the value of the quotation is that in the widely used fourfold framework of Ian Barbour (1990), who explores how science

and religion can be understood to relate, it manifests an integrated relationship (as opposed to one of conflict, of independence or of dialogue). The worldview is one in which it is straightforward to read from penguin behaviour to human behaviour though it is worth noting that the argument is neither entirely anthropomorphic (where non-human behaviour is interpreted as if it was the behaviour of humans) nor one in which the natural world is seen as *the* source of instruction as to how humans should behave. Rather, it is scripture that has primacy; the natural world is held up not so much as a model for us to imitate but as an illustration of how the natural world can manifest that which God wishes for humanity.

The ‘worldviews’ perspective on creationism is useful for two reasons: first it indicates the difficulty of using the criterion of ‘reason’ to decide whether an issue is controversial or not since, without embracing epistemological relativism, it highlights the importance of perspective in these matters – for many people, the position from which one can view dispassionately is so distant that one cannot from there see in much detail. Secondly, as I shall go on to argue, it suggests that standard ways of addressing the diversity of student views in a science classroom may be inadequate.

## **Dealing with Creationism and Intelligent Design in the Secondary Science Classroom**

Few countries have produced explicit guidance as to how schools might deal with the issues of creationism or intelligent design in the science classroom. Indeed, the government production of such guidance raises issues about the extent to which it is appropriate for the state to propose or even enforce a common view on such issues as opposed to allowing decisions to be made at more local levels, whether by school boards, parents, teachers or others.

One country that has produced such guidance is England. In the summer of 2007, after months of behind-the-scenes meetings and discussions, the then DCSF (Department of Children, Schools and Families) Guidance on Creationism and Intelligent Design received Ministerial approval and was published (DCSF 2007). The Guidance points out that the use of the word ‘theory’ in science (as in ‘the theory of evolution’) can mislead those not familiar with science as a subject discipline because it is different from the everyday meaning (i.e., of being little more than an idea). In science the word indicates that there is a substantial amount of supporting evidence, underpinned by principles and explanations accepted by the international scientific community. The Guidance goes on to state: “Creationism and intelligent design are sometimes claimed to be scientific theories. This is not the case as they have no underpinning scientific principles, or explanations, and are not accepted by the science community as a whole” (DCSF 2007). The Guidance then goes on to say:

Creationism and intelligent design are not part of the science National Curriculum programmes of study and should not be taught as science. However, there is a real difference between teaching ‘x’ and teaching *about* ‘x’. Any questions about creationism and intelligent design which arise in science lessons, for example as a result of media coverage, could provide the opportunity to explain or explore why they are not considered to be scientific theories and, in the right context, why evolution is considered to be a scientific theory. (DCSF 2007)

This seems to me a key point and one that is independent of country, whether or not a country permits the teaching of religion (as in the UK) or does not (as in France, Turkey and the USA). Many scientists, and some science educators, fear that consideration of creationism or intelligent design in a science classroom legitimises them. For example, the excellent book *Science, Evolution, and Creationism* published by the US National Academy of Sciences and Institute of Medicine asserts “The ideas offered by intelligent design creationists are not the products of scientific reasoning. Discussing these ideas in science classes would not be appropriate given their lack of scientific support” (National Academy of Sciences and Institute of Medicine 2008: 52).

As I have argued (Reiss 2008b), I agree with the first sentence of this quotation but disagree with the second. Just because something lacks scientific support doesn’t seem to me a sufficient reason to omit it from a science lesson. When I was taught physics at school, and taught it extremely well in my view, what I remember finding so impressive was that we could discuss almost anything providing we were prepared to defend our thinking in a way that admitted objective evidence and reasoned argument. Nancy Brickhouse and Will Letts (Brickhouse and Letts 1998) have argued that one of the central problems in science education is that science is often taught ‘dogmatically’. With particular reference to creationism they write:

Should student beliefs about creationism be addressed in the science curriculum? Is the dictum stated in the California’s *Science Frameworks* (California Department of Education 1990) that any student who brings up the matter of creationism is to be referred to a family member or member of the clergy a reasonable policy? We think not. Although we do not believe that what people call ‘creationist science’ is good science (nor do scientists), to place a gag order on teachers about the subject entirely seems counterproductive. Particularly in parts of the country where there are significant numbers of conservative religious people, ignoring students’ views about creationism because they do not quality as good science is insensitive at best. (Brickhouse and Letts 1998: 227)

More recently, Thomas Nagel (2008) has argued that so-called scientific reasons for excluding intelligent design (ID) from science lessons do not stand up to critical scrutiny (cf. Koperski 2008). With reference to the USA he concludes:

I understand the attitude that ID is just the latest manifestation of the fundamentalist threat, and that you have to stand and fight them here or you will end up having to fight for the right to teach evolution at all. However, I believe that both intellectually and constitutionally the line does not have to be drawn at this point, and that a noncommittal discussion of some of the issues would be preferable. (Nagel 2008: 205)

## Dealing with Creationism and Intelligent Design Elsewhere in the Curriculum

Of course, science lessons are not the only place where teaching about creationism and intelligent design might take place in the curriculum. One might also expect them to be addressed in religious education (RE) lessons, for countries that have such lessons. In England, the DCSF and QCA (Qualifications and Curriculum Authority) published a non-statutory national framework for RE and associated teaching units that include a unit asking “How can we answer questions about creation and origins?” (QCA 2006). The unit focuses on creation and the origins of the universe and human life, as well as the relationships between religion and science. A carefully written 23-page guide was produced. Along with its non-evaluative stance towards the various positions, what strikes me as a science educator is the high expectations of students it has. For example, in answer to the question “Is the universe designed? Who could have designed it?”, it is suggested that teachers of 13–14-year-olds should:

Give the pupils opportunities to explore, through a website, DVD or written text (see ‘Resources’), a range of different answers to these questions, including answers given by members of different faiths. These answers should include the views of creationists, evolutionists, advocates of intelligent design and philosophers of religion, such as Anselm, Thomas Aquinas, Blaise Pascal and Francis Bacon. (QCA 2006: 16)

We can note that this non-evaluative stance towards the various positions has taken place in a context where, since the late 1950s in England and Wales, advocates of religious education in schools have abandoned a form of religious education where the inculcation of Christianity was a central aim and in which Christianity was often presumed to be the sole framework within which life found meaning and moral direction. Nowadays a more pluralist vision is preferred (e.g., Jackson 2004) in which students are enabled to develop, clarify and refine their own views about matters religious. This is very different to the position in science where the presumption, whether implicit or stated, is nearly always that the scientific understanding of the world is either a valid one or the valid one.

Finally, I should note that the distinction between science lessons and religious education lessons, while it may hold at secondary level with subject-specific teaching rather breaks down at primary level where a pupil generally has the same teacher for most or all lessons. From an epistemological point of view this is both the strength and potential weakness of primary teaching. Teaching in the primary school has the potential to make links between subjects with greater ease than is generally the case at secondary school, precisely because the one teacher is responsible for such a diversity of subjects. At the same time, a primary teacher is unlikely to know each subject in as much depth as a secondary specialist, and therefore there is a greater likelihood that subject-specific differences may be elided. This suggests that it may be particularly important for primary teachers to be explicit as to whether they are helping their pupils to understand an issue from the perspective of science, of history, of religion or whatever.

## Discussion

Whatever the subject matter and age range of a class, and the country in which a teacher is teaching, there is much to be said for a teacher bearing in mind that for some students, evolution, creationism and intelligent design are likely to be sensitive issues. Rather less has been written in the philosophy of education literature about sensitive issues than about controversial ones. Death, sexuality, drugs policy and animal experimentation are examples of issues that are sensitive for many students, and many teachers are used to dealing respectfully with students when dealing with sensitive issues.

An advantage of shifting the discourse from controversy to sensitivity is that one shifts the focus from epistemology to pedagogy. One can be sensitive with someone in respect of an issue without implying that one shares the same perspective (or worldview) as the person to whom one is being respectful and considerate; different notions of respect are discussed by Rosenblith and Bindewald (2014) who “make a case for an approach to civic education in the public schools that is rooted in engagement” (p. 596). Explicitly accepting the teaching of evolution as controversial is difficult for many science teachers as the distinction between this and evolution as controversial is a fine one, and many science teachers are likely to see it as selling out to creationists (cf. Hermann 2008).

Of course, my suggestion that teaching in this field be considered akin to the teaching of traditional sensitive issues does not absolve teachers and relevant others such as curriculum designers and textbook authors (Williams 2008), whatever their specialisms, from having as good a knowledge of the issues as they can. Mary Midgley (2007) points out that there is much to be said in initial teacher education for bringing “together lecturers in science and in religious studies in pairs – of course after adequate training – and let them jointly teach classes that combine both sets of trainee teachers together” (p. 42). In my experience such joint teaching, though expensive and sometimes difficult to organise, can work well, so long as there is sufficient mutual trust between the lecturers.

In a school science lesson when teaching evolution there is much therefore to be said for allowing students to raise any doubts they have and doing one’s best in such circumstances to have a genuine scientific discussion about the issues raised. The word ‘genuine’ does not mean that creationism or intelligent design deserve equal time with evolution, nor does it mean that a science teacher should present creationism or intelligent design as valid alternative to the theory of evolution. It is perfectly appropriate for a science teacher to critique arguments for creationism or intelligent design that purport to be scientific. However, in certain classes, depending on the comfort of the teacher in dealing with such issues and the make-up of the student body, it can be appropriate to deal with these issues. If questions about the validity of evolution or issues about creationism and intelligent design arise during science lessons, they can be used to illustrate a number of aspects of how science works and how scientific knowledge is built up over time, while always being open to the possibility of refutation and change.

Having said that, teaching about evolution, creationism or intelligent design, in whatever lesson, is often not straightforward. Some students get very heated; others remain silent even if they disagree profoundly with what is said. We need to seriously and respectfully consider the concerns of students who do not accept the theory of evolution while still introducing them to it. There is much to be said for aiming to get students to understand rather than necessarily to believe or accept the theory of evolution (Smith and Siegel 2004; Reiss 2008b). While it is unlikely that even respectful teaching will help students who have a conflict between science and their religious beliefs to resolve the conflict, good science teaching can help students to manage it – and to learn more science (cf. Long 2011).

Creationism can profitably be seen not as a simple misconception that careful science teaching can correct, as careful science teaching might hope to persuade a student that an object continues at uniform velocity unless acted on by a net force, or that most of the mass of a plant comes from air. Rather, a student who believes in creationism can be seen as inhabiting a non-scientific worldview, that is a very different way of seeing the world.

# Philosophical Questions and Opportunities at the Intersection of Neuroscience, Education, and Research

Clarence W. Joldersma

Neuroscience is a popular solution to a host of social problems, perhaps constituting a “neuromania” (Legrenzi et al. 2011). Education is an especially fertile ground for neuroscientific applications, for there are many who envision finally putting education on a firm scientific footing, a vision that has not been realized up to now. Neuroscience has all the trappings for such a footing: rivalled perhaps only by genetics, it has an immense authority in the popular imaginary, with flashy presentations in the media where alluring images of brains are used to point out crucial differences in everyday behaviors and traits. Previously, discoveries about how the brain operated were limited to what could be found through brain damage studies such as lesions and localized trauma, which typically brought to light very particular disabilities, a kind of subtractive approach. These were usually interpreted as evidence for correlations between local brain areas, particular mental functions, and visible abilities. However, noninvasive techniques to study the brain in action have given us many possibilities of going beyond those earlier limitations. These techniques, which typically involve producing brain images, go by a variety of acronyms including PET, SPECT, MRI, and fMRI. Recent improvements in such techniques have made neuroscience alluring not only for the general public but also for educators. It is very tempting to assume that the noninvasive approaches to localized brain functions give us direct access to particular mental activities, including learning.

Neuroscience’s popularity and authority combine to give it great cachet in its application to educational research and practice, a field that often struggles with issues of legitimacy and expertise. There are many books for the K-12 teachers by popular enthusiasts (e.g. Jensen 2008; Wolfe 2010), which spell out “brain-based” teaching methods and learning strategies, ardently suggesting that neuroscience will

finally give educators effective teaching approaches. There are also more nuanced, scholarly books advocating neuroscience-based educational practices (e.g. Geake 2009; Sousa 2010), whose assumption, likewise, is that education ought to use evidence-based methods. Philosophers of education have noted that these approaches are typically rooted in cognitive science, and thus already interpret education as applied psychology (Smeyers 2016b). Understanding education as applied psychology can easily incorporate neuroscience and thus would have a natural propensity to view education as an application of neuroscientific discoveries. On this model, education amounts to an applied science, which might be called evidence-based learning (Carew and Magsamen 2010). Perhaps in part because of its continuation of the psychological model, neuroeducation does not typically address philosophical issues around the intersections between neuroscience and education.

This gives philosophers opportunity to develop thoughtful, incisive appraisals of neuroscience in its connection to educational research and practice. Jan Slaby has suggested that neuroscience can be doubly fascinating for philosophers, for on the one hand the brain is the zone where “matter meets mind” (subjectivity, consciousness, learning, memory, agency) while on the other the brain is one of the “last true frontiers of science” (with possibilities of novel discoveries and breakthrough technologies) (Slaby 2015). This is particularly true for educational philosophers. Certainly the topics of memory, learning and agency are central in education, and could profit from continued philosophical attention. Indeed, there is now a nascent interest by philosophers of education in the intersection of neuroscience and education (e.g. Joldersma 2016c). This chapter surveys the current work in this area by philosophers of education, and suggests directions for further research. The survey includes ongoing philosophical critique of the ways that neuroscience is positioned and applied in education, while also incorporating scholarship that asks new philosophical questions at this intersection.

## **Philosophy of Education’s Critique of Neuroscience and Neuroeducation**

Although some philosophers of education might be leery of engaging with empirical research in their scholarship, there is often something to be gained in interacting with empirical studies. There are already numerous examples of philosophers of education engaging with, and *doing*, empirical research (Wilson and Santoro 2015). This includes for example Amy Shuffelton’s arguments against a certain conception of poverty and cultural interventions (Shuffelton 2013) and Walter Feinberg’s research in faith-based and public schools addressing religious belief in a democracy (Feinberg 2006; Feinberg and Layton 2014). Conceptualizing the engagement with empirical research has varied, including seeing it at a *midpoint* on a continuum (Golding 2015) or a *fusion* between the philosophical and empirical investigations (Hansen et al. 2015). However, perhaps more fruitful for understanding philosophy’s

engagement with neuroscience is Claudia Ruitenberg's suggestion that "other educational research can provide philosophy of education with phenomena—and knowledge of phenomena—to think *about*, to ask questions *about*" (2014, p. 90). This takes us beyond a mere fusion or a location on a continuum, to a particular *reason* for the engagement. Gert Biesta and Michael Peters argue that a central task of philosophy of education is to "expose and criticise often hidden assumptions and dynamics that are often presented and understood by researchers and policy makers as benign and as orientated towards the improvement of education..." (Biesta and Peters 2015, pp. 620–621). Ruitenberg's suggestion gives this task another content area for such questions, namely, phenomena outside of philosophy of education as such. These philosophical questions can bring to the foreground ways such assumptions and dynamics might play out. Philosophy of education thus has the unique task of asking *philosophical* questions about the empirical research around the nexus of neuroscience, education, and research.

### ***Questioning Frameworks for Simplistic Claims, Neuromyths, and Commercializations***

Educational philosophers are well positioned to ask philosophical questions of neuroscience, both as a science and in its so-called application to education. As a science, neuroscience's findings are illuminated through certain concepts (e.g. levels of explanation, neuron doctrine, cause-effect, appearance-reality, subjective-objective, computational model), highlighting particular dimensions while hiding others from view, thus creating potential distortions in our understandings even as it reveals other truths. This gives philosophers of education something substantive to question, highlighting problematic conceptualizations and simplistic applications, including how uncritical assumptions create problems in neuroscience's application to education. In this section I examine some of the ways in which philosophy of education has developed critiques of neuroscience, including its application to education, and I suggest directions for further work.

One area is that of misleading and simplistic claims about neuroscience for education. There is already much helpful educational literature involving warnings about this, typically tackling the misleading nature of neuromyths and the exaggerated claims of brain-based commercial products. Neuromyths are claims about the efficacy of ways of learning or teaching that are, at best, *loosely* based on neuroscientific research and evidence about the way the brain is involved (Pasquinelli 2012; Tardif et al. 2015). Although often debunked, neuromyths remain a central issue in neuroscience and education, and likely will not be going away soon; for example, a recent study showed that teachers believed in about half of the popular neuromyths (Dekker et al. 2012; see also Willis 2015). Geake (2008) lists examples, including "we use only 10% of our brains", the idea of multiple intelligences, the idea of general brain exercises; the existence of "left- and right-brain learners", that there

are “visual, auditory, kinaesthetic (VAK) learning styles”, and “drinking water enhances learning”, Dekker et al. list several more neuromyths, including “children are less attentive after consuming sugary drinks”, “fatty acid supplements have a positive effect on academic achievement”, “exercises that rehearse co-ordination of motor-perception skills can improve literary skills”, “short bouts of co-ordination exercises can improve integration of left and right hemispheric brain function”, “there are critical periods in childhood after which certain things can no longer be learned”, “extended rehearsal of some mental processes can change the shape and structure of some parts of the brain” (2012, p. 4). Beyond neuromyths, there are also a host of commercial products that claim the attention of educators. Brain-training products and organizations such as *LearingRx*, *CogMed*, and *Lumosity* often use computer-based activities to achieve brain improvement and enhancement. They typically legitimize their claims with appeals to brain plasticity research, suggesting that their activities enhance strategic neurological pathways for cognitive functions such as attention and memory (see Hurley 2012). Some commercial curricula and teaching guides are geared specifically toward educators, including *Brain Targeted Teaching*, *Fast ForWord*®, and *MindUP* (Busso and Pollack 2015). Fortunately, there is also good scholarship showing that employing neuromyths and using these commercial products are problematic for practitioners; ‘exploding’ the myths and deflating the claims is good public service by educational theorists, and this work needs to continue.

There is evidence, however, that in deflating the claims about commercial products or refuting neuromyths, educational researchers often continue to tacitly accept problematic frameworks, including the idea that evidence-based practice should shape educational conversations (Carew and Magsamen 2010; Davies 1999). Philosophers of education have taken a variety of approaches in bringing further this critique, particularly around neuroscience’s application to education. For example, Ansari has examined the ethics around how the current hype around neuroscience influences educators, including the neuromyths teachers might embrace in their enthusiasm for neuroscience’s authority (Ansari 2015). Davis has criticized the propriety of an evidence-based model for education in the first place (Davis 2004; see also Biesta 2007). He suggests that neurophysiology does not have the requisite authority about learning, for the latter involves value-laden claims in ways that the former cannot adjudicate. Maxwell and Racine have explored the ethics of aligning moral education with cognitive psychology and neuroscience (Maxwell and Racine 2016). And Boyles argues for what he calls “neuropragmatism” to counter the “commercialism” of neuroscience’s application to education precisely because it “is currently largely divorced from philosophy and history” (2016, p. 74). In his critique of commercialization, Boyles brings to light that education is more than a technical problem of ‘engineering’, but rather always also involves normative visions of purposes and end goals. These approaches show how philosophers of education go beyond mere critique of the excessive claims by neuroscience-based commercial products, moving the conversation philosophically, to the ethical and conceptual.

## ***Questioning Neuroimaging Technologies and the Medicalization of Learning***

But philosophical questions are also asked in areas beyond the low-hanging fruit of neuromyths, commercial products, and evidence-based practices. For example, the explosion of neuroscientific knowledge involves the development of noninvasive ways of studying the brain. Some neuroscience literature suggests that despite the clear color-coded pictures of brain scans, techniques such as fMRI give results that are at best incomplete (Zatorre et al. 2012). Philosophically, the advent of such techniques has opened up a line of questions that might be termed *technical*, focusing on the status of the claims made on the basis of these techniques, whether that be about what they claim to tell us about the brain's functioning or about the mind and human behavior (Dumit 2011; Manzotti and Moderato 2010; Poldrack 2000; Raz 2011). Smeyers has questioned the assumption of "visible proof" that brain pictures supposedly provide (Smeyers 2016a). More generally, Joldersma has argued that technical criticisms "raise important methodological questions about the scientific project of localization required to confidently draw conclusions about neural correlations between mind and brain..." (2016a, p. 162). The technical or methodological problem here is that in order to get the neural correlation thesis off the ground, the technologies for localizing brain activity need to be unambiguous. There is still debate over whether or not these technologies have yielded the required accuracy (Hanson and Bunzl 2010). Philosophically, however, the technological issues of localization have exacerbated the problem of conflating correlation and causation. Smeyers has suggested that the correlations themselves are plausible only when we gloss over the actual differences between individual brains, "which often vary greatly" (2016b, p. 40). Moreover, as Maxwell and Racine point out, a "significant portion of [this research] is also animal-based..." (2016, p. 64), which requires the assumption of basic similarity to humans for strong cross-over conclusions. Although techniques such as fMRIs are clearly useful in studying the brain, they have often led to overhasty conclusions and applications, temptations that philosophers caution ought to be resisted. Through a critique of neuroscience's technological issues, educational philosophers can rightly question the educational importance of the techniques backing the correlation claims.

Correlation claims are central in neuroscience-based diagnosis of learning deficits, the latest approach to a long history of medicalizing student behavior and abilities (Petrina 2006). By 'medicalization' I mean using the binary of normal and pathological to label students on various dimensions, where the pathological then invites interventions toward restoring normalcy. Neuroscience's standard mode of operation is finding mind-brain correlations, neural correlates as they are often called (Chalmers 2000). This is something that fits hand in glove with the medicalization of behavior (Conrad 2008) and is reflected in education (Tröhler 2015). The unstated assumption here is that differences are medical deficits in normal behavior, for example, shyness becomes an anxiety disorder, wandering attention becomes ADHD. Resistance to authority becomes ODD (oppositional defiant disorder). The

correlation of behavioral differences with brain variances then interprets the neurological distinctions as the source of the behavioral deficits. When what is assumed to be the source of the pathology is discoverable in the brain's structures and functions, it then invites possible micro-interventions at the neuronal level (Schrag 2011). One central philosophical question about the medicalization metaphor is its underlying categorical schema. In previous work I have pointed out that the labels of medicalized deficits such as ADHD and dyslexia are imported into the discovery of neurological differences, which in turn are then used as evidence-based advice for educational interventions (Joldersma 2013). In turn, this approach assumes a one-to-one correspondence between micro-level localized brain processes and macro-level global educational behavior. A philosophical critique of this schema uncovers how neuroscience continues "to categorize learners using apparent neurological differences" (Busso and Pollack 2015, p. 6) while smuggling normative valuations into those judgments through extra-scientific metaphors such as "deficits". That is, philosophy of education attends to the conceptualization of the critique by drawing attention to problematic underlying assumptions of the medical model seemingly inherent in neuroscience. This is especially important in its engagement with neuroscience because many of the current labels for different learners are couched in the authority and popularity of neuroscience.

### *Technological Interventions for Self-Enhancement*

The medicalization issue points to an equally important matter that philosophers of education need to address. As Slaby and others have argued, the medical frame is merely one side of a discourse that has been ensnared by neuroscience. The other dimension involves what Slaby calls "technological self-optimization" (Slaby 2015, p. 20), namely, an anticipatory optimistic future that promises human life progress if not perfection. Medicalization is merely the reverse side of this visionary framework, for it sets, by means of neuroscientific expertise, the demands we as society feel authorized to place on individuals—for example, about what each of us has a duty to do with respect to brain development, maintenance and repair, if not enhancement (Joldersma 2016b). Embedded in the idea of technological self-optimization are problematic concepts of human life, salvation, and utopia. Paul Smeyers has called these theorists the "believers" for whom "the sky is the limit" (Smeyers 2016b). Emma Williams and Paul Standish point out that hidden in this optimism is a problematic fusion of neurobiological accounts of the brain with psychological accounts of the mind (Williams and Standish 2016). As the neuroscientific optimists incur greater inroads into educational practice, more of these sorts of philosophical critiques are necessary.

There are now neuroscientific technologies which no longer merely record brain events, but which are aimed at *interventions* in the brain processes. Although societies have long used neuropharmaceuticals to intervene in what was considered pathological behavior, the new interventions seem more powerful and in need of greater

philosophical scrutiny. For example, an emerging cluster of techniques is called “optogenetics”, methods that combine genetics and optics to control particular events inside specific (living) cells (Pastrana 2011). In particular, the technique inserts genetic material into cells that allow it to be responsive to light stimulation, and this is used as a way to stimulate those particular cells with targeted light. According to one of its main developers, although it is presently not yet ready for application to human brains, this set of techniques will at some point have “potentially near-complete powers for mapping, recording the dynamics of, and controlling the dynamics of neural circuits” (Boyden 2015, p. 1201). Optogenetic technologies, designed to deliberately intervene in local brain events, are now being looked at to improve, for example, cognition (Kantak and Wettstein 2015). Another technique of noninvasive (or quasi-noninvasive) direct intervention in brain functioning, which has already been used with human subjects, including ones deemed nonpathological, is transcranial direct-current stimulation (tDCS). This has been put forward as “a non-invasive tool to guide neuroplasticity and modulate cortical function by tonic stimulation with weak direct currents” (Nitsche et al. 2008, p. 220). This technology intervenes in the brain’s plasticity (as it interacts with the environment) by means of weak electrical currents applied to the scalp through electrodes placed in strategic locations. Depending on where on the scalp the current is delivered, the method is meant to enhance performances of a variety of cognitive tasks of particular interest to educators, including language, mathematics, attention, and memory. Indeed, this method is beginning to be thought of as a low-cost, portable way to help educators: “A major goal of educational efforts is to develop techniques for enhancement of learning and to promote better retention. tDCS has the potential to help in such efforts” (Coffman et al. 2014, p. 899).

Neurologically based intervention techniques into educational behaviors such as learning give rise to a number of philosophical issues, including particularly moral or ethical ones. Are such interventions ethically permissible? Albeit in a slightly different context, Maxwell and Racine have pointed out the ethical issues around the risks of experimental (including imaging) techniques used at the interface between neuroscience and education (Maxwell and Racine 2012), a critique that could be extended to address direct interventions. But further, such interventions give rise to questions concerning the ethical stance involved in believing that technological enhancement of learning is a moral good. What view of normalcy is involved? What is the understanding of the learner’s agency and responsibility that is being harmonized with the good of interventions such as these? Philosophers of education have not yet addressed these questions directly or explicitly. But they could well build on Smeyers’ skepticism that a description or explanation “in terms of neurological concepts and theories does not in itself warrant an *educational* surplus value” (Smeyers 2016b, p. 41). And they could build on Davis’ analysis that there is an inherently ambiguous understanding of the taxonomies used to label learners, distinguishing normal from pathological (Davis 2008). Just changing a brain-state and effecting some behavioral change is not yet educational. To warrant calling it an educational enhancement requires going beyond the factual into the normative, beyond the technical into the realm of judgment. Philosophers of education are in a good position to evaluate the ‘good news’

about the neurological enhancement of learning. Their role can be to help educators sort out the ethical stances they might take toward ‘artificial’ interventions in learning. And central to philosophy of education is connecting such judgments to normative visions of education.

Intervention techniques, medicalizations, and correlation claims call forth philosophical concerns about the *model of learning* that often is assumed. Philosophically, the concept of learning in neuroscience is typically reduced to a brain process associated with, at best, a narrow understanding of knowledge acquisition, including skills such as word decoding or number manipulation. Kraft turns this into a more general question about the propriety of neuroscience’s domination over education, suggesting that it reveals a deficit in educational theorizing itself (Kraft 2012). Standish, similarly, uses Wittgenstein to uncover hidden but problematic assumptions about the relations between mind and body (Standish 2012). When asking questions about neuroscience’s research on learning, philosophers of education can go beyond the typical criticism that neuroscience narrows or reduces learning, to questioning the validity of framing educative learning as primarily a brain activity. By asking philosophical questions about neuroscience’s view of learning, philosophers of education are in a good position to connect this to a critique of the “learning culture” of current schooling more generally, what Biesta (2009) calls “learnification”. And this does not yet address the critique that “learning is not education” (Burbules 2013), something that brings into focus the larger philosophical, normative question of the purpose of education.

### ***Problematic Concepts of Science***

Issues around interventions and localization technologies also lead to a set of philosophical questions concerning neuroscience’s concept of *science*. There is a strong sense that, at least in its practice, neuroscience centrally involves using cellular and molecular neuroscience to explain psychological behavior (Bickle 2003b, 2013). This practice has strong affinities to a long-standing positivist interpretation of science (Misawa 2013; Phillips and Burbules 2000). Philosophers of education have begun to ask what this interpretation imports into its application to education. Schwandt has opened this conversation by outlining possible “deleterious consequences” of science-based educational research (Schwandt 2005). More recently, Smeyers has questioned the model of research in which basic neurofacts are taken to have straightforward applications to teaching methods. He argues that this approach has never really departed from logical empiricism “characterized by the invariance of perception, meaning, and methodology” (Smeyers 2016b, p. 34). This scholarship is a promising start, but indicates that more work can be done in identifying problematic positivist understandings in neuroscience, especially as read by educators. In this regard, philosophers can open up interpretive space by helping education understand the scientific character of neuroscience as a hermeneutic activity, importing framing metaphors and concepts into its conclusions (Hartmann 2011).

This philosophical questioning begins to create elbow room to engage with the scientific character of neuroeducational research and practice. For example, Williams and Standish suggest that the metonymic language used in neuroscience concerning the brain “is made to stand for the whole in some *reified sense*” (2016, p. 20). They argue that the metaphors in neuroscience are so deeply embedded that we often no longer recognize their metaphorical character. Understanding neuroscience’s model of science as deeply hermeneutical creates room for broader questions about the status of its empirical research, precisely for the sake of education. This is an important service that philosophy of education provides, for a critical voice about science itself is nowhere more necessary than in neuroscience research, especially as it is employed toward the improvement of education. Neuroscience as a *science* is itself not without its own tacit assumptions, which deserve to be scrutinized. It has smuggled into its account concepts that come from elsewhere but seem to arise from neuroscience itself, including metaphors such as “information”, “computation”, “plasticity”, and “representation” (see also Borck 2011). The authority and popularity of neuroscience subsequently gives added authority to those imported notions, shielding them from further scrutiny. This means not only questioning particular problematic hidden assumptions in the research itself, but also exposing its preconceptions of what constitutes educational improvement, including what is meant by the term ‘education’. Asking questions about the assumptions of what counts as educational improvement draws attention to the way knowledge and concepts of neuroscience circulate, including how they are translated into education and, in turn, how these new ideas in education are legitimated. Central to philosophy of education’s role with respect to neuroscience is to reveal the way its concepts circulate—with an eye particularly to their translations into education and legitimations for the its practice. By problematizing neuroscience in this manner, it will help enable the re-democratization of the discussion of what is good education, one that cannot be answered by scientific discoveries (Biesta 2010).

A compounding philosophical issue in the science of neuroscience is the question of *reductionism*. For neuroscience, especially cognitive neuroscience, its stock method of analysis typically leads to some form or other of reductionism (Bickle 2003a, 2006; Soom 2011). There are of course many ways to parse out reductionism. Conventionally, in philosophy of science, it has meant the reduction of a theory in one domain to a theory in another—say, a theory in chemistry reduced to a more fundamental one, in physics. The assumption in the reduction is that the ‘higher’ theory is explained, with no remainder, by the ‘lower’ theory. Reduction typically is framed with a levels conceptualization, where a lower level provides simultaneously an explanatory (epistemological) and a causal (ontological) account of the higher level, without remainder. This opens the door for mapping manifest (observed, experienced) phenomena onto unobserved (theoretical, scientific) constructs. This form of reduction is prevalent in the neuroeducation field, often using the language of neural correlates (Aziz-Zadeh et al. 2013; Dehaene et al. 2010; Hruby and Goswami 2011; Kobayashi et al. 2007). In general, the idea is that mental states, construed as mental representations, are correlated with equivalent physical (neural) states.

This then allows physical properties of brains to be taken as both causing and explaining mental representations, reducing the latter to the former.

A central philosophical question arises: Is ‘levels’ the right metaphor? There are, as noted earlier, a number of theorists who use this metaphor in thinking about neuroscience, mind, and education (Bruer 1997; Gazzaniga 2010; Willingham and Lloyd 2007). The ‘level’ metaphor has some strengths, for it helps avoid particular errors. If, for example, mental representations exist on one level (the mind, say), but not the level below it (the brain, say, or the neuron), then it is a mistake of levels to insist that mental representations are in the brain, or that they can be observed via brain imaging. As noted earlier, Williams and Standish argue that neuroscience has pulled us into a category mistake with respect to learning: learning is not a neuronal activity of the brain, but a cognitive human activity—that we shouldn’t talk about what the brain does when we mean something a person does—a version of the mereological fallacy (2016, p. 19). They argue that the reason for this confusion is because neuroscientists and neuroeducators draw on a historical reductionist conception of consciousness. Similarly, Maxwell and Racine tease apart levels of evidence, suggesting that philosophically, some applications of neuroscience to educational practices such as child-rearing have not respected the difference of levels of evidence (2016, p. 62). These are helpful philosophical analyses of reductionism via the idea of levels. However, more philosophical work developing critiques of the idea of levels itself remains to be done. This includes examining the almost inevitable hierarchical implications, the conceptual problem of isolating levels, the reification of entities indexed to levels, and the simplification of causal structures into linear (bottom up) ones.

### *Political Questions*

A final set of philosophical questions might be clustered around what can be called the *political*. Importantly, philosophy of education’s critique of neuroscience, especially in the area of education, can show the limits of conceptualizing the student as an autonomous, liberal subject, and of taking the purpose of education to be about developing individual autonomy. Thompson takes up this challenge, arguing that a future direction of philosophy of education is understanding the limits of the concept of subjectivity. Attending to one such limit, what she calls “normalization in education”, reveals how “[t]he figure of the autonomous pupil is layered with various power constellations: the promise of an autonomous learning process, the perspective of a successful future, the hope of a successful school experience etc.” (2015, p. 657). This limit reveals that the subjectification of the self involves not merely normalizing students with respect to a problematic autonomy but instead more questionably with respect to an enterprising self. Joldersma (2016b) extends this critique, suggesting that neuroscience can be and has been coopted by neoliberalism’s interpretation of an ethic of self-responsibility. These political questions of neuroeducation deserve further exploration by philosophers of education.

## Neuroscience's Possible Impact on Philosophy of Education

Engagement with neuroscience also has the potential for transforming philosophy of education itself. Despite rich critical lenses employed by most philosophers of education, the not-unexpected relative insularity of its disciplinary conversations means that these might harbor unexamined and sedimented ‘commonsense’ concepts and ways of understanding. A standing danger with philosophy of education—and indeed, any discipline—is that it tends to preserve large swaths of its own preferred language and concepts as it goes about its business. It is thus never bad for philosophy of education to have its familiar ideas and patterns disturbed and opened up for examination, “disrupting the complacent belief that one understands one’s own thoughts and the language in which one formulates one’s thoughts” (Ruitenber [2009](#), p. 426). Ruitenber calls this *translation*, and argues that it can be used as a “philosophical method”, one that dislocates the native language through a process of defamiliarization, a distancing which “deliberately and noticeably insinuates itself between the reader and the text, in order to disrupt the apparent familiarity of that text” ([2009](#), p. 433). I am suggesting that engagement with the neuroscience literature can fruitfully be thought of as one such realm of translation, allowing the ‘foreign language’ of neuroscience to insinuate itself between philosophers of education and their familiar concepts and understandings. This process of distancing and defamiliarization from certain conceptions of (say) mind, consciousness, cognition, emotion, or embodiment could lead to novel understandings of these philosophical concepts. This dimension of the intersection of neuroscience and philosophy of education reveals the possibility of going beyond the critical, toward a mutual interaction in which philosophy of education itself shifts ground.

### *Cultural Differences, Plasticity*

One example involves discussions around educating students to appreciate cultural difference (Warnick [2012](#); Yacek [2014](#)), including aesthetic judgment in globally cross-cultural contexts to do so (Nakamura [2009](#); White [2015](#)). Dhillon has argued that neuroscience can help in understanding a new way into making judgments about artworks that belong to an unfamiliar culture, precisely “when we cannot rely on learned conventions to help engage these artworks” ([2016](#), p. 130). She suggests that neuroscience can help make explicit the cognitive structures all humans share, which helps her answer questions about aesthetic properties and aesthetic judgments. In particular, she offers that neuroscience can help us answer the question of the relation between aesthetic properties of an artwork and its underlying (constituent) non-aesthetic properties of (say) line, shape, and color. Her philosophical purpose is to theorize how the presentation of “artworks of unfamiliar cultures should create aesthetic possibilities for educating students towards the global democratic ethos that is required of us today” ([2016](#), p. 131). What neuroscience offers, she

suggests, is a novel understanding of how visual neuro-processing are shared across cultural differences, something that opens up space for appreciating culturally unfamiliar pieces as works of art. Although this is not a substitution of science for philosophy, Dhillon uses neuroscience to open up new philosophical paths.

Another way that philosophers of education have used neuroscience to unsettle the familiar is by borrowing from its conceptualizations. For example, a central discovery in neuroscience is that the brain's plasticity is not limited to early childhood, but endures (Huttenlocher 2009). In this, neuroscience takes plasticity as the brain's ability to change in response to its interactions with its surroundings throughout the course of our life spans. Malabou has made conceptual use of this idea but pushes it philosophically beyond the conventional idea of mere flexibility toward a more radical philosophical meaning (Malabou 2009, 2012). She argues for a notion of plasticity that is not merely an adaptation to our existing surroundings, but more radically, that plasticity involves the freedom to intervene in our circumstances. Bojesen, acknowledging Dewey's use of the term plasticity, uses Malabou to argue that philosophers of education need develop ideas of "educational plasticity" and "the plastic subject" to develop new lines of educational philosophy (Bojesen 2015). Ulmer does just that by taking Malabou's concept to be a "new materialist methodology", using it to reconceptualize policy discourses, including how educational policies are formed and altered (Ulmer 2015). Lewis takes this a step further, using Malabou's idea of plasticity to interrupt the ideas of flexibility, adaptation, and efficiency with the notions of ruptures, events, and explosions. He suggests that this will allow us to more explicitly recognize "the fragility and precariousness of educational life", an indeterminacy that "holds open a promise" in which "an alternative notion of the self can burst into presence without warning" (Lewis 2016, p. 153). This, he offers, takes us beyond Dewey's progressivist understanding of plasticity as a condition for the continuity of growth, by emphasizing contingency, rupture, and risk in educationally formative experiences.

### *Dynamic Open Systems*

A third example is how the model of dynamic open systems can help educational philosophers situate their engagement with neuroscience. The word 'system' connotes both a model (say, a mathematical construct) and a collection of elements that relate to each other in a way that allows them to stand out in a stable fashion as a kind of whole distinct from its surrounding environment—for example, a lake ecosystem. The words 'open' and 'dynamic' indicate that the system does not remain static, but has much internal movement and environmental exchanges as it maintains its overall stability—for example, water enters and also leaves the lake, but it remains more or less stable in water volume and chemical composition. These changes are often described as nonlinear, indicating that when internal changes occur, the result (the whole) is not directly proportional to sum of what went into the process (the elements); rather something novel emerges. The main take-away is that

the system's behavior is neither merely random nor predictable. Rather, the changing behavior of the system seems at once to be unstable and yet something overall is enduring, a form of "metastability" (E. Thompson 2010, p. 40). Metastability is the endurance of a novel pattern of overall behavior that remains stable even though the internal dynamics that constitute it continuously change. Thompson suggests that metastability is necessary "for self-organization and adaptive behavior" (2010, p. 40). This model is a positive alternative to the reductionism of conventional neuroscience, and thus provides a way forward from the search for neural correlates, suggesting that not only the brain, but also the embodied organism's interaction with its environment, might be modeled as a dynamic open system. Philosophers of education are beginning to make philosophical use of this model.

For example, Gallagher uses the dynamic systems model to argue against what he calls "neural hermeneutics", the idea that we can identify brain mechanisms to "understand one another" socially (2016, p. 177), something that he says is associated with "theory of mind" approaches of social cognition. For his alternative he draws on the conclusions of a variety of neuroscience studies that show "cultural variations in brain mechanisms" (2016, p. 181) including perceptual experiences, emotional responses, face processing. This empirical evidence does philosophical work, allowing him to conclude that it undermines the theory of mind approaches, because it shows that social cognition is not "entirely in the brain or inside the head" (2016, p. 181). For his positive alternative Gallagher draws on enactivism, something that "understands the brain as an integrated part of a larger dynamic system that includes body and (both physical and social) environment" (2016, p. 182). Out of this dynamic systems model develops what he calls enactive hermeneutics, an understanding of the face-to-face interactions in terms of "participatory sense making", something that he believes is constitutive of education (2016, p. 188), and "natural pedagogy", an idea that "certain interactive aspects of communicative practices lead to conceptual learning" (2016, p. 185). Gallagher's enactivist approach is informed by the neuroscience which situates the brain in a larger explanatory unit. His conclusion is that, contrary to the theory of mind claims of neural hermeneutics, large-scale patterns of educational behavior cannot be predicted from the neural elements from which they arise. He can draw this conclusion effectively because it is informed by neuroscience, namely, those theorists who model the brain-body-environment as an open dynamic system.

Another example of using open dynamic systems for a "disruption of complacent beliefs" revolves around the implications of neuroscience for agency, free will, and moral development (Bayne and Pacherie 2015; Levy 2015). As Murphy and Brown (2009) smartly ask: did our neurons make us do it? Sankey and Kim provide an example of taking up this task, engaging the question "how free is conscious free will" (2016, p. 114). They employ a dynamic systems model of neuroscience, which allows them to question the hard determinism of conventional neuroscience while using the neuroscientific idea of self-organization to ground moral values in new ways, namely, in our embodiment. In particular, they argue that "moral development is emergent and self-organizing"; they see this as "a potentially new paradigm in moral education", challenging the Kohlbergian tradition of moral development

(2016, p. 117). This is a good example of using insights of neuroscience to disrupt certain “received views” of moral development and what it means to be a responsible self, to argue for another way that our moral values emerge, given our embodiment (see also Fenwick 2009). This example suggests that conceptual models such as dynamic systems can unsettle traditional ways of understanding moral values and serves for educational settings. More generally, neuroscience has the possibility for unsettling familiar language in philosophy of education, opening up new lines of thought and research.

## Conclusion

The area of neuroscience is a fairly recent area of scholarship for philosophy of education. However, as this chapter shows, there are already many lines of inquiry that have opened up as philosophers of education turn to neuroscience. One broad line is a set of philosophical critiques, ranging from simplistic applications to examining the science itself. Another broad line is a set of philosophical inspirations, ranging from drawing on novel understandings of neural plasticity to philosophical appropriations of dynamic open systems. What these lines also show is that much more can be done. Addressing neuroscience, especially in its application to education, will fruitfully involve philosophers of education for some time to come.

# Charter Schools, Free Schools, and School Choice

Terri S. Wilson

## Introduction

This chapter focuses on the philosophical questions and tensions involved in school choice reforms that give students and parents greater flexibility and choice in education. Choice reforms remain diverse, but often emphasize creating and expanding semi-autonomous and independently run public schools. These schools, termed ‘charter schools’ in US contexts and ‘free schools’ in the UK, exist in a variety of forms in many different countries. I offer a brief overview of some of the shared features and commitments of these semi-autonomous public schools, with attention to their different policy contexts. In my analysis, I focus on the distinctly philosophical questions raised by reform efforts that have expanded freedom of choice for parents and families. These reforms – while diverse – often reshape commonly understood definitions between public and private education. In doing so, these reforms create new opportunities and liberties for certain communities and families; they also raise questions about the privatization of interests in public education and the effect of such policies on goals of equity, inclusion, and justice.

Here, while many researchers have focused on assembling important evidence about the practical *consequences* and *effects* of school choice, evidence alone cannot resolve normative debates about the appropriate *purposes*, *aims*, and *values* raised by new autonomous schools of choice. This chapter reviews these philosophical questions along two broad dimensions: (1) rights, pluralism, and autonomy and (2) equity, justice and democratic participation. While I focus on philosophical scholarship in reviewing these three broad areas, I also point to the importance and relevance of empirical research in considering many of these claims. For example, careful empirical research on the causes and consequences of segregation in choice

policies can be used to inform philosophical debates about the democratic value of shared experiences or the claims that choice policies make to serve the ends of equity. I conclude the chapter by sketching out some recommendations for employing philosophical frameworks in the analysis of these policies.

## Market-Oriented Reforms and Rationales

Over the last three decades, market-oriented education reforms have introduced choice and competition into public school systems worldwide.<sup>1</sup> These reforms are broad and diverse. At one part of the spectrum, choice reforms include voucher programs that allow public funding to be used by families to attend private schools. Chile, for example, decentralized their educational system in 1980, creating a voucher subsidy to encourage private school providers to enter the market and compete for students (Parry 1997). While many other countries rely extensively on private providers for public education, a variety of educational reforms have focused on expanding choice *within* the public school sector, the focus of this chapter. In this section, I briefly review the development of and rationale for these reforms, focusing on policies that have expanded autonomous schools of choice.

### *Autonomous Schools in International Perspective*

Public school choice is also diverse, but many reforms have focused on developing new, independent schools of choice, creating quasi-markets in education where parents and students are able to choose among diverse educational options. Such semi-autonomous public schools are termed ‘charter schools’ in the United States and Alberta, Canada; ‘academies’ and ‘free schools’ in the United Kingdom; ‘independent schools’ (*fristående skolor*, *friskola*, or *friskolelagen*) in Sweden, Denmark, and Norway; and ‘partnership schools’ in New Zealand.<sup>2</sup> While the development of autonomous schools varies across these contexts, such schools share a few common features: the devolution of authority (and often funding) to schools, some independence from government regulation, the development of diverse school providers, and the promotion of parental choice among schools (Whitty et al. 1998).

---

<sup>1</sup>A review of the 34 members of the Organisation for Economic Co-operation and Development (OECD) estimates that two-thirds of these countries allow a certain degree of school choice (Musset 2012).

<sup>2</sup>This is not an exhaustive list. Other countries (i.e., Chile, Colombia, Germany) have related policies that offer public funding for private schools. Sweden relies on voucher-like funding to support attendance at *fristående skolor*; Western Australia has recently introduced a charter-like system of schools called the Independent Public School (IPS) Initiative; many other countries (i.e., South Africa, the Czech Republic, China) have also experimented with choice provisions. I’ve focused my review on the choice systems that have prioritized the development of *autonomous public schools of choice*.

Most prevalent in the United States, charter schools exchange increased autonomy for increased accountability. While exempt from many state and local regulations, charter schools are responsible for meeting the academic and other goals specified in a ‘charter’, or contract, with their school authorizer. First established in 1991, charter school legislation now exists in 44 states and the District of Columbia, and more than 6900 charter schools enroll over 3 million children nationwide (National Alliance for Public Charter Schools 2017). Legislation and implementation vary widely, however; certain states have authorized smaller numbers of schools, while other states account for larger percentages, typically with less oversight and more diverse authorizer pathways. In Canada, only one province (Alberta) has established charter schools, but the country has a long tradition of supporting separate Catholic and Protestant school systems, federally funded schools for Aboriginal students, as well as French immersion programs (Bosetti and Gereluk 2016).

