## Preface

The field of vocational education and training (VET) studies is maturing rapidly, as is evident from the mushrooming of new journals, the expansion of the volume of research, and the widening of international cooperation by international VET institutions. Increasing policy emphasis on VET, especially in developing contexts, indicates that there is a realization of the potential of VET for the socioeconomic and cultural development of nations and regions, and the impact it could have on the personal and professional lives of people across the globe.

While millions of learners participate in formal vocational learning at any moment in time, billions daily experience on-the-job training, learn craft skills in their families and communities, and are learning new skills, techniques, and knowledge online. VET stakeholders are questioning the content of the curriculum, realizing that students need to be prepared for a future that is largely unknown, but is likely to be radically different. The design of vocational education and training programs now focuses not only on work-related tasks and activities, but also on generic competencies like learning to learn, problem solving, critical thinking, innovation, and transformation. Students have to be prepared, *inter alia*, to cope with change; to grow their knowledge, skill, and creativity; and to contribute to developing new products and processes. In spite of the critical responsibilities attached to it though, vocational education remains marginalized in educational debates that privilege schooling, and more perversely higher education, which gets attention because of its status rather than scale.

With almost 100 chapters from an international group of authors, this VET handbook is a step toward redressing this imbalance. It considers the changing worlds of work to which VET must respond, as well as insisting that VET should not be narrowly seen to cater only for the formal economy. Issues of economies of care, the challenge of sustainability, planning, and finance are considered, as are the rise of private provision and the role of training in enterprises of varying sizes. The handbook also considers the evolving nature of vocational learning and how this intersects with curriculum and instruction, with a particular emphasis on the major debates about competence that have characterized the field for a quarter century. Since learning cannot be considered in isolation from teaching or the education of teachers and instructors, this is another strand of the handbook that flows into discussions on the measurement of both instruction and learning. While the

learning-teaching dyad is of vital importance, recent years have seen a heightened interest in questions of wider learner support; hence, a section is directed to this growing debate.

Understanding that both scale and context matter, the handbook brings together chapters that examine these issues from the perspective of small-scale and detailed empirical work through to national and comparative surveys. As well as reviewing what exists and the gaps therein, the handbook is future-focused in identifying promising new directions in research and development.

While this handbook is entirely new in its content, it builds on the groundwork done in the foregoing Springer handbook edited by Rupert McLean and David Wilson titled *International Handbook of Education for the Changing World of Work: Bridging Academic and Vocational Learning*. It was precisely because that previous work covered so much ground so effectively that here we could take directions which reflect major shifts in VET research in the past decade.

We hope this handbook will inspire readers to reflect on the continuous improvement of VET policy development, international cooperation, teaching and learning, initial teacher education, continuing professional development, education innovation and administration, and research – all of which will ultimately lead to real improvement of vocational education and training practices.

## Volume 1

<b>Part I The Changing World of Work</b> .....	<b>1</b>
Margarita Pavlova and Salim Akoojee	
<b>1 Skills Forecasts in a Rapidly Changing World: Through a Glass Darkly</b> .....	<b>3</b>
Rob Wilson	
<b>2 TVET Teaching in the Time of Digitization</b> .....	<b>23</b>
Mike Douse and Philip Uys	
<b>3 Skill India: New Skills Development Initiatives in India</b> .....	<b>39</b>
Anita Sharma and Kenneth King	
<b>4 Information and Communication Technologies (ICT) in VET in Russia: New Developments</b> .....	<b>63</b>
Tatiana Dobrydina, Nadezhda Usvyat, and Tatiana Shipilova	
<b>5 The International Quality Competition and Its Implications for Vocational Education and Training</b> .....	<b>79</b>
Felix Rauner	
<b>6 Informal Economies, Work-Based Learning, and Sustainable National Skills Development in Africa</b> .....	<b>103</b>
Salim Akoojee	
<b>7 Innovation Skills in Apprentice Training</b> .....	<b>121</b>
Ludger Deitmer	
<b>8 Challenges to Agency in Workplaces and Implications for VET: Mechatronics Artisans in the Automotive Sector in South Africa</b> .....	<b>139</b>
Angelique Wildschut and Glenda Kruss	

<b>9</b>	<b>Migrants in the Labor Market: Implications for TVET</b> .....	159
	Joyceline Alla-Mensah, Haya Fakoush, Simon McGrath, and Volker Wedekind	
<b>10</b>	<b>The Fourth Industrial Revolution: Trends and Impacts on the World of Work</b> .....	177
	Sang Yun Kim	
<b>11</b>	<b>Greening of the Economy Through Partnerships: Issues and Impacts on Skills Development</b> .....	195
	Margarita Pavlova	
<b>Part II</b>	<b>Skills for Sustainable Human Development</b> .....	<b>219</b>
	Lesley Powell	
<b>12</b>	<b>Transformative Learning in English Further Education</b> .....	221
	Vicky Duckworth and Rob Smith	
<b>13</b>	<b>Analyzing PIAAC Through the Capability Approach</b> .....	237
	Aurora Lopez-Fogues and Rosario Scandurra	
<b>14</b>	<b>Skills Development and TVET Policies in South Africa: The Human Capabilities Approach</b> .....	259
	Siphelo Ngcwangu	
<b>15</b>	<b>Vocational Education and Training Beyond Human Capital: A Capability Approach</b> .....	273
	Jean-Michel Bonvin	
<b>16</b>	<b>Enabling Vocational Lecturer Capacities Towards Sustainable Human Development: Towards Radical Revisioning</b> .....	291
	Kathija Yassim, Neville Rudman, and Lucky Maluleke	
<b>17</b>	<b>Making a Life: Doing, Radical Humanism, and Agency</b> .....	309
	David Balwanz	
<b>18</b>	<b>VET Contribution to Human Development Within a Context of Marginalization: The Case of Palestine</b> .....	323

## About the Editors

**Simon McGrath** is UNESCO Chair in International Education and Development at the University of Nottingham and extraordinary professor in the Faculty of Education at the University of the Western Cape. He was lead editor of the *Routledge Handbook of International Education and Development* and has published extensively on education and development, as well as doing policy work for a range of organizations, including UNESCO, ILO, UNDESA, EU, SADC, and the Commonwealth Secretariat. His most recent books are *Education for Development* (Routledge, 2018) and *Skills for Human Development* (Routledge, 2019, with Lesley Powell).

**Martin Mulder** is professor emeritus of education and past chair of the Department of Education and Competence Studies of Wageningen University, the Netherlands. Most of his recent research is in the field of competence-based vocational, professional and higher education, and training and development. He recently edited *Competence-Based Vocational and Professional Education: Bridging the Worlds of Work and Education* (Springer, 2017). He (co)authored and edited numerous books and articles in peer-reviewed scientific research journals in the field of vocational education, higher education, teacher education, science and engineering education, technology-enhanced learning, management, entrepreneurship, and mainstream educational research. The work of Mulder has been widely acknowledged. He received an Outstanding Reviewer Award of the *Journal of Workplace Learning* twice (2017 and 2018), the European Researcher of Vocational Education and Training Award by the European Commission (2016),

and is an honorary member of the Vocational Education and Training Research Network of the European Educational Research Association (since 2011). Furthermore, he has several more awards from Dutch, American, Asian, and other European organizations. Martin Mulder has served, and still serves, on a number of editorial committees of international journals and held various leadership positions in national, European, American, and world educational research associations. He has presented his work widely in Europe, the Americas, Africa, and Asia. Currently, he is a member of the Academic Board of NCOI and an independent consultant in the field of education and training. He maintains his own website [www.mmulder.nl](http://www.mmulder.nl)

**Joy Papier** is the director of the Institute for Post-School Studies (IPSS) in the Faculty of Education at the University of the Western Cape (UWC), Cape Town, South Africa. The Institute undertakes training and development of adult educators and TVET college lecturers, post-schooling research, and policy analysis in the vocational, adult education, and higher education sectors. Prof. Papier has been active in education, policy, and development for about 25 years, as a school teacher, university teacher educator, trainer, development worker, and researcher. She holds an MPhil (University of the Western Cape), an MEd (Harvard), and a PhD from the University of Pretoria. Her current research interests include TVET teacher education, TVET policy and development, vocational curricula policy, and workplace and institutional cultures. She has published on vocational and general teacher education in several academic journals, presented at conferences and on public panels, participates in national government task teams, and is an external examiner for numerous postgraduate dissertations in the field of post-schooling. Prof. Papier was recently appointed South African National Research Chair in Post-School Studies: TVET, and is co-chair of the African Union commission expert group on TVET.

**Rebecca Suart** is a Postdoctoral Researcher in TVET at the Centre for Education Research Innovation. She completed her Ph.D. at the University of Nottingham, and her research focuses on VET systems within the English Further Education sector for adult learners. More specifically, her focus is on gender and social inequalities, learner aspirations, learning careers, capabilities, and human development approaches. Additionally, her research interests include post-compulsory vocational education, pre-teaching degrees, management and leadership, and supporting learners. Rebecca has worked within vocational skills training at various Further Education colleges in England for more than 15 years. She has held several positions, including vocational lecturer and curriculum management of a broad range of vocational specialisms from fashion to catering. Rebecca is particularly proud of her work on skills competitions. She set up two Further Education Skills Competition Council committees to plan and host competitions across the UK. These competitions proved to be so successful that they provided entrants and medal winners at World Skills competitions.

## Abstract

*Through a glass darkly* is a phrase that has inspired the titles of many works. It implies an obscure or imperfect vision of reality. This is very apposite in the context of individuals making career choices and educational investment decisions. Frequently criticized as unnecessary, misleading, and even impossible, skills forecasts are an attempt to add some light. Now a key element in economic and labor market policy in many parts of the developed world, they also provide a benchmark for debating whether the education and training system produces skills appropriate for the labor market.

Globalization, technological change, and demographic developments are changing the world of work, as well as the provision of education and training,

in dramatic ways. The ever-growing importance of services (in terms of shares of total employment), continuing impacts of ICT including robotics, and a myriad of other factors are changing the nature of work and employment.

Nevertheless, many clear trends emerge that can help those having to make career choices or decide on priorities for investment in human capital make better informed decisions. Policy makers worldwide are keen to try to match skills supply with rapidly changing demand, but perfect matching is probably a chimera in all but the most tightly controlled and planned economies.

This chapter argues that regular skills forecasts are essential in a modern labor market information and intelligence system to ensure economies and labor markets function efficiently. While both precise and detailed forecasting and matching of supply to demand are impossible tasks, it is important that all participants in the labor market are well informed about the world around them and about future prospects. Systematic, consistent analysis and projections, based on sound historical data, can provide such information.

Skills forecasts can inform education and training providers, as well as individuals making career choices, about their best options. Of course, nobody has a crystal ball. The chapter also sets out the problems and pitfalls associated with such work, alongside the case for its continuation on a regular and well-founded basis.

**Introduction**

Globalization, technology, and demography are leading to major changes in economies and labor markets across the world. Concerns about job losses, problems caused by aging populations, and migration, as well as maintaining productivity and economic growth, are all tied up with skills. Does the economy have the skills needed to meet these challenges? Can the problems caused by skill shortages and surpluses be avoided?

This chapter outlines why skills are important, how they are defined and measured, and how the demand for skills is assessed. The key drivers influencing the demand for skills are summarized. The chapter then sets out the case for regular and systematic assessment of skill needs, now and in the future, as part of the broader labor market information and intelligence system (LMIIS) needed to ensure that labor markets work efficiently. It argues that such work is a public good that should be centrally funded by the state. Different approaches to skills forecasting are reviewed and methods critically assessed. While the notion of maintaining a perfect match between skills supply and demand remains a chimera, a good LMIIS is increasingly recognized as a key part of economic, labor market, and education policy by governments across the world (Dickerson and Wilson 2017).

---

## Why Skills Are Important

Work remains the key mechanism by which most people earn a living and why they get out of bed each day. For some it is a chore, but for many others it defines who they are and why life is worth living (Wilson 2013).

From an individual's perspective, skills are the key to obtaining and keeping a job. The skill set that an individual possesses is in part determined by mother nature and in part honed by nurture, education, training, and experience (learning by doing).

From a broader societal/government perspective, skills are seen as the key to productivity and economic growth. The importance of skills in modern economies, at both micro- and macro levels, is therefore widely acknowledged. Skills are key determinants of both earnings and employment (and hence the distribution of income). The demand for and supply of skills, and the matching of the two, are therefore issues of key concern to government.

---

## Defining and Measuring Skills

The definition and measurement of skills is not straightforward and the subject of much debate. Skills are *defined* in many ways (Green 2013). They are traditionally *measured* by proxies such as occupation or formal qualifications.

The classification of jobs by occupation is the most common measure of skill in most countries (as pioneered by the US BLS and used in other countries) (e.g., the UK's *Working Futures* series, Wilson et al. (2016a)). Occupation has the virtue of being easy to measure in employer or household surveys. Jobs are regarded as bundles of skills. The changing occupational composition of employment when disaggregated can therefore provide a useful indication of changing skill requirements.

More recently the emphasis has been on direct measures based on job requirements or task-based assessments focused on employers and individuals. Surveys of employers suggest they are interested in "generic" or "core" skills rather than formal educational qualifications. Core or generic skills include literacy, communication skills, "interpersonal skills," and "adaptability" although the latter are as much personal characteristics as competences that can be taught and acquired (see Green 2008 for details). These so-called "soft" skills are much more difficult to quantify, although a number of serious attempts to do so have been made. The US O\*NET, the German BIBB/IAB systems, and (on a more modest scale) the UK Skills and Employment Surveys (Felstead et al. 2015) all involve recording the generic tasks and skills used in jobs in surveys or other assessments.

The most commonly used indicators of skills within jobs are educational attainment (such as numbers of years of full-time study completed or formal qualifications acquired). These also have the virtue of being easy to measure in household and other surveys. But they are poor proxies for skills utilized in employment. They focus on the situation before labor market entry. Formal qualifications, especially

those of a more academic nature, may have only a loose link with skills needed on the job. Many of the latter will be acquired while working on the job (often over many years) and are not accredited in a formal fashion. An increased flow of better qualified people does not imply that these skills will be fully utilized. Occupational qualification upgrading may result (credentialism) rather than real changes in skill requirements.

---

## **Assessing the Demand for (and Supply of) Skills**

The term “demand for skills” is often used very loosely. It is important to distinguish who the demand is from. Demand from employers arises from their need to employ labor in order to produce the goods and services that they sell. This is well represented by the changing patterns of employment by occupation. Demand from employers can be gauged from information on numbers employed as well as indicators such as unfilled vacancies or other measures of employer perceptions of the situation (e.g., as in the UK Employer Skills Surveys (UK CES 2016)).

This is often confused with demand from individuals when discussing the kinds of courses of education and training they may take in order to acquire skills and formal qualifications. This makes sense from the point of view of education and training providers – it is “demand” for their services. However, from the broader perspective of the demand for and supply of skills in the economy and labor market as a whole, it makes more sense to regard this as an indicator of supply (i.e., investment by individuals in acquiring the skills that they can offer (supply) to employers).

Information on the supply of skill generally is available from trends in labor market flows (e.g., the number of people achieving different qualifications from schools, colleges, and universities) as well as stocks (the number of people who have various qualifications or skills, including whether or not they are economically active).

Vacancies and unemployment can also be used as indicators of the current balance between demand and supply, alongside other measures such as the wage returns to qualifications. Recent evidence in the UK suggests a decline in the average returns for a degree, but increasing heterogeneity in returns by subject area (Britton et al. 2016). However, such estimates do not indicate future rates of return. It is a picture based on looking through the rearview mirror.

---

## **Drivers of Change in the Labor Market**

Reviews such as that by Wilson (2013) and others (see, e.g., Karoly and Panis 2004) suggest that there are three main drivers of change in the labor market: technological change, globalization, and demographics. Together they determine the demand for different goods and services (from consumer and other sources, as incomes have risen), as well as where these goods and services are produced (and by whom).

Individually, and in combination, these three drivers are affecting the structure of employment by sector and within that the pattern of demand for skills (as measured by occupation and qualification). These factors are moderated by economic considerations, including international competition and trade.

For the past few decades, information and communication technologies (ICTs) have been a dominant factor in *technological change*. Some argue that this is coming to an end and other technologies are taking over (e.g., Cliff et al. 2008). However, it seems likely that the interaction of ICT with other technologies will remain a key factor determining labor market change for the foreseeable future. Concerns about the impact of robotics and artificial intelligence on those parts of the economy that manufacture things, as well as in services, continue to headline much political and economic debate.

ICT has changed the way the economy and labor market work, as well as the way people live and control their working lives and social activities. Robots are coming to dominate production in much of the manufacturing industry. Increases in computing power mean that what once required a machine filling an entire room can now be accomplished on a handheld device (or one strapped to a wrist).

The massive increase in data and information available, and the ease with which it can be processed and analyzed, has created new markets and offers up ever more ingenious ways of exploiting this situation. The pace of change seems likely to continue if not accelerate. Although there are some signs of physical limits to the exponential increase in computing power, the scope for combining technologies and of unexpected interactions between them will probably continue to maintain the pace of change for some time yet. “Moore’s law” is based on the empirical observation that physical computing power has doubled every 2 years or so. The end of this exponential pattern has often been predicted, but developments in nanotechnology, etc. seem likely to see it continuing for some time (Kurzweil 2005).

And just because something is technically feasible does not mean it will necessarily happen (Baldry 2008). Outcomes are shaped by social and economic considerations and constraints. Particular technologies have frequently made many people redundant or jobs obsolete, but that does not mean that employment as a whole is reduced. New technologies generally result in new job opportunities. Whether these generate sufficient jobs to offset the job losses depends upon the market. Many of the initial predictions of the impact of ICT were for mass unemployment (Jenkins and Sherman 1979). More considered analysis, recognizing the importance of market adjustments, came to less pessimistic conclusions (Whitley and Wilson 1987). The same will probably be true of the latest round of change, although that may not be much comfort for those negatively affected.

ICT has also had a huge impact on the geographical location of work and jobs both locally (Green 2009) and on a much broader geographical scale (globalization). The end of conventional work patterns, with remote working and telecommuting becoming increasingly prevalent, is one aspect of this. Shifting patterns of global investment, with multinational companies moving capital around with increasing ease, is another.

Authors such as Friedman (2005) argue that *globalization* (in part facilitated by ICT and moderated by economic and political factors) means that there is no longer any certainty about where work will be done and by whom. He emphasizes that the world is now “flat,” a level playing field that everyone can compete upon. Reduced transport and communication costs open up the possibility of outsourcing to take advantage of significantly lower costs for labor and other factors of production, affecting the distribution of work on a global scale.

*Demographics* is the other main driver of change in labor markets. In most developed economies, the key features are a significant increase in the average age of the population, falling birth rates, and rising flows of inward migration (Bosworth 2008). For many developing economies, the issues are somewhat different with outward migration being of greater concern. These trends have significant implications for the structure of demand for goods and services (e.g., rising demand for health care from an aging population, as well as the ability of the labor market to meet the derived demand for skills to supply that care).

---

## Key Trends in the Demand for Skills

Analysis of key trends in the demand for skills across most developed economies shows many similar patterns (see BLS 2016; Wilson et al. 2016a, c). In the USA, the UK, and in Europe, the long-term shift in employment from the primary sector (especially agriculture) and traditional manufacturing industries toward services and the knowledge-intensive economy is a key feature. It is services that have provided the main source of new jobs in recent years (although there are some exceptions such as those Eastern European countries which have benefitted from inward investment in manufacturing as a result of lower labor costs). Soon, three quarters of all jobs in the European Union (EU) are expected to be in services. It is private services which have seen the most rapid employment growth. Education and health (which fall under the heading of non-marketed services in many countries) have also grown very rapidly. These patterns are generally expected to continue, despite the impact of technological change in areas such as banking and distribution.

These changes in the sectoral structure of employment have had a direct impact on the demand for particular occupations and qualifications, as well as other aspects of skills. This has been reinforced by changes in the patterns of employment (skills demands) *within* sectors (driven by skill-biased technological change and changes in how work is organized and jobs performed, all linked to ICT). This has increased productivity in many sectors. Machines, such as robots, now do the routine and predictable work (both manual and non-manual). New technologies have had less impact in areas of work which involve discretion and response to human interventions, even in jobs occupied by low-skilled workers.

Over the past few decades, there has been an increased demand for higher-level occupations. In Europe, almost 40% of employment is now in higher-level jobs (e.g., management, professional work, or technical jobs that typically require a university degree as an entry requirement). But at the same time, there has been

significant growth in some lower-level jobs, especially in services (e.g., elementary occupations in areas such as hotels and restaurants).

It is a moot point whether these trends reflect demand rather than supply. Brown et al. (2008, 2011) fear that for many developed economies high-level jobs may be transferred to lower-cost locations in Friedman's new "flatter world."

Nevertheless, possession of high-level qualifications is still likely to be advantageous in terms of obtaining and retaining employment and the rates of pay received (Wilson et al. 2007). Higher-level qualifications provide flexibility and adaptability helping individuals prepare for probable changes in an uncertain world.

New technology will also have significant implications for the educational process itself and its delivery (ways of learning, plagiarism, etc.). It is also affecting the boundaries between works in the formal as opposed to informal economies, as well as driving other sociological and related changes such as individualization and household restructuring (for a review see Wilson 2013).

---

## Rationale for Skills Forecasts and Skills Anticipation

All the indicators outlined above are backward looking. They are based on what has happened in the past or, at best, the situation which prevails today. They do not provide any help in thinking about what might happen next. Whatever measures of existing skills demand are adopted, they only record the current position. But if individuals and other interested parties are to make informed decisions regarding investment in skills, it is the *future* demand for skills that is important.

The main arguments for why skills forecasts are necessary are that the world is changing rapidly and in uncertain ways and that there is considerable evidence of market failure. Long lead times on investment decisions such as education and training choices mean that skills forecasting is especially desirable. Development of skills takes time (in exceptional cases many years). To ensure the right number of doctors in the future, building and establishing a new medical school can take decades. Most skills can be acquired in a shorter time frame, but many require a substantial investment of time.

The past may not provide a very helpful guide to what is likely to happen in the future, so some attempt to anticipate how the demand for and supply of skill might change in the future is needed. This provides the key rationale for undertaking regular skills forecasts or what is increasingly now referred to as "skills anticipation." Skills forecasters argue therefore that regular and systematic assessments of future prospects are needed to:

- Guide and inform policy formation.
- Guide and inform individual decision making.
- Avoid future imbalances and mismatches.
- Offer up a counterfactual to assess alternative policies or different choices.

But it is important to recognize that skills forecasting is in many respect as much of a “process” as an “end” in itself. Lassnigg (2012) emphasizes the links between the generation of views about the future and perceptions of mismatch and imbalance. This is a two-way process. For example, good-quality LMII can help to improve the provision of advice to labor market entrants. Forecasts of future skills demand can help to inform new entrants and returning workers, as well as learning providers and governments, about how to focus and target their investments in education and training provision. A regular and systematic set of labor market projections, based on transparent assumptions, provides a benchmark for informed debate and decision making, including evaluation of the potential impact of unanticipated structural shocks or more speculative, horizon-scanning exercises.

European experience more generally also emphasizes the importance of building networks of stakeholders that allow discussion of the outcomes and analysis of policy implications (Wilson et al. 2017). Researchers and analysts learn about stakeholders’ views, and stakeholders learn to use the information better. It also highlights that there is not just one single inevitable future – how it evolves depends on decisions made by everyone involved.

Systematic assessment and anticipation of future changes in skill needs is important for many different groups in the labor market. This includes not just individuals making career choices but many other stakeholders, including those responsible for providing education and training, careers advice, and guidance, employers and their representatives, as well as local, regional, and national governments.

---

## Different Approaches to Skills Forecasting

There are two extreme approaches taken to skills anticipation and matching:

- Reliance on market forces – in the theoretical world of the classical economist, rational decisions taken by “homo economicus” result in the best of all possible worlds; intervention is only justified if there is clear evidence of “market failure.”
- Central planning – with the educational system manipulated by “top-down” indicative planning, to ensure that it delivers people with the skills required by the economy (the implication being that the state decides provision based on some “true” forecast of future demand).

The latter was the rationale for the so-called “manpower planning” approaches of the 1960s that characterized some of the earliest skills projections. This kind of approach is now the exception rather than the rule. Even in centrally planned economies, such as China, a much greater role is now allocated to market forces.

The US Bureau of Labor Statistics (BLS) has carried out regular skills projections since the 1950s. Initially, these were intended to help war veterans to understand the job opportunities when returning to the labor market. Systematic scientific methods were applied to attempt to predict the prospects for the economy and labor market with a view to planning education and training systems to match.

The OECD attempted similar work in Mediterranean countries in the 1960s with mixed success (Lyons 1965). Undoubtedly some of the earliest attempts to undertake skills forecasting were naïve. These pioneering efforts were based on the notion that education and training systems could be planned to meet the needs of the economy in a “mechanistic” fashion. It should be recalled that, at this time, significant parts of the world economy were being managed in this fashion (e.g., the USSR and communist China), for whom individual freedoms were of minor consideration. Matching skills supply to meet the demands of the economy was a key aim in many countries.

These mechanistic approaches soon ran into problems because of failure to take into account social and economic aspects of the way labor markets work. In more open economies, more obviously subject to the vagaries of market forces, it soon became apparent that this kind of mechanistic manpower planning did not work. In part, this was because the data available and the models were simply inadequate to represent the complexities and subtleties of the economic and social factors that govern outcomes in labor markets. Even today, with much better data and more sophisticated modeling and estimation techniques, few if any forecasters would claim to be able to predict the outcomes of such a complex system with precision.

More recently, it has been recognized that while it is impossible to predict the future of the labor market in detail, it is possible to identify robust trends and patterns that can be used to inform labor market participants about the world they are likely to face. This is now the key rationale for governments such as the USA continuing to invest heavily in this kind of work.

---

## Making Skills Projections

Various methods have been used to predict the future, some more systematic than others. As well as peering into crystal balls, fortune tellers have read the future in “tea leaves” left at the bottom of a cup or in the palms of the hands (as well as less savory indicators)! More recently the emphasis has been on more systematic and scientific methods.

These include formal, quantitative models, as well as other approaches both quantitative and qualitative (including surveys of employers and scenario development techniques).

At its most basic, any skills forecast requires just two things:

- An accurate assessment of the current position – what is the situation now?
- An assessment of what will happen next (how things might change) – the latter can be achieved in many ways, both quantitative and qualitative.

The many alternative methods each have strengths and weaknesses as well as problems and pitfalls. Some of the main ones are summarized in Table 1.

**Table 1** Pros and cons of different approaches to skills anticipation

Approach	Advantages	Disadvantages
Formal, national level, quantitative model-based projections	Comprehensive (typically covers all sectors) Consistent Transparent and explicit Quantitative	Data hungry Costly Not everything is quantifiable May give a false impression of precision/certainty
Surveys of employers, etc., asking about skill deficiencies and skill gaps	Direct “user/customer” involvement Easy to set up and carry out	May be very subjective and inconsistent Too much focus on the marginal and ephemeral
Focus groups/round tables, Delphi-style methods; scenario development	Holistic (considers a broader range of factors that are just economic) Direct “user/customer” involvement	Can be non-systematic Can be inconsistent Can be subjective
Sectoral/occupational/regional studies and/or observatories (using both quantitative and qualitative evidence)	Holistic (for the sector) Partial (ignores other sectors) Strong on sectoral and other specifics	May introduce inconsistency across sectors

Most require:

- Robust data
- Reliable modeling or other analysis
- Clear assumptions
- An element of judgment

Qualitative methods such as *Delphi techniques* are used, particularly in scientific areas, where experts consult with each other and attempt to **converge** on an agreed view of the future. Reviews of such exercises suggest that a narrowly constituted group does worse than a wider group (e.g., chemists are less successful at foreseeing the future of chemistry than a group including physicists, biochemists, biologists, and chemical engineers).

Another important qualitative approach is *scenario development*. In contrast to many methods which attempt to home in on the most likely outcome, such methods explicitly tackle the uncertainties of the future by imagining different and divergent future worlds.

Nevertheless, a review of best practice worldwide suggests that some form of *quantitative, model-based, projection* lies at the heart of most countries’ efforts in this field of work (Kriechel et al. 2016). Quantitative modeling methods can encompass various techniques:

- Simple extrapolation of past trends
- More sophisticated time series/statistical methods, involving the search for patterns in the data
- Attempts to build in behavioral content based on economic or other theory

Modern-day economic and labor market forecasters rely on two main approaches. The oldest tradition is based on the systematic analysis of data using econometric and statistical methods. Although in many cases these draw on economic theory, the main emphasis is identifying patterns in the data and extrapolating these into the future. Essentially, the view of the future is based on how economies and labor markets have behaved in the past. The other approach is based much more on economic theory, on how economists believe behavior of individual households and firms governs the observed outcomes in economies and labor markets. This approach uses so-called computable models (such as computable general equilibrium (CGE) models or the even more complex “dynamic stochastic general equilibrium” (DSGE) models). However, these are more often used for the development of scenarios than producing point forecasts.

Any attempt to assess the future pattern of skills demand requires a close examination of trends and forecasts in employment by sector and by occupation. The preferred method in most countries is to use a multi-sectoral macroeconomic model. Forecasts of the aggregate macro-economy, and of economic output of goods and services by detailed sector, are combined with information on current developments in employment within sectors by occupation and qualification (Wilson et al. 2016b). The macro forecast usually incorporates a view of labor supply and population. Demographics used to be regarded as relatively straightforward to project, but the growing importance of migration and “aging populations” makes this more uncertain than used to be the case.

Crucial to the generation of the skills projections is detailed occupational analyses and categorization of skills, as well as a good understanding of the current employment structure by occupation.

The advantages of quantitative modeling include:

- The natural desire to quantify, measure, and evaluate
- The benefits of a formal model in enforcing logical consistency and helping to make assumptions more explicit

The USA provides a good example of the benefits of substantial and systematic investment in data, standard systems of occupational classification, as well as models, methods, and systems. Enormous sums have been invested since the 1960s, including their O\*NET system of labor market information and intelligence (see Box 1 and Wilson (2010) for details). The US approach highlights the central role of occupations in a quantitative assessment of the changing demand for skills, providing insight into the key drivers of changing skills demand, including technological change. Detailed data on occupational employment by sector, based on the numbers actually employed rather than on perceptions, is a crucial part of the US statistical infrastructure. This information is an essential element in understanding the current state of play.

Occupations lie at the heart of the systems developed in other countries (see Wilson et al. 2017). The German BERUFENET, the Czech NOS and Occupation Profiles (OPs), and the Dutch AiS all rely on databases defined by occupations or

qualifications (as in the US O\*NET system). These are key to skills and labor market analysis as well as the provision of useful LMII.

Another important lesson from the US approach is the emphasis on combining quantitative and qualitative methods when making projections of future occupational employment trends. Qualitative judgments about changing skills demands within sectors are made by specialist analysts. These judgments are then combined with sectoral employment projections from a macroeconomic model which reflect the way the various drivers of change are altering the employment structure of the USA by sector. The other three case studies covered in Wilson et al. (2017) also suggest that while regular, systematic, and sustained quantitative analysis – including forecasting – is essential, additional qualitative assessments are also important.

#### **Box 1 The US Labor Market Information and Intelligence System (LMIIS)**

Wilson (2010) provides an overview of the US LMIIS. The US Bureau of Labor Statistics (BLS) has produced detailed occupational employment projections, over a 10-year horizon, every 2 years since the 1950s. The most recent results cover 2014–2024 (<https://www.bls.gov/emp/>).

The main focus of the LMIIS is on the skills required within different occupations and sectors. It is based on three elements:

1. The Occupational Employment Statistics (OES) Survey
2. BLS models and systems for projecting the labor market
3. The Occupational Information Network (O\*NET) system for identifying skill requirements within occupations

The OES survey provides a robust and detailed view of current occupational employment within sectors. BLS sectoral experts then assess how this might change in the future. These views are combined with a set of projections from a multi-sectoral macroeconomic model to generate detailed occupational employment projections. O\*NET then enables users to assess the implications of this for changing skill requirements and how this affects their own choices and decisions. For more detailed discussion of O\*NET, see Tippins and Hilton (2010).

---

## **Skills Anticipation as a Public Good**

The future is uncertain and unpredictable. Nevertheless, it is now widely accepted by governments that high-quality labor market information and intelligence (LMII) can help labor market participants, including education and training providers, to make more informed decisions about education and training (see Wilson 2013, for a more general review).

Labor market participants can be better prepared for the world of work they are likely to face in the future by providing them with regular and comprehensive quantitative projections of future skills demand. Skills forecasts have therefore become a common feature of labor market policy and most modern LMII systems (LMIS) in developed economies.

Accepting the case for skills anticipation, the key question is then how should this be accomplished and by whom. Advocates of free markets might argue that it is up to everyone to make up their own minds, but most economists would argue that a key problem in most labor markets is inadequate information, and the state therefore has a public duty to fill that gap.

The approach of the US Bureau of Labor Statistics has been characterized as “Hope and Pray.” They hope that their young people will graduate (with appropriate initial qualifications), and they pray that they will get a job once they do. It is not about centralized planning. The USA probably spends more on its LMIS than any other country (for a brief overview, see Box 1). But this is not done in an attempt to plan the US education and training system from the top down to meet the demands of the economy. Rather, the aim is to inform all participants in the labor market about the world they face, how it is changing, and what might happen next. The main rationale is to make labor markets function efficiently. The aim is to provide detailed labor market information, including a forward-looking element, regularly and centrally. This is then made easily and freely available, with copious guidelines on interpretation. Comprehensive, systematic, consistent, and transparent skills projections are regarded as a “public good” to be supplied by the federal government. This needs to serve many audiences (stakeholders, social partners, practitioners, and individuals) – not just policy makers.

The French also attempted detailed educational and skills planning in the 1950s and 1960s before rejecting it as impractical. However, like many other countries, they have now returned to skills forecasting, focusing on provision of useful labor market information (helping markets to work better) rather than top-down indicative planning (France *Stratégie* 2017). The UK and many other developed countries have followed similar paths. At a broader pan-European level, systematic skills forecasts are now a key part of the European Commission’s policy agenda. Cedefop (the European Agency responsible for vocational education and training in the EU) now leads the way in producing regular and detailed skills projections for the whole of Europe (for details see Wilson et al. 2016c).

Other countries share several of the characteristics of the US BLS system, including the emphasis on providing LMII as a public good. Wilson et al. (2017) compare and contrast the systems in Germany, the Netherlands, the Czech Republic, and the USA. The LMII developed in these four countries is not intended for:

- Use in mechanistic educational planning
- Micromanagement of education and training provision
- The perfect matching of skills demand and supply (in either the short or the long term)

In all four countries (the Czech Republic, Germany, the Netherlands, and the USA), the emphasis is on informing choices at the micro/individual level. There tends to be a mix of both government and independent research organizations conducting the research and analysis, with different degrees of concentration among a few or many organizations or agencies, but centralized government funding is a key element.

While the early history of such projections was focused on mechanistic workforce planning by the state, such a view has long since been abandoned. The focus is now firmly on informing (micro) individual labor market participants, rather than directing (macro) planners and policy makers. However, this kind of LMII is also a crucial input for top-level policy makers, who are tasked with designing an efficient and effective skills system that can be both responsive and agile to changing skills demand.

Regular, comprehensive, systematic, and consistent projections, based on explicit and transparent assumptions, can provide useful information for all labor market participants, helping to inform all those making choices and decisions. They constitute a “public good.”

---

## Matching Skills Supply and Demand: A Chimera?

One of the arguments put forward to support investment in high-quality LMIIS, including forward-looking elements, is to try to ensure a better matching of skills demand and supply. On the surface, this appears like something that no one could argue with. Better matching must be a good thing. However, this relies on a rather naïve and superficial idea of what constitutes good matching. In reality, the matching of skills demand and supply is extremely complex and probably an impossible ideal.

Lassnigg (2012) develops a conceptual framework for the analysis of matching that includes the following basic elements:

- The practice of anticipation and matching at the *individual* as well as the *meso and macro* level, including policies and interventions by the state and the complex involvement of *educational and training institutions*.
- The important role of *symbolic structures* (systems of classification and measurement) at the institutional level – these are simultaneously produced by the practices of the various actors and in turn also guide them, making matching visible and thereby *structuring reality* and going beyond mere information.

There is much more involved than the simple process of trying to fit each and every individual (possibly round pegs) into particular jobs (maybe square holes). Matching has various elements and dimensions, as well as involving many different actors. At the individual level, it is about trying to find the best job now and in the future. All individuals possess a broad portfolio of skills, abilities, and other characteristics that can be deployed in many different jobs. Most jobs can be undertaken by people with a wide variety of skills and experiences. Probably for the

vast majority of jobs and individuals, the matching of the two is therefore not a very precise recipe. Jobs themselves are also dynamically changing over time, as are individuals and their skill sets.

This kind of detailed job matching is not just of interest to individuals but is also of concern to government. In the short term, departments of the state responsible for unemployment and social security will be focused on trying to match the skills of those unemployed searching for work with the requirements of the jobs that employers are advertising.

In the longer term, the government has an interest in trying to ensure that the investments being made in education and training are reaping the highest possible return. Just investing is no guarantee of the best or even any positive return. The investment needs to be in areas that will be needed in the future not those that were required in the past. In many countries there are concerns about overqualification in general (are too many graduates being produced?), as well as whether students are following the right courses of study. Governments are also concerned with aggregate unemployment and unfilled vacancies and other indicators of skills shortages and surpluses at the level of the whole economy, including the ways these imbalances and mismatches may impinge on productivity and growth.

A key issue is the appropriate level of aggregation. In much discussion about matching the emphasis is on the microlevel (e.g., matching models in labor economics and career guidance and individual support in schools and educational institutions as well as through public employment services). However, practices at more aggregate meso or macro levels are also important both for the state and others involved in institution building and policy intervention (at regional as well as national level). Matching also has an important geographical dimension. As sectors grow and decline, this often results in a mismatch between skills supply and demand in particular locations.

At the broadest level matching is about ensuring that the investment in education and training is at the right level. Of course, education is not just about work; there is a vast spectrum of skills used in all aspects of life.

---

## **Skills Forecasts: Who Needs Them?**

There are a large variety of audiences, all with different needs. They include:

- The state planners/policy makers (especially those responsible for education and training, employment and unemployment, as well as economic development)
- Education and training providers (those responsible for setting priorities in terms of course of study offered as well as the curricula covered)
- Companies/employers (concerned about the external labor market they face)
- Individuals making career choices (both in terms of initial education and training and also ongoing continuing education and job mobility)
- Careers advisors (and similar professionals and analysts charged with advising clients)

Their requirements include:

- *Occupational demand* – future employment levels by skill category
- *Replacement demands* – job openings by skill category (replacement demand refers to the demand from employers arising from the need to replace those leaving the workforce because of retirement at old age or other reasons; such demand often greatly exceeds the so-called expansion or structural demand that arises from changes in the levels of employment)
- *Education and training requirements* – qualifications needed in different jobs
- *Supply/demand balances* (vacancies and unemployment rates)
- *Terms and conditions of employment* (including pay)

In an ideal world, different projections would be developed for each group of users, customized for their own particular needs. In practice, constraints on resources mean that in most countries just one set of projections is produced. These must serve different purposes/different audiences.

The general aims and objectives of skills forecasting are to provide a *quantified*, comprehensive, and consistent overview of anticipated skills demand and supplies. This overview attempts to take account of key drivers such as globalization, technological change, and demographic developments. It is intended to inform strategic thinking and policy design at a macro level, as well as helping to guide individual decision making at a more microlevel.

Such skills forecasts can:

- Help to explain past developments in a coherent and logical fashion.
- Make certain assumptions about how this behavior will develop into the future.
- Help to make such assumptions about the future, **explicit** and **transparent**.
- Help to enforce **systematic** and **logical** thinking.
- Provide a useful **counterfactual** to assess policy impacts.
- Act as a **focus** for intelligent **debate**.

The last point is especially important. Skills forecasting should be regarded as a “process” rather than an “end” in itself. Developing a dialogue between the various users and stakeholders, as well as the producers of the projections, is a key part of the value added by undertaking this activity. This should include an educational element. Some care is needed in how to interpret and use forecasts. Users need to be educated in how to make best use of them.

But it is also important to recognize that they are not a panacea. They cannot resolve all the problems of the economy and labor market. In particular they cannot deliver:

- Mechanistic “manpower” plans that enable the government or education and training providers to produce a supply of skills that will match the demand for employers in precise detail

- Precise indications of education and training requirements or job opportunities that will be available in the future

Such projections do not represent a crystal ball in which the future can be discerned. It is impossible to foresee the unforeseen.

They sketch out a broad-brush picture of what the future may look like, highlighting the key trends that can be confidently projected, as well as some of the areas of uncertainty.

In the context of developing economies, it is also important to stress that such projections tend to focus on the formal, well-measured parts of the economy and labor market. If the informal economy is significant, that also needs to be taken into account.

---

## Conclusions

Skills are crucial for both individual and national prosperity. Measuring them is not straightforward, but assessing future trends on a regular basis is a key element in ensuring a good match between skills supply and demand in the future. While not a panacea, such formal and explicit projections can help to inform all the participants in the labor market about the world they are likely to face in the future.

Such work requires:

- Investment in high-quality data and analytical capacity, including a commitment to long-term funding to develop research capability and provide continuity of expertise in this area
- Generation of high-quality qualitative information to help inform and enhance understanding of future skills demand, in combination with the more quantitative analyses that characterize such formal projections

## Abstract

Digitization is fundamentally altering our world and, with it, the roles, requirements, and potential of TVET. While its definition and scope will undoubtedly change – one very possible scenario is for there to be no discrete TVET sector in a few decades' time – the demand for work-related skills provision will be massive, multifarious, and lifelong, and this will need to be met, imaginatively, efficiently, and equitably. The necessity is to reinvent TVET for our times, and the central challenge is to conceptualize and create TVET structures, methodologies, and arrangements appropriate to these dramatically new digital age circumstances. This calls for a redefined and high-status TVET, delivered from various (often

virtual) kinds of centers, each dynamically responsive to trainees' aspirations and to forthcoming market requirements. All should be staffed by competent, confident, cheerful, and well-respected instructors, working effectively in tandem with the best-suited technology, to guide the learning rather than to dictate it. Life skills should be redefined for the digital age; well-informed creativity should be emphasized; the moral dimension – worldwide imperfections, rampant inequalities, and the shame of migrant labor – should be addressed. The selection, preservice, and lifelong professional development of TVET instructors should similarly take advantage of contemporary technology. TVET instructor education should model digital age teaching and learning and, in addition, play a key role in recreating and repositioning the sector.