In England and Wales, national legislation introduced market-oriented education reforms in the 1980s. Schools were incentivized to compete for pupils (and the funding that followed them), and could also elect to become “grant maintained”, with more autonomy over operations and admissions (West 2014). From there, the government directly funded independently run ‘city technology colleges’ (CTCs) and, starting in 1997, ‘academies’, which were externally sponsored and directly funded schools of choice. Choice was expanded with the 2010 Academies Act, which allowed existing public schools to convert to academy status and also created a new category of “free schools” (Walford 2014). Such schools can be newly created by petitions from diverse groups, including parents, community organizations, faith groups, non-profits, businesses, and universities. Like in the United States, free schools and academies have some degree of operational autonomy over admissions, staffing, and curriculum. As of January 2015, 2.7 million students were enrolled in academies throughout England (Drake 2015).

In a similar way, New Zealand devolved considerable operational authority and financial control from a centralized school system to school-specific boards of trustees in 1989. Two years later, more sweeping policy changes did away with enrollment zones, allowing parents to seek admission to any public school (Fiske and Ladd 2003). These ‘Tomorrow’s Schools’ reforms established a system of autonomous and self-governing schools, with widespread choice and competition between schools. In addition to these reforms, in 2012, New Zealand launched a new model of ‘partnership schools’ or *kura hourua* that have more autonomy and focus on disadvantaged communities. Eight schools are currently in operation, with more slated to open in coming years.

Choice has been a longstanding feature of many Scandinavian countries, although reforms in the last 25 years have expanded its reach and prominence. In Sweden, 1991 education legislation established a voucher program that allowed existing independent schools to receive some public funding; in 1996, independent schools were granted comparable funding to other public schools and were no longer allowed to charge additional fees (West 2014). Schools can be run by private and non-profit organizations, including community and religious groups, but must also follow the national curriculum. These schools now make up a sizable part of the Swedish

educational system, particularly in urban and suburban areas. As of 2014, 17% of compulsory schools (Grades 1–9) and 50% of upper secondary schools (Grades 10–12) were independent (Swedish Institute 2015). While less widespread, Norway's Private Education Act (1985) provides state support (at approximately 85%) for private schools, many of which are religious in character or focus on specific curricula. As of 2014, 7% of primary/lower secondary schools (Grades 1–10) and 20% of upper secondary schools (Grades 11–12 and pre-college) in Norway are private (Statistics Norway 2014). Denmark also has a long tradition of supporting private schools, which receive a substantial government subsidy (80–85% of costs). In the 2008–2009 school year, approximately 13% of Danish children in Grades PK-10 attended a private school.

### *Rationales for Market-Oriented Reforms*

While varying across these different contexts, autonomous schools of choice share a variety of overlapping and, at times, conflicting ideas. The market-oriented reforms that have taken hold over the last three decades have developed alongside the broad global changes often categorized as 'neoliberalism'. Although diverse, neoliberalism advances individual and entrepreneurial freedoms within a framework that protects private property, free trade, market processes, and the interests of capital (Harvey 2005). In this framework, many states have pursued the privatization of public goods and services, including education. These reforms are grounded in economic theories that see competition and choice as potential levers of school improvement. In this theoretical model, schools, when asked to compete for students and funding, have built-in incentives to improve their performance. Parents are empowered to choose the 'best' schools, which puts consumer pressure on all schools to improve. As Lubienski (2003) summarizes, "By drawing from market-style institutional forms, choice positions education as a private good to be provided by schools acting more like private organizations and to be pursued by consumers maximizing their individual preferences" (p. 483).

This account of choice has largely been shaped by the insights of rational choice theory. One of the primary assumptions of rational choice is that individuals have and act according to preferences. In this model, several conditions need to be in place for choice to work as planned. Parents must have preferences about education and gather information about available schools, make trade-offs between the different attributes of these schools (e.g., test scores versus proximity), and choose the school that best fits their preferences (Hamilton and Guin 2005). Certain proponents of choice stress that parents must be able to evaluate and choose 'better' schools or schools that do well on standard measures of academic performance.<sup>3</sup> This assumption has been the subject of dispute, as research has found that parents – while often naming academic

---

<sup>3</sup>For a discussion about the centrality of academic quality in choice, see Schneider et al. 2002.

quality as a criterion – actually make choices for other reasons, including demographics and the perceived prestige of the school (Schneider and Buckley 2002).

Other proponents of choice are less concerned that parents will be able to critically evaluate school success; here, choice is good in itself. This rationale prioritizes the creation of diverse school options as an important and independent goal. Some families may be drawn to a Waldorf school, for example, while others may prefer an arts academy, or a school that emphasizes a particular religion or language. In this account, parents are also positioned as consumers who choose schools that best match their diverse interests and preferences. Schools, in turn, have incentives not only to be *better* than other schools but to *differentiate* themselves from the competition and “find their niche – a specialized segment of the market to which they can appeal and attract support” (Chubb and Moe 1990, p. 55). Instead of a ‘one size fits all’ approach, choice policies offer different educational products to meet the distinct needs, preferences, and interests of families.

Here, market-oriented rationales merge with arguments prioritizing expanded choice as a value in itself, grounded in the rights of parents to choose and direct their children’s education. These arguments also overlap with claims that certain communities should be able to democratically establish schools that recognize group identities and support distinctive cultures. Still other arguments link parental choice to school improvement, but not through competitive effects. The very act of choosing – in effect, investing in a particular school community – builds schools around shared commitments and values. Drawing on studies of Catholic schools (e.g., Bryk et al. 1993), some proponents see choice as an important vehicle for parent and community involvement. These diverse arguments underscore, as Ladd (2003) argues, that choice reforms are not merely the outcome of neoliberal ideology, but combine, in sometimes unclear ways, a “number of different philosophical strands that converged on similar policy recommendations related to self-governance of schools and parental choice” (10).

This very diversity underscores the importance of studying the various, overlapping – and at times conflicting – philosophical arguments for choice. Understanding choice involves more than considering if choice ‘works’. School choice raises philosophical questions about the *purposes*, *aims*, and *values* of these reforms. In the next sections, I review these philosophical questions along two broad dimensions: (1) rights, pluralism and autonomy; and (2) justice, equity and democratic participation.<sup>4</sup>

## Rights, Pluralism, and Autonomy

First, how can we understand the rights of families to choose schools organized around their own interests, needs, and ethical convictions? What are the values and claims that justify and support such choices? What limitations should be placed

---

<sup>4</sup>While focused on international contexts and autonomous schools of choice, certain parts of these next sections are updated from literature I reviewed in a previous chapter (Wilson 2012).

upon such choices? The rights of parents to exit public education (in favor of private alternatives or homeschooling) have been recognized in many countries, although their limits have been debated. Indeed, philosophers have long considered questions about the proper scope of state and family authority over the provision of education. Here, philosophy can pose crucial *normative* questions about choice. For example, how should the interests of families in guiding their children's education be balanced against the prospective rights of children? And how should these rights be balanced against other public aims of education, including concerns of equal opportunity?

### ***Parental Rights***

As noted earlier, certain rationales for school choice emphasize the *rights* of families to send their children to schools of their choice or alternatives to state-sponsored schools (Merry and Karsten 2010). While originally focused on parents' rights to choose independent and, in some cases, religious schools, these rights-based claims have also been used to justify the expansion of charter schools and other autonomous schools of choice. These claims (with important limits) have also been upheld by legal decisions in various countries. In the United States, the 1925 *Pierce v. Society of Sisters* decision recognized the rights of parents to educate their children as a form of liberty protected under US Constitution. Other international cases have affirmed parents' rights to direct their children's education. For example, the European Convention on Human Rights (ECHR) holds that states must respect the rights of parents to direct their children's education in accordance with religious and philosophical convictions, but that children also have an independent right to receive an education (Bergström 2010). This precedent has been applied to cases focused on the education of Roma children, as well as the provision of single-sex schools (Poulter 1987).

Parents' rights, across these contexts, have been understood in terms of the right to *exit* state-sponsored schools and also with the right to *hold* private beliefs that may conflict with public schooling. These private beliefs imply the existence of different views of what constitutes a flourishing life, ones that may come into conflict with the curriculum and practices of state-sponsored schools. Galston (2002) has conceptualized these rights as a form of "expressive liberty", defined as "a robust though rebuttable presumption in favor of individuals and groups leading their lives as they see fit, within a broad range of legitimate variation, in accordance with their own understanding of what gives life meaning and value" (p. 3). His argument promotes deference to the rights of parents to lead lives, and raise children, as they see fit with minimal intrusion from the state (Galston 1991).

## ***Pluralism and Recognition***

While the basic rights of parents to ‘opt out’ of public schools are well recognized, advocates also see school choice as a means of recognizing and supporting diverse ethical, cultural, and religious identities. Autonomous schools, in aiming to increase the diversity and range of schools available to families, also draw on philosophical arguments about pluralism and recognition. Galston’s (2002) ideal of “expressive liberty”, for example, while emphasizing parents’ rights, understands difference as an inevitable feature of democratic life. Extending this argument, McConnell (2001) holds that parents should be able to choose among a wide variety of different schools, public and private, which reflect their values and convictions. Such parental preferences should be granted wide latitude, constrained only by minimal civic goals and standards of educational quality. Moving beyond a focus on parents’ rights, McConnell (2001) contends that widespread choice is best positioned to protect liberalism, amid the challenges of cultural, religious, and ideological differences.

In contrast, Macedo (2003) argues that pluralism does not provide an adequate justification for the public funding of private schools. While supportive of educational accommodation to pluralism, Macedo distinguishes between nonpublic values and the public goods created through political deliberation (2003). Although there is a place for many nonpublic values pursued by diverse pluralist communities – the desire to teach children distinctly religious views, for example – these values do not have to be publicly supported. Feinberg (2006) makes a similar argument, seeing private schools as dependent upon a larger system of public education, which reproduces “the understandings and dispositions needed to secure the political climate where all deeply held religious ideals can be expressed” (p. 214).

Reich (2002) also sees pluralism as an inescapable dimension of any liberal society. He maintains that school choice offers a potential vehicle for *accommodating* pluralist preferences within common ideals, rather than seeking to *assimilate* them to any one particular ideal. Here, Reich distinguishes between the ‘structure’ and the ‘substance’ of a common school ideal, seeing that many policy structures, public and private, could uphold common educational values and goals. Such common goals include, at a minimum, learning basic norms of citizenship and securing the future autonomy of students.

## ***Autonomy***

Debates about the limitations of pluralism often turn on the concept of autonomy. Autonomy implies that individuals have the ability to engage in critical self-reflection about their values and commitments, as well as an ability to choose among particular life options, qualities Gutmann (1999) terms reasoned self-rule. As Brighouse (2003) argues, autonomy must be considered differently in the cases of education, where children are in the process of *developing* a capacity for reflective choice. In various

ways, philosophers have noted that children – not just parents and the state – have an independent interest in education: an interest in becoming autonomous.

While there is broad (although not universal) agreement about the value of autonomy, theorists take different positions on what it means, what it requires, and why it should be considered a legitimate goal of education in a liberal democracy.<sup>5</sup> Reich (2002) advances a “minimalist conception” of autonomy, understanding autonomous persons as “self-determining, in charge of their own lives, able to make significant choices from a range of meaningful options about how their lives will unfold” (Reich 2002, 100). Autonomy entails the ability to freely consent to one’s political system of governance and – especially important for schools of choice – the ability to criticize and potentially even exit one’s current community (Reich 2007). Reich is critical of extreme views on both sides: those who reject reasonable pluralist approaches to school choice and those who defend overly expansive versions of choice that would be incapable of securing student autonomy. While supportive of many forms of school choice, Reich (2007) is critical of homeschooling and some religious schools that might prevent students from reflecting on – and potentially choosing to exit – the ethical worldviews of their parents, community, or cultural group.

Callan (1997) also privileges autonomy. Less focused on the requirements of critical self-examination, he advocates for educational experiences that might sufficiently protect children from conditions of ‘ethical servility’. Autonomy is a legitimate goal, in this sense, because it protects a child from subordinating herself to another’s values and goals. From another perspective, Brighouse (1998) calls for ‘autonomy-facilitating’ rather than ‘autonomy-promoting’ education. The distinction is between education that *enables* children “to make better rather than worse choices about how to live their lives” and an education that *ensures* “students employ autonomy in their lives” (Brighouse 1998, 734). In effect, education should provide children with the tools of rational reflection without imposing the normative goal that they should become autonomous. Applied to school choice, this view might support schools that facilitated *opportunities* for students to practice self-reflection, but not ones that *required* such practices.

Many accounts of autonomy view an ability to *choose* a particular tradition as a key part of leading a flourishing life.<sup>6</sup> Making such a choice depends on critical reflection into one’s values, traditions, and beliefs (Burt 2003). Yet, as Warnick (2012) notes, this understanding of autonomy often requires actual *interaction* with different ways of life, including alternate cultural and religious traditions. The requirement to engage diversity often promotes calls for some form of common educational goals or interactions across difference that may only be possible in diverse and integrated schools.

---

<sup>5</sup>Other theorists have disputed the priority and dominance of autonomy in liberal accounts of education. See, for example, the discussion in Swaine (2012) and Hand (2006).

<sup>6</sup>Suissa (2010) critiques this view as unrealistic; in her view, the assumption that families hold a ‘comprehensive conception of the good’ relies on a reductive view of the shifting and multi-faceted values held by actual families.

## Justice, Equity, Democracy

To this extent, other philosophical questions focus on issues of democratic participation and difference. Here, the focus shifts to the *outcomes* of choice. Does choice – as a policy lever – lead to more equitable, just, and democratic outcomes? How do choice plans contribute to, or perhaps work against, equality of opportunity in education? I turn to these questions in this section.

### *Equity and Justice*

Many rationales for expanding school choice invoke concerns of equity and equality. Proponents argue that parents, regardless of income or residence, should have an equal opportunity to choose the schools their children attend. Critics, in turn, have focused attention on the inequitable outcomes of choice, for example, in the sense that some parents are better positioned to take advantage of choice than others. The outcomes of students who remain in district or state schools, and for public education as a whole, also tend to be inequitable. Here, debates about equity often draw on philosophical considerations of justice.

Several philosophers have considered the expansion of autonomous schools of choice against concepts of justice. Brighthouse (2000) contends that choice might be arranged to meet the demands of justice and equity. Justice, for Brighthouse, requires that “children’s prospects...should not be entirely dependent on their own talents and the resources and prudence of their parents” (2004, p. 617). While not arguing for ‘full privatization’, Brighthouse nevertheless advocates for choice systems – like highly regulated voucher programs – that might serve the goals of social justice. From a different perspective, Ben-Porath (2010) draws on notions of justice to develop an argument for ‘structured paternalism’. She argues that the government should structure choices to balance the greatest possible freedom of choice with the greatest possible equality of opportunity. In this vein, Ben-Porath endorses a system of universal choice that would provide all parents with the information and support necessary to make informed choices.

Other philosophers have been more critical about the potential for choice to secure equality of opportunity. Drawing on empirical evidence about the sorting and segregating effects of school choice, a number of scholars have pointed to the anti-egalitarian principles woven into choice proposals. Howe (2007), for instance, argues that school choice has failed to serve egalitarian aims and, moreover, that this goal is unrealistic, given the prevailing political dynamics and systemic inequality in the US context. Similarly, Colburn (2012) maintains that market-based reforms make key assumptions about consumer behavior that are bound to disadvantage children who have parents who are less skilled choosers. Drawing on research on parents’ choice processes, Ben-Porath (2009) endorses school choice as a ‘bounded ideal’, one that needs to be attentive to the different challenges some families encounter in exercising choice, as well as the advantages of other families.

Brighthouse, Howe, and other theorists in the liberal tradition generally use a concept of distributive justice, often understood as access to material goods. However, Knight Abowitz (2001) draws on the work of critical theorist Nancy Fraser (2014) to emphasize that justice involves issues of recognition and participation as well as distribution. Knight Abowitz has advanced a concept of ‘democratic justice’ to evaluate school choice. This concept emphasizes four principles: parity of participation, recognition of difference, redistribution of resources, and representation in decision-making (Knight Abowitz and Karaba 2010). These alternate perspectives turn attention to the link between justice and democratic participation.

### *Democratic Participation*

A number of scholars have pointed to the potential opportunities created by school choice, particularly for marginalized communities (Galston 2002; Merry 2011; Wilson 2016). Here, autonomous schools are “instruments of civil society as well as places of teaching and learning” that offer parents and community groups ways to make education relevant to particular communities (Finn et al. 2000, p. 221). Others have cautioned that school choice – in appealing to particular groups and identities – contributes to widespread patterns of segregation and the dissolution of a “common school ideal”, as families pursue increasingly separate and disparate forms of education (Pring 2007). This view emphasizes the role that public education might play in facilitating meaningful interactions – and the creation of common loyalties – across lines of difference (Gutmann 1999).

In Gutmann’s (1999) account, public schools secure their legitimacy as public institutions by serving as sites of democratic deliberation and participation. Public schools need to be more than just publicly accessible and publicly financed; they must be democratically controlled and operated. Democratic control, however, can be defined in a myriad of ways: as increased parental engagement, decentralized decision-making, or accountability to some public authority. For some scholars, interaction with others, particularly across lines of difference, is a necessary part of what makes a school public. Macedo (2003) argues that this interaction is crucial for the development of civic cooperation and mutual respect. In a similar sense, McLaughlin (2003) contends that common schools in liberal and multicultural democracies face particular ‘burdens and dilemmas’, to help children negotiate difference in productive and sensitive ways. The ‘common school’ as an integrated space of substantive interaction across lines of difference has been an elusive goal, difficult to realize in policy or practice. In this sense, Pring (2007) emphasizes that the common school acts as a kind of moral ideal: “the fight for the common school was essentially a moral one in terms of achieving greater social justice and equality, respect for persons and preparation for citizenship within a democratic order” (p. 504).

While supportive of this ideal, Brighthouse (2007) contends that the goal of a common school should not displace the central normative goal of education: developing

autonomous citizens who have equal opportunities to participate in civic, social, and economic life. Integration across lines of class and race is an admirable goal, but secondary to securing equality of educational outcomes. Proponents of choice have made a parallel argument in defending the academic outcomes of autonomous schools that almost exclusively serve low-income students of color. For instance, in many “no excuses” charter schools, the relentless focus on educational *outcomes* overrides other goals (Golann 2015).

Still others have more sharply contested integration as an educational goal. Michael Merry (2011), for example, holds that the ends of ‘civic virtue’ and ‘self-respect’ are not dependent on integration, but may be better fostered under conditions of segregation. He argues that the culturally affirming education provided in voluntarily segregated schools may help marginalized students in resisting the discrimination they face in other social spaces (Merry 2005). Knight Abowitz has highlighted the potential for charter schools to serve as ‘counterpublic spaces’ that might allow communities a space to organize education around their own interests and identities. Extending this concept, Wilson (2016) described the public qualities of a potentially ‘counterpublic’ school serving Somali immigrant families; she calls for greater attention to democratic practices within such autonomous schools.

## **Integrating Philosophical Questions with Empirical Evidence**

Many of the philosophical questions and concepts reviewed in this chapter are necessarily connected to empirical evidence about the outcomes of school choice proposals. For example, research on the causes and consequences of sorting and segregation in autonomous schools can valuably inform philosophical debates about the link between choice and equality of opportunity, as well as the democratic experiences made possible in these schools. Yet, while research has assembled important evidence about the *consequences* and *effects* of choice policies, evidence alone cannot resolve normative debates about the appropriate *purposes*, *aims*, and *values* of school choice. Here, philosophical analysis plays a different role than empirical evidence, even though the two are necessarily connected. Working with well-crafted empirical research, philosophy can help to illustrate the *significance* of evidence for claims of justice, democracy, and other aims.

For example, consider the growing body of research demonstrating that charter schools increase segregation by race and class. While there may be evidence of sorting and segregation in charter schools, scholars might draw different conclusions about the significance of this evidence. More empirical research, while certainly necessary, cannot, at least by itself, determine which conclusions to support. However, as empirical research examines links between different choice policies and patterns of segregation, philosophical analysis can ask other questions to help further clarify the values and claims involved. For example, is this sorting an acceptable form of pluralism, as communities create schools around their own ethical

convictions? How might choice policies – even ones that contribute to segregation – reflect an appropriate balance between the rights of parents to choose schools and the need to protect the interests of parents and children who lack access to such choices? In both cases, what values, principles, and criteria do we use in making such judgments?

Such efforts, however, also require that philosophers immerse themselves in the available empirical evidence and political contexts of choice. As Howe (2007) contends, philosophers who engage in policy debates should be “required to take stances in light of the available empirical evidence and the political environment in which the evidence is embedded” (p. 259). A long tradition has emphasized the inseparability of philosophical questions from contexts of educational policy and practice (Ben-Porath 2009; Levinson 1999; Moses 2002; Ruitenberg 2014; Wilson and Santoro 2015). The rapidly expanding, often ideologically driven, development of school choice calls out for a careful integration of empirical research and philosophical analysis. Autonomous schools of choice have created powerful opportunities for many communities, but will continue to raise difficult normative questions related to rights, recognition, and justice.

# Academic Freedom, the University, and Public Accountability

Zdenko Kodelja

The term ‘academic freedom’ is ambiguous. It is used to denote two different – although connected – things: freedom of the institution and freedom of the individual person. In both cases, we are dealing with freedom, but they are two different sorts of freedom. One is the freedom of the university as an institution, which in modern democratic and liberal societies is most frequently understood as the (relative) independence of the university from the state and economic powers like corporations,<sup>1</sup> and the other is the freedom of the university professors (and other university teachers), their freedom to research, teach, and publish (Diekema 2000, p. 85). Some authors extend the right to academic freedom also to students and teachers in schools,<sup>2</sup> but such an extension is unacceptable for those who claim that

---

<sup>1</sup>The term ‘academic freedom’ is used in this sense mostly in Great Britain, while in the United States “it almost invariably refers to the freedom of the individual professor” (*Dictionary of the History of Ideas*. 2003, p. 10).

<sup>2</sup>This idea that the “freedom of the professor to teach is merely one side of the coin of academic freedom, the other side being the freedom of the student to learn”, is German in origin. During the half century preceding the First World War, a close affinity between freedom to teach (*Lehrfreiheit*) and freedom to learn (*Lernfreiheit*) was recognized. In this context, the students’ freedom to learn means that students are free to pursue their own course of study, taking whatever courses they like at whatever university they choose (*Dictionary of the History of Ideas*, p. 11). However, although the term ‘academic freedom’ is here used to denote both indicated freedoms, it is obvious that freedom of the university professor to teach and freedom of students to learn (to choose their courses) are two different kinds of freedom. R. Standler also claims that “it is important to recognize that students do *not* have academic freedom in either Germany or the USA. Students are on campus to learn, *not* to create new knowledge. Even in the case of graduate students who are doing research for their dissertations, the topic and methods are approved and periodically reviewed by professors, which is a level of supervision that would be inappropriate for a professor’s research. Students are *not* colleagues of professors” (Standler 2000). According to Standler, academic free-

e-mail: [zdenko.kodelja@guest.arnes.si](mailto:zdenko.kodelja@guest.arnes.si)

academic freedom applies only to university professors or, in other words, to academics and scholars. In any case, there is no doubt that academic freedom applies to university professors. Therefore, for the purpose of this chapter, I can say that there are two different kinds of academic freedom: the *individual academic freedom* which protects university professors, and the *institutional academic freedom* which mostly protects universities (Standler 2000; Diekema 2000, pp. 85–86). In order to avoid possible misunderstandings provoked by using the term ‘academic freedom’ to mean two different concepts, I will use this term only for denoting individual academic freedom—that is, the freedom of university professors—and the term ‘university autonomy’ for denoting institutional academic freedom. In the first part of this chapter, I am going to justify this terminological distinction by presenting some conceptual differences between university autonomy and academic freedom.

## Academic Freedom and University Autonomy

Conrad Russell describes the essential characteristics of the traditional understanding of academic freedom as the freedom of university professors to search for truth, to question received knowledge, and to put forward “new ideas and controversial or unpopular opinions without placing themselves in jeopardy. It is the freedom to follow a line of research where it leads, regardless of the consequences, and the corresponding freedom to teach the truth as we see it, with suitable acknowledgment of views which differ from our own” (Russell 1993, p. 18). Anthony Diekema also defines academic freedom as an important right of university professors which protects them, within the university, “from all of those forces, both internal and external, which tend to prevent them from” their duty “to attain truth, to teach truth, and to publish truth to the fullest extent of their intellectual powers” (Diekema 2000, p. 85).<sup>3</sup> A similar definition of academic freedom – although not explicitly related to

---

dom applies only to university professors. Since it applies only to academics, it does not apply either to students or to teachers in elementary and high schools (*ibid.*), albeit in the USA, academic freedom has sometimes been claimed by high school teachers and students. However, in Germany it is “possible for a school teacher, and even conceivably a school student, to assert *Wissenschaftsfreiheit* (scientific rather than academic freedom). For that right can be claimed by anyone engaged in serious scholarly research and study; it is not confined to academic staff working in universities or other higher education institutions. But it has rarely been claimed outside the context of higher education” (Barendt 2010, pp. 13–14).

<sup>3</sup>Since such interpretations of academic freedom usually include the classical conceptions of truth – as it is defined in the correspondence, coherence, verificationist, or pragmatist theories of truth – they might be problematic for those who favor so-called minimalist (Wright, Putnam, Horwich) or deflationist conceptions of truth (Tarski, Rorty, Nietzsche, Heidegger) and consequently reject the idea of truth as ‘substantive’ metaphysical notion (Engel 2002). Academic freedom understood as a ‘disinterested search for truth’ seems to be problematic also for the defenders of postmodernist views who, like Foucault, think that behind the talk about the disinterested search for truth “lies a will to power, an ideological bias that hides other aims that are all but disinterested” (*ibid.*, p. 2), as well as “that the traditional idea that there could be one true story about the word is not only wrong but obnoxious” (*ibid.*).

the controversial idea of truth – can be found in the UNESCO *Recommendation Concerning the Status of Higher-Education Teaching Personnel*, where it is defined as “the right, without constriction by prescribed doctrine, to freedom of teaching and discussion, freedom in carrying out research and disseminating and publishing the results thereof, freedom to express freely their opinion about the institution or system in which they work, freedom from institutional censorship and freedom to participate in professional or representative academic bodies. All higher-education teaching personnel should have the right to fulfil their functions without discrimination of any kind and without fear of repression by the state or any other source” (UNESCO 1997, point 27).

On the other hand, Diekema defines university autonomy as the right of universities which protects “their corporate autonomy, that is, their freedom from interference by external forces” – such as political authorities, pressure groups, or any other entity which has power in the society – in the affairs of the university as an institution (Diekema 2000, p. 86). University autonomy is here understood as a negative freedom or, in other words, as a relative independence that universities as institutions should have in relation to the state and other external forces. Defined in this way, university autonomy clearly differs from academic freedom which protects freedom of individual professors and not the university as an institution, from external and also internal forces. However, this difference is less clear if we take into consideration the important legal judgment of the US Supreme Court, which gives to universities the freedom to determine for themselves “on academic grounds who may teach, what may be taught, how it should be taught, and who may be admitted to study” (ibid., p. 86).<sup>4</sup> The reason for this lack of clarity lies in the fact that it is not indicated who should, within a university, determine these four freedoms: the university as an institution or university professors? It seems that at least the freedom to determine how something should be taught, if not also the freedom to determine what may be taught, should be included in academic freedom. Such an inclusion would be in accordance with the UNESCO *Recommendation*, where it is stated that university professors “have the right to teach without any interference” and that they “should not be forced to instruct against their own best knowledge and conscience or be forced to use curricula and methods contrary to national and international human rights standards”.<sup>5</sup>

---

<sup>4</sup>This formulation of university autonomy has had an impact also on the understanding of this autonomy outside the USA. Moreover, it was directly included in the Statement on Academic Freedom, Ch. 3.

<sup>5</sup>“Higher-education teaching personnel have the right to teach without any interference, subject to accepted professional principles including professional responsibility and intellectual rigour with regard to standards and methods of teaching. Higher-education teaching personnel should not be forced to instruct against their own best knowledge and conscience or be forced to use curricula and methods contrary to national and international human rights standards. Higher-education teaching personnel should play a significant role in determining the curriculum” (UNESCO 1997, point 28). However, the widely accepted claim that university professors should not be forced to teach against their conscience is open to question. An example which shows that this claim is not as unproblematic as it seems to be at first glance is the case of a university professor who argues

An additional argument in favor of the thesis that university autonomy and academic freedom are two different, although connected, forms of freedom can be given on the basis of one of the widely accepted definitions of university autonomy which is stated in the previously mentioned UNESCO *Recommendation*. The autonomy of the university is there defined as “that degree of self-governance necessary for effective decision making by institutions of higher education regarding their academic work, standards, management and related activities consistent with systems of public accountability, especially in respect of funding provided by the state, and respect for academic freedom and human rights” (UNESCO 1997, point 17). In addition, it is stated also that university autonomy is “the institutional form of academic freedom and a necessary precondition to guarantee the proper fulfilment of the tasks entrusted to the” university professors and the universities.<sup>6</sup>

If university autonomy is a necessary condition for academic freedom, it is clear that it cannot be the same as academic freedom.<sup>7</sup> But despite the previously mentioned arguments against the identification of academic freedom with university autonomy, there are some interpretations of academic freedom according to which academic freedom is, in essence, the same as university autonomy.<sup>8</sup> However, if we

---

that the requirement of following a human rights code which gives a specific right to the students violates his rights to freedom of conscience, academic freedom, and freedom of speech. It is well known that Jordan Peterson, a professor at the University of Toronto, generated international controversy in 2016 with his public refusal to use gender-neutral pronouns (like ‘they’ or ‘ze’ and ‘zir’, instead of ‘she’ or ‘he’) when referring to transgendered students, in the name of his right to freedom of speech. The critics claim that his rights to academic freedom and free speech are not unlimited and that his refusal is contrary to the rights of those students (guaranteed by Canadian human rights legislation) to equal treatment without discrimination based on their gender identity or expression. On the other hand, his supporters argue that forcing university professors to speak in a particular way does not mean only the infringement of their right to freedom of speech but also to force them to act against their conscience. Since no one should be forced to act contrary to his conscience or be prevented from acting according to his conscience, it follows that also the university professors should have the freedom to act according to their conscience although legal obligations demand otherwise. Therefore, these opposing interpretations (based on good reasons for mutually exclusive alternatives) show that the discussed problem presents a moral dilemma which cannot be resolved without the violation of either the rights of university professors or those of transgendered students.

<sup>6</sup>“Autonomy is the institutional form of academic freedom and a necessary precondition to guarantee the proper fulfilment of the functions entrusted to higher-education teaching personnel and institutions” (UNESCO 1997, point 18).

<sup>7</sup>Finally, academic freedom is not to be identified with university autonomy. Universities are autonomous to the extent that they can set their internal policies with independence from outside influence. Whether they respect academic freedom depends on the character of the policies they set. In practice, university autonomy stands in the same ambiguous relation to academic freedom as national sovereignty stands with respect to human rights: sometimes it protects it from a hostile external environment; sometimes it merely facilitates internal assaults (Green 2003, p. 385).

<sup>8</sup>Such an interpretation is, for instance, included in the argument used in response to the criticism that the draft of the Slovene *Higher Education and Research and Development Activities Act* (2007) reduces the autonomy of the state universities. For, the official argument has been that the draft act does not reduce university autonomy because it guarantees the autonomy of university professors, which is, in essence, *the same as institutional autonomy*. Just the opposite interpreta-

reduce the university autonomy to academic freedom, we lose precisely that which is supposed to ensure academic freedom. This reduction would be problematic even if academic freedom could be secured without university autonomy, on condition that it is true what UNESCO's definition of university autonomy includes, namely, that university autonomy is a necessary precondition for the fulfillment of the role which a university has in addition to that of ensuring academic freedom (UNESCO 1997, point 18).

Furthermore, the assertion that university autonomy is a necessary condition for academic freedom also allows us to point out that it is not sufficient. Medieval universities, for instance, had substantial autonomy,<sup>9</sup> but academic freedom of their professors was very limited. "The scholar was free to teach and write only within the framework of an accepted doctrine, and was always liable to charges of heresy and subversion. Even if he had felt subjectively free, having been in agreement with basic tenets of the existing religious and social order, he was not objectively so, since he could not go beyond those limits" (Ben-David and Collins 1966, p. 222). Academic freedom of university professors was at that time, as well as later on, limited also regarding their conduct of research. Even though some university professors think that their (our) main task as researchers "is to do research for its own sake" (Rescher 1965, pp. 261–276) there is no doubt that the conduct of research is limited by the available financial resources,<sup>10</sup> as well as by the legal requirements and the norms of research ethics.<sup>11</sup>

However, in spite of such examples which confirm the thesis that even a high level of university autonomy is not enough for guaranteeing academic freedom of their professors, university autonomy is still often justifiably defended on the grounds that university autonomy is a necessary condition for academic freedom. For this reason, university autonomy is in some countries such a highly appreciated value that it is guaranteed by their constitutions. However, if we look at these legal formulations of university autonomy more closely, we can see that at least in some

---

tion of academic freedom, which reduces academic freedom to university autonomy, we can find in the decision of the Federal Court in [Virginia](#) when it "ruled that professors have no academic freedom; *all* academic freedom resides with the university".

<sup>9</sup>The result of the fight of the medieval universities for their independence was that they became to a considerable extent autonomous institutions, that is, legally self-governing corporations, protected by royal charters or papal bulls. They had the freedom to appoint their own professors, control admissions, and establish their own organization of study and standards for graduation (Le Goff 1985, pp. 73–133).

<sup>10</sup>Academic research cannot be unlimited because it mostly depends on money which "plays a crucial role in deciding whether a particular problem will be studied, who will study it, how it will be studied, and even whether the results will be published" (Shamoo and Resnik 2009, pp. 5–6). Especially when research is financed by private funds, "the main reason for investing money in research" is "the prospect of profit" (*ibid.*, p. 6) and not to do research for its own sake.

<sup>11</sup>Among the principles for ethical conduct in research are, for instance, honesty, objectivity, openness, trust, confidentiality, respect for research subjects, social responsibility, and so on (*ibid.*, p. 28–29). Such ethical principles not only restrict academic freedom but also protect it because they prove to the public that research – conducted in accordance with ethical principles – is trustworthy and accountable.

of them it is not defined as something which has value in itself, but only as having predominantly an instrumental value. This means that university autonomy is not understood as an aim, but rather as a means for achieving academic freedom, which is itself protected by the constitutions of some of these countries.

On the other hand, also academic freedom as an end is sometimes understood as a means to an even higher end, that is, the *search for truth*.<sup>12</sup> This is not surprising at all if we take into consideration that “the conventional justification of academic freedom”, as Ronald Dworkin stresses, “treats academic freedom as instrumental in the discovery of truth. According to this view”, he says, “a system of independent academic institutions and scholars who are independent within them provides the best chance of collectively reaching the truth about a wide range of matters, from science to art to politics. We have a better chance of discovering what is true,” those who support this view declare, “if we leave our academics and their institutions free from external control to the greatest degree possible” (Dworkin 1996, p. 185).<sup>13</sup>

Dworkin sees in this conventional defense of academic freedom the influence of the argument, “that truth emerges best from a marketplace of ideas from which no opinion is excluded”, used by John Stuart Mill in his well-known defense of freedom of speech.<sup>14</sup> Although Dworkin admits that the search for truth in the university can be more successful when university professors are “free from either political control or the dominion of commerce”, he argues that this conventional defense of academic freedom as necessary for the search for truth is not enough. He is persuaded that the defense of academic freedom should not be based only on epistemological grounds, but also on ethical ones. He sees the ethical grounds in the ideal of ethical individualism which supports academic freedom “not just as a wise

---

<sup>12</sup>Nevertheless, the free search for truth as the aim of academic freedom is mostly related to the research that university professors do simply because a new truth must be discovered first, and only after that can it be published or involved in teaching. Moreover, university professors can publish texts which do not include new truths and their teaching is quite often nothing more than the transmission of certain old and widely accepted truths. In this context, the search for truth has been understood neither as a search for a religious, revealed truth nor “for an ultimate truth for all time, but a contestable truth that could be countered and superseded when new and better knowledge was proposed” (Williams 2016, p. 14).

<sup>13</sup>But such an understanding of academic freedom (which presupposes the idea that freedom of university professors is a necessary condition for discovering objective truth) is now under challenge because “the very possibility of objective truth is itself under challenge” from the postmodernist, relativist and other critics (Dworkin 1996, p. 183). One of the consequences of these critics was “the collapse of truth within humanities and social science disciplines”, which began a few decades ago and “had a devastating and enduring impact upon the pursuit and transmission of knowledge and the meaning and purpose of academic freedom” (Williams 2016, p. 46).

<sup>14</sup>Mill’s main arguments for preserving freedom of speech can be summarized as: (1) If any opinion is suppressed, the suppressed opinion might be true. To deny this is the same as assuming our own infallibility. (2) Even if the suppressed opinion is false, it may contain an element of truth. Since the general opinion is rarely if ever the whole truth, the only way of finding the missing true element, which can supply the whole truth, is to permit the false opinions to be heard. (3) Even if the prevailing opinion is the whole truth, if it is not permitted to be questioned, it will be the prejudice, that is, a belief without a rational ground (Mill 1985, pp. 115–116).

environment for academic discovery, but as encouragement of and protection for the primacy of individual conviction” (Dworkin 1996, pp. 187–188).

This ethical justification of academic freedom shows ethical importance of academic freedom, but it does not deny the value of epistemological justification for academic freedom, which is widely considered to be a right: a right of university professors to freedom of research, teaching, and publishing. In the second part of this chapter, I am going to limit my short and incomplete analysis to two topics which are directly connected to one of these three constitutive elements of academic freedom, that is, to freedom of university professors to publish. The first topic is freedom to publish as a special right; the second can be illustrated with two questions: What can university professors say and what should they say in a public debate?

## Academic Freedom and the Right to Publish

I have already mentioned that the freedom of university professors to publish is usually considered to be a right. Since this right is obviously related to a well-known general right to free speech, which is one of the basic human rights, it seems that academic freedom is “just the application of that more general right to the special case of academic institutions” (ibid., p. 184). However, according to Dworkin such an interpretation “would obscure much that is special about academic freedom” (ibid.). Academic freedom, for instance, does not apply to everyone. It applies only to certain people and certain contexts, that is, to university professors in universities. Free speech, on the contrary, is a moral right – and in many countries also a legal right – that everyone has. Everyone is entitled to freedom of speech, including university professors, but they are, in contrast with other people, also subject to greater restrictions and entitled to “further protections associated with their roles” (Green 2003, p. 385). Academic freedom is therefore “a matter of *special rights*, not general rights” (ibid.). Or more precisely, it is, as says Leslie Green, “a matter of role-related special rights”, that is, the rights which only those who act in particular roles possess. In this sense, parents have a special right to guide and discipline their children, “police to arrest, judges to decide, parliamentarians to legislate, and so forth” (ibid., p. 386). Since the academic role of university professors is to do research, to teach and publish, they have a special right to academic freedom. Their right to publish has been traditionally understood as a right to full freedom in the publication of the results discovered by study and research (*Statement of Principles on Academic Freedom and Tenure* 1940, Art. 1).<sup>15</sup> As such, this right is much more

---

<sup>15</sup>University professors “should be free to publish the results of research and scholarship in books, journals and databases of their own choice and under their own names, provided they are the authors or co-authors of the above scholarly works” (UNESCO 1997, point 12).

limited than their right to freedom of speech that they have as citizens.<sup>16</sup> But the question is whether the limit to the freedom of expression of university professors when participating in public debate should be “over and above what applies to all citizens?” (Van Parijs 2004, p. 6). Although many academics agree that they should not be more restricted on what they can say in public debate than they are as citizens, it seems that they accept special obligations that are imposed on them because of their special position in society. The reason for such an assumption lies, for instance, in the 1940 *Statement of Principles on Academic Freedom and Tenure*, accepted by the American Association of University Professors and the Association of American Colleges, where it is stated that university professors “are citizens, members of a learned profession, and officers of an educational institution. When they speak or write as citizens, they should be free from institutional censorship or discipline, but their special position in the community imposes special obligations. As scholars and educational officers, they should remember that the public may judge their profession and their institution by their utterances. Hence they should at all times be accurate, should exercise appropriate restraint, should show respect for the opinions of others, and should make every effort to indicate that they are not speaking for the institution” (*Statement of Principles on Academic Freedom and Tenure* 1940, Art. 3).

## Academic Freedom and Academic Duty

To say that university professors have a right to publish is to say that they have *no duty not* to publish. This means that they, as holders of this right, are free to do something in the sense of nonforbiddance. In this case, it is not important if university professors are able to do what they are free to do. The only important thing is that they are not disallowed to publish and publicly express their views. But despite this clear definition of this right as a liberty right, it remains unclear whether or not this right means only that university professors have no duty not to publish, or it also means that he has no duty to publish. The real question here is not – as it might seem at a first glance – whether university professors have a right not to publish at all and being in spite of this fact a professor at the university. For, the answer to this question is already known at least in developed, contemporary, and more and more competitive societies and universities where all university professors are more or less in a situation which can be well described with the famous slogan: publish or perish! Therefore, the right question is rather if university professors are free in a sense of

---

<sup>16</sup>The *Convention for the Protection of Human Rights and Fundamental Freedoms*, for example, stipulates that the exercise of the right to freedom of expression “may be subject to such formalities, conditions, restrictions or penalties as are prescribed by law and are necessary in a democratic society, in the interest of national security, territorial integrity or public safety, for the prevention of disorder or crime, for the protection of health or morals, for the protection of the reputation or rights of others, for preventing the disclosure of information received in confidence, or for maintaining the authority and impartiality of the judiciary” (Art. 10.2).

having discretion over whether to publish or not such things that they believe to be important and true and, at the same time, would have undesirable consequences for them if they were published.<sup>17</sup> The answer is yes, if we ask whether they can decide to publish them or not. They are certainly free to choose what to do. But on the other hand, the answer might be just the opposite, namely, that university professors in such a case are not really free to choose to publish them or not, if the point in question were the following: Should the wish to avoid such undesirable consequences for university professors have priority over their moral duty to tell the truth?

The answer, given by Philippe Van Parijs, is negative. “Many research results, when thrown into the public debate, may have undesirable consequences”, he says, “but this is a small cost to pay for the benefit of being able to trust that, whenever academics speak out, they utter statements they genuinely believe to be true, rather than statements the uttering of which they believe will have good consequences for themselves, their audience or whatever other group. The painful truths, those which politicians and journalists” would not like to be topics in public debate, “are precisely those which academics have a special responsibility to state and emphasize” (Van Parijs 2004, p. 9).

University professors have, therefore, a special responsibility, a special moral duty which Van Parijs explains by using a comparison with the duty that doctors have. “In the same way as a doctor has a duty to act when he sees a person collapsing in the street, (...), an academic who, owing to his specific competence, is particularly well placed to detect and assess the first sign of a major danger, has a duty to speak out. Whether about the side effects of using asbestos in buildings or about the loss of biodiversity, whether about the swelling of the public debt or about the consolidation of urban ghettos, academics can legitimately be criticized for not making the effort and taking the time to warn decision makers and the general public before it is too late” (ibid., p. 10). Even more, he is persuaded that it is not enough that academics do their duty to speak out only when they assess the first sight of a major danger. They should intervene in public also when they think that they “can usefully contribute, by pointing to crucial facts which may otherwise go unnoticed or by explaining relevant connections which may otherwise be given inadequate attention, or in any other way that may help avoid errors and confusions” (ibid., p. 9). However, even this is not enough. For, according to Van Parijs, they

---

<sup>17</sup>The answer to this question can be either negative or affirmative, depending on the chosen ethical approach. For a nonconsequentialist, who thinks that it is wrong in itself to not tell the truth (not publish something that a professor believes to be true and important for academics or the general public), the answer is negative. For a consequentialist, who thinks that professors should not publish such things if this has better consequences than there would be if they published them, the answer is affirmative. However, if a greater harm is done by not publishing, then professors, who in spite of this greater harm do not publish them (because this has better consequences for themselves), should be judged as blameworthy. In this case, greater harm implies greater blame and vice versa. On the other hand, professors may be regarded as worthy of more blame for not publishing when the gravity of the harmful consequences that would befall the professors if they published is lesser. In this case, a lesser risk of harm implies greater blame. Therefore, professors are blameworthy in proportion to the gravity of the harm that is done by their acts.

must always, when they intervene, whether to ward off major disasters or for any minor purpose, say nothing but what they believe to be the truth (*ibid.*).<sup>18</sup> And the opposite, it is morally unacceptable and shameful for scholars to say anything they do not believe – or refrain from saying what they do believe – because of benefits they may thereby be able to get or penalties they may thereby be able to avoid. Van Parijs admits that doing so in extreme cases is excusable,<sup>19</sup> but nevertheless harmful to the dignity of the status that scholars have. On the contrary, those scholars “who are willing to put at risk some of the comforts of their status”, some attractive “contracts or promotion prospects, or even their very career, because” they feel “the duty to publicly express, deserve” in his opinion “more than our respect”, they deserve “our admiration and our praise” even if “only few of us agree with the content of what is being asserted” (*ibid.*, pp. 10–11).<sup>20</sup>

Indeed, such scholars really deserve our respect, admiration, and praise, especially if they – as it is supposed in the context of the previously described understanding of the duty to speak out in public debate – do not limit their interventions to their area of expertise. For, in such cases, academic freedom does not protect university professors. It is supposed that they are in such cases – when they publish or publicly express their opinions which are not seen as the results of their research – protected as citizens who have a right to freedom of speech. But, unfortunately, this is not always true. One of the most famous cases, which proves that it is so, is the case of Bertrand Russell, who lost his job at Trinity College, Cambridge, in 1916 for his anti-war protests and then again in 1940 at The City College of New York, where he was teaching mathematical logic, for his views on marriage, contraception, and morals (Russell 1993, p. 24).

It seems, therefore, that academics who feel a duty to publicly express their views in order to protest injustice or other wrongs sometimes cannot do their moral duty without engaging in civil disobedience<sup>21</sup> and suffering the consequences of

---

<sup>18</sup>Dworkin also emphasizes that university professors have a moral duty to discover and tell what they believe to be the truth. In his opinion, “scholars exist for that, and only for that” (Dworkin 1996, p. 190).

<sup>19</sup>For him such cases are those “in which a person’s life prospects or a whole family’s material or physical security are at stake” (*ibid.*, p. 11). But these extreme cases are the exceptions that prove the rule: professors ought to tell only what they believe to be the truth when they intervene in public. This is their moral duty. Looking from the deontological or nonconsequentialist perspective, they should not lie (say something they do not believe) because this is morally wrong in itself, and not just wrong because it has bad consequences (the harm done to the dignity of the status that professors have).

<sup>20</sup>Nevertheless, if such acts surpass what academic duty requires, then they should be treated as supererogatory acts, that is, as acts that it would be good to do, but not wrong not to do. In this case, university professors are free to do such acts or to omit them. Consequently, professors are praiseworthy for committing these acts but not blameworthy for not committing them.

<sup>21</sup>Rawls defines disobedience as “a public, nonviolent, conscientious yet political act contrary to law usually done with the aim of bringing about a change in the law or policies of the government” (Rawls 1971, p. 364).

breaking the law.<sup>22</sup> This is of course a high price that only very few academics are prepared to pay. However, such a duty transcends what is ordinarily understood as a responsibility of university professors or, in other words, their accountability.

## Public Accountability

Public accountability of professors and universities is normally seen as the other side of their academic freedom. However, the question is: to whom are they accountable and how is their accountability to be discharged? It is generally accepted that professors and universities are accountable to their students and funding bodies (public or private) for the effective and excellent conduct of their teaching and research activities, and for the efficient and proper use of the financial resources at their disposal. On the other hand, during the last three or four decades, university accountability has been widely seen as the replacement of the supposedly diminishing trust in the university by the objective assessment of its performance. As a result of the impact of the prevalent neoliberal policies in many countries, “the quest for greater accountability has increased” and, according to Onora O’Neill, this “new accountability culture” – “which is promoted as the way to reduce untrustworthiness” of universities – “aims at ever more perfect administrative control” of universities (O’Neill 2007, pp. 45–46). The performance of universities and their professors “is monitored and subjected to quality control and quality assurance. The idea of *audit* has been exported from its original financial context to cover more detailed scrutiny of non-financial processes and systems. Performance indicators are used to measure adequate and inadequate performance”. This new accountability “has often displaced or marginalized older systems of accountability. In the universities, external examiners lost influence as centrally planned teaching quality assessment was imposed, [...] universities are judged and funded by their rankings in league tables of performance indicators. Managerial accountability for achieving targets is also imposed on” universities “although they are given little institutional freedom. Universities are

---

<sup>22</sup> Much more controversial are those cases when university professors in the name of academic freedom – which in some countries, such as the USA, covers one part of a wider freedom of speech that all citizens enjoy – use hate speech that insults or offends members of some racial, ethnic, and religious groups or publish “particularly controversial or unacceptable opinions, say, on the intelligence of different ethnic groups or on the Holocaust” (Barendt 2010, p. 13). The problem is that although such misuse of freedom of speech seems to be morally unacceptable, it is not clear whether universities are entitled to discipline such “professors because they regard their speech” (articles in newspapers, blogs, etc.) – on issues of public concern outside their scientific disciplines and expertise – “as irresponsible and as damaging to university reputation or standing in the community” (ibid., p. 295). On the other hand, inside the university, universities are obligated to guarantee freedom of speech ‘within the law’, while “they can forbid a meeting if it is clear that the speaker is going to incite crime, infringe public order legislation, use threatening (or other) language intended or likely to cause racial or religious hatred, or in some other way to break the law” (ibid., 282).

supposedly still autonomous, but they have little choice but to cut or close departments with a lower research rating who lose their funding” (ibid., pp. 47–48).<sup>23</sup>

However, the claim that trust should be replaced by accountability is unconvincing because – as O’Neill stresses – “we cannot have *any* form of accountability without *some* forms of trust. Those who recommend the increased oversight, monitoring of standards, recording of performance outcomes, sanctioning of poor performance and tighter contractual relations required by various contemporary forms of accountability have not miraculously discovered forms of accountability that work without trust. Rather they invite us to trust both certain complex, indeed arcane, processes of monitoring, inspecting and controlling that are introduced in the name of accountability, and those who impose them” (O’Neill 2013, p. 10). Therefore, the question which remains is whether we have good reasons to trust the systems of accountability provided by the external institutions such as national quality assurance agencies.

## Concluding Remarks

Academic freedom and autonomy of universities are still treated as ideals. As such, they are stressed also in the *Magna Charta Universitatum Europaeum*, adopted by university rectors in Bologna in 1988. However, in the last three or four decades, both of them have been considerably diminished in many countries because of the implementation of some measures inspired by neoliberal ideas. In Europe, this process – which is now going on in many countries – started in the UK when the Thatcher government decided to put increasing emphasis on the responsibilities of universities to contribute to national economic and social progress and on their accountability to the public. The other side of this increased importance of the instrumental value of knowledge is the diminished importance of the pursuit of knowledge for its own sake. On the other hand, as a result of neoliberal politics, the quest for greater accountability has increased and, according to O’Neill, this new accountability culture – which is promoted as the way to reduce the perceived untrustworthiness of universities and other public institutions – aims at ever more perfect administrative control of universities. This claim for greater accountability of universities shows that although universities are recognized as autonomous institutions, they are not seen as trustworthy, that is, as institutions that are trusted to be able and willing to assure the expected quality and efficiency of higher education by themselves. Consequently, quality assurance agencies at national and European level have been established. Nevertheless, it seems to me that their establishment – which was supposed to improve the trust in universities – significantly contributes to the decline of university authority and autonomy even if it improves the quality and efficiency of universities.

# Social Media, Digital Technology, and Education: Personalized Learning and Questions of Autonomy, Authority, and Public/Community

Heather Greenhalgh-Spencer

Recent innovations in the use of digital technology in the classroom have given rise to multiple philosophical questions about the purposes of education, the nature of teaching and learning, and relationships between students, teachers, and the world. Multiple philosophers of education have examined questions that are increasingly salient with the rise of digital technology in the schools: questions around networking, the social self, autonomy, authority, and change (Standish and Blake 2000). There are many philosophical standpoints from which to analyze these technological changes. Posthumanist philosophers have foregrounded the ways that digital technology calls attention to new understandings of what counts as human, and the ways that these new understandings of human-nonhuman relationships open up new spaces for teaching and learning. Ferrando (2013) argues that digital technology invokes the metaphor of the transhuman; she further calls attention to the ways that transhumanism offers new metaphors of pedagogical relationships. Scharff (2013), likewise, call attention to the ways that new media and new technologies reframe our understanding of humanity, theories of mind, and relationships with nonhumans. New media and digital technology draw new lines around and new purposes for education and democratic citizenship (McCarthy et al. 2011). New philosophies of technology also invite us to consider ecosophy and the connections between consumption, technological use, and our impact on the planet (Greenhalgh 2014). There are philosophers who have called attention to the ways that digital technology may (Taylor 2016) or may not (Farber and Metro-Roland 2014) create a new understanding of ‘presence’ in the classroom.

Philosophic inquiry into the connections between digital technology and education often relies on the idea that everyone has equal access to digital technology; and as some philosophers have noted, this is not the case. While access to the internet is,

---

H. Greenhalgh-Spencer (✉)  
Texas Tech University, Lubbock, TX, USA  
e-mail: [heather.greenhalgh-spencer@ttu.edu](mailto:heather.greenhalgh-spencer@ttu.edu)

increasingly, a global phenomenon, there are many philosophers who remind us that access to the internet and use of social media—for anything, including educational ends—are uneven (Greenhalgh-Spencer 2015; Tomalty 2017; Akamai 2016). There are countries with high-speed access to the internet and pervasive use of social media sites. There are other countries where use of sites like Facebook is ‘a luxury’ (Wyche et al. 2013). There are many philosophical standpoints from which to negotiate the intersection of digital technology and schooling.

For the sake of space, in this chapter I foreground three key philosophical concepts: *autonomy*, *authority*, and the notion of *a public* or *community*. In order to give concrete examples of how these philosophical questions play out, I use *personalized learning* (PL) as an example where digital technology and social media interact with the practices of schooling and the changing landscape of ideologies, policies, and practices of education. PL makes a good case study for the exploration of autonomy, authority, and community because PL represents itself (in some ways, brands itself) as a method of learning that exists within a school policy landscape that relies on the authority of standardized tests, and yet PL fosters a practice that is meant to generate more autonomy for students and a greater sense of community embeddedness. Thus, I draw attention to the ways that autonomy, authority, and public/community emerge within PL contexts.

I acknowledge, up front, that the PL examples I use in this chapter come from Europe, the UK, Australia, and the USA. Context matters; it should be noted that my examples come from places where most schools have access to high-speed internet (even if not all of the students in the school have access to high-speed internet at home). I also acknowledge that the practice of PL—like any educational practice—is uneven. I have intentionally tried to find examples of the ‘best cases’ of PL in practice; and I largely take the practice of PL ‘at its word’—so to speak—in order to dive into the philosophical questions that emerge when a pedagogical practice is trying to create autonomy and community in a schooling system that is driven by authority. I begin the chapter by defining PL and describing three key components of PL: data-driven instruction, student agency, and the use of social media sites (SMS) to create social connections. I then flesh out some of the questions that a philosophical orientation opens regarding autonomy, authority, and privacy in PL contexts.

## What Is Personalized Learning?

Personalized learning (PL) is a new model of teaching and learning that attempts to disrupt traditional models of schooling. It has gained in popularity as both media outlets and monetary investors have rushed to proclaim PL as a ‘disruptive innovation’ that will change the face of education. Multiple news outlets have reported on the turn to PL in education. A news story from *CNN* (Simon 2016) reported that PL would become the learning of the future. A report by the European Commission (2016) touted PL as a modality of learning that would facilitate learning for *all*. A

report by Britain's Undersecretary of State for Schools (2014) argued for the increase of PL in Britain's schools. The Gates Foundation (2010) has promoted PL as a way to allow students to be more engaged in their own learning and to learn concepts in both greater depth and breadth. In fact, the Gates Foundation (2016) has given millions of dollars to the development of PL as a pedagogical strategy. Mark Zuckerberg, the founder of Facebook, has also given over 100 million USD to promote PL on a global scale (Cutler 2015).

While PL can mean different things to different people (Redding 2013; Zmuda et al. 2015), it is often described as a type of learning where students take 'ownership' of their own learning. Students use digital and social technology to be autonomous learners and to connect with classmates and community members—forging both community-based and global connections—in order to accomplish student-initiated learning goals. Teachers use the data that is generated through online and computer-based student (inter)actions, as well as standardized and mandated assessments, in order to develop personalized learning plans for each student. Learning becomes more data-driven as teachers harvest the data generated through the use of digital technology in order to create instruction that is targeted to the needs of each student. The primary goal of PL is to create autonomous learners who drive their own learning, set their own goals, work at their own pace, and use their own interests to guide personalized education pathways. It is important to note that PL practitioners and researchers situate PL within a context of neoliberal schooling policy. PL is trying to find balance between the political supremacy of standardized tests and accountability movements while also providing student-centered and even student-driven models of teaching and learning.

PL is facilitated by three key foci: data-driven instruction (DDI), student agency, and the use of social media sites (SMS) to create connections to a global public or community. In order to flesh out the ways that autonomy, authority, and privacy become meaningful in PL, it is important to flesh out these PL practices more fully.

## What Is DDI?

Data-driven instruction (DDI) involves the active use of multiple data sources, by both teacher and student, in order to facilitate decisions about student strengths, student weaknesses, and future pathways toward learning. The literature on DDI tends to focus on the use of quantitative and validated measures as sources of data. For example, Gregory and Kuzmich (2014) argue for DDI that includes the use of state-mandated tests (ITEST, PARCC, STAAR), nationally validated tests (NWEA MAP), and other cross-validated measures. In addition to these tests, teachers should also use district level tests, curriculum-based formative and summative assessments, and even daily quizzes. Data-driven instruction is a practice, a philosophy, and a 'mindset' (Gregory and Kuzmich 2014). DDI acquiesces to the neoliberal push for quantitative measures of achievement—achievement defined as high scores on standardized tests. However, DDI is also the backbone—the

authority—by which students can make their own decisions. So, for example, a student can use the data to advocate for herself/himself in order to find learning pathways that are more interesting to the student.

In addition to written exams and evaluations, there is a strong focus on the use of data gathered from computer programs that students use for learning. Koedinger et al. (2013) argue for the use of software programs that generate rich data on each student. Many learning programs gather information not only on how many questions a student gets right or wrong but also on how much time a student took to come up with an answer and how many ‘attempts’ a student needed before she/he got the answer correct. Intelligent learning systems adapt to the needs of the student, track concept mastery, and also track where there was a pause, interpreted as a student hesitating (Koedinger et al. 2013). This allows the teacher to infer things like whether or not a student is struggling with a given concept and can even be used to infer things like the level of student ‘grit’ or perseverance.

In PL contexts, both teachers and students discuss the data and then use the data to create personalized pathways toward ‘mastery’. Students and teachers come up with a plan that will allow the student to name areas of weakness and then create goals and work flows that are aimed at improving those areas of weakness. At these personal conferences, a teacher and student will also talk about student’s strengths and then set goals and work flows that will enable the student to go beyond the traditional curriculum in ways that are interesting and meaningful to the student. Student data informs student and teacher choices; this requires a high level of data literacy—particularly for the teacher—but for the student as well.

Mandinach and Jackson (2012) argue that DDI necessitates a high degree of data literacy. It is imperative for teachers to know the strengths, weaknesses, and affordances of each data source so that a rich picture of the student’s needs is created. For example, it becomes important for teachers to understand what the NWEA MAP test can tell you about a student and what it cannot tell you. PL teachers must use learning analytics tools. These tools allow teachers to “make use of data in their courses to monitor and predict student performance” (Dietz-Uhler and Hurn 2013). In fact, there are DDI scholars who see enormous potential in harnessing the power of all of these data streams in order to facilitate educational data mining (EDM) that would allow for better analysis on individual, school, district, state, and national levels (Romero and Ventura 2013).

In many ways, the quantitative data that is gathered as part of DDI tends to conflate ‘learning’ with competency or achievement on tests or quizzes. This form of data fits neatly within neoliberal discourses around what counts as learning and the purposes of schooling as a measure of accountability toward the specific skills. However, this is not the only form of data collection. Most PL teachers also talk about ‘data’ that is collected from their personal interviews with students, observations about students, conversations with students’ family members, and student ‘learning journals’. There are qualitative components to DDI as well. The choice to refer to these personal conversations as ‘data’ validates neoliberal discourses—plays the game of neoliberalism—while also creating space for these personal interactions to ‘count’ as one of the necessary practices of schooling.

DDI and data literacy form only part of the equation of PL. Student agency is also imperative in PL contexts: the idea that students should drive their own learning.

## What Is Student Agency?

For many PL scholars (e.g., Lindgren and McDaniel 2012), student agency is even more important than data-driven instruction and data literacy. Student agency involves both knowledge and choice, as well as ‘ownership’ of the learning process. Students must be informed about where they stand vis-à-vis the school standards; they must also be informed about the various and multiple pathways toward using what they know and taking it beyond traditional schooling expectations. As Wise (2014) points out, this means that both students and teachers must be trained to read and analyze data. Students are taught to use data to set goals, reflect on their progress, and become an informed partner—with their teacher—in the learning process. Student data literacy becomes a necessary component of informed choice, but the data is meant to be in service to empowering the student to actively guide his/her own education.

If we take PL at its intention, then PL allows the student to have the authority to guide their own learning, to make choices about when, how, and what they learn. The data, and the ability to point to the data as ‘evidence’ of why a student is making specific choices, provides the student with an authoritative voice. The student speaks in the language of data, competency, and accountability and yet leverages that language to create more autonomy for herself/himself. To a certain extent, this choice is limited as even many PL schools are required to comply with state-mandated tests and expectations. However, there are some PL schools that have negotiated a cessation of school accountability measures. In those schools, students can push against school standards and expectations; they can question what counts as knowledge and why. Students have a far wider degree of autonomy. One of the issues, though, is that these schools are only given a cessation of accountability for a time. The schools need to ‘prove’ that their unorthodox measures are leading to educational gains. Yet, the accepted ‘proof’ of success is still performance on standardized tests. There is a mismatch between the aims of the more autonomous PL schools and the accountability culture that only accepts quantitative data and test achievement as a measure of success.

Student agency can take many forms in practice. It can involve personal interviews with the teacher about current and future goals. It can involve the keeping of a goal journal where the student takes a moment each day to review previous goals, track progress, and set new goals—with or without the teacher’s help. It can include students correcting their own tests or assignments and then using that information to decide what they need to do for the rest of the week. The teacher and student work together to define important projects, and the student exercises agency over how those projects are to be accomplished. Students keep track of their own progress on

various projects or assignments. In many classes, students may also be required to post their progress on a class data board. This allows the student to see what progress they have made toward meeting their goals. It also allows them to see how they compare to others in the classroom.

The idea behind ‘student agency’ is to create an empowered student who can interact with the teacher and others in the class, but who can also be responsible for their own learning both inside and outside of the classroom. The goal is to create a student who knows how to learn, knows how to find challenges, and knows how to move beyond the constraints of a curriculum focused on getting everyone in the class to a minimal level of competency. This is, admittedly, a limited definition of agency. However, advocacy for any form of student agency in the school pushes against the neoliberal discourses of accountability through standardization and quantitative data from state-mandated tests. As a student in the PL classroom, you work with the teacher to decide whether to go back and relearn difficult concepts or whether to move onto creating your own project that will allow you to apply what you have learned or move on to some other concept entirely. You take assessments when you feel ready. You explore the questions that are intriguing to you. As long as your choices are supported by data—your data—you can choose how, when, where, and what to learn.

Data is a key component of student agency. Quantification of the self (the quantified self) becomes indispensable to the empowerment of the student agent. There are many who argue that the move toward data is a move toward neo-Taylorism and neoliberalism (Moore and Robinson 2016). While I resonate with the argument that the move toward the quantified self is a move toward neo-Taylorism, the reality is more complex than that. Quantification of the self not only has the potential to turn humans into datafied objects, it also has the potential to allow students to speak back and counter traditional voices of authority. Discourses of neoliberalism are connected to discourses of quantification of human capacity. When the student has the ability to leverage this language in order to create more agency and choice, the student is ‘playing’ the game of neoliberalism, while also opening pathways toward greater student autonomy. Students speak using the language of neoliberalism to advocate for more choice and agency in where, how, when, and what they learn. Students become agents—more fully subjects—because they feel empowered to give voice to what they want and need. They give voice to these wants and needs using the very language (quantification) that tends to concretize the traditional power relationships and, in this way, disrupt traditional power relationships. The goal behind arming students with the ability to understand and track their own data is to empower the student to speak back to the teacher and the school system and to make choices on their own.

In addition to DDI and student agency, the use of social media sites (SMS) to facilitate connections to local and global communities, and to promote public engagement, is also key to PL.

## How Are SMS Used in PL Contexts?

Social media sites (SMS), such as Facebook, Twitter, Pinterest, Instagram, etc., are commonly used in PL contexts because PL advocates both for the creation of outward connections and the development of twenty-first-century skills (Beetham and Sharpe 2013; Ravenscroft et al. 2012). Multiple PL scholars (e.g., Mao 2014; Dabbagh and Kitsantas 2012) argue that students must learn how to use SMS so that students can better drive their own learning, find their own knowledge, and connect with others on both a community and global level. The use of SMS involves several different practices in PL contexts.

For many PL students, the use of SMS is part of their ‘individualized pathways’ toward learning goals. Students must find knowledge that is relevant to group projects or personalized assignments; and students use SMS to find experts who might be willing to help them with knowledge needed to complete learning projects. Students reach out to members of their community, parents’ colleagues, teachers’ colleagues, and even people they’ve seen on TED Talks or other online presentations to gather information that is necessary for completion of assignments. PL instructors guide students on how to use SMS to create connections both with people they know and people with whom they are only marginally connected. This practice provides students with multiple opportunities to use SMS to make connections with the adult world. PL teachers see this as a chance to foster ‘networking’ and communication skills. PL teachers also see this practice as a chance to guide students toward the ability to find information for themselves using online search engines, as well as digital connections to others. Some PL classes guide students toward group projects with students in another class, and SMS are used to facilitate group work. Finally, PL teachers often require the use of SMS because they see this as a chance to help students develop ‘twenty-first-century skills’ like the ability to competently navigate online spaces. While PL focuses inherently on the individual, and personalized goals and learning pathways, it is also common to make sure that students are still connected to the idea of a community—a public. Furthermore, PL advocates for the idea that learning happens both inside and outside of the classroom. SMS promote the idea that learning is ubiquitous, that learning happens in the classroom, in the museum, in the home, in the street, and SMS are there to document and facilitate the learning that happens regardless of location.

Thus, SMS fulfill four requirements of the PL experience: they enable students to find out information for themselves by connecting to and conversing with experts outside of the classroom, they enable students to engage with others (other classmates, community members, global citizens) on meaningful projects, they facilitate the development of twenty-first-century skills, and they facilitate the practice of ubiquitous learning and ubiquitous documentation of that learning.

Key PL practices—DDI, student agency, and SMS usage—are meant to guide toward better learning. Approaching PL from the stance of a philosopher opens up multiple questions about the learning process, including: how does PL facilitate

autonomy? What counts as autonomy, and why does autonomy matter in a PL classroom environment? How much autonomy is possible within schooling spaces that are shaped by public and policy notions of accountability and authority?

## Potential Questions of Autonomy

There are multiple ways to think about autonomy and how definitions of autonomy intersect with PL. For the sake of space, I will highlight two key philosophical arguments around autonomy: that autonomy is necessary for human flourishing and that autonomy requires informed and voluntary action. I start with the assumption that autonomy, flourishing, and voluntary action will look different within the context of children in school rather than adults in the public sphere. Nevertheless, these concepts are useful for thinking about current technology-in-schooling practices such as PL.

Concomitant with PL's goal of facilitating student agency and autonomy, there are multiple philosophers who argue for autonomy as necessary for the development of human capacity and human flourishing. Benson (2013) argues that autonomy is absolutely necessary for a good education, in both the sense of creating a good human life (moral, ethical) and fostering a good human experience (flourishing). Benson (2013) writes: "autonomy is not a method of learning, but an attribute of the learner's approach to the learning process", and he argues this autonomous approach to learning is necessary for deeper understanding to occur (p. 2). Brighouse (2003) foregrounds the ways that schooling is necessary *because* it enables the process of becoming an autonomous person. Mill, too, believes that autonomy is the highest goal because it is the primary promoter of a good life and a good society. Mill (1859/1966) writes: "the free development of individuality is one of the leading essentials of well-being; that it is not only a co-ordinate element with all that is designated by the terms civilization, instruction, education, culture, but is itself a necessary part and condition of all those things" (3.2). Mill (1859/1966) further argues: "The human faculties of perception, judgment, discriminative feeling, mental activity, and even moral preference, are exercised only in making a choice" (3.3).

PL is embedded in the belief that it is through autonomy, individuality, and agency that students are able to become more fully themselves, that they are able to live the good life and 'practice' for continuing to live the good life into adulthood. While PL practitioners would likely find themselves in agreement with the philosophies of Mill and others, in practice, the facilitation of autonomy is a difficult process. PL schools are often still required to take state and district mandated standardized tests. What should a PL teacher do if a student—by using their own autonomy—refuses to learn the concepts necessary for passing the mandated tests? Questions of autonomy in PL classrooms also come up due to the fact that these classrooms are full of kids, full of children whose minds, senses of self, comprehension of goods, and practices of discipline are still very much in development. PL teachers are constantly faced with the question: what does agency look like for a child? Does student agency look different for the child in kindergarten versus the child in 11th grade? Is *student*

agency a different concept and practice than ‘agency’ writ large? In other words, is there something about being a student that automatically leads to a curtailment of agency and autonomy, and is that a good thing? Is there a difference between agency and autonomy, especially as it is practiced in the classroom?

These PL questions are echoed in the ways that other philosophers have addressed the concept of autonomy. Christman (2018) argues that autonomy is “the independence of one’s deliberation and choice from manipulation by others, and the capacity to rule oneself”. Autonomy necessitates both knowledge and voluntariness: “competency conditions and authenticity conditions” (Christman 2018). Therefore, to be autonomous, a person must have the knowledge to competently make a choice and the voluntary (non-coerced) capacity to proceed with that choice. Feinberg (1982), likewise, contends that autonomy necessitates both the competence to make informed choices and the ‘sovereign authority’ to proceed with those choices. Feinberg specifically notes that when we force a person—against his/her will—into a new state of being or place, even if that is better for them in the long run, we violate that person’s autonomy and undermine his/her status as a person. The concepts of informed choice and sovereign authority to proceed with that choice, even if it is not in the best interest of the self, come into play within the PL classroom.

As mentioned before, PL necessitates that both teacher and student have access to student data. The teacher is supposed to act as a guide and facilitator, but, theoretically, it is up to the student—as an agent and ‘owner’ of his or her own educational pathways—to make choices about how to learn. Collection of and conversations around data are meant to fulfill the requirements of autonomy: that the student is informed and competent to make a decision and that the student is allowed to make voluntary (non-coerced) decisions about his/her learning pathways. Ideally, students would meet with their teachers, go over the data, and discuss how the data guides toward the need for improvement in certain areas. Then, with the help of the teacher, the student would decide how she/he might best learn those concepts or how she/he might best improve those areas of weakness. The question arises, however: who determines whether or not the student is informed and competent enough to make decisions? If autonomy not only requires voluntariness but competence, what is the process for determining competence? Furthermore, because the data is meant to reflect weaknesses as determined by assessments that are aligned with school ‘standards’, are the students’ decisions about their personalized learning pathways truly voluntary? Is there coercion—even unintended coercion—in the fact that students are exposed to both teachers and data that reflect back to the student the mandated standards of the school? In PL schools, students are meant to use their own data to decide when, how, and what to learn; but these choices are shaped by data that guides toward achievement of school standards. The data itself guides toward certain conclusions and actions. Given this, are students truly experiencing voluntariness when they use their data to guide learning choices?

A philosophical lens on PL also opens multiple questions around authority. How does PL disrupt notions of authority in the classroom? How do traditional modes of authority still reproduce themselves in PL contexts? How do new media facilitate and disrupt authority in the classroom?

## Potential Questions of Authority

There are multiple philosophical conceptions of authority. Kierkegaard (1992) argues that authority involves a subjective assent to dogma, truth, ideology, or practice. Authority involves a dispositional response from a believer in acquiescence to authority. It is the conformity of one's person to the beliefs and practices of the authority figure. Authority guides both beliefs and actions. On the other hand, Bingham (2009) argues that authority is relational, that it is a flow of power and practice that is bound up in a circuitry of context. Gadamer and Bernasconi (1986) also add to an understanding of authority by parsing the difference between authoritative and authoritarian: 'authoritative' is authority that is earned through knowledge and ability; 'authoritarian' is a person or institution that demands obedience and that works toward domination. In truth, all of those concepts of authority are at play in the modern classroom. In the traditional classroom space, authority is modeled and practiced in every aspect of the classroom. The teacher often stands at the front of the class. Desks and workspaces are oriented so that students can see the teacher and so that students can be seen by the teacher. The teacher is seen as the referent of knowledge, the final arbiter of what counts as truth. The teacher corrects the work; and the teacher assigns grades. Even in PL contexts, it is the teacher who assigns grades that go on report cards. Hopefully, the teacher has also gained knowledge and skills that create a sense of trust in the students. Authority is also relational in that the sense of authority is created within the context of a classroom environment where the teacher is perceived as being the one in charge. However, there are also several aspects on PL that create spaces of contestation of traditional classroom authority models. In some ways, PL pushes against traditional models of having the teacher in charge.

One of the primary ways that PL enables students to challenge traditional classroom authority models is through the use of SMS to connect with outside experts. While Mao (2014) argues that SMS are often used in classroom spaces to simply negotiate group work, Castells (2015) and Selwyn (2012) show that SMS can also be used to connect with information that exists outside of the traditional space: outside of the teacher, outside of the accepted textbooks, outside of the standardized curriculum. Blaschke (2012) further contends that SMS-facilitated self-directed learning and self-created knowledge challenge the traditional classroom space where teachers are considered to be the purveyors of knowledge or the 'knowers'. In PL contexts, students use SMS to contact people in their community, to contact people in specific knowledge communities, and to research information needed for their own knowledge-building projects. Because PL actively facilitates going beyond the traditional curriculum, textbooks and teachers are not seen as the ultimate authority.

Another way that PL contexts challenge traditional authority models in the classroom is through the mandate that students understand their own data and use their own data to guide learning goals. When students and teachers meet, they talk together about what the data—often gathered both from tests and student interac-

tions with computers—shows that the student needs. Teachers talk with the students about their needs. But students are also expected to speak back to the teacher and articulate the ways that they see their own needs and their own data. The quantification of the self—enabled through large-scale online data collection around student performance—enables the student to become an authority on what she/he needs in order to meet learning goals.

Analyzing PL from a philosophical standpoint opens many questions about authority. What happens if an outside person or an outside website provides information that differs from the established curriculum or the knowledge of the teacher? Who, then, counts as the ultimate authority? Are students given the space to decide who or what to believe? Also, because PL focuses on creating student agency and providing students with the tools to articulate their own learning needs, the student is considered an authority on their own learning. However, what happens if the student's understanding of their own learning needs conflicts with the ways that teachers see the student's learning needs? Whose voice takes precedent?

There are also multiple questions around the creation of a public or community that arise when PL is examined from a philosophical standpoint.

## Potential Questions of Public/Community

Roberts (2015) defines 'public' and 'community' as overlapping concepts that have similarities and differences. The idea of a 'public' invokes a political community, whereas 'community' invokes a group of people that are bound together by some commonality. The community can be based on geography, location, nationality, race, gender, and multiple other identity positionalities. The community can also be based on commonalities of desire or interest. A public, on the other hand, has distinctively political or 'power-oriented' connotations. There are many ways that PL both facilitates and challenges the creation of a public or the creation of community.

PL students use SMS to facilitate group work, to collaborate with community members, to contact outside experts, and to move beyond the standardized curriculum. These students often use SMS to create 'community' in the sense that students are interacting with people who have shared interests, shared goals, and a shared location. However, PL students may also choose to create learning goals and group projects focused on political action or policy change. For example, I have seen PL students involved in projects that promote conservation. These students used SMS to gain information about conservation issues and also to promote public education around these issues and even to organize boycotts and political action to promote conservation. In this way, students were using SMS to invoke or create a 'public' devoted to policy change and action around conservation issues. As multiple scholars have noted (Castells 2015; Xenos et al. 2014; Gil de Zúñiga et al. 2012; Dahlgren 2013), political action and a policy-oriented 'public' can be created online and have

real effects on material contexts. PL students have the opportunity to participate in both ‘communities’ and ‘publics’ as they work with others on various projects.

There are also ways that PL is in tension with, or complicates, the creation of community and a public. Essentially, PL is focused on the individual student. DDI, the use of SMS, group projects, and the concentration on student agency are all meant to enable the student to guide his/her own learning. The examples given above, of students working with other classmates, other community members, and outside experts, in the service of knowledge creation or political action, are all activities that are primarily meant to enhance the experiences of individual students. The development of the individual student is the principal goal. The co-development of the individual student and the creation of a community are facilitated through SMS and the collective work on a common project. In many ways, these community projects or the use of SMS to tap the community for expertise provides a showcase for the complicated ways that autonomy and individualism are intertwined with the creation of a community on digital platforms. The use of these platforms, and the goal of working with the community on these projects, opens philosophical questions around autonomy, community, and pedagogical practice. Should more time be given to group discussions and projects that allow for diversity of opinion and experiences, creation of communities of practice, and democratic discussion? Should more time be allowed for students to work on their own, finding their own pathways toward deeper learning and more critical questions? How much time does one give to group work versus more individualized work? Which wins out: the autodidact or the group work model? In what ways does the use of SMS facilitate the development of self and autonomy as embedded within a community? Analyzing PL from a philosophical standpoint opens many questions about creation of community/public and the ways that community creation can be in tension with personalized learning models.

## Conclusion

Digital technologies—such as SMS, web-based learning programs, and computer-enabled data collection—are changing the face of schools. PL is only one example of new models of education that are emerging from and reliant upon digital technologies. These technologies are giving rise to new questions and negotiations of educational practice: How does digital technology create the possibility of connection? How does it facilitate isolation? How does digital technology create a public and facilitate public interaction? How does it facilitate autonomy? How can digital technologies enable challenge to traditional authority, and how do they enable surveillance and concentration of traditional power? These are questions that need continual philosophical analysis as digital technology increasingly becomes a normalized facet of interaction in the school.

# Videogames and Learning: Ethics, Ontology and Epistemology

Jennifer Jenson and Suzanne de Castell

## Introduction

Videogames have flourished economically and culturally in the first two decades of the twenty-first century and their educative possibilities have concomitantly been both lauded and elusive. Yet a relatively scant literature to date examines videogames through philosophical lenses, including but not limited fundamental questions of ethics, ontology, and epistemology. This chapter seeks to address that important omission in light of the increased attention paid to videogames in the past two decades in educational theory and research. It focuses on ethical, ontological, and epistemological questions and problems related to video games and learning generally.

Much of this work begins with reference to theories of play elaborated in the mid-twentieth century by Dutch historian Johan Huizinga (1949/1980) and French philosopher Roger Caillois (1961/2001). Their ludological approaches have been used to elucidate whether and how videogames can be considered ‘play’, and have formed a base for discussions of play and its relationship to learning. For Huizinga, play is something that does not have to be purposeful, it does not need to happen in the service of learning something, nor is it connected necessarily to real life. Play is something that is, in his words, ‘free’ and contained within a ‘magic circle’ that places play outside of everyday pursuits and concerns and is bound by rules and structures agreed upon in advance. Playing within the magic circle means playing within a rule structure, and agreeing to abide by those rules for the duration of the play session or game.

Caillois (1961/2001) also argues that play is central to human culture, that it is voluntary and it is removed from daily activities and pursuits. He creates a typology for play, arguing that it can be distilled into four types of games: competition (*agôn*), chance (*alea*), role-play (*mimicry*), balance/vertigo (*ilinx*). He argues that these game types can and do intersect and that they each can be measured depending on the particular game for more or less *paidia* (play) or *ludus* (game). *Paidia* is spontaneous, free-form play, like play that occurs on a playground, emergent and changeable, while *ludus* is rule-bound play, such as playing a game of chess. Caillois' typological discussion is significant in so far as it provides a framework from which one form of play can be measured and talked about as opposed to another.

Game studies typically trace its roots from these early historical and anthropological theories of the social and cultural role of play. To set the scene in for considering the significance and use of videogames for education more specifically, we first tackle questions about, and identify claims and evidence for, game-based learning, including some of the fundamental problems, questions and gaps that render much of the empirical work on games and learning ultimately inconclusive. To address these theoretical and methodological weaknesses, we then turn to a consideration of the specifically *philosophical* questions and issues raised by the phenomenon of digital games and gaming, and conclude with suggestions about the potential contributions to this field of philosophical investigations capable of taking the measure of the rich and varied mediascape of digital games and gaming.

## Videogames and Education

What, then, have been the arguments for and against using videogames for education? What empirical evidence has there been for or against videogames as learning tools? What is being presupposed with respect to pedagogical and educative values of learning through games?

The main lines of argument about videogames and their educational potentials include claims about minimizing the consequences of failure, improving problem solving, supporting interest in history and culture, developing leadership skills, improving spatial reasoning, creating communities and 'affinity' groups, and enriching subject-based learning (math, science, history, literacy). An illustrative recent study used the OECD's (Organization for Economic Cooperation and Development's) 2012 Program for International Student Assessment data from over 12,000 Australian school students, and found that students who played online games regularly (almost daily) scored 15 points above average in maths and reading tests and 17 points above average in science. The researcher, Alberto Posso (2016), explained in an interview about the study that "When you play online games you're solving puzzles to move to the next level and that involves using some of the general knowledge and skills in maths, reading and science" (Gibbs 2016). Students' engagement with social media, by contrast, resulted in 4% lower average scores, and a rate of decline that correlated with the increased frequency of social networking

usage. The researchers are careful to point out that these correlations do not prove that the critical variable was videogame play: it's possible, for instance, that students who excel in math, science, and literacy are more likely to play videogames. Still reports of this kind, which find gains in conventional assessments of school subject-matter learning, fuel popular enthusiasm about their potential as educational media.

There are two significant reviews of games and learning that arrive at somewhat different conclusions that are worthy of a brief overview. The first, by Michael F. Young et al. (2012) reviewed over 300 articles on games and learning. They found that games that focused on language learning, history, and physicality (like dancing games) were related to more positive learning gains, while math and science games were less effective. Their review did not include anything on whether playing games promotes or stifles creativity. Similarly, there is no mention in the review of whether games can promote logical thinking. They conclude that: "Many educationally interesting games exist, yet evidence for their impact on student achievement is slim" (p. 1). The second review, somewhat in contrast, does find evidence that for "near and far transfer" from games when integrated in classrooms (Tobias and Fletcher 2012, p. 233). These reviews concentrated on the question of transfer – can learning in games be transferred to understandings outside the game? The overall answer seems to be "sometimes" (Connolly et al. 2012).

One part of the reason for this might be that game-based learning, as we have elsewhere argued (de Castell et al. 2014), is not as yet a fully formed area of study and much of the work in the area is justly characterized as both a-theoretical and empirically ungrounded. One early theorist of the value of play and its importance in the design of instructional environments is Lloyd P. Reiber (1996), who argued that "seriously playing", in an environment designed to support learning, is a worthy educational endeavor and one that recognizes and capitalizes on play's significant cognitive contributions to learning. Reiber, an educational technologist and instructional designer, contends that 'serious play' can scaffold, motivate, and support learning, especially in well-designed educationally meaningful environments.

Far more widely read than Reiber's pioneering work is one of the most often cited populist advocates of gameplay for learning, Marc Prensky, author of one of the earliest books on the topic, *Digital Game Based Learning* (2001). His argument is that the new generation of learners, that is the "21st century learner", will learn much through playing games, and will demand that learning be "fun" (2001, p. 4). His fundamental claim is that learning occurs through playing (digital) games, and that fun is an essential component of both games and learning. Games, he argues, support this new type of learner and they do so through their mechanics, rule-structures, and other ways of keeping the player engaged and having fun. Prensky's 'theory' in 2001 was that digital games were poised to revolutionize learning, driven by a generation of learners who would demand a different kind of education, in part at least through playing digital games.

James Paul Gee takes a different tact. Games – and his work refers primarily to commercial games, not necessarily educational games – are, he argues, very good examples of how to support learning. Using a semiotic analytical framework, his

highly influential and oft-cited book, *What Video Games Have to Teach Us About Learning and Literacy* (2007), argues that “good” video games are “good for learning” in that they use design principles well supported by learning sciences research. Games, Gee contends, are extremely good at helping players learn. He writes: “Video games don’t just carry the potential to replicate a sophisticated scientific way of thinking. They actually externalize the way in which the human mind works and thinks in a better fashion than any other technology we have” (Gee 2007, p. 200). For Gee, games are good learning environments because players are able to play through and ‘learn’ their complex systems and that learning to play a game involves players in critical thinking, strategic decision-making, the acquisition of new ‘semiotic domains’, including for some games, technical registers involving the learning of formal scientific concepts. Gee outlines 36 learning principles, including, for example, identity development, risk-taking, systems thinking, practice, and transfer of skills that he argues ‘good’ games deploy, describing how such games help players learn. It perhaps goes without saying that, from a philosophical standpoint this argument is perilously tautological if by ‘good’ Gee means ‘good for learning’. The concept of “goodness” is notoriously complex and, arguably, “essentially contested” (Gallie 1955), from which it follows that other ways in which a game might be judged to be “good” need not necessarily lead to learning.

For Gee and Prensky like the much earlier work by Seymour Papert who also aligned his learning philosophy, constructionism, with the power of play and its relation to learning, games are very good at combining both play and learning. This early theorizing, however, has not yet been empirically substantiated. Not that empirical evidence is necessary for theoretical adequacy or even polemical effectiveness, but game-based learning and its enthusiastic early embrace has now two decades later, at least had to check its claims in the light of there being very little evidence to demonstrate that the learning that results from play is learning that is either educationally significant or transferrable to other contexts. Indeed, what players seem to learn from playing games is most often bound to mastery of the game itself, such that a game’s successful players might well be very unsuccessful learners of anything beyond it.

Jonas Linderoth, one of the critics of approaches taken by Gee and Prensky, argues that games are very good at making players *think* that they are learning. Using an ecological psychology framework that examines how players perceive and act on affordances in an environment, he takes games as a specific case, arguing that “Learning in a game situation becomes first and foremost a question of becoming capable of perceiving affordances and developing skills that are necessary in order to utilize these affordances” (Linderoth 2012, p. 49). Linderoth argues that what games do best is to help players progress through the game by mobilizing in-game affordances such as, for example, making objects glow to distinguish them as the correct ones players must seek out to interact with in order to progress through the game. He argues that this ‘highlight’ affordance means the player doesn’t even have to be familiar with the particular game environment, just the conventionalized affordance of highlighting. He concludes that games do not necessarily demand the same kinds of skills or knowledge that, say, reading a musical score would, and that “per-

haps some good video games offer a pleasure that comes from a continuous *illusion of learning*” (2012, p. 59).

In the next section, we highlight four concepts that are commonly used to describe how game-based learning is actualized through gameplay in order to show some of the theoretical underpinnings of learning through games.

## Game-Based Learning in Action: Four Concepts

The four concepts that we have chosen to illustrate here that are used in support of game-based learning are: immersion, interactivity, fidelity (how much a game is like a real-world experience), and gamification. The first, immersion, is often mentioned in reviews and descriptions of games, especially in describing player attention. It most typically refers to a player’s level of involvement in a game – the more involved, the more attention paid to the game, the greater the possibilities for learning, or so this argument goes. Immersion is said to be a characteristic of the state of “flow”, a theoretical construct developed by Mihaly Csikszentmihalyi (1990), according to which a person can become so involved in a deliberate effort that they lose all sense of time and, indeed, any sense of how much effort might be involved in the task. Games, it has been argued, are very good at producing this effect on players and harnessing ‘flow’ for learning has been a common research goal.

Interactivity is something that games are particularly good at – a player acts (clicks a point on the screen, normally) and the game/game world reacts, based on game rules and artificial intelligence algorithms. For a learner, this means they are continually receiving feedback from the game: they can be rewarded and punished, they can get lucky and advance on little to no skill, and they can fail and replay without consequences. Thus, games have the possibility to provide persistent feedback, and scaffold players from beginner levels to more advanced play through interactive engagement with players. In that respect, games are seen by many to be ideal learning environments as they can support multiple skill levels and provide ongoing scaffolding and ‘just in time’ assistance, a kind of ‘holy grail’ for educators.

Fidelity, more than immersion or interactivity, has been a problematic concept for proponents of game-based learning. There is by now a well-established and effective deployment of high-fidelity simulations for a range of skills, notably flight training, and the use of simulations for military strategy goes back a lot further than the advent of digital games. ‘Fidelity’ is a complex concept, in important ways. Technological advancements in high-definition three-dimensional displays increasingly accurately enable fidelity in representing playable physical realities. Yet fidelity of that kind, however realistic, may not always engage the player in a simulation of performative context and activity. Good simulations need not always *look* like what they are simulating, and yet may *be* like it. Fidelity can mean adhering in graphical quality, and/or in rule structure, and/or in controllers (like plastic guitars and drums) to the real world in such a way that transfer of skills is possible. One example is the ongoing concern that playing first person shooter games supports

real-world shooting skills. While largely unproven as a general argument, digital games' fidelity to a type of interaction, in this case shooting, has been a basis for alarmist discourse about the media effects produced as a result of playing games in particular, games that feature violence and aggression.

Little help is given, however, to understanding the specific ways games might support learning from arguments against playing videogames that engage the problem through a 'media effects' discourse, that adopt a reductive, single-factor conception of causation, then conflate correlation with causation in order to derive conclusions about, for example, playing violent videogames leading to violent real-world behaviors. Other claims for fidelity are, potentially, more educationally significant. Music games, for instance, karaoke games like *SingStar*, show players graphically how close they are to being in tune and keeping up with the song's rhythm. So it is not surprising that some studies (de Castell et al. 2014) report games of that kind have supported greater awareness of pitch, and others have demonstrated that rhythm games like those with plastic drums in *Rock Band* or even tap-the-rhythm tablet games increase rhythmic accuracy. The really interesting question here, though, is whether players are learning, for instance, about 'pitch', or 'rhythm', or mastering a set of skill requirements of a specific game, and our calling these 'pitch' and 'rhythm' presumes a transfer of learning beyond the game that may not in fact happen. Does the expert player of *DanceDanceRevolution* actually become a better dancer? Or even 'improve physical dexterity'? This debate about the importance of 'fidelity' to game-based learning is of considerable importance to educators. It seems a common-sense likelihood, however, that the closer a player comes (is taken) to enacting performances that imitate the accomplishment aimed at – so, not necessarily just skilled at pointing and clicking – the greater the likelihood that game-based learning will issue in 'real-world' abilities. As gestural interfaces for digital gameplay evolve, the range of transferable skills that might be developed through gameplay may surely grow apace.

Finally, gamifying educational experiences, whether through digital or analogue tools has gained significant traction over the past 10 years or more. Gamification refers to the use of game-like structures and rule systems that support persistence in a learning task. This can take the form of quests, reward structures, points and other accounting systems, and badges, among other devices. Purdue University, for example, uses badges to track student progress and extracurricular activities in an effort to support student engagement and improve institutional rates of student retention ([www.itap.purdue.edu/studio/passport](http://www.itap.purdue.edu/studio/passport)). While certainly motivating for some learners, badges and other game-like mechanics can be meaningless at best, and a powerful distraction from learning at worst. Ian Bogost (2011) has referred to gamification devices as "exploitationware", insofar as often those badges or quests have very little to do with learning, but can have much more to do with tracking, surveillance, and even marketing. Gamification is most pointedly directed at keeping students engaged in the performance of predetermined and routinized activities to which learning becomes a secondary consideration.

Game-based learning and 'serious' play can, we argue, reveal some of the ways in which cognitive theories, especially those regarding intrinsic and extrinsic moti-

vation, are instrumentalized. The collection of badges for instance, for all but the rare badge aficionado who might be collecting badges ‘for their own sake’ can really only support those who are extrinsically motivated by, for instance, public recognition for acquiring the most, or the rarest badges. Gamification’s interactivity, while massively appealing to some players, is simply an extrinsic reward system for predefined tasks accomplished, nevertheless its popularity is evidenced most recently in the avidity with which millions of people are currently engaged in the collection of Pokemon via the Pokemon Go mobile game.

Accumulation, however, is not learning, nor are there educational or even the most basic of learning goals explicitly supported in much that is currently being gamified. Enough has by now been written and said about the importance of intrinsic motivation, of learning ‘for its own sake’ and not for extrinsic ends, such as the public recognition or monetary rewards that might accrue from access to jobs requiring educational credentials, to make it highly likely that, in the study of game-based learning, gamification and interactivity have less to offer to educational theory and research than immersion and fidelity. It is worth asking, too, how the student as player is constructed in ‘gamified’ educational settings, and whether game-based learning activities which are not voluntary can be considered ‘play’ at all. Notwithstanding such theoretical arguments as these, it must be acknowledged that support for the ‘gamification’ of education is widespread, enthusiastic, and growing.

It is evident that the significance of digital gaming for education is only beginning to be understood, and beneath the conceptual complexities and empirical challenges of advancing knowledge in this field lie several quite fundamental philosophical questions. Most games and learning research is explicitly positivist, looking for learning outcomes without changing the question about what *counts* as knowledge in games. Other studies are more critical and exploratory, attempting to document what learners (and teachers) think they know better or differently from playing. We do know that studies to date of games and learning rarely result in measurable transference to concepts and practices outside the game. This transfer of training problem, however, needs to be approached through the recognition that changes in media result in changes in what and how we know, with the implication that we may not always recognize ‘transfer’ when we see it. In the next three sections, we consider some of those fundamental philosophical questions related to videogames and education, including ethical considerations, ontological matters, and epistemological shifts.