## Introduction

This chapter focuses upon the emerging roles of TVET instructors, as the sector (sub-sector) enters, experiences, affects, and is affected by the digital age. It assesses how best these key concierges of skills development may be prepared to deliver and facilitate the building of capacities in effective and imaginative response to the rapid and accelerating changes in technologies, economies, labor markets, personal aspirations, and the nature of work.

The world, the countries that comprise it, institutions within and across those countries, and thus everyone's conditions and aspirations are being – and will, exponentially and largely unpredictably, continue to be – **dramatically transformed by digitization**. This involves a thoroughgoing surge forward into a fresh dimension – a pivotal leap in human potential as profound as the wheel in relation to development and as significant as the book in the context of education.

It is as if all living creatures were about to need to survive under water. Fish, akin to digital natives (Prensky 2001), are unable to offer advice as they are in that moist element already and know of no other. But land animals (digital immigrants) cannot conceive what will submarinally be involved, and so they too are unable to contribute to the debate. The young have grown up in a digital world; the un-young, even the most digitally intrepid, necessarily perceive it as something rather alien and somewhat scary and, save for a few digital intrepids, venture no further than the fringes, often enjoying those brief excursions, but never seeking to inhabit the obscure interior. There is a need to prepare for this *proximo antediluvium* situation, but the metaphorical fish cannot be communicated with, and the *terra animalia* hesitate to speak.

And yet that fundamental reappraisal cannot be avoided. The digital age necessitates a reevaluation of what TVET is for, optimizes the means by which its evolving objectives may be met, and enables digitally comfortable instructors to facilitate that constant skills development process. Inevitably, the role of TVET in

producing people with the skills (and the competency and confidence to upgrade and refocus those skills on lifelong bases) that will enable them to survive and thrive in this vibrantly evolving world will, while magnifying in size and differentiating in nature, also alter profoundly.

The paramount challenge is not to improve skills development in and for this digital age by building gradually, cautiously, and incrementally upon that which has gone before. **The necessity is to reinvent TVET for our times**, on a universal basis with due attention to variations globally, and to make it future-proof. A full recognition of the profundity of ongoing and future technological transformation, economic change, and occupational upheaval is vital if TVET is to be credible – and to achieve, at last, the high status that it deserves. It is on that basis – that things will never be the same again – that this chapter proceeds.

Much time and energy have been devoted to defining and delineating “TVET” (“training” or “skills development”), and this speculation shall not be overindulged here. For present purposes, let it be said, simply, that we are considering work-related skills development, broadly interpreted. There are many designations for the sector under consideration, and a veritable mulligatawny soup of acronyms has been cooked up (AppT, VocEd, TVE, TVET, Tfd, TechVoc, OE, VET, CTE, WE, etc.). In this chapter, and without prejudice, the decision of the TVET world congress held in Seoul in 1999 that “the best, most comprehensive term to use is **Technical and Vocational Education and Training**” (UNESCO-UNIVOC 2012) is accepted as our working designation.

---

## The Evolving World and the Embryonic World of Work

The changes being wrought by digitization will be (a) generally, highly significant and (b) specifically, unpredictable. Occupational futurology is a vast and vain pursuit. A third of a century ago, it was being predicted that, for example, “forthcoming technological developments, including automation and robotics, will have minimal consequences for professions where person-to-person relationships are paramount such as... *banking... entertainment... (and) customer service*” (Manpower Services Commission 1983). Ah well!

The evidence of this technological transformation is readily apparent as one communicates with friends online or via mobile devices, checks out at a supermarket, deals with one’s bank (if one can reach it), undergoes medical assessment or treatment, makes travel bookings, or accesses entertainment in one’s home. Similar realizations may be deduced from simply witnessing a 5-year-old entirely at home with a device containing a zillion times the computational power (let alone the creative potential) of the mightiest desktop at the turn of the millennium. Presently, an era of self-driving cars seems to be arriving. Will there soon be self-repairing cars? Or cars that converse with one another regarding those repairs – and loftier matters – in languages that mere humans cannot comprehend?

The Digital Revolution has been on its way for decades now, and it is explained elsewhere (Bonk 2016; Contact North 2016; Douse and Uys 2018) that, with

digitization, the world is so profoundly and deeply transformed that entirely fresh educational approaches are both necessary and possible. Just as existing jobs now increasingly necessitate the possession of digital skills, entirely new jobs based upon digital possibilities (for instance, online web assistants and myriads of software and mobile development specialists) are progressively being created. Technology will assuredly alter roles: robots will take over many operations (in factories as in hospitals), and drones are likely to replace so many others as they allow speedier visual access of everything from giant warehouses to power lines. But the displaced operatives and reassigned theatre nurses will apply different skills and hundreds of thousands will soon be working in the drone economy across, for instance, infrastructure, agriculture, construction, defense, energy, and logistics. By such means, organizations will be more productive, and, hopefully, the **work becomes less strenuous physically and more fulfilling personally**.

Let it be noted also that technology is starting to behave in intelligent and unpredictable ways that even its creators do not understand. Artificial intelligence (AI) is creating technologies that adapt to us rather than us to them and, in education and TVET, even coming to recognize when learners are more effective on their own – when to get out of the way and when not to help, interrupt, or distract. Let us recognize also that our technologies are extensions of ourselves, codified in machines and infrastructures, in frameworks of knowledge and action. AI can help solve some of our world's most vexing problems – day-to-day communication, health care, transportation, loneliness – but its real magic will be **technology that adapts to people**. Computers are not here to give us all the answers but to allow us to put new questions, in new ways, to the universe. If we are intelligent enough to pose good questions, it will be profoundly and positively transformative for humans and humanity.

And this transformation flows far beyond the world of work. Through contemporary technology, we are all connected to one another, wonderfully, perpetually, terrifyingly, and inescapably. But this connectedness is often accompanied by uncertainties and a sense of *anomie*, sometime verging upon the psychotic. During this time of digital transition, some feel that a balance needs to be struck between the call of the crowd and the opposite need for time and space apart – to be “off the grid” (see Powers 2011, on *Hamlet's Blackberry*, which wrestles with a similar existential confrontation). In encountering digitization, TVET needs to take such psychosocial challenges on board.

---

## TVET's Status in This Digital Age

Much of the discussion on skills development in the digital age has focussed on general education, and some, but not all, of those ideas are relevant to this present discussion. Over the centuries, much consideration has been afforded to its objectives, for instance, “No child should leave school without basic skills – a love of learning, a respect for knowledge, a desire for wisdom, a critical fluency with contemporary technology, a facility for spoken communication, a fascination with

that which is difficult, a unique set of enthusiasms stimulated and underwritten by education. . .” (Douse 2014), along with contributions by Socrates, Aquinas, Rousseau, Locke, Dewey, Freire, and others.

The British House of Lords, no less, has declared that digital skills should be taught as a third core subject and treated with the same importance as numeracy and literacy (UK Parliament 2015). Elsewhere it has been suggested that “all children across the globe should become fluent in three languages: their mother tongue, an international language and a programming language” (Douse 2014). And yet education worldwide is increasingly characterized by fragmentation, selection, and segregation rather than by coherence, intelligibility, and equity. All too frequently, TVET initiatives are mounted to repair the damage done to learners by chaotic and illogical general education arrangements.

It is necessary to acknowledge the historical role of academic credentials in reinforcing social class hierarchy. The “vocational” is far too frequently perceived, and made operational, as “technician or craft vocational,” excluding preparation for such professional vocations such as engineering, nursing, medicine, architecture, or law. It may usefully be recalled that “vocation” is from the Latin *vocātiō*, meaning “a call, a summons” to an occupation toward which a person is especially drawn, such as that of a member of the healing professions, or an aid worker or, indeed, a religious minister or, perhaps stretching it a bit, a politician.

The prestige of workers is defined not only by the occupations in which they are engaged but also by the routes and pathways by which they arrived in those positions. If TVET is for artisans and signwriters but not for surgeons and lawyers, it defines itself definitively as, at very best, second rate. If it is aimed at those who fall from the academic path or by the wayside, it cannot help but be seen as a safety net for failures, however nicely dressed up it is. In many developing countries, vocational centers cater for dropouts, pushouts, and other refugees from “academic” education. Institutions within the TVET sector are seen as inferior to “ordinary” schools, and, even in developed countries, this image of being “below standard” prevails.

We are devising tools that diminish both our need for tools and our ability to use them to good effect. Clearly, TVET is changing and will need to change much more, in order to respond to and support that dramatic evolution in the nature of work. If it continues to be perceived, operated, and funded solely as direct preparation for “non-professional” work, as remains the case in much of the world, it will retain its poor status, lose its essential purpose, and avoid its opportunities. The world of work is undergoing fundamental transformation, but people continue to lament the lack of technicians while wanting their own offspring to become lawyers: TVET is for “other people’s children” (Douse 2015).

According to the US government (Department of Labor 2013), an engineer is a problem-solver, while a technician is a doer. Similar oversimplifications have abounded through history, from the Platonic philosopher-kings, through Coriolanus’ plebs, to the threefold “academic-technical-practical” segregation of 11-year-olds in the mid-1940s UK, emulated across much of the world, and based upon flawed tests and erroneous educational philosophies. Similarly, there has long been a distinction

made by both social scientists and aspirational parents, between largely intellectual, predominantly office-based (or “white collar”), and largely practical or manual (or “blue collar”) work. The former is linked with the “professions” and “semi-professions,” the latter with skills of the kinds delivered in TVET centers.

In this emerging digital age, the nature of work has undergone and will continue to undergo seminal changes, so that **distinctions based upon collar color are becoming historical**, just as all employment tends to involve both problem-solving and actual doing, and universities increasingly become “upmarket TVET centers.” If these distinctions ever represented anything more than the fortunate using “professional” language to preserve their privileges, any vestige of authenticity is swept away by the classless tide of digitization. The manager (male) no longer dictates (in any sense) to his secretary (female) – people have their own word processors (which do many things besides processing words and will ever do more) and personal online and mobile communication devices and systems, and all tasks are shared (or so they should be soon).

The radical restructuring and redefining of work for the digital age are already reflected in the upward differentiation of TVET from “dropped out primary” and “failed secondary” to “graduate apprenticeship” and “university of technology,” although parity of esteem has yet to be achieved. The evidence-supported opposition to selection at 11 or at 14 has seldom been extended to the rejection of academic selection at 18. Perhaps that battle is about to arrive: the notion of **comprehensive universities**, mixing higher- and lower-achieving students to the benefit of all, and to society, is now being advocated (Blackburn 2017). In any case, TVET, wherever delivered, has a crucial role to play in society emerging from Industrial Age practices and enabling knowledge workers to survive and thrive in the digital age, through flexible entry pathways – and it is digitization that makes their achievement feasible.

---

## What Are Those “Digital Skills”?

Digital skills are already highly valued across the world of work. Tomorrow they will be regarded as vital. The day after that they will be unexceptional and, indeed, somewhat humdrum. Much as the ability of human resources to read is (in much of the world, if not yet quite all) simply taken for granted. Applying those skills may be categorized as:

- **Digital literacy**, which is being able to think in and creatively utilize the ever-evolving language of the digital world, in other words, those capabilities which equip an individual for twenty-first century living, learning, and working
- **Digital understanding** [or fluency], which builds upon a confident familiarity with that language in order to reflect upon its practical implications, avoid potential pitfalls, predict forthcoming opportunities, and plan ahead adeptly and adventurously

While jobs in the explicit and so-called ICT and mobile sector are booming, these are by no means the only opportunities that require digital skills, and, indeed, it is

sensible to assume that almost all jobs require them to some level. And acquiring digital literacy, and even digital understanding, has never been easier (although digital wisdom takes longer – which is another story). The usage of mobile, social, and analytical tools is permeating the length and breadth of every function across every organization – also in tertiary and higher education – creating a huge demand for digital literacy and fluency and certainly not just in the IT department. Indeed, digitization is not “IT” (or even “ICT”). In fact, “ICT” is so very twentieth century, and TVET needs to get beyond it. No more “TVET and ICT” reports or policies. **TVET now means TVET based upon digitization.** No more “ICT instructors” – every TVET instructor is a digitally grounded instructor. No longer mere digital literacy for some, but digital understanding/fluency for all. Blended learning, in which the face-to-face and the virtual are intermingled, is becoming the norm.

For example, there is a widespread realization that advanced technical skills in mobile, analytics, and social media need to be complemented with business acumen, highlighted by articles along the lines of “Business Professionals Must Understand the Digital Age Language.” One response has been for those in IT to move into management – or vice versa, although that is less likely. But neither remedy really meets the challenges of these times. The real answer is to recognize that management now *means* “management in the context of digitization” and to train accordingly. In the same way, “auto electricians” now *means* “auto electricians in the context of digitization” and should be designed and delivered accordingly. The same is true for medicine, dentistry, fine art, HRD, and so forth.

And, of course, this twofold expertise across all disciplines should be provided by TVET centers on a lifelong rather than just a preservice basis. Thus, on a very practical level, such centers should soon, reflecting this trend toward “digital ubiquity,” consider the future of their digitization (formerly ICT) units in favor of every subject area (child care, design, secretarial, catering, civil engineering, law, etc.) being effectively digitally based. Whether this results in the entire dispersal of those (sometime ICT) units’ faculty to other branches, or in smaller (digitization) units concentrating on producing high-level digital specialists, may be left as an interesting open question for now.

---

## Soft Skills for the Digital Age

Whereas “hard skills” are those needed to do the actual work, “soft skills” are those interpersonal qualities (also known as people skills) and the personal attributes that are desirable in order to thrive in the workplace. They include, for example, effective communication, courtesy, flexibility, integrity, a good sense of humor, and a strong work ethic (see Robles 2012 for the “top ten” listing). Many TVET centers certainly cover some of those widely desired attributes but are seldom geared specifically to soft skills for the digital age. It is similarly increasingly acknowledged that change management does not just need to integrate top-down and bottom-up strategies but also inside-out (i.e., people) strategies to be successful (Uys 2007, 2009, 2010, 2015).

Drawing upon existing lists of “skills required in a knowledge society” (see, e.g., Conference Board of Canada 2014, to whom due acknowledgement is made), it is suggested that, in addition to digital understanding, the following capabilities might be appropriate for technical and vocational learners and practitioners in the time of digitization:

- A confident familiarity with **contemporary communications skills**
- A lifelong commitment to **self-directed learning**
- A facility in **thinking critically**
- A proficiency in **managing knowledge**
- Being a **responsible team member**

Similar characteristics are required also (indeed more so) in TVET instructors.

**Creativity** in technical and vocational education is an area where limited research findings are available (two interesting studies are those of Middleton 2011 and Ogbonna 2015). A recurring theme, there and elsewhere, is that the culture of TVET, as presently perceived and practiced, is – to make an unsubstantiated generalization – antipathetic toward originality and vision. Creative research is no longer in the exclusive custody of higher education!

WorldSkills (formerly the Skills Olympics) has achieved a great deal internationally, not only in enhancing (among a regrettably limited audience) the status of skills, fairly broadly defined, but also the promotion of creativity within that area (see WorldSkills 2017). Similarly, from its inception in 2000, and with an average of 250 multilateral projects a year, the European Union’s “Leonardo da Vinci–Vocational Education and Training” program (2017) has successfully developed a stock of innovative practices and procedures in areas such as training, transparency instruments, guidance and counselling, e-learning, and instructor methodologies.

The worthy WorldSkills, da Vinci, and a few similar initiatives notwithstanding, it is the case that **creativity requires much greater and more creative attention in the digital age TVET sector**. Indeed, the increasingly narrow general education curriculum, frequently turning the focus away from arts and creative subjects in favor not just of STEM but on those convergent elements of STEM that may most readily be assessed, not only ignores a vast chunk of young people’s varied aspirations and learning needs but also fails to prepare them for the twenty-first century’s social, recreational, as well as occupational demands. Here, it is another instance of TVET being called upon to repair the damage inflicted upon learners by dysfunctional general educational approaches.

---

## The Ethical Dimension

The transmission of skills does not occur in a moral vacuum. Those soft skills should extend to fostering responsibility and being worthy of trust, (a) because they are good business and (b) because they are good in themselves. Beyond that, as well as

local imperfections, there are vast inequalities and injustices within and between countries. While TVET's central objective is other than the production of ethical activists, it is reasonable to suppose that – without engaging in propaganda or compulsion – the lifelong “TVET experience” should result in very many people much more determined and significantly more competent to help create a **better world** (or fragment thereof) in terms of, for example, the environment, health, communication, hospitality, caring, construction, animal welfare, arts, and the quality of life and human happiness generally.

**Rampant inequality**, between and within countries and across groups (for instance, women, ethnic minorities, workers with disabilities, migrants, etc.), is ubiquitous. Trainees (and, indeed, instructors) should be familiar with the range of issues related to worker's rights and employer's responsibilities. TVET “should embrace a constructive critique of the world of work including its assumptions and the power relationships within it. This is where universal access to the internet via desktop and mobile devices can create a level global playing ground. The importance of professional associations and trades unions as guardians of standards and campaigners for equity should be emphasised, as should skills in workers' rights advocacy and practical capacities in various forms of industrial action. . .” (Douse 2013). This too should be regarded as a necessary soft skill for the digital age.

**Migrant labor** is, apart from the planned and usually lucrative career excursions of a few privileged expatriate experts and international entrepreneurs, one of history's greatest inhumanities, on a par with slavery, with which it overlaps (and which manifestly still exists). Headlines such as “Nepalese migrants building the infrastructure to host the 2022 World Cup have died at a rate of one every two days in 2014” (Guardian 2015) typify the exploitative situation. Some countries, including several in South Asia, deliberately train their nationals for that heinous trade, counting upon the remittances for national budgets and wishfully hoping that workers with accredited qualifications as, say, master masons will be paid marginally more than unskilled laborers.

More positively, digitization offers many opportunities for significantly overcoming disadvantage and ameliorating segregation. For instance, assistive and adaptive technologies, which are objects or systems designed to increase or maintain the capabilities of **people with disabilities**, can be used to achieve inclusion. Such disabilities can include visual, cognitive, learning, and mobility incapacities; “responsive assistive technologies include screen readers, robotics, voice recognition, magnification, text-to-speech functionality, short message service, instant messaging, telephone relay, video captions, and hands-free navigation and gesture-controlled interfaces” (Uys and Douse 2017).

---

## Digital Age TVET Provision

To a large extent, enabling trainees to master digital skills involves the same principles as teaching them twentieth-century skills: using a variety of appropriate pedagogies, breaking down the material into small steps, encouraging much practice

under sensitive supervision, blending face-to-face and digital learning experiences, and providing early feedback. One major difference in degree consists of the ability and desirability of trainees benefitting from self-instruction: to that extent, an objective is, wherever appropriate, to **establish an environment wherein the trainees may take control of their learning**. Digitization creates similar opportunities for deeper independent learning but also more expansive collaboration opportunities, nationally and globally.

As the Director of a University-Community Transformation Centre points out, “. . .the digital age has transformed the way TVET is operating. Technological integrated learning is ubiquitous in the TVET context and the learning occurs not totally as a response to teaching, but rather as a result of a social framework that fosters acquisition of knowledge” (Mustapha 2017). His call to “move far beyond the traditional view of teaching as delivery of information” is echoed, and his schema of web-based education as an evolving level of continuity:

- Web 1.0 as a web of information connection
- Web 2.0 as a web of people connection
- Web 3.0 as a web of knowledge connection
- Web 4.0 as a web of intelligence connection

is appreciated (Mustapha 2017). Which poses the question as to what the digital age TVET institution should be – if the realistic and necessary objective is to support, reflect, and apply the techniques made possible by the digital age, when we come across a “TVET center,” what exactly is it that we shall see?

While specific situations, contexts, and aspirations vary widely, digitization has consequences and offers opportunities for transformation to all TVET centers worldwide. The first of two major challenges to the global TVET system is the very **massiveness of the training and re-skilling required** but which may also be provisioned and realized through digital connectivity and integration. Workers in all areas and of every level must now very frequently refresh their skills, if not alter their career paths, or even move into entirely new careers, if they wish to stay relevant and marketable (let alone professionally fulfilled) in this rapidly changing digital environment: that too is made possible by digitization.

The second has already been touched upon under both boundaries and status: where does TVET end and something else begin? If just about every job is both practical and theoretical, in a world where collar color is no longer distinctive, is the role of TVET simply that of delivering those elements of capacity building that no one else (universities, professional associations, company training schemes, etc.) is providing? Or is the sector in competition with those other providers? Or are **entirely new digital age definitions, visions, goals, and missions** necessitated? It is conceivable that tertiary, lifelong and higher education will merge and even include elements of secondary education, all engineered and supported by blended interactions and flexible pathways between the various levels.

Clearly, TVET needs to deliver much more much better. The TVET instructor may involve a wide range of media and devices to communicate content, but the

trainees' development in understanding is much more specifically tied to particular instructional approaches and technologies. As the Motivis Learning CEO put it: "Google, YouTube, and/or Wikipedia can answer almost any question, but no search engine or social media platform can be relied upon to put information into developmentally appropriate contexts" (Peddle 2017). But this presumes that the instructor is skilled enough to assist the trainees in gaining optimum advantages from the learning technologies or that the "instructor" still needs to "instruct" in a world in which information is universally accessible through online and mobile devices. As with teachers in general education, TVET instructors carry huge responsibilities to create the framework and scaffold the learning, and, if they lack digital understanding, they cannot contribute that much to their trainees' all-around development in the digital age.

While the digital future will transform TVET – in terms both of what needs to be learned and how best it should be "delivered" – as with general education, it involves no either/or choice between technology and teacher. Just as "digital education needs excellent teachers and the teaching profession needs digital education" (Hassel et al. 2012), so also does digital age TVET require **excellent instructors working in tandem with the optimum technology**. The human instructor will very much be needed to create blended learning experiences, motivate trainees, support them with time and task management, mentor and model life skills, help them dig deeper into material and develop higher-order thinking skills (analytical, conceptual, and creative), and take responsibility for ensuring learning outcomes. They will retain responsibility for diagnosis, assessment, and accreditation: and in each of these, they will be supported by digital technology: no longer the "sage on the stage" but the "guide by the side," not to mention the "critical friend to the virtual end," somewhat more Satnav than satrap!

---

## Open TVET Learning

Distance TVET has an increasingly significant part to play in the blended skills development setting. Such remote instruction may be:

- Synchronous, with instructor and trainee **interacting in real time** (e.g., video-conference, shared online whiteboards, Skype, or telephone)
- Asynchronous, with **interaction other than in real time** (written online feedback on assignments, answer students' questions via email, or post a response to an online discussion board)

And both forms overcome some of the problems of location and distance. Instructor and learner need not even be in the same continent or time zone provided they remain on the same wavelength: each may choose their preferred work setting. Moreover, specialist or "Mediagenic super instructors" (to borrow a phrase from Bryan Hassel) may reach a "potentially boundless number of trainees..." As this technology advances, none should ever have to learn how

to lay bricks or make soufflés or deal with angry customers “. . .from anyone other than the very best explainers of those topics worldwide” (see Hassel et al. 2012).

The more divorced TVET redeploys from a specific and physical location, the easier it becomes to imagine different kinds of employment arrangements for instructors, located in virtual centers, providing instruction online, designing instructional resources or curricula, or giving quality assurance. Similarly, online TVET instructor professional development may take place anytime and anywhere, in a dynamic setting, bespoke, and available upon demand. These changes will not come about automatically, and TVET is certainly not there yet. A basic and obvious necessity is the provision of universal low-cost access to broadband Internet for all centers, instructors, and trainees worldwide (making The Global TVET Centre feasible and inevitable, see Uys and Douse 2017 on “The Global School”). **Excellent digital tools and excellent live instructors, working in tandem, seamlessly blended**, for all trainees, should be the TVET policy goal.

---

## Sufficient and Suitable TVET Instructors

This digital age necessitates – and makes possible – the provision of sufficient competent, confident, and cheerful TVET instructors, deserving and receiving widespread respect and playing key facilitative and professionally fulfilling roles in “skills development founded upon digitization.” Just as next year’s TVET instructor may be working from a physical or a virtual center, or as an online provider or designer, so too may that professional’s career-long capacity development be facilitated by a **revitalized TVET instructor profession**. Irrespective of their vocational specialities (ideally reflecting the market’s forthcoming priorities), all TVET instructors will be teachers of digital skills and effective agents in the propagation of digital literacy and fluency (much as it has often been said in general education, especially in English-speaking countries, that “every teacher is a teacher of English”). Not only will they continue to be well versed in content, they will increasingly need to become experts in skills development and learning experience creation, at least matching the needs of knowledge-based workers.

Clearly, the unparalleled changes, challenges, and opportunities involved in digitization necessitate entirely fresh thinking regarding TVET instructors’ roles and capacities, through pre- and in-service initial training and throughout career-long professional development. These digitally comfortable professionals, in addition to having a suite of basic technology-related skills, will take on new and often more sophisticated duties and responsibilities in ways that will challenge the existing capacity of many TVET educator centers and systems to prepare and assist them over time.

Instructors will become “guides” and “facilitators,” intelligently utilizing the vast and readily available source of information and ideas, the experience and expertise of the trainees, applying techniques such as business games, hospitality management simulations, and the “flipped workshop and class” (see Uys and Douse 2017, for

a detailed discussion of these possibilities). Moreover, trainees will become “co-instructors” in learner-centered environments: competent and confident digital age TVET instructors will have no problem with that.

Inevitably, some will respond negatively to this challenge – change is frequently resisted for a wide range of reasons (often unrelated to the nature of that change). “Digital dividends” (World Bank 2016) makes clear that, while technology will not replace teachers, teachers who use technology will replace those who do not. This applies equally to TVET instructors: while technology will not replace them, it will profoundly alter what they do and how they do it, and those who make the best use of contemporary (and evolving) technology will replace those who do not. Or, to look at it another way, with digitization and the necessary support, **effective TVET instructors will come into their own**, deserving and receiving widespread respect. [Indeed, having called those who impart TVET skills “instructors” throughout this chapter, the possibility of their osmotically becoming “educators,” within a seminal postsecondary alignment, offers no menace.]

---

## TVET Instructor Preparation

Digitization is changing dramatically that which TVET instructors need to learn, not only reflecting the transformation of the world of work but also responding to the revolution in instructional techniques, equipment, and technologies. In a similar manner, digitization is offering fresh possibilities regarding how TVET instructors receive basic training and continuous professional development. In such dramatically altered circumstances, the necessity is to **redefine TVET instructor education for the digital age**. If TVET instructor training institutions continue to prepare instructors for obsolete jobs in factory-era TVET centers, the future is already over. Places (some virtual) where instructors are enabled to become and remain effective and self-assured as facilitators of TVET transmission in the context of digitization must themselves be transformed into new kinds of learning spaces, and instructors must be trained and guided therein, so they are ready to work well in the centers of the future.

Across the world, many existing systems of TVET instructor preparation are unfit for purpose: failing to equip the instructors with the skills needed to enable their trainees to be successful in the twenty-first century, being still blinkered by the twentieth. Not all furnish potential instructors with the digital skills or technological confidence required to serve present let alone coming generations of digital native and socially networked trainees. And certainly not all prepare them for careers in a globally integrated knowledge economy that rewards teamwork, continuous learning, and constant innovation. Current and future generations of trainees will be technically savvy; their instructors must be ahead of the game (or at the very least know how the game is played); those who educate those instructors must be in advance of the tournament.

Drawing upon the American Association of Colleges of Teacher Education’s consideration of educator preparation and twenty-first century skills (AACTE 2010)

and recognizing the unsurprising overlap with the set of soft skills required in a knowledge society (see above), it is suggested that TVET Instructor Educators should produce instructors who will, for example, place knowledge acquisition and skills development in a global context, facilitate learning in multiple modalities, use the full range of digital age learning tools, encourage divergent inquiry, and be lifelong learners themselves. A critical element of a twenty-first century TVET instructor education institution must be that its own faculty model digital age teaching and learning. Instructors should be educated to be responsive to accelerating changes in global society and ready quickly to shed outdated policies, curricula, and practices in order to embrace **fresh and more effective approaches that address the needs of twenty-first century trainees and communities.**

---

## Conclusion

In a decade or so, there will probably be no “TVET sector” as we know it; within a couple of decades, there may well be no discrete “TVET sector” at all. Focussing upon the skills needs of the nonacademic undoubtedly served valuable public and private purposes over the now-concluding period between industrialization and digitization. But comprehensive tertiary institutions and systems may now, and at last, embody the true *universitas* spirit. Whatever the mechanism, and however the occupational kaleidoscope settles at any point in the flow of time, **the massive, multifarious, and dynamic requirement for lifelong skills development will need to be met, creatively, efficiently, and, hopefully, equitably.** What that provision is called is among the most minuscule of the problems.

The central challenge is that of conceptualizing and creating TVET structures and arrangements appropriate to the dramatically new circumstances of these present and the forthcoming times. Which involves proceeding far beyond the examples and the particular innovations, interesting though they well may be. Which necessitates utterly reworked definitions of, for example, skill, work, qualification, curriculum, assessment, trainee, instructor, apprentice, TVET center, and, of course, “TVET” itself. It is also necessary to distinguish between the likely, the possible, and the fantastic.

Digitization enables and requires the transformation of not just the scope, delivery, and effectiveness of TVET, but, even more fundamentally, enables the creation of comprehensive, open, and nondiscriminatory arrangements that bestow both work-related and life-related learning possibilities upon the entirety of humanity, and at last fulfills skills development’s reach and purpose. And all of that to be envisaged and achieved by those with heads in the clouds and both feet firmly placed upon *terra firma*. And, let it also be emphasized, not by remote coteries of sequestered decision-makers with noble intentions unmatched by close acquaintance with reality but by means of the kind of **well-informed universal participation** that, at its best, contemporary technology makes possible, enjoyable, and unavoidable.

## Abstract

In the past four years of the new Indian government (2014–2018), there has been a plethora of changes in the skills system in India. There is a new Ministry of Skill Development and Entrepreneurship (MSDE); a new campaign to “Skill India”

has re-established the goal to train over 400 million people by 2022; a new National Skill Development Mission with its brand “Skill India” has been set up; and a host of new acronyms covering apprenticeship, qualifications, quality assurance, labor market data, and national and overseas skills has been launched. Most of these are explained in the new document, *National Policy for Skill Development and Entrepreneurship*, of 2015.

This chapter analyzes the new skills environment in India and asks whether it has been able to begin to address many of the very long-standing characteristics of skills in India.

Despite the renewed ambition of India to skill a mass of its own people and to provide the surplus of these young skilled people to the aging developed nations of the world, there is little evidence in the new mission that the crucial lessons and experiences from the last government’s skills mission and skills development initiative have been taken on board. The question remains whether the modification of skill development in India consists of renaming many of the approaches to the endemic features of skill in India or whether it constitutes a determination to break with the past.

## The New Government’s “Skill India” Campaign

The new government came to power in May 2014. The reform and modification of skill training in India began soon after. What substantially has changed since May 2014?

In his very first address in the Lok Sabha (Parliament) on 11 June 2014, the new prime minister pledged to redeem the image of the country from the allegations about “Scam India” to “Skill India” and to enhance its stature nationally, through “cooperative federalism” among the central, state, and local governments (Narendra Modi 2014). While laying out the mandate of the newly formed government, he said “Only a graduation certificate is not enough (sic). We need skills. We need to concentrate on skill development (Narendra Modi 2015).

Acknowledging the formidable scale of this challenge, the government notified the creation of the first dedicated Department of Skill Development and Entrepreneurship on 31 July 2014. The prime minister commented “Today the world focuses on trade in goods but in future the core issue will be how to get skilled people. We need to work in this direction” (Financial Express 2015).

On 9 November 2014, this department became a full-fledged Ministry, the Ministry of Skill Development and Entrepreneurship (MSDE), with the following already existing organizations under its purview:

- The National Skill Development Corporation (NSDC) – This was a public-private partnership company setup in 2010 under the aegis of the Ministry of Finance,

and its aim was to make a significant contribution to the overall target of skilling and upskilling 500 million people in India by 2022. This would be mainly done by fostering private sector initiatives in skill development programs.

- The National Skills Development Agency (NSDA) (As of October 2018, the NSDA has been merged with the National Council for Vocational Training to form the National Council for Vocational Education and Training.) – This was an autonomous body which had come into existence on 6th June 2013. It subsumed the then Prime Minister’s National Council on Skill Development (PMNCSD), the National Skill Development Coordination Board (NSDCB), and the Office of the Adviser to PM on Skill Development. The NSDA’s role included anchoring the National Skills Qualifications Framework (NSQF) and facilitating the setting up of professional certifying bodies in addition to the existing ones.
- National Skills Development Fund (NSDF) (2015, MSDE, National Skill Development Funds) – This was set up in 2009 by the Government of India for raising funds both from government and non-government sectors for skill development in the country. The fund is contributed by various government sources and other donors/contributors to enhance, stimulate, and develop the skills of Indian youth by various sector-specific programs. A public trust set up by the Government of India is the custodian of the fund.
- National Institute for Entrepreneurship and Small Business Development (NIESBUD) – This was an autonomous institute which was part of the Ministry of Micro, Small and Medium Enterprises (MSME). This move under MSDE provided a strong link of skill development with entrepreneurship and prompting start-ups.

On 16 April 2015, the Training Directorate, part of the Directorate General of Employment and Training (DGET) under the Ministry of Labour and Employment (MoLE), was also moved to MSDE. With this Directorate, the entire network of industrial training institutes (ITIs) and apprenticeship training schemes became part of the MSDE.

The MSDE structure thus became complete by moving all the most important players in skill training from different departments and ministries to be under one roof. The DGT, as it is now called, and NSDC together had the target of training 250 million youth in different skills as per the then existing National Skill Development Policy of March 2009, which was 50% of the total skill development target (500 million) of the then Singh government (2015 MSDE 2009)

The desire to project the identity of the country as “skilled India” could be considered as one of the most significant developments driven by the prime minister in the field of skill training in India. With a ministry of its own, skill training has become a “National Agenda.” The biggest challenge of fragmented approaches and lack of adequate focus and coordination faced by skill training in India since 2007–2008, when multiple structures under different roofs (DGET under Ministry of Labour and Employment, NSDC under Ministry of Finance, NSDA under the former Planning Commission, etc.) were set up, was now being resolved. Coordination and consolidation of skill training could now be driven and included in the

policy decisions to be taken by the MSDE. A new skill ecosystem was being created in the country.

The first Minister of State for Skill Development and Entrepreneurship assumed charge of the newly formed Ministry of Skill Development and Entrepreneurship (MSDE) on 11 November 2014. Following the vision of the prime minister, he affirmed that Skill Development would play a critical role in fulfilling the objectives of the prime minister's Skill India campaign and that the ministry would coordinate with other ministries/departments to achieve the mission of skilling India (Business Standard 2014).

The minister stressed the importance of the rationalization of the existing skill development schemes and outlined specific deliverables for the short-, medium-, and long term for the ministry. He restated that the ministry was expected to play a key role in reaping the "demographic dividend" in the country. This is India's claim to have a unique 25-year window of opportunity, when it will have the world's youngest workforce, much younger than China or the OECD countries.

The minister affirmed that there would be a positive contribution from "Skill India" to the prime minister's "Make in India" campaign. The latter aimed to make India a global manufacturing hub. Clearly, "Make in India" cannot succeed if India is not able to provide its own well-trained workforce; and "Skill India" would succeed only if the skilled youth are appropriately employed after training. Accordingly, the "Make in India" and "Skill India" campaigns are expected to be well-linked, and they should closely support each other; one would enhance the economy by inviting global organizations to set up their manufacturing units in India, while the other would provide well-trained manpower to be employed in these manufacturing units, supporting integration of more and more skilled labor into the system. After all, skill development cannot be pursued in isolation from production and employment.

On 15 July 2015, when MSDE celebrated the first World Youth Skills Day, the prime minister launched the Skill India campaign (Press Information Bureau 2015). In his address, he gave the country a vision. He said that in the twenty-first century, India's industrial training institutes (ITIs) would acquire global recognition for producing quality skilled manpower. He called for constant updating of training programs and syllabi to ensure that the youth is exposed to the latest technology and industry environment. He said the government would work to promote both apprenticeship and entrepreneurs. He declared that it is important to predict the possibilities of the future and prepare for them today.

The Skill India campaign of the new government includes four major initiatives:

- (a) The National Policy for Skill Development and Entrepreneurship, 2015
- (b) The National Skill Development Mission
- (c) The Pradhan Mantri Kaushal Vikas Yojana (PMKVY); and
- (d) The Skill Loan scheme

One concern in reviewing these would be whether they would take account of the fact that 93% of the Indian economy is in what India terms the unregistered or unorganized sector of the economy, or that, in this vast informal economy, skills are

basically acquired on the job, often moving from casual labor to different levels of skill, again unregistered and unrecognized.

## **The National Policy for Skill Development and Entrepreneurship 2015**

The National Policy for Skill Development and Entrepreneurship 2015 (hereafter Policy 2015) supersedes the National Policy for Skill Development, 2009 (Policy 2009) (2015, MSDE, GOI [Government of India] 2009). The Policy 2009 was the first ever policy document for skills development in India. The document was developed, under the previous government, for the then DGET with support of the ILO. The document also mentioned that it should be reviewed and updated in 5 years' time. Accordingly, the National Policy on Skill Development and Entrepreneurship, 2015 has done justice to this pledge.

On substantive issues, the Policy 2015 does not miss any points from Policy 2009 including the vertical mobility, interministerial coordination, incentivizing the private sector for increasing their participation in skill training, financial support to candidates seeking skill training, addressing the unorganized sector, and use of digital platforms. Most other developments like the recognition of prior learning (ILO Report 2014), National Skill Qualification Framework, pathways for vertical mobility of ITI trained youth, Institutes for the Training of Trainers (IToT), etc., which were already in place by 2014, have also been covered in the Policy 2015. The Policy 2015 captured the state of skill development in the country at that time but rationalized it by bringing realistic targets.

What is new in Policy 2015 is its emphasis on the term “aspirational” for skills training. Aspirational applies to both youth and employers whereby youth sees it as a matter of choice and employers acknowledge both the productivity linked to skilled workforce by paying the requisite premium, and they recognize the link to Make in India (2015, MSDE, National Policy for Skill Development and Entrepreneurship 2015a). The same message is further reflected in the new focus of the policy. Policy 2015 is about “meeting the challenge of skilling at scale with speed, standard (quality) and sustainability”; Policy 2009 focused more on “rapid and inclusive growth”(2015, MSDE, GOI [Government of India] 2009, para 4.0.1, p. 23).

The most notable shift in Policy 2015 was the change in the quantitative skilling targets. When launching the “Skill India” campaign, in July 2015, the prime minister announced the new target for Skill India was 400 million persons to be trained in different skills by 2022. This was certainly a substantial reduction from the previous government’s 500 million.

This was not just a reduction in the target by 20%, but also the Policy 2015 made it clear that of these 400 million, those who are new entrants to labor market and require skill training are only around 26%. The remaining approximately 74% of the 400 million (298.25 million) are those who may require different approaches like recognition of prior learning (RPL), reskilling, upskilling, and skilling of the existing

unskilled workforce, especially those below 45 years of age. This reformulation was a new and substantial change.

In fact, until April 2015, when the Ministry for Skill Development and Entrepreneurship (MSDE) had come into existence, the target for skilling continued to be referred to as 500 million. An example of this is seen in the report of the subgroup of the Chief Minister on Skill Development (Report of the Sub-Group of Chief Ministers on Skill Development 2015), a group appointed by the NITI AAYOG (The National Institution for Transforming India – a new form of the previous Planning Commission of India), which met in April 2015 to discuss and put their thoughts together on various aspects of Skill Development in the states. The report of this subgroup, published in September 2015, still mentioned the skilling target as 500 million (Ibid, p. 24, para 2.38)

The specific skill training targets under Policy 2009 were always a point of discussion under the previous government. The authenticity and source of the numbers were queried. The current government's specific skilling targets are also already being reconsidered by the MSDE. In a press conference held on 8 June 2017, the senior officials of MSDE said "We don't want to chase any number. Whether it is 150 million by the National Skill Development Corporation (NSDC) and 350 million by ministries – we are delinking it, not attaching any number" (Livemint 2017). MSDE also refused to spell out a new number that the Union government and its 22 departments and ministries will each be set to attain.

As the new ministry, MSDE, also focuses on entrepreneurship, the Policy 2015 reflects this focus and has a full set of separate objectives for entrepreneurship. These include the organizing of a "world class entrepreneurship education curriculum" through thousands of Entrepreneurship Hubs in colleges, as well as national and state level (2015, MSDE, National Policy for Skill Development and Entrepreneurship 2015b).

It is noteworthy that the Policy 2015 does acknowledge the fact that 93% of India's workforce is in the unorganized sector and also that there is an unrecognized apprenticeship system or on-the-job training system operating in this informal sector. It is assumed in the Policy that the recognition of prior learning (RPL) system will take care of their formal certification.

## **National Skill Development Mission 2015**

Although there had been a National Skill Development Mission from 2009 (2012: [Government launched a National Skill Development Mission in the Eleventh Five Year Plan](#)) under the previous government, the new government's National Skill Development Mission 2015 is the first to focus policy on creating convergence across sectors and states in terms of skill training activities. As per the MSDE, "... To achieve the vision of 'Skilled India', the National Skill Development Mission would not only consolidate and coordinate skilling efforts, but also expedite decision-making across sectors to achieve skilling at scale with speed and standards. It provides the institutional mechanism for achieving the objectives of the Mission" (2015, MSDE [National Skill Development Mission](#)).

By contrast, the mission 2009 focused on issues including remodelling India's formal apprenticeship scheme, improvement in accreditation and certification systems, reorienting curriculum on a continuous basis, and establishing an institutional mechanism for providing access to information about a skill inventory and skill map on a real-time basis ([2012 Skill Development Mission](#)). The Skill Mission 2015 has a similar focus, presented differently: "To rapidly scale up skill development efforts in India, by creating an end-to-end, outcome-focused implementation framework, which aligns demands of the employers for a well-trained skilled workforce with aspirations of Indian citizens for sustainable livelihoods" ([MSDE: National Skill Development Mission](#)). There is a greater urgency in achieving outcomes and securing convergence across institutions in the mission statement 2015.