## Philosophical Investigation Levels Up: Ethics and Games

Ethical inquiries that appear peculiar to digital gaming have focused on games, on player ethics and playing as ethical practice, violence, addiction and on ethics in design and the ethical responsibilities of game designers.

There is a small but steadily growing literature on the ethics of videogames, with Miguel Sicart’s *The Ethics of Computer Games* (2009) being at this time probably

the most comprehensive philosophical treatment. Sicart argues that computer games are 'ethical objects', and its players are ethical agents for whom ethical thinking is integral to play. Refusing the perspective typical of moral panic literatures that seek causal connections between playing certain kinds of videogames, most notoriously violent ones, and player 'desensitization' to violence leading to ignoring or even engaging in violent real-world behaviors, Sicart argues that far from being "passive moral creatures, exposed to unethical content: computer game players reflect, relate, and create with an ethical mind" (2009, p. 4). He goes on to argue, counter-intuitively on the face of it that "Manhunt, a game banned in several countries, is a rich ethical experience if played by mature players. On the other hand, a game like *Knights of the Old Republic 3* which allegedly allows players to take moral choices and play by them, is an example of unethical game design" (Sicart 2009, p. 4). It is, he contends, as ethical subjects that we experience computer games as moral objects.

With respect to violent video games, violent video game effects literature has successfully demonstrated that there is a causal link between playing violent video games and the inducement and reinforcement of aggressive feelings and behaviors. Most of this work is quantitative, experimental, and lab based. Work by Barlett et al. (2009) in a review of violence effects literature and video games divides the wide range of literature available on the topic into three categories: aggressive cognition, aggressive behavior, and prosocial behavior. Aggressive cognition studies have demonstrated that there is indeed a relationship between violent video game playing and "aggressive priming, activation of aggressive scripts and knowledge structures and a hostile attribution bias compared to non-violent video game exposure" (Barlett et al. 2009, p. 382). For example, a lab-based study sought to examine violence desensitization and its potential increase in aggressive behavior. It set out lab-based sequential tasks where participants were asked to play a violent or nonviolent video game and brain activity was measured, and then aggression was measured by how often they chose to "attack" an opponent with noise blasts (Engelhardt et al. 2011). The study found that violence desensitization leads to greater aggression, and claims a causal link between playing video games and violent actions.

On the second point, and related to the above, aggressive behavior has been measured using a variety of methods and aggressive thoughts and actions (Anderson and Bushman 2010; Carnagey et al. 2007). Willoughby et al. (2012) are even more convincing on the point, stating: "Each violent video game episode may reinforce the notion that aggression is an effective and appropriate way to deal with conflict and anger" (p. 2).

And finally in terms of prosocial behavior, which includes empathy and the helping or rewarding of others, researchers have also demonstrated a decrease in prosocial behavior on the part of players with exposure to violent video games (Anderson et al. 2010; Funk et al. 2004; Bushman and Anderson 2009). Anderson et al.'s (2010) metareview on violence and videogames reviewed studies that included those that examined videogames and prosocial behaviors, which in the literature they reviewed was demonstrated through the donation of jelly beans or money and/or helping someone, including self-reports of helping behaviors. They found that regardless of

research design or analyses, video games correlated positively with lower prosocial behaviors in players regardless of time spent playing the game and/or sex of player.

A considerably different treatment of ethics and digital gaming is Mary Flanagan and Helen Nussenbaum's, *Values at Play in Digital Games* (2014) which interrogates, from the standpoint of "values-conscious design", not so much the "ethics of games", but, "ethics at play". Their design-informed approach speaks particularly to how games function as social technologies and they offer an approach to game design practices that amounts to a kind of critical pedagogy, a curriculum for ethical inquiry and critical reflection embedded in a game-based approach to moral education. Their approach is useful in so far as it reorients game design and design considerations as fundamentally ethical choices that are being made. Those choices impact how we play and how our play affects us, as the above literature on violence demonstrates.

Illustrating how design practices offer new ways of interrogating ethics and digital gameplay, the classic example must surely be Gonzalo Frasca's game 'September 12th' (2003), described in the *New York Times* as "An Op-Ed composed not of words but of actions". In a technically and graphically simple Pacman-like 2D interface, terrorists, civilians, and US soldiers try to blow one another up, conveys through its 'tit for tat' mechanics the futility of America's 'war on terror' powerfully conveying that fighting back only prolongs war, and that the only way to 'win' is to stop playing – to discontinue 'engagement'. This is a very good example of a game that is attempting to teach ethics.

These approaches resist the literal-mindedness of popular 'panic literatures' that address ethics and values in relation to videogames, gaming, and game culture, and provide instead detailed and well-grounded considerations of how games as socio-technical devices engage their players with both familiar and unprecedented ethical situations, conditions, and dilemmas. Far more prevalent, however, are games that do not consider how their designed experiences impact player behavior and choice.

## Up Next: What's in a Game?

Ontologically speaking, we again encounter both quite traditional philosophical questions, and some more recent emergents from this specific medium. One paradigmatically ontological question that arises about play in virtual environments pivots on the concept of the 'real'. From studies of avatars and player identities, to 'media effects' research and 'game addiction' studies, to the rise of 'virtual' currencies, the seemingly very real consequences of playing in virtual worlds call into question how 'being' might now be apprehended and understood. A fascinating and prodigious body of work has addressed the real/virtual distinction, at least as far back as John Austin's (1962) classic analysis of the concepts "real/unreal" in *How to Do Things with Words*.

Another familiar ontological question in digital game studies concerns the very idea of a 'game', and recalls in particular, Wittgenstein's refusal to accept that there

is anything ‘games’ have in common, so that the question of what a ‘game’ is cannot be answered insofar as ‘game’ is undefinable. To this argument, an eloquent response has been Canadian philosopher Bernard Suits’ analysis in *The Grasshopper: Games, Life and Utopia* (1978), in which he early on tackles this Wittgensteinian commonplace. “Don’t say”, contended Wittgenstein in the Investigations, “that there must be something common or they would not be called ‘games’ – but *look and see* whether there is anything common to all” (in Suits 1978, p. 21). Suits counters that “This is unexceptionable advice. Unfortunately Wittgenstein himself did not follow it. He looked, to be sure, but because he had decided beforehand that games are undefinable, his look was fleeting, and he saw very little” (p. 21). Suits then embarks of a deeper and more extensive examination of games, inviting the reader to “defer judgement as to whether all games have something in common pending completion of such an inspection” (p. 21). Suits’ examination, which argues, interestingly, for the *intrinsic worth* of game playing, adopts the discursive form of a Socratic dialogue between, among other characters, the grasshopper in the leading role of one who, like Socrates, confronts his own death and yet refuses any means of evading it. Suits’ own efforts to “look and see” find just the kind of common feature Wittgenstein did not, specifically that “playing a game is *a voluntary attempt to overcome unnecessary obstacles*” (p. 54) So far, so good. It is, however, in his further elucidation of this persuasive conceptualization that difficulties arise: “To play a game” Suits explains more fully, “is to attempt to achieve a specific state of affairs [preludory goal], using only means permitted by rules [lusory means], where the rules prohibit use of more efficient in favour of less efficient means [constitutive rules], and where the rules are accepted just because they make possible such activity [lusory attitude]” (p. 55). This decomposition of Suits’ shorter formulation appears to subject his position, arguably unnecessarily, to objections that this definition is tautological, defining a game by reference to its ludic (literally ‘game-like’) features, then defining the ludic by reference to itself, ‘the lusory’. Whether or not such a criticism is more of a pedantic technicality than a philosophically compelling refutation is something that can perhaps be debated, but Suits’ philosophical contribution to understanding what makes something a game is not.

However, it still gets us only part way towards addressing the more recently emergent philosophical question of *videogame* ontology. That further question is illuminatingly discussed in a rather more contemporary essay, ‘Defining the Videogame’ (2015) by Veli-Matti Karhulahti, which takes up both the Socratic form of Suits’ investigation, and his main characters, Grasshopper and Scepticus. Videogames, contends Karhulahti, are ontologically distinct from games more generally insofar as they are computational artifacts that evaluate player performance. Karhulahti elaborates the point, quoting from a dissertation by Sara Iversen (2010) that “...the only radically novel [things] about computer games in comparison with analogue games are their ever-increasing ability to handle vast amounts of information extremely quickly and the machine’s position as referee as well as definer and executer of mechanisms” (p. 33) and goes on to explain that “it is the videogame artifact that [is] consider[ed] as the evaluating judge” (Karhulahti 2015, n.p.).

There are of course artifacts that evaluate their users' performance that we wouldn't call videogames, and this Karhulahti illustrates by reference to computational artifacts that evaluate player performance that are not games but instances of "gamification": using "game design elements in non-game contexts" (Deterding et al. 2011). Gamified artifacts such as cars that measure fuel consumption and provide thrifty drivers with trophies borrow ludic elements from games but are not themselves games. Interestingly, here again we find ourselves perilously close to tautological definition, a predicament from which Karhulahti seeks to escape by (again) privileging the very process of definition, with its requirement for a 'look and see' approach to analysis which recognizes that something can fit within different, even contradictory discursive categories. Arguing that the specific rhetorical processes by which definitions are accomplished significantly and substantively remediate the definitions that can be accomplished by their means, Karhulahti concludes, provocatively, with the suggestion that "scholars might soon persuade each other via videogames".

The ways games function as rhetorical devices, notably in education, advertising, and politics, is elucidated by game designer and media scholar Ian Bogost. He argues in *Persuasive Games* (2007) that videogames' core computational affordances for running algorithmically driven processes and manipulating rule-based symbolic systems constitute a new and distinctive "*procedural rhetoric*" that can be highly effective in building and conveying arguments, and in persuading players. Such studies in game rhetoric can help us to discern how that medium is shaping its own discourse/s. And if we really do 'look and see' what videogames are and can do, we will need to acknowledge that digital games, as a medium, can bypass linguistic articulation altogether, and yet be highly effective programs for communication and experience. Games are inhospitable to propositional knowledge encoded in language and text. This means that designing and using games for learning entails a re-mediation of curriculum and pedagogy. The important and largely overlooked point here is that changing media, from writing and speaking and blackboards and books to digital game forms and functions, requires us to break new epistemological ground.

## Final Level: Ludic Epistemology

Both our intellectual tools, and paradigmatically, our *epistemological* investigations, need re-tooling to tackle new and emerging kinds of questions that digital gaming raises about alternative ways to explore philosophical ideas and practices.

To recognize the ways media shape what we can see and say by their means invites a consideration of the epistemic implications and consequences of the specific medium through which and within which what we call 'knowledge' is understood, undertaken, and accomplished. In game studies, this means formulating and learning to work with a '*ludic epistemology*', a theory of knowledge for digital

game-based learning. So, does knowledge look like when it is encoded in the form of a game, and learning takes the form of play?

In narrative structures, in characters, both playable and not, in its landscapes and soundscapes, its social networks, rules and activities, gameplay afford players skills, knowledge and understanding in forms, *tied to and enacted through all aspects of the game*, that do not invariably transfer to what has become widely recognized as ‘learning outcomes’.

Many years ago in his philosophical treatise *The Concept of Mind*, Gilbert Ryle (1949) recounted the story of a visitor to Oxford who had asked his host to show him the university. His host took him to the science lab, the lecture theater, the library, the cafeteria, the student lounge, the soccer field, the bookstore, and the president’s office. At the end of several hours of touring, the visitor thanked his host but politely insisted he wanted to see the university. “You’ve shown me the playing fields the classrooms the library, all that, but where is the university?” An instructive story for our purposes. Because of course there is *no* university apart from these separate things, and all of these things are ‘the university’.

Similarly, there is no ‘educational content’ in digital games that can be teased apart from its different characters, their different goals, activities, and roles, the kinds of conflicts arising between and among them, the quests and challenges encountered in navigating its virtual environments, and the like. This programmed assembly of interactive procedures offers the player perspectives and experiences in which knowledge is just one player on a very crowded field, and facts play at best a supporting role. Games thus call upon an epistemology very different from that through which curricular knowledge (lesson, test, and textbook) has been understood, changing in turn what knowledge as meaningful ‘content’ in play can mean.

In the context of gaming, the mobilization of players’ attention and intelligence through interactive game play can encompass the acquisition of motor and perceptual skills, the completion of increasingly complex interlinked tasks, the learning and systematic pursuit of game-based narrative structures, the internalization and enactment of affect, and a range of other attendant forms and conditions of learning. It is unlikely, however, that learning that is expressed in these terms will be either sought or recognized in educational assessments of player learning.

## Conclusion

In conclusion, although little is gained by looking to digital gameplay for traditional curriculum-based learning outcomes, considerable learning that is of value can be and is being supported through the medium of digital games. The persisting challenge is seeing this: instead of presuming we know what to look for, how do we find new ways to ‘look and see’ the scope and depth of what this medium can do? The key, we think, to better understanding games through a philosophical lens is to consider what games do from the standpoint of ethics, ontology, and epistemology. There are, of course, other considerations from an educational standpoint including

whether or not playing games actively harms players either because of violent content leading to aggression or because play can be additive for some players. There are of course many other important philosophical perspectives that could well be discussed in relation to video games that we have not had the space to discuss including aesthetics, subjectivity, objectivity, and power, but we have attempted to characterize what we view are the ones most relevant to education.

Ian Bogost's (2011) *How to Do Things with Videogames* demonstrates the range and variety of uses of videogames, proposing an approach he terms "media micro-ecology", an approach to detailing the many and varied uses for which the medium of the digital game is highly effective. A more explicitly philosophical contribution to understanding the specific forms through which even esoteric philosophical knowledge and understanding can be realized through gameplay, Liam Mitchell's (2016) essay, "The Political and Ethical Force of *Bastion*, or, Gameplay and the Love of Fate", provides a carefully detailed account of how and why playing *Bastion* advances – through its mechanics – an argument about contemporary society and an ethical and political position that enable its player to experience choice as it is expressed in Nietzsche's theory of eternal recurrence. As to how games accomplish this, Mitchell explains that "Videogames... bind players by way of algorithms established by digital technology as well as by social convention, and they thereby require players to establish a relationship to these algorithms that is often, and by necessity, unconscious and indirect rather than deliberate. More or less opaque, these coded procedures for carrying out player commands govern player action, and the power that players feel derives in part from their ability to master these algorithms... achieving an intuitive relation to a particular set of rules" (2016, n.p.). Arguing that games can "create worlds in which players live out experiences that contravene control and calculability", he goes on to show how, in *Bastion*, players are confronted with the complexities and challenges of Nietzsche's vision of the world by placing its players "into an experiential position wherein ... lack of choice seems like a wonderful thing. It teaches the player the love of fate". Theoretically and methodologically innovative studies of this kind advance, we suggest, precisely the sorts of 'looking and seeing' that will most productively inform a philosophically adequate grasp of what digital gameplay is, how and why it matters, and what it can offer to education.

# Children as Consumers

**Bruno Vanobbergen**

According to a survey carried out in 2013 “three hundred thousand children between the ages of 12 and 15 work in the Netherlands” (Lieten and de Vos 2013). They do so not because it is pleasant or educational, it would seem, but because they ‘need’ money to buy a mobile phone or tablet. Children want to fit in at school and so possessions such as a smart phone are vital. They want to behave like autonomous consumers. But a smartphone is expensive; some parents cannot or do not want to pay for it and so the children decide that they will have to work. “So, they willingly give up their childhood for restricted freedom”, explain the researchers Kristoffel Lieten and Sarah de Vos.

This trend fits into the broader picture of the lives of many children and youth in economically developed countries. Children and youth have become fully functioning consumers and their lives are inherently connected to this (Cook 2008; Buckingham 2011). This is reflected in how children spend their free time, but also in the educational environments for children and young people (Pugh 2009; Marshall 2010; Pyvry 2016). There are a multitude of items ‘on the market’ and they all try very hard to appeal to children. This discourse has also become embedded in education, where policies frequently refer to children as ‘clients’ of the education system. Parents also play a role in this (Vincent and Maxwell 2016; Cairns et al. 2013). Children and their parents increasingly share the same environment. They use the same tools, they want the same sport shoes, they play the same games and they watch the same TV shows. Simultaneously, it is important to see how parents are addressed within this context in relation to shaping their children’s upbringing. Making children happy is an important constant in this setting, whereby the happiness of children involves far more than just having a tablet or smartphone. It also concerns the domains of care, health and safety. In 1993, in her book *Sold Separately*,

B. Vanobbergen (✉)  
Ghent University, Ghent, Belgium  
e-mail: [bruno.vanobbergen@ugent.be](mailto:bruno.vanobbergen@ugent.be)

Ellen Seiter explained how the commercialisation of children's environment was embedded in many settings that are important for children and their upbringing.

It is worth noting that, despite the broad social focus on the commercialisation of children's environment, there is very little educational literature on this topic. Some research has been conducted on how children become consumers (Rozendaal et al. 2008). There are studies that focus on the impact of children on the buying behaviour of their parents (for example, van der Schors et al. 2014). And there has been sociological research into the increasing social inequality in relation to the "consumer childhoods" phenomenon (Lareau 2003; Vincent and Maxwell 2016). The educational literature on this topic, however, tends to be guidance literature, and typically presents upbringing and education as diametrically opposed to consumption (Buijzen 2010). Raising children seems to encompass a battle 'against commerce'.

In this contribution, I will not focus on the issue of whether the commercialisation of the children's world is good or bad. Neither will I focus on issues such as the appropriate age for children to have a smartphone? I will, however, concentrate on the various ways in which we write and talk about the child as a consumer. An analysis of this discourse should provide an insight into the various meanings that are attributed to children and childhood. How children are seen, what people expect of them and how people identify with children is largely dependent upon the times and space in which we live. Culture plays an important role in all of this, but so does the socio-economic context, for example. The life of a 13-year-old girl from a white middle-class environment is likely different from that of a 13-year-old girl in the Roma culture. Being a child in a working class setting today is completely different from being a working-class child 100 years ago. This seems to be obvious but is often forgotten. We systematically talk about 'the child' or 'children' and assume that a child follows his/her 'nature'. However, the discourse about children and childhood is always related with how we talk about parents and what we expect from them. In the second part of this contribution, I will focus on the meaning of the discourse on the consumer child for the relationship between childhood and parenthood. Building upon Heinz Hengst's concept of the liquidation of childhood, I will elaborate some thoughts on today's child's subjectivity and the place of children's rights within this discussion.

A theoretical concept that could help us approach and analyse being a child and childhood in a more contextualised manner is 'generationing', developed within the broader paradigm of the *sociology of childhood*. According to Alanen (1999) 'generationing' refers to processes through which some individuals are constructed as 'children' while others become 'adults', having consequences for the activities and identities of inhabitants of each category as well as for their interrelationships. The concept of 'generationing' shows us how our take on being a child goes hand-in-hand with our view of being an adult. Expectations about children are not separate from expectations with respect to parents, for example.

## Can Children Still Be Children?

'Can children still be children?' is the question that is often asked because of the changing world of children. The issue as to whether children still have sufficient time and space to genuinely be 'children' was first investigated at the beginning of the 1980s. Neil Postman, a leading American communication scientist, was extremely concerned about the increasing influence of television on children's lives at that time. Television provided an entire world in which children were offered answers to questions they had never asked. Postman (1983) was talking about disappearing childhoods. According to him, safety and innocence, terms that had long been used as metaphors for a happy childhood, were being displaced by violence, aggression and sexuality. In addition, the television threatened the classic educational relationship. It was parents' responsibility to gradually guide children through their lives. Parents were the gatekeepers to the world and gradually opened specific doors. With the breakthrough of television, followed today by the internet and social media, the gates have been removed and children are quickly exposed to the world.

Postman's position can still be seen today. A fine example is the bestseller *Toxic Childhood: How the Modern World Is Damaging Our Children and What We Can Do About It* (2006) by the English author Sue Palmer. Palmer suggests that children today are becoming less happy. This, according to Palmer, is expressed in current childhood issues, from eating disorders, to ADHD and autism, to the depression suffered by many children. Children also experience many more opportunities to form relationships with others. Much of this contact is 'fake' and so children learn from an early age to compete for other people's attention. Children seem to be vulnerable victims of an ongoing media and consumption culture. The result is a society that is primarily characterised by a moral and cultural decline. To fight this decline, Palmer published *Detoxing Childhood: What Parents Need to Know to Raise Happy, Successful Children* (2007), in which she referred, among other things, to the importance of 'real food' and 'real play' for the development of children.

However, the idea that children can no longer be children not only links into the mediatisation of their world; the range and complexity of leisure time activities has also led to concerns about the pressure and commotion within children's lives. Throughout their childhoods, children are urged to achieve success as early as possible. The high-profile book *Slow Kids* by Carl Honoré (2009) suggested that today's children are constantly suffering from choice stress. The range of activities and options is so huge that children are overwhelmed by too much choice. According to Honoré, this type of upbringing equates to product development and we must return to the 'basics', e.g. simple playtime in the sandbox.

## Happiness as the Cement for Raising Children Within a Commercial World<sup>1</sup>

Today, we can identify a strong commercialisation of emotions, particularly the anxiety and uncertainty of parenting. A happy childhood, it is assumed, is a safe childhood. Parents are advised about the best internet filter, play areas need to fulfil a huge list of European standards and children are not allowed out in traffic without a helmet and high-visibility vest. To support us in ensuring the safe upbringing of our children, all sorts of gadgets and applications have been developed. There is the American Mamabear and the Dutch Wheresapp, for example. The options are endless: from checking the Facebook page of your precious son or daughter, to checking that they are at school. This concerns GPS tracking tools that show you, on a map where your child is located at that very moment. Parents can also set a 'safe zone'. When the child leaves the safe zone, the parent is sent a 'red alert'.

What is clear from the previous comments on the changing world of the child is that there is a focus on the child's happiness. Both Postman and Palmer see the commercialisation of children's worlds as a threat to happy childhoods. However, research on the history of childhood and education also shows how this very commercialisation played an important role in the creation of the idea of a happy childhood.

Various authors have indicated how, in industrial societies at the end of the nineteenth century, the focus on the importance of a happy childhood gradually increased (Stearns 2010). Happiness is thus a characteristic that is not naturally connected to childhood, but that became regarded as vitally important for childhood, at a specific moment in time. Traditional societies made no direct link between childhood and happiness. This does not mean that, in earlier societies, parents were not concerned about their children or wanted them to be unhappy. It does, however, mean that there was no concept of happiness that was linked to childhood. Childhood was not necessarily perceived as a happy time. At the beginning of the twentieth century, happiness, much like nutrition, became a vital concept for ensuring that children developed into normal adults. Three social developments played a central role in this: (1) the breakthrough of the commercial (children's) industry, (2) the professionalisation of parenting and (3) the declining infant mortality rate.

### *'You Gotta Smile to Be Happy'*

Stearns (2001) identified the development of the European consumer society in the eighteenth century, but it is difficult to pinpoint exactly when this began. Consumer societies have developed gradually. There do seem, however, to be a few key

---

<sup>1</sup> Some parts of this paragraph are translations of an earlier publication on the history of happiness and childhood: Vanobbergen, B. (2012). De gelukkige jeugd: realiteit of mythe? In: S. Vandamme (Ed). *Geluk: Drang of Dwang?* (pp. 25–40). Gent: Academia Press.

moments. An influential wave of consumption began around 1850 and continued until around 1920. At that moment, European society demonstrated all the characteristics of our current consumer society. Middle-class parents in the first decades of the twentieth century were, for example, increasingly organising and designing their homes with the happiness of their children in mind. Playrooms emerged and large groups of parents were persuaded that the happiness of their offspring was only possible if new items could be purchased on a regular basis. One of the most cited historians for this period is Viviana Zelizer. Zelizer (1985, 112) suggests that children have gradually disappeared from the labour process but without losing their economic significance. “Children were removed from the market between 1870 and 1930 in large part because it had become more economically efficient to educate them than to hire them. (...) As children became increasingly defined as exclusively emotional and moral assets, their economic roles were not eliminated but transformed; child labor was replaced by child work and child wages with a weekly allowance”. Children no longer work as such but are expected to work on their own development at school. They are no longer paid but many do receive pocket-money to take their first steps as consumers. The sentimental value of children and childhood became centralised. A child was expected to provide love, a smile and emotional fulfilment, not money or labour. Children and childhood were represented in strongly romanticised and sentimental terms, such as innocence, and in need of help in a harsh world.

### *‘Making the Child as Happy as Possible’*

The focus on children’s happiness and the corresponding sentimentalisation of childhood led to a fault-line between childhood and adulthood, whereby children were associated with specific needs and requirements. This, in turn, led to a change in emphasis with respect to behaviour towards children: it is no longer about control but about caring for the child. The consequence of this was the emergence of a whole series of specialities and specialists whose role it was to support parents, teachers and schools. Manuals for ordinary parents on raising ordinary children were now given titles such as “*Hoe opvoedingsfouten te vermijden*” (*How to Avoid Parenting Mistakes*) or “*Opvoedingsmoeilijkheden van iederen dag*” (*Everyday Parenting Problems*) (Bakker et al. 2010, 331). There was a huge focus on small issues such as children’s bed-wetting or not wanting to eat. Parents had to learn to fathom the emotions of their children and focus on their children’s subconscious processes.

In the context of the professionalisation of parenting, it is interesting to see how children’s happiness also became linked to their health. Grains and soup, but also medicines, for example, are directly linked to ensuring a happy childhood. Together with the image of the naturally happy child, there is the concept of the understanding, loving mother. Warm-heartedness and tenderness form the key traits that should shape the mother’s relationship with her children. My own research into guidance literature in women’s magazine from the second half of the twentieth century shows

an especially interesting field of tension when it comes to children's happiness (Vanobbergen 2007). On the one hand, there is the cherished notion that the child is inherently good and happy and that the most important task of the parent is to maintain this happiness. In the article 'Is the Atmosphere in Your Family Kind-Hearted or cold?' from the *Rijk der Vrouw (Woman's Realm)* from 9 July 1969, we read:

In a kind-hearted atmosphere, the child is happy and if there are any upbringing blunders (and these are faced by all parents!), they are accommodated and compensated for by the general atmosphere that pervades the family; true love can resolve all sorts of problems.

On the other hand, the call for tenderness and love in the family is clearly linked to finger-pointing towards those parents who equate unconditional love with a *laissez faire* parenting style. Some of the titles of articles from *Rosita* don't beat around the bush: "Mother Was to Blame for Betty's Laziness" (3 January 1966), "Martha Always Got Her Own Way with Mother" (15 February 1966) and "Bad Eaters Are Made, Not Born" (22 March 1966). Mothers must be sensitive and loving but must combine this with their role of leader down the pathway to life. The article 'Lieve wildemannen' (Sweet savages) from *Ons Volk* from 24 April 1970 ends with the recommendation:

Our ancestors said, 'No roses without thorns', and this is very true. It takes greater courage to refuse a slice of ham after a meal or insist on the use of a bib, than to give in to these whims based on various pretexts, the first of which is laziness.

An article from *Mimosa* from 31 July 1966 summarises this duality:

There are many parents, who can be called modern in the good sense of the word, who do not recoil, where necessary and required, from maintaining order and discipline in the family. (...) Raising children requires love and understanding in the first instance but also requires a firm, corrective hand from time to time.

### ***Declining Infant Mortality Rate***

Until around 1900 in Belgium, the infant mortality rate fluctuated at around 150 to 250 per thousand newborns (Devos 2005). In other words, around one in five babies died before their first birthday. Between 1900 and 1925, this figure rapidly declined. In this period, the infant mortality rate decreased to around half. In the Netherlands, we see comparable figures (Treffers 2008). In 1880, around 200 per 1000 infants died; in 1925, this had decreased to around 50 per 1000. The bacteriological revolution, under the pioneering efforts of Louis Pasteur, had created a solution to the issue of contaminated cow's milk, i.e. sterilisation. The focus on private hygiene (washing, food) and public hygiene (the provision of sewage systems, improvements to drinking water standards and the construction of healthy labourer's homes) played a vital role in reducing the infant mortality rate. In combination with the previous factors, the declining infant mortality rate also drew greater focus towards the needs of the individual child (Stearns 2010).

## A New Claim on the Child(hood)?

Research on the history of childhood and education shows how the breakthrough of a child-based world that was heavily shaped by commercial industry, fitted into the broader ‘educationalization’ of the children’s world. “Educationalization” refers to the overall orientation or trend towards thinking about education as the focal point for addressing or solving larger human problems (Smeyers and Depaepe 2008). It is described as a sub-process of the modernisation of society, but it also has negative connotations, such as increased dependence, patronisation and pampering. But what led to child rearing and ‘commerce’ growing apart, when they had been so closely intertwined in the early days? Key to understanding this is the script theory of Heinz Hengst (2000).

Hengst distinguishes three competing ‘childhood scripts’. The first is the bourgeois ‘childhood script’, developed and controlled by the adult middle-class. This script is supported by those who could be referred to as representatives of the broad, educational project (parents, teachers, children’s carers, schools, etc.). It is the shelter or blanket that we provide to the world of children to protect them from as many threats as we can. The second script is that of the child. It assumes that children all share a social fate: surviving a world developed by adults, within which children are confronted only with cultural material that guarantees a hopeful future. The third script is the script of market-focussed thinking. This is created when children form part of the consumer society and is best expressed in the slogan “sell to the decision-makers” (Hengst 2000, 18).

According to Hengst, the expansion of the consumer society has led to children’s culture becoming less ‘childlike’, in the sense that they have been freed from the classic upbringing and development discourse. Parents, teachers and psychologists may put up resistance, but nowadays there are very few arguments against this loss of control over upbringing. Oelkers (2002) suggests that the development towards our consumer society fulfils the classical pedagogical leitmotiv of putting the child in the centre in an ironic way. Whereas educators have never succeeded in the full realisation of a child-focussed upbringing, today we are faced with a commercial culture that is entirely focussed on children. However, according to Oelkers, rather than an emancipation process, this concerns a new type of claim on childhood even if it is perhaps less explicit than previously. The children’s world, as created by the market, is presented as a world for and by children, but in reality, is a world that is completely created by adults.

Hengst (2001) prefers to talk in terms of a ‘liquidation of childhood’. Modernity was characterised by a childhood in which the centrality of labour has been replaced by play, learning and development. The disappearance of this type of childhood refers to the disappearance of qualitative differences in the experiences of the various generations. “Liquidation does not mean that childhood is converging with or dissolving into adulthood but that its form is changing in such a way that the relations between generations can no longer be adequately described with the paradigms of modernity” (Hengst 2001, 13). Increasingly, value is attached to

non-educational domains in daily life, while just one of the cornerstones of modernity corresponds to defining children and youngsters based on strong, educational criteria. Hengst thus puts out a call for children's current activities to be reviewed from the perspective of this emancipation. This means, among other things, that we must be bold enough to position children's learning in other situations. The monopoly of learning at school has not only been substantially challenged by commercial culture, it has also been attacked. Children's commercial culture has, itself, become an important learning platform.

## A Liquidation of Childhood?

Hengst's claim about the so-called liquidation of childhood and his conclusion that relations between generations no longer can be adequately described with the paradigms of modernity raise important educational questions. First, this discussion affects our idea about the child's subjectivity. For a long time, the condition of childhood has been regarded as an unformed adult subjectivity. Locke for example defended the idea that the child needs to be understood as lacking that which defines an adult, for instance reason or physical independence. Against this way of thinking, there is the recognition that childhood appears as a form of subjectivity in itself. "The child is not so much an adult which is yet to be, as something different from the adult which requires acknowledgement as such" (Archard 2015, 13). It was Rousseau who initiated the grounds for this alternative subjectivity. He was one of the first authors who pointed to the importance of a permanent re-evaluation of childhood and its place in and significance for adult self-understanding (Kennedy 2002; Archard 2015). It was the Romantics who discovered 'child' as an alternative subjectivity and prophet of unfinished being. The Romantics succeeded in breaking the concept of a static and autonomous subject of the Enlightenment, but could only present the new subject as a prophetic and utopian figure. Freud and especially Jung will work this further out by putting the 'adult-child' contradiction in a dialectical relation. This results in a form of adult subjectivity that is informed by child subjectivity.

Childhood development is about constructing boundaries, both within the self and with the other. The adult who takes up the task of constant reconstruction of these boundaries, based on ongoing experience and belief, puts herself again in the position of a child: of beginning again, of not possessing all the information, "of encountering the world and the other as not completely known, as unfinished" (Kennedy 2002, 165). The re-evaluation of childhood and its place in and significance for adult self-understanding is a crucial dimension within educational thinking. Therefore, we need an educational stance that reflects this re-evaluation. In putting childhood and adulthood in dialogue, a kind of education can appear that devotes itself to the broad cultural emergence of the subject-in-process. Childhood can't be interpreted in terms of static and natural. The question is not if childhood is disappearing, nor if adulthood is disappearing. The question is how to keep the valuable dialogue between childhood and adulthood alive.

In today's dialogue between childhood and adulthood, it is inevitable to pay attention to children's rights, as these have influenced intensively our actual views about parenthood and child rearing. It is impossible to elaborate all relevant issues. I will focus on one that is strongly related with the discussion on children as consumers: the child's autonomy. The image of the autonomous child is often put forward by the corporate world (Seiter 1993; Pilcher 2013). At the same time, it is one of the most important concepts in the plea of those who strongly defend the image of the child as right-holder.

## **The Autonomous Child: Where Children's Rights and the Corporate World Meet?**

It is important to notice that in the debate on the rights of the child up until now the emphasis is on the rights that children *have* (Roose and De Bie 2007). Supported by for example the academic paradigm of the sociology of childhood, mainstream children's rights movements consider children as social actors, as active agents and autonomous, independent human beings in constructing their lives (James and Prout 1997; Jenks 2005). This idea is also reflected in the research on children as consumers. Research by Pilcher (2013), for example into how children deal with (their) clothing, shows that children are not simply 'followers' of the clothing industry, but make choices on a very active basis and thus play a defining role in their 'me-making'.

For many parents in Western societies this focus on the child's autonomy and independency often feels strange and problematic. It results in feelings of uncertainty about their educational role. In this, the corporate world is often seen as a concurrent rather than a partner. The corporate world, via a strategy of *othering*, has placed children and adults in separate worlds, whereby the adult world appears to be a *Dystopia* and the children's world a *Utopia*. "School education, teachers and parents are outside this utopia. They are, at least in part, the real from which escape is sought" (Kenway and Bullen 2001, 73). For children, today's 'commercial world' is a form of resistance; a reference to forbidden domains. Children delight in what their parents rejected: the obscene, macabre and grotesque. Commercial children's culture represents the opportunity to escape from reality. Children are given a reflected image in which their needs and requirements can be realised and problems resolved via consumption. Consumer culture shows children what they can expect when they become adults: a place where play has had to make way for work, mutuality for tyranny and spontaneity for monotony (Fiske 1996).

Several authors point out risks of a rights tradition emphasising individuality and autonomy. Mortier (2002) for example stresses that the emphasis on people as autonomous individuals ignores the fact that they often do not act autonomously. It also ignores the fact that it is a fiction to believe that the recognition of rights will lead to autonomy. Failure to recognise that both autonomy, in this sense, and the

idea of legal status as a pathway to this autonomy are fictions creates a possible dichotomy between ‘citizens’ and ‘non-citizens’ on the one hand and between the ‘rights of children’ and ‘the rights of parents’ on the other hand.

The complexity of human rights in light of children requires us to move beyond modernity’s morally autonomous individual. As long as rights are grounded in free, equal or autonomous individuality, children will be pushed to the outer edges of the social circle. As John Wall (2010) indicates, human rights need to be imagined as more than mere expressions of individual liberties or entitlements. Human rights ultimately derive their meaning and purpose from their capacity to expand the diversity and inclusiveness of human relations. In this interpretation, children’s rights and human rights are rights that are to be shaped in a participative way, a process during which parents and children themselves participate in the definition and the content of these rights (Roose and De Bie 2007). Building upon this starting point, Mullin (2014) develops an interesting view on how the autonomy of the child fits well with some forms of paternalism by the parents. If we treat children as morally important only because their welfare has intrinsic value, and override their attempts to pursue goals driven by what matters to them, then we fail to fully respect them and their autonomy. However, if we disregard the features that threaten their ability to recognise what matters to them, or to pursue their goals, we also fail to respect them.

## In Conclusion

The commercial world is neither an addition to the world of children nor an infringement on it. It simply forms an integral part of children’s world. It is important to chart and analyse how the various positions within this debate develop and how certain views of children and their parents are regarded as ‘desirable’. Next, there is the importance of questioning these views. One possible way to do so is analysing often used concepts such as the child’s subjectivity, the autonomy of the child or the best interest of the child from an educational perspective. Looking at the discussions on a consumerist childhood out of an educational framework makes it possible to illuminate that these discussions are less new or provocative than often thought. With this contribution, we have tried to provide impetus in this regard.

# Democratically Undemocratic: The Case of School Bullying

Ronald B. Jacobson

Is the United States a bully? This was the question posed to me as a presenter at a philosophy of education conference in Toronto not long ago. In my talk I did not mention the political landscape or, for that matter, the United States. But, the truth of the matter is that students, teachers, workers, bosses, spouses, and, yes, even countries often find themselves on one side or the other of the bullying equation. But, what is bullying and where does it fit in the democratic landscape? Along with defining bullying, discussing its many motivations, and suggesting a path forward, in this chapter I will also argue that bullying is but one iteration of the eternally contentious case of the ‘other’. I will begin my exploration precisely on this topic.

## Democratically Undemocratic

Adam Phillips in the preface of his book *Equals* writes, “If the best thing we do is look after each other, then the worst thing we do is pretend to look after each other when in fact we are doing something else” (2002, p. xi). Phillips goes on to outline our work of altruism (e.g., a counselor working to help a counselee) and how such altruism often becomes centered in something else, i.e., our own pleasure or self-interest. “One of the many disturbing things about psychoanalysis – as a description of who we are, and as a kind of help”, Phillips continues, “is that it shows us why it is often so difficult to tell these things apart” (2002, p. xi). Here, using a psychoanalytic philosophical lens, Phillips unearths the complexity involved in equal and unequal relations, arguing that even in our most democratic moments our actions are often steeped in undemocratic intensions.

e-mail: [ronald.jacobson@cwu.edu](mailto:ronald.jacobson@cwu.edu); [jacobr@myuw.net](mailto:jacobr@myuw.net)

For example, it is curious to me that the United States, often asserting itself as a champion for democracy around the world, still consistently discusses policy from the stance of self-interest. In fact, when the United States responds militarily around the world, it often justifies those actions to the American people as actions that are ‘important to US interests’. In other words, the United States, and any country for that matter, may espouse democracy around the world, but often justifies its actions to its own constituencies based on the fact that it furthers their own self-interests in the region. Phillips might argue that while America claims to act democratically, it may also be ‘doing something else’. I do not intend here to paint the United States in a bad light (is the United States a bully?), but only to give example to Phillip’s contention. From Phillip’s point of view, all of us are involved in this process of altruism tainted with self-interest all the time.

Robert Coles in *The Secular Mind* goes a step further, arguing that the human condition is fundamentally situated in the narcissism of insecurity. “In the biblical chapters that follow the expulsion of Adam and Eve from the Lord’s terrain”, Coles argues,

much is made of the consequent and subsequent physical hardship, pain ... But there was, too, the subjectivity that this new life brought: human beings as exiles, as wanderers, as people paying (forever, it seemed) a price for an act of disobedience, a severe transgression that carried with it the death penalty. That inner state was, right off, marked by self-preoccupation – another first, that of a necessary narcissism as a requirement for a creature suddenly at the mercy of the elements, and with a fixed span of time available. ... We are left to fend for ourselves, and to do so with apprehension either a constant presence or around any corner (1999, p. 13).

Whether one adheres to the biblical narrative or not, Coles contends here that human existence is marked by apprehension; i.e., threats are around every corner as we compete with those around us (as individuals or as countries) for the limited resources of land, materials, access, and even prestige. Hence, as we aspire to democratic processes, from Cole’s perspective those moves are always imbued with apprehension of the ‘other’. We look to the other, but we worry about ourselves. Hence, Phillips’ claim: “If the best thing we do is look after each other, then the worst thing we do is pretend to look after each other when in fact we are doing something else” (2002, p. xi). In this chapter I will argue that bullying is situated within this larger phenomenon of self-interest or, perhaps better, self-preservation. But, I will also argue that in a bully’s attempt to use bullying to create security, she actually eclipses the self she is trying to save. I begin with a general overview of bullying.

## Definitions and Motivations

Reviewing the current empirical research, we can define bullying in this way: “bullying is proactive, it is repeated over time, it is targeted upon a victim, and it may involve verbal abuse, physical abuse, or subtle relational disruption. It is disruptive

to the learning environment and to the victim's well-being and involves elements of asymmetric power focused on securing some objective (whether tangible – e.g., lunch money; or intangible – e.g., social status). Bullying is also dyadic (between individuals), as well as enmeshed in peer relations” (Jacobson 2013, p. 14).

In terms of bullying prevalence within schools, a fairly reliable rule of thumb would be that about 30% of P-12 (i.e., preschool through twelfth grade) students are involved in bullying (either as a bully, victim, or both) in any given time period. Internationally about 8.5% of boys 11, 13, and 15 are involved in bullying (bully, victim, both) in Sweden (Craig et al. 2009). This rises to 45% in Lithuania (the United States is about 22%) (Craig et al. 2009). The same study finds about 5% of 11-, 13-, and 15-year-old girls are involved in bullying (bully, victim, both) in Sweden, with 35%, again in Lithuania (the United States is about 17%) (Craig et al. 2009). Of course, these numbers change depending on the target. For example, 44% of kids with autism are victimized in bullying, and those with autism are also found to have higher odds of bullying (Montes and Halterman 2007). A 2004 study finds that 81% of all males and 72% of all females experienced bullying in one form or another during their K-12 schooling years (Holt and Keyes 2004).

The literature raises several potential motivations for bullying behavior (Jacobson 2013, pp. 34–39). Some research suggests that individual misunderstanding is at the heart of bullying. This misunderstanding is conceptualized in two ways. First, we imagine such misunderstanding situated in the notion that the bully is not aware of or does not understand the policy, rules, or definitions of bullying activities. A second site of misunderstanding involves empathy. Empathy, or an awareness of the “thoughts, feelings, and intentions of another”, has been linked by some to “inhibit or, at least, mitigate [bullying] aggression” (Kaukiainen et al. 1999, 83). Linked to empathy is the corollary of perspective-taking (i.e., the ability to see life from the perspective of another, to understand the way another sees, feels, experiences something) (Farley 1999).

Another motivational possibility involves the notion that school bullying is centered in individual skill deficiency. On the one hand, victims are depicted as potential targets because they lack friends (Espelage and Swearer 2004; Juvonen and Graham 2001, 80, 338) and, more foundationally, the skills to develop and maintain such friendships. Victims also are seen to have low self-esteem/self-regard (Olweus 1993, 33; Juvonen and Graham 2001, 78). Some victims are also targeted, it seems, because they are reactively aggressive, i.e., because they lack anger management skills (Olweus 1993, 33; Juvonen and Graham 2001, 306). Additionally, victims are often seen as passive (Olweus 1993, 32; Juvonen and Graham 2001, 77, 306) or as anxiety ridden (Swearer et al. 2004, 69). On the other hand, the bully is also depicted as one who may struggle with outbursts of anger and aggression (Olweus 1993, 35). Some portray bullies as individuals lacking in social skills or social intelligence (Sheridan et al. 2004, 245–257). Additionally, the literature indicates that the bully may lack cohesive relationships in the home (Olweus 1993).

A third motivational possibility raised within the literature involves individual delinquency, prompting punitive and rehabilitative anti-bullying approaches. Here, the bully is depicted in some measure as a trouble-maker, a malformed individual, a

'bad egg'. This is not necessarily meant to disparage the bully, but to underline the desire of the bully intent on causing harm to another. Bullies seem to take pleasure in the tears of their victim.

Finally, school bullying is also depicted as centered in environmental or ecological norming, prompting whole school approaches. Research links bullying activities with a lack of parental closeness (Kasen et al. 2004, 200) or inappropriate parental modeling (O'Connor et al. 1980 in Rigby 2002, 152). The literature also indicates that peer ecologies deeply shape and motivate bullying activities (Duncan 2004, 232, 240; Juvonen and Graham 2001, 83–86; Hoover and Oliver 1996, 5). Some also argue that how the larger culture views bullying or aggression (Rodkin 2004, 101), teacher attitudes (Holt and Keyes 2004, 122–124; Espelage and Swearer 2003, 378), and school relational climate (Holt and Keyes 2004, 124–125) all may motivate bullying activity in some measure.

Embedded within most of these motivations is a notion of the unintentional bully. In other words, it is skill deficiency, the inability to control aggression, a misunderstanding of the rules, not understanding fully the fact that bullying activities hurt the victim, and family norming that are at the heart of bullying activity. Yet, by definition, bullying is intentional and repeated, far from accidental. Instead of a phenomenon that is situated in poor social skills, I would assert that the intentional nature of bullying means that it is aimed toward some sort of satisfaction.

## **The Self-Interest of Bullying**

Research raises another possible motivation, status acquisition through dominance. I would like to consider this notion in more depth, seeking to understand a more foundational element in the bullying encounter. To do so, I will begin with a bullying incident that took place on a public school campus not long ago. Jake was a popular sixth-grader at a local public school: Southside K-8. Jake had attended Southside since kindergarten. He had plenty of friends and admirers, made good grades, excelled in music and sports, and had adequate social skills. Jake was also a bully. Matthew, one of Jake's classmates, was an unremarkable sixth-grader at Southside. Matthew had also attended this school since kindergarten and, up until his sixth-grade year, had cultivated good friendships and adequate grades. Matthew was sensitive and typically non-aggressive. In the fall of his sixth-grade year, Jake and a group of classmates began to target Matthew in the daily bump game. This targeting was informal at first, Jake, Sammy, and Jeff seeking to always eliminate Matthew first from the game. The targeting escalated as this group of boys encouraged others to join in the exclusion until the entire bump crowd (from 20 to 30 children) was seeking exclusively to knock Matthew out, purposefully missing shots to keep their friends in. In the end, the bullies gained a sense of status with many of these 30 children who would roar wildly as Matthew, again the first to be eliminated and deeply humiliated, would walk away in tears. This targeting of Matthew soon moved beyond the bump game to other parts of his day. Matthew,

though he did not understand why, had become a pariah not only with the trio, but with a significant population of the school as well. Matthew finally transferred to a new school, thus freeing himself from the abuse he experienced at Southside. The next year, in the absence of Matthew, the trio simply picked a new target – Trent. In the late spring of his sixth-grade year, one of the school staff asked Jake why he continued to persist in his activities, knowing that he was risking reprimand and expulsion. His casual response is telling: “because I like to make him cry” (Jacobson 2013).

This scenario is not unlike many bullying encounters, but it raises an interesting question: What is the satisfaction of Matthew’s tears? What is it that felt good to Jake (his ‘I like’) when humiliating Matthew? Pellegrini and Long argue that bullying “is a specific form of aggression and one that is used deliberately to secure resources” (2004, 109). What might these resources be? Pellegrini et al. continue: “Bullying seems to be used as a way in which boys [and I would argue girls as well] gain and maintain dominance status with peers” (2004, 110). Rachel Simmons, referencing the findings of Michael Thompson et al. (2001) and colleagues, asserts that “every child wants three things out of life: connection, recognition, and power. The desire for connection”, she continues, “propels children into friendship, while the need for recognition and power ignites competition and conflict” (2002, 9). Malecki and Demaray contend that “students’ bullying behavior may actually increase (or at least not reduce) their peer support” (2004, 221). In other words, the bully may be, in part, seeking to establish his own status within the peer community by casting the ‘other’ as illegitimate. Anthony Pellegrini offers helpful insight here:

Harassment is often public when perpetrators use it to display dominance over their peers. This sort of public display is especially evident during early adolescence, a time when social status is in a state of flux because of rapid physical changes and changes in social groups. (2001, 129)

Some would simply argue that Jake must have had a problem with Matthew; i.e., that more generally the bully doesn’t like the autistic or gay student he targets. This would make sense, and certainly may be the case in some situations, but why then are most bullying encounters public encounters? Research reveals that most bullying is witnessed by others. “Pepler and Craig reported that peers are present in 85% of bullying episodes” (cited in Sutton and Smith 1999, 97–98). If Jake simply didn’t like Matthew, he could corner him in the bathroom and take out his displeasure on him. But, instead, Jake chooses a public arena in which to target Matthew. And, further, the next year Jake simply chose a new target to publically humiliate, Trent. This bullying, witnessed by others, often raises the bully’s status in the eyes of many within his or her peer group. The bully regularly employs ‘associates’, somewhat under her control, who gang up on the victim. Bullying, then, becomes a public power move, leaving the perpetrator more securely ‘inside’ and the victim more clearly ‘outside’. This is not to say that bullying does not take place privately, but even then it rarely stays private. Stories of bullying are shared by the bully with friends and, like in the case of Matthew, it isn’t long before others are brought into the dynamic. Everyone involved knows who is in control and who is powerless.

The literature more precisely envisions a number of nuances regarding status as an aim of bullying. Status often allows one to construct lines of inclusion, i.e., who is in and who is out (Simmons 2002; Brown 2003; Juvonen and Graham 2001, 225–226). Dominance, often associated with status, is depicted as a primary goal of bullying (Rigby 2002, 150; Pellegrini and Long 2004, 109–110). Such attempts at dominance are seen to become more sophisticated – perhaps more politically appropriate or simply more effective – as one grows older (Hawley 1999 in Rigby 2002, 150). High social status is often sought by the bully (Rodkin 2004, 94), offering certain benefits to the bully with peers (Pellegrini and Long 2004, 108–111) – especially as one negotiates group inclusion (Pellegrini and Long 2004, 112) – and offers the bully a certain amount of attention (Juvonen and Graham 2001, 224–225) and attractiveness (Espelage and Swearer 2003, 376). Likewise, for the victim higher status becomes a buffer *against* victimization (Juvonen and Graham 2001, 346), while low status becomes a pathway *to* victimization (Juvonen and Graham 2001, 270).

On this view, bullying becomes less about putting someone in their place or an accidental bump in the hallway; it becomes an intentional tool to garner public status, a sought-after resource often in short supply. On this view, Jake didn't have a problem with Matthew; in fact, Matthew was incidental. Instead, Jake was performing for the 20 to 30 classmates watching the drama unfold. Here Jake is working to establish his own status in the eyes of his peers. His project was to 'be someone' in their eyes. He certainly is dominating Matthew, but he is at the same time doing something else. Matthew's public tears are satisfying because in them an exchange is taking place between Jake and the watching world. What might that exchange entail? The satisfaction of Matthew's tears is found in the fact that they were proof that Jake was 'someone' in the eyes of others. He was higher, more powerful in this public display. Jake is fighting for his life (with apprehension around every corner), i.e., his 'place' with his peers and within the greater population of Southside K-8. And, in fact, status is always status *with* others. Jake needs the crowd to 'be someone'. Trying to fix the relationship between Matthew and Jake often misses the point. The real exchange is between Jake and the watching world. This is about Jake's self-interest, about his own survival.

## Identity, the 'Other', and Listening

Jessica Benjamin, in her work *The Bonds of Love* (1988) seeks to better understand how dominance operates in male/female relationships. More precisely Benjamin is interested in what domination and submission 'give' to the participants. From a psychoanalytic philosophical perspective, Benjamin contends that humans maintain a basic need to recognize and be recognized. Here, she argues toward the importance of reciprocity in human interaction, a balance between assertion and recognition. This process, Benjamin contends, is an important pathway of identity

construction. In other words, Benjamin argues that we need the other to gain a sense of ourselves.

For example, let's imagine that I am the main performer, a guitar player, in a live concert viewed by tens of thousands of concert-goers. Let's further imagine that I spend 20 min performing the guitar solo of the century. At the end of the solo, complete with fire and smoke and all the energy and skill one human can muster, imagine that the crowd is completely silent. Certainly this could be because they are left in awe and are speechless as a result of my performance. But, more likely their silence indicates their disapproval of my solo. What, then, is my imagined conclusion? Simply, I am a terrible guitar player or, at best, the solo I just performed was unimpressive. Why would I come to that conclusion? Because I need the crowd to cheer for my solo. Their applause affirms my ability and my performance. Benjamin contends that this reciprocity (which is often termed 'object usage' in the psychoanalytic literature) is a fundamental element in identity construction. I assert on the audience (i.e., play a guitar solo) and they assert back (i.e., applause). This back and forth is not simply a mirroring of activity (i.e., active listening) – i.e., I don't need the audience to pull out guitars and play back to me – but, instead, it is a sign that my efforts have affected another, reflecting back to me the validity of my efforts. I need the crowd to cheer wildly or to buy my CDs, then I conclude that I am a good musician.

Benjamin argues that this reciprocity happens moment by moment, allowing us to build a sense of who we are. Here we think of a parent's interest and love toward a child (I am interesting and lovable), a teacher's affirmation of the learning of a student (I am smart), the responsiveness of a pet to our approach (I am a dog person), etc. Jake performed for the crowd, and their cheers and pats on the back at the elimination of Matthew affirmed his status (I am somebody here), his place to stand in the eyes of his peers. The satisfaction that Jake felt was based in his perception that he 'was someone' on campus, a perception that was gained through the roar of the crowd.

Let's push this a bit. Earlier I noted that research indicates that misunderstanding can be a motivator for bullying behavior, either a misunderstanding of the rules or what actually constitutes bullying activity or a misunderstanding of the fact that bullying actually hurts the victim (i.e., a lack of empathy or perspective-taking). Hans-Georg Gadamer in his work *Truth and Method* (1996) deepens the notion of understanding, arguing that all understanding is actually self-understanding. On this view the bully doesn't fundamentally misunderstand the rules or her victim; instead insight into their own experience is eclipsed.

Gadamer argues that our history positions us toward new experiences with certain expectations or prejudices toward understanding in certain ways, that "the prejudices of the individual ...constitute the historical reality of his being" (1996, 277). "Hence", Gadamer contends,

the most basic of all hermeneutic preconditions remains one's own fore-understanding, which comes from being concerned with the same subject. ...Thus the meaning of 'belonging' – i.e., the element of tradition in our historical-hermeneutical activity – is fulfilled in the commonality of fundamental, enabling prejudices (1996, 295).

You and I *belong* together because we are affected by history, the same history which has affected that which we are trying to understand. Without this belonging, the Other is so ‘other’ as to surpass any expectations toward it. Yet, tradition, while making new understanding possible, also can preclude it.

The prejudices and fore-meanings that occupy the interpreter’s consciousness are not at his free disposal. He cannot separate in advance the productive prejudices that enable understanding from the *prejudices that hinder* it and lead to misunderstandings. (Gadamer 1996, 295 emphasis mine)

Hindering prejudices are prejudices, affected by history, which we stick to, which we do not allow to be challenged.

Thus, according to Gadamer openness is fundamental to all human understanding. “We cannot stick blindly to our own fore-meaning [i.e., prejudices] about the thing if we want to understand the meaning of another” (1996, 268). If our prejudices can make us deaf, causing us to stick to our fore-meaning, then how do such hidden prejudices come to light? Gadamer contends that they do so “in the experience of being pulled up short by the text [of an Other]. Either it [i.e., the Other] does not yield any meaning or its meaning is not compatible with what we had expected” (1996, 268). In this difference, a question is raised (e.g., have I not understood this correctly?). Openness to the ‘truth’ of an Other (i.e., that the Other might have something valid to say, even if it confronts the way we have always understood something), then, allows the alterity of new experience to bring to light our prejudices. A question does not initially assert an answer, instead it puts something in jeopardy. “To ask a question”, Gadamer contends, “means to bring into the open. The openness of what is in question consists in the fact that the answer is not settled” (1996, 363).

Openness means being ‘positioned’ toward an Other, open to them really saying something to us, even something against us, because we know our understanding of a subject is always limited. Hence, understanding is not something to be mastered. Gadamer argues that ‘being experienced’ does not consist in the fact that someone already knows everything and knows better than anyone else. Rather, “the experienced person proves to be, on the contrary, someone who is radically undogmatic; who, because of the many experiences he has had and the knowledge he has drawn from them, is particularly well equipped to have new experiences and to learn from them” (1996, 355). Openness means that our understanding is always in question, that in fact, *we* are in question. The openness (grounded in our finitude) necessary for hermeneutic understanding moves from the mastery of a technique to a way of being in the world. Openness means relinquishing control of the Other, listening to them because we understand that *our* understanding is always limited.

Gadamer argues that a question not only puts some topic in jeopardy but, as I have alluded above, that we ourselves are put at risk (our prejudices revealed) by the question that challenges our present understanding. A true question brings our prejudices to light. We are confronted with the fact that we may have not understood correctly. The ‘insight’ offered by hermeneutic understanding not only sheds light on the subject we are trying to understand but upon ourselves as well.

Insight is more than the knowledge of this or that situation. It always involves an escape from something that had deceived us and held us captive. Thus insight always involves an element of self-knowledge and constitutes a necessary side of what we called experience in the proper sense. (Gadamer 1996, 356)

In this, prejudices are brought to light by the question raised by something which was other than we expected. Patricia Altenbernd Johnson argues that for Gadamer, “understanding always involves a degree of risk”. “We risk our very existence”, she continues, “...Understanding is entering into play where we are not in control of the movement, but rather are changed by the play” (2000, 71). New understanding turns us back on *ourselves*, revealing our own knowledge and assumptions. We are put at risk. Thus understanding with an Other reveals our own historicity (granting us further self-understanding). Gadamer argues that it is “only through others [that] we gain true knowledge of ourselves” (1979, 107).

Hence, for Gadamer all learning is self-learning and we get stuck when we stop listening. In other words, understanding is reciprocal, requiring the give and take of listening and speaking. Remember, Benjamin from a different perspective ties identity construction to this kind of reciprocity, noting that we get stuck when the conversation becomes unidirectional. Remember, the guitar player needs applause. But, according to Gadamer we stop listening precisely because the other puts us at risk. Our fear, according to Phillips, is that we will become Democratic and, in that space of reciprocity with the other, we are called to surrender our own self-preservation. Bullying, dominating another, secures our place; we take matters into our own hands. But, without reciprocity, the ‘sense of self’ we hope to be confirmed by others becomes stuck. It is in the act of risking our self that we open ourselves up to risk as well as confirmation. One last point is important to consider here.

## Schools and the Fabric of Bullying

Michel Foucault in his anthropologic philosophical work *Discipline and Punish* (1995) raises the notion of disciplinary training, and more specifically *dividing practices*. Foucault argues that dividing practices are used in a variety of settings (e.g., military training, athletic training, etc.) and certainly rear their head in school motivational culture. In short, Foucault argues that in such systems we often create the ideal subject (e.g., warrior, student), creating grids of value based on how close to the ideal students find themselves. According to Foucault, the use of dividing practices,

Measures in quantitative terms and hierarchizes in terms of value the abilities, the level, the ‘nature’ of individuals. It introduces through this ‘value-giving’ measure, the constraining of a conformity that must be achieved. ...The perpetual penalty that traverses all points and supervises every instant in the disciplinary intuitions compares, differentiates, hierarchizes, homogenizes, excludes. In short, it normalizes. (Foucault 1995, 182–183)

An example will be helpful here. Let's imagine a high school AP Physics teacher, wanting her students to work hard for the 'love of science', tells everyone at the beginning of the semester that they will automatically receive an 'A' in the course. What will the likely result be? Many students will conclude: "If I already have an 'A', then I really don't need to do the homework (it will make no difference) and I won't study for the weekly quizzes and unit tests (they don't matter)". In fact, a friend of mine did just this with his high school advanced band students. Up to that point, grades were based on the practice time each student spent working with their instrument. My friend wanted students to practice 'for the love of music'. What resulted? Students practiced less. If the grade was already in hand (everyone would get an 'A'), the motivation to practice was diminished. I am not arguing here for or against letter grades, but only mean to make the point that schools often use grades to motivate.

But, let's extend this example. In our AP Physics course, if everyone is promised an automatic 'A', who will be ecstatic? Likely those students who struggle with physics will be pleased. But, who will be upset? Likely, the parents of students who tend to do well in science. Why? Because if everyone receives an 'A', there is no differentiation between their student and everyone else. And it is that differentiation (i.e., my score compared to the average – national or otherwise) that qualifies me for a stronger college. Strong students (compared to others) get into Harvard. And Harvard graduates make more money and have more opportunities than community college grads (or so the story goes). It is exactly the space of comparison between students that Foucault highlights; this space creates the impetus for motivation. This space moves students to seek to close the gap between themselves and the next closest competitor. Foucault doesn't necessarily disparage competition, but highlights the value that we extend to those ranked higher. "For the marks that once indicated status, privilege, and affiliation", Foucault argues,

were increasingly replaced – or at least supplemented – by a whole range of degrees of normality indicating membership of a homogeneous social body, but also playing a part in classification, hierarchization, and the distribution of rank. In a sense, the power of normalization imposes homogeneity; but it individualizes by making it possible to measure gaps, to determine levels, to fix specialities and to render the differences useful by fitting them on to another. (1995 184).

And, remember, Foucault argues that these grids of comparison, used to motivate, introduce a 'value-giving' measure, measuring the gaps between students, gaps that translate into opportunity. Does the system work? We seldom see students seeking to write the worst paper or run the slowest in a race. Instead, we celebrate those who are the fastest, the smartest, the prettiest, the funniest, etc. Those at the top, those who dominate, are celebrated. Interestingly, for a time our US national slogan for education was 'Race to the Top', exemplifying how integral the notion of Foucault's dividing practices are in the culture of P-12 schooling. Extrapolating, one could argue that Jake, rather than a delinquent, had simply taken the narrative of schooling seriously. Public domination of a classmate, besting him in the eyes of others, garners status and accolades. Bullying, the public domination of another, works in schools because it is of the same fabric as school motivational culture

itself. Why don't students cry, fail, or lose to be someone on campus? Because that is not the narrative that we have spun, at least in the majority of our training cultures.

## Living in an Insecure World

In his consideration of the one who humiliates another, Phillips asks, "It is a question, as it often is, of anticipated catastrophe; what, we must ask, is the imagined devastation that will occur if the mocker doesn't mock? If he isn't laughing at his victim", Phillips continues,

If he stops arranging his humiliation, what does he fear might happen? What might they do together? The so-called psychological answer might be, he will see too much of himself, too much about himself, in his chosen victim. The political answer would be, he would turn democratic. What mockery reveals, in other words, is the emotional terror of democracy. That what is always being ridiculed is our wish to be together, our secret affinity for each other. (2002, pp. 43–44)

It is only through our reciprocal interactions with the other that we are able to develop a sense of self or, as Gadamer would put it, that we find self-understanding. But, here Phillips also reminds us that our 'wish to be together' coincides with the terror we feel toward those around us as we compete for scarce resources. Hence, as we long for democratic, reciprocal exchanges, at the same time we resist them because of our own work of self-preservation. Hence, like the United States, we seek to live democratic lives undemocratically. Bullying isn't special, it is simply another case in our complicated battle with the other for self-survival. It is seated in our eternal human need to be someone in the eyes of the other, the very other that serves as a daily threat. What would it mean to not be afraid of those around us? This is the question at the heart of mitigating bullying activities in schools, in the work place, in the world around us. What would it mean to lay aside the need to perform in order to be valued?

I have contended above that bullying is often centered in our own insecurity. Bullying here represents a scramble for resources. What would it mean to create educational systems that do not pit competitors against each other, deeming those at the top more acceptable than those at the bottom? How might we shift schools from systems of knowledge comparison (who knows the most) to growth (are all making progress)? Bullying, and the insecurity that roots it, prevents us from the very reciprocal encounters that hold promise for human growth (i.e., identity through encounters). Might it be that schools and organizations may need to target the cultures of relationships within them more intentionally rather than focusing so singly on the bottom line or on learning standards? I don't mean 'teaching proper relational skills' but paying attention to the cultural milieus that shape those relationships. What would it mean to create schools and organizations where the fear of the other, especially as it becomes tied to status (i.e., being someone in that community), might dissipate? How might we move from our partisan certainty and, thus,

our opposition to the other toward a more Gadamerian ‘openness’, working to mitigate the ‘threat’ of the other, helping our students/employees to move from control of the other (think/be like me) to a desire to understand the other (inquiry)? This is cultural work. Re-storying schools and communities – who counts and who doesn’t and why – and the narratives that operate subtly, but so powerfully under the radar. Unearthing those stories, working collaboratively to create new narratives of motivation and value will be necessary. Of course, at the heart of those narratives is a realization that even as we espouse democratic encounters, we are always doing something else at the same time. Until we take this aspect of interaction seriously, we will struggle to stem bullying, as we have for generations.

# Study War No More: Trigger Warnings and Guns in the Classroom

Amy Shuffelton and Samantha Deane

On college campuses in the United States, trigger warnings are under fire. To begin the 2016 academic year, the University of Chicago told the class of 2020 that: “our commitment to academic freedom means that we do not support so called ‘trigger warnings,’ we do not cancel invited speakers because their topics might prove controversial, and we do not condone the creation of intellectual ‘safe spaces’ where individuals can retreat from ideas and perspectives at odds with their own” (Schaper 2016). The letter grounds this rejection of trigger warnings in the belief that freedom of expression is an intellectual, personal, and communal good that is at odds with, and ultimately trumps, the personal need for safe harbors. Although the University of Chicago was probably the most prestigious university bluntly to disavow trigger warnings, it has not been the only university to weigh in. In 2015 the president of Oklahoma Wesleyan University proudly responded in an open letter to a student who claimed he felt victimized by a reading from the Bible. “Oklahoma Wesleyan is not a safe space, but rather a place to learn: to learn that life isn’t about you, but about others”, Dr. Piper (2015) stated. “This is not a day care. This is a university”.

Concurrently, at the University of Houston, the faculty was warned about how to deal with a different kind of trigger. As the *Washington Post* (Moyer 2015) put it, “eye-raising *bullet* points advised faculty not to ‘make provocative statements’ or ‘cute signs’ about the new campus carry law, and to ‘only meet ‘that student’ in controlled circumstances’”. The context for this warning was a new concealed carry law, Texas SB11, which went into effect on August 1, 2016, and gave students the right to carry guns in the classroom. For those unfamiliar with gun regulations in the United States, ‘concealed carry’ is the practice of carrying a concealed weapon in public. It is legal in all 50 states, with some states requiring a permit, some states

---

not, though often gun carriers are subject to restrictions. Concealed carry, for instance, may be prohibited in bars, in churches, in government buildings, or on college campuses. SB11 denies Texas public universities the right to impose such a restriction, although private universities maintain that right – and continue to exercise it. Significantly, the University of Houston trigger warnings came from a working group of faculty members constituted by the faculty senate, not from university administration. In contrast to the letters from administrators mentioned above, which loftily tell staff and students that the classroom is still a space for provocative discussion, the faculty-created presentation takes into account the real dangers that faculty members and students face in classrooms when guns are present. It is hardly surprising that a University of Texas emeritus economics professor chose to quit his job, refusing to work in a climate of triggers, in an era of seemingly endless mass shootings (Larimer 2015). In a disturbing bit of symbolism, the SB11 law went into effect on the 50th anniversary of the University of Texas “clock tower massacre”, arguably the first modern day mass school shooting (Frosch 2016).

In comparing these instances of trigger warnings, and warnings about warnings, across university campuses, we question what these very different kinds of ‘trigger’ have in common and why, if they are different, we use language that lumps provocative course material together with weapons. There are some straightforward differences and commonalities between the kind of ‘trigger warning’ implied by the University of Chicago letter and the kind in the University of Houston presentation to faculty. When a faculty member offers a trigger warning about, for instance, the unsettling rape scene in Toni Morrison’s *Beloved*, he or she does so with the aim of warning students who might be, or know someone who is, a rape survivor. The scene, proponents of trigger warnings argue, can *trigger* painful flashbacks and emotional anguish. Language, this implies, functions like a kind of weapon, with the ability to inflict harm just as a gun does. Alternately, suppose a faculty member teaching Toni Morrison’s *Beloved* avoids the kind of challenging conversations about racial and sexual violence that at best lead to transformative learning, lest a gun-toting student take offense. In this case, the instructor also does so with the aim of preventing harm, but the protection is extended to those whose complicity with ongoing racial and sexual injustice makes violence against women and racial minorities possible. Trigger warnings, in their University of Houston sense, have the side-effect of protecting students from the painful exploration of disconcerting stories and histories. They protect privileged students from confronting in a college classroom the possibility that they bear ethical and/or political responsibility for sexual, racial, imperial, and other kinds of violence. Freedom to carry guns in the classroom therefore has exactly the effect that the University of Chicago worried about: creating classrooms in which ‘individuals can retreat from ideas and perspectives at odds with their own’.

The linguistic connection between troubling discourse and a gun is significant but problematic. The phrase ‘trigger warning’ is intended to signal a controversial topic and thus an intellectually, ethically, and perhaps personally challenging conversation. But given the material omnipresence of guns in the United States, where there are currently thought to be as many guns as people, it inevitably also implies

literal guns in classrooms. Even in states other than Texas, where guns can still be barred from classrooms, students and faculty are constantly aware of the possibility of gun violence. Although the prevalence of gun metaphors in Americans' speech might be thought of as an *effect* of guns' prevalence, we argue in this chapter that it has *consequences* as well, and that treating ideas as falling into the same category as guns does education a disservice. A long-standing tenet of law and morals holds that it is legitimate to use force in one's own self-defense. Traditionally, self-defensive force was only legitimate when retreat was impossible, but under the 'stand your ground' laws that now hold in many states, it is legal to use force without retreat so long as one *believes* oneself to be under threat. If a Toni Morrison novel is understood to be the equivalent of a gun, an angry student could too easily perceive himself as having the right to shoot back with a real weapon. Note that we are not suggesting that it would in fact be morally or legally acceptable for him to do so, not least because we find 'stand your ground' laws unjustifiable, certainly when it comes to guns and also when it comes to conversations. Rather, we mean to emphasize that metaphors guide our reasoning and our actions. It is thus not outlandish to suggest that for universities to treat disturbing ideas and gun violence as categorically similar has emotional and cognitive effects that can have material effects as well.

There are important differences between these two kinds of trigger warning, but that distinction is obfuscated when universities adopt the language of guns to describe pedagogical practices. By way of shorthand and to keep the different kinds of 'trigger' distinct, in the rest of this chapter we shall refer to them as idea-warnings and gun-warnings. Good teachers have been issuing idea-warnings about upcoming course topics for as long as it has been considered good practice for teachers to take a student's individual, personal characteristics into account. Anytime a professor offers a preface to assignments, readings, or conversations, he or she is telling the students what to look out for, where potentially tricky topics or controversial issues might arise, and where students might face emotional as well as intellectual obstacles to engaging with the material. This is advisable, and good teachers do this regularly. However, these prefaces became formalized 'trigger warnings' only when the generation of students who grew up aware that there could be guns in their schools reached college. Use of gun metaphors to describe pedagogy has the effect – unintended, but still problematic – of stripping the prefaces of their educational framing and inviting in guns, or so we argue. But guns have no place in classrooms. There are better metaphors for the interaction between reader and text, and for the classroom discourse that follows it, than armed combat.

## **Guns in the Classroom**

It could be said that guns entered the modern classroom in 1974 when Anthony Barbaro built a sniper's nest in his high school's third floor classroom – killing three and wounding 11. However, from 1974 to 1991, a span of 17 years, only one

other incident can be classified as a school shooting. This stands in stark contrast to the 7-year stretch between 1992 and 1999, when at least 11 mass school shootings occurred. Newman et al. (2004) call such shootings “rampage” school shootings. They distinguish these from other school-site violent incidents – e.g. a gang feud that leads to homicide on a school campus, or a teacher shooting himself in his foot by accident – from which they seem qualitatively different. For Newman et al. (2004), a “rampage” indicates a shooting that takes place in a school; has multiple victims, some of whom are symbolic; and has one or more shooters who were or are students of the school. Jonathan Fast (2008) uses similar criteria. He too notes that the shooting must occur on school grounds, but notes that the shooters must be adolescents and the victims must number at least two, excluding the shooter who may or may not die by committing suicide (p. 15). Prior to 1992, such shootings were anomalies, so infrequent and random that they did not warrant special interrogation as a distinct or especially interesting problem. Rather, they were generic, if also tragic, episodes of school disasters, which in and of themselves are not historically new.

The inaugural date of the gun’s entrance into the classroom is of little consequence, but the problem of rampage school shootings and the subsequent significance of guns in schools reached a historically significant turning point in the 1990s. Following the proliferation of mass school shootings by students or former students in that decade, school administrators were forced to craft new policies surrounding firearms on school grounds, while federal and state legislators across the nation dealt with various gun safety proposals. In the wake of intense public concern about deranged teenagers with guns, the ‘fact’ that 135,000 guns were brought into American schools every day has been widely cited. That this number is entirely unsupported is of little consequence (Cornell 2006, p. 61). After extensive research on the origins of this number, Cornell notes that it appears to have been inferred from survey data about students who reported bringing a gun to school sometime during the year combined with the average number American school children.

Guns had become part of the imaginary landscape of the American school, and they are increasingly part of the actual landscape. In a 2015 symposium in *Educational Theory*, philosophers of education discussed the educational implications of this trend. Shuffelton (2015a) Warnick et al. (2015) considers why angry adolescents might choose *schools* as sites of violence, pointing to schools’ importance in the imaginary landscape of adolescent social life. Schools are at once the sites where young people hope to find love and friendship and where they sometimes fail to do so. In schools, children and youth are subjected to adult discipline, making schools seem, to some, like appropriate places for the use of unrestrained power. Not all angry adolescents turn to guns, of course, and other articles in that issue, especially Amy Shuffelton’s article on masculinity and honor (2015b), Aislinn O’Donnell’s article on shame (2015), Harvey Shapiro’s article on Agamben and violence as a ‘state of exception’ (2015), and an article co-authored by Gabriel Keehn and Deron Boyles (2015), consider the dynamics of interpersonal relationships and school shootings. Jane O’Dea (2015) considers the effect of watching media violence, and Dianne Gereluk (2015) considers policy implications. Harvey

Shapiro's forthcoming *Handbook of Violence in Education* (2017) will explore school shootings and other school violence.

Across the country, 800 gun bills were introduced following the Columbine High School shooting, with a mix of success and failure, while on the federal level, Congress has passed only one gun-safety law between the Columbine shooting and the Newtown Connecticut school shooting (Fuller 2014). The 2007 law aimed at updating the national background database came on the heels of the Virginia Tech shooting, which simultaneously ignited intense conversations about campus conceal and carry (Debrabander 2015).

Meanwhile, the National Rifle Association (NRA), which had traditionally been a network of hunting enthusiasts, shifted its focus to politics. Under the leadership of Wayne LaPierre, it became a right-wing powerhouse, using guns as a means to mobilize conservative voters in support of a radical new interpretation of the US Constitution's Second Amendment, which addresses the right to bear arms. Fear of violent crime, which as a political discourse in the United States has long associations with racial tension and particularly with White fear of Black power, became a kind of "dog whistle", a call to the American right wing to support right-leaning candidates (Lopez 2014). The NRA has blown this whistle for the past several decades. It endorses politicians who support increasingly permissive gun laws and undermines politicians who support any restrictions. Even with the vast majority of US voters expressing their approval for gun law reforms following the Newtown Connecticut massacre, modest reforms could not pass in the United States Congress, due to the number of Republican senators who were unwilling to risk NRA sanction. As rampage shootings have increased in frequency, the government has loosened gun restrictions. Further entrenching the difficulty of reining in the proliferation of guns was the 2008 Supreme Court case *District of Columbia v Heller*, which reinterpreted the Second Amendment as affirming an *individual* right to bear arms. *Heller* necessitated revisions of gun laws across the United States, ending years of restrictions on concealed carry in places like Washington DC and Chicago, where guns were not being used for hunting.

Campus concealed carry is part of this shift. As Firmin DeBrabander (2015) writes in his recent book *Do Guns Make Us Free?: Democracy and the Armed Society* (a question to which his answer is, unequivocally, no), "after the Newtown shootings, LaPierre unveiled the NRA's master solution: the National School Shield, which called for placing police officers or armed guard in every school in America, or banning that arming teaching and school staff" (pp. 158–159). The NRA's answer to gun violence, in other words, is more guns. In this view, armed students are not the threat in this world but the protection, the last bastion between the unarmed professor and the 'active shooter'. Yet, as DeBrabander notes, the extent to which "we make schools forbidding places" (p. 173) moderates the kind of citizens we seek to cultivate. Pointing to the physical reconstruction of schools into fortress like structures in the wake of rampage school gun violence, DeBrabander argues that the building and staffing of the fortress/school happens as a response to rampage events but follows the NRA's logic. Insofar as those with guns are viewed as armed peacekeepers, any plans to secure life (and education) sans guns court disaster. The

problem with the NRA's logic, as DeBrabander points out, is that it rests on the assumption that anyone who carries a gun will necessarily be a *peacekeeper* – which, in fact, educators and citizens have every reason to doubt.

## Language Mediates Reality

Given the ways in which idea-warnings and guns in classrooms align with progressive and conservative political positions, those who favor the first sort generally despise the second, and vice versa, although some dislike trigger warnings of both sorts. For those who favor one but not the other, it can seem obvious that the two 'triggers' have nothing in common, and that only a precious over-concern with language enables us to make the connection. As George Lakoff and Mark Johnson (1980) point out in *Metaphors We Live By*, however, "metaphor is pervasive in everyday life, not just in language but in thought and action. Our ordinary conceptual system, in terms of which we both think and act, is fundamentally metaphorical in nature" (p. 3). The example they use to clarify "what it could mean for a concept to be metaphorical and for such a concept to structure an everyday activity" is, coincidentally, of acute relevance to this piece: Argument is war. As they explain, the 'argument as war' metaphor means, "We can actually win or lose arguments. We see the person we are arguing with as an opponent. We attack his positions and defend our own." Etcetera. Yet there are other metaphors a culture could use for argument – argument as dance, for instance. In such a culture, arguers might be understood as "participants in performance, and the goal is to perform in a balanced and aesthetically pleasing way" (p. 5). When the metaphor changes, so does the structure of everyday activities.

Richard Rorty (1991) echoes Lakoff and Johnson but adds to their ideas the imperative of social and political progress. Rorty asks that we "think of human minds as webs of beliefs and desires, of sentential attitudes – webs which continually reweave themselves so as to accommodate new sentential attitudes" (p. 93). Beliefs, for Rorty, are expressed as modes of action, or habits, and insofar as beliefs are habits they require little to no reweaving of our web. Following Dewey, Rorty believes that inquiry is prompted when our beliefs/habits make us rethink our web and that at the point of inquiry we weave in new habits. Rorty argues that at some point in this process, the inquirer recontextualizes to such an extent that it may be appropriate to consider the context of her beliefs as a new context (p. 94). New contexts are endless and can be precipitated by any number of things but they generally fall into two kinds. The inquirer might gain a new set of 'attitudes' toward the existing language shaping her web. For someone who as a matter of habit used the metaphor 'argument is war', this might mean changing her attitudes towards these argument/wars – expecting safe space to be provided for noncombatants, for instance, or limits to the use of force, or (in the case of supporters of Texas SB11) the addition of armed 'peacekeepers' to the classroom. A second possibility, for Rorty, is that the inquirer's web will be so thoroughly reconstructed that entirely

new habits will be put in place. The ‘argument is war’ metaphor might be replaced by argument is dance, or – who knows? The new metaphor may be yet undiscovered. Rorty describes the first recontextualization as akin to translation, the second as learning a whole new language.

The temptation to seek a single, universal language – free speech rights, for instance – thus misses the point. If all human languages have an innate structure, and our language’s structure leads us to treat argument as war, then triggers are in the classroom whether we like it or not. If, however, one takes a pragmatic approach, the triggers are only there for as long as we remain in the habit of bringing them in. A gun-warning offered in the context of Texas’ campus carry law is a part of a conversation with distinct linguistic rules. As the faculty senate members who issued the gun-warning clearly perceive, one of those rules is that classroom debates are like wars, and following SB11, that means that real guns will be present and possibly used. When the University of Chicago administrators refuse to issue ‘trigger warnings’, they are, in effect, translating when they should instead be using a new language. Rather than imagine a new language – one suited for pedagogy instead of for battle – the University of Chicago Dean of Students who wrote the letter invites students to think about their learning in terms unsuited to the debate. The University of Chicago cannot make classrooms spaces for “fostering the free exchange of ideas” while simultaneously “building a campus that welcomes people of all backgrounds” so long as classrooms feel, to some students, like war zones (Grieve 2016). Disparaging ‘safe spaces’ as a zone to which students will not be allowed to ‘retreat’, the letter celebrates free speech but leaves no room for reimagining classrooms as places where swords are beaten into ploughshares, where students will study war no more. Like the title of this piece, ‘study war no more’ references an American spiritual, part of the rich tradition of Black music and picked up by opponents of the American war in Vietnam. It continues to be widely sung by folk musicians; those wanting to hear it can find many versions on line.

## **John Dewey: Communication, Democracy, and Pedagogy**

Framed in terms of the liberal rationale of rights, the different camps can seem irreconcilably at odds, with free speech pitted against the right to psychological and bodily security. For pragmatists, philosophical analysis should be able to move past this kind of either/or. While Lakoff and Johnson and Rorty illuminate the importance to this project of language, especially metaphor, John Dewey provides a political and educational impetus for carrying out the task of differentiating guns from ideas.

Dewey defines democracy as ‘a mode of associated living’, and, as he explains in *The Public and Its Problems*, this ‘association’ cannot be the association of the herd, in which individuals live peaceably side-by-side. Democracy involves the creation of common meanings through communication. As he stresses in *Democracy and Education*, it is not incidental that the root of common, communication, and

community is the same. As Dewey (1954) sees it, “democracy is a name for a life of free and enriching communication... It will have its consummation when free social inquiry is indissolubly wedded to the art of full and moving communication” (p. 184). The interdependence of the herd is transmuted into democracy when “participation in activities and sharing in results are additive concerns” (p. 152), for which communication is a necessary condition.

Because communication brings the public of a democracy into being, the specific language citizens use shapes the political alternatives available to us. Rorty adds to Dewey’s key insights a richer appreciation of how language ‘speaks us’ just as much as we speak language. Dewey also recognized, however, that language “controls sentiment and thought” (p. 142), and that humans can, therefore, only work toward achieving democracy insofar as their communication promotes individuals’ growth. As Dewey states, “the characteristic of the public as a state springs from the fact that all modes of associated behavior may have extensive consequences which involve others beyond those directly engaged in them” (p. 27). The capacity to work with others, an interest in others, an openness to new ideas, and a willingness to trust others to take up peaceful projects of community building, these are the keys to ‘moving communication’.

For Dewey the classroom is a unique space to cultivate both individual growth and a democratic public. In fact, the realization of democracy depends on how effectively democratic modes of association are practiced in schools. In his 1899 essay, *The School and Society*, Dewey (2007) argues, “When the school introduces and trains each child of society into membership within such a little community, saturating him with the spirit of service, and providing him with the instruments of effective self-direction, we shall have the deepest and best guarantee of a larger society which is worthy, lovely, and harmonious” (p. 44). In later work, especially *Democracy and Education*, Dewey stresses that the classroom is not just a preparation for democratic life but democratic life itself. The capacity to communicate and the willingness to see the other as a worthy conversation partner are democratic habits that take root in school. This was perhaps, Dewey’s, single most important observation: that democracy *is* education, and education *is* democracy.

How, then, does a teacher foster communicative abilities – and thereby foster a democratic ethos of association, especially given students who have very different life experiences? The first step is that the teacher must come to know the life experience of her students. “He [the teacher] must survey the capacities and needs of the particular set of individuals with whom he is dealing and must at the same time arrange the conditions which provide the subject-matter or content for experiences that satisfy these needs and develop these capacities” (Dewey 1997, p. 58). Further, Dewey’s account of experiential education is situated on the assumption that when we take experience into account, education is based in and seen to be a social process, and once education becomes a social process the teacher becomes a member of the group, rather than an external boss. The other students in the classroom are as much a piece of an individual’s learning experience as is the textbook, the classroom architecture and design, the teacher. And when education is seen as a social

process, all members of the community are responsible for the creation of common meanings through communication. To create a classroom environment in which such communication can happen, the teacher may often need to provide prefatory information, including idea-warnings, letting students know what hazards and challenges texts may present, what they will want to look for and look out for. This is good pedagogy, and there is no need to expand the reach of guns through use of ‘argument is war’ metaphors such as ‘trigger warning’. The creation of such an environment fosters the free exchange of ideas better than any declaration of individual rights does.

## Conclusion

Insofar as guns infiltrate our language, they shape our world. When a pedagogical preface turns into a ‘trigger warning’, it serves to warn students that the topic is dangerous *and* that they might want to arm themselves before they enter the classroom. In a context where material guns are available, this metaphor remakes the classroom profoundly. Trigger warnings are an invitation to view ideas as threats, and therefore to decide whether to retreat or stand one’s ground, as they sink ideas into the same category as guns. A pedagogical preface, on the other hand, can say to students, “you will read a challenging article, but here are some ways *you* might want to read this article. Here is what you might want to keep in mind. Perhaps this is not bedtime reading”. A pedagogical preface can tell students they have an ethical responsibility to their classroom community, and it does not demand that they go it alone. Rather, a good pedagogical preface will take stock of students’ potential needs and experiences – perhaps even recommending they seek a means to process or think through difficult material. As Dewey reminds us, good teaching demands the inculcation of habits for communication, cooperation, and accommodation. Pedagogical prefaces are aspects of ethically responsive and democratic pedagogy. They light the way for the transformation of conflict into politics, but we should not call them ‘trigger warnings’.

If we are going to study war no more in university classrooms, what new metaphors might we turn to instead? Although Lakoff and Johnson mention, ‘argument is dance’ as an alternative, they acknowledge that this metaphor is so far from ‘argument is war’ that *we*, who rely on that metaphor, might well not recognize arguments structured as dances as *arguments* at all. And in a democracy, arguments are worth having. Fortunately, however, our language already offers us alternatives to war. According to Rorty, the inquirers who are good democratic citizens are the sorts of people who welcome the opportunity to reweave our own webs. Conversation as reweaving makes us spiders, then, house-builders and fabric-makers. Henry David Thoreau offers yet another metaphor, one closer to the ancient ideal of turning the weapons of war into agricultural tools.

“In *The Senses of Walden*, Stanley Cavell reads a phrase from *Walden* – “After hoeing, or perhaps reading and writing, in the forenoon” – as establishing an analogy between these activities” (Fulford 2016, p. 525). Amanda Fulford (2016) plumbs this metaphor in “Learning to Write: Plowing and Hoeing, Laboring and Essaying”, as follows:

For Thoreau, hoeing is not plowing (the systematic lifting and turning of the soil in a regular pattern). Nor is it furrowing (the forming of regular trenches in the soil to prepare it for sowing)...Hoeing is also not (in the agricultural sense) the same as harrowing – the systematic breaking up and smoothing out of the soil to make a finer finish that makes undertaking subsequent tasks easier. Yet there is a paradox here: hoeing *is* harrowing when thought of in relation to our words. For Cavell, the effect of our words is harrowing in that we are disturbed by them... (pp. 526–527)

Fulford’s argument, like Cavell’s, is about written language. Insofar as her focus is how student authors can find their own voices, though, in the face of pedagogies that encourage standardized modes of expression, her essay touches on exactly the concern shared by defenders of free speech and defenders of students’ psychological and bodily security: students’ ability to express themselves, including the aspects of their deeper selves at odds with the smooth surface that social conventions demand. Proponents and opponents of trigger warnings *qua* idea warnings can agree that students’ encounters with texts, their discovery of the ashes of chronicled nations, their articulations of their own understandings, and their encounters with their fellow students’ articulations, involve a kind of hoeing, an uncovering and tearing out, that is often harrowing. In Fulford’s words, “the act of writing is one of cutting and dividing words, of exposing ideas so that readers are themselves exposed to the cutting characteristics of words” (p. 526). “The ashes of chronicled nations” (p. 526) is a deliberate misquote of another Thoreauvian reference to hoeing, cited by Fulford. Thoreau writes of uncovering with his hoe “the ashes of unchronicled nations”, which implies the discovery of unknown tales. In the context of a colonized territory, e.g., Concord Massachusetts and the rest of the American continent, in which farmers working the soil have regularly turned up the artifacts of Indian nations, this also has a double meaning. It is the chronicles of subordinated peoples that are often harrowing for students to read.

To move from a metaphor of argument as war to argument as agricultural labor, then, does not mean that classrooms will evade difficult subjects or that disagreement will be silenced. Proponents of vigorous argument and defenders of students’ safety alike have reasons to prefer this shift. ‘Hoe warnings’, or perhaps ‘harrow warnings’, does not have quite the same ring as ‘trigger warnings’, which is perhaps exactly as it should be, since pedagogical prefaces are nothing to fear, supportive of democracy and simply good teaching. We are not naive enough to think that this word change will bring an end to the use of guns in classrooms, as only effective regulations and their enforcement can do that. Because the metaphors speakers use shape their actions, however, we do have grounds to believe that shifting the terms will at least not invite guns where they do not belong.

# Towards a Pedagogy of the Radicalised

Stijn Sieckelinck

Radicalisation, contrary to what many citizens believe, does not always produce violent action. But, even where it does not result into terrorism, radicalisation may destroy (often young) lives, bring families to despair, and leave professionals behind in defeat. Hence it is not only a security issue but also a socialisation issue *par excellence*: it usually refers to young people in full development, looking for their place in the societal order. This chapter intends to demonstrate how, judged from a pedagogical perspective, radicalisation should not be understood one-dimensionally. The process of radicalisation can be considered both a (response to a) crisis in upbringing and an opportunity to grow political consciousness. Where black-and-white thinking is typical to the radical mind-set, it is a challenge for radicalisation researchers not to limit their analyses to similar black-and-white viewpoints.

This chapter presents some insights from 10 years of educational research into youth radicalisation, a largely underrepresented field in social and particularly educational research. A remarkable dearth, as open democracies inherently bear the possibility of producing political and religious radicalisation. Historically, miscellaneous ideologies have been labelled radical, of which the most discussed are: ultra-right-wing nationalism, animal right activism, left-wing anarchism, and Islamist Jihadism. A common element in all these narratives, one could say, is the refusal to live by the laws of constitutional democracy. Whereas all these strands have been subject to academic investigation in the past, the recent series of painful revolutions in the Middle East (euphemistically called the Arab Spring) brought unprecedented momentum into those parts of the world that many young citizens in our countries – by birth and/or identification with the underdog (see below) – feel affinity with. The alleged interference of the Western powers (either assumed or proven) gave an enormous sweep to the already disgruntled youths looking for a way to alter the course of their lives, by resisting the Western neo-colonial,

---

Institute for Societal Resilience, Vrije Universiteit, Amsterdam, The Netherlands

neo-liberal, and secular world design. This accumulation of local and global dynamics resulted into the (among radicals highly anticipated) establishment of an ‘Islamic State’, catering mainly for Muslims who feel like their religion is under threat, yet evolved into a fascistic society with its own territory and legislation, cleansing it from every presence or reference to other worldviews, religions, or traditions.

Confronted with previously unknown high numbers of youth leaving home to wage the violent Jihad in the Levant, policy makers in all Western countries are giving educational institutions a central position in their public safety agenda against extremism (see, for example, Radicalisation Awareness Network 2015). This agenda causes all kinds of practical and philosophical complications. By analysing and reconsidering the definition of radicalisation for educational purposes, identifying the different dimensions of this growing landscape, and reflecting upon possible educational responses, this chapter draws out the philosophical questions of educating against extremism and explores whether we are in need of a pedagogy<sup>1</sup> of radicalisation.

## A Contested Concept

As noted above, the recent sequence of civil uprisings in the Arab world and its echoes in the heads and actions of Western youth, predominantly with a migrant background, have attracted a hitherto unseen amount of interest in youth radicalisation by scholars and practitioners alike. Among professionals and officials, the concept of radicalisation is usually understood as a process by which an individual or group comes to adopt increasingly extreme political, social, or religious ideals and aspirations that reject or undermine the status quo (Wilner and Dubouloz 2009). Radicalisation is, more specifically, understood by many as the process in which a person becomes increasingly hateful towards a part of society and anyone who defends the status quo.

However, from a philosophical point of view, the concept of radicalisation is problematic. This can be illustrated by considering the differences between the definitions of the Secret Services of the Netherlands and the United Kingdom (see also Borum 2011). The principal difference concerns the use of the term ‘terrorism’. In the UK version, radicalisation is considered to be a direct route to (support for) terrorism, whereas in the Dutch version, terrorism is one of the means or strategies that could eventually be used by someone who is currently going through a process of radicalisation. This difference in definitions relates to the difference between radicalisation that funnels and results in violence on the one hand, and radicalisation that, although usually very annoying or unpleasant for its direct environment,

---

<sup>1</sup> Unlike its use on the European continent, the term ‘pedagogical’ in English has a narrower, classroom-bound meaning. The Dutch equivalent *pedagogisch* or German *pädagogisch* has its roots in the continental philosophical tradition, and refers to the entire business of rearing children – educational, cognitive, social, emotional – in family, school, and society (De Winter 2012).

remains non-violent in character on the other hand. Bartlett and Miller (2012) defend an elaborate view of the difference between violent and non-violent extremism, that it is not what people say or think, but whether they commit violent acts that counts. This difference is very important, since only a minority of individuals with radical opinions turns to terror (Dearey 2009; Bartlett and Birdwell 2010). Nevertheless, even if not all radicalisation leads to extremist actions or terror, all terrorism appears to be caused by a form of radicalisation. The link between the concepts of radicalisation and terrorism is therefore logical and invites caution at the same time.