The implementation framework stipulated in Mission 2015 is new and is built on the new structures – MSDE is the driver of the Mission, a Governing Council for policy guidance at the apex level, a Steering Committee, and a Mission Directorate (along with an Executive Committee) as the executive arm of the Mission. The Mission Directorate is further supported by the National Skill Development Agency (NSDA), the National Skill Development Corporation (NSDC), and the Directorate General of Training (DGT) – all of which will have horizontal linkages with the Mission Directorate to facilitate smooth functioning of the national institutional mechanism.

With MSDE in place, the structures for implementation of the Skill Mission 2015 were already set. The Secretary of MSDE was to provide the requisite leadership and the linkages among the three pillars – NSDA, NSDC, and DGT.

### **The Pradhan Mantri Kaushal Vikas Yojana (PMKVY) (The Prime Minister's Skill Development Scheme)**

As part of the Skill India Campaign, PMKVY has been included as the flagship scheme of the MSDE. Popularly referred to as "Skill Certification Scheme," the scheme aims at enabling a large number of Indian youth to take up industry-relevant skill training that will help them in securing a better livelihood. The scheme implementation lies with National Skill Development Cooperation (see below).

PMKVY is actually a re-worked version of the existing National Skill Certification and Monetary Reward Scheme, popularly branded as STAR (Standards Training Assessment and Reward) which was an incentive-based skill development model. STAR was introduced on 16 August 2013 by the previous government with a budget outlay of INR 10 billion (USD 156.1 million) and a target to motivate 1 million youth to acquire vocational skill during the first year of its implementation.

PMKVY was introduced in a much bigger way – a corpus of INR 15 billion (\$ 225 million), which was a 50% increase, and target of covering 2.4 million persons, which included 1.4 million youth to be skilled and 1 million workers who would be certified under RPL (recognition of prior learning). Under the scheme, a monetary reward of INR 8000 (USD 124.9) is provided to trainees on successful completion and certification of their skill training courses.

The scheme is hosted by NSDC (see below), and the training is imparted against national occupation standards (NOSs) for specific job roles, formulated by industry-driven bodies, namely, the Sector Skill Councils. Trainees with prior experience or skills and competencies are also assessed against NOSs, and candidates get monetary rewards against successful assessments. It facilitates the process of skill upgradation and reskilling of the existing workforce. A live PMKVY dashboard has been set up which gives the number of persons enrolled and trained at any point of time.

The STAR scheme of the previous government had evolved from the then flagship scheme, the Modular Employable Scheme (MES), associated with the ILO, under the Skill Development Initiatives (SDI). MES-SDI scheme was an immensely popular initiative among both the youth and industry. It overshot the target set in the 11th Plan by close to 40%. In July 2013, 1433 course modules had been developed covering a variety of trades and 7000 Vocational Training Providers along with 46 Assessing Bodies registered.

In early 2013, ILO was requested by the DGET to strengthen the implementation of the SDI-MES scheme. After a series of meetings, a review workshop in Bhopal, and follow-up interviews, ILO submitted a report which included key issues and recommendations (ILO Report by Astha Ummat: SDI-MES feedback from the ground 2013). Most of these recommendations have since been adopted in the PMKVY.

MSDE further modified the implementation modalities of the scheme, to make MES into the PMKVY. These included the following:

- Implementation of the scheme was shifted from the states to NSDC. NSDC used its established network of Sector Skills Councils (SSCs) to implement the same.
- SSCs, autonomous bodies, tasked with developing a robust training delivery mechanism, were invited to partner PMKVY and take responsibility for:
  - Affiliation of the vocational training partner (VTP) – a task which was earlier with DGT ([MSDE – NSN – Sector Skill Councils in India](#))
  - Training the trainers of these VTP
  - Supporting assessment of the trainees (fee based)
- In PMKVY, the VTPs submit proposals to SSCs for conducting training programs. Registered VTPs are mandated to submit the biometric attendance of the trainees and trainers, as well as a detailed monitoring report to SSCs on the designated portal on regular basis.

The Sector Skill Councils are allotted training targets by NSDC, which are then distributed among their affiliated VTPs.

This change is seen as a large contribution toward promoting a sustainable business model for Sector Skill Councils, which were set up under the previous government. Selected states which wanted to continue the MES have been allowed to do so under the State Skill Development Mission ([MORD DDU-GKY- State Skill Development Missions](#)).

Under the PMKVY, skill training is being provided in 221 courses over 34 different industrial verticals (groups of industry having similar processes and may have

similar skill needs) through authorized training centers. As per the Government of India report of 6th June 2018, since its launch, close to 5 million candidates have been trained under the PMKVY so far (1.9 million under PMKVY 1 and 2.75 million under PMKVY 2, 2016–2020). PMKVY targets to train 10 million youth by 2020 ([2.5 Crore trained under Skill India in 3 years under Ministry of Skill Development and Entrepreneurship programs](#)).

In addition, 933,000 youth have been oriented under the Recognition of Prior Learning (RPL) program of PMKVY which recognizes and certifies skills acquired through informal means, bringing about a major shift from the unorganized to the organized economy. Under the fee-based skill training, the number of training centers has increased to 11,035, and close to 10 million youth have been trained so far (*ibid*).

This is a marked increase from the 703,535 persons which were reported to have been trained/tested under the Modular Employable Scheme of the former government from April to December 2013 ([Outcome Budget 2013–2014 of the MoL&E](#)).

### **The Skill Loan Scheme**

This scheme which aims to provide financial support to the eligible candidates for undertaking skill training programs has been in place since 2012. The then existing model loan scheme for vocational education and training had the approval of the Indian Banking Association (LiveMint, IBA approves vocational education loan scheme [2012](#)). As per the scheme, no collateral security from students was required and there was no age bar for availing of the loan. The focus was on enabling interested youth to undertake skill training. The skill loan amount was in the range of INR 20,000 (312.2 USD) to INR 150,000 (2341 USD) with a variable interest rate. The list of expenses which could be included under the loan covered all elements considered necessary for completion of the course.

This very same Skill Loan Scheme was relaunched by the present government as part of the Skill India campaign on 15 July 2015 with just a minor change in the range of the loan amount (Skill Loan Scheme, PIB Ministry of Skill Development and Entrepreneurship [2015](#)). The minimum amount of loan has, in the new scheme, come down to INR Rs. 5000 (78 USD), and the rate of interest has been specified as a simple rate of interest at 11% and 12% per annum charged during the period of study.

---

### **The Modification of Skill Training: A Journey Over the Last 4 Years**

What has really changed over the last 4 years? Is the current government's Skill India just a modification of the previous one's? Is the Skill India Mission only renaming many of the approaches to the endemic challenges of skill in India, or does it constitute a determination to break with the past?

In this part of the chapter, we review this key question. The information source is primarily the press releases and feedback received from the practitioners.

Skill development under the present government has taken a priority with a hope that the Skill India Mission will supply huge human resources not only in India but also internationally. Undoubtedly, a massive restructuring of the Skill Development ecosystem has been undertaken at the national level. However, the policy decisions undertaken so far seem to be more on upscaling what was already in action.

One aspect evident across all the current approaches of skill development is a sense of urgency and of achieving the target numbers. However, the targets laid down in many cases are far higher than can be possibly achieved. And to make these closer to the real situation, conditions are sometimes altered, thereby reducing the intended impact.

Some approaches seem to open doors for the early school leavers, while others don't. But the overarching fact remains that all the decisions are in favor of those who are digitally empowered – whether they be the training providers or the youth. It can be argued that there is thus a bias against skills for poorer sections and for rural areas.

The service sector has also been given a space of its own in the skill agenda of the government by allowing them to participate in the National Apprenticeship Promotion Schemes (see further below).

However, Skill India has so far not focused sufficiently on the quality aspects of skill system; and the government seems to be quite aware of this. In May 2012, the subcommittee of the National Council of Vocational Training (NCVT) ([DGET-39th NCVT Order](#)) for norms and courses was reconstituted and orders for revision/revamping of the craftsmen training courses issued. Almost all the craftsmen training courses ([MSDE-DGT: List of courses under Craftsmen Training Scheme](#)) under NCVT, being implemented in industrial training institutes, were last revised in 2014. Then, the Mentor Councils (MCs), having representatives from thought leaders among various stakeholders considered relevant for the particular trade, were set up to support the revamp/modification of the courses. No major revision of curricula has been undertaken since then. The only change in some of the courses undertaken, since 2014, has been giving a NSQF reference to these courses.

In November 2016, the approval for establishing Mentor Committees (Government approves creation of sector mentor committees – [The Economic Times 2015](#)) (new name for the Mentor Councils) has been given by MSDE. However, if the pace of curricular revision remains the same as earlier, the revised version would most likely not be available for implementation any time before April–May 2019 when the general election is taking place.

While celebrating the first two years of Skill India, the MSDE minister announced that “This year we will focus extensively on quality; our schemes and programmes have to orient themselves to seek regional balance so that maximum number of people can reap the benefit and add to their personal and the country's economic growth. . . . Our endeavour will be to give wings to the dreams of our people and empower them to be successful in their life [sic]” ([Press Information Bureau – MSDE celebrates Second Anniversary of Skill India Mission](#)).

Let us look at the major schemes under “Skill India” and find what really changed over the last four years and also what does this mean for India’s Skills Mission. As will become clear, several of the initiatives of Skill India are apparently reworking of earlier initiatives, while a few are continuing as they were. A snapshot of these is presented below.

## National Skill Qualification Framework

The National Skills Qualifications Framework (NSQF) in India was notified on 27 December 2013, superseding the then existing frameworks, which also included the National Vocational Educational Qualification Framework developed by the Ministry of Human Resource Development (NSQF ([MHRD \[GOI\]](#), [NSQF Notification](#))). It was further agreed that NSDA, which is mandated to coordinate and harmonize all skill development efforts of the Government of India and the private sector, would anchor and operationalize the NSQF.

The NSQF, it was stated, would lead to an outcome-based approach in learning – both in the general and vocational space – provide transparent progression pathways, establish equivalence of certificates/diplomas/degrees, support in development of quality qualification with formal certification that also permits acquisition of higher qualifications, facilitate recognition of prior learning and promote international mobility, as well as credit accumulation and transfer system.

The NSQF, having been formally notified in December 2013 under the former government, was still a new topic when the new government came to office. There were already many commentators who wrote in favor of the idea of adopting NSQF; but there were equally a good number of critical views which argued against having the single framework for the country which is full of diversities and contains a huge unorganized sector.

In an interview in the *Economics Times* in April 2015, the then MSDE minister stated that “By 2020 an educational qualification will not be enough. You would need an NSQF to apply for any vacancy in the government” ([The Economic Times 2015](#)). The recruitment rules that the Government of India and Public Sector Units (PSUs) of the central government use will be altered so that the eligibility criteria can be defined in NSQF levels. State governments and PSUs will be asked to amend the rules for the same. All the skill training programs are being aligned to the NSQF. Courses that are not compliant to NSQF will not receive any government funding. Training and educational institutions that are funded by the government will also define their eligibility criteria in NSQF levels.

Regardless of the critics’ views, the implementation of NSQF was intensified over the last four years. However, no major quality change in the qualification packs (QPs) and the National Occupational Standards (NOSs) which form the NSQF has been notified in last four years.

In 2015, after the formation of the MSDE and the launch of Skill India, the MSDE set up a committee under the then retired Director General of Employment and Training, to rationalize and optimize the functioning of the Sector Skill Councils.

The seven member committee included authorities on vocational education and training in India. In its report, the committee noted that the level descriptors given in the NSQF lack clarity and objectivity. The report further mentions that “NSQF is quite technical and even the so called professionals do not understand it properly and therefore, there should be a sensitization and communication campaign with the help of seminars, workshops, etc. to educate all concerned about the nuances of each aspect” (2017 MSDE – Report of the Committee for Rationalization & Optimization of the Functioning of the Sector Skill Councils 2016).

An important element in a framework is its acceptance in the employment market and its link to remuneration benchmarking. As of now, the NSDA, the NSDC, and also the Sector Skill Councils (SSCs) which are responsible for implementation of NSQF do not have an answer to the monetary or other advantage a candidate would have on moving from one level to another. This raises the question – If the workforce with higher levels of achievement on the NSQF is not paid a higher wage, will skills development initiatives not be diluted? How will skills become aspirational in the language of Policy 2015?

## **Incentivizing Skill Training for the Private Sector**

Skill training became a sensitive issue for India already in 2010. It was realized that skill training would become attractive for the poor and excluded communities only when the youth from these communities are compensated for the time they spend in the training institutes and also that the private sector would participate in skill training only when they see larger benefits in doing so.

Hence, during the period of the previous government, a number of benefits were extended to the private sector for engaging in skill training. These included:

- Subsidized soft loans and financial assistance for skill development initiatives
- Service tax exemption for units engaged in skill development
- Private sector income tax benefits by donating money to NSDC for skill development activity
- Benefit from the Income Tax Act through participating in skill development activity

Besides, under the Companies Act 2013, it was already made mandatory for larger companies to spend at least 2% of their average net profits made during the three immediately preceding financial years on corporate social responsibility (CSR) activities and/or report the reason for non-expenditure. The term “Large Companies” here refers to companies with an annual turnover of INR 1000 crore (USD 156.21 million) and more, or a net worth of INR 500 crore (USD 78.1 million) and more, or a net profit of INR 500 crore (USD 78.1 million) or more during any financial year.

The CSR activities include “employment enhancing vocational skills.” The phrase “employment enhancing vocational skills” under CSR is further clarified as

the following – “Spending in Technical and Vocational Training for skill building based on training cum apprenticeship results in enhancing the employability of such trainees” ([Frequently Asked Questions On the provisions of Corporate Social Responsibility under Section 135 of the Companies Act 2013 and Rules thereon](#)). The cost of expenses such as stipend, faculty, infrastructure costs, etc. will be included as CSR activities. It will not deprive the company which is providing such training from hiring a trainee from that pool of talent. However, if such training is provided to existing employees, then it will not qualify as CSR.

Besides the above possibilities, financial incentives in the form of reimbursement of training costs for participating in MES (now PKMVY) programs or short-term courses in partnership with NSDC were available to the private sector.

The present government continued to offer all these incentives extended to the private sector by the previous government. The MSDE minister in a press release on 11 December 2014 shared these initiatives again as an offer to incentivize the participation of the private sector in skill development ([Press Information Bureau, GOI](#)).

At the level of advocacy and agenda setting, both the prime minister and the MSDE minister have held meetings with the big industries, coaxing and persuading them actively to engage in skill training. This has intensified the participation of larger companies in skill training activities. Currently, a good number of big industries are active in such skill development – TATA, L & T, GE, Bajaj, Ashok Leyland, Reliance, and many more.

The monetary benefit of participating in skill training programs was initiated by the previous government in August 2013 with the introduction of an incentive-based skill development model under the National Skill Certification and Monetary Reward Scheme. An average monetary reward which the trainee received on successful completion of the training program was around INR 10,000 (USD 156) per candidate.

The present government has taken this scheme seriously, and, as of today, almost all the courses other than the ITI programs are linked with financial incentives. On successful completion of training under Pradhan Mantri Kaushal Vikas Yojana (PMKVY), the candidate receives a certificate as well as a monetary reward, which depends on the job role she/he undertook and the job role levels. On an average, the candidate gets INR 8,000 (USD 125) on successful completion of the course. Even in the other component of PMKVY, which is the RPL (recognition of prior learning), the candidates, on successful completion, get certificates as well as monetary rewards. The same is the case with another large scheme – DDU-GKY, to which we now turn.

### **Deen Dayal Upadhyaya Grameen Kaushalya Yojana (DDU-GKY) (GOI) (Deen Dayal Upadhyaya Rural Skill Development Scheme)**

DDU-GKY, implemented by the Ministry of Rural Development (MoRD) and another flagship scheme of the present government, has been a clear case of the

renaming of an earlier scheme. This scheme was being successfully implemented under the former government as a placement-linked skill scheme known as “Aajeevika” (“livelihood”). The Aajeevika was launched under the National Rural Livelihood Mission (NRLM) in June 2011 by the then government mainly to address the skill training needs of the rural youth and extend to them placement-linked training. The scheme was found very successful especially by industry. Possibly, this is because it was the only scheme that mandated inclusion of generic life skills including basic English, IT, and soft skills in the training program, which are considered essential skills by the industry.

On 25 September 2014, under the new government, Aajeevika was relaunched as a promotional scheme, named DDU-GKY, and focusing on training rural youth for jobs. The scheme in its current version recommends use of technology in implementation and monitoring of projects; it also adds incentives for the trainees. DDU-GKY, through its training partners, has also employed use of biometrics, a modernized way of checking attendance of both the trainer and the trainees. In addition, DDU-GKY as part of its management process and requirements ensures that all training partners invest in IT infrastructure for sharing real-time performance data as well as for connecting with potential employers.

Given DDU-GKY’s special status, it entails financial support of INR 1000.00 (USD 15) to the candidate placed during the initial 2–3 months. To incentivize the youth for enrolling in the DDU-GKY program, candidates are provided free training, free uniform, free course material, free lodging and board in case of residential programs, reimbursements of transport expenses in nonresidential programs, placement for at least 70% of all those trained with a minimum salary of INR 6000.00 (USD 93) per month (as cost to company), and post placement salary top-ups every month of INR 1000.00 (USD 15) for 2–6 months depending on location of placement.

As per the DDU-GKY web page, the scheme is presently being implemented in 21 states and Union Territories, across 568 districts, impacting youth from over 6215 blocks. It currently has over 690 projects being implemented by over 300 partners, in more than 330 trades from 82 industry sectors ([National Skills Network](#)).

In the financial year 2015–2016, around 236,000 candidates were trained, and of these, around 110,000 were placed in jobs. However, in the financial year 2016–2017, the number of trained youth went down to 163,000 candidates, of which 148,000 were placed. In 2017–2018, the number was further reduced to about 131,000 trained of which only 76,000 were placed ([Deen Dayal Upadhyaya Grameen Kaushalya Yojana](#)).

The then MSDE minister, in answer to a parliamentary question in December 2014 ([GOI, Press Information Bureau](#)), stated that it is estimated that there are nearly 80–100 million (which is more than the 55 million included in the scheme document) youth in the age group of 15–35 years who can be skilled to join the workforce. The DDU-GKY has identified this group for skill development.

One key feature which has been part of the revised schemes is the extensive use of the Internet. Both the schemes, PMKVY and DDU-GKY, require transfer of live

biometric data and monitoring details on a daily basis. This development of using Internet for scheme governance and monitoring has also been extended from these two short-term schemes to the long-term training schemes. In the case of both the Craftsmen Training Scheme (which is being offered through the Industrial Training Institutes) and the National Apprenticeship Promotion Scheme, the enrolment and the registration are on their portals.

Though this is seen as a positive development, it does not match with the realities of India. India's Internet penetration is not even close to 50%. Hence, many youth, and mostly the needy ones, are being excluded from these social schemes. According to a report of March 2017 (Media Nama 2017), urban India has close to 60% Internet penetration, while rural India is still at 17%. With these conditions, these schemes which rely highly on the real-time data are a big challenge to implement.

---

## What Has Been Really New in the Government's Last 4 Years?

### Paving the Way for Vertical and Lateral Movement for the ITI Trainees

- Opening opportunities for higher qualifications to the ITI trainees: As a vertical pathway for the ITI trainees, MSDE has proposed to set up a separate education board which could offer the ITI graduates, class X and XII certificates. This proposal has been recently approved (Times of India 2017). The academic certificates issued to the ITI graduates would be acknowledged by all the central authorities including the All India Council for Technical Education, Central Board for Secondary Education, and state education boards. Through this, matriculate ITI pass students, having spent 2 years on their ITI course, would not have to pursue secondary school completion (commonly referred as 10 + 2 in India) but will be able directly to get admission in colleges in the first year of undergraduate program.
- MSDE is still under the process of moving under its responsibility, 23,000 polytechnic colleges with 1.6 million engineering students and another 4 significant central skill development programs run by various ministries (The Indian Express 2017).
- Opening of lateral pathways in training and upward mobility of students – Components of the National Apprenticeship Training Scheme (NATS) for graduates from the department of higher education, Ministry of Human Resource Development (MHRD) are under consideration for transfer to MSDE. These include the Community Development training polytechnics and the “spinning & weaving” trades (All 23,000 polytechnic colleges likely to come under skill development ministry 2017).

The Directorate General of Training (DGT), MSDE in May 2017 announced the launch of high-end diploma courses in welding technology, industrial electronics and automation, manufacturing technology, automotive technology and IT,

networking, and cloud computing. As stated by the then minister MSDE, the need for advanced level courses/specialized courses has been long felt in the vocational training landscape in the country. The courses are of 2-year duration and were introduced from August to September 2017 at National Skill Training Institutes (NSTIs), DGT training institutes for advanced skill training. These courses would enable trainees to acquire cutting-edge training by providing an opportunity to sharpen their hands-on skills in specialized areas. One fourth of the training period is dedicated to on-the-job training in the form of an industrial attachment. Such decisions, according to the DGT, will extend the skill pyramid beyond the current vocational training provision.

In April 2018, in a daylong State Ministers Conference, new courses to promote emerging skill areas, like artificial intelligence, robotics, 3D printing, etc., were launched for ITI youth in collaboration with NASSCOM (National Association of Software Services Companies) ([Our aim is to ensure one ITI in every block](#)).

Taken as a whole, the preceding initiatives promise substantially to alter the positioning and reputation of skills training in India.

### **Acknowledging the Need of Experts to Envision, Plan, and Implement Skill Training**

With the formation of the MSDE, an initiative was taken to create a separate cadre of experts who could envision, plan, and implement skill training. Setting up of this separate cadre is an attempt to attract young and talented administrators for skill development.

In January 2017, the MSDE issued the formal notification for setting up of a new cadre in India – the Indian Skill Development Service (ISDS) (PIB, GOI – Government issues notification of Indian Skill Development Services [2017](#)). This service, created for the Training Directorate of the Ministry, would be able to attract qualified experts who will give new impetus to the initiatives of the government for skill development and also provide efficient and effective implementation of the many schemes just described. Through this service the skill landscape is expected to get strengthened and modernized in line with the current scientific and industrial development in the country. In years to come, the ministry will be able to create a workforce of trained skill administrators who will enable us to achieve the goal of increased skilled youths.

As a further marker of its increased status, the MSDE recently got three senior positions – it has in place additional secretaries responsible for DGT, NSDA, and MSDE.

### **Visibility and Promotion of Skill India Campaign**

To make skill training aspirational, it seems that branding and visibility of Skill India should be a major driver. A lot has happened in this regard:

- A new “Skill India” Logo was launched on 15 July 2015, giving it an identity of its own. Orders for wide use of this logo have been issued.
- “Skill India” advertisements are commonly seen on the baggage tags at the airport, showing a colorful picture of youth in skill training.
- Hoardings on “Skill India” with sector-specific skilled manpower needs until 2022 can be seen in many conspicuous locations – e.g., the Delhi Metro stations and inside the metros, in the bus stops, etc.

Even the press releases by the Public Information Bureau (PIB) have seen manifold increases. The largest number of press releases by the MSDE were seen in March 2015, when 26 press releases were issued. A number of web-news portals covering the day-to-day developments and news on skills training in the country have been launched as start-ups. The more popular ones are the *Skills Reporter* – India’s first skill start-up with the latest information on skill development, vocational education, and training (<http://www.skillreporter.com>) and the *Skill Times* from the National Skills Network (NSN) – a bi-weekly newsletter on skill development, training, employability, and entrepreneurship ([www.nationalskillsnetwork.in](http://www.nationalskillsnetwork.in)).

## Expanding the Skill Training Institutional Network

In December 2015, the Prime Minister’s Office directed skills ministry officials to open within one year 7000 new industrial training institutes (ITIs) or nearly half the number of all existing ITIs opened in India across six decades (Live Mint 2016). The government thus aimed at increasing by 50% the capacity of India’s then existing 13,105 ITIs (which included both government and private ITIs), having a training capacity of 1.86 million students in skills related to fabrication, electronics, and automobile industries, among much else.

As the government could not have opened 7000 ITIs on its own, the MSDE is undertaking multiple approaches – offering soft loans to private players to open ITIs and persuading companies operating in their respective areas to adopt old ITIs or open new ones. A full evaluation of the implementation of this ambition is still pending.

However, according to the DGT (data collected on 29 September 2017), the number of ITIs is 13,910, and the total training seats/capacity of these institutes (as given on NCVT MIS portal) is 2,978,478. As per the GOI press note dated 6th July 2018 (refer end note 34) since the inception of MSDE, there has been a 32% increase in the ITI count and a 54% increase in seating capacity since 2014.

## Rationalization/Consolidation and the Quality Review

In 2015, the MSDE appointed a Committee on “Rationalization & Optimization of the functioning of the Sector Skill Councils” and to suggest reforms in the vocational education and training system. The committee (mentioned above) headed by the

ex-Director General for Employment and Training (DGET) submitted their report which was placed on the MSDE's website for comment and feedback. The committee gave 52 recommendations. It raised issues about the short-term courses, which are primarily offered through SSCs under PMKVY and DDUGKY, and it mentioned that the short-term courses should be discontinued; only long-term competency-based courses should be offered; the SSCs should be restructured, and much else. The question is – to what extent would MSDE act on the recommendations made in the report? So far very little or no action in this direction seems to have been initiated.

### **Some of the Recent Decisions Made by MSDE Raise Big Questions on the “Quality” Expectation in VET**

One such example is the **National Apprenticeship Promotion Scheme (NAPS)** launched by MSDE in October 2016 to increase the engagement of apprentices from the then 230,000 to 5 million by 2020 ([Guidelines for implementing NAPS](#)). To enable it to reach this target, NAPS incorporated a few major changes:

- (i) It opened the door for enrolment of early school leavers as apprentices, provided these youth successfully undertook a minimum of three months of a basic training course in the classroom setup.
- (ii) It incentivized employers who engaged apprentices by reimbursing 25% of prescribed stipend subject to a maximum of INR 1500.00 (USD 23) per month per apprentice to all employers who engage apprentices. In addition to these incentives, the organization which also offers basic training would be reimbursing the cost of basic training (up to a limit of INR 7500.00 (USD 117) for a maximum of 500 hours/3 months) by the Government of India.
- (iii) The number of apprentices which could be engaged by employers increased to a maximum of 10% of the organization's total employees as against the earlier existing 2.5%.
- (iv) The monitoring of apprenticeship training by the government officers got relaxed – the tasks which apprentices would undertake in the industry would not be any longer monitored by the government. Though the apprenticeship training in its new form has opened doors to the medium and small industry and also the service sector enterprises, the dilution in monitoring may impact the quality of training in the longer run.

Here again, the entire process of registration for both the youth and the establishment under NAPS is through a dedicated portal. As per the National Apprenticeship Promotion Scheme progress report in July 2017, there was an increase in the number of establishments registered for apprenticeship by 282% – from 13,790 units already registered in August 2016, the NAPS portal has 33,272 units in July 2017. The number of apprentices registered also increased – from 113,000 apprentices in August 2016, the portal has 653, 000 youth registered in July 2017. The real impact on the ground – in the number of registered establishments which would actually engage apprentices; as well as the number of registered youths who get actually be

engaged as apprentices, is far from clear. This might be due to complex issues faced by the NAPS portal which is being redesigned. The new portal is now under the administrative powers of NSDC.

Here again, the digitalization requirement raises questions on the Internet coverage in the rural areas and the fear of excluding the rural youth in NAPS; and above all, there is the risk of delays due to non-performance of the portal.

The MSDE continues to evolve in its design and structure. The work allocation between DGT and NSDC, especially as both these verticals are engaged in training, has been continuously changing. When MSDE was formed, it was agreed that all training less than six months would be the mandate of NSDC, while those longer than six months would remain with DGT. In April 2018, a part of the apprenticeship training got moved to NSDC's desk. Though on paper the distinction was clear, the reality was very different. As of today, NSDC is steering the apprenticeship portal and the apprenticeship training for private sector with new training areas and courses designed by the industry members, while the traditional apprenticeship training with designated trades is with DGT.

---

## Is the Government's Skill India Moving in the Right Direction?

A number of positive initiatives have been made under the present regime.

The emphasis on skill training, by forming a separate ministry for Skills Development and bringing under it the nodal institutes for Small Business and Enterprise Development, elucidates the importance given by the government to youth, employability, and entrepreneurship. As compared to being just a directorate, the ministry now has a strong agenda and deals with other ministries at par. A number of MOUs on Skill Development between MSDE and other ministries have been signed, clarifying the sectoral skill development agenda. Where possible, coordinated action for skill training is being promoted. An example of this convergence of central skill development schemes became visible when the responsibilities in skill development in polytechnics were transferred to MSDE in July 2017.

With a Skills minister at the leadership level, each initiative has become more compelling and has attracted larger visibility. Though the issues, more or less, are the same – strengthening coordination with state governments, launch of new training courses, restating the need of ITI in each district, accreditation, and self-grading exercise, the level at which these are addressed has made a big difference in its attainment. In addition, the Skill Development ministers from the states are regularly called for conference to deliberate on the skill issues ([Our aim is to ensure one ITI in every block of the country by end 2018 and up-grade our skill institutions with market relevant skills – Dharmendra Pradhan](#)).

The targets and budgets for skill development are now more focused and easier to measure. The MSDE expenditure of INR 21.73 billion or USD 339.97 million (revised estimates) in 2016–2017 got increased in the budget to INR 30.160 billion (USD 471.14 million) in 2017–2018.

Counting the two years in ITIs as equivalent to two years in general secondary has been an important step toward reducing the traditional divisions between vocational and academic pathways. It has also suggested that the ITI is not the end of the road but can connect with regular college.

Another prominent shift supported by the present government is the broadening of scope of the industries' involvement, especially through apprenticeship training. The industries are now permitted to recruit apprentices up to 10% of their total employees' strength. Some states like Maharashtra have extended this limit to 25%. But to encourage more companies to participate, the monitoring of the scheme has been diluted to a large extent. In fact, it could be argued that the apprenticeship scheme is being promoted as "getting cheap labor."

However, the expected qualitative reforms in the skill training did not take place as expected. The report on restructuring of the VET by Sharda Committee recommended a long list of action points, which when implemented, would lead to quality skilled manpower. The industry continues to raise the issue of poorly trained youth and is feeling this gap to such an extent that some of the industries have set up their own training centers. This raises questions on the then established connection between the "Skill India" and "Make in India" missions, which were in 2015 announced on big platforms by all the political leaders.

Another aspect to be highlighted includes the financing of participation in skill training. As compared to only one skill training scheme being linked with financial rewards with the previous government, the current government has almost all the skill training initiatives (other than ITI courses) linked with financial rewards – be it to the private sector or to the trainee. The motivation and drivers to skill training seem to have changed. Is this the direction that would drive India to reach the dreams projected under "Skill India"? Is this the approach which would make skill training "aspirational" for the youth of the country? The innovative ideas which can provide the required and sustained impetus to Skill India – are these yet to be launched?

Some more questions confront us: whether the present government is a modifier or an innovator or a reformer in the area of skills development. Has it substantially restructured and reinvigorated the whole area of skills development or has it merely taken over and renamed skills initiatives from the previous regime?

As noted earlier, the new government was formed in June 2014; and the Skill India Mission was launched in July 2015. But over this period, has the skill training offered for the youth, the ultimate beneficiaries, remained the same as they were in early 2014 under the previous government? The setting up of the new ministry – MSDE – had raised high expectations for big reforms and a new direction to the India's skill training system. However, many aspects of the skill training system remain unchanged. The launch of the Skill India mission in 2015 announced the training target as 400 million people in different skills by 2022. However, barely 40 million people have been trained by various stakeholders since then, including 25 million by the ministry of skill development ([Government weighs legislation on right to skill training](#)).

Also strongly linked with skill training is the job growth. Unfortunately, the job growth in the country in the last 4 years has not been very promising. Before

sweeping to power in 2014, the new government appealed to young job seekers with a promise to create 10 million jobs. Four years later it remains unclear how many positions have been created. Yet more than 12 million Indians enter the workforce every year, as government data show (World's fastest growth yet to make a mark on India's job market 2018).

The new government saw back in the construction of Policy 2015 that the crucial issue was to make “quality vocational training aspirational both for youth and employers” (2015, MSDE, National Policy for Skill Development and Entrepreneurship 2015a). This was always going to be a massive challenge in a country where caste has reinforced attitudes toward manual work for hundreds, even thousands, of years. The recognition that 93% of the workforce was in the informal sector and that there was an informal unrecognized apprenticeship system was an important starting point in Policy 2015. The creation of a stand-alone ministry for skills was a crucial step in the long road toward skills recognition. It will be vital also to follow the attempt to create a specialist cadre of officers – the Indian Skill Development Service – and a high-level National Institute of Skill Development to encourage the many different initiatives to build a new nationwide recognition of skill.

Ultimately, it will be these changes in the recognition of skill that will be vital rather than the crude numbers of skilled people, apprenticeships, and new ITIs. Securing world-class skills in just a few years is clearly a dream and especially so in a country where even the pursuit of world-class universities has been a challenge.

It is clearly too short a time for the government's many plans and initiatives in skill development to take their desired shape. But it will certainly make sense to revisit the Indian skill training system in five years' time and look back to see where the government had succeeded in this crucial first period with its ambitious and aspirational Skill India.

## Abstract

This chapter focuses on the status of vocational education and training (VET) in the Russian Federation, which has dramatically changed. The problem of training highly qualified mid-level manpower in VET institutions is due to the emergence of modern technologies, the widespread use of computer technology. Modern economy requires such middle management specialists who are able to solve new tasks in complex and constantly changing conditions. This chapter highlights how modern information and communication technologies, being both a goal and a means of training in VET, open up new learning opportunities and contribute to the formation of key competencies of future specialists to satisfy the

demands of present-day labor market. A lot of new professions have emerged in the modern labor market, and this has led to the necessity of new competences' development. Nowadays new professional standards are being introduced in Russia, and along with the other purposes, they aim at changing the content of vocational education and training.

## **Vocational Education and Training in Russia: Problems and Development Prospects**

Vocational education and training (VET) is an important part of education in the Russian Federation, and as an institution for the training of workers and employees, VET plays a major role in the modern life of the society. In accordance with the Law on Education (2012), the following levels of vocational education are established in the country: (1) secondary vocational education; (2) higher education, Bachelor's degree; (3) higher education, specialty and Master's degree; and (4) higher education, training of highly qualified personnel (The Education Act of the Russian Federation 2012).

Until 2012, there was one more level of vocational education in the country: primary vocational education with a wide net of vocational training schools (The Education Act of the Russian Federation 1992). As this level "drops out," two programs are introduced into secondary vocational education to replace it. These programs are considered to be a successful combination of skills in the field of primary vocational education with the knowledge and skills necessary to carry out the work requiring a level of secondary vocational education. As a result, the basic programs of secondary vocational education are divided into training programs for skilled workers and mid-level training programs (The Education Act of the Russian Federation 2012).

Since the beginning of the second millennium, the system of secondary vocational education of the Russian Federation has undergone significant changes, both positive and negative. The specialists (Anfimova 2009; Chernyshova 2015; Tkachenko 2014) note that at present the system of VET is experiencing certain difficulties. Among the reasons for this are the following:

- Demographic decline
- An increasing availability of higher professional education
- The general unstable situation in the economy and, as a consequence, the lack of interest of employers in improving working conditions and saving on wages

Today in Russia, only 20% of the employed population work on the basic specialty received in the educational institution, and 42% of young people change their professions in the first 2 years after graduating from vocational schools (Altunina 2012).

The current trend is growing due to the high technological level of the processes in the industrial sphere; first of all, people with low qualifications, narrow specialization, and low general educational level are without work (Jugfeld 2014).

At the XIX St. Petersburg International Economic Forum, within the framework of which the leadership of the country formulated the tasks related to the further development of the Russian economy, it was noted that “it is those regions that have made significant progress in the development of VET, as a rule, and on the whole demonstrate high socioeconomic dynamics.” In this regard, improving the system of VET and strengthening its relationship with real production operation are important tasks; and the training of specialists must take into account not only the requirements of the present day but also the prospects for the development of new markets and technologies (Putin 2015).

Today, the quality of education is undoubtedly a strategically important factor in the country’s further social and economic development, a condition for ensuring its national security, on the one hand, and a means of social protection, a guarantee of stability, and professional self-realization of the person at different stages of life, on the other.

The problems of lack of highly qualified personnel led to the fact that the modernization of VET is one of the priority tasks set for the Ministry of Education of the Russian Federation. According to “The Strategy for the development of the system of training personnel and the development of applied qualifications in the Russian Federation for the period until 2020,” approved by the board of the Ministry of Education and Science of Russia, the protocol of July 18, 2013 N PK-5vn, Russian secondary vocational education should move to a new level by 2020.

The current stage of the development of the secondary vocational school is characterized by a steady tendency to expand the scale of training specialists. The requirements for the content of vocational education and training are changing. VET currently faces new challenges on formation of students’ system thinking; communicative, legal information culture; creative activity; and ability to analyze the results of their activities (Belousova 2015).

To perform the tasks to improve VET, the Russian Government has developed a set of measures that should be implemented in three main areas:

- Work to ensure that graduates are qualified for current economic needs
- Cooperation of business structures and the state within the framework of the development of the VET system
- Monitoring the quality of training under the VET program (Medvedev 2015; Strategy 2013; The Order of the Government 2015)

---

## **Informatization of the Society and Modern Labor Market Demands**

In the modern world, there is a rapid development of the capabilities of information technology tools, telecommunications systems, and new information technologies; and a postindustrial information society is being actively formed. In such conditions,

not only fundamentally new opportunities but also new, previously unknown challenges appear for man.

Rapid scientific and technological progress has led to the emergence in the labor market of completely new professions that irrevocably enter the life of the society, cutting off the old ones. Some of them are already in demand, the others are used by very few. A number of new professions emerged with the development of information technology. They include work on the Internet: a project manager, a web designer, a web programmer, and a development specialist. However, over time, they have developed into such professions as banner makers, content editors, and web developers. Among new professions connected with ICT, there are also software testers, engineers of automated testing, Internet coach, and technical writers.

In addition to the above, the list of new professions in other spheres includes credit brokers, administrators of non-state pension funds, personal insurance consultants, underwriters, copywriters, event managers, brand managers, communication managers, communication officers, etc. And this ongoing process is sure to enhance. For example, recently, the Ministry of Labour of Russia has published the project of the professional standard “Marketer” (The Project 2017).

The changes have also touched on such a traditional field as pedagogy. Pedagogical professions in modern society traditionally include teachers, lecturers, and educators, and anything new is difficult to come up with. But new professions of the modern society have appeared – tutors, coaches, and facilitators. Tutors train on an individual program; coaches are engaged in the personal development of the student and motivate, inspire, and seek to realize the potential of the student; facilitators are responsible for the student’s social adaptation.

With the Internet technology development, improving information transfer systems – Skype conferences, cloud storage systems, and others, the form of participation in labor activities also changes. A skillful user of a personal computer, who has a good command of printing skills and basic computer programs, can make money on the Internet without wasting money on office rental. Complete freedom of movement is also a huge advantage of this online work: no matter where you are now, in Russia or abroad, and what time it is now, day or night, if you have a laptop or even a mobile phone you have constant access to your job.

On July 1, 2016 in Russia, the amendments introduced by the Federal Law into the Russian Federation Labour Code (2016) came into effect. According to them, the Labour Code was amended by Art. 195.1, in which there were concepts of the qualification of the worker and the professional standard. In accordance with this article, the professional standard is a characteristic of the qualifications necessary for the employee to carry out a certain type of professional activity.

The main goal of the adoption of professional standards, which are widely used in world practice, is a more detailed description of regulating labor relations and updating of the outdated regulatory framework. The need to introduce professional standards was caused also by the fact that the characteristics of the jobs contained in the Unified Qualification Handbook did not correspond to the current situation on the labor market: many of the professions listed in them were not used, and many popular professions in them were not fixed at all. Among the professions, which are

very rarely met nowadays and are going to disappear quite soon, there are photographers, seamstresses, weavers, secretaries, drillers, librarians, telephone and telegraph operators, and estimating draftsmen.

Scientific and technological development of the professional skills and competences of the worker leads to the change in the content of education. Before the introduction of professional standards, the representatives of the same profession, but of different generations, “were not standardized” and had different skills and knowledge.

The description of the requirements for a specialist in professional standards is a complex combination of modern requirements for knowledge, cultural and professional skills, and work experience. These features of professional standards make them the main elements of the national system of qualifications, linking labor market and vocational education and training. And the standards do not rely on educational programs, but on the real work experience of the relevant specialists. In the opinion of one of the professional standard developers (Zaytseva 2015), the standards are to be as they are seen by the concerning professional communities. Standards for the description of professions are developed with the aim of obtaining qualitative characteristics of qualification levels at the national level and at the industry level. Moreover, industry standards for job descriptions provide comparability of qualifications both within the country and recognition of qualifications by different countries.

The professional standards highlight specific labor functions ranked by skill level, depending on the complexity and responsibility of the work performed by the specialist. In this case, the standard first indicates the type of professional activity and then describes the generalized labor functions, each of which includes a set of interrelated certain labor functions. A certain labor function is realized by performing specific labor actions, applying the necessary skills and knowledge (all this is also included in the standard). Thus, the professional standard is a detailed description of the competence necessary for a specialist to perform work (Neprokina and Pchelintseva 2016).

In accordance with the Federal State Educational Standards of Secondary Vocational Education, the majority of which were introduced on January 1, 2017, the ability to use information and communication technologies to improve professional activity is a universal competence for graduates of VET regardless of the nature of their professional activities.

For example, the professional standard “Teacher of vocational training, vocational education and additional vocational education” determines the following necessary knowledge and skills of using ICT for this profession:

- Necessary knowledge: the main sources and methods of searching for information necessary for the development of software and methodological support; modern educational technologies of professional education (vocational training); psychological and pedagogical foundations and methods of using technical means of education, information and communication technologies, electronic educational and information resources, distance educational technologies; and

e-learning, if their use is possible to master the subject, course, and discipline (module);

- Necessary skills for performing labor activities: conduct educational, planning documentation, school room documentation (if available) on paper and electronic media; create reporting (analytical and analytical) and information materials; fill and use electronic databases about the participants of the educational process and its implementation for the formation of reports in accordance with established regulations and rules; and provide this information at the request of authorized officials (The Order of the Ministry for Labour and Social Protection of the Russian Federation of October 18, 2013)

Necessary skills for performing various labor actions by social workers include the use of Internet resources to provide citizens with state and municipal services, including filling out application forms (The Order of the Ministry for Labour and Social Protection of the Russian Federation of November 18, 2013).