While, from a professional perspective, the need for insights and tools to counter radicalisation is legitimate and tangible, from a philosophical perspective we should be wary of using the concept of radicalisation too easily. The term is derived from the Latin word *radix* or root. Radicalisation in this etymological sense, then, is the movement of someone going back to the roots. But this needs not result into violence. Several researchers have warned against a too facile use of the term radicalisation. The process we call radicalisation is, according to Mandel (2009) “relative, evaluative and subjective” (pp. 101–113). He suggests that becoming radical is not merely a matter of being extreme in one’s views, and must always be in comparison with something, such as the law or tradition. Another implication is that, according to Sedgwick (2010), the concept of radicalisation focuses on individuals, and to a lesser extent on the group and ideology, omitting the wider circumstances and possible root causes. In Kundnani’s (2014) analysis of the concept, the notion of radicalisation is seen as having undergone a multitude of remarkable transformations since its birth, mainly in the direction of practical usefulness in order to prevent violent extremism (pp. 14–35). A particular powerful critique is that the young people we call at risk of so-called radicalisation actually are not going back to their roots; instead they break with every existing tradition to cultivate a version of Islam that is free of any cultural embedment. Olivier Roy (2014) finds in the modern disconnection between faith communities and sociocultural identities a fertile ground for fundamentalism. His book cover reads: “Instead of freeing the world from religion, secularization has encouraged a kind of holy ignorance to take root, an anti-intellectualism that promises immediate, emotional access to the sacred and positions itself in direct opposition to contemporary pagan culture”. Many radical youth are found at the margins of their religious and ethnic communities. Often, parents are unaware and may be fearful of their offspring’s ideas. This observation is important as it may indicate that Jihadis who turn to extremism should not be called ‘radical’, as they are not reinterpreting a lost tradition, no matter how hard they try to reclaim a lost Prophet’s tradition in their propaganda.

Is there any alternative term we can use? Hannah Arendt argues that “evil is always extreme, but never radical – it lacks the requisite depth” (1963). In the same vein, Paulo Freire, in his preface to his seminal work *Pedagogy of the Oppressed* (1970) makes a pivotal distinction between the radical and the “sectarian”: “On one side, there is radicalisation. Radicalisation, nourished by a critical spirit, is always creative... [it] criticizes and thereby liberates. On the other side, there is sectarianism. Sectarianism, fed by fanaticism, is always castrating... [it] mythicizes and

thereby alienates (p. 37). The pedagogy of the oppressed... is a task for radicals; it cannot be carried out by sectarians” (p. 39). From this it follows that young Jihadist actions fit more within a scheme of sectarianism than radicalism. These critiques show that, whereas the concept of radicalisation is practically relevant, it is not entirely without problems. It is even, in Gallie’s (1956) words, essentially contested, which is probably a positive label in this context, as radicalisation is closely related with the political sphere in which difference is to be upheld.

Having analysed the concept of radicalisation, is there a way to reconsider the definition for educational purposes? Where we might benefit from using the term ‘sectarianism’ instead of ‘radicalism’ from a philosophical point of view, the following definition may inform professionals’ practical decision-making. According to a recent study, radicalisation was said to call for pedagogical response:

when a child or adolescent starts to develop strong political or religious ideas and agency that are so fundamentally at odds with the educational environment or mainstream expectations that the pedagogical or educational relationship is increasingly put at stake. (Adapted from Sieckelink et al. 2015)

This definition was constructed in an attempt to be more attentive to the meaning experienced by actors in an educational environment (youth and teachers alike), and puts the pedagogical relationship at the heart of the concept. On the one hand, it certainly adds a pedagogical flavour to the aforementioned, more security-oriented, definitions. On the other, it probably would not work for security purposes. Again, this shows that defining radicalisation is context related and deserves on-going discussion.

## Typologies and Journeys

The question ‘who are the radicals?’ puzzles researchers to this day. For decades, there was an almost general consensus that terrorists are ‘normal’ persons. Notably Silke (2008) in his forensic research found no pathogenic, pathological profile that sets the very few people who engage into terrorism apart from the general public who refrain from it. His findings can be seen as an empirical corroboration of Arendt’s ‘Banality of Evil’-thesis, developed by the latter following the trials of Nazi-official Eichmann.

Recently, this consensus has come under pressure. Weenink (2015) concludes, based on a study of Dutch police files, that more than half of the foreign fighters who left to fight in Syria or Iraq suffer from what he calls ‘psycho-social’ disorders. At least 20% show severe behavioural disorders or have been diagnosed with schizophrenia, autism, or psychosis. However, methodologically, it remains unclear to what extent these individuals can be labelled as such, given the fact that the researcher was not allowed to see their medical files. The biggest problem with this paradigm, however, is that the criminal behaviour is assumed as an indication of individual psychopathology which makes every rebellious behaviour a sign of

psychosocial disorder. This study risks putting the cart before the horse by suggesting that mad acts are produced by mad minds, drawing from a simple causality scheme to explain complex deviant behaviour.

Nevertheless, more and more researchers see this work as an invitation to attack Silke's claim of normalcy by looking into the pathological character of the radical subjects. As yet, this discussion is far from settled. If we were to build a profile of the Jihadi, we would soon find out that the diversity is larger than commonly expected. New realities emerge very quick and are almost unpredictable. Before the Islamic State was declared, the motivation of the leadership figures had a well-founded, even ethical character. The escalation of the Middle East conflict into a civil war, however, seems to have brought a shift in recruitment: more individuals were joining and more emphasis was put on adventurism and violence. The intensification of the military struggle seems to have brought a shift in the type of youngster who travel abroad to join the fight. Youth with a criminal past discover a new market for their delinquent lifestyle in the Caliphate. Or as one of our informants entrusted in an informal conversation: "Actually there are two types of conversions today: You convert to Islam or you can turn to jihad". The first requires study, dedication, and patience; the latter a deep-seated discontent, desire for violence, and a rogue state in development. Of course, we already knew that ideals do not always turn out positively, especially in the minds of young people, who are known for wanting to die or kill for the wrong causes. But seizing the violent Jihad as the next chapter in an already battered life that is dominated by crime, drugs, and a lack of prospects seems to have little to do with striving for a better world. The hardening of the battle in the Levant may have changed the nature of extremism itself. In the kaleidoscope of risk factors for violent extremism (Ranstorp 2016), geo-political and ideological or religious factors dominate the debate, but there are other relevant factors, such as psychological factors, social factors, and group dynamics.

A fuller analysis requires us to consider the material conditions and predicaments, as well as spiritual and moral questions underlying the motives for joining radical environments. Most importantly, as radicalising youth are in adolescence, which is naturally a phase of big transitions, a credible typology starts from this dynamic reality, rather than from static categories. Grouped by their prevailing "leitmotiv", a recent ethnographic study (Sieckelinck and De Winter 2015) reports the following "journeys":

1. Being pushed out: pushed away from problems in the family and/or neighbourhood, a polarised environment, experienced lack of emotional support. Pushed towards a surrogate family, towards authority figures with ideals that seem to give an answer to tensions and insecurities. Eventually, de-radicalisation is set into motion because the person has had enough of the hatred, the negativism, and the common violence in such movements.
2. Being pulled towards: pulled towards the magnetic force of extremist movements. Growing up in a warm and stable family context. Intelligent, ambitious youngsters, with a strong emotional response to injustice. A desire for depth, meaning and a clear goal in life. Because the family cannot meet this specific

need, these persons break away and find a new destination in the radical movement. Ultimately, de-radicalisation is often triggered by boredom or sudden insight into the hypocrisy of the extremist organisation.

3. **Passionate personalities:** certain youngsters are drawn to special and extreme challenge, of whatever nature. Family and social environment cannot fulfil their powerful desires for which they will go to extremes. For example, such individuals are known to have memorised religious or ideological books word by word. In the end, de-radicalisation starts with dissatisfaction about the simplified content of these studies and of the extremist ideal.

What connects these three journeys is a derailed quest for identity. In very different ways, every 'radical' is in an obsessive search for meaning: what is my role in life, where do I belong, what does really matter to me? Where the societal debate over ethnic, religious, and political identity is intensified, the search for identity development can more easily derail among young people. Radical groups may provide what the family context or larger society cannot provide in this sense: a clear sense of identity, a clear purpose, and a sense of belonging. These three journeys (see also Sieckelink et al. 2017) may allow us to think beyond homogeneous checklists as forms of risk assessment. In addition, they convincingly demonstrate that if researchers don't take the dynamics and differences into account, they risk making the same mistake as the former-radical research subjects once did: pinning people down on one of the many aspects of their complex identities. Youth identities are in flux.

In his study of social movements, the sociologist Manuel Castells (1997/2010) distinguishes three types of identities that are directly connected with the meaning we give to and gain from being in the world: legitimating identity, resistance identity, and project identity. The first identity is built with blocks of established institutions; the second withdraws into the trenches and enters opposition to the status quo; the third criticises the institutions in order to participate in better institutions. Already in the 1990s Castells designated violent jihadists as a prototype of the resistance identity. These groups manage to reach young people who are disappointed by the institutions (which often have problems with this group) and take them into a 'perfect storm' by the combination of global Internet mobilisation and the promise that they offer the only global alternative worldview and revolutionary, though politically ultra-conservative, practice.

## Security Versus Socialisation

Research at the intersection of Education and Security Studies is extremely scarce and what is out there is preliminary and hypothetical. When radicalisation first appeared on the international policy and research agendas, it was almost exclusively understood as a security issue, demanding more specialised judicious and criminological expertise (San et al. 2013; Glees and Pope 2005). Nowadays policy makers

and researchers consider the social domain more and more important in countering violent extremism (Veenkamp and Zeigler 2015). Therefore, the recent impact of political and religious radicalisation on our societies has generated a search for effective preventative interventions in the social and educational domain. A well-known example is the Prevent Strategy in the UK (gov.uk 2011), which explicitly includes teachers in the duty “in the exercise of their functions to have ‘due regard to the need to prevent people from being drawn into terrorism’”.

But what can be expected from teachers and youth professionals? Security and Intelligence services have a well-defined role: by approaching young people with radical ideas as at least suspect and – since anti-terrorism legislation was passed unequivocally – even as guilty before charges, they track down youngsters as villains who dare to show any active sympathy with a radical political or religious discourse that may hamper the democratic status quo. In a reaction to the tendency of approaching young Jihad sympathisers as criminals, an important group of scholars has explored an – until then – overlooked dimension in times of ‘war on terror’: the victimisation of young people leaving for jihad. Illustrative are the well-received publications by Weine et al. (2009) and Weine (2012).

Pedagogically speaking, judging adolescents for their subversive views or activities is highly contested, as young persons, to successfully negotiate the transition from childhood to the adult world, have to perform an array of developmental tasks in which the status quo is never sacred (Erikson 1968; Sieckelinck and de Ruyter 2009). Many young people explore modes of engaging with radical and alternative perspectives when grappling with identity issues. While adolescents already face many transitions in various domains of life (friendships, identity, and in their families), “a crucial time of flux follows when they begin to take a view on international events and on their own socio-political identity” (Bhui et al. 2012). This developmental dimension somewhat corrects the static nature of both the victim- and the villain-approach. What’s more is that not only the villain-perspective, but the victim-perspective as well is deeply problematic for educationalists as it overlooks the fact that the people involved are active agents themselves. People construct, maintain, and transform their identities actively. The portrayal of radical youth as vulnerable city children brainwashed by malign recruiters or the frequently found reference to “bumping into the wrong friends” somewhat dismisses this active dimension (see also the promising subculture approach on this issue, e.g., PISOIU 2015).

While intelligence investigators look primarily for suspects, teachers aim to educate and transform their students. Although there may be an overlap somewhere, these goals are clearly distinctive. The difference is best illustrated by the way both domains approach radical youth. Intelligence and security services cannot but approach them as suspect and dangerous, whereas educational institutions approach their students at least as worthy of education, which in Biesta’s view (2015) consists in socialisation, qualification, and individuation. In this light, society’s inclination to come after these young people with a repressive agenda from the first indicator on appears problematic if not all available educational cards have been played. This reflex characterises what Ben-Porath (2006) has called a belligerent

society, in which education is reduced to an instrument for public safety. A thriving democracy, Ben-Porath argues, requires expansive education, in particular when public safety is at issue.

When landscapes of security, intelligence, and education start to shift, this may reduce educational possibilities to counter radicalisation unless a feasible educational outlook is developed that can inspire professionals, citizens, and families to deal with the early stages of possible radicalisation, not based on suspicion but based on empathy and trust. This outlook is very welcome as educational professionals are increasingly confronted with radicalisation-related challenges. Educational institutions are expected to signal deviant behaviour of pupils and arrange follow-up trajectories in case someone is flagged. Moreover, schools feel an obligation to respond to highly media covered extremist events and reassure their pupils in the wake of attacks or in enduring conflict. Third, teachers are frequently confronted with pupils' polarised opinions and conspiracies about collective identities and global politics. This may indicate a looming democratic deficit which is about to present an ever bigger challenge to schools and societies.

## **Towards a Pedagogy of the Radical<sup>2</sup>**

Now that the questions regarding definition, typologies, and the socialisation dimension are presented, one may ask: what educational strategy is defensible? From the arguments in the last section it follows that the goal of our education cannot be that students will learn to keep quiet on issues that seem important to them. Osler (2009) convincingly argues that we need to recognise these pupils as “emergent cosmopolitan citizens living in an age of globalization and human rights” (p. 65). When students practice hate speech, they are better approached not as villains or victims (Sieckelink et al. 2015) but as political agents in spiritual and educational need. As Miller (2013) puts it, young people (and perhaps some of their teachers) may be attracted to radicalism and they may hold extreme views but this is the very stuff of [Religious] Education: “To fail to address such issues in a way that will lead to dialogue, disagreement, investigation, analysis and criticism is to fail those young people and to fail to promote their moral development” (2013, p. 197). Above all, in a societal context of increasing polarisation and populism from all sides of the political spectrum, it is misleading to suggest a merely organisational response or a technocratic correction will bring any sustainable solutions.

The term ‘pedagogy’ is often interpreted as a ‘teaching’ method rather than a philosophy or a social theory. The educational outlook on radicalisation that so many practitioners are in need of, though, cannot be limited to a method or a set of tools, but requires a true pedagogy of radicalisation. As the Greek roots of the word

---

<sup>2</sup>An important share of this section is based on an analysis of personal conversations with David Kenning, extremism-consultant to various governmental organisations. All inaccuracies are the author's responsibility.

‘pedagogy’ illustrate, education is inherently directive and must always be transformative. In other words, what these practitioners seem deprived of is a philosophical anthropology: a theory of human nature, or a socially informed vision of the kind of mind-set we are dealing with here. This pedagogy allows us to approach these youth in the classroom as emerging political agents who may adopt an extreme ideology to escape from their everyday life world in which they run considerable risk of ending up victim or villain, with often little in between. This reality is the real fuel of fascist projects such as the Islamic State. Unlike the intelligence and security perspective, an educational outlook allows youth, through extensive educational interaction, to probe identities that differ from the expectations and demands by the mainstream environment.

Awareness programmes are often developed to warn children against dangers for their development or the community, but education can go further than instruction about vulnerabilities. Looking at radicalisation from a less anxious point of view, it would be an interesting challenge to include youth’s daily experiences, conflicts, and emotions in the programmes. Of course, one can speak with them in idealistic terms about what is evil about war or the violation of human rights, but if there is no room to discuss their own feelings or the hate or fear of certain others, education loses its credibility. Teaching resilience against extremism can go hand in hand with teaching peaceful resistance. Issues such as the rapid multiculturalisation of neighbourhoods, the bio-industrial footprint on the planet, or lethal drone attacks without trial require negotiation, and classroom disagreement on these matters should not be considered a failure but may even indicate that the shared process of *negotiation and compromise* has yielded a win-win outcome. Neglect of this dimension may result in a highly undesirable situation in which adolescents either fall into a kind of nihilism, cynicism, or stupefaction, or else they embrace radical extremism. It is much more sensible, just as Davies (2008) argues, to provide room for youth’s own narratives, perspectives, emotions, and ideals. Naturally, this will sometimes lead to conflict, but the important difference from emotions and hostilities that are released on the streets or the internet – or worse, that fester away under the surface – is that they can be used in an educational context as a basis for constructive (i.e. controlled) expression of peaceful fighting (Mouffe 2005; Achterhuis and Koning 2015) in an atmosphere of “positive” conflict (De Winter 2012).

From a pedagogical point of view, the problematisation of radical behaviour by medicalising and criminalising individuals is expected to be unproductive and possibly counter-productive. Any pedagogical response to radicalisation is unlikely to succeed if it merely aims at de-radicalisation; it may work better as a vessel for ‘re-radicalisation’. Instead of trying to de-radicalise their students, teachers may have more impact when redirecting the need for combat (or ‘Jihad’) into a different direction by employing three strategies on three different levels: mental, relational, and behavioural. Firstly, on the mental level, professionals may want to take strong views and obsessions serious in personal conversations and work on elements of it, piecemeal fashion, through dissolution: What is behind the mind-set? Breaking down in pieces everything that feeds one’s uncertainty or discomfort (this conversation is not about ideology or radicalisation or religious arguments, but about feelings and dig-

nity. Arab poetry could help with reaching this deeper level). Secondly, on the relational level, the teacher takes alienation, disenfranchisement, and victimisation serious through deflection: Who is the enemy? Many are angry at their father, seeking his attention and despising his way of life altogether (Sieckelink and De Winter 2015). This very anger is then directed at the West, again seeking attention and despising its culture and power at the same time. The strategy aims to bring the direction of one's combat in a ricochet: which party deserves the anger? Thirdly, on the behavioural level, it is important to recognise the need for risk taking so that it does not escalate into recklessness, via a strategy of displacement: How can someone make an impact on the world otherwise? Awareness programmes should go hand in hand with exercises and activities that help students acquire peaceful protesting skills. The re-radicalisation strategy can be seen as a way to respect the sense of agency so vital in radical biographies by reframing this initial question: how can I prove myself/my value? In Freire's terms: to build on a future in which my actions matter.

In this process, it proves unnecessary and counter-productive tying the superiority of British or Western values to this pedagogy of radicalisation. The radical mind-set will be hardly impressed by a focus on the nation state or on the democratic state. What may have impact is a focus on the youth's own state of mind by trying to understand what meanings of the world are central in the developing mind. Conspiracy theories, for example, are often the cornerstones of one's identity. Kicking against them may not yield the desired result. Helping youth to self-reflect on them will have more effect. The rise of the radical mind-set calls for solutions in which the adolescent's decision-making processes are central and brought in relation with existing power structures. Interventions against extremism will have little effect unless this problematic mind-set, nourished by the youth's struggles underneath the shell of the 'radical identity', is sufficiently addressed. If necessary, students' minds may benefit from co-creating a 'counter-culture of semi-darkness' where resistance against expectations, definitions, and power is allowed and identities can be explored freely, instead of complying with the high standards for clear and constructive British or European citizenship.

Finally, research suggests that parents are only very rarely a direct cause of radicalisation, just as they are almost never a direct trigger for de-radicalisation. Nevertheless, the family – together with other 'educators' like school, youth-work, church, or mosque – can and must play an important role in the youth's search for identity and a place in society. It is in precisely this area of identity development that a major hiatus occurs. It is worth looking into the strength and pitfalls of authoritative coalitions between parents, schools, and others involved. Many radical youth initially express a clear need for recognition and authority. In fact, they want to be recognised by authorities. Instead their experience is that these very authorities stigmatised them. This leads to deep feelings of indignation and humiliation and subsequently to a mode of defiance and vengeance. The forces feeding these latter feelings are often too powerful and complex for individual parents and teachers to handle. Together, adults in the youth's life may offer the space of recognition and moral authority that these youngsters need to successfully perform their rites of passage (Mahdi et al. 1998; Grimes 2000) from childhood to adulthood.

## Conclusion

Julia Kristeva speaks of “the challenge posed by adolescence as a problem for international politics and individual psyches alike” (Kristeva 2013). And indeed, in an era of social media, global connectedness, and polarisation between groups in society, there is a constant battle going on for the hearts and minds of our children and youth. We, educators, risk to lose this battle to some alternatives out there (offline, but particularly online).

The popularity of radicalisation research has generated a host of studies that are mainly motivated by two questions: what causes radicalisation and how can it be countered? However, a continuously contested concept, radicalisation remains an elusive notion. Methodologically, due to a dearth of empirical qualitative fieldwork, the meanings young people themselves attribute to ‘radicalisation’ are largely unaccounted for. Moreover, there is reason to question the value of this research until the definition of the problem is taken into consideration. How is radicalisation linked with societal tendencies such as secularisation, neo-liberalism, and globalisation that have great impact on youth’s lives? Unless these fundamental issues are addressed, the value of radicalisation research, no matter how booming, is questionable.

Although studies on terrorism have been piling up, we still lack a pedagogy of radicalisation. There is a clear and urgent need for more educational/pedagogical insights on these matters in a time when in Europe as in the United States, in primary and secondary schools and at universities, by the Far/Alt Right and Islamic Fundamentalists, but also leftist and rightist single issue groups, the political polarisation in our societies is almost visibly growing. Hence radicalisation ought not to be considered a problem in itself or (even worse) the domain of Islam, but is better regarded as a phenomenon that shows that we have not succeeded in offering every youth in our polarising societies what they need. Extremism has roots in a context of identity politics over issues such as religion and multiculturalism and in some families or neighbourhoods, children will lack the safety net that helps them overcome critical life events. Both conditions may interfere dramatically with the adolescent’s moral development, as explained above.

While extremism studies will always be connected to public safety issues, this chapter shows the problems with approaching radicalisation from a security perspective only. Underneath the apparently impenetrable coat of the radical identity are universal needs that involve navigating the transition from childhood to adulthood. Radicalisation emerges as a coping mechanism, as a way to explore the world, as means of resistance, as a manner to ban existential uncertainties, as a way to be guided, as a mode to acquire answers, as a stronghold in difficult times, and as an opportunity in which a firm sense of self can be established.

In many opinions on this issue, pundits and scholars either stress ideology or psychology, thereby failing to acknowledge that in the real life stories of radicalised youth, there is no space between both, which is exactly why the experience of radicalisation is so strong and transformative. A pedagogical perspective demonstrates

this interconnectedness of psychological mechanisms and ideological narratives. Therefore a pedagogical contribution to understanding and dealing with issues of radicalisation and extremism will have to negotiate precisely this complex developmental reality through a perspective in which hope and radical imagination are kept alive.

# Patriotism and Nationalism

M. Victoria Costa

## Introduction

Proposals for civic education often include among their central goals the cultivation of patriotic or nationalistic ideals and feelings (Galston 1991, 241–256; Tamir 1992; Callan 1997, 100–131). These proposals understand patriotism and nationalism as sets of beliefs, attachments, and dispositions to act in support of one’s political community. Sometimes the terms “patriotism” and “nationalism” are used interchangeably, expressing the tacit assumption that countries are (or ideally ought to be) nation-states (Ben-Porath 2012). At other times, the term ‘patriotism’ is used to refer to a morally preferable form of attachment to a political community (for example, one that is inclusive and respectful of the basic rights of individuals and groups), while ‘nationalism’ is used to refer to intolerant, exclusionist, or violence-prone forms of identification. However, it is also possible – and seems better – to distinguish between patriotism and nationalism on the basis of their objects. This not only marks a genuine distinction, but it also permits a more careful examination of the question of whether either form of identification is morally desirable instead of giving an answer by stipulation. Among other advantages, the object-oriented strategy takes into account the attachments of transnational peoples, such as Kurds, Basques, and indigenous peoples in the Americas. This aids the discussion of certain political issues that have become more salient since the fall of the Soviet Union and the end of the cold war.

Patriotism has as its object an institutionalized political community such as a country, and it includes special concern with fellow citizens who already share specific legal and political institutions. In contrast, nationalism has as its object a group of people who share a certain sense of common identity. National identities

are typically grounded in a belief in a shared history, an attachment to a homeland, and an aspiration to self-government (Moore 2009). Although some national identities are constructed on the basis of narrow ethnic and religious affiliations, others are more inclusive and culturally pluralistic. Moreover, the content of particular national identities can change significantly over time, becoming more – or less – politicized. One reason that the distinction between patriotism and nationalism is usefully drawn in terms of their respective objects is that many countries contain more than one nation within their borders, and some nations extend into more than one state. As a consequence, the targets of patriotic and nationalist civic education do not always coincide.

When national groups have a stable history of peaceful coexistence within the shared political institutions of a single country, it might be feasible to design multicultural educational programs that combine the cultivation of a patriotic sense of belonging to the multinational political community with the study and recognition of national groups within society.<sup>1</sup> Such programs of multicultural education often include the study of processes of immigration and the contributions that immigrants have made to the wider society. However, the difficulties faced by recent immigrants to integrate and to feel at home in their new country are different from those of national minorities that are deeply rooted in the territory but aspire to some form of collective self-government – such as the Maori people in New Zealand, or indigenous peoples in Canada. As a consequence, the kinds of policies that can be implemented to respond to the particular needs and demands of minority nations and immigrants are quite different as well, even if they are often discussed under the general label of multiculturalism (Kymlicka 2001). There are of course significant differences among immigrant groups themselves that affect their prospects for successful integration in their new country (Hochschild and Cropper 2010). A variety of factors impact the extent to which immigrants can feel at home and welcomed, such as whether they are confronted with racism, or other forms of prejudice, as it is the case for immigrants of Muslim origin in many Western societies in light of ‘security concerns’ in recent decades. Although civic education programs could certainly aim at discouraging prejudices and stereotypes, emphasis on patriotic or nationalistic forms of identification may actually get in the way of facilitating immigrants’ integration by reinforcing their perception as ‘outsiders’. On the other hand, it might be possible to appeal to a real or aspirational national or patriotic virtue of inclusion and acceptance in order to combat such tendencies.

When societies are deeply divided along national lines, the goals of patriotic and nationalist education can come into sharp conflict (Spinner-Halev 2003). In such a situation, the state is often perceived as representing the majority nation, and one source of disputes is precisely which political community should be the primary focus of children’s loyalty. Even moderate educational programs aiming to create a thin sense of identification with existing political institutions may backfire, and be

---

<sup>1</sup> However, programs of multinational civic education face a number of challenges in their efforts to shape desirable forms of nested identities. For a discussion of these issues in the context of Canada see McDonough (2003).

perceived as assimilationist by national minorities. This seems hard to avoid, since schools face choices regarding the language(s) of instruction, which official holidays to celebrate, and how to teach children about the history and symbols of the country and its regions. Educational practices tend to better reflect and enable the self-understandings of members of the national majority in a territory or region, as against those of others. As a result, when members of national minorities are territorially concentrated, they may expect to have their own separate schools and to be able to teach their history and culture to new generations in order to maintain a separate identity.

## **Arguments for the Cultivation of Patriotic and Nationalist Attachments**

There are two general types of normative arguments that have been developed in support of patriotic and nationalist approaches to civic education, which can be labeled ‘non-instrumental’ and ‘instrumental’, respectively. Non-instrumental arguments try to make a case for the intrinsic value of the relevant beliefs, attachments, and dispositions to support one’s political community. One non-instrumental strategy takes these ties to be constitutive of individuals’ identities and therefore to be central to the flourishing of those individuals and the communities to which they belong (MacIntyre 1995; Miller 1995; Hurka 1997). However, instrumental arguments are more common. These arguments take the value of patriotism and nationalism to be dependent on their contribution to the achievement of other political goods, such as countering social fragmentation, promoting solidarity and social justice, or encouraging democratic participation (Moore 2001b; Callan 2002).

### ***Non-instrumental Arguments***

Although there are variations in the details of non-instrumental arguments that support cultivating attachments and loyalty to country and/or nation, all such arguments begin with the claim that individuals typically have strong feelings of identification with their political communities, and that one result of having these feelings is that their well-being is perceived to be tied to the prosperity of their communities. These bonds and attachments are described as intrinsically valuable, and therefore something that parents would wish to transmit to their children. These same attachments are also considered to be the source of obligations to support one’s political community and fellow members. Making use of an analogy with family relationships and friendships, some advocates of patriotic and nationalist partiality – Thomas Hurka (1997) and David Miller (1995), for example – argue that there are important goods internal to political relationships, and that special obligations can be derived

from them. Given that individuals' subjective feelings of identification and the corresponding sense of obligation can vary in many ways – both interpersonally and intrapersonally – Miller (1995, 65–73) adds that the more precise content of these obligations is to be determined by public debates among members of the political community. The result is a view according to which subjective feelings tie individuals to their political community, but it is the community as a whole that establishes the particular obligations owed by members. For Miller, these obligations count as legitimate provided that their content is established in open and democratic ways: that is, as a result of collective self-determination. This way of solving the problem of the content of national obligations is dependent on the existence of democratic mechanisms, so it better explains the ties and obligations that hold among members of nations that already have their own political institutions.

A more extreme version of the non-instrumental argument has been proposed by Alasdair MacIntyre (1995), whose views continue to shape much of the contemporary debate on the morality of patriotism and nationalism. According to MacIntyre, one's relationship to one's political community is central to acquiring moral knowledge, moral motivation, and genuine self-understanding. MacIntyre claims that we always learn morality in the context of a particular community, in the sense that the moral rules and norms we are taught have a precise content as part of the way of life and specific institutions of our community. MacIntyre thinks that most individuals will come to understand their own lives as embedded in the history and traditions of their political communities, and will develop a sense of what they owe to others that is shaped by such communal ties. He claims that if the relations individuals have to their political community are severed, they will lose their grasp on authentic standards for moral and political judgment. So for MacIntyre the question of whether one should be loyal to one's nation or one's country does not seem to be open to discussion. Despite its obvious conservatism, this account still makes some room for limited forms of rational criticism of the current practices of one's political community. An individual's allegiance is to 'the political project of the nation', and the current government and leaders may fail to represent what others take to be the core values of this project.

While these types of claims continue to be central to the non-instrument arguments of patriotic and nationalist partiality, they have received a variety of criticisms (Moore 2001a, 25–51; Kodelja 2011; Primoratz 2015). One initial point worth making about these arguments is that they rely on a particularistic ethics that attempts to ground obligations to the political community directly in the relationship between the community and its members: a relationship that is supported by strong feelings of attachment and identification. One may simply find such a theory of the source of obligation implausible. Moreover, if – as is typically the case – individuals are involved in a variety of valuable relationships, and have multiple and overlapping identifications with communities and groups, advocates of patriotic and nationalistic partiality must at least provide additional reasons for giving special weight to these attachments (when they exist) at the expense of all the others. This is necessary if they want to defend the claim that these attachments should become central to educational practices and be transmitted to new generations. Further, and

as was mentioned earlier, patriotic and nationalist attachments do not always coincide, and may pull in different directions, leaving open the question of which should take priority. Moreover, many contemporary societies contain immigrant groups that maintain strong ties to their native countries, and they also typically contain groups with cosmopolitan attitudes and commitments, who may reject patriotic and nationalist educational programs on the basis of their own moral and political attachments and convictions (Furia 2005). So it seems difficult – to put it mildly – to design educational programs that can fairly accommodate the resulting variety of loyalties, attachments, and identifications. This is a serious problem for those who employ the non-instrumental argument precisely because it is something like an internal criticism.

Here is another criticism of the non-instrumental argument, at least as MacIntyre presents it. The undeniable fact that people can live good lives in societies that are multinational and multicultural – and that they can live good lives even if they migrate from one society to another – raises serious doubts about his account of moral learning and moral judgment (Waldron 2003). Even if many children first learn moral and social norms in the context of small communities that are relatively homogeneous, they are able to incorporate and navigate a wider variety of norms as they grow up. It is also possible to critically revise some of the norms one has learned growing up, and to decide not to follow them as an adult, without necessarily at any point losing one's standards for moral and political evaluation. As Waldron (2003) points out, people are capable of developing strategies for cooperatively interacting with those who come from very different cultural backgrounds. Indeed, one might argue that civic education should actually encourage such interactions. In any case, as a consequence of these cooperative interactions, people are capable of learning new norms or transforming old ones. In fact, most human lives are not lived within one single monolithic or 'pure' culture. Even when people live in the same place all their lives, their cultural practices embody heterogeneous fragments taken from a variety of cultural sources, constantly subject to transformation and adaptation. For this reason, even the distinction between global and local cultural phenomena is hard to maintain.

### *Instrumental Arguments*

A second general type of argument in defense of patriotic or nationalist policies of civic education depends on the claim that shared identification with the political community is instrumental in producing significant benefits. It is worth pointing out that this sort of argument favors nationalist projects when the nation has its own political institutions – that is, when 'nation' is understood as the people of a whole country – but it is not very accommodating of the aspirations of national groups that lack their own political institutions and live side by side with other groups within the same country. One reason for this is that feelings of identification and attachment are expected to provide the ties that bind the citizens of a country together in ways that

facilitate the functioning of existing institutions, helping to secure common goods such as justice and democracy. And in the absence of an overarching shared identity, the argument favors its creation, that is, some sort of project of (multi) nation-building. But such projects are often resisted both by national majorities and minorities.<sup>2</sup>

One version of the instrumental argument claims that a shared identity creates bonds of affection and solidarity that aid in the implementation of policies of distributive justice (Miller 1995; Callan 2004). On this view, feelings of emotional identification with the political community and fellow citizens are valuable because they encourage cooperation on common projects and make participants more willing to make sacrifices for the common good or for the welfare of others. In this way, if civic education succeeds in encouraging such feelings, citizens would be more likely to support policies that secure access to education, health care, and other social benefits for the worst off members of their society. The problem with these claims is that they do not seem to have sufficient empirical support. There does not seem to be any clear correlation between widespread patriotic or unified nationalist feelings on the one hand, and well-functioning welfare institutions on the other. For example, citizens of the United States are, arguably, more unified by feelings of national belonging than are citizens of Canada or the United Kingdom, but the American welfare state is much less developed than the Canadian or the British one. As Margaret Moore (2001b) has persuasively argued, redistributive welfare policies depend on the existence of large bureaucratic institutions that mediate between citizens' feelings and public policy. Once established, such policies seem to work independently of national feelings that might or might not support them. On the other hand, as Moore points out, when there are persistent feelings of hostility or indifference towards national minorities or immigrants in a society, redistributive policies that benefit them may be hard to sustain in the long run.

Another version of the instrumental argument claims that a shared political identity helps representative institutions to function more effectively and encourages democratic participation. Advocates of this line of argument claim that a shared identity facilitates debates about the common good by reducing distrust among the parties (Miller 1995, 90–98). When there are different national groups with antagonistic identities, genuine democratic dialogue is very difficult if not impossible. Moreover, under such circumstances members of national minorities are often discouraged from participation as they feel that the interests of their groups are not adequately represented in the political process when they consistently find themselves on the losing side of debates. However, all that these considerations actually license us to conclude is that national divisions often pose serious challenges to democratic mechanisms. They do not license the conclusion that civic education, oriented to creating a shared identity, is the most promising way to overcome these

---

<sup>2</sup>Regarding difficulties in cultivating a sense of shared identity in schools in deeply divided societies, see Spinner-Halev (2003). Among the examples he discusses are India and Israel, and the associated divisions between Hindu and Muslim populations, and Jewish and Palestinian populations.

challenges. In fact, there are other policies that seem to be more appropriate: for example, reforms in representative institutions that facilitate power sharing in government (Moore 2001b).<sup>3</sup> At most, civic education would have to work alongside other policies to overcome national divisions. Even if educational programs could try to encourage a sense of belonging together, they would also have to recognize minority nations and accommodate reasonable demands for distinctive forms of education. Historical and sociological studies of nationalist movements might indirectly teach competence in assessing the reasonability of nationalist demands. But, if they are to satisfy this educational goal, such studies would need to be careful to avoid taking sides on the question of whether nationalist attachments are valuable (McDonough and Cormier 2013).

Of course, in societies without deep national divisions, it might well be true that nurturing and maintaining patriotic feelings in schools would improve the quantity and quality of democratic participation, and would facilitate implementing redistributive policies. But, even if true, this would support only a more restricted version of the argument. Moreover, given the complexity of social phenomena, the empirical evidence in its favor appears inconclusive. In light of this, critics of patriotic civic education point out that merely having the potential to produce valuable consequences is not enough. Rather, if we are to evaluate the instrumental argument seriously, we must take into account the kinds of dispositions that actual educational projects generate in different societies, and make an overall assessment not only of the benefits it produces, but also the costs (Brighouse 2003). The costs of civic education may turn out to be significant, if they produce extreme forms of patriotism that numb citizens' critical capacities to evaluate their countries' foreign policies (Brighouse 2003; Costa 2011a; Kodelja 2011).

## The Need for a Sense of Belonging

As the preceding discussion has shown, one common assumption made by advocates of patriotic civic education is that a having a sense of belonging together contributes to the well-functioning of social institutions and the well-being of individual citizens. What such theorists seem to assume, without arguing for it explicitly or even recognizing that argument is needed, is that having a sense of belonging crucially depends on experiencing specifically patriotic feelings of attachment and identification. Their assumption seems to be that social stability is under serious threat unless

---

<sup>3</sup>But while a variety of accommodations can help mitigate conflicts among national groups, it may also encourage feelings of separateness or indifference between them. Often national groups are interested in learning about the cultures and languages of other societies, but not about those of their own neighbors. This need not be the result of any hostility, but of the view that, say, learning English as a second language will increase their children's opportunities in the future. See Kymlicka (2003).

citizens share some common political identity that functions to counter the fragmentary tendencies of pluralism and multiculturalism.

The assumptions just described might go some distance in explaining the common tendency in many countries of giving a patriotic orientation to courses that cover the history and governmental institutions of their society, especially in primary and secondary schools. Patriotic emphasis in civic education is often a response to recent political events, such as armed conflicts or re-drawing of borders. For example, this was the case with newly formed countries in Eastern Europe post 1995 (Bromley 2009).<sup>4</sup> However, advocates of patriotic civic education disagree about how best to achieve patriotic goals. A moralizing and sentimental approach is very common in practice, especially regarding the teaching of history, but very few theorists openly defend it. The problem with a moralizing history is that, even if it successfully manages to transmit an inspiring picture of the country and its people, it invariably also involves a distortion of the truth about past events. A well-known advocate of this approach – despite the required distortion – is William Galston (1991). He argues that loyal identification with one's country is best encouraged by presenting "a pantheon of heroes who confer legitimacy on central institutions and are worthy of emulation" (1991, 244). Galston is concerned that a more critical and truthful approach would undermine "structures of unexamined but socially central belief" (1991, 242). However, one drawback of making use of 'noble lies' to encourage patriotism is that students may continue believing in such fictions when they grow up, even against evidence to the contrary. These false beliefs may undermine their civic capacities to critically assess policies adopted by their country or proposed by their political candidates and leaders. Fictions are often more comforting than the actual facts and may make it easier to maintain loyalty to one's beloved country. If this type of sentimental civic education succeeds in its goals, then, as Callan (1997, 100–131) has pointed out, it may also encourage self-deception by leading people to filter complex political events in ways that allow them to maintain their belief in the bland and uplifting stories they are comfortable with. And there is also the risk that a sentimental civic education will not succeed in the first place; a sentimental presentation of the past may well fail to persuade students, since they are often exposed to less sanitized versions of the past in the media, in the family, and in other social settings.

Objections to Galston's simplifying and distorting form of civic education do not apply to other educational attempts to inculcate patriotism. In fact, Callan argues that teachers should be truthful in their civic lessons, discussing past and present injustices while also encouraging students to seek out what is best in their country's traditions. The alternative patriotic approach Callan recommends attempts to strike a delicate balance between cultivating loyalty and preserving the capacities and motivations required to support just causes. When patriots with a sense of justice are confronted by serious injustices perpetrated by their own country or compatriots, their patriotism could then provide the motivating force to struggle to right those

---

<sup>4</sup>But there is a significant trend towards incorporating universalistic values in civic education, emphasizing international cooperation, tolerance, and respect for human rights (Bromley 2009).

injustices (Callan 2011). However, a loyalty oriented by a concern for justice presupposes that the object of loyalty has morally valuable features. As a result there is a significant tension between loving one's country deeply and appreciating that it has serious moral flaws. When patriots who are inspired by a sense of justice discover that their country is complicit in severe injustices, they might feel prompted to fight injustice, but they might just as easily give up their patriotic loyalty (Costa 2011b).

## Beyond Shared Identities

Many disputes about the desirability of patriotic forms of civic education reflect the difficulties involved in the joint projects of inculcating loyalty to the existing political community, teaching history and social sciences rigorously, and encouraging critical reflection about the functioning of social institutions. These difficulties might be avoided by giving up on patriotic civic education and looking instead for some other way to create a sense of belonging together.

One alternative proposal to create a sense of belonging together is inspired by the work of John Rawls (1993) and focuses on achieving consensus on political principles of justice and democracy. Consensus on principles of political morality could be the source of social unity, insofar as these principles are capable of accommodating a plurality of reasonable values and forms of collective identification. According to Rawls (1993, 5–6), to be just a society must guarantee a set of basic rights and liberties to all of its members, including the right to vote and to run for office. It should also implement policies that secure equality of opportunity, as well as redistributive policies that improve the life prospects of its worst off members. However, advocates of a 'Rawlsian' civic education are not necessarily committed to the view that schools should teach these particular substantive principles. This would amount to teaching a political ideology that many citizens might reasonably reject. Rather, schools might teach respect for basic rights and liberties and might advocate democratic procedures for decision-making: ideas that are more likely to gain widespread support because they can be seen as embodied in the constitution and the legal and political system (Costa 2011a). Whatever the precise content of these principles, if members of society could converge on accepting them, then it seems that they do not need to think of themselves as a single people with a shared past. Rather, they could think of their shared institutions and public culture as embodying these binding principles. Moreover, it would be possible to study the history of these institutions, and the public culture, in ways that acknowledge the grievances and perspectives of different groups, while also providing some hope that the gap between the political ideals embodied in these institutions and their actual workings can be reduced over time.

The principle-based strategy for civic education has received a number of criticisms. One common criticism is that placing this sort of emphasis on a set of political principles as a focus for unification may have unwanted exclusionary

effects. Such a policy would place an undue burden on members of society who do not explicitly endorse the political principles accepted by the majority, even if they have demonstrated that they are good citizens, capable of interacting with others in tolerant and respectful ways (Williams 2003, 219–223). Contrary to the principle-based strategy, Andrew Mason (2000, 115–147) argues that all that civic education really ought to cultivate is a sense of belonging to the political community. And to have such a sense of belonging, all that need be true is that that citizens feel at home in their political community. For Mason, for a person to feel at home in the institutions of a polity is for her to be able to find her way around in that polity and to experience participation in its institutions as natural. One difficulty with this proposal is that such a sense of belonging cannot be the result of indoctrination, but must stem from an inclusive form of education that also equips students with the critical capacities, political virtues and knowledge that are necessary for good citizenship. Mason thinks that programs of multicultural education that recognize the variety of cultures and affiliations of members of society and encourage their mutual valuing may help create this sense of belonging, if they work together with other policies supporting integration. One advantage of this proposal is that it could allow different groups to interpret the values embodied in their shared institutions in different ways.

Melissa Williams (2003) expresses similar concerns about forms of civic education that are designed in order to create a shared identity or a consensus on political principles. As an alternative, she proposes that we design civic education around the idea of ‘citizenship as shared fate’. This is the idea that we are in webs of relationships with others, and that we share our lives with others, whether we voluntarily choose such relationships or not. Given our interdependency, she argues that we need to find ways of living together that can be justified in reciprocal ways, and that this involves cultivating a number of political virtues (Williams 2003, 233–235). Even in an increasingly interconnected world, Williams admits that the (multi) nation-state remains a central site for civic activity. Following Williams’ account, Sigal Ben-Porath argues that encouraging students to see each other as sharing a common fate might contribute to the functioning of the existing democratic institutions of their country by equipping them with dispositions to deliberate together and find mutually acceptable solutions to common problems (Ben-Porath 2012). However, Ben-Porath’s assumption that the task of civic education is to cultivate a sense of shared fate only among fellow citizens overlooks a key element of Williams’ proposal that makes it more responsive to the conditions of an increasingly globalized world. This is the idea that significant relationships and interactions among people do not stop at the borders of countries, and that political virtues are also necessary to evaluate and shape these interactions in fair and legitimate ways. Many social, economic, and political relationships that have enormous impacts on people’s lives fail to have boundaries that coincide with those of the state. For these reasons, students should be encouraged to reflect on the fact that they share the world with others and that interdependencies create responsibilities to cooperate and to respond in morally acceptable ways to problems that cross political boundaries, such as environmental disasters, humanitarian crises, global epidemics, or inter-

national crime. Critical reflection could also be extended to the ways in which one's political behavior and consumer choices might aggravate these problems. Good citizens may (or may not) have deep feelings of attachment to and identification with their countries, and they may (or may not) welcome the development of international and transnational political institutions. But they must be aware of their civic obligations, and the ways in which their decisions affect not only their local community, but also people who live in other parts of the globe (Costa 2016).

## Conclusion

This chapter has examined the question of whether the cultivation of patriotic and nationalist ideals and attachments should have a central place in programs of civic education. It argued that the most useful way to draw the distinction between patriotism and nationalism focuses on their respective objects of loyalty; patriotism is loyalty to a country while nationalism is loyalty to a people. This way of distinguishing between patriotism and nationalism formed the background for the discussion of a variety of arguments for cultivating patriotic and nationalist political attachments in schools. Among other things, the background distinction highlighted the fact that such arguments tend to better account for the aspirations of groups that already have their own political institutions. The chapter also examined an assumption common to these programs of civic education: that a shared identity grounded in patriotic or unified nationalist feelings is crucial for citizens to have a sense of belonging that supports the flourishing of more just and democratic institutions. It discussed the difficulties involved in teaching patriotic or nationalist loyalty in ways that do not distort past and present events. It also examined a number of alternative ways to encourage a sense of belonging that do not privilege patriotic or nationalist ties at the expense of others forms of political attachment, given the existence of multiple identifications and loyalties, some of which transcend political borders. More crucially, given that social, political, and economic relationships and interdependencies do not stop at borders, well informed and competent citizens need to be disposed to examine them from a point of view that acknowledges political affiliations but does not privilege them at the expense of the rights and interests of others.

# Non-human Animals

Kai Horsthemke

## Introduction

Most of our contact with non-human animals occurs, directly or indirectly on a daily basis, when we eat them, when we wear products that have been made of their skin, fur and bones, and when we use commodities that have been tested on them in laboratories and/or that contain products of animal origin. We keep them as pets, status symbols, and aids or tools in our work. Less frequently, we seek out their presence in circuses, zoos and game parks, and use them for recreational purposes: we ride and race them, fish and hunt them. Some of us also study them, both in artificial (laboratory) and natural settings – to learn more about them and about ourselves.

Conflicts of interests, then, commonly occur in situations where animals are utilized for human ends and benefits. Relevant theories that defend this exclusively instrumental view of non-humans and that grant animals at best moral object status, theories like so-called indirect duty views<sup>1</sup> and contractarianism (with its idea of ‘justice-as-reciprocity’), are loosely subsumable under the label of (moral or ethical) anthropocentrism, or ‘human-centred ethics’. As I have shown elsewhere (Horsthemke 2010: 135–158), they prove to be vulnerable either to the so-called argument from marginal cases or to the argument from speciesism, or both. The former states that any account designed to exclude animals from the realm of (directly) morally considerable beings will also exclude certain human beings (like young children and people with cognitive disabilities, senile dementia, and the like).

---

<sup>1</sup>Theories of ‘indirect duty’ essentially deny that we can have any direct duties to non-human animals. To speak of our ‘duties to’ them is to acknowledge in the main our responsibility to God, in respect of his creation, and/or to other human beings, i.e. not to hurt their feelings or affront their sensibilities. I return to this issue in my discussion of Aquinas and Kant.