And even for such a profession, which seems not to be related to the new information technologies, as a waiter (barman), the necessary skills for performing various labor activities include the ability to use computer programs to conduct office work and comply with the rules for organizing the work of the waiters/ bartenders team and use information technologies used by food organizations to conduct office work and to comply with regulations for the organization of the service (Federal State Educational Standard 2015).

---

## ICT in VET

Complex, high-tech, and rapidly changing manufacturing, developed infrastructure, and using advanced achievements in the field of information technology put new demands on training labor resources – specialists in various fields. Under the conditions of the information society, the competitiveness of graduates is largely determined by the level of their information culture, that is, the ability to act independently in a highly automated information society, effectively use its capabilities, and protect from its negative impacts.

Among the core or key competencies determining the degree of development of the information society, the Council of Europe allocated such competence as the mastery of new technologies (Council of Europe 1995). It is generally accepted that any specialist, any educated member of the information society, should:

- Have access to databases and information services
- Understand the various forms and ways of presenting information in verbal, graphical, and numerical forms
- Be aware of the existence of publicly available sources of information and be able to use them
- Be able to evaluate and process the data available to it from various points of view
- Be able to use the available data to solve specific problems (Filatov 1997)

The need for training professionals with the required skills and competences and the professionals for emerging jobs demanded that the whole system of education and vocational training should be refocused (Shumakova 2014). Strategic direction of content development of vocational training in Russia is connected, first, with the transition to professional educational standards and, on their basis, to a new generation of educational standards and, second, to training on modular programs, created on a competent basis. The interaction between employers (business structures) and institutions of vocational education is particularly important in the development of a new generation standards and, then, in the creation of VET working plans and work program. This is based on new technologies of education (Tkachenko 2014).

Informatization of the society has directly affected and even more intensively continues to influence the education system, which is already designed to prepare students with the anticipation of the demands of the society. The condition for the implementation of these requirements is universally recognized as informatization of education. “Informatization of education, introduction of new information technologies and means of telecommunications is a key condition for the preparation of future specialists who are able to orientate and adequately act in the world around them, a condition for forming a new perception of life and finding rational ways of orientation in problem situations” (Higher School in 2000, p. 30).

The analysis of scientific sources on the topic under study shows that scientists are searching for the most effective pedagogical conditions for informatization of education. The ideas of informatization of education are considered in works by Bepalko (2012), Vagramenko (2000), Gershunsky (2002), Andreev (1995), Vagramenko (2000), Davydov (1996), Lapchik (2007), Polat and Buharkina (2010), Torina (2001), and Christochevsky (2014).

The problem of facilitating the integration of ICT in VET is being debated by many European researchers. There are different ideas about the use of ICT in teaching and learning environment in VET supported by a large range of literature: Salmon (2002); Price and Kirkwood (2008); Stothart (2006); Beetham et al. (2009); Wolf (2011); Dudeney and Hockley (2008); Green and Tanner (2005); Chapelle (2001); and Merrill (2002). While some of these studies found this integration to be productive and conducive to language learning, others found it not as abundant as in face-to-face interaction.

The effectiveness of using ICT in education is often compared with the use of traditional teaching methods, evaluating the result of training and reducing the time spent by students, without taking into account the new information technologies that contribute to the goals and objectives of training. “The introduction of new information technologies qualitatively changes the education itself, transforming it in accordance with the general principles of informatization of society on the way to its development in the information society. And this is one of the most important aspects of introducing ICT into education” (Andreev 1995). In the opinion of Liferov (1997) and Tikhonova (1998), informatization of education revolutionizes it, as new information technologies change the very nature of thinking and therefore the very nature of education. When using ICT in teaching, the role of the learner changes, which, from the passive consumer of information, becomes an active participant in the process of acquiring knowledge.

The task of e-learning is not to displace traditional face-to-face training, but to integrate effectively into it. Obviously, with proper organization, mixed instruction can provide the highest quality of education. In this case, the task of delivering the materials of the taught course can be largely accomplished by the electronic means of the system, while during face-to-face meetings the instructor can focus on the students' questions, on clarifying difficult moments, and on organizing discussions, i.e., to activate the learning process. ICT in education provides new opportunities for more active involvement of students in the educational process. For example, many students, because of their modesty, are reluctant to answer on campus. Online forums eliminate these limitations, involving the student more deeply in training (Gilmudtinov 2008).

The Russian scientists Andreev (2010), Gershunsky (2002), Gromov (1993), Kolin (2002), Koren (2013), Polat and Buharkina (2010), and Rymanova (2013) note the following main points of influence of ICT tools on the effectiveness of teaching:

- Expanding the possibility of educational information presentation
- Strengthening the motivation for learning and stimulating interest in the subject through the use of computer capabilities
- Changing the way of management of educational activity and maintaining a dialogue of the training and trainee
- Increasing the set of applied training tasks
- Changing control over the activity of trainees, increasing objectivity of evaluation of learning outcomes, and providing flexibility in managing the learning process
- Implementing differentiated, personality-oriented training and its individualization
- Increasing the independence of each student in the cognitive process
- Forming students' reflection on their activities
- Educating the culture of using information technologies
- Forming a single information picture of the world

The American scientists (Roblyer and Doering 2013) summed up the reasons which practitioners had cited over the years for why ICT should be integrated into teaching:

1. ICT motivate and engage students by gaining their attention, supporting manual operations during high-level learning, illustrating real-world relevance through highly visual presentations, engaging students through production work, and connecting students with audiences for their writing.
2. ICT support students' learning needs by supporting effective skill practice, helping them to visualize underlying concepts in unfamiliar or abstract topics, letting student study systems in unique way, giving access to unique information sources and populations, supplying self-paced learning for accelerated students, turning disabilities into capabilities, saving time on production tasks, grading and tracking students' work, providing fast access to information sources, and saving money on consumable materials.

3. ICT help to prepare students for future learning, focusing more on “learning to learn” skills such as thinking creatively and reasoning effectively, than on memorizing facts, definitions, and rules.

The organization of professional training of specialists involves the use of new information technologies as:

- (a) The subject of the study (to get acquainted with modern methods of collecting and processing information)
- (b) Teaching aids (to optimize the learning process and form an individual style of professional activity)
- (c) A tool for solving professional problems (to optimize the process of solving professional problems)

Gershunsky (2002) points out the four most significant areas of computer use in education: the object of study, a means to improve the effectiveness of pedagogical activity, a means of increasing effective activity in education, a component of the system of educational and pedagogical management. Each of these directions, according to the scientist, “corresponds to a certain sphere of society: socio-economic; philosophical and methodological; scientific and technical; psychological and pedagogical” (Gershunsky 2002, p. 301).

The results of different sociological research show that the level of the formation of skills and abilities in the use of new information technologies today does not meet the requirements that are imposed on the specialist. The reasons for this are the contradictions between what and how students study in the educational institution and what and how they should do in future professional activities. Therefore, the task of training future specialists is not only to transfer certain knowledge and skills to perform the necessary operations while working with ICT tools but also to learn how to develop and use their new opportunities that will be required for students in their future professional work.

---

### **The Possibilities of the Moodle Virtual Educational Platform (on the Example of Teaching English)**

To date, there are a significant number of platforms in the world for organizing e-learning. Initially, they appeared in the USA and in the last decade are actively developed and implemented in Russia. Existing curriculum management programs fall into two broad categories: closed source (commercial) and open source (distributed free of charge) (Gilmutdinov 2008).

Among open educational resources, the Moodle environment has become increasingly popular. “Moodle” is an abbreviation of the phrase “Modular Object-Oriented Dynamic Learning Environment” and represents an automated computer-based and Internet-based learning management system. The first version of Moodle was developed by Martin, a teacher at the University of Pert from Australia, and put into

operation in August 2002 (Volzhenina and Kravchenko 2012). Despite the fact that the Moodle system was initially oriented toward university education, it was subsequently successfully used to organize both pre-universities (school), secondary vocational education and postgraduate (corporate) education. Moodle has a very large and active community of people using the system and developing new features and enhancements. You can access this community at [//moodle.org/](http://moodle.org/) and take a course on using Moodle. There you will find many people who are ready to help new users start working with Moodle, fix problems, and use Moodle effectively. At the time of this writing, there were more than 325,000 people registered with [Moodle.org](http://moodle.org/) and over 30,000 sites built on the Moodle platform in 200 countries. The world community has also translated Moodle into more than 75 languages ([http://moodle.org](http://moodle.org/)).

Moodle is used to organize:

- Distance learning – in which the teacher and student most of the time do not meet in person.
- Distance support for full-time education – using e-learning tools, the student can receive assignments and send them for verification using the Moodle system.
- Support for full-time education – the implementation of individual practical assignments; tests take place during training sessions in the e-learning system Moodle.

The advantages of distance learning before face-to-face training are mainly in the ability of teachers to develop and present on the market of educational services courses that are in demand in the regions. “Using the electronic educational environment Moodle allows conducting training at an individual pace (the speed of studying the material provided is set by the student himself, depending on personal circumstances and needs); provides freedom and flexibility (the student can independently plan the time, place and duration of classes); provides accessibility (the educational resource is available regardless of the geographical and temporal position of the student and the educational institution), mobility (effective feedback between the teacher and the student is one of the main requirements and grounds for the success of the learning process), technological learning (use of the latest achievements of information and telecommunication technologies in the educational process), and creativity (creation of comfortable conditions for creative self-expression of the trainee)” (Dobrydina et al. 2014, pp. 285–286).

As noted above, the main training units of Moodle are training courses. Within the framework of this course, one can organize:

- Interaction of students with each other and with the teacher. To do this, such elements as forums and chats can be used.
- Transfer of knowledge in electronic form with the help of files, archives, web pages, and lectures.
- Testing knowledge and learning with tests and tasks. Students can send the results of work in text or as files.
- Joint educational and research work of students on a specific topic, using built-in wiki mechanisms, seminars, forums, etc.

As an example of applying the educational platform Moodle, the course “English language for tourism” can be considered, in which a significant part of the hours is allocated for independent students’ work. Taking into account the rather short period of the implementation of the language training courses within the VET program (18 study weeks, 2 hours per week), the author of the course intended to use the electronic course in the Moodle system to provide homework and additional and individual work for students. The course “English for Tourism” is planned for students of the 1st and 2nd year of secondary vocational education in the areas “Tourism,” “Hospitality,” and “Service” and is focused on the implementation of a competence model of modern educational and professional standards.

In accordance with the curriculum of the discipline, the course “English for Tourism” is studied for three terms. Each term is divided into three modules in accordance with the schedule. Each module contains practical, test tasks, a list of independent and laboratory works, educational audio and video materials, etc.

In addition to the prompt completion of tasks and consultations, a testing system was created, with the help of which students can test their knowledge at the end of each module, using questions for self-control, as well as test tasks.

The virtual course developed by the author extends the possibilities using interactive tasks, computer, and multimedia technologies. At the same time, the course is designed in such a way that students of different language levels can use it. The course can be adjusted in time to solve specific educational problems and implement various training strategies. In addition, consultations with the teacher in real time are provided in the course.

The structure of the course includes the news forum, the discipline program, the course annotation, and the course instructions; texts, tasks, video, and audio fragments for independent work are also presented. The course provides authentic texts in English, as well as assignments aimed at enhancing the lexico-grammatical material, developing oral communication skills and discussing the topics studied. Each section contains a glossary on the topic, which should be learned in detail before commencing work on the section. In each section, there are audio materials for self-listening and assignments aimed at controlling the understanding of what was heard. Before performing these tasks, the previous tasks within this section are to be done (for better understanding of the audio material).

To view video materials, the indicated hyperlinks are used, and students perform all the specified tasks related to their viewing. Before watching the video, some tasks are worked out (translate unfamiliar words, answer the questions, etc.).

Before completing practical exercises and grammar exercises, students independently repeat theoretical material on relevant grammatical topics.

The work of students is controlled by the teacher, and based on the results of the assignments, grades are posted or comments are sent.

The course under consideration includes the following sections: How to Develop a Career in Tourism, How to Meet Expectations and Requirements of Tourists, How to Deal with Money Matters in Tourism, Globalization, Travelling Abroad, Business Trips, and Business Hotels.

In the section “Travelling Abroad,” students work on lexical and grammatical material on the following topics: “Travelling by Air,” “Travelling by Sea,” and “Travelling by Train.” As a part of the section, students acquire the necessary skills to compose a travel itinerary, as well as the skills of conducting dialogical and monologic language on the elaborated topics of the section. In the “How to Develop a Career in Tourism” section, students learn about the following topics: “Careers in Travel and Tourism,” “The World Tourism Organization Studies,” “Global Tourism promotion,” and “Managing your own Business in Tourism” in volume, necessary for working with foreign language texts in the process of professional activity. Having worked out the material in this section, students describe the ways of creating their own tourism business. As a form of the students’ knowledge assessment, they are offered the task in the form of case. The students are to find on the Internet 5 positions in any tourist companies for which they can apply according to their desires and competences.

Summarizing the above, it can be stated with a high degree of confidence that the Moodle platform can be considered now a modern comfortable e-learning environment focused on students in enhancing their internal motivation. The use of Moodle’s virtual educational platform in teaching a foreign language helps to increase the effectiveness of this process and, undoubtedly, is promising in the formation of students’ competencies related to the use of a foreign language in their future professional activities.

---

## Conclusions

The system of Russian vocational education and training is now being reformed and modernized by changing its structure, updating the content of education, and improving the quality of management. The general unstable situation in the economy, demographic decline, and increasing availability of higher vocational education are considered to be among the main factors, which have caused the difficulties in developing VET in Russia lately and led to the necessity of VET modernization. The state strategic policy for solving the problems of the Russian VET system is aimed at training graduates qualified for current economic needs, cooperating with business structures and monitoring the quality of training.

Being now actively adopted in the country, the professional standards are to link labor market and VET as they are created with the participation of professional communities and highlight specific labor functions to be trained in VET. The standards reflect the emergence of new labor functions and professions that appeared in the labor market as a result of scientific and technological progress. To become a good specialist, the VET graduate is able to act independently in a highly automated information society and efficiently use ICT capabilities.

Thus, the informatization of society necessitates the informatization of education. In the context of these innovations, ICT tend to have double-use nature in VET: they are treated as a purpose of training (the use of ICT is an essential element of labor functions of any professional) and as a means of training (the use of ICT makes the

study process more effective). Integrating modern information and communication technologies into VET is certain to be an important driving force promoting vocational education and, consequently, providing in future the economic and cultural growth of the society.

## Abstract

The scientific and political discussion about the transformation of the industrial society is characterized by the thesis of the tertiarization of the economic sectors and the replacement of the industrial by the knowledge society. A guiding principle derived from this scenario is to introduce modularized certification systems for the qualification of skilled workers in the intermediary sector. The European Union has thus introduced the formula: “Qualification independent of place and time.” This creed had just as negative effects on the quality of vocational education and training as the so-called “college-for-all” policy.

At the same time, the international quality competition has triggered a modernization of industrial structures, especially in the manufacturing sector and in production-related services, which has been accompanied by the replacement of scientific management with the introduction of participatory forms of corporate structures, flat organizational forms, and a transfer of competencies and responsibilities to directly value-adding work processes. Since then, these consequences of the international quality competition had wide-ranging effects on the ways vocational education and training were structured. One of these consequences can be seen in an international upgrading of dual vocational education and training on the basis of broadband core occupation, which are open to progress and change. Such core occupations have a high potential of identification and are closely linked to the guiding idea for modern vocational education and training itself, which is: enabling people to shape the world of work and society in a socially and ecologically responsible manner. The high level of innovation and competitiveness of countries with a well-developed dual vocational education and training system can be regarded as indicators of a modern vocational training policy.

## Introduction

This chapter aims to show that the crisis of industrial society, triggered by an accelerating differentiation of social spheres and the associated separation, specialization and dismissal of social work, the gigantic advances in productivity and the resulting phenomenon of mass unemployment, the alienation in the labor force, is not a one-way street. The aim is to investigate whether the crisis of industrial society, as identified mainly by industrial sociology in the 1970s and 1980s, has at the same time produced the potential for its modernization and humanization. Whether this potential is recognized and used is crucially a matter of coping with the crisis by empowering professionally qualified specialists to help shape the world of work. This model of modern vocational training also has an economic root: a paradigm shift from a large-scale economy to a globalization of economic development characterized by international quality competition.

The MIT study “Made in America” presented in 1989 established for the first time in a comprehensive study the risks of the policy of tertiarization and deindustrialization (Fourastié 1954) and argued for a strengthening of the producing sector (Dertouzos et al. 1989). Michael Porter comes to a similar conclusion in his highly acclaimed work “The Competitive Advantage of Nations” (Porter 1990):

- *“The manufacturing-services link is becoming an important part of the argument that a nation cannot afford to ignore its international competitive position in manufactory.” (252)*

- *“The United States in the early postwar period represented the continuation of a potent, self-reinforcing system for creating and upgrading competitive advantage in an enormous range of industries that had been put in place many years earlier.”* (306)

Two decades later, the policy of deindustrialization in the United States had not changed, according to US Federal Reserve Exchequer Paul Volcker. He said in an interview, *“America (once) was the largest exporter in the world and not – like today – the biggest importer. [...] Our task is [...] to increase our competitiveness. To do that, America needs to rebuild its industrial sector”* (Volcker 2009, 96). He commented on the structure of the workforce: *“I wish we had fewer finance engineers and more real engineers, for example in mechanical engineering. [...] Young ambitious Germans realize that the relative advantage of the German economy lies in export and mechanical engineering. Even the best Americans do not even think about it”* (ibid., 95). His conclusion: *“We need a cultural break”* reflects the drama of deindustrialization and its consequences in the USA.

In the German-speaking countries of Europe, a different development can be observed. For example, in Germany in 2010, 90% of German industry’s investment in research and development is in the manufacturing sector. The share of employees in the manufacturing sector, including production-related services, is just under 60% (!). And the manufacturing industry produces about 80% of all production values (see Huber 2010, 72 ff. And the Federal Statistical Office 2017).

*The tertiarization thesis: the shift of the economy to services such as health/care, knowledge, art, counseling and communication, is based on a misjudgment of economic change.* The modern economy must be judged by how it lives up to its “service function” for the realization of a sufficient life for the whole of humanity. It is still and increasingly based on the environmentally and socially acceptable industrial methods and products produced by science and research. This includes:

- The production and distribution of healthy food to eliminate hunger in much of the world
- The development and introduction of environmentally friendly energy sources and systems
- The reconstruction of natural habitats and conditions
- The ecological modernization of the economy

---

## **Crisis and Future of the Industrial Society**

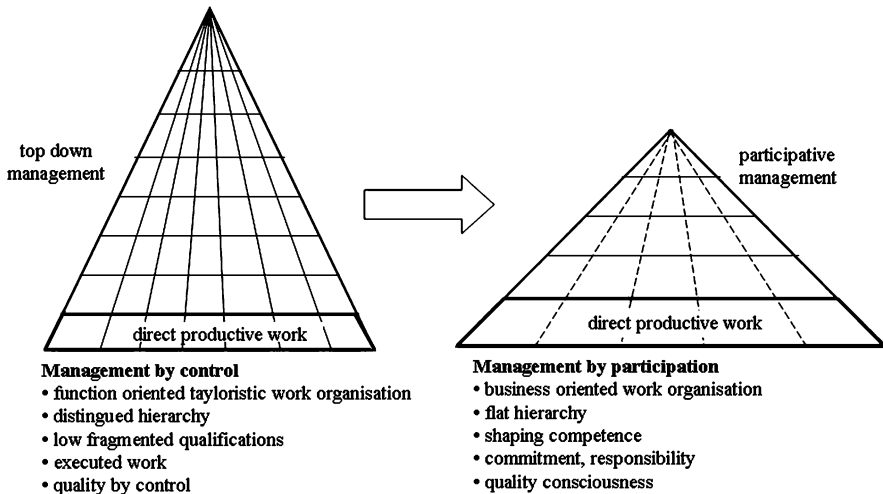

Industrial sociological research has interpreted its thesis of the progressive devaluation of skilled labor until the end of the 1970s as one of the logics of capital utilization inherent laws and has been proven by numerous studies. In the mid-1980s, Horst Kern and Michael Schumann in their book *“The End of the Division of Labor?”* reach – at least for the core workforce of the companies – a new, opposite assessment (Kern and Schumann 1984). And another 10 years later,

the SOFI (Social Science Research Institute Göttingen) presents a “*Trend Report Rationalization*,” in which the end of scientific management (Taylorism) is stated (Kern and Schumann 1984), just as it is by the industry itself with its new mission statements and strategies for the gigantic reengineering in the industrial key industries since the beginning of the 1990s propagated and operated. It cannot be overlooked that under the conditions of global quality competition and the high level of technological development, only the withdrawal of specialization and fragmentation, especially in the organization of industrial processes, can save the project of industrial society from collapse. The withdrawal of function-oriented organizational concepts in industry and their overlapping by process-oriented business concepts are characteristic for the industrial development at the end of the last century. Dieter Ganguin, a member of an IBM team of experts developing an open computer integrated manufacturing (CIM) architecture, made a noteworthy conclusion in this regard: “*If flat organizational structures, cooperative management, teamwork, and autonomous decisions are key features of future work organization, This must be both taught and trained. Here, VET has to go completely new ways. In the classical understanding of vocational education such guiding ideas are not created. The pattern of responsible, self-reliant and socially-active citizens must become the guiding principle of any education and, moreover, must be anchored in social as well as in business activities*” (Ganguin 1993, 33).

With the MIT study “*The Machine that Changed the World*,” the largest industrial study ever conducted, another model for human resource management emerged (Womack et al. 1990, 119 ff.). The drama of the study and the structural change it examined towards lean production is due to the fact that the labor productivity of the Japanese lean production model of the automotive industry was two times higher than that of the European and US automotive industry. The lean production is due to the shifting of responsibility and competences into the directly value-adding processes, the possible reduction of management levels, the establishment of quality circles to increase the quality assurance and the innovation potential (Fig. 1).

The supposition of corporate functions through a business process-oriented work organization and the realization of a flat corporate structure allowed the top-down management structure to be replaced by participatory management. This shift in the organization of business processes has been instrumental in increasing operational flexibility and flexible specialization in the production process, and thus in increasing labor productivity. The economics of mass production have been replaced by an economy based on international quality competition. This structural change challenged vocational training planning to reduce the horizontal and vertical division of labor in lean production (Table 1).

The traditional industrial context-free occupations in countries with developed dual vocational education and training were in conflict with the operational structures oriented towards new business processes. With some time delay, the development of broadband core occupations as a guiding principle of professional development has been established (see Rauner 2005, 2017, Chaps. 1.6–1.8) as well as some groundbreaking occupational projects then continued in practice (Bremer and Jagla 2000; Rauner and Spöttl 2002).

**Fig. 1** Business process-oriented organizational structure

**Table 1** Lean manufacturing characteristics, including learning in the work process (Womack et al. 1990, 82)

Characteristics	Japan	The USA	Europe
Production hours per vehicle	16.8	25.1	36.1
Assembly errors per vehicle	60	82	92
Number of suggestions for improvement from employees	154	1	1
Reflection of work experience (hours)	380.3	46.4	173.3

The evolution of education systems shows that work and education: the structure of employment and education systems, has diverged in many countries. The guiding principle of the knowledge society and Daniel Bell’s explanation for the triumphant advance of theoretical scientific knowledge strengthened the “College for All” policy and thus the international trend of academizing education (academic drift) (see Gelbert 1993; Harwood 2010) (Fig. 2).

High student enrollment rates of between 70% and over 90% in many OECD countries are a clear and unmistakable indication of an educational policy geared toward a seamless transition from primary to higher education. Striking is the pronounced heterogeneity between extremely high and low entry rates for university studies. For example, the student enrollment rates of around 40% in Switzerland are opposed to those of Australia, New Zealand, Poland, and others of over 80%. The “College for All” policy is in clear contradiction to the competitiveness and innovative capacity of many countries. Switzerland and, to a lesser extent, Germany are examples of good interaction between the employment and education systems. In Switzerland, for example, 70% of all age groups opt for dual vocational training and only about 40% for higher education (Strahm 2014, 26). The attractiveness of the dual vocational training also results from the fact that only with a completed dual

Chart C3.2. Entry rates into tertiary-type A and B education (2000,2012)

1.The entry rates for tertiary-type A programmes include the entry rates for tertiary-type B programmes.  
 2.Year of reference 2011 instead of 2012.  
 3.Break in time series between 2008 and 2009 due to a partial reallocation of vocational programmes into ISCED 2 and ISCEB 5B.  
 4.Year of reference 2001 instead of 2000.  
 Countries are ranked in descending order of entry rates for tertiary type A education in 2012.

Fig. 2 Study beginners rate (OECD 2014)

vocational training and a vocational high school diploma access to a Fachhochschule study is possible. The extremely low youth unemployment rate of approx. 3% confirms the good interaction between the job market, vocational training, and studies. In his analysis of this relationship, Rudolf Strahm concludes that the Swiss dual vocational training system and the equivalent access to higher education through vocational training is the decisive factor for the high competitiveness and innovation capacity of the Swiss economy (Strahm 2010). In international comparison, Switzerland always ranks at the top of the list (Fig. 3).

With regard to the quality of (vocational) education systems – one of the 12 dimensions of the Innovation Index – Switzerland achieves a value of 6.5 (!) for vocational training (The Global Competitiveness Report 2015–2016, 336 pp.).

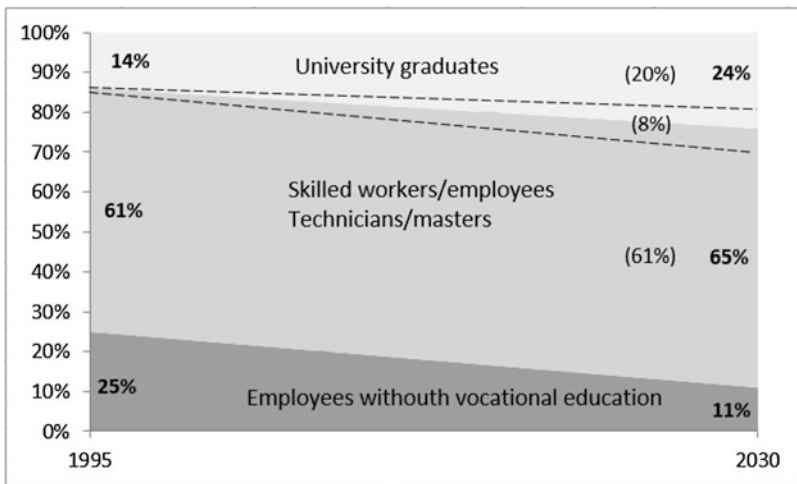

Whether and to what extent the share of highly qualified workers in the employment system will increase is controversial in labor market research. The introduction of shallow corporate hierarchies and the concomitant transfer of competencies and responsibility to the direct value-adding sector of companies argue for a reduction in management levels and thus lower demand for executives. This development is offset by stronger demand for research and development. It seems assured that the decrease of the low skilled will be accelerated. In sum, this means that the proportion of employees in the middle employment sector (skilled workers, technicians, master craftsmen) tends to remain stable or even to increase slightly (Müller 2009).

In countries where companies are highly competitive, the proportion of highly qualified workers in the employment system (with a university degree) is around 20% (Fig. 4).

Using the example of the USA, Nicholas Wyman documents the effects of the “College for All” policy on economic development. He concludes: “Today around thirteen million Americans, so-me with college degrees, are unemployed

**Fig. 3** The Global Competitiveness Index 2015–2016 ranking (left), GCI profile of Switzerland (right)

**Fig. 4** Structural development of the employment sector from 1995 to 2030 (according to Schüssler et al. 1999, 57; BMAS 2013; Vogler-Ludwig et al. 2014; Zika et al. 2012, 4)

or have given up trying to find work” (Wyman 2015, 8). At the same time, there has been a large gap at skilled worker level (middle-skills gap) for years. No wonder, as only 0.5% of high school graduates in the USA complete dual vocational training. This also contributes to the high youth unemployment rate of 14.4% (2015) (ibid. 8).

## Substitution of Vocational Occupations and Qualifications Through Automation (Working World 4.0)

With the research and development initiative Industry 4.0, the European Union promotes dialogue and development for the fusion of information and communication technology (KIT) with machines and production systems. In this way, this initiative to modernize production technology is linked to the research and development programs of “Computer Integrated Manufacturing” (CIM), which in the last two decades of the twentieth century triggered a powerful impetus in engineering and occupational science research and development. The projects carried out as part of the European Strategic Program of Research in Information Technology (ESPRIT) show that as early as the mid-1980s, the potential for the development of production technology was seen in KIT. The funding of a CIM project based on Howard Rosenbrock’s concept “Designing Human Centered Technology” (Rosenbrock 1980) was initially an outsider project. It had the function of developing a computer-integrated production technique that does not aim to objectify and eventually substitute the qualification of the production specialists (the main aim of the then CIM technology) but to strengthen it. The ESPRIT project “Human-Centered CIM Systems” (HC-CIM Systems) should demonstrate that it is possible to design CIM as a “tool” (in the broadest sense) (Corbett et al. 1991).

Awakening from the dream of the deserted CIM factory in the 1990s, the HC-CIM Systems project continued to be at the center of the guiding principles of “work and technology” research and the research interest in the analysis and design of human-machine-interaction implied by KIT. It is therefore not surprising that the research and development initiative “Industry 4.0” is from the outset focused on the synthesis of human and artificial intelligence – at least programmatically – and thus also aims at an upgrading of the technical work (Spath et al. 2013).

### The New Quality of 4.0 CIM

The original CIM approach came 30 years too early, according to the realistic assessment of Industry 4.0 experts, as the required KIT systems were not yet available. Today, nothing stands in the way of implementing a HC-CIM system, since the Industry 4.0 concept includes this guiding idea in its program and almost unlimited storage and network capacities are available.

Industry 4.0 is characterized as a higher level of horizontal and vertical integration of production systems and resources based on powerful KIT systems along the value chain, with the aim of implementing the guiding idea of lean production (Fig. 1). The current state and the development of holistic KIT-supported corporate structures show that the introduction of lean functional and control structures is still important (Schmitz et al. 2015). Characteristic Industry 4.0 features are:

1. Optimization of the Supply-Chain-Collaboration (SCC) and the Supply-Chain-Management (SCM)

The many small decentralized control units are linked to form an SCC/SCM logistics system. Often a uniform optimization along the value chain by a central

unit is dispensed with in favor of an optimization based on the voluntary cooperation. The self-interest and self-initiative of those involved in the process are regarded as the basis for maintaining entrepreneurial room for maneuver with optimal use of all logistics functions.

2. Prospective quality management based on large historical datasets

One branch of the Industry 4.0 research and development initiative assumes that the analysis of the large “historical” data volume via the respective production system (big data) makes it possible to establish a prospective quality management system. It’s about generating answers to the question, “*What will happen when and where?*” However, the patterns generated by the analysis tools represent the past, and their predictions are extrapolations from past developments. They tend to be reactive and therefore too little focused on innovation in enterprise organizational development and prospective quality management.

3. Risk prevention through self-directed production (Stolle 2015)

Risk prevention should be able “*to make good decisions*” based on sophisticated analytics. “*At the end, the employee analyzes the various alternatives and suggestions in the system and uses his expertise to select a suggestion for the ‘smart assistance system’*” (Stolle 2015, 97). The guiding principle of vocational education – ability to help shape the world of work in social and ecological responsibility – can be applied to the design of human-machine interaction in the design of analysis systems. This would then lead to another form of risk avoidance, which would also take into account the goals and projects of company organizational development.

4. Security buffer in (globally) networked industrial structures

The characteristic developments of the Industry 4.0 initiative include the establishment of security buffers and security networks in the form of (intermediate) storage capacities (buffers) and time windows. This is also a reflection of the technocentric “just in time” production regime. With the provision of the components of the suppliers at exactly the right time and at the right place of assembly, (intermediate) bearings should be dismantled. The risk potential of just-in-time networking with supplier companies was underestimated. Risk control required costly logistical emergency measures, for example, to transport items by plane to maintain production. In the Industry 4.0 concept, therefore, security buffers, security networks, and time windows are again being created as elements of computer-aided risk management.

5. “*Without analysis systems (analytics) companies are blind to risk control*” (ibid., 97).

This position is often found in the development of software tools for risk control and maintenance of the components of Industry 4.0. Opposite positions are justified from the perspective of Human Resources Management. Thereafter, the importance of professional competence of specialists and executives in Industry 4.0 increases, as the high degree of informational networking of all subsystems in the value chain entails a high degree of unpredictable events and risks. This can be a power failure, unexpected illness, or failure of components in the production system. In such cases, it depends on qualified professionals who are able to solve the problems professionally and creatively in the respective situation.

6. High flexibility and decentralized production, planning and control systems (PPS) Mastering the high flexibility of modern KIT-based production systems is a competitive advantage under the conditions of international quality competition. This also applies to the fast response to customer requirements. The high control effort caused by the deterministic PPS real-time accuracy control can be drastically reduced by the adoption of control tasks by the production specialists. In addition, this form of lean and decentralized control concepts can increase the quality of production planning and control, improve learning in the work process, and strengthen the innovation potential for organizational development (Womack et al. 1990).

### The Production Work of the Future

The production work of the future – including the production-related services – is the subject of engineering and work science research as well as a broad discussion in the organizations of the working world and the companies. Striking is, first of all, the widespread proposition that the digitization of work will contribute to a higher qualification of skilled workers at all levels of qualification. It is not surprising, however, that other theses in the relevant scientific publications are also represented, as in the heyday of industrial sociology research in the 1970s and 1980s. Three competing theses competed then and compete today. All three theses invoke empirical findings.

The thesis of the *higher qualification of skilled workers*, triggered by the computer-supported and integrated forms of production technology and their application in the manufacturing industry, was especially represented by Blauner (1964), Touraine (1975), Haug et al. (1980, 1981), and Spath et al. (2013).

The opposite thesis of the *dequalification of workers* “in the modern production process” was represented in a critique of capitalism by Harry Braverman (1977). With his “de-skilling” thesis, he influenced a whole generation of sociological researchers (e.g., Baethge 1970; Mickler 1981).

Finally, a research group of the Sociological Research Institute Göttingen (SOFI) founded the thesis of the *polarization of qualification requirements* in a study commissioned by the Federal Institute for Vocational Education Research (Baethge 1977). According to this, the technical change in production work affects a minority of employees as a higher qualification and for the majority as a dequalification. This thesis also has its followers in the Industry 4.0 debate and research (Autor and Dorn 2013; Hirsch-Kreinsen 2016).

In a critical analysis of 1980s industrial sociological research, Burkart Lutz comes to a similar conclusion: “Everything looks as if the highly developed industrialized nations are about to enter a vast field of experimentation, to discover and test new forms of using technology and human work in a gigantic trial and error, that is likely to last for decades, which may then again promise a longer period of stability” (Lutz 1988, 21). With increasingly intensive use of technology, Lutz says, three lines of development will compete with each other:

1. “*Computer-assisted neo-Taylorism*” with its deterministic-centralist tendencies, which can be observed in the relevant technology markets, and which relied on the de-qualification of employees.
2. The development lines of “*qualified group work*.” This scenario is characterized by a reduction in the horizontal and vertical division of labor and is accompanied by an appreciation of the technical work.
3. Lutz sees a third corridor in the “*dichotomy-based re-professionalization of executive work*.” This path is characterized by a tendency of the academization of vocational education (ibid., 22).

Hartmut Hirsch-Kreinsen summarizes the current discussion on the consequences of the digitization of work in a work sociologically accentuated literature study (Hirsch-Kreinsen 2016). The conclusions of this study remain behind the development of design-oriented scenarios (Lutz 1988; Rosenbrock 1980, 1983; Heidegger et al. 1991).

Erik Brynjolfsson and Andrew McAfee go beyond the traditional patterns and theories of qualification research with their analysis “The Second Machine Age.” They are based on Moravec’s paradigm. Moravec stated that “*it is comparatively easy to solve computers with the power of adults to solve mathematical tasks, master intelligence tests or play chess, but it was difficult or impossible to equip them with the skills of a one-year-old child in terms of perception and movement*” (Moravec 1988, 15). The Moravec paradigm has now been confirmed in many ways by AI experts, for example, by Steven Pinker: “*What we have learned from 35 years of research on artificial intelligence is that the difficult problems are usually easy to solve, but the simple ones are very difficult. . . . With the new generation of intelligent technology, it will be stock analysts and petrochemical engineers and members of probation committees who run the risk of being replaced by machinery. Gardeners, receptionists and chefs will be safe for decades to come*” (Pinker 2007, 190/91).

The fundamental empirical analyses of Moravec’s paradox confirm the thesis founded at the beginning of the chapter (2) of upgrading the directly value-adding specialist work in companies with lean organizational structures. Vocational education and training based on the guiding principle of design competence can rely on this.

---

## **The Implementation of the Guiding Principle of Vocational Education into Vocational Education Practice: As an Engine for Quality Economics**

*The ability to shape the working world in social, ecological and economic responsibility is the engine for quality economics.* The process of transformation from vocational training aimed at adapting to vocational training aimed at participation and co-creation of the world of work holds innovation potential for a humane working world and calls for VET practice, research, and policy to realize an integrated innovation strategy. In this innovation triangle, it is not only important that these three actors have the appropriate competence but also that they are willing and able to

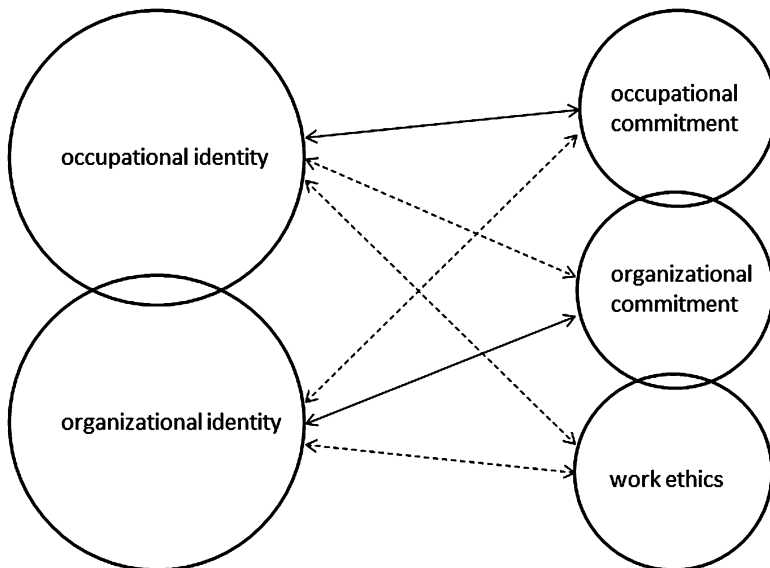

integrate their competences into a common innovation process. For the shaping and organization of vocational educational processes, this transformation process also requires the development of original vocational didactics with three main focuses:

### **Qualification and Occupational Research for the Identification of Professional Development Tasks as a Basis for Professional and Curriculum Development**

The occupational form of social work in countries with a developed vocational training finds its expression in development-open broadband core occupations (Rauner 2005), which have a high identification potential. The identification potential of the occupations is measured with an identity-engagement-model, with which also the identification potential of the training companies as well as the resulting occupational and organizational commitment can be measured (Fig. 5).

The development of occupational identity and professional competence are closely linked. A high potential for identification of a job is the prerequisite for a high degree of commitment, the perception of tasks of quality control, and a correspondingly high sense of responsibility.

Empirical research on identity engagement profiles shows that the attractiveness of apprenticeships for apprentices and companies is very different (see Figs. 6 and 7).

**Fig. 5** Extended theoretical model on the connection between commitment, identity, and work ethic

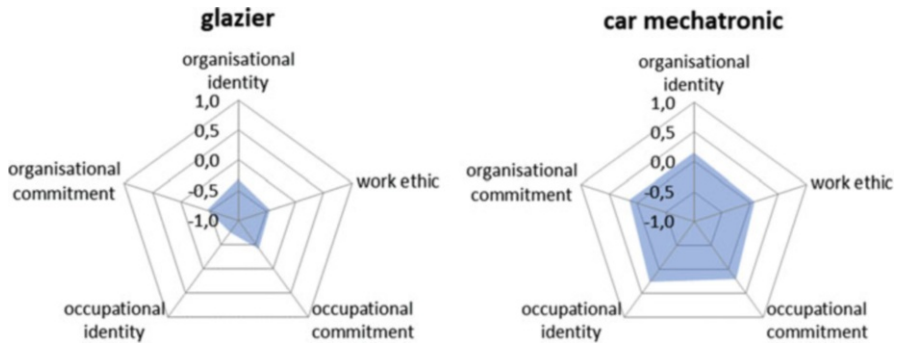

Fig. 6 Identity/commitment charts of glaziers (left) and car mechatronics (right)

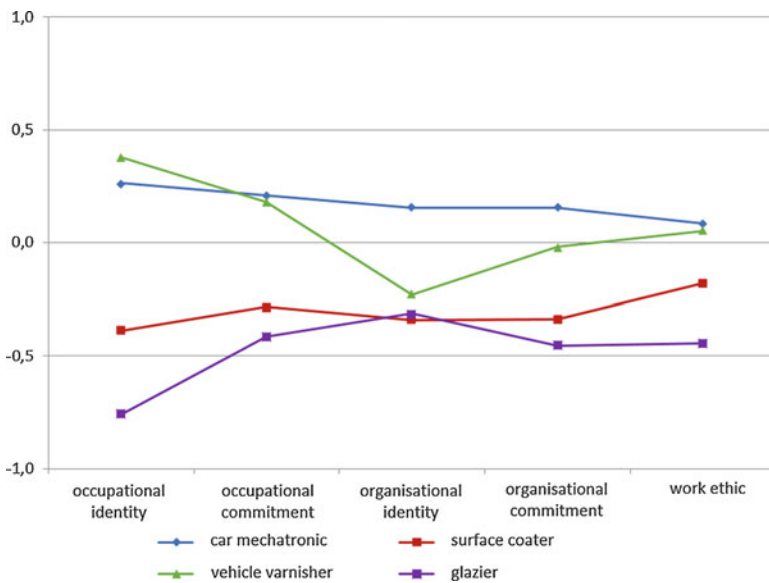

Fig. 7 Identity and commitment profiles in selected professions

**Criteria of Modern Professionalism**

1. *Shaping competence as guiding principle for vocational education*

Professional shaping competence as a leading goal for vocational education has meanwhile become widely established as an educational mandate in educational laws and ordinances of Germany. The KMK formulated in 1991 as an educational mission for the vocational school: “The trainees should be empowered to shape the working world and society in social and ecological responsibility.” With this formulation, the KMK adopted the concept of a shaping-oriented vocational training developed in the 1980s (Rauner 1988). In a series of pilot projects, this guiding principle has been extensively studied in terms of its viability for the didactical behavior of teachers and trainers and its importance for the quality of VET.

2. *Prospective planning of vocational education and training*

Shaping-oriented vocational training suggests vocational training planning that is prospective. It claims to point beyond company practice – and this includes VET practice. The operational practice is understood not only as a given but also as a critical and in need of design. Vocational and vocational education planning is not reduced to record and analyze the existing practice by task analysis and activity studies and to derive and synthesize job profiles and training plans from it. Prospectivity is thus not aimed at improving forecasting tools for predicting future work structures but at describing the alternative development pathways of future practice with the aim of acquiring competence for shaping change.

3. *Work context and work process knowledge as features of modern work*

The definition of occupations through working contexts dissolves occupational structures from the surface of technical change and abstract activities, while at the same time increasing the quality of occupational orientation of these professions and their anchoring in social consciousness. As a work context, a work-based understanding of the profession is to be understood as a clearly distinguishable and identifiable field of work for outsiders, which is composed of comprehensive and coherent work tasks and has a work object that can be clearly identified and meaningfully created in the context of social division of labor. This is the basis of the concept of open, dynamic core professionalism (Heidegger and Rauner 1997).

4. *Withdrawal of horizontal specialization through the introduction of core occupations*

Reducing the division of labor into business process-oriented organizational structures requires a corresponding reduction in the number of occupations and their clustering in core occupations. Core occupations cannot be realized as “short training occupations” below the level of skilled workers, as they usually cover more than one traditional occupation in terms of their training scope. The broadening of the vocational basis places high demands on the qualification for demanding professional work. The core occupations represent a broader starting position for career paths.

5. *Time stable professions*

The anchoring of occupational profiles in social consciousness, their suitability for orientation in the choice of occupation, as well as the identity-creating potential of a profession for apprentices and employees depend crucially on the temporal stability of the occupations. Occupational profiles with a lifespan of not more than 15 years are characteristic of hectic VET planning that insufficiently meets this criterion. As technical and economic change holds both opportunities for the development of new and the “dying off” of old occupations, the development of long-lived occupations places high demands on VET planning. The justification of occupational profiles through work contexts essentially determines the lifespan of occupations. Thereafter, a distinction can be made along the decreasing orientation of the working relationship as a structural feature:

- “Timeless” and long-lasting professions such as doctor and educator, as well as a greater number of craft trades

- Technologically induced occupations (e.g., electrical and chemical professions)
- Technology-based occupations (e.g., “process control electrician”)
- Narrow performance-oriented occupations (e.g., “telecommunications teller,” “turner,” as well as the large number of specialized business fields)

#### 6. *Open, dynamic occupational profiles*

The open, dynamic vocation still assumes a particular work context but has to

- Allow it to be experienced in adequate educational processes as an example of the professional activity of skilled workers
- Be able to expand in the course of independent co-shaping of work, work organization and technology and thus of the tasks
- Be open to new job-related tasks

Conclusion: The temporal and content-related stability of job profiles is the prerequisite for the occupational images in the public discussion in the choice of career and for the development of professional identity of the occupational owners (especially the trainees) again gaining in structural strength, which has been lost in the course of the incessant renaming by the principle of organization-oriented organization of enterprises.

VET research is challenged to establish a qualification, occupation, and curriculum research in cooperation with the institutions of VET planning – as an engine for international quality competition.

## **Replacing the “Applied Knowledge”-Tradition with Work Process Knowledge as a Basis for Vocational Learning**

The internationally established practice of didactics of vocational education is characterized by an understanding of professional knowledge, which is gained through the didactic transformation and the reduction of context-free scientific knowledge. It is mainly about the simplification of complex – often mathematically formulated – theoretical content. The principle of purposive subject theory is reflected not only in the curriculum and in the textbooks of vocational education but also in the equipment of the specialist rooms and workshops. For example, in a well-equipped vocational school, it is possible to experimentally investigate the characteristic behavior of electrical machines in the form of student experiments. In contrast, it is seldom possible to study electrical machines as aggregates for solving specific drive problems. The science-based experiment confirms the “theory of the engine.” The engine appears as an objectification of the engine principle. The laboratory motor is a purpose-free engine. He becomes the engine itself. Only when electrical machines are also examined on their use value side – according to the requirements – will the contents of the subject become an education-relevant, vocational content. It is the merit of Donald Schoen to demonstrate the practical competence and professional artistry as an autonomous competence not guided by the theoretical (declarative) knowledge. He points to it critically: “*This concept of ‘application’ reads to a view of professional knowledge as a hierarchy in which, general principals occupy the highest level and,*

*concrete problem solving ‘the lowest’*” (Schoen 1983, 24). Competence development can therefore not be justified systematically, if, according to Schoen, it should consist in something other than the application of the systematically learned.

### **Work Process Knowledge**

If the concept of the holistic task solution is formulated on the level of vocational knowledge, the category of work process knowledge is useful (Fischer and Rauner 2002). Work process knowledge arises from the reflected work experience, it is the knowledge incorporated in the practical work. As context-related professional action knowledge, it goes far beyond context-free theoretical knowledge. In the field of expertise research, Wilfried Hacker distinguishes between action-guiding, action-explaining, and action-reflecting knowledge (Hacker 1992, 94).

*Action-guiding knowledge (Know-that)* is rule-based knowledge that consciously or unconsciously regulates the execution of an action. It also includes implicit knowledge (Tacit Knowledge) depending on the work task and occupation, which finds its expression in the work process as concrete professional action and can be observed but which largely eludes the linguistic representation (Polanyi 1985; Neuweg 1999). Whenever aspects of practical knowledge are involved (Benner 1984; Haasler 2004), implicit knowledge also comes into play.

*Action-interpreting knowledge (Know-how)* is understood as the knowledge that professionals have to explain a work situation. This includes the ability to deal professionally with the work situation as well as the application – if necessary – of mathematical, diagrammatic, and medial illustrations of the activity to be explained. If one follows the interpretation that this form of knowledge is also interpreted as procedural knowledge and builds on the action-guiding knowledge (Know That), this level of work process knowledge can be assigned to the category of know-how.

The *action-reflecting knowledge (Know-why)* enables one to answer the question of “why like this and not otherwise?” and to consider alternative solutions, taking into account the criteria relevant to a specific situation. This knowledge dimension establishes shaping competence. This includes the ability to communicate and reflect on job tasks and their solutions with clients, supervisors, and work colleagues. In school, for example, in the context of projects, work reality can be transcended.

Work process knowledge can be illustrated in the form of three concentric circles, of which the inner represents the action-guiding knowledge and the outer – with the greater reach – the action-reflecting knowledge. The degree to which these three levels of knowledge are also three independent dimensions of knowledge can only be clarified empirically. The different levels of work process knowledge are closely related to the levels of professional competence.

## **The Theory of Multiple Professional Competence as a Basis for the Shaping and Evaluation of Vocational Education Processes**

Historically, the reference to “real life,” according to Klieme and Hartig (2007, 17), is considered a key feature of the concept of competence. In this context, Andreas

Gruschka considers a concept of competence to be necessary, which is not limited to individual actions: “*Competencies are not tied to a specific task content and a correspondingly narrow-minded application, but allow a variety of decisions. This they certainly have in common with education, as it is preferably updated in the acceptance and solution of such open situations and tasks as a progressive movement of the subject*” (Gruschka 2005, 16). In this sense, Connell et al. (2003), in a fundamental contribution to categorical differentiation between abilities, competencies, and expertise, succeed in establishing a theory of multiple competences.

The term “*multiple competence*,” based on the concept of *multiple intelligence* by Howard Gardner, is to take into account the state of competence and knowledge research, according to which a distinction can be made between several relatively autonomous competences in humans, which can differ between individuals – depending on occupational socialization and qualification. The proximity of the concept of *multiple competence* to Gardner’s theory of *multiple intelligence* is evident (Gardner 1991, 28, 124 pp.).

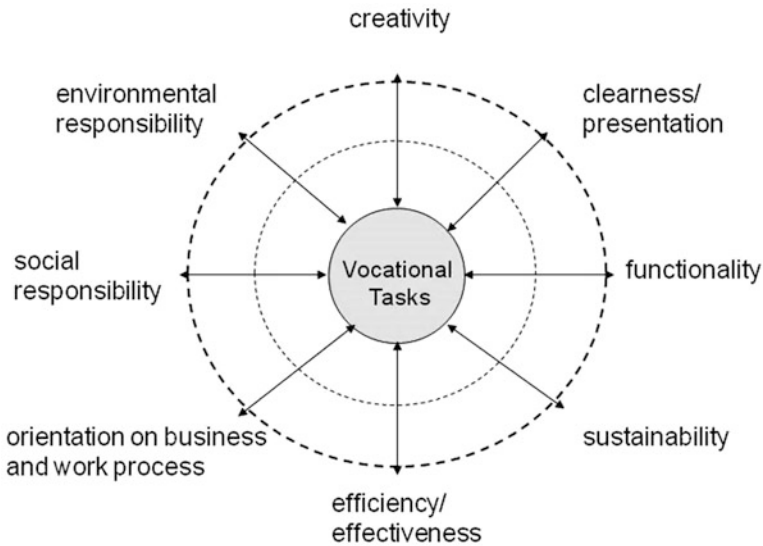

Abilities can be conceptualized as functionally integrated intelligence profiles. The development of specific skills provides a space for competence development (Connell et al. 2003, 140 f.). The concept of multiple intelligence and a model of multiple competences based on it allow to emphasize realistically the potential of competence development given by the occupational work on the one hand and the intelligences of the individual on the other hand. These differ not only from individual to individual but also from one profession to another.

The designation of the eight components of occupational competence, which in their interaction constitute the ability of holistic task solving, as a multiple competence, emphasizes the second aspect of a differentiating theory of professional competence (Rauner 2017, Chap. 2.5.4) (Fig. 8).

Professional competence (development) is then a process of the expression of professional abilities, which is given on the one hand by the individual intelligence potentials as well as on the other hand by the requirement structure of the holistic solution of professional tasks.

### **Practical Terms and Communities of Practice**

The concepts of work process knowledge correspond to the concept of practical concepts by Klaus Holzkamp (1985, 226 f.). According to this, the concepts subjectively possessed by humans are fundamentally practical insofar as their aspects of meaning, the scope, and fields of meaning (as the sum of the aspects of meaning and their connection) are characterized by the respective developmental processes. In the spirit of Schoen, training therefore does not depend on teaching and learning scientifically defined terms. These represent only a fraction of the meaning aspects of practical terms and thus justify a very limited (professional) competence to act. Using the example of the category “electrical voltage,” the relationship between theoretical-scientific and practical concepts should be examined more closely. (The term “electrical voltage” has the meaning of a general fundamental

**Fig. 8** Shaping of multiple competences represented through the levels of action-guiding, action-interpreting, and action-reflecting work process knowledge

category in electrical engineering: teachers of electrical engineering are convinced that without the understanding of this basic term no “electrical engineering understanding” is possible (Adolph 1984, 101). See also the illustrative example of Polanyi on the relationship between theory and practice of cycling (Polanyi 1958, cited according to Fischer 2002, 69 p.).)

Electrical voltage is defined as a physical phenomenon induced by the change in the magnetic field that can be experimentally reproduced. The real technical and economic state of electrical tension, on the other hand, is something completely different. The technical realization of electrical voltage follows the specifications (use value properties), which are set for the unlimited variety of different voltage sources and shapes from the mono cell to the 400-kV high-voltage system each. The obvious variety of voltage forms and sources – and with them the ever available forms of electrical voltage – have in principle an infinite number of utility value properties and object significance (in the sense meaningful knowledge). The technical subject “electrical voltage” places highly varying demands on consumers, development engineers, skilled workers, teachers, nurses, or economists. The relevant aspects of meaning and fields of meaning of the respective practical concepts of electrical voltage are diverse and at the same time highly relevant for competent action.

The members of different communities of practice have their own domain-specific practical terms in which the domain-specific object meanings each form specific fields of meaning. It is therefore necessary to investigate more precisely

whether and how the fields of meaning relate to the same concept in different professions, in which way the aspects of meaning correspond to each other and how they are linked to other conceptual fields. The practical terms not only regulate the current labor practices but they also justify the communication in the communities of practice by symbolically representing the context-specific conditions symbolically. In their learning theoretical foundations for situated learning in this context, Lave and Wenger come to an almost provocative for vocational education insight:

*This point about language use is consonant with the [...] argument that didactic instruction creates unintended practices. The conflict stems from the fact that there is a difference between talking about a practice from outside and talking within it.*

*Thus the didactic use of language, not itself the discourse of practice, creates a new linguistic practice, which has an existence of its own. Legitimate peripheral participation in such linguistic practice is a form of learning, but does not imply that newcomers learn the actual practice the language is supposed to be about. (Lave and Wenger 1991, 107 f.)*

By contrast, the mutual narration of stories, in view of the challenge of solving difficult problems, is of exceptionally great importance in the practice communities:

*Such stories constitute a vital part of diagnosing and carrying out new repairs. In the process, newcomers learn how to make (sometimes difficult) repairs, they learn the skills of war-story telling, and they become legitimate participants in the community of practice. [...] Participants engage in the work of staying sober and they do so through gradual construction of an identity. Telling the personal story is a tool of diagnosis and reinterpretation. (ibid., 109)*

Conclusion: Depending on the profession or occupation, empirical VET research must therefore examine domain-specific, through which preunderstanding and through which experiences the vocabulary and subjective theories of learners are characterized (conceptual change research, Bauer 2013). Taking this as a starting point, it must be didactically explored with which steps and stages the developmental systematic mediation of work process knowledge can take place. In this respect, the developmental logical systematization of working and learning situations, e.g., in the form of cases and projects, is an adequate form of systematic VET, which has the opportunity not only to acquire effective technical skills and reflexive knowledge but also rich, meaningful, and action-guiding concepts, as well as theories and action strategies, embedded and supported by the process of professional identity development. The concepts defined in the paradigm of scientific rationality, on the other hand, almost completely obscure reality – especially the working world to be shaped by employees. In this respect, the vocational and vocational field didactics are well advised to deal with the symbolic representations of the work experience. In this sense, meaningful terms are those that represent the domain-specific meaning aspects and fields of meaning. But these can only be determined in their interaction between the objective conditions and the formation of subjective meaning structures and related symbol meanings.

## Summary and Outlook

The thesis of the tertiarization of the economy, the end of the industrial society and its replacement by the service-information-etc.-society have proven to be wrong. The industrial production of (over) food will continue to be the linchpin of the modern global economy. Thus, the formula of the knowledge-based economy and the knowledge-based society, trying to reconcile the diversity of post-industrial social images, produces a problematic and diffused picture puzzle that leads to the neglect of the development of ecological, humane, and socially acceptable industrial methods and products. Foundation of a modern society. The social knowledge is to a large extent the knowledge incorporated in the practical work of skilled workers: the working process knowledge. It is based above all on reflected work experience and, in its significance for the solution of social tasks and problems – whether as a doctor, industrial mechanic, educator, or specialist purchaser – goes far beyond scientific knowledge. The professional or occupational knowledge and skills, as represented in the technical work and in the related vocational training, justify the ability of the holistic solution of professional tasks. In addition to the disciplinary scientific knowledge, the basis of the “knowledge explosion” of the last century, in the modern industrial society and under the conditions of international quality competition it is especially important to enable specialists and executives to work holistically. Their professional competence requires modern professionalism in the form of broadband and development-oriented core occupations. Specialist work also creates an occupational identity and occupational commitment based on it as well as a sense of responsibility and quality. On the other hand, ideas and projects for the horizontal and vertical division of work into a multitude of specialized occupations of different qualification levels and modules are based on the scientific management of industrial mass production of the last century.

The future of specialist work is not a question that can be answered by studies in industrial sociology, but a political and professional design task. Here, the guiding principles of shaping-oriented vocational education and development-oriented broadband core occupations are of central importance.

## Abstract

This chapter examines the key features of learning in, and for, the informal sector in the African context. It posits the view that there is an important opportunity provided in the contemporary discourse of work-based learning for ensuring that learning in this sector is enhanced, while the more complex issue of the sector’s legitimacy in the national development discourse is being debated. It suggests that the emerging notions associated with the current work-based learning (WBL) discourse can be usefully incorporated to legitimate learning in this sector and to ensure its positive elements are incorporated into national skills development systems. The renewed interest in the concept provides an opportunity for

## Introduction

Large parts of Africa, Latin America, and the Caribbean and Asia face major challenges in providing effective access to quality work-readiness opportunities that accord with their specific circumstances. The predominance of a large informal sector which comprises more than 90% (Walther 2007) of the regional economies in sub-Saharan Africa and East Asia and importantly makes up almost 30% (cf. Thai and Turkina (2013) of the international economy suggests that a new perspective is required for understanding and advancing its role in national development. While the importance of this sector has long been ignored, more recent attention by regional and international entities attests to the importance of this sector in national development – as a “. . .real economy, made up of micro- and small activities, which generates employment (up to 95% of the world of work) and wealth (estimated as up to 60% of GDP in some countries)” (Walther 2011: 3). Indeed, a recent ADEA conference called for some quite drastic attention to the sector as a mechanism for realizing an alternative developmental path

African economies too frequently operate according to a development model in which growth depends almost exclusively on the ever-greater presence of global companies. But current trends, reflecting the “third industrial revolution”, underline the crucial role that other types of production unit (particularly in the informal economy) will play in the future as a source of innovation and new types of jobs and activities. This sector exists in all countries of the continent, but it is currently either ignored or neglected. (ADEA 2014: 2)

While the sector has been relegated to the periphery in most transition and emerging economic contexts, learning in this sector has been marginalized. The continued existence of the sector, however, testifies to its resilience and reproductive capacity. Indeed, it is clear that some quite novel learning forms exist that secure its robust existence. Under the broad rubric of “informal apprenticeship” (ILO 2012), the work by the ILO has been seminal in attempting to come to grips with this somewhat less than conventional learning form. Coming on the back of considerable neglect of the sector, the very nature of the Technical and Vocational Education and Training discourse, which used the college as a basis for learning for work, clearly did little to engage this sector. Arguably notions of “work” clearly did not incorporate that which existed outside of the formal enterprise. Importantly,

it took the ravages of employment decimation of the 2008 subprime crisis that led to some attention to the sector. Asking “Is the informal normal” (OECD 2009) started the debate and discussion around its reality with respect to employment and jobs. We have, however, indeed come a long way from those heady days with the call for the more recent partial recognition becoming quite robust. Some work has recently become more acutely focused on the sector looking specifically at learning forms in this sector (see ILO 2012; Walther 2008; Charmes 2016; Stuart et al. 2018). It provides an important opportunity under the rubric of work-based learning to shine the spotlight on this unique learning and training form.

“Work-based learning” has become a significant component of the international discourse for enhancing school-to-work transitions. Under the broad rubric of learning associated with “real work contexts,” it not only incorporates the notion of “apprenticeships” but has also become a catch-all phrase to refer to all learning associated with real on-the-job training (see, for instance, Ismail et al. 2015). As a significant component of workforce development and learning for real work contexts, it can be usefully employed to legitimate learning in the informal sector – a learning form which while it is widely practiced still needs to be incorporated in national skills systems. The term has already significantly widened the existing understanding of effective school-to-work transitions and skills development systems (see, for instance, Maurer and Blom in this edition). Associated as it is with the renewed attention to expanding the ambit of apprenticeships, it provides an opportunity to bring into focus further forms of learning that exist in various contexts and that have not yet been fully incorporated in the national space in emerging and transition economies.

As an essential component in resolving skills deficits for the economy, challenges to implementing work-based learning solutions range from a lack of commitment to its implementation, an absence of sound legal frameworks, a focus on definitional clarity, and a perceived (in-)capacity for effective implementation. Clearly the policy intention that underpins its importance is sometimes lacking, but international attention has significantly advanced its currency. Many countries have started thinking through how this learning can complement and advance existing practices. The current attention to WBL forms, especially because it is an emergent notion, can provide an important moment to legitimating and advancing existing learning forms in the informal sector. Furthermore, the current international attention to advance work-based learning and incorporate it into the policy space provides an important historical moment to opportunity to advance its interest.

This chapter explores the nature, role, and form of learning in the informal sector in Africa and provides the basis for its incorporation into the work-based learning discourse. It begins with an overview of the nature of the informal economy and the learning “systems” in place that characterize it. This is followed by emergent notions of work-based learning and then how learning in the informal economy can be accommodated within a work-based learning framework. The potential for inclusion into the national skills development system and the opportunities provided by the current discourse of work-based learning is then examined with potential pitfalls analyzed.

## Understanding the Informal Economy: Size, Shape, and Legitimacy

Understanding the nature, form, and context of the informal sector is an important starting point for its overall development. A brief overview of the size and extent of the sector in Africa is provided in this section.

### Size and Shape

Evidence suggests that the share of those in the informal economy in Africa is extensive and expanding. It is estimated that nine (out of ten) workers in both rural and urban areas hold only informal jobs (ILO 2009). The share of informality varies across the region: informal employment is lower in Southern Africa, where it ranges from a low of 32.7% in South Africa to 43.9% in Namibia and other parts where it accounts for between 80 and 98% of people in work. In Zambia, for instance, at least 90% of the employed population has their main activity in the informal sector.) In other sub-Saharan African countries for which data is available, informal employment tends to be the first job for most youth. According to the ILO data in eight sub-Saharan African countries, at least eight in ten young workers are in informal employment (ILO 2015a, b). The Association for the Development of Education in Africa (ADEA) inter-country quality node conference (2014) has, for instance, also pointed out that “In most countries, the informal sector is large in comparison to the formal sector: it accounts for 80–98% of people in work. Formal employment levels are low (2–7%) and the formal private sector is little developed (1–5%) (ADEA 2014).”

Data extracted from various sources attest to the size of the sector in Africa (see, for instance, Stuart et al. 2018). The table below captures some of the available data. Employment in the informal sector in Africa (from among data cited from 160 countries) has placed Benin (96.3%) and Burkina Faso (90.5%) and Mozambique as among the top of the countries with highest presence of the informal sectors as a share of nonagricultural employment (Charmes 2016) (Fig. 1).

In addition, a number of other countries are cited with considerable informal sectors, with South Africa ranked as the lowest. The predominant female composition of the sector is also a key characteristic of the sector, with high incidence of poverty recorded by those engaged in it (Kamdima and Nkunika 2012).

### Nature and Character

Despite considerable advancement in the kinds of data available, key elements of the informal economy are still shrouded in mystery. For instance, its origin and nature is still contested. Singh et al. (2012) argue that the informal economy is a product of the twin failure of “poorly run institutions” and “excessive regulation”

Category	Employment in the informal economy as a share of total non-agricultural employment Figures (2005–2010) <sup>a</sup>	Share of persons in informal employment in total non-agriculture (%) by Gender <sup>b</sup>
>90%	Benin (96.3%), Burkina Faso (90.5%)	
>80%	Mozambique (87.2%), Cameroon (84%), Mali (82.7%)	
>70%	Morocco (78.5%), DRC (77%), Kenya 76.8%, <b>Zambia (76.3%)</b> , Madagascar (73.7%), Uganda (73.5%), Lesotho (70.7%)	<b>Zambia (2008)</b> Male (62.9%), female (80.1%)
>60%	Cote d'Ivoire (68.7%), Ghana (66.3%)	
>50%	<b>Liberia (56.4%)</b> , Zimbabwe (51.6%), Egypt (51.2%)	<b>Liberia (2010)</b> Male (47.4%), female (72%)
>40%	Tanzania (46%), Algeria (45.6%), <b>Namibia (43.8%)</b>	<b>Namibia (2008)</b> Male (41.1%), female (47%)
>30%	<b>South Africa (32.7%)</b>	<b>South Africa (2010)</b> Male (29.5%), female (36.8%)

**Fig. 1** Employment in the informal economy as a share of total nonagricultural employment (Africa). (a) Source: Charms 2016 (Employment in the informal economy as a share of total nonagricultural employment in 60 countries (%)); (b) Source: ILO (2012) Key Indicators of the Labour Market (KILM) 2011, 7th Edition, ILO, also cited in Kamdima and Nkunika (2012: 2)

which “force” individuals, workers, and businesses into the informal sector. Associated with a weak legal framework, informality is more likely to be prevalent among youth, women, and the more vulnerable individuals. In the case of developing and transition economies, it has been contended that “. . . employment is informal out of necessity for those not able to find formal jobs and in the absence of privately or publicly provided social protection” (ILO 2014: 24). Many African students have interrupted periods of education, alternating with significant work breaks, exposing them early on to informal work, and making it more difficult for them to acquire either proper academic qualifications or quality work experience (ILO 2016: 34). It can be confidently presumed though that the lack of adequate formal employment opportunities, therefore, provides an important impetus for the expansion and sustainability of the informal economy, especially in transition economies. It has, therefore, been a powerful element in livelihood development for large numbers of those unable to be absorbed in the formal economy.

The local circumstances that underpin its existence profoundly affect its form and character with various types evident. The spectrum ranges from conventional local home-based activities including vending of food and small merchandise to providing health products and care (traditional healers) and from tailoring of garments to more expansive furniture manufacturing and automobile repair. There are regional variations. The sector in the more central regions of the continent (i.e., Nigeria, Senegal, and Kenya) is associated with significant innovation in manufacture as opposed to a more retail-dominated form further South of the continent. Their widespread presence at both urban and rural contexts defines their character. The predominance of retail activity in urban areas is contrasted with quite innovative agri-based activities in rural contexts. Some quite novel forms of agri-based manufacture are also to be found in some areas.

Similarly, the underground mining activity in South Africa and the fishing activity in the lakes of Malawi differ significantly in the way they have originated and are currently undertaken. Authorities respond in different ways at both the local and national levels, and local circumstance ultimately shapes how these enterprises operate. Thus, while regulation powerfully defines their character, the very nature of the informal sector varies significantly, and its ability to adapt to differing circumstances is clearly difficult to track. In many respects, market demand defines its very existence, with regulation outside the purview of its logic.

Different kinds of entrepreneur types have also been identified depending on local and national circumstances. In Zambia, for instance, the informal economy is dominated by Micro, Small and Medium Enterprises (MSMEs) with most of these businesses (92%) often functioning with only one operator (Conway and Shah 2010). Many of these are family-based with little cash transfers changing hands, with only 12% of MSMEs being “entrepreneur” firms, employing workers who are paid solely in cash. Here, the vast majority of MSMEs are concentrated in the agricultural sector (70%), with most of the remainder in the retail sector (21%) (ibid.).

Another important characteristic of the informal labor market is its strong gender bias: a high proportion of women in the active labor force in the developing world are in the informal sector. In SSA, this share is even higher (Steel and Snodgrass 2008; CSO 2011). It has also been contended that women are concentrated in the more precarious types of informal employment (Chen 2007, 2008), with the average earnings from these types of informal employment too low to raise them out of poverty, but has been known to be used in the absence of other sources of income (Benjamin and Mbaye 2014). It is clear that governments are increasingly required to ‘acknowledge its existence and to the national economy’ (Conway and Shah 2010) if they are to attend to the welfare to those employed therein.

## **Advocating for the Informal**

Advocates for the advancement of the informal economy have become more robust. The international community led by the International Monetary Fund (IMF) has been vocal about its positive impacts. The admission that the informal economies are much larger in poor and emerging economies than in richer countries means that some concerted attention has to be given to its advancement in these contexts. The value of this economy has been identified to advance its role in employment and livelihood development:

...the informal sector has an important role of play, especially in developing economies where it may be viewed as the nursery of future economic growth in the formal economy. It serves as an important buffer against economic uncertainty and underdevelopment in the formal sector by providing livelihood to large segments of the population. (Singh et al. 2012: 42–45)

African voices have also become more vocal regarding its significance as a mechanism for development. ADEA’s ICQN Conference held in 2014 links

development of the informal economy with the very choices that need to be made regarding the developmental model, with increasing consensus that the upliftment of the sector needs to be taken much more seriously than has hitherto been done.

There is increasing consensus that if African economies are to succeed, then it is necessary to "... create added value and stimulate the informal economy at the heart of socio-economic development strategies and policies" (ADEA 2014: 2). Legitimacy and advancement of the informal economy are clearly at the core of this quest, and learning in, and for, its advancement could provide an important element in this quest for legitimacy. The admission that this sector is to be given attention is contained in this important regional pronouncement:

... Just because the vast majority of young people enter informal employment, they are no less in need of training in order to perform properly the tasks entrusted to them. (ADEA 2014: 3)

The reality of responding to this sector, however, still needs to be realized.

---

## **Understanding Learning for That Informal Economy: Rethinking "Informal Apprenticeship"!**

Learning in this sector is perhaps more ad hoc than is conventionally conceded. The complex sector is marked by a less clearly defined learning environment that will require considerable understanding of the circumstances and contexts under which they take place. Just as there is very little engagement between the informal and formal economies, learning in, and for, this economy is clearly more disparate than they need to be. More clarity about its key features and its incorporation as a necessary component of national skills systems will clearly advance its legitimacy.

Learning in the informal economy was given prominence by inter alia Hoppers (1983), King (1977, 1996), and Haan (2006). The latter's work in sub-Saharan Africa which focused on apprenticeships in this sector found and referred to the learning formation in the informal economy as a form of "apprenticeship." It was clearly understood in terms of current nomenclature found in Western European systems. Referred to as the most common form of nonacademic training in the sub-Saharan region (Haan 2006), it represented an example of a learning formation provided outside of the state national system, offered sometimes for a fee. Importantly, it was found that the system leads to self-employment rather than to wage jobs. In Ghana and Kenya, for instance, where quantitative information on apprenticeships was most abundant, "informal apprenticeship forms" were found to be widespread and served as an important element of training in the urban economy (Haan 2006; King 1996). While the work placed learning in this economy in the international stage, its attractiveness has unsurprisingly not gone unnoticed. By referring to it as a form of "apprenticeship," however, it served

to simply undermine its key features, which were not rooted in formality, although clearly defined rules pertain. The nomenclature, however, was established.

The nomenclature is still widely used by various transnational entities. The ILO, for instance, has undertaken significant work in the area over the past decade (ILO 2008). Referring to learning in this sector as a form of apprenticeship, i.e., “informal apprenticeship,” it turned out to be an important starting point in understanding the learning practices in this economy (Comyn 2015). While the rubric of “informal” apprenticeships, of course, belies the extensive and established sets of rules and regulations that underpin its current form in different contexts, the reality of this learning form had been established.

Much has been done to distinguish this learning from its “formal apprenticeship” counterpart. This short ILO definition already makes this evident:

It [informal apprenticeship] is based on a training agreement between an apprentice and a master craftsman. In this agreement, which may be written or oral, the master craftsman commits to training the apprentice in all the skills relevant to his or her trade over a significant period of time, usually between one and four years, while the apprentice commits to contributing productively to the work of the business. Training is integrated into the production process and apprentices learn by working alongside the experienced craftsman. (ILO 2012)

The understanding of the learning form is clearly an important starting point in understanding its unique character.

The OECD have also described learning in this economy as associated with a “traditional” or “family-based” perspective (OECD 2014: 11). It is considered a form of “traditional” apprenticeship characterized by a master craftsman, who undertakes the training of a willing participant as he or she becomes inducted into the particular craft or skill. Learners in informal micro and small businesses learn technical skills from master craftsmen and practitioners at the workplace and are introduced into a business culture and a business network which makes it easier for them to find jobs or start businesses. Training in this “enterprise-based apprenticeship system” is referred to as cost-effective because it is integrated into the production process while for learning on the job enables understanding of what work in this context entails. The advantage of this training form allows learners an opportunity to opt out early if they find that it does not accord with their character.

While the learning environment is integrated into the work process, the chances of an unsavory learning environment are very real, with possibilities of exploitation and ineffective practices being sustained. As regards cost, the advantages of shared costs make it an inexpensive national learning form. Training investment is shared between the master craftsman and the “learner/apprentice.” It provides access to training for those unable to gain admission to some public and private training opportunities, which are sometimes not only costly but tend to exclude those without any formal schooling. As a training form suited to marginalized communities, learning is not only an option, but in many cases, it is the only alternative to accessing livelihoods. It is therefore not unsurprising

that informal apprenticeships that transmit the skills of a trade to a young person in a micro or small enterprise have operated for generations in many African countries.

The case for changing nomenclature of this learning form is a persuasive one. Referring to it as “informal apprentice” tends somehow to relegate its importance in the national skills development system. It undermines its key features and tends to suggest that it is “less important” than its formal counterpart. While it is clear that the reference to the informality of the apprenticeship is essentially a product of the kind of economic production to which it responds rather than a haphazard construct of selected practices, this can sometimes be mistaken.

Clearly, the key difference between the formal and informal learning and training systems is on the basis of the “theoretical” or “classroom-based” component. The absence of government involvement, together with any ostensible theoretical (read “classroom-based” learning) component is considered to reflect the crucial difference between the formal and informal systems as identified by the resource guide developed for engaging this sector (see, for instance, ILO 2012, op. x).

While it has been emphasized that learning in the informal sector should not be considered as “unorganized,” it can be misconstrued. As the ILO Director-General has pointed out, “Learning practices which are embedded in social rules, norms and local traditions provide a conducive framework for training to take place” (ILO 2012, Foreword). Their association with a socially agreed “rules and regulations,” agreed to and respected by all parties, is often defined by social norms, customs, conventions, or cultural values. They are also “socially enforced” by informal mechanisms such as reputation, reciprocity, social sanctions, shunning, ostracism, and religious beliefs which provide the basis of their legitimacy in their local surrounds. In some cases, traditional authority has some role in assuming some responsibility, but crucially the consultation and informal sanction occur outside of the national legal system (ILO Resource Guide 2012: 10), which tends to be less than ideal from a national skills system perspective.

The reality that learning in this informal sector is associated with a lack of a standard curricula experience, together with the absence of any formal certification, provides the basis for its current deficit. The importance of certification in this context will, of course, need to be reviewed, with the proviso of its utility in this sector.

Thus one of the key features of learning in the informal sector related to its current nomenclature will need review. Identifying it as a form of “apprenticeship” might well be expedient in the short term but will need to be reviewed if it is to describe accurately its peculiar features.

---

## **Work-Based Learning (WBL) and Apprenticeships**

Work-based learning has commanded a considerable amount of attention internationally. Various countries are in the process of developing frameworks and policies designed to incorporate it into its national skills development system. Reasons for this are varied, from its promise to provide a framework for understanding and implementing more acute mechanisms to respond to employer needs as skills

development levies are introduced. Clearly in an important way, it suggests that a more deliberate attempt is being made to ensure that national education and training systems are charged to be much responsive to the economy than they hitherto been.

Much more work has, however, to be done to clarify what it means in different contexts. Described as a concept without a “commonly accepted definition” (Beijing Normal University 2017), the suggestion is that it has clearly become a catch-all phrase for all manner of school-to-work transition contexts. Not only do researchers and transnational entities have different understandings of the concept, reference to different practices in various countries attests to the complexity of the diversity of practices that are described by it, from classroom-based instruction to workshop-type practices to actual work in real contexts. It does, nevertheless, incorporate all manner of apprenticeships, learnerships, and mentorships and even has been referred to “workshop-type” learning which replicates simulated working conditions (although the latter is perhaps less frequent). Defining it in particular contexts is therefore particularly crucial in light of it becoming “. . . a research field parallel to TVET” and in light of the fact that it does, as Richard Sweet points out, represent “. . . a powerful pedagogical approach which is embedded in general education (high schools and universities) and vocational education” (Sweet 2013).

There is widespread optimism that it has capacity to resolve key socioeconomic challenges of unemployment, livelihood development, and poverty alleviation. The fact that the broad sweep of its purview is encompassing and inclusive does, however, lead to the danger that virtually anything can, and is likely to, be subsumed under its wing. This is not intrinsically a bad thing. The contextual variants will enrich its premises and provide a fuller meaningful response to its effective incorporation in ensuring that education and training systems become more responsive and inclusive. Recent attention by international development and transnational entities has, however, attempted to cast some light around its key features, which will provide an important starting point in the national space.

The Inter-Agency Group on Technical and Vocational Education and Training (IAG-TVET) agreed and published a policy guideline leaflet entitled *Investing in Work-Based Learning* published in June 2017. It provides a definition that represents an important starting point:

Work-based learning refers to all forms of learning that takes place in a real work environment. It provides individuals with the skills needed to successfully obtain and keep jobs and progress in their professional development. (June, 2017)

While arguably vague, the parameters to which it refers have been clearly sketched. Of course, notions of “work” and “learning” as is notions of “real work environments” will clearly hinge on final agreement as to its real meaning and import. The document does, however, go further in clarification. Reference is made to the “. . . the common types of work-based learning’ viz. Apprenticeships, internships/traineeships and on-the job training.” These essential forms are illustrated below:

- Apprenticeships  
Defined as those that “...provide occupational skills and typically *lead to a recognised qualification*.” As a combination of learning “...in the workplace and school-based learning,” it is referred to as being undertaken in a ‘structured way’- understood conventionally as being associated with a formal employment contract signed between the parties, with the incumbent in receipt of a regular salary
- Traineeships and Internships  
...are workplace training periods that complement formal or non-formal education and training programmes. They may last from a few days or weeks to months. They may or may not include a *work contract and payment*.
- On-the-job training  
This training form refers to “...training which takes place in the *normal work environment*. It is the most common type of work-based learning throughout an individual’s working life” (IAG\_TVET 2017).

Clearly, as a broad “consensus position,” the document is useful in prescribing the broad features of the concept. The consensus reached by the IAG-TVET suggests that work-based learning accords in general with a learning form linked much more deliberately to the world of work understood in its widest form in all of its manifestation-waged labor and other forms including that of the informal economy.

At some level, the document has resolved what has been regarded by some as the somewhat “tenuous” relationship between work-based learning and the formal education and training systems. As Maurer (in this edition) points out, the fact that it is often associated with work tasks rather than formal learning objectives makes its suitability to all forms of learning for work particularly enticing (understood in its most widest sense, i.e., livelihoods and waged employment). But, as many have also pointed out, informal learning can in fact occur by observing and imitating in the workplace modeling (see, e.g., Bandura 1972) or by learning through experience (Kolb 1984) or incorporate a degree of socialization by the development of “work ethics” (cf. Maurer citing Heinz 2005 in this edition), although these are essentially referenced to learning for formal contexts.

The importance of this initial work is that work-based learning can be utilized to expand notions of learning and “learning for work.” The attention drawn to the needs of the entire economy cannot be avoided. As a concept, WBL has the transformative potential of engaging national systems to rethink notions of skills and responsiveness to various sectors and perhaps be more responsive to sectors that have been ignored or not given adequate attention. It has potential to significantly transform the way national systems respond to their learning needs.

The tentative definition of work-based learning can be used to accommodate learning in the informal sector. While the notion of apprenticeships for the informal economy advanced by the ILO is an important starting point in ensuring that learning in this sector is not ignored, much work has still to be undertaken in support of advancing the specific learning in this sector. While the current nomenclature

under the broad umbrella of “apprenticeship” can be used, attention has still to be paid to the sector as a separate component of the skills system distinct from the “formal.” The starting point offered by IAG-TVET in the absence of a unifying framework provided for work-based learning can be used by those advocating learning in the informal sector. Clearly work-based learning can provide a valuable starting point in legitimating the learning in the informal economy, which is often lost to the national system and becomes subsumed as an “alternative” form of skills development that exists outside of what we regard as “conventional.”

---

## **Work-Based Learning in the Informal Economy**

There is an opportunity provided by work-based learning to respond more adequately to the needs of those in the informal learning and training sector. It allows for a more measured examination of what is possible, without negating its potential, while ensuring that its more exploitative elements are challenged. There are valuable advantages in ensuring that skills development and learning in the informal economy are supported, enhanced, and sustained. The notion of work-based learning, however, provides a concerted attempt to advance its key features and expand existing attempts at engaging learning in this sector.

Unlike the apprenticeships designed and implemented in the formal enterprises, these informal “apprenticeships” provide a valuable opportunity for access and livelihood development that can be usefully replicated in the formal economy. It is evident that its ability to advance access to labor markets by providing opportunities for those who are outside of the formal education loop is considerable. It can represent a powerful means by which governments can access this group to enhance their literacy and life skills and advance the skills and employability in the sector. In addition to offering a flexible mode of training delivered on-site, usually in the learner’s own community, the organic sustainability of this form of training provides a valuable means by which to reach out to those that have been left out of the formal education sector. The skills focus of the sector that enables on hand skills to be transmitted is likely to result in enterprise development albeit in the informal realm. In addition, there is a possibility that the benefits of the additional education and training provided as a result of inclusion into the national system have the potential to establish partnerships with formal enterprises and generally uplift the sector.

The warnings to the limitations of current learning practices in the informal sector are nevertheless important. Criticisms that the training is still tied to the very excesses related to informal economy and those related to health, safety, and lack of livelihood security, exploitation, and inequity are clearly valid. They should not be ignored in our enthusiasm to embrace learning in this sector. Indeed, the African Development Bank (AfDB), for instance, has argued that while there was capacity in the informal sector to create jobs and incomes, there are challenges that need to be addressed. The association with poverty in the informal sector needs to be addressed. It clearly needs to respond to excesses related to those informal workers without secure income,

employment benefits, and social protection (AfDB 2013). The ILO has also posited the observation that some governments have committed to the need to protect those in the informal sector who work in low-skilled jobs, exposed to inadequate and unsafe working conditions (i.e., low wages, long working hours, and an absence of social protection) and inadequate training opportunities (ILO 2016: 83). The possibility that informal apprenticeships don't always function well in light of the precarious "decent work" outcomes is an important one and cannot be left unresolved. Engaging it through WBL can make that difference.