K. Horsthemke (✉)  
KU Eichstätt, Eichstätt, Germany

The latter holds that excluding animals simply on the basis of their not being human is an irrational prejudice not unlike that involved in sexism and racism (see also Horsthemke 2015: 125–146).

It is widely accepted among animal psychologists, ethologists and students of animal behaviour in general that we are only beginning to recognize the vast reservoir of shared properties and similarities between ‘us’ and ‘them’, not to mention the many superior characteristics and capabilities possessed by non-human animals. Differences between humans and non-humans are differences in degree, not in kind. Other animals, too, are conscious individuals, many possessing even conative and cognitive abilities. Like humans, they have biological as well as conative interests and a life that can be better or worse for them; they can be harmed and benefited; and they deserve to be treated and given consideration in accordance with their particular characteristics.

Questions about the conative and cognitive life, as well as the status and treatment of other-than-animals have been receiving *systematic* consideration by philosophers for close to 50 years. Since the publication of *Animals, men, and morals*, edited by Roslind Godlovitch, Stanley Godlovitch and John Harris (1971), which also contained the first exposition of Richard Ryder’s term ‘speciesism’ (the analogy being with sexism and racism) and which was famously described by Peter Singer as “a manifesto for an Animal Liberation movement” in his review for *The New York Review of Books* (Singer 1973), a wealth of philosophical, scientific and other literature has been published on the theme of systematic discrimination against non-human animals. Courses on comparative psychology, animal ethics and animal rights have been introduced in the undergraduate and postgraduate curricula of a substantial number of universities worldwide. It is all the more puzzling, then, that it is only in recent years that these issues have been addressed within philosophy of education, the focus being mainly on the eating of animals.<sup>2</sup> By contrast, environmental education has for many years received wide coverage, not only by philosophers but also by other social scientists, natural scientists and politicians.

This chapter is part of the growing body of literature on animal-related education. It examines how empirical evidence (psychological, medical and statistical) for the purported links between animal abuse and human violence bears on education. The chapter’s chief normative focus is both on the moral implications of a psycho-physical continuum between humans and non-humans and on the promise of theriocentric (animal-centred, as opposed to anthropocentric) education. Does anti-racist and anti-sexist education logically entail anti-speciesist education? Similarly, is there a necessary link between human rights education and animal rights education? In drawing attention to these questions, the chapter presents an account of moral education as both education in matters of social justice and education in ‘moral feeling’, cultivation of (appropriate) moral sentiments. Given most children’s natural interest in, and feeling for, animals (see Wilson 1984; Myers 1998), this should arguably be easier than is commonly assumed. However, as I will

---

<sup>2</sup> See, for example, Rowe (2009, 2012), Rice (2013a, b) and Rice and Rud (eds.) (2016).

argue, it does require considerable effort and commitment on the part of educators, parents and teachers alike.

## Animal Abuse and Human Violence

According to sociologist Margaret Mead, “One of the most dangerous things that can happen to a child is to kill or torture an animal and get away with it” (quoted in Clifton 1991: 45). Many philosophers have discussed the link between animal abuse and violence towards people. The ‘tradition’ and intellectual history of this concern notably encompasses the views of Thomas Aquinas and Immanuel Kant. Aquinas argues that, since animals can be treated cruelly, cruelty to them is to be condemned for two reasons. Firstly, it may lead to cruelty to human beings, and secondly, it may not only hurt the feelings of other human beings, but it may also not be in the general interest of those who profit from the animals, and for whose sake the animals exist. God, after all, cares for non-rational creatures for the sake of rational creatures (Aquinas 1976: 56–9, 118–21). Kant offers two inversions of the Thomist argument: “Tender feelings towards dumb animals develop humane feelings towards mankind”, and “If (a man) is not to stifle his human feelings, he must practice kindness towards animals, for he who is cruel to animals becomes hard also in his dealing with men” (Kant 1976: 122, 123). For a long time, however, it proved difficult to establish logical and empirical grounds for inferring that kindness to animals necessarily entails kindness to humans, or that cruelty to animals will lead to cruelty to human beings.<sup>3</sup> It is only in recent years that, on the basis of psychological, medical and statistical research, an impressive body of evidence has accumulated in support of what for a long time had been little more than an interesting hypothesis. Recent findings indicate that inmates serving terms in prison for abusive and violent crimes often have histories of abuse towards animals when they were young (see Linzey 2009 *passim*).

One response has been the demand for new and improved legislation (see Schaffner 2009; Robertson 2009), which would include longer prison terms and higher fines, as well as a mandatory psychiatric evaluation and treatment for anyone convicted of mistreating animals.<sup>4</sup> Two major worries remain, however. While new and improved legislation should no doubt be welcomed, the question remains how powerful any law can be in the absence of legal rights of individual animals. The

---

<sup>3</sup>I wish to note at this juncture that appeals to kindness and injunctions against cruelty constitute a basis neither for morality nor for moral education. Most importantly, embodying as they do reference to agents’ mental states, motives or intentions, they fail to account for our positive and negative duties. At most, such appeals and injunctions characterize a virtue ethic’s identification of ‘rightness’ and ‘wrongness’, respectively, without these necessarily translating into action.

<sup>4</sup>There is a persistent worry that the punishment meted out in response to the abuse and torture of animals is either applied inconsistently or does not even begin to fit the crime, or both. The argument runs that large-scale animal abuse remains legal – pertaining especially to the food, biomedical and clothing industries.

vast majority of animals in the vast majority of countries lack *locus standi*, legal standing – so any piece of legislation will lack an important component when interpreted by judges or juries. In contrast, human rights abuses are in principle dealt with successfully, because of the legal acknowledgement and bindingness of human rights, nationally and internationally. My second worry is that, laudable as considerations of just desert, deterrence and rehabilitation projects may be, any such punishment necessarily involves combating the symptoms rather than the underlying disease. This is where deontological and/or consequentialist reasons and principles need to be supplemented by virtue-ethical considerations, fellow-feeling, compassion and care. Children do not develop into good adults, i.e. morally decent individuals, merely through a series of proscriptions or threats of punishment – quite the contrary. It is desirable neither that they are guided solely by their feelings or emotions nor that they are guided exclusively by their intellect. Feelings on their own are not a trustworthy guide because they change, often quickly and radically. Yet, to expect children to rely on their intellects alone would be to treat them as intellectual robots. The idea of mass-producing intellectual robots acting solely on principle or on the basis of cost-benefit analyses, and who dismiss the *rational* significance of feeling and caring, is not an attractive one.

In the next section I examine the complementarity of social justice and moral sentiments in moral education.

## Capabilities, Moral Sentiments and Social Justice

In *Frontiers of justice* (Nussbaum 2006) Martha Nussbaum takes up three urgent problems of social justice not (or only insufficiently) addressed by current (notably Kantian and Rawlsian) theory, problems that are nonetheless of immediate concern in everyday practical life. She seeks to establish a theory of social justice that will accommodate not only those with mental and physical disabilities and foreign nationals but also non-human animals. In proposing a capabilities approach to questions of social justice and moral entitlement, Nussbaum provides a list of capabilities that give “important precision and supplementation” to rights – or rather, to use her preferred notion, to entitlements shared by humans and non-humans (Nussbaum 2006: 284–285). Apart from my concerns in the latter regard,<sup>5</sup> I do not believe that all the capabilities listed by Nussbaum are basic. Some clearly are (like ‘life’), but most appear to be derived from more basic capabilities, e.g. for well-being, flourishing and the like. Nonetheless, her list (which also includes “bodily health”, “bodily integrity”, “senses, imagination, and thought”, “emotions”, “practical reason”, “affiliation”, “other species”, “play” and “control over one’s environment”; Nussbaum 2006: 393–400; see also Nussbaum 2004: 314–317) is useful in that it

---

<sup>5</sup>In section 7.1 of my book *The Moral Status and Rights of Animals* I argue that rights share certain features with entitlements, claims, etc., but that they cannot be viewed as synonymous with any of these (Horsthemke 2010).

gives content or substance to the rights humans and animals might reasonably be said to share.<sup>6</sup>

Especially pertinent to present concerns are Nussbaum's thoughts on moral education, and on the educational significance of moral sentiments in particular. She points out that any theory or tradition that "derives [ethical and] political principles [solely] from the idea of mutual advantage, without assuming that human beings have deep and motivationally powerful ties to others" (Nussbaum 2006: 408) may *appear* to have a distinct advantage over theories that emphasize more or less extensive benevolence.

The capabilities approach demands a great deal from human beings. ... The solution to our three unresolved problems [i.e., extending principles of social justice to those with mental and physical impairments, foreign nationals and non-human animals] requires people to have very great sympathy and benevolence, and to sustain these sentiments over time. (Nussbaum 2006: 409)

This raises the question whether any such approach is at all realistic. Nussbaum responds by noting a substantial "defect in the classical theorists' treatment of the moral sentiments: their lack of attention to cultural variation and the role of education" (Nussbaum 2006: 410). With the exception of Rousseau, all "seem to hold that the repertoire of sentiments of which a group of citizens is capable is pretty well fixed" (Nussbaum 2006: 410). By contrast, Nussbaum emphasizes "the malleability of moral sentiments, their susceptibility to cultivation through education, ... sentiments that will support radical social change in the direction of justice and equal dignity" (Nussbaum 2006: 410, 411).

This account of moral sentiments provides a natural and attractive account of moral *motivation* – as contrasted with accounts of principled *requirement* or *duty*. It also takes care of the supposed requirement of *impartiality*. Some moral sentiments and virtues (like love and friendship) are *partial*; others (like honesty and beneficence towards others in general) are not. What is needed is not strict impartiality but an understanding of the nature of the different moral sentiments and virtues and how they relate to one another.

In my view, in order to effect any *lasting* changes, also in terms of legislation regarding the treatment of animals and environmental policy in general, moral education needs to incorporate more than reasons and principles associated with a deontological orientation or rights ethic.<sup>7</sup> It needs to include considerations of kindness, empathy, sympathy/compassion, empathy, feelings of kinship – indeed –

---

<sup>6</sup>What remains unclear, however, is how Nussbaum's verdict that "research using animals remains crucial to medical advances, both for humans and for other animals" (Nussbaum 2006: 403) is to be squared with her capabilities approach. While she emphasizes, in this context, "the dignity of animals and our own culpability toward them" (Nussbaum 2006: 405), her verdict is based not only on a factual error (see Horsthemke 2010, section 3.7) but also appears to be normatively inconsistent.

<sup>7</sup>While no philosophical work on animals would be complete without mentioning Peter Singer's essential contribution (Singer 1975), I do not think his utilitarian position affords animals the necessary protection and consideration. Most starkly, it is at best silent on the killing of non-humans, provided that this occurs painlessly (see Horsthemke 2010: 186–206).

appeals to *human* benefits (whether individual or collective), etc. That is, if moral rules and principles are to be useful and motivationally effective in our lives, they need to affiliate with rule- and “principle-independent (positive) human emotions” and virtues, like care, empathy and sympathy/compassion (Slote 2013: 30; see also Beetz 2009). There is a possible compromise between the rule- and principle-based considerations of, for example, a rights-based ethic and a care conception, which will avoid relativism as well as nurture social and environmental literacy and responsibility. It will consist in the adoption of a rights and duty orientation as the basis, without denying the importance of a care conception. After all, children are not made moral individuals by appealing first to their intellect and only thereafter, if at all, to their feelings. As Amy Gutmann has observed: “To cultivate in children the character that *feels* the force of right *reason* is an essential purpose of education in any society” (Gutmann 1987: 43; emphasis added). An affective capacity for morality provides the ‘raw material’ for fostering rational self-determination and the use of reason for making choices and decisions. Just as society can be responsible for “nature-deficit disorder” in children (Louv 2005), it can achieve the opposite, through both the elicitation of care and compassion as well as the education in moral reasoning, and inculcation of principles and skills. Just as “children have to recognize [or be made to feel] that their parents – or parental substitutes – *love* them” (Slote 2013: 30; emphasis in original), they have to realize that what is wrong for others to do to them is wrong for them to do to others. This appears to be the essence of the idea that there is no substitute for a direct concern for others as the basis of morality. Children must learn to cultivate their empathic and ‘sympathetic imaginations’. This is not easy, as Richard Hare has cautioned: “And it will not be brought about by rational discussion alone” (Hare 1992: 125). Thus, the ethical significance of feelings is not questioned. What *is* doubtful, however (and this is where I disagree with virtue ethicists and care ethicists in particular), is that the motives and ethical beliefs underlying the practice of virtues, care, recognition of responsibilities, etc. differ from culture to culture, *and* that such empathic and sympathetic imagination, caring, etc. can actually provide a sound moral basis, i.e. a guarantee or consistent prescription, for right action. Empathy and compassion might be seen as the heart of a comprehensive social justice movement, but rights are, or rather *should be*, its backbone.

### **Children and Other Animals: A Brief Digression into the Terrain of Developmental Psychology**

For every horror story involving the torture and death of animals at the hands of children and teenagers, there are arguably multiple success stories and often heart-warming accounts of symbiosis, rescue operations and reunification involving young humans and animals. Given most children’s natural interest in, and feeling for, animals (as I document below), moral education as *both* education in matters of

social justice *and* education in ‘moral feeling’, cultivation of (appropriate) moral sentiments should be easier than is commonly assumed. However, it does require some effort and commitment on the part of educators, parents and teachers alike.

Edward O. Wilson has referred to “biophilia” as “the innate tendency to focus on life and life-like processes” (Wilson 1984: 1):

From infancy we concentrate happily on ourselves and other organisms. We learn to distinguish life from the inanimate ... (p. 1) Life of any kind is infinitely more interesting than almost any conceivable variety of inanimate matter. (p. 84) ... the urge to affiliate with other forms of life is to some degree innate, hence deserves to be called biophilia. The evidence for the proposition is not in a formal scientific sense: the subject has not been studied enough in the scientific manner of hypothesis, deduction, and experimentation to let us be certain about it one way or the other. The biophilic tendency is nevertheless so clearly evinced in daily life and widely distributed as to deserve serious attention. It unfolds in the predictable fantasies and responses of individuals from early childhood onward. It cascades into repetitive patterns of culture across most or all societies, a consistency often noted in the literature of anthropology. These processes appear to be part of the programs of the brain. (p. 85; see also Kahn *passim*)

When Wilson first articulated these opinions, they might have struck many as fanciful, romantic and somewhat devoid of scholarly rigour. Yet, an increasing number of researchers and educators are now studying the interrelationship between children and animals (see Finger 1994; Krueger and Krueger 2005; Louv 2005; Melson *passim*; Myers *passim*). More recently, Gail Melson and Peter Kahn have argued that a biocentric approach, informed by the concept of biophilia, to the study of children’s perceptual, emotional, cognitive and social development would enrich our understanding of children’s relationships, play, fears and sense of self, as well as their and our grasp of what it is to be human (Melson 2001; Kahn 1997; Kahn 1999). Most children are curious naturalists, “folkbiologists” (see Hatano and Inagaki 1999; Inagaki and Hatano 2004): they have a core domain knowledge of “living things” (Melson 2001). They intuitively perceive, categorize and think about biological phenomena. Kayoko Inagaki and Giyoo Hatano have established that children understand, classify and explain living systems as unique in terms of “vitalistic causality”, a form of construal in which the primary causal concept is “life force” (Inagaki and Hatano 2004). The question remains, of course, whether children’s acquisition of ‘folkbiological knowledge’ occurs in the same way across cultures.

Kahn has conducted extensive cross-cultural research involving children, teenagers and their parents, in order to determine their moral reasoning about the natural world, their views on non-human animals and environmental degradation (Kahn 1997, 2002; Kahn and Friedman 1995). Perhaps unsurprisingly, he discovered two main trends in environmental moral reasoning, namely what he refers to as anthropocentric (or human-centred) and biocentric (life-centred) reasoning. The former concerns effects of maltreatment of non-humans, pollution, etc. on human beings, and human interests and benefits (such as the value of environmental literacy); the latter, unlike the former, ascribes intrinsic value to the natural (human and non-human) world. Interestingly, Kahn appears to suggest that while there is little evidence of substantial differences in cognitive understanding and moral reasoning

across cultures,<sup>8</sup> there are major differences across generations. He labels this phenomenon “environmental generational amnesia” (Kahn 2002: 93, 105ff.), a phenomenon that refers to each successive generation’s perception of the natural context of its childhood experience as the norm against which to judge or on which to act.

An additional problem, which is arguably not ‘cultural’ but rather manifest in the ‘urban’-‘rural’ divide, concerns what Richard Louv has characterized as ‘nature deficit disorder’ in children and young adults. There has over the last few decades been a marked tendency in children in urban industrial contexts towards an increasingly sedentary life, to spend much of their leisure time with television, computers, play stations, mobile phones and other technological gadgetry, rather than in immediately interpersonal<sup>9</sup> and outdoor activities. The net results have been not only high rates of child obesity, over-prescription of anti-depressants to children and young adults and the prevalence of ADHD (attention deficit and hyperactivity disorder), but also a kind of alienation from nature. The solution suggested by Louv and others (to spend more time with animals and in natural settings) is at once obvious and simple but at the same time difficult to achieve. After all, natural outdoor play spaces are diminishing, and parental unavailability (due to work commitments) or general inability to monitor their children’s movements is frequently matched only by parents’ fears about violent crime, their children’s exposure to drugs and alcohol – hence their preference to keep their children in safe, controlled domestic environments. Yet, even in the absence of natural play settings or personal contact with non-human animals, children and teenagers’ natural interest (both cognitive and affective) in living organisms, notably animals, may be harnessed educationally (and developmentally), through the use of picture-books, fictional and non-fictional texts,<sup>10</sup> films, visits to parks, animal sanctuaries, rescue shelters and the like, followed by exercises in personal reflection and analysis, and group discussions.

Gene Myers’s (Myers 1998, 2007) main objective is to impress on readers “how animals can become significant in development, particularly in the development of a sense of self” (Myers 2007: viii). The notion of self and the significance of caring are central to Myers’s book: animals are characterized as catalysts for the development of morality, a theory of mind, a sense of self that has life-long implications, and for the learning about the nature of life – what it means to be alive. Animals provide a vibrant sense of aliveness and vitality. The natural bond between them and children, and animals’ qualities that they share with human beings and that differ from humans’, are important factors in the child’s development of a concept of self and what it means to be human. Children are profoundly concerned with and

---

<sup>8</sup> Kahn suggests “that similar manifestations of nature occur across diverse locations and that such similarities help explain children’s similar environmental moral constructions” (Kahn 2002: 105).

<sup>9</sup> I use the term ‘interpersonal’ to include both human beings and companion animals. Whether or not (some) animals are ‘persons’ could be the topic of classroom discussion; see below.

<sup>10</sup> On the use of books, see Melson (2001); Krueger and Krueger (2005). Obviously, one ought to distinguish between children’s anthropomorphic projections of their own instinctual drives and children’s identification with non-human animals as an indication of a deeper, trans-species connection.

connected to animals, and Myers and others consider this an important feature in children's moral development. To be truly human and humane, the verdict is, we may need animals around us and in our lives.

Like Myers and others, Melson argues that "children's ties to animals seem to have slipped below the radar screen of almost all scholars of child development" (Melson 2001: 12). She examines not only the therapeutic power of the presence of companion animals for emotionally and physically handicapped children but also the ways in which zoo and farm animals, and even certain television characters, become confidants or teachers for children – and sometimes, tragically, their victims (see especially chapter 7 in Melson 2001). Quoting G. Stanley Hall, from his 1904 text *Adolescence*, she

can almost believe that, "[i]f pedagogy is ever to become adequate to the needs of the soul, the time will come when animals will play a far larger educational role than has yet been conceived, that they will be curriculized, will acquire a new and higher humanistic or culture value in the future comparable with their utility in the past". (Hall; quoted in Melson 2001: 179)

## Moral Education, Young People and Animals

According to Paul Waldau, there is

an important area of dispute over animal issues that arise in children's lives. The principal way that many children encounter other animals in their schools is on their lunch plate. (Waldau 2011: 151)

"Whether or not it is right for human beings to eat animals is an issue about which many young people have strong convictions; and it is one that in one way or another involves us all in our everyday lives" (Standish 2009: 31). In the article from which this observation is taken Paul Standish is "imagining a course based on extracts" from J.M. Coetzee's novel *The Lives of Animals* (Coetzee 1999), whose prominent dialogical form and subject matter and the "reflections" by prominent thinkers in related fields<sup>11</sup> that follow the text "make it a rich potential resource for moral education ... for teenage students or older people" (Standish 2009: 31). The central issue (concerning the moral permissibility of factory-farming animals and slaughtering them for human consumption) could lead to more in-depth, critical and philosophical discussion:

- Are there morally relevant differences and similarities between humans and non-humans? What are they? Are they differences 'in kind' or 'in degree'?
- Are all human beings 'persons'? Are (some) animals 'persons'?
- Is anthropocentrism an extension of androcentrism and ethnocentrism?

---

<sup>11</sup>Marjorie Garber, Peter Singer, Wendy Doniger and Barbara Smuts are the respondents. Amy Gutmann is the author of the introduction to Coetzee's novel.

- Is discrimination against animals (speciesism) relevantly like sexual and racial discrimination (sexism and racism)?
- What about ‘the dog in the lifeboat’<sup>12</sup>?
- Is it morally permissible to use animals in biomedical research, for clothing purposes, and to keep them in circuses and in zoos?

Waldau distinguishes between “the education that zoos claim as the result of their exhibition of captive animals”, “the more immediate, hands-on education one derives from spending considerable time in the field with animals in their environment”, and institutional or “formal education” that is “premised primarily” on the study of texts, “classroom discussions, and controlled experiments at the laboratory bench” (Waldau 2011: 143). The institution of zoos offers an opportunity for classroom discussion, not least because of the frequent claims regarding their educational benefit or value. While many children arguably benefit from visits to zoos, the ‘overriding’ educational value is rendered somewhat questionable in that captive animals commonly exhibit stereotyped behaviour or develop certain neurotic habits and pathological traits, which renders inferior the information about ‘wildlife’ in zoos to that garnered through proper wildlife studies.<sup>13</sup>

“A particularly complex topic at [secondary] level is known as ‘dissection choice’ ...” (Waldau 2011: 151). Dissection of various living beings, ranging from worms via frogs to small mammals, has been a traditional activity in biology classes. Students frequently refuse to participate in this activity on the grounds of conscience, and this has led to substantial educational and legal disputes over the right of children to make such choices (pp. 151–152). The two main arguments against dissection choice are (1) that such choice undermines science; and (2) that the existence of a law permitting students to choose is commercially harmful. The first argument fails because not every student will end up doing science. Moreover, a student’s refusal in no way threatens “the curiosity required for geology, anthropology, physics, or even many of the biological sciences pursued at the molecular level” (p. 152). In fact, forcing students against their better (moral) judgement to engage in activities like dissection is likely to turn them off science and therefore, in turn, to undermine the image of science. As Waldau reports, the second type of argument is “odd ... from one vantage point – in the US, for example, those states with the most bio-technology research (California and New York) have had dissection choice laws in place for a number of years” (p. 152). The argument in favour of dissection choice holds that such choice raises significant issues that have a direct bearing on students’ moral (intellectual and emotional) development. Choice-based legislation encourages critical engagement and interrogation of scientific (and other) practices and fosters in students a sense of responsibility for their own choices

---

<sup>12</sup>This question refers to the following thought experiment: if a lifeboat can only accommodate four individuals, but there are four humans and a large dog, then who should be sacrificed? I found myself in a less extreme lifeboat situation, following the sinking of the *Achille Lauro* in late 1994, and it was not at all like the scenarios famously constructed by analytical philosophers. Nonetheless, these imagined situations do get us to test our moral intuitions.

<sup>13</sup>See Horsthemke 2010: 59–63.

and actions. For Waldau, “dissection choice offers an important educational opportunity” (p. 153). Lobbying against the right of children to opt out of dissection is not only anti-democratic but also pedagogically dubious, because “it is entirely possible that denying students at this level the chance to make decisions about morally charged matters harms [their] moral development” (p. 153).

In higher education especially, according to Waldau, “animal science” constitutes the bastion of anthropocentrism and is seen to be pursued by “those students whose thinking is not childlike or frivolous” (pp. 154). By contrast, “the field of ‘animal studies’ [draws] insights from many different disciplines, including history, literature, law, religion, geography, anthropology, sociology, philosophy” (p. 156), art, psychology, ethology, etc., and would therefore “create interdisciplinary possibilities that go beyond the limitations of the dualistic ‘arts (humanities) and sciences’ mentality that now dominates ‘modern’ higher education” (p. 158).

Moral education, it has been established, has both an intellectual and an affective or virtue dimension. If “resourced” in the ways suggested by Standish and Waldau, it “not only fosters virtues but in actual practice sustains the prospering of human imagination” (Waldau 2011: xiv). In the classroom, “as in life, inquiring beyond the species line prompts healthy, communicative forms of thinking and rationality” (p. xiv).

## The Possibility and Promise of Animal Rights Education

The possibility of animal rights education is clearly contingent on the possibility of animals having (moral) rights – or in principle being ascribable such rights. In a fairly trivial sense, talk of animal rights conveys the idea that animals matter morally, that humans have certain responsibilities in this regard, that animals should not be made to suffer gratuitously, and so on (cf. Waldau 2011: xiii-xiv, 157<sup>14</sup>). In a more controversial and philosophically challenging sense, ‘animal rights’ leads into deep deontological territory. Not only is rights language held to be meta-ethically and normatively defensible and preferable to competing moral considerations,<sup>15</sup> but non-human animals are also claimed to be among the sorts of beings to whom one can meaningfully attribute rights. Rights can be taken to exist not only in law, but are correctly seen also as binding moral precepts that do not depend on legal

---

<sup>14</sup>Paul Waldau states that “[m]any people today understand “animal rights”, however one defines it, to be a path of caring” (Waldau 2011: xiv), an understanding he appears to share. He suggests that “animal studies” can move towards a “kind of ‘animal rights’ approach in that it opens up education to the historic and cultural values of compassion and connection with the more-than-human world” (p. 157). I consider the connection between rights and care (compassion, etc.) to be desirable – but it is certainly not a necessary connection, as many mistakenly assume.

<sup>15</sup>A review of non-anthropocentric accounts that – in principle – accommodate animals in the requisite fashion indicates why appeals to kindness, theriophilia, reverence for life, sympathy, and the principle of utility fail either as compelling moral theories or as efficient action-guides, or both (see Horsthemke 2010: 170–229).

institution for their validity. An interest model of rights (as opposed to a choice conception) advocates protection of all those who have interests and a welfare, and guarantees the pursuit of non-threatening interests, by means of (equal) rights. At the level of basic moral rights, all right-holders (human and non-human) have the same rights, for example subsistence-rights, liberty-rights and welfare-rights. Non-basic moral rights are not necessarily shared by moral agents and moral recipients – indeed, not even by all agents. Although rights confer prohibitions and restrictions, with regard to agency, they are not absolute. It is permissible to override them in situations where right-holders cannot reasonably be called ‘non-threatening’ or ‘innocent’. On the other hand, the obligation to provide assistance and duties of beneficence obtain only if such assistance and beneficence do not themselves involve violation of rights (see Horsthemke 2010, Part II).

Some educators, such as those in the natural science professions, “have been reluctant to embrace animal rights”,<sup>16</sup> while others, such as those in the humanities and social science professions,

have taken leading roles in the modern animal rights movement ... Overall, though, the larger education system has only slowly become aware of the importance of learning about animals and their moral significance. (Waldau 2011: 144)

Waldau points out that “virtually all of education about animals leaves modern people poorly informed about other animals” and clinging to the idea of a “customary division between humans and animals” (p. 145). He continues: “The deeper educational message [even in so-called ‘humane education’] is that non-human animals are rightfully subordinated to humans, who alone are the really important beings” (p. 148). Kahn, Myers, Standish and Waldau have provided some useful tools for beginning to challenge the educational status quo. A focus on ‘animal rights’ may bring this challenge into an even sharper relief.

The promise of animal rights education, in turn, depends on the possibility of animal rights education. If animals were not among the sorts of beings who could meaningfully be said to possess rights, and if animal rights education were logically impossible (other than in a considerably more diluted or trivial sense), then it would make little sense to speak of the ‘promise’ of animal rights education. On the other hand, if animal rights education is pedagogically and philosophically meaningful, then this arguably involves substantial rethinking of extant educational curricula. The issue of ‘promise’, then, could be addressed equally in terms of human (especially children’s) interests and in terms of non-human benefits and interests. That non-human animals would benefit from an increasingly enlightened attitude on the part of human beings is not in doubt. I contend further that animal rights education harbours substantial benefits for human beings, in terms of contributing to our moral (intellectual and emotional) development.

---

<sup>16</sup>In the USA, for example, students applying to veterinary schools are typically reluctant to use the phrase “animal rights” in their application, as this would in many instances diminish their chances of being offered admission (see Waldau 2011: 159).

## By Way of a Brief Conclusion

If there is evidence to show that people who maltreated non-human animals as children more often than not grow up to be abusive adults (even serial killers), then perhaps children who grow up caring for (i.e. in a climate of compassionate fellowship with) animals will, more often than not, develop into caring, compassionate adults. Clearly, the empirical evidence for this is considerably more difficult (if not impossible) to supply than in the case of abusive children who later become serial killers. But perhaps the very least one can say is that exposing children to the needs and interests of non-humans is very likely not only to benefit the animals in question but also to promote in children an attitude of empathy, responsibility and respect – which is bound to make them better people.

# **Discussion**

# Philosophy of Education

Nicholas C. Burbules

The field now called ‘philosophy of education’ has been, during several periods of Western philosophy, simply a part of mainstream philosophy. The concept of Socratic dialogue, central to the writings of Plato, is a clearly pedagogical notion. In *Meno*, *Phaedo*, and other dialogues, the philosopher plays the role of ‘midwife’, engaging others in a dynamic of question and response designed to prompt *anamnesis* or ‘recollection’ of latent understandings. This method of instruction is inseparable from the Platonic theory of knowledge; one might say it is a theory of knowing, in practice.

Similarly, the *Republic’s* design of an ideal society fundamentally depends on a theory of education. The class structure of Plato’s ideal society is created (and rationalized) by an educational theory based on the ideas of in-built potential and meritocracy. One might go even further and say the overall design of the Republic grows out of this educational theory. The process of education ensures that people are selected and trained for the roles society needs from them, *and* the roles in which they will be most successful and self-fulfilled (of course, in Plato these educational processes are partly dependent on manipulation and the ‘myth of the metals’).

In the early modern era, Rousseau’s *Emile* outlined a theory of upbringing based on ideas of radical freedom, child-centered pedagogy, learning through discovery, and a rough developmental theory that all became influential on progressive learning theories of the nineteenth and twentieth centuries. But it is no accident that this book came out the same year as Rousseau’s *The Social Contract*. One way to read *Emile* is as a parallel to the central concept of the ‘general will’ in *The Social Contract*, and its key dilemma: how to ensure that the (descriptive) general will – what people by and large actually want – is congruent with the (prescriptive) general will – what is actually good for people and what they *should* want. For the tutor

in *Emile*, the process of instruction is intended to create a perception of free choice by the student, but choice which the tutor shapes in order to be certain that those choices reflect the student's interests. This process sometimes involves (again) deception and manipulation, because the outlines of the student's environment, within which the student makes apparently 'free' choices, are all designed by the tutor. On a related point, the Rousseauian ideas of *amour de soi* and *amour propre* represent two kinds of self-love: the first grounded in natural needs and desires, the second ('pride') in social comparisons, which is in that respect potentially dangerous. These principles are essential to Rousseau's political psychology; *Emile* is the text where he tries to explain how the formation of these forms of self-love can be fostered in ways that drive authentic and not socially shaped choices (self-valuing pride, for example, that does not become vanity, envy, or conceit).

More recently, the later work of Ludwig Wittgenstein can be seen to rely centrally on educational concepts. In the *Philosophical Investigations* and other texts he continually returns to the question of *how we learn X*: how we learn language (or language games, as he calls them), how we learn to follow rules, how we learn our way around a city – or, across a range of human practices that we seek to master, '*how we learn to go on*'. He shows this preoccupation through a range of cases, examples, and thought experiments that ask the reader to imagine and work through questions in their own minds. While not a Socratic dialogue, there is something dialogical about these texts because they call forth an active engagement and response by the reader (and, indeed, Wittgenstein often articulates an imagined question, objection, counterexample, or response and then replies to it). I and other colleagues have argued that this educational dimension, especially in his later work, is essential to understanding Wittgenstein's broader philosophical project.<sup>1</sup> Wittgenstein, who worked for a while as a primary school teacher in rural Austria (as well as his university teaching at Cambridge), also offers numerous reflections – and self-criticisms – of his own efforts as a teacher.

These examples are meant to illustrate an important strand in Western philosophy in which philosophy of education is not a derivative, secondary, or 'applied' branch of philosophy, but one central to philosophical thought itself.<sup>2</sup> Whether in ethics, epistemology, political philosophy, or philosophy of language, there are substantial examples of philosophical views in which education and attendant concepts of teaching and learning have been inseparable dimensions of mainstream philosophical concerns – first, as essential aspects of how those mainstream concepts are conceived, and second as indispensable components of how certain philosophical aims or ideals are to be achieved.<sup>3</sup>

<sup>2</sup>Another example, concerning education in John Locke's theory, is Nazar, Hina. "Locke, Education, and 'Disciplinary Liberalism'." *The Review of Politics* 79, no. 2 (2017): 215–238.

<sup>3</sup>This account is partly inspired by Jim Giarelli's distinction of philosophy of education, philosophy and education, and philosophy as education, though I frame the issues slightly differently than he

Something changed during the early and mid-twentieth century. John Dewey and others became termed ‘philosophers of education’ (ironically, because there is no better example of the centrality of education to other philosophical concepts and theories than Dewey). Professional associations, journals, and graduate programs began to appear across the United States, and in other countries.<sup>4</sup> Courses dealing with philosophy of education moved from philosophy departments to colleges and departments of education. With these structural and organizational changes also came significant shifts in status. Philosophy of education came to be defined, and often defined itself, as part of the professional development and socialization of practitioners, and sometimes as an avenue of influence over policymakers, more than as an independent branch of academic inquiry. Very few philosophers of education in schools of education had cross-appointments in philosophy departments, and even fewer had their primary appointments in those departments. Within universities professional schools are often viewed as lower status academically. At the same time, in order to secure legitimacy within schools of education, philosophers of education had to defend the relevance and utility of their work for the fields of practice and policy. (A personal anecdote: in my very first department meeting as a new professor I introduced myself as ‘a philosopher who studies educational issues’, and was bluntly told by a senior colleague that I belonged in a philosophy department, not an education school.)

With these structural and organizational changes, then, a different conception of philosophy of education as an ‘applied’ branch of philosophy came to the fore. Philosophers of education may be philosophers, but they labor in the vineyards of practical problems: they bring other philosophical ideas in epistemology or ethics or political philosophy (work done by ‘real’ philosophers, like John Rawls) to shed light on educational problems. In engagement with those philosophical theories they might make marginal contributions to the ideas contained in the masterworks, but this is an offshoot of the effort to ‘apply’ them to issues of practice and policy: elaborations of those ideas, but hardly significant, original philosophical contributions themselves. Dewey, for example, who spent his entire career in philosophy departments, is rarely taught in philosophy departments any more. Richard Rorty, more recently, was once taken seriously as a ‘real’ philosopher but was scorned by many once he started working on Dewey and pragmatism; when he moved to Stanford, late in his career, he could not secure a primary appointment in the philosophy department and ended up in comparative literature instead.

A related idea was that philosophy provided certain general tools or methods that could be applied to educational problems: *analytical* tools that sought to clarify, distinguish, and subdivide educational concepts and terminology (different kinds of ‘teaching’, for example, that might be used interchangeably in casual discourse, but which are fruitfully distinguished from one another); or *critical* tools that sought to

did. James Giarelli, “Philosophy, Education, and Public Practice,” in *Philosophy of Education 1990*, ed. David Ericson (Normal, Ill.: Philosophy of Education Society, 1991).

<sup>4</sup>Nicholas C. Burbules, “Continuity and diversity in philosophy of education: An introduction.” *Educational Theory*, Vol. 41 No. 3 (1991): 257–263.

diagnose flawed arguments, empty slogans, or sloppy, misleading rhetoric. On this account, philosophy was like a referee who called out violations of conceptual rules, but did not interfere substantively in educational debates – *what* to teach was a matter of democratic public policy, *how* to teach a matter for empirical research. Philosophers *qua* philosophers had no special authority in trying to resolve such questions. (A similar metaphor was the philosopher as groundskeeper, clearing and tending the soil but not deciding what to plant there.)

As a result, philosophy of education as it became a professionalized subdiscipline struggled between these two worlds: unable to secure status and boundary acceptance as a serious part of academic philosophy, while simultaneously needing to establish its value within professional schools concerned mostly with the preparation of educational practitioners. The idea of an ‘applied’ branch of philosophy attempted to address both concerns: on the one hand, by reassuring philosophical colleagues that philosophy of education drew its core concepts and theories from the philosophical canon; and on the other hand by reassuring educational colleagues that the work was relevant and useful. The problem was that work that strengthened the link with one side typically suffered at the other: this dialectic of legitimacy was rarely productive in both domains, and individual philosophers of education, based on their talents, interests, and opportunities, invariably gravitated toward one pole or the other. This often created tensions within the philosophy of education community over who was a ‘real philosopher’: rivalries reinforced by competition between different graduate programs, professional societies, and journals.

During the last part of the twentieth century, these sorts of arguments became overlaid with another set of changes: a rapid diversification of the field, especially by gender, and partly by ethnicity and race; and the rise of theories, for example Foucault, that came to be broadly termed ‘postmodern’, which explicitly problematized and challenged just these standards of disciplinary status and boundary drawing as manifestations of power and exclusion of diverse communities seeking access to the field. As more diverse participants entered programs of study, attended and presented at conferences, and published in the journals of the field, they also brought with them new literatures and areas of interest that were (one might say) more theoretical than philosophical – feminism, psychoanalysis, critical race theory, queer theory – and which, *as part of their investigations*, questioned or challenged disciplinary methods and standards from the standpoint of whose voices, issues, and perspectives they privilege or exclude. In short, a set of demographic and generational changes reinforced, and was reinforced by, a set of theoretical shifts. The canon of philosophical literature and the faculties of most philosophy departments are dominated by white men – and this was taken as *prima facie* evidence that the problems of the field were similarly biased and partial. When it was said, as it was said, that these critical trends further diluted the philosophical credibility of the field of philosophy of education, this criticism was itself reflected back through a mirror that portrayed it as yet another strategy of exclusion and silencing of these new voices. The very touchpoints of the philosophical canon were themselves under attack for neglecting issues of power and difference.

As a field ‘in-between’, as I have described it, this applied conception of philosophy of education was also influenced by changes on the side of the profession. The same issues of diversity, changing identities, and inclusion/exclusion were at work in critical studies of education. The 1980s and after brought a growing awareness of how far schools were from the avenues of opportunity they believed themselves to be, for many students. Inequality came to be seen as the normal condition of schooling, and not as an unfortunate aberration. If philosophy of education was going to be seen as relevant and responsive to these concerns, it was going to have to change its orientation, from what had been an often idealistic and prescriptive approach (what education can be) to a more critical one (against what education is). Choices had to be made between an orientation stressing meritocracy or excellence to one addressing the processes of disadvantaging students; from one that sought to establish the potential grounds of legitimate inequality to one emphasizing the need to reduce inequality; from one seeking to identify common or shared educational aims to a perspective emphasizing difference, conflict, and sometimes incommensurability, in such aims. Added to this, the severity of concerns over disadvantaging and inequality gave an even greater urgency to the demand for relevance, for making a difference in addressing educational conditions of injustice and harm. This combination of factors tended to pull the pendulum further away from seeking philosophical legitimacy as a priority; more participants saw their academic and professional work as an extension of their social and political commitments to transform schools – or, in many cases, they did not see any difference between the two to begin with.

In particular, the conception of the philosopher of education as an impartial referee or groundskeeper was challenged: the very idea of impartiality or ‘a view from nowhere’ was seen as an effort to mask the substantive commitments that philosophers actually do have behind a pretense of neutrality. It was a central claim of critical theories based on identity, positionality, and the critique of power that all views are a view from someone, and from somewhere; and that the claim of impartiality is in its effects simply a reinforcement of the authority of traditionally dominant groups who might think that their standpoint is neutral or universally valid, but who are in fact simply reasserting their own presuppositions and authority. By definition these can be very difficult to recognize ‘from the inside’, and so it takes the critical assessments from those not of the dominant groups to identify this bias and partiality. Demanding that those others frame their arguments and justifications within the dominant conventions of philosophy, therefore, can be just another effort at ‘normalizing’ them and stripping them of their critical force.

This position, however, runs into a couple of difficulties itself. One is that the critique of dominant perspectives only carries weight if the arguments, the evidence, and the principled positions about inclusion and exclusion can be comprehended by the dominant groups, and can be persuasive with them. This suggests a standpoint that is comprehensible to all parties: if not a ‘view from nowhere’, then at least a position that all parties can recognize and accept – or that is, if you will, translatable across perspectives. The alternative would be a position of radical incommensurability, in which the dominant perspective cannot understand or appreciate the

critique – which seems to defeat the purpose of offering it. (It also just seems empirically and experientially false – these criticisms can be and often are heard, understood, and responded to. The very possibility of disagreement and critique rests upon comprehensibility.)

The other difficulty is with what a theoretical orientation based on identity, positionality, and the critique of power has to offer the practical activities of schooling. Foucault himself identifies schools as disciplining institutions; power is ubiquitous, there is no escaping it. But the common stance toward practitioner preparation, school reform, and policy is essentially meliorist, especially within education schools. One's critique can be savage, but schools of education are not the places of revolution. There seems to be something uneasy about combining the urge toward 'relevance' (and its attendant political realism) with the content of many theoretical critiques. And it is hard to imagine that this is the platform on which to rest the future vitality and survival of the field of philosophy of education as a professional discipline.

Two tensions, then, run throughout this account. One is the relation of philosophy of education to the wider discipline of philosophy, and how to balance academic credibility and status with practical impact and relevance. The other is the relation of a field that is increasingly shifting toward the critique of professional practice and policy, to survival within academic institutions that may support such work as intellectually valid, even illuminating, but whose overall priorities are about reforming and improving educational institutions, not overthrowing them. As universities cope with their own financial difficulties and are forced to make strategic choices within an overall culture of performance management, what is the case for philosophy of education today?

In seeking a basis for the future of philosophy of education, three interrelated trends seem worth nothing. First, there is a return to the question of philosophy of education as central to philosophy, not simply as a derivative subdiscipline. Current discussions of 'non-ideal theories' pose certain questions to philosophical ideals: What is their value if they are not practically attainable? At what point is it relevant to philosophical inquiry to ask *whether* and *how* they might be attainable? These are, in many cases educational questions.<sup>5</sup>

On the Platonic model, philosophy helps us identify ideals that are acontextual, ahistorical, and conceived in the abstract; in the *Republic* Plato compares this with creating a statue and polishing it to the highest degree of perfection imaginable. These ideals establish the timeless standards against which we judge our human aspirations toward truth, justice, and beauty. Of course, as imperfect creatures we can only ever partially achieve these ideals, but the reality of imperfection does nothing to change or challenge the nature of the ideal itself. We just need to work to continue to try to approximate the ideal ever more closely. Philosophy, on this view, functions to identify these ideals, and to guide and inspire us in the endeavor toward them.

---

<sup>5</sup>This section is excerpted and adapted from Nicholas C. Burbules, "Non-ideal theory and the philosophy of education," *Philosophical Studies in Education* Vol. 46 (2015): 25–35.

With non-ideal theory, it is not just a matter of recognizing that we can never fully attain our ideals; rather, we need ways of thinking about how to choose and act in a context that is intrinsically limited. It makes a great deal of difference whether one regards non-ideal theory as stating that our actual achievements in pursuing justice are partial, provisional, and bounded by what is possible – but nevertheless always directed toward the eventual achievement of the ideal – or whether one regards ideals as *heuristics* that help us operationalize goals in the real circumstances that confront us. This difference is crucial. The first regards the relation of non-ideal and ideal theory as an exercise in short-term vs. long-term perspective-taking: for example, in adopting transitional policies that are not ideally just as a way of achieving future outcomes that may be more just. The second reframes the difference as a metaphysical distinction between the realm of Platonic ideals and the realm of human practice.

If one thinks of an ideal only as a framework for thinking, judging, planning, and acting in the real world of practice, then we can ask which kinds of ideals are fruitful and generative, and which are hegemonic and inhibitive. ‘Fruitful’ here means both helpful in guiding our thinking and practical choices in actual situations that concern us, as well as helpful in allowing us to clarify, better understand, and sometimes modify the ideal itself. In short, ideals should help us not only by guiding action, but also in creating occasions for reflecting on those ideals. Non-ideal theory grows out of this process, not as a gradual approximation of the ideal, but as a series of reflections on why it is an ideal and why it is not possible to achieve it. It seems that no context exemplifies this dynamic quite as clearly as education, in which critical reflection and thought about the end-goals is also a part of those end-goals.

This analysis of the non-ideal also pertains to many critical theories of education; here too a certain utopianism can prevail, challenging dimensions of the status quo without a reflection on the actual, practical alternatives that are possible. There seems to be, ironically, a reluctance to subject certain ‘social justice’ education ideals to the same critical scrutiny that their advocates project upon conventional policies and practices. In pluralistic societies, no position can be shielded from question – but more to the point here, a critical philosophy of education that simply promulgates ideal types against which to judge and criticize the messy and imperfect achievements of practice is simply a new kind of Platonism.

There is something more here than the recognition that life is imperfect. The relation of ideal to non-ideal theory is also about rethinking, and sometimes challenging, aspects of ideal theories when they put us out of touch with contexts of actual practice. Our ideals provide concepts and principles that should inform human judgment and action, not models that we should try to emulate. This is a way of thinking about philosophy of education: being able to keep in sight both the ideals that guide us and the particularities of a situation that resist or belie those ideals. We should not give ourselves up merely to a kind of situational opportunism, or even worse to the vulgarities of ‘whatever works’. Ideals don’t become irrelevant. But at the same time we recognize that our ideal theories are not roadmaps; they are heuristics that *gain* purchase and meaning as they are rethought in the context of practice, and which will inevitably need to be rethought and reinterpreted as a result.

On a related theme, the question of philosophical inquiry as a ‘view from nowhere’ versus an entirely positional (and in this sense relativistic) standpoint theory can be reframed. I and others have written about *situated* philosophy of education.<sup>6</sup> This perspective starts, again, with the idea of a practice. The activity of philosophizing is one such practice. A practice is a socially established, cooperative human activity that has normative standards that govern its activity, and that is adapted to local contexts and innovations over time. All practices, in this sense, are situated – that is, they are carried out by particular people, under particular conditions of place and time, in particular ways that are deemed ‘proper’ by the norms of the practice itself. Sometimes, though not always, practices are situated in formal institutional contexts that are designed to support and sustain those practices. But whether through such formal mechanisms or not, practices must contain within them, as part of their operations and norms, processes for initiating and orienting new practitioners into the practice – they need to be self-reproducing, if they are to continue over time. This persistence of a practice, even as some of the particular activities of the practice might evolve and change, is itself a constitutive element in a practice (hence not all human activities, therefore, are practices, because not all activities are intended to be repeated or sustained).