There are dangers and challenges in the sector, and it is necessary that the real challenges of the sector need to be examined, and responded to, within particular contexts. It is true that depending on the local context, the terms and expectations of the training may not be clear and there can be a lack of innovation in production and transmission of skills. In addition, while there may well be an absence of conventional "quality assurance" measures, the measure of an apprentice's competency is clearly continuously assessed by the mentor who is ever-present. Thus as a measure of the effectiveness of this training form, the importance of ensuring mentor development is overwhelming. Where work conditions fall far short of decent work standards, this can, and needs to be, be addressed within a skills development framework. Similarly, the gender biases existing in some trades can also be responded to within a national skills framework. Thus while it is often the case that master craftspeople may not be sufficiently skilled to train young people effectively, their expertise in ensuring that this training form is sustained cannot be ignored. Intervention in this sector will, however, need to be carefully managed.

Similarly, it is important, therefore, that the advantages of this informal training form are harnessed. Current attempts to rehabilitate it by formalizing its key features might, however, need to be carefully reviewed for its effectiveness. The danger of diluting its key premises by overregulation is real lest it undermines its core features. Thus, while regulation is an important starting point for incorporating it into the national skills system, there is, perhaps, a step that precedes this – that of understanding its key features. Regulation needs to ensure that its key premises are not diluted. For instance, the fact that learners (read apprentices) in this informal sector find their own master craftspeople, sometimes without any mediation or direction, is indicative of the strong social cohesion that exists in the sector. Ignoring this might well undermine a key ingredient of success. Formalizing this will invariably impact on its effectiveness. In addition, the on-the-job learning through active mentorship of the owner, or designated colleague, is clearly an area that needs strengthening.

Work-based learning needs to incorporate advantages of the current informal apprenticeship form. Learning in and for the informal economy is associated with learning a diverse range of different skills which are embedded and intrinsic to the manufacturing process. The different perspectives and starting point in this sector are arguably more fundamentally work-based than are routinely considered to be so. The holistic, rather than atomized, competencies are clearly directed at ensuring that the incumbents are prepared for the entire work process, rather than factory floor workers who are designated to achieve mastery of very specific and technical skills associated with effectively implementing technical tasks. In the

informal learning model, discrete technical tasks are enmeshed with a range of entrepreneurial competencies that are perhaps less useful for employees expecting employment than they are in a real-world work-related retail context. WBL can therefore provide an important opportunity for understanding and enhancing practices considered effective in both the sectors.

The one advantage that it has over its more formal counterpart – that related to employment outcomes and readiness for the task at hand – needs to be enhanced. Arguably one of the biggest challenges is that learners in this sector see no end to their tenure, except if they decide to terminate and move off into their own enterprise. Essentially, “graduates” from the “informal sector” either emerge from the system as fully able to undertake self-employment or serve in the “employ” of their mentor for longer than is warranted; in both cases, the aim of ensuring effective skilled outcomes has been met. In this way, informal WBL has resolved at least one fundamental critique of the formal apprenticeships system – that of effective outcomes. Francis Teal (2016) with reference to formal apprenticeships reminds us of the essential weakness of the current formal apprenticeship system, whose effectiveness is intrinsically dependent on the nature of the labor market. In the informal sector, the labor market demand element is eliminated. The clearly identified market-responsiveness agenda evident in the informal sector appears to respond effectively to real market circumstances.

Comparing learning and training in the informal and formal economy is less useful than understanding the strengths, premises, and objectives of each. Learning and training in a large-scale industrial work-space is clearly different from a small enterprise with limited resources. While understanding informal apprenticeship systems in context of its formal counterpart represents an important starting point in legitimating the sector, its very premises – as a result of its different origin, purpose, and form – make it far less useful exercise. In the context of an industrial economy with a focus on establishing mass-based employee training, the formal apprenticeship model is clearly an important one.

For work-based learning to respond to key imperatives of the informal economy, it is necessary to understand what it comprises. The information available has suggested that there are a large number of “known unknowns” in the informal economy, with widespread generalizations less easy to be made. As a result of the diversity and variation in types of enterprises, which is itself ultimately determined by a range of national, regional, and local contexts, it is clear that it will necessarily be differently experienced and understood in different contexts and its implementation and utility will be determined by context.

---

## **Still Some Way to Go and Some Crucial Questions Need to Be Answered**

We have advanced significantly from early dubious hesitancy in legitimating the sector. The call for engagement with this education and training form is, as we have seen, shifted unquestioningly on the development agenda. The difficulty in

implementation has to start with commitment to include the sector in the formal policy space. Much has been done with many countries beginning to establish frameworks that attempt to meaningfully deal with the notion of work-based learning. Much is still to be done to realize the potential of the concept to be meaningfully applied to developmental contexts and make it responsive to the informal sector. It has been argued that although formalizing the informal system is not a sine qua non for improvement, the overall result of this initiative is likely to improve linkages to the formal system and might well aid in legitimizing the sector – a goal espoused by many (see, for instance, ILO 2017). The fact that it competes with key markets currently served by the formal sector, it will require some degree of legitimation and formalization, as the two complement each other for nationally effective outcomes.

It is clear that a combination of approaches and interventions may be required to improve the learning in the informal sector. The quality of training, the level of skills acquired, working and learning conditions, entrepreneurship and employability beyond the local community, and young women's access to nontraditional occupations will all need some attention. It is crucial that such provisions build on existing apprenticeship practices in the informal economy and do not drive out existing “good” practices while aiming to address deficiencies. It is likewise important to view policy approaches as complementing efforts to expand the formal TVET system in the quest to improve existing national skills development systems (ILO 2012, *Foreword*).

Some issues and questions that need to be addressed include:

- Do we need to rethink and separate the notion of “formal” (and “informal”) apprenticeships? What indeed does the notion of informal apprenticeships suggest and what are the implications for its usefulness?
- The nature of the strength of learning and training in the informal sector. Is this a conceptually unique phenomenon or a conventional practice “unworthy” of serious engagement except for identifying challenges?
- We need to improve it by bringing it into the ambit of the formal system. Is this a meaningful, yet tentative, response? What notion of formality do we have? Is it based on existing systems in these contexts?
- The issue of understanding the nature of the informal sector has been adequately acknowledged. How do we not destroy the essence, and value, of what is already there and “working for purpose”?
- Are existing apprenticeships in this sector competency-based? Is competency about recognition or quality? If recognition, what would be the purpose? And if quality, how to ensure success and legitimacy?
- The informational challenge. Do we really know what happens in these “learning” and “work places/spaces”? Is the challenge of appropriate methodology and “gross” (over-)generalizations that obfuscate, rather than illuminate, being responded to? Do we really understand what is happening in the sector?

While we can take some comfort that we have moved considerably from the quite questionable insinuation that asks “Is informal normal” (OECD 2009) to the

reality that “Informal is the new normal” (Stuart et al. 2018), there is much to be done. However, we still have some way to go in the skills development arena before we accept that the skills development and learning and training forms in this sector are indeed significant. Even the ODI report neglects to make the case for skills, suggesting that if the sector is to be revitalized, “Policies to target self-employed workers could include promoting access to capital and technology, supporting cross-border trade and improving infrastructure in the workplace, including for home-based workers (Stuart et al. 2018: 1). Clearly the overall need to, “... take the informal worker close to the definitional threshold of formality” (ibid, 26) is still overwhelming.

In this regard, changing terminology might well be an important starting point. Rather than consider it a form of apprenticeship, it might well be conceptually appropriate to refer to learning in the informal sector as a form of work-based learning that is clearly distinct from the formal sector apprenticeship model. As illustrated, learning in and for the informal economy is clearly distinct from its formal sector counterpart, with its clearly defined sets of rules of engagement.

---

## Conclusion

The brief overview of the nature, form, and context of the informal sector, and learning practices within it, in the African context suggests that learning practices need to be considered an essential element in overall national skills development in emerging economies. Currently incorporated under the broad rubric of “informal apprenticeships” (ILO 2012), it is argued that the notion of work-based learning can provide a powerful means by which to ensure that informal learning forms are embraced in the national space. In the context of limited formal employment opportunities, embracing this education and training form can advance national development goals and resolve key socioeconomic deficits.

The opening of the opportunity offered by emerging notions of work-based learning means that some considered engagement around the concept can take place as it pertains to learning in, and for, the informal economy. The determined attention paid to understanding learning in the sector can ensure that national resources can be marshalled toward it. It is, however, necessary that the integrity of the current learning practices in the informal economy is not violated while, of course, ensuring that its key contradictions and excesses are curtailed. Crucially there is a wider need to embrace the informal economy as a whole which would lay the groundwork for revitalizing the system. Whatever interventions are to be explored, what is necessary is that it takes as a starting point what currently exists and is working. This might well suggest that understanding and advancing learning in the informal economy must relate intricately to its key strengths. It does, however, require a commitment to an overall view that it needs to be considered a legitimate element of the overall national development thrust considered appropriate for transition in developing contexts.

The issue of responding and learning from learning practices in, and for, the informal economy is captured appropriately by the following reminder by Ivan Light”

... Instead of a unitary theory of disease that yields a single remedy for all ailments, a quest allopathic medicine abandoned long ago, informal economy researchers have to tailor their policy prescriptions to the specific causal scenarios in different places. This requirement makes one-size-fits-all policy recommendations hard to craft and unsafe to implement. The right course, of course, is the hard work, sensitivity to detail and location-specific research. (Light 2013: xv)

We might well need to step outside and explore uniqueness and difference by engaging with this education and training form to learn what works, rather than to start from a perspective directed at improving the current practice by intending to insert within it a brush of formality that might well undermine its key strengths.

## Abstract

Product and process innovations are of ultimate importance for a long-lasting enterprise competitiveness. Across all branches and services, innovations can be understood as changing the functionality, performance of products, and quality of services including the way they are produced. An important difference between innovations is that of radical versus incremental innovation. Whereas radical innovation is basic and of disruptive character and is based on paradigmatic change of the current technology concept, incremental innovations are of smaller scale and take place concurrently on the basis during work processes. While reflecting on innovation skills for apprentices, it can be stated that incremental innovations could be given into the hands of workers, foremen, and apprentices. Assuming that different in-company training pathways of apprentices are possible, the development of innovation skills toward incremental improvements on product, as well as production processes, could be brought into reality.

But many companies fail to do so because they miss specific vocational development know-how on the level of their vocational trainers. The quality of

the products could be improved while a productive manufacturing is in place. But why is it useful that this starts already on apprentice level? Why should they learn things which go beyond the traditional demarcation beyond engineering and production areas? Why is it important of being creative on making *incremental improvements* within the work process? Under which framework conditions could achievements in apprenticeship training be found and developed further?

---

## Introduction

Companies could develop the innovation skills of their workforce to increase innovative capacity of the enterprise. This is not exclusively on planning and product creation level but also on the direct production level, including that of product service. When the quality of the product is produced more efficiently by keeping quality standards, including the way they are produced, this has direct implications for the productivity and the companies' future.

The development of innovative capabilities of apprentices is discussed from different perspectives: innovation research literature and by case studies. This in order to define framework conditions for innovative work and learning environments within companies. The ways of how innovation processes in companies are currently organized and how in-company training of apprentices is addressed are under reflection. This chapter compares nine company cases of apprenticeship arrangements to analyze some lessons for innovative learning and working environments. The investigation instrument is called "QRC tool" which analyzes the relationship between quality of training, returns of different apprenticeship, and the cost related to the apprenticeship cases. The tool is used as self-assessment by trainers and person responsible of apprenticeship organization. The quality of the apprenticeship in its relationship between the design of the learning approaches and the in-company training plans is studied. Recommendations for elements of an innovative learning environment to enhance the innovative capabilities of apprentices are given.

---

## Expanding Innovation Understanding

The notion of innovation as a social process, which includes many different actors, is widely accepted in innovation research (e.g., Lundvall 1992; Morgan 1997). In a classical understanding, innovation could be understood as a top-down process from research toward practice. This means that companies develop new products or launch new processes in which more or less engineers or researchers are *the key*

*actors within, as those one who drive an invention, an idea into innovation.* But in a wider innovation understanding, this is also influenced by the workers, tradespeople, and/or apprentices.

An important step in opening up the work arena for innovation is done by setting up *design to manufacturability* (e.g., Nonaka and Nishiguchi 2001; Nonaka and Teece 2001): This means leaving the sequential innovation track toward a more iterative understanding of innovation, in which also the manufacturability of a new product is one of the key problems to be solved and not at the end of the process but rather at the being of different development stages (Schlünssen 2014).

The economic studies of Hall and Soskice (2001) make clear under which conditions this new character of innovation is needed, when they summarize that “incremental innovation at the side of workers is getting increasingly important for the global competitiveness of enterprises. . . for example in such industrial areas where highly sophisticated industrial machinery; innovative tools or other process automated production machinery, automated transport systems and high quality engines are produced.”

Workers’ feedback into what is planned by the engineers is considered highly relevant because it entails information about the manufacturability of the concept design and before further design details are undertaken. *Therefore* it is necessary that workers are able to make incremental improvements to the manufacturing process to achieve better product quality and make the manufacturing easier and more productive. Workers must be able to confer the possibilities for improvement. There is a need for communication skills to interact with engineers, in the context of improvements to the manufacturability or the “design to assembly” quality of the different products. Therefore it can be said that the worker needs to maintain “holistic skills” (Rauner 2007; Ruth and Deitmer 2010).

Shared knowledge is one of the important issues for successful innovation practices. Therefore, the organizations, networks, or teams which have established the best structures and methods to develop a common understanding among individuals representing different functions (organizations or disciplines) are those with the best innovation performance and thus with competitive advantage (Hong et al. 2004). The synergy of shared knowledge cannot easily be achieved, because knowledge does not have a unique nature. There can be different “cognitive universes” between organizations and departments, and there can be incompatible knowledge domains between departments and teams; knowledge can be tacit in nature and thus difficult to codify or to make explicit (Senker 1993). This knowledge can be described as “sticky,” that is, held by individuals and cannot be separated or objectified. Thus we observe plenty of obstacles to knowledge sharing, which impede knowledge sharing as a planned process. But nevertheless, some good practices with regard to knowledge sharing are reported (e.g., Nonaka and Takeuchi 1995; Nonaka and Teece 2001; Harryson 1998).

Kevin Morgan (1997) pointed out the interactiveness and the multi-actor-based character of innovation processes: *There is now growing support for the view that*

*innovation is an interactive process between firms and the basic science infrastructure, between the different functions within the firms, between users and producers on interfirm level and between the firm and the wider institutional milieu and that this process should be conceived as a process of interactive learning (Morgan 1997, p. 493).*

I consider five influential key aspects of contemporary innovation (Ruth and Deitmer 2010) in relation to the involvement of workers in design and their construction work:

1. **The idea of sequential innovation steps has been overcome these days while the markets require higher quality and their flexibility on time:** Engineers and other technical experts design sequentially. In this role model of workers, manufacturing is at the end of the process.
2. **The concept of innovation in a wider understanding transcends the “expert model” and involves the workers much earlier.** Workers are interviewed about the plans that have been drawn up by the engineers and their feedback forms part of the development process. This can be considered relevant because it entails information about the *manufacturability and production of the concept design*. Apprentices taking part in such meetings not only learn about how to produce a quality product, but are better able to reflect on the quality of the product (Toner 2011).
3. **The evolution from sequential to concurrent (or at least overlapping) innovation phases.** The knowledge and experiences that are available in functional areas at the end of the innovation process (e.g., manufacturing expertise, but also suppliers’ capacities) are required at the earlier stage (concept design) and during the ongoing development phases. Knowledge sharing between the manufacturing and early design stages is alike, with the need to bring workers’ knowledge into the design process.

The following section will discuss this new understanding of innovation in terms of economic implications.

---

## **Different Production Concepts and Vocational Formation of Workers**

Post-Fordism signified the beginning of a new industrial era, one associated with dynamic economic and social development, which has severe consequences for the personal qualification system including the vocational competencies of workers and apprentices. The competition between companies in a post-Fordist era arises from additional nonmonetary factors such as the unique quality, design, and technical performance of the products, including the timely responsiveness to the needs and wishes of the individual customers (Koch 2006).

Additional to that some of the customers even wish to receive tailor-made or one of a kind product. This sounds contradictory because one of a kind product sounds expensive, but their manufacturing has to be achieved cost-effectively. To follow

these new requirements, the factory becomes “leaner” with less hierarchies. The direct production capacities are equipped with planning and control competence in order to be more flexible when producing variants of a product. Such a production concept is based on the availability a skilled worker has knowledge of the planning, the preparation, the production, and control of his work based on strong communication abilities to coordinate himself with planning and other departments in the company.

The post-Fordism model is possible because digital technologies have advanced over the years to allow just-in-time manufacturing of high-quality product variants. There is no longer a need to stock up on a given product. Products are made on demand and then they are dispatched. The key to production flexibility and high productivity lies therefore in the qualifications of the workers and in the use of such production technologies, which allow direct and flexible control by workers (Table 1).

This change within production philosophy can be described as a move from a top-down management approach toward a participative management approach (Corbett et al. 1991; Deitmer and Attwell 1999) which requires a commitment to innovation at all levels of the workforce, not just at the top of the organization.

In a QECD literature study on workforce skill and innovation, Phillip Toner points out that across different sectors, learning by doing strategies is to be found in almost all fields of production. In the more innovative work environments, this can lead to improvement in the efficiency of the production processes and the product design and performance (Toner 2011, p. 28). The central place to find out such improvements is the direct production environment based on the existence of highly skilled workers. Such high-performance work structure is based on the practical and experienced knowledge of the workers which is sustained by theoretical knowledge provided by schools and extra courses (Nyhan 2002, p. 112).

Practical knowledge is generated on application context and is directed by validity criteria such as practicability, functionality, and failure-free use of given technologies. Such expertise is based on a strong worker history by years of practical work experiences on more and more complex work projects and task (Hirsch-Kreinsen 2008, p. 27). Learning by doing is a result of the experience of the direct production workforce and the way how this experience can be accumulated in the production and service process. Besides the worker qualities, it is the management which must be able to motivate the workers to share knowledge, for example, by incentives, like extra bonus, etc. The overall competitive strategy of the firm is crucial and specifically to which extent it competes on quality, customization of client needs, design creativity, and the ability to achieve cost reductions through innovation and investment (Toner 2011, p. 29).

As part of this understanding, the worker has to communicate regularly with engineers, managers, and other planning functions based on team sessions. Equipped with multiple skills, including the ability to assess the quality of products, they must be able to confer about the possibilities for improvement (Deitmer and Heinemann 2009).

**Table 1** Change of innovation management strategies and effects on skills of workers (Deitmer 2011)

Innovation management by: segmentation of quality and control	Innovation management by: participation and involvement of all company actors	Consequences for the skill formation of workers and apprentices
Function-oriented work organization	Business-oriented work organizations	Learn to work within the business process cycle and at different workplaces
Distinguished hierarchy, separation of production and control	Flat hierarchy, more integrative skills needed such as	Self-regulated working based on methods like “plan, do, act, and control cycle”
Lower and fragmented qualifications	Process and shaping competencies	Improving ability feedback for products and production processes
Production follows a work execution function	More commitment, responsibility on direct production level	Developing vocational identity and occupational commitment
Quality by external control	Quality consciousness on all hierarchy levels	Professional level of training based on key work and learning task; co-shaping of workplaces

## The Case Study Method

In the next two sections, several company cases are analyzed to find out key lessons for an innovative apprenticeship. But before methodology and criteria for this evaluation is explained, some information on the background to this development is given. The “Quality, Return and Cost (QRC) tool” was developed by the Bremen University research group (Analyzing the results of more than 170 companies by using the Evaluation Tool in the industrial region of Bremen, Northwest Germany, the IBB research group discovered that, on average, the apprenticeships produced net returns (Rauner et al. 2008; Heinemann and Rauner 2009). In fact, some 55% of the companies that took part in the self-evaluation realized net returns. The companies’ actual net returns diverge, some companies gaining more than 10% net return per apprentice over the full training time. It is an online- and questionnaire-based research and development tool for company trainers to assess the innovation capabilities of their apprentices. They are examining the workplace learning within their companies. However, it should not only allow the analysis of the training practice but also to stimulate a debate in the involving company about how the apprenticeships can be improved further.

The case studies are based on the generated (self-)evaluation data by the trainers. They were invited to (self-)evaluate the apprenticeship by rating ca. 35 questions on costs, achievements/benefits, and quality reached in the particular apprenticeship (QEK-Fibel 2011). The data of these investigations allows answering questions such as: Is our apprenticeship innovative? What could be the reasons for this? How do costs and benefits of the apprenticeship in our company interrelate with quality?

Based on the aggregated data also the sector, branches, or occupational groups can be analyzed. In addition the cost of undertaking an apprenticeship can be analyzed, for example, if there are high cost and little return of costs by the productive work of the apprentices. Because a high-quality apprenticeship taking the apprentice into the center of company work processes can at least in the 2nd year of the apprenticeship allow for net benefits of the apprenticeship. Therefore the IBB Group identified that a high-quality apprenticeship correlates with a better rentability of training. This means when apprentices are given high-quality work tasks in a systematic and well-organized training way (based on a prior company specific system of task from beginner task up to advanced and young expert task (Rauner and Haasler 2009, pp 25–37), they then get a semi-productive worker within the company and offer returns to the relatively high costs of an apprenticeship (min 2 up to 3.5 years). However, this correlation does not work for all apprenticeships. It has to be differentiated that often high quality can be also reached by relatively high costs. Employment-oriented vocational training represents such cases, which count for a big majority of companies (see Rauner 2017, in which he speaks of a quarter of companies with primary interest in getting cheap labor workforce).

The quality of learning within an apprenticeship is evaluated by six main criteria followed by questions for the trainers. The first four criteria and indicators are input criteria representing quality and innovativeness of the in-company work and learning processes. The last two criteria (output dimension) are related to the effect of the training on the apprentice formation, his or her commitment to the occupation, as well as their professional competence, which is seen as an outcome of the training process:

1. **Supporting work-based learning at the workplaces:** This criterion counts for the frequency and quality of work and learning task with a high relevance for the professional profile. The level of professional task involvement is measured by percentages for each apprenticeship year. High percentages of professional and real tasks are appreciated in distinction to simple and easy to learn task which are representing low skilled task not on the level of a skilled worker and.
2. **Developing the professional level of the work task:** This is done by the QRC users who give the achieved average final examination figures at the end of the apprenticeship. These figures are the results of the final written tests and interviews undertaken by the examiners (VET teachers and company professionals) to prove the ability of the apprentices to reach the functional, processural, and holistic skills. Also the time needed to become acquainted with the professional area after the apprenticeship is rated by the users.
3. **By supporting self-regulated learning, the learning is learned:** This criterion investigates the relationship between detailed assignments and the level of the apprentice ability for self-oriented business and work orders. Is the apprentice able to plan, do, act, and control his work on his own?
4. **Learning within the work and business processes:** Studies the degree of the apprentice participation on real work assignments as part of business processes.

Does the apprentice understand the relevance of this own work task in relation of the whole company? Can the apprentice explain the relationship between work and business process? This has an impact on the apprentice quality responsibilities.

5. **Professional competence:** This is assessed by the level of professional competence (low, middle, or high) in relation to work order on skilled worker level.
6. **Vocational and occupational commitment:** The commitment from the apprentice to be innovative at work and attention spent by the apprentice toward quality while accomplishing work tasks. Also the way the apprentice finishes and controls their work task in a professional manner consistent with the level of a skilled worker.

Real work process-oriented learning in enterprises can work as a basis for developing innovative capabilities of apprentices. In the next section, I will show that the presented concept (Heinemann and Rauner 2009; Piening and Rauner 2014) can identify and separate stronger innovative cases from less stronger case due to his quantification by an innovation spider. By contrasting stronger with weaker cases, some framework conditions for an innovative learning environment can be identified.

---

## Examination of Cases

The nine cases come from different labor market areas, such as industrial and craft trade sectors. These are vocational occupations such as industrial and building electricians, mechatronics engineers, mechanics, and hairdressers and painters. All cases are analyzed by using the QRC tool (The cases were identified by Bremen University VET teacher students. These students are doing their internships in companies during their VET professional teacher education.). They were investigated to find out whether there is a relationship between the quality of learning environment and innovative capability of the apprenticeship students.

Table 2 gives an overlook of the cases about company types covered and the QEK results achieved. The different cases are ranked in three fields: *top*, *middle*, and *lower field*. The first three represent stronger apprenticeships which relates to the way that they organized and developed the innovative capabilities of apprentices. In the middle field are three cases clustered. All cases are above average but still have different weaknesses regarding some of the dimensions of the QEK tool (e.g., too little support for apprentices; missing real work task). The cases in the lower area represent cases which are below the common quality standards of the sectors and have in all dimensions of the QEK tool more or less bigger deficits represented by weak quality index and *poor* spiders. The comparisons are possible because they are taken out of a pool of more than 170 companies in several German regions (Rauner et al. 2008).

Table 2 allows us to compare the conditions and personal capabilities needed to reproduce innovative behavior at the side of apprentices and help us to summarize recommendations for an innovative training organization. It helps us to understand better the mechanism for an innovative training organization and deliver ideas for

**Table 2** Ranking cases by quality index and their spider profile

Quality index (QI); innovation spider profile: stronger, developed with weaknesses, greater weaknesses	Type of company	Strength; weaknesses
Top field: innovative and high-quality apprenticeships		
Place 1; QI 2.0; stronger spider +++	Manufacturing company, HB, automation packing technology	The productivity of apprentices above average
Place 2; QI: 2.42; stronger spider +++	IT service company, OL; Lower Saxony (KS)	Above sectoral standards trainer system
Place 3; QI: 2.62; stronger spider: +++	Small electric craft trade, Lower Saxony; (MK)	Learning on real work task already in the 1st year; weaker involvement into business processes
Middle field: satisfactory apprenticeships		
Place 4; QI: 3.13	Automation control systems, Lower Saxony. SME (MM)	Learning based on real work task
Well-developed spider: ++		First two learning years too many unqualified work task; vocational commitment is weakened by too little involvement in business processes; no skilled work task in the 1st year at all
Place 5 QI: 3.18	Lower Saxony, high precision metal production parts (CV)	Above average in making work experience; profitable training, lacking own work task; lacking well involvement into overall business processes; professional commitment still too weak
Well-developed spider: ++		
Place 6 QI: 3.35	Electrical engineering and installation; supplier shipyard (SF)	Weak occupational commitment while dominant in-house orientation; not involved in real work task in 1st year; not effective learning while too little learning in the total business process cycle; too much learning in company training centers, too little at the workplace
Well-developed spider: ++		

*(continued)*

**Table 2** (continued)

Quality index (QI); innovation spider profile: stronger, developed with weaknesses, greater weaknesses	Type of company	Strength; weaknesses
Lower field: weak practices and of apprenticeships with low quality and profile		
Place 7	IT development and service company, HB (CD)	Missing trainers or responsible skilled colleagues giving advice and feedback; too little own and responsible work activities; experience-based learning is not well planned, structured, and/or guided within the company business processes; 1st year a real waste of time by “staying around” and looking for relevant real work task
QI: 3.98		
Spider with greater weaknesses: +		
Place 8	Hairdresser, North German town (KN);	No learning on real work task; cannot make work-based experiences while only learning on “dolls and puppets”; but learning by simulation is too narrow, missing recognition on customer requirements and needs, reached professional skill and experience-based learning level too low
QI: 4.01		
Spider with greater weaknesses: +		
Place 9	Small painting company, Lower Saxony (KB)	First year nearly no learning within the work process, too much aside from the real work and learning activities; no involvement in real business processes; 1 year over 85% of activities are unskilled; only under 40% of the learning time is based on skilled work activities; too much theoretical learning in so-called courses; learning at work in general by 36% too little; normal is 60%
QI: 4.31		
Spider with greater weaknesses: +		

training the trainers as well as introducing organizational development processes (OD processes) into the training organization of an apprenticeship company.

Across all cases, the time spent within real work environments is a critical issue and influences the quality of learning. In other words, when apprentices have too little involvement in the real-work environment and business processes, they do too much unqualified work (on the level of a helper or unskilled worker). This means that they learn little and have greater difficulties to develop their full professional competence they would normally achieve. In cases where the students get a chance to get challenged by real work task, they can develop much higher vocational

commitments. These students seem to be much better motivated to overcome problems or any barriers in getting real work tasks in a good manner.

Another feedback across all nine cases is the critical factum of the 1st year of apprenticeship which challenges all companies. All companies face rising business and workplace requirements due to market and technology changes. Apprentices are not well prepared by the previous school education and have not learned to be self-oriented. But to get them involved on business-related work task right from the beginning is rather a challenge for the companies. Apprentices need therefore beginner task on a less complex level which also allow them to make mistakes and follow different pathways, because mistakes may damage costly products and could have critical implications on company orders. Here comes the difference toward the stronger apprenticeship cases (see Table 2). They were able to bridge such critical situation by developing *beginner task*. Another possible strategy is to develop cooperation projects with the VET school by cooperation projects or that of some companies in the same occupation work together in a training network. This allowed all apprentices to start on challenging work task related to their occupation.

In the following sections, the first good practice case is explained in more detail. The guiding principles of training personal and the organization of the apprenticeship are described. The case is placed in the machine tool sector market of medium-sized manufacturing industry (see case in the top field on place 1, in Table 2).

---

## In-Depth Analysis of One of the Best Cases

The manufacturing company was founded 40 years ago by an entrepreneur with an engineering background in process technology. Entrusted by his former engineering post in the regional food processing industry (coffee brewer), he began to develop packaging machinery for other application fields, like packing automation machinery of pharmaceutical products.

Most of the products are cutting edge in whose performance customers have been extremely satisfied and which are now widely exported to other countries like the USA and Asian markets. Customers make demands in relation to the timeline, reliability, and robustness of their machinery. Therefore, the productivity of the company and its business future is dependent very much on the creativity and technical competence of the engineers and technicians and of the skills and competences of workers, meisters, and apprentices on the shop floor. The company recruits its shop floor personnel by apprenticeship; most have undertaken an apprenticeship of at least 3 years in occupations like industrial mechanic, toolmaker, or industrial electrician.

Because of its rising turnover and expanding sales figures, the company has grown over the years to become a medium-sized company with around 250 employees. Fifty percent of the employees are involved in manufacturing, while 21% of the company staff are involved in the construction and design of the products; engineers and technicians are mostly recruited for this purpose. In many cases the engineers began their career as apprentices. The number of management

and administration personnel is small, at around 17% of the workforce. Apprentices represent 6% of the company employees.

The apprenticeship is supported by school lessons at the local technical vocational school, and a normal apprenticeship lasts for 3.5 years, including theoretical and practical exams at a chamber of commerce and trade before a regional expert commission of company representatives and technical or commercial vocational school teachers.

But what makes the apprenticeship training at this company so different from other German companies and why can it be regarded as innovative and of good practice by comparison with the apprenticeship practices of other companies?

This is because there is a common understanding of some key principles across the trainers and co-trainers as well as other technical workers of the company. The following three key principles of the training organization are discussed and widely implemented within the company apprenticeship training:

**First lesson: “Our apprentices are in the middle of company action.”**

The apprentice has an active role in the everyday production and manufacturing of the complex products, in the different workshop departments. This means that the apprentices follow the production process throughout the company. It can be said that apprenticeship training is part of the everyday life of the company. The apprentices are directly present in the production process not in a training center which does not exist. They are visible to the other workers and make in touch with internal “customers” from the others departments (from pre-production up to service and assembly). Therefore, the apprentices are expected to integrate well into the everyday life of the company. An apprentice road map is defined by the part-time acting company trainers. Here it is laid out what kind of key work task can be learned within each production unit or department.

**Second lesson: “Our apprentices can work on our products as early as possible.”**

The principle encourages the apprentice to get in touch with real company and work orders and the handling of related products and machines in an early stage, which should enable them to develop a better understanding of the importance of the production quality of the various product components to the quality of the finished product and how this can be best achieved. In this respect they learn about the involvement of the key actors and what role they take during the planning, manufacturing, and maintaining or servicing of the product. With such a holistic understanding of the business process, the apprentices are later well prepared for production, system assembly, and customer service activities, even abroad.

**Third lesson: “Sharing of knowledge between manufacturing, construction and design is one of our key assets.”**

The company employees understand this key lesson as an approach to establishing a strong relationship between engineers and workers. This means that working with the engineers is not a one-way street but is more an understanding or dialogue between partners. One partner is more responsible for the design and construction of the production machinery, whereas the other partner takes on the role of manufacturing

this product in an effective and high-quality way. During the vocational training of the workers, an intelligent dialogue between skilled workers and engineers is established right from the beginning, and the process, from design to manufacturing, has to be understood as early as possible. This means that the apprentices are also learning partly the task of designing products and of constructing via CAD, etc. This means that during the apprentices' active learning tour or their work experience journey through the company, they are supported by a stay of up to perhaps several months within the design and construction department. Nevertheless, this is supported too by apprentice learning on company action projects. These are small projects within the first apprenticeship training year and which allow a team of apprentices to undertake their own construction and design work. Through these learning routes, the apprentices learn to give feedback to engineers, for example, whether the product will be appropriate to manufacture or not.

The analysis of the self-evaluation results shows that major differences occur first of all between the 1st and the 2nd year of the apprenticeship. In the 1st year, apprentices have difficulties undertaking directly productive jobs with the products they are working on. It is just too expensive when apprenticeship makes mistakes since they have not learned enough during the 1st year of the apprenticeship. But the apprentices in this case study reach much higher quality standards as their professional competence and independent learning and working increases. The apprentice in this highly innovative apprenticeship in this case study learns to carry out demanding work and learning tasks that support the development of autonomy. The result is a relatively fast growth of competence, along with higher occupational commitment as well as the achievement of higher levels of professional competence.

---

## Conclusions

The different cases show that good training companies developed a training structure which influences quality and efficiency apprenticeship. This is the way how the company can organize its apprenticeship, by, for example, allowing time for work task reflection and impact after completion. In the strong cases, this helped to maximize learning potential of work and learning processes for the apprentices. In the same occupational field, there are quite considerable differences between the various companies. It can be stated that the companies themselves are able to influence the learning quality of their apprenticeship. A key role plays the trainer and the co-trainer system which are in nearly all cases not on a full-time level but part-time trainers. High-quality apprenticeships do not only benefit apprentices but also it's worthwhile for the company in purely economic terms, while training cost can be somehow compensated.

*Informal learning based on reflecting on work experiences:* To enhance the innovative capabilities and building capacities of workers, it is important to start by learning from work experiences and this should be right from the beginning of an

apprenticeship. This means that from the beginning, the apprentices are motivated by real work and learning tasks (WLTs). Work and learning tasks are integral parts of the company's business processes, and they can increase in their difficulty: from beginner and advanced beginner to young and full professional expertise task (Havighurst 1972, Rauner and Haasler 2009, pp 25–37). As shown in the above described good practice case example, this is done by maximizing the learning time within the production. Learning for apprentices in learning workshops or training centers resides in a real work task and not in general learning task. But to create a learning climate, it is important for apprentices to be in the “middle of the action” and to take part in the business process. But to get this done, a kind or internal “road map for the apprentice” has to be developed by the company training management (Howe et al. 2001).

*There are different kinds of work and learning tasks for beginners, advanced beginners, and young experts:* The work and learning tasks have to be placed in a certain order; this means there are work and learning tasks for beginners, advanced beginners, and young experts. This means that the latter, the most difficult tasks, should not be at the beginning of the learning career of the apprentice. The principle for ordering the WLTs in a training package for the apprentice program (road map) is building on his prior knowledge. The collection of WLTs in a training plan therefore displays an increasing complexity. At the beginning there are more experiences which allow orientation; later more detailed work process knowledge is built (Rauner and Haasler 2009).

*Comprehensive work tasks with planning and preparation as well as assessment after work completed:* All work tasks to be picked up for the training package of the apprentice should be verified by the trainer to ensure that comprehensive work tasks are undertaken. This means that the apprentice learns to do the job in its operation but they also need to understand other quality assurance activities like planning the work and preparing and assessing the work done. The full documentation of the work task undertaken should be included. This also covers feedback on the work activities, whereby work steps are discussed with planners and engineers. The manufacturing of the products has to be discussed as openly as possible to see whether the quality of the product can be met or, if not, where the difficulties and hindrances lie (Deitmer and Ruth 2007).

*WLT as a part of the company's business process based on common quality standards:* The work and learning tasks must be arranged in a systematic order and not arbitrarily. For the trainer it is therefore important to consider which learning and work tasks are appropriate for the current status of the apprentice. In some company learning cases, it may be advisable for the trainer to plan a deeper investigation of his company. A questionnaire or an investigation grid with the most important aspects to be adhered to could be utilized. Such instruments turn a non-systematic visit by the trainer into a target-oriented investigation. It is therefore important to track down details at the workplace and to interview the other workers for further ideas. The most interesting points will be the verification of the work tasks for the apprentice. The trainer has to coordinate this kind of investigation with the company management in order for

these measures to be supported and to obtain the necessary financial backing. It must be underlined that all activities are about obtaining more information on work tasks.

*WLTs should force apprentices to cooperate with colleagues and departments:* The basic idea of a WLT concept is to develop complete units of working and learning that match the practical skill needs of work-specific tasks and which, although covering a complete task, build upon each other and in total cover the complete business processes (Howe et al. 2001). WLTs not only describe the object of the work, work methods, work instruments, and other requirements, but they should also look for learning through others and in cooperation with others. Therefore the social and cooperative situation in which the WLT is embedded is important. The apprentice may be encouraged to cooperate with other apprentices and with colleagues but also learn to talk with the design and construction department at an early stage. This can help to enrich his/her innovative capabilities so that he/she is able not only to undertake work but also to talk about work and the effects of work on the completion of the complex technical product.

Reflecting on QRC tool impact, there can be a positive statement to be received from all users of the instrument. Different levels of the quality of apprentice learning can be studied. This allows to direct and stimulate after the assessment is done perspective dialogue between company and external researcher or consultant on which of the quality criteria and dimensions are differently scored and why. The following discussion can be used to install an apprenticeship development debate within the company training organization. This process could have a new training arrangement in mind. Also the constructive review of less and well-developed spider delivers room for interpretation and discussion under training and co-training staff. In conclusion, the quality, return and cost tool (QRC) seems to be a good tool to make company decision-takers more receptive to a quality of training debate. This needs to be followed by other training quality improvements such as specific train-the-trainer measures.

**Abstract**

Vocational education and training (VET) is challenged to respond to a shifting work milieu, globally. In South Africa after apartheid, the current goal is to train more artisans to address growing inequality, high youth unemployment, critical shortages, and continued blockages to the production of quality intermediate-level skills, significant challenges within the national context. A particular concern is the need to train and retain more black and women artisans (Wildschut et al. 2015) to shift past patterns of discriminatory access and success. This makes recent critiques of a productivist approach to vocational education and training (VET) particularly significant in the South African context.

One response has been to draw on the capability approach of Sen (1992) and Nussbaum (2011) to argue for an approach to education and training that builds broad capabilities and human well-being, not only the skills immediately required for the workplace, and that this should be done in a way that is driven by social justice, equality, and human development concerns (see Part 2 of this volume). The capability approach rightfully shifts emphasis toward the role VET plays for individuals and communities. However, our research highlights that systemic, sectoral, firm, and occupational conditions shape the possibilities for individuals to truly enact capabilities within workplaces in significant ways. We cannot ignore the implications of these changing conditions if we aim to transform the development of VET skills and capabilities in a holistic manner.

The argument is built through reflecting on the case of intermediate-level skilling in the mechatronics function area in the automotive sector in South Africa, as an emerging economy. The growing use of technology in intermediate-level work requires different and higher-level knowledge, skills, and attributes than has been traditional for intermediate-level occupations. But boundaries in the workplace are maintained in such a way as to disadvantage the enactment of new capabilities especially for those from disadvantaged and poor backgrounds, women, and blacks. At the same time, the South African automotive sector is strongly governed by global production chains, which also tend to constrain the types of VET required from those employed in the sector.

The analysis raises a critical question for the global debate on the future of VET: with a multiplicity of factors that impact on both the development and enactment of intermediate-level skills and capabilities in workplaces, how can VET systems more effectively enable the development of holistic individual capabilities that support empowerment and agency?

## Introduction

Strengthening the outputs and outcomes from vocational education and training (VET) is increasingly recognized as critical to addressing inclusive economic and social development goals, globally (Unni 2016; Agrawal 2014; Aggarwal and Gaskov 2013; Nuwagaba 2012; Awogbenle and Iwuadmadi 2010; Khan et al. 2009; Kuruvilla and Chua 2000). There is a strong call that VET should play more than a narrow role in development, beyond the traditional vision of preparing young people with the right skills for the workplace.

Critics of the dominant productivist approach to VET argue that it is “. . . too short term in its focus on immediate employability rather than lifelong processes” (McGrath 2012: 625). Critiques are emerging in a range of country contexts (Lopez-Fogues 2016; McGrath 2012; McGrath and Powell 2016; Ngcwangu 2015; Balwanz and Ngcwangu 2016), stressing that the purpose of VET is greater than contributing to economic growth and national competitiveness. Rather, VET should develop the agency and human capabilities of individuals and communities to participate actively in all spheres of life, in a holistic manner, and to promote social justice (McGrath 2012; Powell 2012; McGrath and Powell 2016; Tikly 2012; Velde 2009). A related strand of research aims to understand how VET can contribute to sustainable development (Fien et al. 2008; Anderson 2009). The concept of human capabilities, by definition, stresses agency, and the opportunity to select and choose (Nussbaum 2011), which these scholars argue, should inform the role and nature of VET in future.

The capability approach rightfully shifts emphasis toward the role VET can play in the human development of individuals and communities, and its tenets have been useful to shift the discourse around VET, by emphasizing the mutuality and inclusiveness of capabilities across multiple domains (Anderson 2003: 4), not only toward the labor market. In an emerging economy like South Africa, with complex patterns of inequality that are resistant to change, the development of individual human capabilities through VET is particularly significant. As noted by Anderson (2008), as a principal site of subjectivity formation, and one that has been historically constituted by productivism, VET must reflect critically upon its own origins, assumptions, and purposes to adapt to its changing landscape and prepare its learners for alternative, post-productivist futures. Giroux (2012) likewise asserted the need for paradigms that oppose and supersede the “productivist” frameworks within which VET is currently located and has traditionally been evaluated. Productivist frameworks have tended to “underplay the wider economic and labour market contexts in which providers operate, focusing on the ‘failings’ of learners and colleges rather than those of employers and government . . . also displaying a methodological deafness to the voices of learners, lecturers and communities, instead assuming that employability was the only goal of VET” (Powell and McGrath 2014: 127).