This conception of practice is useful because it embeds the ideas of education and reproduction into the conception of a practice itself. Indeed, the normative structures of a practice need to be understood not only as the regulative principles that facilitate the conduct of the practice in a particular place and time, but also as the conditions that allow that practice to be taught, learned, and mastered by new participants in the future. Without those, a practice will die out. Considering philosophy as a situated practice, then, focuses immediate attention on how people do philosophy, and the ways in which it is done by particular people, under particular conditions of place and time, and in particular ways that are deemed ‘proper’ by the norms of the practice itself. This framework clarifies both the nonarbitrary elements that provide continuity to the practice of philosophy, as well as the contingent manner in which those elements are interpreted and applied in real-world contexts.

‘Situated philosophy’, then, is philosophy carried out under four broad conditions:

- (a) It is conducted with a self-critical awareness of its status as a human practice, and recognizing how the conditions of that practice facilitate and constrain the content of work that is done.
- (b) It realizes that it is a practice always carried out by particular people, under particular conditions of place and time, in particular prototypical ways that are deemed ‘proper’ by the norms of the practice itself.
- (c) It considers the conditions of reproducing itself as a practice, not as extraneous considerations, but as integral to and constitutive of the nature of its practice.
- (d) It maintains a keen awareness of the social effects of what is said and written under its auspices.

---

<sup>6</sup>This section is excerpted and adapted from Nicholas C. Burbules and Kathleen Knight Abowitz, “A situated philosophy of education.” *Philosophy of Education Society Yearbook*, 2008, Ron Glass, ed. (Urbana, Illinois: Philosophy of Education Society, 2009), pp. 268–276.

Situated philosophy is decidedly not the view from nowhere. It is, and recognizes itself to be, a practice always carried out by real, ordinary people in all their imperfections and circumstances. At the same time, the completely historicized view of philosophy as merely the conventions of belief and value favored by particular groups of people who have the institutionalized power and authority to impose their views on others cannot be maintained (for one thing, it is self-contradictory, since its own claim is apparently not a merely contingent one). Furthermore, not all practices can be sustained over time; and the very persistence of a practice shows that its activities and regulative norms are not merely contingent and arbitrary – it must be effective at addressing important and existentially recurrent human problems and concerns.

While philosophy is certainly implicated in a broader network of social effects, it cannot be understood merely as the sum total of those effects. The continuity of philosophy and its manifest success in attracting and socializing generation after generation into its activities shows that its beliefs and norms are, while not transcendental or universal, certainly generalizable over a very broad range of participants, contexts, and concerns.

When we focus on the reproductive processes by which we train, initiate, and socialize new participants into the practice of philosophy, education comes back into philosophy in a fundamental way. Philosophy of education can illuminate the significant educational dimensions underlying major philosophical problems. Moral philosophy cannot be simply an examination of what it is right or wrong to do, without asking whether and how it is possible to actually foster the development of people who will think and act that way. Epistemology cannot be simply the examination of truth conditions or criteria of warrant, understood entirely apart from considerations of how people learn to interpret and apply those standards; or whether, as research increasingly is showing, there are severe limits on people's capacity to actually do this. Critical thinking cannot be simply a set of analytical skills and tools, but is also a set of emotional conditions and dispositions toward enacting them. Political liberalism cannot be simply a set of abstract principles and ideals, but the actually achieved areas of overlapping consensus that enable citizens to pursue and achieve them. This way of thinking about philosophy, as I discussed at the beginning, is grounded in quite ancient understandings and traditions.

Another radical implication of this account is to change the dynamic of philosophy, philosophy of education, and the concerns of educational research, policy, and practice. This shift reinforces a certain kind of philosophical honesty. Rather than preaching to educators about what they can and should be doing in their work, without fully appreciating the impediments and very real risks such activities would subject them to in institutions and society as they exist today, philosophers of education cannot separate their utopian ideals from a consideration of the conditions of practice that might conceivably sustain them. There is, and must be, a certain recalcitrance to practice (this is what sustains it as a practice) and we need to understand why this is so; we cannot simply make things up as we might wish they should be.

And this leads to a final implication. Rather than assuming the vocabulary of 'applying' philosophical tools to educational problems, perhaps we ought to invert the order of things, beginning with concrete and richly detailed case studies and

examples, and drawing philosophical insights from the analysis of those particulars. The subtlety of those analyses comes not from philosophical cleverness alone, but from the far deeper subtlety and complexity of the world as we find it – perhaps especially the world of education and the endlessly difficult formal and informal settings in which we try to help young people gain the knowledge and capabilities of becoming successful adults.

This perspective relates to a renewed interest in casuistry, and the centrality of *cases* to philosophical thinking and to education directed toward promoting philosophical thinking. Ever since the publication of Jonsen and Toulmin's *The Abuse of Casuistry*, there has been a reappraisal of the benefits of case-based reasoning.<sup>7</sup> Jonsen compares this with the process of medical diagnosis: drawing from the experience of observing a range of similar cases, the skilled practitioner assesses the key factors of a novel case. Principles play a role in this process, but are not simply 'applied' to the case; the practitioner has to make judgments about where, how much, and in what respects the present case is similar to precedents. This kind of analysis relates to legal judgment and ethical decision-making as well. But then we might ask what constitutes a good case. Meira Levinson and Jacob Fay explain the pedagogical role of "richly described, realistic accounts of complex ethical dilemmas that arise within practice or policy contexts, on which protagonists must decide among courses of action, none of which is self-evident as the right one to take".<sup>8</sup> Working through complex cases, they say, fosters the development of that kind of practical reasoning (*phronesis*) that constitutes a marriage of theory and practice. They argue explicitly that practical ethical judgment can best be fostered through this case-based method.

One way to think about what constitutes a good case is to consider a relatively poor one. Let me recount one example, though well-known from basic ethics courses: the trolley car dilemma:

There is a runaway trolley barreling down the railway tracks. Ahead, on the tracks, there are five people tied up and unable to move. The trolley is headed straight for them. You are standing some distance off in the train yard, next to a lever. If you pull this lever, the trolley will switch to a different set of tracks. However, you notice that there is one person on the side track. You have two options: (1) Do nothing, and the trolley kills the five people on the main track. (2) Pull the lever, diverting the trolley onto the side track where it will kill one person. Which is the most ethical choice?<sup>9</sup>

There are several things that make this a poor ethical case. It is extremely thin on details. For example, who is the one person? A stranger? An infant? My mother? Albert Einstein? Would these factors affect my judgment? Should they? Such questions can only be broached when there is enough rich detail and context provided to make this look like an actual human choice. This leads to another problem: it is

<sup>8</sup>Meira Levinson and Jacob Fay. *Dilemmas of Educational Ethics: Cases and Commentaries*. Harvard Education Press. 8 Story Street First Floor, Cambridge, MA 02138, 2016: pp. 3–4.

<sup>9</sup>[https://en.wikipedia.org/wiki/Trolley\\_problem](https://en.wikipedia.org/wiki/Trolley_problem) [Accessed January 17, 2017].

artificial, contrived in such a way as to force an either/or choice in a manner that is very rarely the case in real life. Is there a third option? Why not? Furthermore, who am I in this case? Myself, with all my particularities and relationships, or an abstract agent? What if I know that I will have horrible nightmares, no matter what I choose, because either way I will be culpable in the death of innocent people? Is that a relevant factor, for me, that might not apply to a more cold-hearted agent? In addition, the case conflates the choice of action versus inaction: it suggests that even though I had nothing to do with creating the trolley accident I will be ethically responsible for the death of five people if I do nothing. But choosing not to get involved in a tragic scenario is not the same as actively choosing a course of action that directly and intentionally kills someone. Finally, the framing of the story seems to want to force a utilitarian analysis; it prejudices the question of what kind of moral reasoning is applicable to the case. Good cases would be exactly opposite to each of these features; they would be richly detailed, realistic, contextualized as to circumstance, sensitive to the particulars of personal agency, complex in the available choices and potential consequences, and ambiguous in not prejudging the theories or concepts through which one ought to think about those choices. As a result, such situations would not frame ethical decisions as simple either/or choices.

These considerations of non-ideal theory, situated thinking, and case-based methodology outline a way of thinking about philosophy of education that undoes some of the antinomies discussed previously. They argue that philosophy of education is not a derivative subdiscipline of philosophy nor a domain for the secondary application of philosophy theories or methods, but an area of original inquiry that sheds light on important philosophical questions, understood at the level of potential human achievements and not just as ideals. They argue that philosophy of education is strengthened through an appreciation of actual educational institutions, policies and practices, because these are indispensable dimensions of how and where actual educational progress can be made. And even where these examinations might be critical, they are critical within a perspective that is self-critical as well – in other words, avoiding self-righteousness and realistically assessing the shortcomings of our own ideals, understood not as blueprints but as heuristics to stimulate new conversations with the actors within institutions, policies and practice, honest conversations – and not as pronouncements buttressed by philosophical theories and jargon. One of the ways to keep philosophical reflections about education honest is by emphasizing case-based methods: working from the particulars of complex, realistic problems (or, even, real problems) to extract the philosophically important and interesting dimensions of how we should think about and try to cope with those problems – problems that may not be amenable to philosophical ‘solutions’, but which require instead philosophical insight and patience in order to grapple with them. This is another aspect of case-based methods: thinking of problems not as straightforwardly solvable, but as steps in an ongoing process of improving our understandings and capabilities (sometimes through error and correction). For philosophical problems, ethics for instance, this brings questions of learning and development back to the fore.

Philosophy of education can contribute to such reflections, and benefit from them.

# Political Literacy: The State and Education

Roland Reichenbach

## Preliminary Notes

Isaiah Berlin (1909–1997), a decisive anti-Platonist, wrote in the epilogue of his *Personal Impressions* (2001): “My interest in ideas, my belief in their strenuous and at times ominous power, and my conviction that humans who fail to grasp these ideas correctly will feel threatened even more seriously by the uncontrollable terror of nature or even by their own institutions. World events reinforce all of this anew every day” (pp. 372f.).

Those who want to implement ideas on education consistently (these days through competence orientation) will be directed and monitored by national government. Good old liberalism with its cultural niches, loopholes, and fallow soil must be left behind. Current education’s utopias are mostly all-embracing and focusing on administrative issues. And those who implement them tread confidently. The only thing that disturbs them a bit at times is human nature or even the world itself. Yet this will be overcome (one states): “There is always something here on Earth to hinder ideals to be realized. Since one obviously needs to remove this obstacle from humanity’s path, it follows that no sacrifice can be too great in approaching the goal” (Berlin 2001, p. 373).

The chapter is structured in two parts. The first part – merely as an example – traces a few ideas on the connection between state and education from antiquity to the present day. This should illustrate the fundamental public divergence of notions on policy issues involving the meaning of education and the state’s role in educating its citizenry. The second part discusses the commonly evoked (but seldom critically questioned) importance of education within a democratic form of state.

## Some Ideas on the Relationship Between State and Education

“Even a people of devils would need the state”.<sup>1</sup> The clue of liberal legitimation of the state can be seen in mutual partial renunciation of freedom by its citizens (Höffe 1988, p. 77). This accomplishment by an electorate should help ensure fulfillment of the public’s core self-interests. First of all, the idea of assuring freedom by partial renouncing is of political significance, but it also has ethical as well as educational implications: the role and tasks of the state is at stake. Hereby implicit assumptions about the nature of human beings and human life play a crucial role: What can be expected from individuals and social groups when it comes to practice freedom and education and self-transformation? What is the responsibility of the state in this respect?

In what follows, at first, a few historic perspectives on these topics are briefly discussed, exemplified by philosophers and intellectuals (namely Plato, Wilhelm von Humboldt, Georg Wilhelm Friedrich Hegel, Basil Bernstein, and Isaiah Berlin). It may be true de facto that these names play also no important role in today’s educational discourses, nevertheless, they should because they are still most interesting interlocutors.

### *The Just State and Good Education*

The ‘sociology’ of Plato’s ideal *State* seems to be quite simple. There are three ‘social classes’, namely (1) peasants/workmen, (2) soldiers/guardians – and very few – (3) philosophers. The latter are supposed to practice political power in a morally legitimate way. Plato, in the seventh book of his utopia, proposes the ‘ideal’ program of education. It is remarkable that this program, at least in the first stages, at the elementary level (lasting until the age of 20) includes all children (also girls).<sup>2</sup> The curricular focus of fundamental education is placed on art education and physical training.

After the first stage, allocation of all young ‘citizen’ to three social classes is achieved by means of quasi-‘psycho-metric’ criteria, the possible features of the ‘soul’ correspond to one’s social class. If this ‘allocation idea’ disturbs today’s readers, they can recall that ‘talent’ and ‘skill’ are spoken of in a rather loose and naturalistic manner contemporaneously. The Platonic society and educational utopia only serve as precursors of the less questionable idea of meeting individual traits and functions of a socially desirable society and form of state.

---

<sup>1</sup> This is the translated title of an article written by Otfried Höffe (1988) in which he makes reference to a quotation of Immanuel Kant’s *Zum ewigen Frieden* (Kant 1984, p. 31).

<sup>2</sup> 2500 years later we share the view of an institutionalized education for all children and youth, even if this true utopia has not yet become a reality for all children. The ‘No Child Left Behind’ Act initiated by US President George W. Bush in 2002 had a prominent precursor on the right to education in Plato – a right that should be guaranteed by the state.

Sir Karl Popper belongs among the most vehement of Plato's critics. In *The Open Society and Its Enemies*, he warned urgently of 'the spell of Plato' and rejects this social utopia as totalitarian.<sup>3</sup> Obviously Plato's *State* is fundamentally *anti-liberal*. The crux of platonic anthropology is precisely that the 'normal' human beings cannot practice their freedom without harming themselves or others in the short or long term. Plato must have thought little of the acts of his democratic contemporaries. These not only concerned the Peloponnesian War's 27-year duration, which he had to witness as the Athenian citizenry conducted it in a truly inept manner, but also the execution of his teacher, Socrates (Carr and Hartnett 1996, p. 30).<sup>4</sup>

Plato's criticism of democracy applies less to the democratic form of state itself as to the danger of a related sudden change into tyranny. The unsatiable desire for freedom led to disobedience against authorities, to abuse of laws, and finally to no leadership being tolerated (Plato 1992, 563d).

In this extreme form, satisfying special interests and corruption blossom in particular. The rich and powerful assume leadership roles in the demos. They do indeed donate part of their accumulated wealth to the class lacking property. As a rule, though, this only serves their self-interest (Plato 1992, 565a). In the class war that results from it, the demos accept a strong hand. A new leader, who fights militarily against the conditions and thus becomes ever more tyrannical (*incidentally*: we are still in ancient Athens here and not in today's Ankara...). According to Plato, democracy will eventually harm the populous itself.

The allegory of the cave stands for the necessity to have a political and moral establishment without which a state cannot be led justly. However, this elite must be educated to protect itself, because whoever risks leading people out of the cave of simple opinions into the light of truth risks being killed by the mob that he wants to "enlighten" (see 492bd, 494a, 499d-500a, 517a).

One can criticize Plato's 'story' as a basis to legitimize elitist education and training, but one can also read it as a warning and commandment to be careful – as an insight that democratic policy is fragile and can tumble over. It is "no natural talent of humanity" (Meyer 1994, p. 17) and cannot only be lost "gambling" but also "against one's will" (p. 35).

---

<sup>3</sup>Karl Popper (2003). *Die offene Gesellschaft und ihre Feinde*. Tübingen: Mohr Siebeck (original 1945). The first volume was entitled *Der Zauber Platons*.

<sup>4</sup>During Plato's year of birth (428 BC) Pericles had already been dead 1 year, and the period of peace and cultural enlightenment (the age of Pericles, 448–431 BC) belonged to the past. Athenian democracy was repealed repeatedly by pro-Spartan conservative powers but replaced by democracy each time. It was a time of demagoguery, of war, but also of Socrates, who was 38 years old at the outbreak of war and later its inner circle including Plato's – from 408 BC until Socrates execution in 399 BC.

## *To One Person the State Is Nearly Nothing; to the Other It Is Almost Everything...*

In his 1792 *Ideen zu einem Versuch die Gränzen der Wirksamkeit des Staates zu bestimmen* (the Spheres and Duties of Government, first published with the original German spelling in 1851), Wilhelm von Humboldt (1767–1835) turned against a comprehensive power of the state. The criticism is not directed simply against Plato's utopia but against the "police and welfare state" within Prussia's "enlightened absolutism" (see Lischewski 2014, p. 175).

Humboldt argued for a liberal state under law with the primary task of guaranteeing the individual right of freedom. It should *not* have become involved with 'training human beings'. State interventions in education and the classroom are, in Humboldt's opinion, only legitimate in an emergency. This radical position of Humboldt's hardly supported by representatives of political liberalism (except, for instance, in the USA) is based on the idea of a person's true purpose of a person. To him, this means the highest and best proportioned training of one's strength and transforming it into a whole.

The 'powers' of the ego are spontaneous: the human being was self-activated from the outset: the 'I' usurps the world in order to strengthen itself and impress its character on the world.

Especially the latter has the added function of *resilience* in this interplay as well as the polar tension between 'I' and the world in which the 'I' processes itself and becomes stronger as a result. Humboldt uses the training idea to study the importance of language as a medium which couples the 'I' and the world.

Within the framework of engaging 'school plans' for Königsberg and Lithuania (1809 and 1810), Humboldt formulated the two major goals of institutionalized training: *individual bodily strength* and *general human training*. Interesting but surely problematical here is the role of the state: On the one hand, training is indispensable as the true human goal for the liberal order. Yet, on the other hand, the state should be denied the power "to promote training by building up regulation and financing of a public school system" (Giesinger 2016, p. 30). However, according to Giesinger, this raises the question whether certain social groups would be excluded and also remain uninsured without state regulation to establish Humboldt's training ideal in reality (*ibid.*).

While Plato had much trust in the state and finally only the (just) state, Humboldt seems to view it instead as a necessary evil. In a certain sense he expresses an apolitical position that is blamed for his classical training ideal: the world 'only' serves Humboldt in the final analysis as an occasion and material of forming an increasingly grandiose 'I'. Outside of self-training, it appears to give human beings no further tasks. Yet premature criticism may be aimed in the wrong direction here too. This 'solipsism' recalls 'constructivism', the widespread but qualitatively wanting notion, and the talk related to it. Each child, it insisted, builds his or her 'own world', and the school was obligated to support this process. Yet the development of 'personal worlds' is not a mandate of the state. If it has a task at all in training issues, then it must rather be directed toward insuring a world for *everyone*.

The notion of the state as viewed by Georg Wilhelm Friedrich Hegel (1770–1831) is also shaped by his ideas of training people, yet its consequence – especially the role of the state – stands diametrically opposed to that of Humboldt. Hegel understands training in the *Phenomenology of Spirit/Phänomenologie des Geistes* (1986/1807) as alienation (*‘Entfremdung’*), renunciation (*‘Enttäusserung’*), and extinguishing of the natural self (*‘Aufheben des natürlichen Selbst’*). Training is the effort to overcome unformed ‘natural subjectivity’. This refers to forms of vanity, arbitrariness, and cravings, which are only transcended by the (training) process of “uplift of the objective spirit” or “Hinaufheben des objektiven Geistes” in the public at large (see Lischewski *loc. Cit.*, p. 194).

One could formulate this contemporarily: Training is the (subjective) acquisition of objectified culture. It claims the ego’s preparedness to sub-ject (*‘unterwerfen’*) itself – as a subject – to symbolic classifications (language, grammar, logic, technical knowledge, etc.) – and thus obtains as a person a reflected position within the moral community. The ‘System’ of morality is classified by Hegel in three segments: family, society, and nation. The task of the school consists in negotiating between the family and the community. Teaching is oriented toward *specific topics of expertise*, which helps release the child from its emotional and ‘merely’ subjective bond to the family. Teaching methods and acquisition of knowledge that are arranged, let us say, from the top and outside, lead to *‘alienation by training’*. Yet increasing acquisition of cultural assets eventually brings one to *reconciliation* between the self and the community, between subjective and objective spirits at a higher level.

The state needs to support this process, because (for Hegel) it embodies the degree of ‘objective spirit’ itself. One must know: behind the objective spirit hides an *‘absolute spirit’* – ultimately a seemingly pantheistic image of God that is in no case personalized.

This absolute spirit prevails without recognizing itself and hence uses humanity and its training processes as a means of achieving this self-awareness. The so-called ruse of reason should not be taken as an offense by the absolute spirit, because we owe it great deal....

But the fact that the state should embody ‘the actually reasonable’ was naturally criticized afterwards for glorifying the state and naïvely approving of the factua. Yet one can also oversimplify Hegel:

*First*, the dialectic of the training process – alienation and reconciliation – is indeed imbedded differently in semantics today, but should be considered as a standard construct in training theory. *Secondly*, Hegel sees the development and strengthening of his reflected self-consciousness as a right shared by *all* humanity, which *thirdly*, should be guaranteed by the state for this reason particularly – and *fourthly* – by a curriculum that must orient itself to culture and science without granting particular preferences to some groups or rulers. Whether or not this glorifies the state, Hegel recognizes in an anti-indoctrinaire moment the idea of institutionalized training guaranteed by the state (which, by the way, he also touches upon in terms of its disappointing sides).

## Broadly Based State-Decreed Pedagogy

It occurs to me that precisely liberal societies today seem to believe in the power of institutionalized training in such a platonic way (and so in part did Humboldt and Hegel). This applies even if a refined spiritual superstructure can hardly be detected any longer. Educators should arrange things. The state should regulate, monitor, and certify the educational system and with it formal training. At the same time, the economic framework of the discussion on competence serves as the basis for its justification.

A recent OECD document is entitled *'Equipped for Life? Most Important Results of the Programme for the International Assessment of Adult Competencies'* (PIAAC or PISA for adults). At a prominent point it mentions: "Skills have essential impacts on the life opportunities of each person: Skills can change lives, create prosperity, and promote social inclusion. Without the right skills, people are pushed to the edges of society. Without such skills, technical progress cannot bring about economic growth. Industry and states will not be competitive in today's increasingly interlinked and complex world. In an increasingly complex world, can they no longer keep pace in the competition? The premise of drawing on the greatest possible uses from investment in skills and qualifications is reliable information on skills needed in the job market and a workforce trained to supply them. Further assumptions include political measures guaranteeing that skills are used effectively to create better jobs, so that living conditions improve overall. In order to support these goals the OECD has begun to measure the skills of the adult population...".<sup>5</sup> Now adults get involved too. Plato would have rejoiced.

Basil Bernstein (1924–2000) was one of the first solid critics of the broad-based debate on skills.<sup>6</sup> He sees the reason for its "success" in (1) this debate's "universal democracy" for "All are inherently competent and all possess common procedures" (Bernstein 2000, p. 56); (2) it comes across as sympathetic today to introduce learning human beings as active and creative designers of an important world above all. Thus the suspicion is effectively disarmed from arguing a behaviorist perspective known to be notably less interested in the subject (for how can one be against creativity and individual activity?). Add to this (3) the friendly idea of self-regulating development and self-regulating learning (since any other learning is suspicious). And finally (4) it has become impossible to defend against the terminological reductionism of competence and emancipation.

Transforming the comprehension of training, which has become virulent here, can be viewed as a shift in focus or the ideal of training as a cultural asset and expertise for the model of education as a skill and human capital (see Münch 2009). Münch sees the root cause of this movement as the shift of symbolic power away from 'national educational elites' to 'knowledge elitists organized as transnational entities'. The "Pedagogy", Bernstein (2001, p. 379f.) says, citing Sertl (2004, p. 26)

<sup>5</sup>[https://www.oecd.org/berlin/SkillsOutlook\\_2013\\_GER.pdf](https://www.oecd.org/berlin/SkillsOutlook_2013_GER.pdf) (downloaded on 11 March 2017).

<sup>6</sup>For instance, *Pedagogy, Symbolic Control, and Identity* (Bernstein 2000).

“is like an invasion affecting all sectors of life, even in the more intimate (...), and there is no escape from this general pedagogy trend in modern societies”.

And he adds in another report: “Pedagogy is the focus of my theory to the extent that pedagogical modalities are crucial realizations of symbolic control, and thus of the process of cultural production and reproduction. Symbolic control, through its pedagogical modalities, attempts to shape and distribute forms of consciousness, identity and desires” (Bernstein and Solomon 1999, p. 267). At the end of the twentieth century, Bernstein insisted that he could only still make out a “totally pedagogized society”: “The labor world is being transformed pedagogically into lifelong learning, and this delivers both the key and the TPS [*Totally Pedagogized Society*] legitimization. It is not difficult to understand how management of ‘short-termism’ (that’s to say the short time span within which skills, tasks, and entire job sectors change constantly, vanish, or are replaced by new ones, where life experiences lack the basics of stable future expectations and the related anchorage as well as management of ‘short-termism’ translates into socialization for the TPS via lifelong learning” (Bernstein 2001, p. 365, transl. by Sertl 2004, p. 20).

The shift of social and state responsibilities in education – that is, the issue of how state and management in the pedagogized society are to be viewed – is interesting: “A key characteristic of the TPS is that it is state-driven and state-funded. The weak state of the global economy requires a strong state in the pedagogical field. This was not the case when competence models held dominant positions in the pedagogic field” (Bonal and Rambla 2003, p. 180). In the training sector, *liberal* societies count on the state central monitoring. This involuntary Platonism is ironic: while the market follows its own laws, complex regulation systems in the training sector replace a long lost cosmology.

## Democracy and Education: Cult of Incompetence?

The good reputation of democracy is young. Only after World War II could it create such a good name over a broad stretch of thought and life that it was also connoted morally positive, resulting in *criticism* of democracy becoming suspect (see Sartori 1992; Schmidt 1995). During the twentieth century’s pre-war and interbellum years in Europe, it would still have been possible to criticize the democratic dimension of mutual coexistence and joint decision-making in an elitist manner, perhaps as a “cult of incompetents” (Faguet 1911). It produced an egalitarian culture of dilettantes and increasingly threatened “true education” (see Kassner 1910). But democracy had been linked to the terror of political tyranny for the white hope even in educational and training thought, although the close contact between democracy and education had been postulated earlier – with John Dewey (1916) leading the way.

However, the notion that ‘good’ education has to be *democratic* is a politicized twist of pedagogical thought that is anything else than obvious. Why shouldn’t the German attribute ‘*volksherrschaflich*’ function as a quality trait of education

processes? Hannah Arendt had decisively rejected the idea that education qualified *as* democracy or *for* democracy. “Already educated” must always be assumed in politics, and those who “want to educate adults actually want to patronize them and prevent political action” (Arendt 1994, p. 258). She believed that emotional development suffers damage if children are exposed too early to the glaring “light of public relations” (p. 268).

What at first seems to be a romantic argument, according to Arendt, is in point of act an insight into the meaning of a clear distinction between pedagogical and political thought. Indeed it does not coincide with the border between youth and adulthood but correlates to it. “Treating children as if they were adults” is just as *apolitical* as wanting to educate adults (see Arendt *loc. cit.*, p. 276).

From time to time the ‘good’ reputation of democracy restricts the ability to assure oneself of the seriousness of the presumptions, ‘costs’, and ambivalence of this form of state and lifestyle. Such skepticism still nurtures the old criticism of democracy that has only proved this form of government – entirely Aristotelian – due to lack of a better alternative (Aristoteles 1981). The high demands and expectations toward democracy or democratic life today reflect conceptions of state citizenship, political, and democratic education and training. The mature *citoyen* (in contrast to a mere *bourgeois*) a member of the community who commits himself to the general welfare and takes part in public life (or in other terms, a political person engaging on moral or ethical grounds as a moral subject) should represent the goal of education and training.

“Under democratic conditions”, wrote democracy theorist Giovanni Sartori (1992, p. 11), “it will at least be observed that false points of view send a democracy in the wrong direction”. Doubt about the propriety and use of idealism in political pedagogy is appropriate. Ironically, in view of democratically elected figures such as Berlusconi, Erdoğan, or Trump, Plato’s criticism of democracy no longer comes across – temporarily in any event – so unsympathetically, as Popper seeks to present it (Popper 1945), even if it no longer seems really “magical”.<sup>7</sup> Yet Obama still had better prerequisites than Trump to become a philosopher king. Trump is a suitable template for a (platonic) dystopia of democracy.

Despite all the evidence and doubts, the word for “active participation” in political training is connoted as especially positive (see Steutel and Spiecker 2002): participation is politically and morally welcome, one seems to know here, and therefore it must also be a task of public schools.<sup>8</sup> The related pedagogy is called: ‘getting the students involved’. So-called active participation is so important that questions about the *goals* and *means* of being active only interest in second place. Yet active

<sup>7</sup> Karl Popper (2003). *Die offene Gesellschaft und ihre Feinde*. Tübingen: Mohr Siebeck (original 1945). The first volume bears the title *Der Zauber Platons* (The Open Society and Its Enemies).

<sup>8</sup> Prominent examples for empirical studies with this outlook were/still may be the BLK programme ‘Live and Learn Democracy’ (see Diedrich et al. 2004), the IEA Civic Education Study (see Torney-Purta et al. 2001), the participation study ‘*mit*Wirkung’ financed by the Bertelsmann Foundation (Fatke and Schneider 2005), the Sachsen-Anhalt study (see Krüger et al. 2002), repeated youth studies by Shell Germany (e.g. 2002), and many others.

participation was also a sacrosanct notion in the Hitler youth movement and its feminine counterpart, the *Bund Deutscher Mädel* (Flessau 1979). It also emerged later in the Free German Youth (*Freien Deutschen Jugend*). Thus participation certainly must not have been sacred in and of itself. In contrast to this, *rights* of political participation and simultaneous *rights to keep one's distance* must each be held in high esteem by modern society (see Reichenbach 2001, pp. 166–171).

### *Is Participation 'Good'?*

The pedagogical credo of participation was widespread and remains so in the German-speaking countries and the USA (Edelstein and Fauser 2001; Himmelmann 2005). Consequently, *political training* is no longer distinguished analytically from *democratic education* or *moral training*. And the school too is not further separated from *democratic education* or *moral training*. The school – with a pedagogical reform impetus – is glorified as the *Polis* (see von Hentig 1996) and described by John Dewey as an *embryonic society*.<sup>9</sup> Both metaphors are important and misleading, because a *Polis* only exists among free peers,<sup>10</sup> and the school is not a mini-society but rather part of society, and the schools not a mini-society but rather part of society.<sup>11</sup> According to Dewey, the important achievements of *progressive education* were seen in part as purely antithetical to idealism in the Kantian tradition. Kant's thinking on political training had left an especially notable impression in Germany (Himmelmann 2005).

One way or another, 'politics' managed to establish itself as a school subject in Germany. An important historical premise could be located in the "re-education effort which the young West Germany wanted to invest in for a new democratic orientation of the education effort with the Western allies after 1945" (Sanders 2005, p. 16). So far, one searches in vain for an equivalent for the *Bundeszentrale für politische Bildung* (1963)<sup>12</sup> in most countries (also in Europe).<sup>13</sup> The fact that political education should be a concern of mandatory public schools builds no consensus at all in various European countries or groups of states. Where this is the case due to critical historic transformations – perhaps Germany, France, Spain, or Greece (Mickel 2005, p. 650) – political training is obviously very

<sup>9</sup> John Dewey (1956). *The School and Society*, Chicago: University of Chicago Press (original 1915).l

<sup>10</sup> As Arendt (1996) put it: Between people who do not rule, command, or obey each other.

<sup>11</sup> The presentation of the schools as *Polis* is most *schmalz* or bombastic, but in any case it's not entirely honest. Therefore, the *Polis* has little to do with institutionalized education or training. But the fact that there is an extracurricular 'school life' that can be politically idealized is perfectly obvious.

<sup>12</sup> Founded in 1952 and named the 'Bundeszentrale für Heimatdienst'.

<sup>13</sup> There is also neither a European Union political training course nor one on the EU (Mickel 2005, p. 636), although the importance of intellectual orientations for the EU's unity and coherency is naturally recognized.

widely comprehended – ultimately not ‘only’ as national citizen training but also as ‘social’ or ‘moral’ training. Then the school also has the task of promoting assumptions of individual skills for participating in civil society – and this is equated with political training.

### *Going to the Toilet*

Such a broad understanding of ‘politics’ loses its political character, although it may appear pedagogically attractive. Actually this expresses an amalgam of very differently accentuated democratic theories, and the differences would be relevant in understanding the potential and limitations of political training in the schools. If one reduces the three essential paradigms of modern democratic theory (liberalism, republicanism, and deliberation) to each one’s central mechanism for securing the political community, it can be claimed that liberal positions mainly emphasize use of political and legal *institutions*, republican positions stress the meaning of citizen *virtues* that make a community coherent and capable of empathy, whereas deliberative positions reduce ultimately to *procedures* that serve (the ideals of) an argumentative consensus (see Schaal und Heidenreich 2006, p. 192). These are points of stress: institutions, virtues, and discussion procedures that naturally are neither mutually exclusive in terminology nor in fact.

In contrast to liberal perspectives, republican and deliberative positions stress the importance of *democratic forms of participation* (Gerhart 2006). Political participation can be viewed as taking part, producing, and maintaining a public sphere. Its complement or opposite is withdrawal into the sphere of privacy or intimacy. Habermas’ *Structural Change in Public Affairs/Strukturwandel der Öffentlichkeit* (1990/1962) or even Sennett’s *Fall of Public Man* (1974)<sup>14</sup> at the latest diagnosed the blurring borders between these two spheres and especially criticized in ‘privatizing the political sphere’. For example, Benjamin Barber’s critique compares the secret ballot cast in voting machine cubicles with a line waiting to use the toilet:

Our primary electoral act, voting, is (...) like using a public toilet: we wait in line with a crowd in order to close ourselves up in a small compartment where we can relieve ourselves in solitude and in privacy of our burden, pull a lever, and then, yielding to the next in line, go silently home. Because our vote is secret – ‘private’ – we do not need to explain or justify it to others (or, indeed, to ourselves) in a fashion that would require us to think publicly or politically. (Barber 2003, p. 188)

Going to the toilet stands for a private understanding of democracy and a type of loss of democratic consciousness. There is no coercion for accountability at the site of political decision-making; each and everyone may harm the common good at his or her will. The public affair transforms itself into a private decision-making moment

---

<sup>14</sup>Richard Sennett: *Zerfall und Ende des öffentlichen Lebens oder Die Tyrannei der Intimität* (1986) [The Fall of Public Man]. Frankfurt am Main: Fischer.

of weighing how to maximize the individual's opportunity instead of improving society (see Schaal and Heidenreich 2006, p. 166).

'Strong' communitarian and participatory democracy must be challenge in regard to both the utopia of a long-living and 'lively debating community' and concerning the suggested symmetry and community ideal. The *kratic* and *kratological* momentum (Hösle 1997, p. 95)<sup>15</sup> – that is, the power motive of all politics – finds little mention here. Even the *pseudo-participation* analysis by Pateman (1970), into which each firm practice of participation threatens to fall, is unnoticeable. Rulers and the ruled are often identical here. Pabst (2003, pp. 9–33) has referred to the misleading interpretation by which *democracy* – even from the derivation of its name – means popular *rule* and was presented in such a manner: yet the Greek *kratein* means 'exercise power' and not 'to have authority' – in contrast to *archein* (as in 'oligarchy'), which means 'to rule'.

If anything, the *demos* possesses power in a democracy (over the government or the governing), but the people don't rule. *Democratic* knowledge – in the sense of political training – would also be viewed as knowledge of power, and skilled democrats would be secularly oriented as *cratologists* (power experts, so to speak). Politically informed people would not only know about the power of people but would also know specific power practices – ways to exercise their 'power skills'. Political training might be more attractive overall if it would also be represented and understood as power theory – admittedly politics would attract even more hesitant people with questionable motives. Emergence and vanishing of individual desires for civil society participation may underlie simple cycles of *Engagement and Disappointment* (see Albert O. Hirschman 1984<sup>16</sup>) that cannot be guided either politically or pedagogically (nor should they be).

## *Lies and Deception*

Political training directed toward the general welfare alone – however highly motivated – possesses the problem of weighing the meaning of power in practice and strategy too little and/or too one-sidedly by considering only its negative aspects. Yet the pursuit of *particular* interests is the central motive that leads to political action, even if one tries (or should try) to create clarity about common interests in the discussion. Pursuing particular interests usually requires that they remain secret. But lies and deception belong among the ingredients of politics. For the community theorists of politics, political participation without lies and deception as well as

<sup>15</sup>Vittorio Hösle (1997). *Moral und Politik* (Morality and Politics). Munich: Beck.

<sup>16</sup>Albert O. Hirschman (1984). *Engagement und Enttäuschung, Über das Schwanken der Bürger zwischen Privatwohl und Gemeinschaftswohl*, Frankfurt a.M.: Suhrkamp (American original 1982: *Commitment and disappointment: About the swaying of citizens between private and common good*).

collective decision-making without strategy and deviousness not only seems imperative but also possible (see Meyer 1994).

Hannah Arendt's estimates on this are just the opposite. She writes in *Wahrheit und Politik* (2006): "Nobody has ever doubted that honesty in politics is scarce. Nobody has ever thought truthfulness to be a political virtue" (p. 9). Nevertheless, the issue is and naturally remains virulent. How then could the truth survive at all if it has proved to be so powerless in the *public* world. Political discussions concern facts and opinions. One can debate opinions, but not facts, one would presume.

Beside mathematical, scientific, and philosophical truths, Arendt refers to the politically important and underestimated *factual* truths without knowledge and recognition of which securing so-called freedom of opinion turns into a farce (p. 23). Factual information inspires political thought and keeps it within limits (ibid.) Thus it is central for political discussion to know, for example, if it is recognized as a fact that an Armenian genocide occurred – or if one can say (and may just as easily) that the Armenians had attacked eastern Turkey. Since facts (ideally) are not negotiable, "[they] stand outside all conventions and all voluntary accords", and thus the exchange of opinion about them contributes "not in the least to their establishment" (Arendt 2006, p. 27). While one may quarrel with unwelcome opinions, discarding them or making compromises with them, according to Arendt, it's precisely the "unwelcome facts (...) that are of an immovable stubbornness that can be shaken by nothing other than smooth lies" (ibid.) 'Post-factual politics' and Trump's coinage of the term 'alternative facts' indicate a loss of recognized reality, which hopefully sounds creepy to even than the ingrained constructivists who exist there today.

### *The Political Apathetics*

Given an idealized and morally loaded understanding of politics, political apathy comes across today lamentable in general. Apathy, the condition of lethargy and indifference, represents no flattering diagnosis in a world of activist interventionism. Yet it concerns a morally suggestive diagnosis: As if politically inactive people would *generally* be inactive and as if political activity *in general* would be welcome. As if – to repeat – it does not depend particularly on *whoever* is politically active with which goals and *which politically active resources*. In contrast to other 'apathies', political apathy is a lack of training: Those who lack interest in sports, the fine arts, or nature would hardly be classed as 'apathetic'. But the sector of apathy represents a universe, while it can only deal with activity and always being well-informed in order to cope with a relatively small sphere of individual human life. The *normative surplus of determination* in modern life – 'too many shoulds' – also forces people to draw a line relentlessly on some more noble tasks and become 'apathetic' in, let us say, a zone-specific sense. It remains impossible to interest and commit oneself intensively to everything of importance at the same time, no matter how desirable this might seem.

Those who criticize political apathy seriously in democracies – aside from important exceptions – cannot distinguish basically between *being politically educated* and *being compatible with democracy und fitting behavior*. Thus this also means between *political training* and *democratic education in the broadest sense*. Complaints related to that lack of differentiation (claiming that schools undertake too little for political training) may be justified in the strictest sense. However, it is too dramatic, since most schools of the Western European type may long since have been labeled ‘democratic’ *in many regards*: types of behavior and skills are encouraged, challenged, and drilled into them without which the democratic ethos could only exist with difficulty. Apart from this, an anti-dogmatic moment inhabits the scientific orientation of the academic content. But the fact that the school could *never be merely democratic* (and should not be either) is a moment that signifies the limitation of all political school training.

### *Educated Spectators*

More important than the question of how many citizens are actively engaged in politics as a rule seems to be the issue if society as a whole generally behaves in ways that support the democratic ethos or is at least compatible with it. It is assumed that this ethos is also shared by the so-called silent majority – that is the apathetic ‘normal’ people – who strive for and perhaps even realize a halfway meaningful and honorable life and coexistence. From this viewpoint, it is naturally still important to know if a *political culture* exists that deserves this name. More fundamental is the question if the “passive” majority cultivates connections in its worldly life of *culturally argumentative strategies* in every realm that could also be “resolved” by the most *nonpolitical* of all communicative forms – namely by instructions, orders, and compulsion (Meyer 1994). This could be identified as a *democratic ethos*.

In contrast to this, political training is a bit like aesthetic training or training in the natural sciences – that is, it is not to be expected from the majority in developed form or expression. It has indeed been customary to view political training as the interplay of political *know-how*, political *interest*, and political *action* or as the interplay of political *know-how*, political skills, and attitudes, positions, or orientations.

In respect to political *training* in a *narrower* and scholastic sense, one ultimately must assert from the perspective of critical terminology the primacy of the *knowledge aspect*. Admittedly this fails to fit in with the new training world, but it remains more convincing. This involves knowledge about (1) political institutions, their function, and the meaning to democracy; (2) political procedures and strategies; (3) political traditions, ideas, and utopias; (4) political actors, parties, and personalities; (5) general and specific political debates, for example, political topics, and finally knowledge of the differences between other forms of understanding and practices (which might be called the ‘highest’ form of political knowledge).

Children and youth can be *educated* and *socialized* into democratically suitable or democratically conforming behavior. This means (or should mean) acquiring a democratic ethos in the mainly down-to-earth arenas due to the manner in which adults communicate with children and with each other on problem-solving and overcoming conflicts, seeking consensus but also being able to cope with dissent. But this training happens *in no sense automatically* or even in a *political* sense, although the democratic ethos sometimes seems to be the soil in and out of which the political training drives toward blossoming in a narrower sense.

That said, it is precisely the *lack* of this soil – namely the scandalous *lack* of democratic procedures and participation rights – which politicizes people, whether young or old. And that is what probably drives people to official and informal politics (see Reichenbach and Breit 2005).

Political *interest* quite often coexists very well with political *inactivity* – especially among the millions of ‘spectators’ who form large observation posts – sometimes quite nearby, sometimes far from the political arenas. They may outnumber the relatively small crowd of political ‘gladiators’ by hundreds, thousands, or tens of thousands,<sup>17</sup> but they usually have hardly any chance for direct and well-rounded participation *inside* the arenas. The spectators – in contrast to the gladiators – don’t get their hands dirty (or don’t have to). Most of them know better, and that’s fine.

Spectators supposedly have the overview. They can offer differentiated comment. They can also provide primitive commentary at the taverns. Yet – in regard to politics – they are at least the reflected splendor of the *bios theoretikos* or even the *vita contemplativa* if not its expression.

By contrast, those who perform as gladiators amid the *vita activa* – as Arendt (1996) notes – cannot know ultimately how well or how effectively he conducts himself. He has no overview. He lacks intermissions to reflect quietly upon what he will do next. He is thrown from one decisive situation into another and must always act as if he knows exactly how to react. Naturally he is very well informed about what move to make in some cases (but not always) and is forced to make decisions nevertheless.

Discussions are long, but life is short, to borrow a formulation from Marquard (1981). And whoever wants to succeed in life itself – as a *man or woman of action* – must take a stand from a miserable position over and over again. On the other hand, spectators (whether anarchists, early Christians, socialists, or conservatives) may delight in their possibly fitting commentary, even if it has no practical impact. He risks nothing and loses nothing. His hands aren’t dirty, but – to recall Jean-Paul Sartre’s play on words in *Les main sales* – he has no hands to get dirty either.

If all goes well, the spectators are politically trained citizens who have the necessary know-how about how to react – or should have it. It is not of *primary* importance if they are actively engaged. Important is that they continue to observe and comment. ‘Being active’ means nothing in reference to political training or even being educated, for even a dangerous idiot can be active. If the uneducated heads are

---

<sup>17</sup> Lester Milbrath (1977) distinguished between *gladiators*, *onlookers*, and *apathetics* in regard to *political* participation by the citizenry.

active (It would be naïve to believe there are only a few of them), the democratic ethos will be tested dramatically, in part for its suitability. It will therefore be better for all that those who have no grasp of politics not to worry about it too much either.

This view – already formulated in Plato’s *Alcibiades* (1996) – may not fit into the *political* and *educational correctness* of today’s pedagogical democracy entreaty. Yet that doesn’t improve the idea either (calling for modern societies to train as many people as they can to be politically active). Where we find only gladiators and no spectators or even any apathetics – that is where the activist utopia would become a reality, chaos would be perfection: there would be no corrections (e.g., recall votes), no oversight, and hardly any intelligent commentary, since they could only develop in the *vita contemplativa*. In short: only thanks to the spectators in particular can the democratic ethos be realized even in the political arena.

It’s probably not political training in the school which motivates the question ‘On which side do you stand?’ But political training in the school can help grasp the meaning of the question, to recognize the need to answer it, and finally to respond to it.

# Subject Index

## A

- Ability, 965–978
  - grouping, 807
- Abnormal children, 1172
- Aboriginal identity, 1032
- Aborigines, 510
- Absolute
  - assessment, 897
  - spirit, 541
  - truth, 22, 24
- Abstemious reflection, 601
- Abstract anthropology, 397
- Academic
  - duty, 1300–1303
  - freedom, 1167, 1293–1304
  - literature, 1249
  - research, 1297
- Accountability, 309, 890, 897, 901, 1010,  
1206, 1208, 1209, 1214, 1218
  - culture, 1310
- Acculturation, 21
- Accumulation, 1326
- Accusation, 74
- The achievements of those natural-scientific  
investigations, 910
- Acquaintance, 1124
- Action, 1054
- Active citizenship, 1210, 1211, 1218
- Active participation, 1216
- Actor-network-theory, 731
- Adab*, 20
- Adaptive preferences, 974
- Admission, 789, 793, 798
- Adolescence, 403
- Adorno, 730
- Adorno's theory, 247
- Adult
  - educator, 50
  - sexualities, 981
  - society, 991
- Adulthood, 999, 1004, 1007
- Aesthetic, 739, 740, 742
  - education, 13, 276, 535–538
  - experience, 140, 192, 278, 537, 538, 542
  - judgment, 535
  - literacy, 270, 277, 278
  - objects, 276
- Affirmative action, 203
- Africanism, 519, 520
- African Americanism, 518–519
- African philosophy of education, 517–528
- Against interpretation, 277
- Agamben, 734, 737
- Agamben's method, 33
- Aggression, 1353
- Aggressive
  - behavior, 1328
  - cognition, 1328
- Agonistics, 874
  - contestations, 286, 287, 290–292
  - cosmopolitics, 828
  - pluralism, 283
  - politics, 286
- A human among humans, 798
- Aims talk, 309
- Alienation, 554
- Alleged atheism, 1064
- Allgemeine Pädagogik, 895
- Alphabet, 1129
- Alphabetic writing, 419