However, we live in a world in which digital technological requirements are affecting and, sometimes, disrupting the nature of work dramatically. But while there is wide-scale acknowledgment that work change impacts on skills requirements (Christidis et al. 2002) actually, there is a very small and highly contested, empirical

evidence base showing how the skills demanded from individuals in particular occupations are actually affected in the workplace (Burke and Ng 2006; Burns 2007).

Our research in the South African context highlights how systemic, sectoral, firm, and occupational conditions shape the possibilities for individuals to enact human capabilities within workplaces in significant ways. We cannot ignore the implications of these changing conditions if VET aims to develop skills and capabilities in a holistic manner.

In this chapter, the value of understanding the complex and intertwined socio-economic challenges inherent to a specific work context is demonstrated, to frame further engagement on the ways in which VET can contribute. The heart of the chapter draws on a fresh analysis of a set of case studies on intermediate-level skills development and work in a single industrial sector, the South African automotive sector. The case studies were conducted for different purposes and used diverse conceptual frameworks, all as part of the Labour Market Intelligence Partnership (LMIP) (McGrath 2015; Garisch 2015; Garisch and Meyer 2015; Wildschut and Meyer 2016). Full details of the design and methodology are available online, in each case study report ([www.lmip.org.za](http://www.lmip.org.za)).

The chapter begins by exploring South Africa's position in the global automotive value chain and how mechatronics is seen as a critical function area toward maintaining and/or strengthening the current global position. Drawing on Lall (1992), we argue that developing technological capabilities at intermediate levels is as critical for technological upgrading and economic growth as it is at high-skills levels. This highlights the critical role of VET in building technological capabilities, particularly in work environments disrupted by intensive digitalization.

The section entitled “[Workplace Conditions Can Constrain the Contribution VET Can Make to Capability Building](#),” moves to the firm level, to explore expectations for growth, and changes to the organization of work that result from growing automation of production. The section entitled “[VET Needs to Ensure that Artisans Have a Wider Range of Capabilities to be Effective in the Current Automotive Workplace](#),” outlines the challenges for VET in terms of the capability development of mechatronics artisans, in this context. The section entitled “[Workplace Culture and Discourse](#),” adds another layer by illuminating how, despite changing expectations, the dynamics of workplace discourse, shaped by social inequalities, may constrain the enactment of individual capabilities at the intermediate level – with implications for the future role and nature of VET.

Drawing on these empirical insights, in the conclusion, we propose that VET needs to build individual technological and human capabilities in ways that allow for agency and navigation of the growing demands of the workplace, on a more equitable basis.

---

## **Mechatronics Artisans in Global and National Context**

In this section, the specific nature and challenges of the automotive sector in South Africa is considered, and then, the new field of mechatronics is explained.

The national automotive industry has its origins in an industrialization strategy based on import substitution, heavy industry, and the extension of the color bar (Gelb 1987; Barnes 2000, 2013). Since 1995, government faced the challenge of reintegrating the industry into international producer-dominated chains, at the same time as having to respond to new dynamics of globalization and liberalization (McGrath 2007) and to extend access and participation in long racialized systems of education and training, occupations, and professions (Mbatha et al. 2015; Bonnin and Ruggunan 2013).

### The Globally Disciplined Automotive Sector in South Africa

Figure 1 represents the current producer-driven automotive value chain diagrammatically: a collection of vehicle assemblers that operate with a string of upstream component manufacturers. The bulk of the value chain is currently made up of seven light vehicle assemblers (the Original Equipment Manufacturers or OEMs), with a primary production focus on passenger and light commercial vehicles. All OEMs are multinational corporations, and there is no domestic capacity for vehicle assembly. There are domestic component manufacturers alongside multinational firms, tiered according to their position: direct suppliers to OEMs are considered to be Tier 1s, while those that supply the Tier 1s are classified as Tier 2 or 3. Component manufacturers may also supply the automotive replacement market, either via an

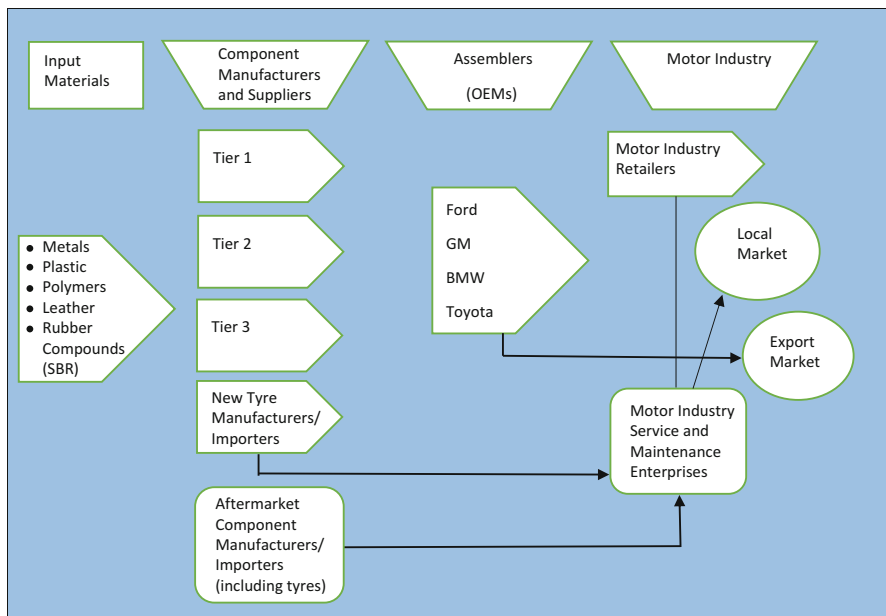

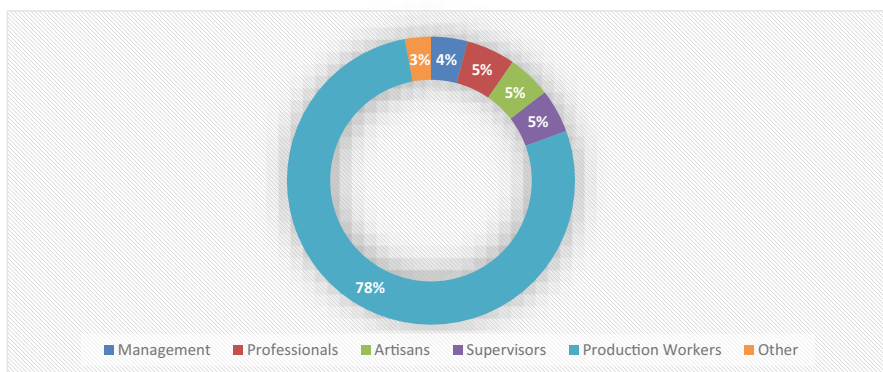

Fig. 1 Automotive value chain in South Africa. (Source: Garisch and Meyer (2015))

OEM's dealership network or the independent aftermarket, which is dominated by large wholesale groups (Garisch 2015).

The automotive sector is significant to the economy as a whole, being a major employer, and vital to trade strategy, with over 50% of its output exported (B&M Analysts 2013: 8). The bulk of employment is production workers at the semiskilled level, but with growing automation, the small group of artisans and technicians at the intermediate level play an increasingly significant role (Fig. 2).

The strongly structured value chain is dominated by the small group of OEMs, who are able to organize production at a global level and to discipline their suppliers to produce what, where, and when they demand. This implies severe constraints on the ability of national industrial and skills policies, or innovation systems, to influence production decisions (Sturgeon et al. 2008, 2009). South African factories are also subject to a degree of competition for output quotas with existing and potential sites in other emerging economies. Their relative position is based on their own productivity and competitiveness, but also considerations about size of local and regional markets, and proximity to major international markets (Kruss and Gastrow 2012; Gastrow and Lorentzen 2012). OEMs increasingly have concentrated their supply, forcing many local South African Tier 1s into partnerships or mergers with global Tier 1s, in order to survive and avoid the very real risk of being excluded from the value chain entirely.

However, some emerging countries have been able to grow their technological capabilities to engage proactively in automotive innovation, rather than only local routinized production to the benefit of the multinational companies (Nübler 2014; Lall 1992). As Lall (1992: 166) explains, "simply to gain mastery of a new technology requires skills, effort and investment by the receiving firm, and the extent of mastery achieved is uncertain and necessarily varies by firm." Such technological capabilities can secure local firms' place in the global value chain, and can grow jobs in the local economy, to alleviate poverty and inequality (Altenburg et al. 2008;

**Fig. 2** Breakdown of employment by category for South Africa 2012. (Source: B&M Analysts 2013: 33 from original data from the South African Automotive Benchmarking Club and the Automotive Industry Export Council)

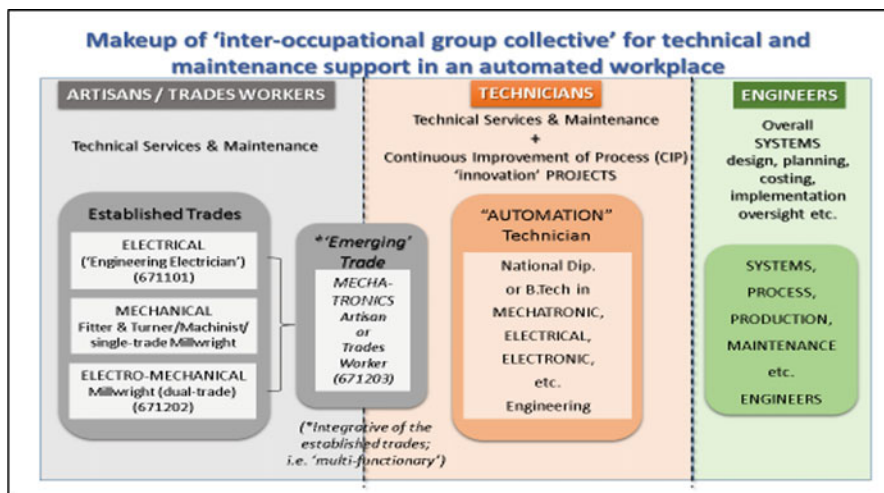

Dias et al. 2012). In an emerging economy like South Africa, therefore, a key developmental role is the extent to which the national VET system builds technological capabilities, to contribute to shifting an industrial sector’s current unfavorable position within the global production chain (Gastrow and Kruss 2012).

### **Mechatronics as a Field of Practice Critical to Sustaining the Automotive Sector’s Global Position**

Mechatronics is at the forefront of global automotive design, manufacturing, and production processes and, hence, is one of the critical competences required to sustain and grow the position of the South African industry (MerSETA SSP 2011). It encompasses electrical, mechanical, control, and computer engineering skills across a range of traditionally distinct disciplines.

Engineering professionals, technicians, and artisans are the current mechatronics functionaries, although, until recently, they were trained as generalists. Figure 3 illustrates the collective mechatronic support team that characterizes most automotive firms today.

A dedicated mechatronics qualification at the vocational skills level was recently instituted (see Table 1), along with recognition as an artisanal trade (DHET 2012). These effectively formalized opportunities to practice mechatronics skills at intermediate levels. Whereas artisans are the hands-on functionaries who keep the production line running, the tasks of technicians are essentially digital information processing-oriented, while engineers are responsible for overall systems development and management. The intermediate-level work required in the mechatronics

Mechatronics systems	Mechatronics systems	Mechatronics systems

Source: Garisch and Meyer 2015

field typically deals with maintenance and process modifications of the mechatronics systems that require automation and less directly with automated production itself.

Locally, public technical vocational education and training (TVET) colleges have become the focal point for the delivery of intermediate-level skills. Increased funding support is channeled into improving the capacity of the system to deliver on its mandate, both in terms of human resources and capital upgrading (DHET 2013). Fundamental challenges remain endemic across the system: often outdated training curricula, weak lecturer capacity, poor access to appropriate and up-to-date equipment, and machinery and training facilities that lag behind production and technological changes in the workplace (Akoojee et al. 2005; McGrath 2004; Kraak et al. 2016; Buthelezi 2018).

For an individual, in the context of very high unemployment rates, gaining a VET qualification to access employment may be highly significant. However, the challenge for the VET system is to build individual human capabilities so that those who complete a mechatronics qualification at intermediate level are also able to make work, occupational, and career choices in a rapidly changing workplace. In the automotive sector, mechatronics artisans with the technological skills and capabilities to contribute to productivity and process innovation in the workplace are also critical to sectoral attempts to retain and enhance the local industry's position in the global production chain.

The following sections present evidence on changes and continuities in automotive workplaces to begin to identify the specific challenges for the VET system in South Africa and for the enactment of individual capabilities of mechatronics artisans.

---

## **Workplace Conditions Can Constrain the Contribution VET Can Make to Capability Building**

This section draws on the empirical studies (McGrath 2015; Garisch 2015; Garisch and Meyer 2015), focusing on how changing conditions in the workplace may impact on what is required from VET, in relation to two dimensions. First, company trends, and how automotive firms articulate their skills needs, are considered. Second, the focus shifts to changes to the organization of work and how this creates specific intermediate skills needs.

**Table 2** Senior management views on trends in employment

Trends in employment	Engineering (mechatronics)			
	“Medium or large”		“Small”	
	At present	In the future	At present	In the future
Subcontracting	1	1	0	0
Outsourcing	3	2	1	1
Centralization	1	1	0	0
Casualization of work	2	1	0	0
Temporary contracts	1	0	0	0

Source: Garisch (2015)

### Company Trends and Expectations

Firm expectations for growth and change shape their training climate and, also, their relationship with outside training providers. The research finds that firms highlight the dictates of the global economic climate as the single most important factor impacting on future business growth, followed by market volatility and shifts, with smaller, privately owned firms perceiving themselves as more vulnerable to these factors than larger firms. Technological advances in work organization, ecological and environmental footprints, and training opportunities for workforce development are not deemed significant factors likely to affect growth (Gamble 2016). It could be that factors such as improvements in production efficiency are perceived to be easier for firms to control, than external economic forces, given the strongly disciplined automotive production chain.

New, less permanent forms of work in specific function areas were found to be a significant and growing trend across all firms included in the study, but mostly in larger firms (Garisch 2015) (Table 2). For example, installation of new equipment is often done by external contractors, or maintenance support can be privatized. Employment trends such as subcontracting, outsourcing, decentralization, casualization of work, temporary contracts, and seasonal work fluctuations will not only affect employment flows. They have clear implications for firms’ motivation to invest in education and training of current staff and prospective entrants.

McGrath (2015), reflecting on Tier 1 firms’ perceptions of skills needs, found low labor force attrition, limited recruitment targeting very specific skills needs, and a tendency to upskill internally. These employment practices do not reflect a strategic vision for technological capability building. They can lead to low demand for new VET qualifications, which, in time, can become a constraint on technological capability building.

### Organization of Mechatronics Work

Technological change did not impact strongly on firms’ expectations of future business growth and forms of employment, but it was perceived to impact extensively on the organization of work at the intermediate level. Specifically, changes arose from the

impact of automation of production, equipment, and processes. The most salient features of these developments include computer-based technologies like human-machine interfaces (HMIs), programmable logic controllers (PLCs), and supervisory control and data acquisition (SCADA) systems and networks in relation to both the automatic control of electromechanical systems and capturing performance data of equipment and processes. As indicated by one respondent:

Basically, all your companies these days are going the automation route . . . everything has gone more software/hardware-based . . . interlinked or integrated. You're getting a lot of PLC computer-based integration with your hardware components and stuff that you're running on your production line . . . (*Technologies Trainer, OEM*)

More functions are driven by ICT platforms, which are predicted to “become increasingly clever” in the future, and so the organization of work is viewed as having become more complex and sophisticated. There was broad agreement across all firms (with some differences by size of firm) that there has been an increase in the level and breadth of the knowledge and skill required from those in the technical and maintenance support functions. The spread of sophisticated automation has given rise to the *need for increased maintenance and manufacturing engineering expertise* to support automated production.

With a growing focus on data processing and analysis, and programming-related aspects in support of CIP, respondents agreed that it is important for artisans to have a grounded understanding of the workings of equipment. This ensures that a modified process, or even a whole system, is not made to run on false assumptions, with potentially disastrous consequences. Strong and up-to-date technological capabilities are of critical importance to assist artisan-level functionaries to adapt to the shift to systems-driven production processes. For example, they may have to contextualize a vibration problem on a machine within the context of the total system. Also, root-cause analysis involves extensive reliance on the *digital analysis* of equipment and process performance *data* using specialized statistical software tools. That is over and above routine process monitoring and fault detection by computerized means (such as error codes on the PLC or running a diagnostics program from a laptop or iPad).

In addition to the demand for more holistic system-level *thinking* capabilities and associated *higher-order analytical capacity*, the types of skills required from mechatronics artisans are also affected by the ways in which firms and departments organize mechatronics work and the level or extent of workplace automation across departments or plants. By all accounts and based on actual observation, these manifestations of automation are most pronounced in body and paint shops. Conversely, intermediate-level work at assembly plants was least affected, as work processes will always involve manual operations (Garisch and Meyer 2015). McGrath's (2015) research similarly provides evidence of limited impact on some intermediate-level work, depending on firm size and different departments within an automotive firm. Some Tier 1 firms – particularly the more routinized metal-working elements of the domestic segment – asserted that the nature of technological change does not result in radical changes in artisanal skills requirements:

Motor companies will come to us to say we have a new requirement/specification. We then align with licensor who will give us the initial technology . . . The licensing agreement will tell you exactly where to get the machines from. . . . Once a polymer technologist knows theory, when you get a new recipe, he knows what to do . . . same old stuff; different colour. (*Manager, Tier 1 firm*)

The impact of such changes on workplace organization, and on the nature of work, holds profound implications for the knowledge, skills, and overall competence requirements for artisans to function effectively and successfully. They are now required to install, repair, service, and maintain production machinery and equipment controlled by computer-based or intelligent systems. The pace of change and extreme variation in the intermediate-level mechatronics skills requirements means that many firms opt for in-house training to ensure better alignment with their needs, rather than formal VET qualifications.

A strong trend observed in the automotive assembly companies where automation of production lines has taken root was the emergence of a distinctive mechatronics systems support function rendered by teams. Such teams generally included a troika of functionaries drawn from the electrical, mechanical, and automation fields that collectively underpin the disciplinary and skills base of mechatronics. The electrical and mechanical functionaries are typically traditional artisans who have been upskilled internally to meet the systems-level operational expertise required, usually through one of the two means: (1) self-driven or initiated on-job learning through curiosity or (2) attending specialist or advanced education through in-house training centers or at parent companies (Garisch and Meyer 2015).

At the same time, compliance with international technical standards and safety regulations, as well as in-house quality assurance systems, contributes toward the growing proceduralization of the local work of artisans and technicians. This includes the work of fault detection and problem-solving in the mechatronics field of practice. Overall, technical functionaries are compelled to adhere to formalized task descriptions. Only when such prescripts fail to deliver solutions can creative problem-solving be employed. Incidentally, it is often claimed that newer-generation artisans, conditioned by a culture of procedural compliance, often lack creative and analytical thinking capacity.

What are the implications of the competitive pressures automotive firms experience, and of the changes to the workplace that accompany automation, for the role and nature of VET? The next section demonstrates the wide range of capabilities VET needs to develop in mechatronics artisans.

---

## **VET Needs to Ensure that Artisans Have a Wider Range of Capabilities to Be Effective in the Current Automotive Workplace**

Firm respondents were unequivocal in their views that for artisans to be effective in such a changing work environment in the automotive sector, their capabilities – the knowledge, skills, and dispositional sets – need to be extended and more holistic, so that they can exercise choice and agency. As one respondent indicated:

the type of person or artisan that we need in that type of [automation] environment is a person that is multi-functional – whether it's robotics or systems, mechanical, electrical or whatever . . . (*Engineer, OEM*)

This section summarizes key changes to intermediate-level skills requirements in the workplace, identified through the empirical research on changes to firms' expectations and the organization of work.

### **Artisans Must Employ Planning, Organizing, Management, and Administrative Skills**

Work schedules are usually developed by maintenance planning engineers. While supervisors carry the responsibility for the allocation and coordination of tasks, it is ultimately up to the individual artisan to plan and organize his/her work. Of critical importance is the timely identification and procurement of the parts required for maintenance jobs and, similarly, the reordering of parts for those replaced in breakdown situations. These practices stand in stark contrast to the old-school era, in which artisans simply arrived at the breakdown scene with their toolbox and walked away upon completion of the repair job, with all administration-related aspects being left to the supervisor and engineer for processing.

Management responsibilities have traditionally been considered a function performed only by professionals, but this has shifted dramatically in the last few decades. Artisans and technicians are increasingly called upon to perform and be responsible for certain managerial functions. For example, if a breakdown occurs and lasts for more than the allocated time (in some cases no more than 10–15 min), a report must be drafted and presented to the management. Artisans in automotive firms are increasingly responsible for procurement, planning, organizing, leading teams, and reporting to line management.

Greater administrative capabilities are also required from present-day artisans. Such “additional” responsibilities include compiling and presenting breakdown reports (in a team context) as well as handover reports upon completion of shifts. Older artisans reportedly found administrative tasks to be severely challenging. In this changing work environment, artisans are required to take greater ownership for preparation and post-task administrative responsibilities, which necessitates higher levels of organizational competence. The narrative of this artisan respondent illustrates the trend:

Production pressures sometimes force you to lose sense of how to organise and then you might get into trouble with your safety or injure yourself and whatever, but if you get your organisational skills right and you start planning, okay. (*Artisan, OEM*)

Another respondent highlighted the administrative shift required as work becomes more procedural: “whatever you are doing you have to do procedurally, for example . . . that has to be in the log . . . they must be able to trace every step back . . .” (*Artisan, OEM*).

## Artisans Must Possess a High Level of Computer Literacy, Research Skills, and Dispositional Attributes

In the past, artisans mainly required basic levels of computer literacy, but increasingly, much higher levels are required for intermediate-level work:

I will plug in my laptop, do diagnostics – where is the problem? What needs to be replaced - things like that. I also make slight programme changes on PLCs, modify present operations, HMIs [human machine interface systems], setting your drives . . . and maintain those things . . . (*Artisan, OEM*)

Another respondent concurred, “your basic electrician does not cut it anymore because he now also has to service your robot . . . he has to understand basic PLCs and programming because all of the jigs and fixtures are nowadays running off PLCs” (*Engineer, OEM*).

The increased expectation that artisans should be aware of, and be able to analyze, different technologies, and engage with abstract knowledge, is widely shared. An artisan respondent reflected on the new technological capabilities required “if, in my work, I read about something or somebody comes . . . with a new product or a new type of machine, I have to research it and evaluate it . . . can it work or can it not work and if it makes sense . . .” (*Artisan, OEM*). Other respondents confirmed the growing intellectual work “. . . they [artisans] need to be able to read a little bit more . . . it’s no longer about you working with your hands, it’s also more about reading papers about different technologies . . . to understand what is happening in those areas” (*HR professional, Tier 1*). Mechatronics technicians and trades workers are increasingly required to conduct *research* in relation to specialized information, with the main research areas being technology and programming updates, and properties of materials. As indicated by another HR professional, reflecting on the entry of mechatronics apprentices and artisans to their firm, “that’s why we changed our entry requirements and made it to a higher level just to make sure that we got people who . . . are analytical thinkers” (*HR professional OEM*).

In addition to high levels of research capacity and increased systems-level thinking capacities, a set of aptitudes and dispositional attributes were outlined as crucial for present-day artisans. The following attributes were the most highly rated for mechatronics artisans: passionate interest in mechanical equipment, such as robotic equipment and technologies and a natural curiosity to know how it all works; ability to think creatively, identify, and solve problems; being good at physics and mathematics; ability to integrate different knowledge types (e.g., conceptual vs situated knowledge) and across disciplines; willingness; and being self-driven, showing commitment and determination to work until the job is done and doing the best possible, even with small jobs (Garisch and Meyer 2015).

Across all automotive firms, there are increased instances of employees in different occupational groups required to work more closely with each other, in multidisciplinary teams. Teamwork is a notable trend in the world of work and an essential feature of plant work globally. Hence, increasing emphasis is placed on the importance of interpersonal communication skills and capabilities for artisans.

In sum, respondents highlight that to become a “true” artisan in the automotive sector context, one must develop a comprehensive understanding of the overall production process, intimate knowledge of equipment and components, technologies, and interlinking systems, as well as the appropriate hand skills, dexterity, and experience to cope with and resolve major breakdowns as part of a team.

---

## Workplace Culture and Discourse

Thus far, we have analyzed the changing knowledge, skills, and dispositional capabilities that artisans need to develop to be effective in the workplace. Two further intertwined dimensions have implications for the nature and role of VET in the South African context. That is the focus of this section, to demonstrate how workplace cultures and workplace discourses can constrain how mechatronics artisans are able to enact their capabilities.

In theory, the trend toward growing use of technology and the need for increased mechatronics teamwork should result in less hierarchical organizational structures and increased inter-occupational interaction. Another expectation is that occupational descriptions or titles will become less significant in setting the parameters of work and engagements within workplaces. There is an established literature (Burns 2007; Muzio and Kirkpatrick 2011) suggesting that organizations have become the major site and normative location of where the bulk of work takes place, so much so that it has led to the conflation of occupations and organizations in many instances. Equally convincing are those authors arguing for the decreasing relevance of occupational belonging to an individuals’ conception of self. Strangleman (2012) argues that work was once absolutely central to individuals and groups as a whole. People carved out meaning and identity and would be socialized into and through employment in an occupation. But this has now been largely eroded through shifts in the nature of work, such as new organizational systems, technological advancements, as well as rigid organizational cultures. Such perspectives have led to the argument that, much more so than was the case in the past, it is the organization that regulates the behavior of individual members, rather than the occupational or professional grouping that an individual belongs to.

In practice, the research found occupational description remained very important for delineating the scopes of artisanal work and its relation to other occupational scopes of work. This led to new mechatronics functionaries at the intermediate level facing resistance and contestation in their attempts to enact their skills and capabilities in the work setting.

To take the example of teamwork. Teamwork is increasingly deemed necessary for optimal plant functioning. It is expected to offer excellent situations for positive experiences, knowledge transfer between different occupational groups, and successful navigation of social boundaries. In more instances than not, actual mechatronics teamwork was characterized by the reassertion of boundaries between occupational groups, often sparked by conflict. Breakdowns become key sites of contestation, where it is common place for artisans, technicians, or engineers to

indicate – “this is not my work.” The constraints on artisans enacting new capabilities were evident in this typical comment: “I’m a technician, I’m not going to take that motor out because that’s a job for an artisan” (*Technician, Tier 1*).

The strict protocols for problem escalation and the hierarchy involved in the day-to-day planning and scheduling of tasks appear to create spaces that strengthen boundaries, because tasks are determined in relation to the traditional responsibilities of artisans, technicians, or engineers. When conflict arose over the responsibility for work tasks such as fault-finding and fixing, lower status mechatronics tasks were always assigned to the artisans. It seems that closer working relationships illuminate potential overlap in tasks and responsibilities, which result in ongoing reaffirmation of status and position.

Furthermore, in great part due to the history of South Africa, the research shows that occupational boundaries are typically inscribed with social differences. Occupational boundaries between artisans, technicians, and engineers are maintained and contested in automotive workplaces, reflecting deep-rooted racial, gender, and language inequalities (Wildschut and Meyer 2016, 2017). For example, one respondent, referring to why there are not more women in mechatronics, asserted that “they’re probably not interested in manual labour” (*Trainer, OEM*). Another respondent highlighted how workplace perceptions are linked to race and age, “white artisans are inclined to stay at the plant and are loyal” (*HR Professional, Tier 1*).

These dynamics not only affect the enactment of capabilities but also the acquisition of VET skills, as central to artisanal training is a close mentoring and supervisory role played by a qualified artisan through an apprenticeship program. In this regard, for example, one respondent describes the language dynamic that might arise between an artisan and their apprentice:

we have a country full of diversity so sometimes things you say in Afrikaans . . . this guy maybe he is Xhosa he doesn’t understand Afrikaans . . . So communication is coming in the in between language, English . . . I’m fortunate I know a bit of Sotho and Tswana so I can communicate well. (MinCase)

Another respondent acknowledges the language dynamic and is aware that being able to speak “their language” puts him in a position of advantage. Brockmann’s research (2010, 66) similarly highlighted the centrality of the “social norms and values of occupations and pathways, governing ideas of how apprentices are expected to behave and what and how they are expected to learn.” Here the implication of historical language values impacts on African apprentices who do not speak the language well. Another respondent reflects on an incident where he asked the supervisor to explain a concept and the supervisor responded in Afrikaans, saying “los maar” (leave it!). The question was more related to the fact that the apprentice did not understand Afrikaans that well, rather than the inability to grasp the concept. Consequently, the whole interaction made the apprentice feel incompetent. This aligns with the work of Trice (1993, 26) who demonstrates that occupations establish “rigorous socialization experiences underscoring that the knowledge, skills and abilities are not easily learnt by just anyone and that they require a special learning experience and a special person to grasp them.”

In South Africa, a range of descriptors of social difference can intertwine to affect true access to artisanal training and employment. In this case, the extent to which individuals can become “true” mechatronics artisans is negatively affected by social difference.

VET therefore needs to ensure that the *capabilities that matter* to individuals are developed in such a way that they are empowered to enact them in the workplace. Artisans need to develop not only a wider set of technological and non-technological capabilities as discussed in the previous section. They require a set of human capabilities that can support increased agency to judge when and how to navigate occupational boundaries, so that they can play a proactive role in the workplace. In the case of mechatronics artisans, the capabilities required to navigate social boundaries within the workplace are becoming a critical skill that the VET system of the future needs to facilitate.

---

## Conclusion

The study highlights a set of critical points as we think toward VET of the future. Firstly, it shows how sectors and firm contexts shape the types and scope of capabilities required by intermediate-level workers in significant ways. Secondly, in contrast to expectations, we find the notion of occupation remains important for describing intermediate-level work within this specific field of practice. Lastly, we find that social difference remains a fundamental basis upon which occupational description is discursively maintained, given the historical context of South Africa.

In the 2009 version of this volume, Maclean and Wilson (2009: lxxviii) stated that VET has had to respond to “changes in demand over time for skills and technologies used in workplaces, the globalisation of production, the increasing utilisation of information and communication technologies (ICTs) and related matters.” We are of the view that our research contributes to add substance to understanding the way these dynamics are unfolding in emerging economies, illustrating the complex intersecting dynamics that impact on the required VET systems in future.

A range of “other” influences and important considerations were also outlined through our findings. Company strategies, workplace organization, workplace cultures, and occupational boundaries can nuance the requirements for skills development to such an extent that VET needs to change significantly. Developing capabilities such as critical thinking, agency, and empowerment is typically proposed to promote individual freedoms. Our research suggests that these “other” capabilities are equally critical for developing the artisans of the future: individuals who are able to enact the capabilities required to navigate complex workplaces and constantly changing technologies.

The evidence presented in this chapter emphasizes that systemic, sectoral, and workplace conditions cannot be ignored in moving toward VET that capacitates individuals to respond better to the changing world of work and their social reality. Thus, while HCT has been useful to shift emphasis to individuals and communities, the workplace remains a critical site of evaluation.

The evidence also underscores the social nature of work and the importance of understanding this, as we engage toward VET systems in the future (Vallas 2001). In this regard, research on the economic and social relations of work (Greckhamer 2011; Weeden 2002; Kalleberg 2009; Griffiths and Lambert 2011) could usefully contribute to further theoretical engagement around the role of VET in developing capabilities required for contemporary workplaces. The South African evidence shared in this chapter reminds us that we cannot ignore the role of class categories and discourses within workplaces. These dynamics have the potential to powerfully mediate economic and political benefits (Burger et al. 2015), and so if we want to transform inequalities and capacitate individuals and firms, VET has to understand and confront such issues.

## Abstract

Migration is increasingly being seen as a political challenge and, thus, a policy priority. Yet the integration of migrants into labor markets is a key element of the political contestations of migration. On the one hand, successful labor market integration offers the promises of wider integration into society and the prospect of

migrants being net financial contributors to the host economy; on the other, xenophobia often centers on the notion of migrants “taking our jobs.” Clearly, these wider issues cannot be solved simply through TVET. The reasons for migration, immigration law, and overall labor market structure lie outside TVET’s sphere of control. Nonetheless, TVET can and does play a role in managing migration.

Conventionally, this has been largely a systemic response, focusing primarily on qualifications and certification. These do have an important role to play, but we have learned over time the limitations and costs of such approaches. In particular, opinions of employers and educational institutions regarding comparability of qualifications have proved resistant to messages of portability. We suggest that there is a need to look beneath the system level at how institutions, classrooms, and teachers can become more responsive to migration. Key issues here include language and psychosocial learning, as well as information, advice, and guidance. Migration can change classrooms and learning for the better, but vocational providers and teachers need support in capitalizing on the opportunities available.

## Introduction

Migration is a central facet of human history. It has played a crucial role in who we all are today. At a personal level, all four coauthors of this chapter have been migrants. While migration is a feature of human development across the ages, there is currently an arguably unprecedented level of movement of people for a range of reasons. Because the people who are moving are predominantly of working age, there are particular effects of migration on the labor market in both sending and recipient countries and increasingly in transit countries too. While many migrations exist beneath popular and policy gaze, large and sudden migrations are often associated with xenophobic reactions in recipient countries and become problems of politics and social policy. Significant attention is now focused on how best to integrate migrants into the labor market. Another policy response to this is to try to limit future migrations by focusing on reducing some of the push factors. While out-migrations are not usually a major policy tool of countries, more than a century of large-scale migration from the Philippines and decades of outflows from South Asia and parts of Eastern Europe have sensitized governments to the possibilities provided by remittances. Thus, there has been increasing management of such movements, including the eventual return of migrants to their native countries.

TVET has been widely identified as part of the policy toolkit for managing migration. This is the subject of this chapter. After briefly describing some of the current trends and highlighting the various types of migrants, we turn to consider skills and migration. This discussion will be at three levels. First is the extra-systemic. While TVET can play a role in responses to migration, its role is limited and matters of political economy loom large. These include questions of labor

market structure, and immigration policy. Second, we look at the systemic level, in particular issues around qualifications and certification, where much of the TVET and migration debate has been focused. Third, we consider the level of colleges, teachers, and learners, with a specific focus on what migrants need to learn and how this can be supported. Although we touch briefly on issues in sending and transit countries, our focus here is mainly on recipient countries. However, throughout our discussion it is vital to remember that TVET and migration is not a simple technical issue but is currently a highly contentious matter of public policy where policy drivers lie outside the control of sector specialists.

---

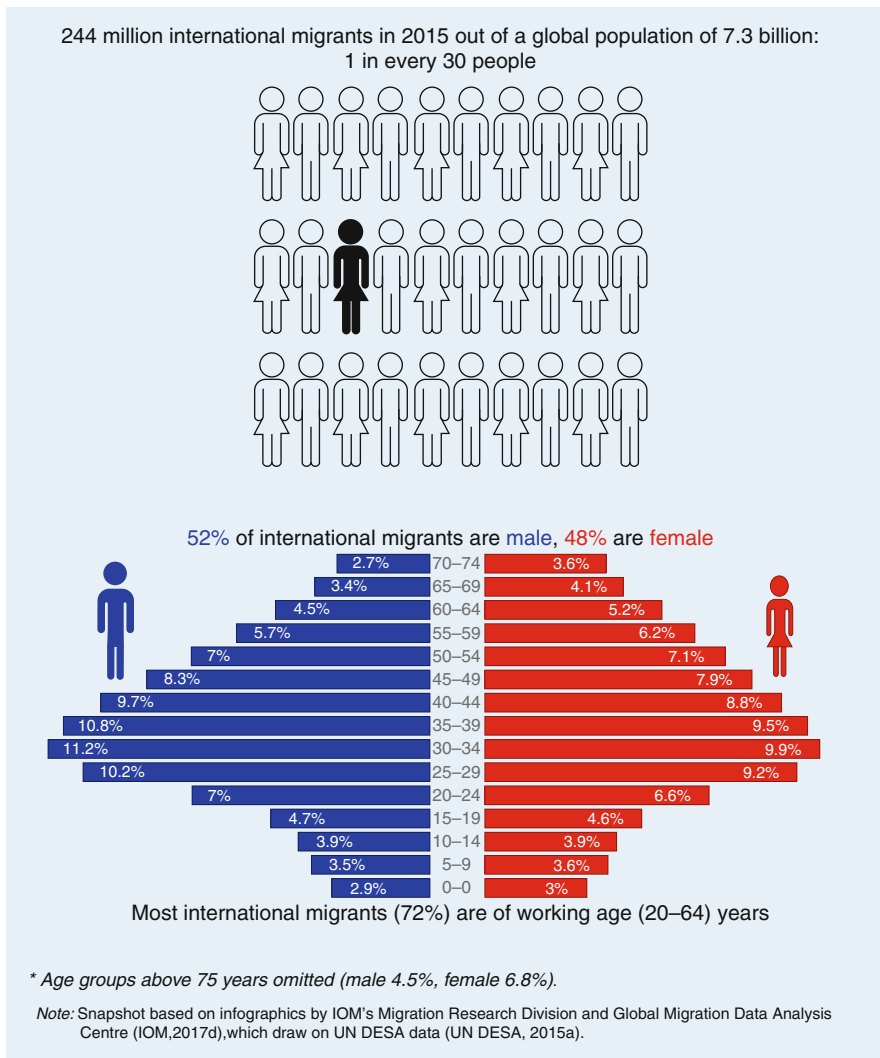

## Migration

Migration is increasingly becoming a controversial topic and high on the global policy agenda. Media-fuelled hostility toward migration is more visible in advanced economies than a decade ago. Politicians are using migration to shift electoral debates. Alleged threats to state security, austerity, and concerns about labor market integration, especially for refugees and asylum seekers, have dominated the anti-immigration rhetoric.

However, migration is not just on the agenda because of the rise of xenophobia in certain settings. The stock of international migrants rose to 258 million in 2017, compared to about 150 million in 1990 (International Organisation for Migration 2017). This stock comprises refugees and asylum seekers, and labor migrants and their families, with those moving for labor migration being roughly twice as numerous as the former categories combined. This large increase in the number of international migrants has attracted the attention of the global community, although it represents only 3.3% of total global population (*ibid.*) (Fig. 1).

Migration is a complex and multi-causal phenomenon. The decision to migrate places migrants in two main categories, namely, forced migration and voluntary migration, although these categories are best understood as two ends of a spectrum. The former includes irregular migrants, environmental migrants, refugees, and asylum seekers, while the latter consists of labor migrants and leisure migrants such as retirees. Recognizing the diversity of the types of migrants is intrinsic to discussing the current trends and challenges of migration. Labor migrants are often further divided into two major types, namely, highly skilled, which includes health professionals, engineers, and other professional occupations, and low-skilled migrants, such as domestic and construction workers.

While some countries afford migrant workers the same rights as citizens, others explicitly discriminate against them, rendering them more vulnerable to indecent work and, at worst, modern slavery. In settings where the informal economy predominates, they may find themselves subject to the worst labor conditions, but may also flourish freed from state regulation and supported by diasporic networks. Many OECD countries now implement increasingly selective criteria favoring highly skilled migrants with skills that are in short supply (UN 2013). In contrast, in the Middle East, the percentage of low-skilled domestic and construction workers within labor migrants is estimated at 95% in Gulf Cooperation Council (GCC) countries (International Labour Migration *n.d.*). Many such workers are considered victims of

**Fig. 1** International migrants out of the 2015 global population. (Source: IOM 2017)

forced labor migration (ibid.). These migrant workers are paid low wages and often live in work camps in remote locations with restrictions on bringing family members (Humphrey et al. 1991).

A distinction between asylum seekers and refugees is essential. While asylum seekers and refugees are often mentioned alongside each other, both statuses offer individuals different sets of rights. Asylum seekers are those waiting for a decision to be legally identified as refugees (United Nations High Commissioner for Refugees 2015). It is estimated that the number of asylum seekers pending decision is 2.8 million worldwide (United Nations High Commissioner for Refugees 2017).

The average waiting time for a decision on an asylum claim varies from one country to another. For example, in the UK, more than 50% of asylum claimants wait more than 6 months for a decision. This is important, as during the waiting period asylum seekers have no access to education, training, or the labor market (Doyle and O'Toole 2013). Similarly, in Ireland and Lithuania, asylum seekers have no access to the labor market at all until they can be granted a refugee status (European Employment Policy Observatory 2016), while in Kenya asylum seekers are interred in camps and have no access to the labor market. In contrast, Greece, Portugal, and South Africa grant asylum seekers the right to work as soon as they claim asylum. In Germany, those awaiting a decision are guaranteed 3 years leave to remain while in training and a further 2 years post-training (Diehl 2018). This reflects a deliberate legal change designed to encourage employers to take on immigrant trainees.

Refugees, on the other hand, are internationally defined, and their legal rights and the state's obligation toward them are explicit, even if not fully honored. The number of recognized refugees has increased by an estimated 65% in the last 5 years (United Nations High Commissioner for Refugees 2017). In Europe, refugees have full legal access to the labor market and vocational training, which is promoted as the best method of integration (European Council on Refugees and Exiles 2011). Nonetheless, challenges for refugees in the European labor market go beyond work permits, as we will show below.

A large proportion of refugees reside in developing and middle-income countries. In countries such as Turkey and Jordan, where the number of refugees is particularly high, access to the labor market is still practically restricted by limited number of work permits for refugees (Lenner and Turner 2018; Takahashi et al. 2018).

---

## Beyond the TVET System

In trying to define the different statuses of distinct migrant groups, we have already touched upon how the combination of immigration and employment laws and policies affects migrants. More general issues of labor market structure are also central to migrants' integration into host societies and economies and how much TVET can do to facilitate this.

Historical accounts show that migrants have always been an important source of labor for host countries, filling positions that are unattractive to citizens (Doomernik and Bruquetas-Callejo 2016). At different periods, both economically and politically, migrant movement is either encouraged or curtailed through immigration policy (van Mol and de Valk 2016). While their contribution to the growth of some sectors in host countries cannot be ignored, migrants are often the subject of debate in trough periods. Recent examples include the negative immigration discourse around Brexit and the increasing popularity of far-right leaders in Europe as well as anti-immigration policies in the USA, Australia, and South Africa. On the other hand, migration policy is used by high-income countries to attract high-skilled labor in sectors such as health and information technology. For instance, in 2013,

56% of STEM workers and 70% of software engineers in Silicon Valley were foreign-born (Kerr et al. 2016: 4).

In spite of migrants' contributions to host countries, their impact on labor markets is often perceived negatively by the public, particularly when the general political atmosphere is toxic. Such perceptions have led to studies conducted to ascertain the actual labor market effects of immigration. A meta-analysis by Longhi et al. (2010) concludes that immigrants' average impact on residents' wages and employment is very small. They suggest that effects are dependent on comparative skills levels of the two populations.

Migration is not just an issue for recipient countries. The issue of "brain drain" has attracted considerable attention. Emigration necessarily has effects in the sending economy. The conventional argument was that the emigration of skilled workers from less developed countries was a major brake on national economic development (e.g., Bhagwati and Hamada 1974). Particular attention has been paid to health and education workers, in light of both the costs of training and the well-documented place that both have in economic and social development (e.g., Bodnár and Szabó 2014). Moreover, there are concerns that remittances may reduce the incentives for other family members to participate in the labor market (see Vadean et al. 2017). However, there is counterevidence that several of the most prominent sending countries are exporting low-skill labor, that the remittances generated outstrip any losses to the domestic economy due to wage differentials, and that returnees contribute to upskilling and improved productivity. There is evidence too that higher-skill migration may not be so negative, resulting in "brain circulation" rather than "brain drain" (Morgan et al. 2006; Varma and Kapur 2013). Indeed, some countries specialize in training skilled labor for export, due to the perceived benefit to be gained from remittances or return migration. Examples include the Philippines and Pakistan's export of health professionals (Dodani and LaPorte 2005; Hartmann 2008). This point is buttressed by the fact that in 2015, remittances to developing countries reached about \$429 billion, exceeding the amount of ODA in the same year (Ratha et al. 2014). In the most extreme example, that of Lesotho, remittances exceeded GDP for more than a decade after 1982 (World Bank 2018). However, the positive effects on the labor market can only be reaped where migrants worked in positions commensurate with their skills at the time of departure or improved their skill set through training or further education abroad. This means that for migrants who worked in low-skilled jobs due to the poor recognition of their skills or skills mismatch, return migration will not benefit their origin countries maximally. Remittances will also be affected by such barriers (Bodnár and Szabó 2014). The recognition of migrants' skills and qualifications is therefore central to gains in migration. This will be discussed later in this chapter.

A third category of country has begun to be talked about more in the very recent past: transit countries. With the large flows of migrants into Europe, countries around the edges of the Mediterranean have found themselves hosting increasing numbers of migrants who intend to move on to Northwest Europe. Similar patterns can be found elsewhere, as on the Latin American migration routes to North America and in certain sub-Saharan migration hubs. Clearly the influx of a population that is

supposedly transient but which may in fact be sedentary for the medium to long term brings a whole set of new dynamics for labor markets, for TVET systems, and for social policy more broadly. Migrants in transit countries may try to avoid the state and its agents, fearing repatriation, and so are unlikely to enter formal TVET. However, they are likely to access the labor market. This is necessary to raise income to move forward in their journeys but is typically characterized by illegality and informality, making them particularly vulnerable to indecent forms of work.

What TVET can do to support migration and immigrant labor market insertion inevitably is highly dependent on overall labor market structures and specific approaches and attitudes to migrant labor market participation (Beicht and Walden 2017; Friberg and Midtbøen 2017). We will illustrate this with three brief examples.

Ghana is typical of African countries in having a large informal economy. Historically, this has been the major labor market destination of immigrants, reflecting the lack of regulation and the ease of entry and exit (Callebert 2016). A large number of Nigerians were working in Ghana in the first decade of independence. Eventually, this led to a xenophobic reaction, and the 1969 “Aliens Compliance Order” resulted in the expulsion of about 200,000 West African migrants, mainly Nigerians (Kobo 2010). There are no contemporary figures for the number of migrants in the informal economy, but it appears that there are significant numbers, facilitated by their own diasporic networks (Meagher 2013).

Jordan, like other countries neighboring Palestine, has had more than 70 years of experience of large numbers of Palestinian refugees. While much has been done to support this population, there has been a strong political view that problems of Jordanian unemployment mean that locals should have priority in the labor market. More recently, Jordan has experienced a new wave of refugee migration, this time from Syria. With support from the European Union, Jordan has adopted a new approach to migrant employment through the creation of special economic zones that employ Syrians and which have access to the European single market (Huang et al. 2018). A goal was set to issue 200,000 work permits for Syrian refugees. What makes this policy possible is that the jobs are not attractive to Jordanians, but this does raise challenges in terms of decent work and how standards might improve over time.

South Africa has a long history of migrations. In the past 150 years, a mineral and then industrial revolution sparked a series of waves of major European immigration. The mining sector in particular then became dependent on large numbers of African migrants, both from within South Africa and from the wider Southern and Central African regions. Since 1994, South Africa has also seen large-scale immigration from other parts of Africa, including DR Congo, Eritrea, Nigeria, Somalia, and, especially, Zimbabwe, with current estimates pointing to approximately four million immigrants (UNDESA 2017: 26). While international migrants were central to the building of the economy, there are now significant barriers to legal migration. Moreover, migrants, both legal and illegal, forced and voluntary, have been subjected to a series of xenophobic attacks in recent years (Crush 2014).

## Using the TVET System to Respond to Migration

The drivers and dynamics of migration are highly complex, as we have indicated already. However, for the purposes of this chapter and its location within the wider Handbook, our primary concern is with the far more modest question of how TVET can be organized so as to better meet the needs of migrants and the firms and societies in which they are seeking integration. Indeed, this is not even all that could be said about TVET and migration, as TVET in sending countries is being supported in part to improve local employment prospects in order to limit migration. However, that is not our focus here.

In this section, we look at the related issues of recognition of formal qualifications and prior experiential learning, how these relate to debates around modularization, and questions of financing TVET for migrants.

### Recognition of Qualifications and Prior Learning

Migrants' smooth integration into new labor markets is very dependent on both the actual and the perceived extent of mismatch between their skills and competencies and those required in the new setting. That it is potentially both a matter of actual measurable gaps in their skills and an issue of informational failures is crucial to addressing this issue as it implies the potential need for multiple strategies.

One of the driving forces behind the rise of qualification frameworks in the last quarter century has been the need to address labor migration. This is very apparent in regional frameworks, perhaps most obviously in Europe given freedom of movement within the Schengen Zone, but also, for instance, in the Southern African region with its history of major labor migrations. Regional qualification frameworks are designed so that equivalences between qualifications across members states are agreed, qualifications are harmonized, and the equivalence of qualifications is communicated to employers and workers alike.

Of course, there are greater challenges when individuals are moving between different formal qualifications frameworks, e.g., from the Southern African to the European. Official processes of establishing equivalences between such frameworks necessarily are complex political and technical exercises. UNESCO has made considerable progress in the higher education sphere through its *Convention on the Recognition of Higher Education Qualifications*. Progress in TVET, however, has been slower.

Qualification frameworks have sometimes been motivated by the challenges of large-scale inward migration. For instance, one of the rationales for Hong Kong's qualification framework was to help the special autonomous region to deal with large influxes of workers from the rest of the country (Ip 2013). Equally, Australian efforts to support framework development in the Pacific Islands and similar EU efforts in the Balkans and the Mediterranean littoral have been motivated by concerns to ease integration of likely migrants into the host economies.

While qualification frameworks are not without their wider problems (e.g., Young and Allais 2013), this is an important function for them. However, inevitably there

still remain challenges at the level of whether employers are convinced that, for instance, an EQF level 4 mechatronics engineer from a particular country is really the equivalent of someone from the local vocational training center.

What is possible with formal qualifications and perceived/actual gaps is a relatively straightforward process of mapping these gaps and then intervening to fill them. The issue of the recognition, validation, and accreditation of prior learning (RVA) is conceptually more complex.

The *ILO Recommendation on Human Resources Development: Education, Training, and Lifelong Learning* and the *UNESCO Guidelines on the Recognition, Validation, and Accreditation of the Outcomes of Non-formal and Informal Learning* both call on member states to establish a framework for the recognition and certification of skills, including prior learning and previous experience, irrespective of where and how these were acquired.

Many have answered this call. However, the terminology, methods, and effectiveness of approaches vary considerably. Many countries operate a portfolio system in which candidates prepare a collection of evidence that they meet the requisite skills and competencies of the formal qualification they wish to acquire (Aggarwal 2013). In the French system, this dossier is only developed after the candidate has received guidance about the process and the likely viability of their case. At this point, they typically develop a portfolio, supported by an advisor, which is brought together through an overarching declaration of how they meet the requirements for the sought qualification. This then goes to a national board for assessment, which includes an interview. Where the candidate is judged not to have all of the requisite skills and knowledge, the board is required to give clear information on what is lacking and how and where it can be acquired, and further support is offered until successful certification (Paulet 2013).

France also does allow a second, less common, route, consisting of a practical test of a real or simulated situation in which the candidate can demonstrate competence (Paulet 2013). This is closer to the trade test tradition of some Anglophone countries, where a candidate can present themselves to an accredited testing center to undergo the same practical test as would be required of an apprentice or public vocational learner.

RVA was not originally designed with migrants in mind but is potentially well-suited to many of them, as has been noted by the Southern African Development Community, for instance (Aggarwal 2013). However, issues of language, of understanding the complexities of the new system, or of lack of access to evidence from home, particularly for refugees, may get in the way. The French emphasis on an advisor is likely to be an important support in such cases, although clearly the cost will have to be borne by someone, most probably the state.

Although RVA is clearly an attractive idea that can promote both labor market efficiency and inclusion, it has not developed as smoothly as advocates have expected. Federal countries, such as Canada and Germany, have particular problems due to their devolved governance structures for recognition of skills (Rietig 2016). This can serve to exacerbate a key RVA system challenge, that of stakeholder buy-in. Governments, educational institutions (of different levels), and employers must all actually recognize what is notionally recognized (Yang 2015). However, there are many cases of RVA not resulting in employment, wage increases, or access to higher

qualifications, particularly where there is excess supply of potential learners or workers.

Moreover, such systems are primarily seeking to meet the needs of those with the lowest levels of formal education and training, but portfolios, declarations, and interviews require relatively complex and advanced organizational and comprehension skills. Support, as in the French model above, thus is likely to be crucial. This though hints at one key weakness in many national RVA systems: that of mentor/assessor quality. Yang (2015) notes a range of countries in which these key individuals receive little or no training.

RVA systems are also complex and costly to administer (Yang 2015). Moreover, where there is no national qualifications framework or one exists but qualifications are outdated and of little relevance to the world of work (including the informal economy), then it is hard for RVA to operate.

Even less than qualification frameworks was RVA setup to address migration. However, this is clearly a potentially important role for RVA in supporting migrants' labor market integration. Nonetheless, the challenges facing RVA are often heightened where migrants are concerned, and these needed to be addressed seriously in host countries.

An interesting recent development in the area of RVA comes from the Philippines. One of the world's largest labor exporters, the country has become concerned to improve the conditions of its migrants while outside the country and to ease their reintegration into the national labor market. Working with major recipient sites, such as the GCC states and Hong Kong SAR, the Technical Education and Skills Development Authority (TESDA) has been developing mutual qualification recognition agreements and has been carrying out testing of expatriates in situ, leading in most cases to awards of TESDA certificates (De la Rama 2018).

## **Modularization**

Our discussion of qualifications and RVA has been implicitly couched in terms of whole qualifications. For several decades, the move toward "modern" qualifications has typically been aligned to a focus on competency-based modular training (see elsewhere in this Handbook for more of that debate). Modularization potentially aids migrants with existing skills as it allows a focus on smaller units of additional learning to be acquired to make up mismatches in skills (Rietig 2016).

Modularization has been an increasing trend in some parts of the world (e.g., Europe). In reviewing the European modularization experience, Pilz et al. (2017) note that inclusion has often been a major priority of such reforms. However, they suggest that modularization's effects on inclusion have often been less positive. This relates to the point we have already made about RVA's complexity. Modularization does allow for learning to be digested in smaller chunks, but it also can lead to huge menus of options that are difficult to navigate. The anti-equity effects of this may be particularly present for migrants who may add an unfamiliarity with modular systems to a wider set of marginalizations.

## Finance

Much of what we have discussed in this section can be seen as an extension of existing debates about TVET system reform, around qualifications, and assessment. A discussion of TVET financing is a staple part of such debates. There are major concerns internationally about the inadequacy of TVET funding. This includes underinvestment by states, employers, and learners/families. The costs of seriously trying to integrate migrants into labor markets through TVET are inevitably higher than for the reform processes more generally.

However, the societal costs of weakening labor market insertion are likely to be far higher. Why TVET is expected to play a part is due to its own philosophical understanding that people become fully human and fully part of a community through participation in decent work. While many migrants are poorly placed to invest in their own skills needs, the greater imperative of social integration may make governments and employers (through corporate social responsibility) willing to invest. This will be necessary to ensure that migrants can access as necessary RVA and some of the services we will describe in section “[College, Teachers, and Learners](#).”

Additional training comes with both financial and opportunity costs. The longer and more full-time a program is, the greater both types of costs are. Evidence from Germany suggests that both contribute to high dropout from training of migrants and refugees (Rietig 2016: 7). Of course, legal barriers on migrants earning while learning only serve to increase the likelihood of dropout and the pressure for bursaries.

---

## College, Teachers, and Learners

The migration and skills debate has been too heavily concentrated at the systems level, reflecting the wider dominance since the early 1990s of a global TVET policy “toolkit” (McGrath 2012). However, there are a range of other issues and initiatives that require consideration.

## Information, Advice, and Guidance

Navigating the labor market has become more complex for everyone in the light of multiple forces. Watts (2011) argues that this complexity requires that more attention be awarded to the information, advice, and guidance (IAG) given to those trying to navigate labor markets. These challenges are particularly great for migrants, who are likely to be dealing with unfamiliar languages, cultures, labor markets, and education systems. Hence, their need for quality IAG is even more pressing.

However, IAG services are absent in many countries, particularly the poorest. Where they exist, they tend to be uneven in their coverage and limited in their effectiveness. Developments in South America (Jacinto 2011) are indicative of both strengths and weaknesses. Job search assistance and counseling services after initial TVET in South American countries are generally undertaken by the training or public employment

services. For example, the Peruvian Programme of Training for Work (CAPLAB) organizes a network of education for work centers and has integrated them with labor information and intermediation public services. The more innovative schemes usually go beyond career guidance. They offer young people tools to build their own strategies on the basis of their interests and potential, providing them with better information about social and work environments and postsecondary education. Different initiatives of career guidance for young students of secondary school have developed in recent years. For example, the ILO's Project for Youth Employment Promotion in Latin America (PREJAL) promotes the development of training and the participation of private companies in fostering social and work-related inclusion. Specific actions include career guidance and support services for young people from disadvantaged socioeconomic backgrounds who have recently graduated from secondary education and are seeking to enter the labor market. While IAG is most needed by the more marginalized, including migrants, it is most available to the most privileged. This may further exacerbate the inequitable aspects of modularization described above.

IAG for migrants is essential to improve their labor market integration. However, this requires careful consideration of the experiences and aspirations of migrants (Rietig 2016). Local authorities need to understand the needs and experiences of migrants in order to offer appropriate guidance and opportunities. A study of migrants' experiences in the UK and Australia shows that much of the guidance for forced migrants is provided within communities and charity organizations where the focus is more on welfare and legal advice. In some Australian centers, even though dedicated employment and education officers are available, they are often unable to keep up with the changes in the country's educational and vocational systems, and they are rarely informed of the quality of the international qualifications formerly acquired by migrants (Hannah 2000). Similarly, Webb et al. (2017: 358) argue that, in Australia, professionals employed to assist migrants to secure training and education fail to recognize the different needs of migrants. Rather, migrants' accents are used to decide which service they may need without any probe into what their skills needs are (ibid.). Moreover, any consideration of IAG for migrants must acknowledge the ways in which migrants, whether legal or illegal, have good reason for being suspicious of their host states and any advice that they receive from their agents.

## Language Training

Where needed, early language training is essential to help migrants transition smoothly into education, training, and labor markets in host countries. However, in spite of its importance, language provision across countries varies due to many factors such as coordination between different providers and funding (OECD 2014). Inadequate funding for language training reflects in the poor language proficiency and labor market outcomes of migrants. On the other hand, extensive duration spent learning a host country language locks migrant in, further delaying their access to employment. This is a feature of integration programs in the Nordic countries and Germany (OECD 2014: 87). As a result, while the learning of a host country's language ideally should

precede education or employment, improved outcomes are realized when language training is integrated into vocational education and training (Desiderio 2016). Sweden's adoption of an occupationally embedded strategy has proven to be successful in integrating migrants quickly into the labor market (OECD 2014). Moreover, this is important in enabling migrants acquire vocational language proficiency peculiar to their trade or occupation (Guo 2013). In this regard, research on highly skilled Zimbabwean migrants with fluent levels of formal English has shown that the communicative competencies required to flourish in the workplace are very different from proficiencies in formal language settings (Madziva et al. 2016). The challenges here include writing of CVs, performing in job interviews, and successful integration into workplace cultures through informal socializing. Issues may also face migrants whose cultural or religious differences from the majority in terms of eating and drinking may complicate rather than lubricate social interaction.

For TVET institutions and language providers, therefore, there is the need to understand the different language needs of migrants and tailor training or pedagogy to meet these needs. A study of the experiences of African migrants in TAFE institutes in Australia by Onsando and Billett (2009) showed that there were differences in the language learning needs of adult and young refugees, but teachers did not comprehend this. This phenomenon has been observed in other countries and is partly explained by the fact that vocational teachers often lack the expertise to teach language courses, while other language providers lack the expertise to offer vocational language training (OECD 2014). As a result, strong coordination between the stakeholders involved is needed to address the gaps for the benefit of migrants. Also, while challenging, tailored language training is necessary to enable migrants make the most of the language opportunities provided (ibid.).

## Psychosocial Learning

Moving to a new culture requires much learning to fit in to meet the ways of daily life in the new society. We have already talked about the relatively obvious issues of language learning, but this can be likened to the tip of the iceberg. In VET, there are further challenges in understanding how the world of work actually works in another country, including issues such as how to interact with employers, customers, etc.

The process of moving country is stressful and migrants may need support in developing resilience. Issues here extend to the realm of mental health. As the WHO notes:

Being a refugee or a migrant does not, in itself, make individuals significantly more vulnerable to mental disorders, but refugees and migrants can be exposed to various stress factors that influence their mental well-being.

Refugees and migrants have often faced war, persecution and hardship in their country of origin. Many will have experienced displacement and difficulties in transit countries and embarked on dangerous travels. Lack of information, uncertainty about immigration status, potential hostility, changing policies, and undignified and protracted detention all contribute to additional stress. (<http://www.who.int/migrants/about/areas-of-work/en/index5.html>)

This means that ensuring successful integration of migrants into TVET and labor markets needs to take account of the challenge of supporting mental health.

## **Facilitation of Local Work Experience**

Successful labor market integration often depends on a mixture of qualifications and work experience. The lack of one or both often hampers local youth in their search for decent work. Young migrants may face similar or worse problems. However, older migrants may also find themselves in the peculiar situation of having their previously valuable stocks of both qualifications and experience suddenly devalued. We have already addressed the qualification issue, so it is worth a brief consideration of how work experience in the host country can be acquired.

Cedefop, for instance, has highlighted the potential of internships and volunteering to enable migrant workers to build the social capital necessary for employment after training (Cedefop 2011). Webb et al. (2017) have found some evidence for success in this strategy in Australia. However, here we need to be mindful of the wider critiques of internships and volunteering as also serving the function of allowing core activities of organizations to be excised from the wage economy, permitting heightened exploitation of labor. Moreover, volunteering and internships are often seen as the preserve of the privileged. This points to the real and opportunity costs of doing unpaid work. While this is certainly true, many more vulnerable new entrants or returnees to the labor market are forced to take on such roles as what they perceive as their only hope of accessing decent work. The costs of this, and the potential for exploitation, of course are likely to be even higher for migrants.

This points to the need to address the challenge of local work experience for migrants robustly. This means designing programs that maximize the learning and other benefits of such opportunities and minimize the costs and risks of exploitation.

## **Implications for Teachers and Classrooms**

While the focus of skills and migration thinking has largely been at the system level, it is evident that there are major implications at the classroom level, as illustrated by the above points about information, and language and psychosocial learning. However, the implications for classrooms and teachers go much further. Here it is worth reflecting quickly on lessons from the much larger debate regarding the internationalization of higher education. Put simply, this literature increasingly suggests that curriculum and pedagogy will need to undergo changes if the classroom demographics change (Leask 2009). Mertkan et al. (2016) point to the profound but unplanned ways in which learning and institutions start to transform when the student body radically changes. However, even where smaller numbers of migrant learners enter institutions, it is essential that commitments that “no one is left behind” result in changes that accommodate new learners.

Much of the range of changes outlined in this section have very major implications for teachers and teaching in vocational systems. They add to the complexity of the work of being a VET teacher. This points in turn to questions about adequate initial and subsequent professional education for VET teachers to support their processes of facilitating learning of migrants, regarding the provision of specialist support beyond these teachers in the areas outlined above, and concerning the funding of better approaches to supporting the learning of migrants.

---

## Conclusion

Migration is increasingly being seen as a political challenge and, thus, a policy priority. Yet the integration of migrants into labor markets is a key element of the political contestations of migration. On the one hand, successful labor market integration offers the promises of wider integration into society and the prospect of migrants being net financial contributors to the host economy; on the other, xenophobia often centers on the notion of migrants “taking our jobs.”

Clearly, these wider issues cannot be solved simply through TVET. The reasons for migration, immigration law, and overall labor market structure lie outside TVET’s sphere of control. Nonetheless, TVET can and does play a role in managing migration.

Conventionally, this has been largely a systemic response, focusing primarily on qualifications and certification. These do have an important role to play, but we have learned over time the limitations and costs of such approaches. In particular, opinions of employers and educational institutions regarding comparability of qualifications have proved resistant to messages of portability.

We suggest that there is a need to look beneath the system level at how institutions, classrooms, and teachers can become more responsive to migration. Key issues here include language and psychosocial learning, as well as information, advice, and guidance. Migration can change classrooms and learning for the better, but vocational providers and teachers need support in capitalizing on the opportunities available.

## Abstract

The world is at the onset of the Fourth Industrial Revolution (4IR). Already we are using 3D printing to manufacture cars, drones to deliver products, and even talking with robots. In the late 1990s, the world was shocked by the emergence of the smartphone equipped with computers, phones, and cameras. Now, just 20 years later, we are at the brink of using bio-implantable communication devices. The emergence of such new technologies is dynamic, and it is bringing about radical and holistic changes in the way people live, work, and conduct relationships. These changes are found everywhere, not just in certain elements of society or markets, and are occurring simultaneously to create a whole new order. That's why we call the 4IR a revolution, not just a change or transformation.

This chapter analyzes the current state of dynamic change and an unpredictable future, discusses both positive expectations and negative concerns and implications

## **Introduction: A New Era of the Fourth Industrial Revolution**

The world is at the onset of the Fourth Industrial Revolution (4IR). Already we are using 3D printing to manufacture cars, drones to deliver products, and even talking with robots. In the late 1990s, the world was shocked by the emergence of the smartphone equipped with computers, phones, and cameras. Now, just 20 years later, we are at the brink of using bio-implantable communication devices. The emergence of such new technologies is dynamic, and it is bringing about radical and holistic changes in the way we conduct business and interact with each other. These changes are found everywhere, not just in certain elements of society or markets, and are occurring simultaneously to create a whole new order. That's why we call the 4IR a revolution, not just a change or transformation.

The World Economic Forum (WEF) declared the dawning of the 4IR in 2016. Participants at the forum defined the 4IR as “a revolution that fundamentally changes the way people live, work, and conduct relationships.” In response, Klaus Schwab, Founder and Executive Chairman of the WEF, suggested that all stakeholders from every part of the world with issues must participate in discussions to come up with countermeasures.

In the book, *The Second Machine Age*, Professors Erin Brynjolfsson and Andrew McAfee (2014) of the Massachusetts Institute of Technology described the changes of the 4IR as the inflection point of “unprecedented things” resulting from the “full force” of digital technology. They also pointed out the possibility of negative impacts that could come from such revolutionary changes, such as social imbalances.

This chapter analyzes the current state of dynamic change and an unpredictable future, discusses both positive expectations and negative concerns and implications on societies as humankind has been rearranging its rules and orders to accommodate such technology-led developments. In particular, this chapter examines changes in technological environment, industry and business developments, and changes in economic processes such as shared economy and platform economy.

The implication of these changes to role required of humans, its corresponding capabilities, and required skills and the structure of the labor market will be discussed. And finally, under these circumstances, the role of education will be also discussed.

## Historical Significance of the Fourth Industrial Revolution

About 10,000 years ago, early humans hunted and gathered for survival. Then, beginning in the sixteenth century, the agricultural revolution introduced tools and livestock that increased food production and enabled food storage. The human population increased and people started to settle down into communities around food centers. Subsequently, the clothing, food, and housing industries developed, around which human labor was centered. Moreover, the division of labor marked the beginning of what we know today as jobs.

During the middle of the eighteenth century to the nineteenth century, the railway-based transportation industry and coal-fired energy industry were at the center of the First Industrial Revolution. Steam engines produced electricity and soon factories were replacing human workers with machines for mundane tasks. This led to a sharp rise in productivity and people began to explore the most efficient way to make use of human labor. For example, people began to take breaks between labors.

During the Second Industrial Revolution that lasted from the end of the nineteenth century to the early twentieth century, the conveyor belt marked the beginning of the widespread application of machinery for labor. This enabled the mass production of goods. The massive quantities of goods naturally led to trade and distribution, igniting the growth of commerce and industry, and the concept of capitalists and laborers took hold. Laborers were hired by capitalists via contracts, and the type of employment in which workers receive wages in exchange for the provision of labor became mainstream.

From the middle of the twentieth century to now, the Third Industrial Revolution involved the evolution of global industries spearheaded by digital technologies such as the computer, semiconductors, the Internet and mobile phones. Such digital technologies further advanced automation in the manufacturing industry and created new service sectors across all industries. Services within the shared economy such as ridesharing and home-rental services are just some recent examples.

During the Third Industrial Revolution, digital technologies went through decades of progress and development and are now resulting in waves of new innovations. Modern digital technologies affect not only industries, technology, and products but every aspect of human life. And the 4IR coincides with the innovation and convergence of such digital trends. High-dimensional digital technologies are converging with relevant or nonrelevant counterparts to create new combinations, bringing about changes that were unimaginable in the past.

In an interview with the Huffington Post in 2015, Ray Kurzweil, Google's technology advisor, and mastermind inventor predicted the future of humanity as the result of the 4IR (Howard 2015).

Dr. Kurzweil said:

By 2025, 3D printers will print clothing at very low cost. There will be many free open source designs, but people will still spend money to download clothing files. 3D printers will

print human organs using modified stem cells with the patient's own DNA providing an inexhaustible supply of organs and no rejection issues. We will spend considerable time in virtual and augmented realities allowing us to visit with each other even if hundreds of miles apart. We will be able to reprogram human biology away from many diseases and aging processes, for example deactivating cancer stem cells that are the true source of cancer. . . .

At the time, his claims seemed somewhat over the top, but one by one, Dr. Kurzweil's predictions became reality in less than 2 years.

---

## **Changes in the Global Industry Due to the Fourth Industrial Revolution**

### **Changes in the Technological Environment: Rapid Progress of Technology**

Recently, many researchers have put forth their own analysis and predictions about the 4IR, but each of them is different. Each researcher uses his or her knowledge and logic to create a narrative about how the 4IR will affect industries and cultures, and how it will evolve in the future. The reason why so many different narratives can coexist is that the 4IR is moving at a rate so fast, it is impossible for us to predict the future, and it is so diverse that we cannot view it holistically at just one glance. We call this the destructive power of change. An important reason why the 4IR has the destructive power of change is that it starts from a time of radical advancements in technology.

According to the hyper curve developed by Gartner (Fig. 1), an IT market research firm, the digital technologies that are driving changes in the 4IR such as the Internet of Things (IoT), 3D printing, robots, and Big Data are now at the "Peak of Inflated Expectations." For a certain technology to be at the peak of inflated expectations means the innovations expected from utilizing the technology has reached its highest level. Some of these technologies may not end up developing as we expect in the future. However, the fact that there are so many technologies at the peak of inflated expectations can also mean that recent technologies have given us many sources for creativity and imagination.

From now on, we need to go over several technologies among representative technologies of the 4IR such as artificial intelligence (AI), Blockchain, IoT, and 3D printing.

The research of AI was first published in academia by Alan Turing, a British mathematician and logician. This was 68 years ago in 1950. Unfortunately, research results over the past 50–60 years have not even reached the lexical meaning of AI of "embodying human intelligence." This is not the case anymore. AI technologies, such as Google's AlphaGo and IBM Watson, are displaying levels of intelligence comparable to that of humans. It may be more accurate to say that they have already surpassed human intelligence. The influence AI will have on humankind in the

**Fig. 1** Gartner Hyper Curve for emerging technologies 2017. (Gartner 2017)

future may be frightening. As high-level AI technologies gradually penetrate into the human realm, they can threaten not only human jobs but human dignity as well. That's why AI is the core technology of the representative technologies of the 4IR.

Blockchain technology has recently gained attention due to virtual money's popularity and is another representative technology of the 4IR. Literally, Blockchain means to connect blocks via chains. It sends every party involved in a transaction the transaction history (block), and every time a transaction takes place, it happens transparently by cross-checking every block to prevent data forgery and hacking. At present, the technology is used for specific uses such as for virtual money, but it is expected to be used for a variety of personal and business transactions in the future. The widespread application of Blockchain technology will transform the traditional business structure where a central host controls and manage transactions to one where authority and information will be distributed equally to stakeholders. For example, in the financial industry, the central banks of each country have the say over monetary circulation and financial transactions, thus all authority is centralized. However, if Blockchain technology is applied in the future, participants will have equal access to financial information and have the right to manage financial transactions via distributed operation system.

The Internet of Things is a technology that is playing a key role in connecting everything on earth, and it is even called the "Internet of All Things." In the 1990s, computers were personalized and the Internet became widespread, opening up a new, information-centered paradigm for business. We called this the digital revolution. Back then, we expected a time would come shortly where all information would be stored and managed in cyberspace (atom to bit), and used the word "revolution" to describe the period of change. But only now, 30 years later, we are finally heading toward a true "digital revolution." The IoT is the foundation and technical bundle that connects all the physical information of the world with cyber information. It also stores and utilizes the information.

In order to understand the core technologies of the 4IR, we need to review the concept of a Cyber Physical System (CPS) (Fig. 2). The term CPS was introduced for the first time in 2011 as a part of "Industry 4.0" in Germany, where the 4IR was first introduced as a new industrial paradigm. CPS is a virtual system that connects the physical world with the digital world and is similar to IoT. If the Internet is a substantial term, CPS is a conceptual term. The concept of CPS is still evolving and is constantly being updated by associated agencies such as Germany and the United States. In 2016, the National Institute of Standards and Technology (NIST) published a report by the CPS Public Working Group detailing the specific definition of CPS and its development outlook. According to NIST, CPS is an interactive network-based smart system that links the physical with the cyber world.

Similarly, 3D printing technology transforms cyber information into physical entities through additive manufacturing. For example, in today's manufacturing environment, axles and bearings of automobiles must be manufactured separately and then assembled together. By using 3D printing, bearings and axles can be made at the same time in a single process. A US company called Local Motors already produces finished vehicles using 3D printing. The applicable

**Fig. 2** CPS conceptual model. (CPS 2016)

areas for 3D printing are expanding rapidly, and there are even expectations to use 3D printing to replicate human organs in the near future.

Industry 4.0 technologies Brenna Sniderman et al. (2016)

Product impact	Technology
Physical → Digital	Sensors and controls Wearable Augmented reality (AR)
Digital	Signal aggregation Optimization and prediction Visualization and POU delivery Cognitive and high-performance computing
Digital → Physical	Additive manufacturing Advanced materials Autonomous robotics Digital design and simulation

According to global consulting firm Deloitte, core technologies and concepts of the 4IR such as IoT, 3D printing, and CPS ultimately play a key role in transforming physical objects into digital information and digital information back into reality. In the process, information technologies such as AI, Big Data, and Blockchain use digital information to provide useful services as well as value to human beings.

Numerous research institutes and distinguished professors are presenting innovative technologies that will lead to the 4IR and ranking their importance. They also talk about the future changes in industry and society to come as a result of innovative technologies. The technologies mentioned above cannot be said to represent all the technologies of the 4IR. In the future, even more influential technologies may arise. The important thing is that in the next few years, industry, society, and the labor market will be greatly influenced by such new technologies, and we need to be ready to accept change.

## Changes in Industry and Business: Breaking Boundaries

Even though digital technologies are leading the changes of the 4IR, changes such as product-technology convergence, manufacturing and service convergence and alternative industries are also happening simultaneously. Traditional boundaries segmenting industries may be destroyed or replaced by new ones. Some industries can be replaced by new promising industries, and companies that fail to accept new changes will lose their competitiveness and disappear.

The “war without guns” between automakers and IT companies is a prime example of the struggle for control over the disappearing boundaries between two industries. The current transition from manned, gasoline engine cars to autonomous electric cars cannot be seen as a mere evolution of technology, but a paradigm shift in the automotive industry as well as the beginning of rivalry among companies to survive. If autonomous electric vehicles end up dominating the market in the future, the automotive industry will be led by core technology companies such as batteries and autonomous navigation software companies, not traditional automotive manufacturers. Then, IT companies will have the most say in automobile design and gain the most profit. Existing automakers may transition to mere car assembly companies. This is a likely scenario based on the following three facts. First, the cost of IT is increasing more than 25% per vehicle produced; second, the core technology of automobile production has shifted from engines and brakes to batteries and software; and third, the value added from production itself can be reduced by utilizing new technologies such as smart factories.

In addition, intangible businesses and platform-based businesses are expanding. There is no need for a company to possess all the necessary resources or capabilities internally. Companies can find resources and capabilities externally and use them appropriately. This means, platform businesses that provide resources and capabilities for other companies are increasing, and the number of companies that make use of such services to conduct transactions and share information with other companies is growing. Platforms are expected to become even more diverse in form and function, from servicing online-based commerce and data sharing to off-line manufacturing.

A representative example of a manufacturing platform is a smart factory. The unmanned factory controls itself, and the materials and machinery communicate with each other. Factory facilities are run by a central control system, and information and data are shared in real time among the facilities, processes, and systems. When a product is ordered, the manufacturing schedule is optimized by the central control system, and the necessary processes are carried out by the factory itself. When manufacturing begins, information about the current production situation and specific manufacturing processes are collected and analyzed in real time, and the system determines and controls production according to product-specific requirements. The production flow is automatically designed and executed as if the product and facility are in communication. In some processes, 3D printing can be used to produce and assemble parts that previously had to be made separately from the production process.

Global companies have recently built smart factories to produce a variety of products with minimal costs and manpower. In 2017, GE invested USD 200 million in Mumbai, India, to put its “Brilliant Factory” into operation. GE’s entire line of

products, including aviation, power plants, oil and gas and transportation, is produced in a single plant. The central control system selects materials based on the input costs, and through radio frequency identification (RFID) tags on the selected materials, the necessary parts are manufactured, optimal processes are identified and everything is assembled on its own. In addition, it produces products with digital files and 3D printing, and links various information stored in the system to other value chains (orders, supply chains, services, etc.).

As seen in the case of advanced automobiles and smart factories, the 4IR has blurred and destroyed existing boundaries between industries and businesses, and new alternatives and convergences have surfaced.

New values can be found in the connections between data, technology, business and other areas that were once considered unrelated. The subject of connection does not always have to be new. In some areas, two separate entities can go beyond connection and become a whole new entity in a “strategic convergence.” The boundary between the manufacturing and service industries began to blur in the 2000s. However, recent inter-industry convergence patterns are much more dynamic. The IT industry is already behaving as any other industry such as the automotive, energy, distribution, and financial industries. A convergence among such entities will create a completely new output.

## **Changes in Economic Processes: Shared Economy and Platform Economy**

Recently in Germany, there has been an active food sharing movement/social business (Foodsharing.de). In 2012, a local initiative to share leftover food began, which is now sharing 6.7 million kilograms of food per year through 22,000 food savers (volunteers who manage food stores and connect them with consumers). Initially, a store set aside food that was close to expiring on a separate shelf for people to take as needed and underprivileged people began to make good use of the food. In response, the store became more active in promoting the initiative, and the public also took part by donating its own food on the shelf. Subsequently, the store’s brand image improved and sales increased. There are now food sharing companies all over Germany, specializing in reducing food waste and helping neighbors in need.

Another reason for the success of the food sharing business in recent years comes from a mobile-based, real-time information sharing technology called Online to Offline (O2O). Thanks to smartphone technology, it is now possible to share food storage statuses and quality information in real time to connect suppliers and consumers. The expansion of the food sharing movement can be explained by the emergence of the concept of a “shared economy.” Within a shared economy, the product or service in transaction is not owned by a single party, but shared by many on the basis of collaborative consumption.

Mass production during the Third Industrial Revolution led to excessive consumption, and it was not easy to connect surpluses with new demand. However, as in the case of food sharing, the O2O technology of the 4IR can match the surplus of resources with

new demand in real time. In other words, a shared economy seeks to achieve efficiency in consumption rather than in production. Consumers share things they do not need with other people, and those who need certain goods pay a certain fee to use them. As people focus on utility rather than ownership, the notion of ownership is also changing. People think, “Not all of the goods I use have to be mine,” resulting in the reduction of over-production. Thus, attitude change is an essential part of the process.

In the future, not only goods but intangible things such as time, ideas, and technologies may be shared. Already companies such as Uber and AirBnB have grown into leading global companies and are conducting platform-based businesses based on the concept of sharing goods. Platform start-up Quirky has already attempted to trade ideas, and business platforms that share, manage, and buy and sell intangible goods such as volunteer work and time management applications are emerging.

There is a term “prosumer” that refers to those that are both consumers and producers at the same time. The 4IR is breaking the barriers between consumers and producers and actively turning out proactive prosumers. They often order customized products to fit their needs and even make their own products by using technologies such as 3D printing. We call making one’s own product DIY.

TechShop, a chain of membership-based, open-access, DIY workshops and fabrication studios in the United States is a prime example of companies for DIY. The first TechShop opened in Monroe Park, California in 2006, and gave members access to a variety of tools and facilities for design and manufacturing for a membership fee of around USD 100 per month. The company even provides 3D printers, laser-cutting machines, and other expensive prototyping equipment for members to make their own prototypes for ideas and designs. Some users ended up achieving their dream of starting a business. The spread of DIY culture and companies like TechShop is not a temporary phenomenon. It is a key change in economic activities based on the revolution of manufacturing and consumption. The cost of “machine activities” such as manufacturing will decrease as costs that go toward value-added “human activities” such as design, ideation, marketing, and services increase. Prosumers will act as communication channels for manufacturers and consumers in the 4IR.

Going forward, economic activities will be carried out within the changing environment of the 4IR, including the shared economy and platform economy. As a result, the daily economic activities of people will differ greatly from the present, different types of skills and competencies will be required.

---

## **Possible Changes in the World of Jobs**

### **Machine Replacement: Redefining the Role of Humans**

In the nineteenth century when Ford introduced a conveyor belt, most people welcomed the revolutionary automated production system, but some futurists were concerned that low-skilled human jobs would be replaced by machines or robots. At present, 4IR presents the same expectations and concerns. So then, how will the role of humans change within the 4IR?

**Fig. 3** The changing role of humans

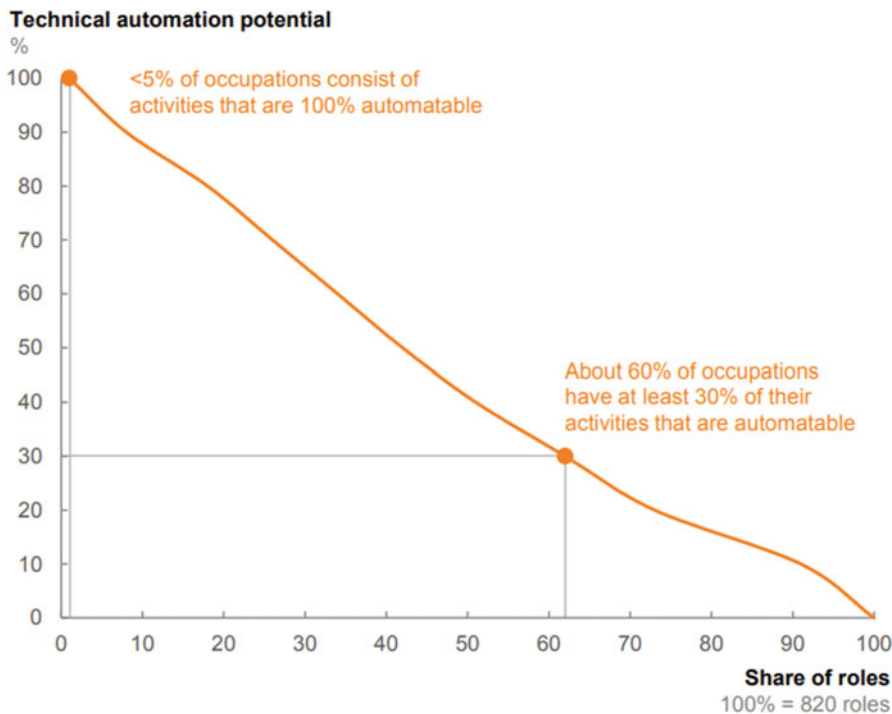

In the Third Industrial Revolution, humans were closely linked with computers and machines to automate (Fig. 3). In the 4IR, computers and machines will communicate independently via systems with diverse SW technology like AI. From this point of view, the most urgent issue of the 4IR is the changing role of humans and the possibility of job cuts. People are concerned that machines are increasingly able to replace humans even in creative and specialized jobs, and that human jobs will disappear as a result.

PwC suggest that in the next few years, the drone business will replace USD 127 billion in the added value of various industries (PwC 2016). Drones are already in use in various industries such as agriculture and transportation and have clear cost-saving benefits. The recent explosive growth of the drone market has even been viewed as the first step toward world domination by robots. Some economists argue that automation via robots will be a major threat to human labor in the next few years, and that by 2030, machines will replace 50% of all jobs. However, McKinsey recently presented an alternative opinion: AI, robots and objects are not going to replace human occupations, but human activities. Since a single occupation is made up of various activities, even if some activities are replaced by machines, the entire occupation will not be replaced.

McKinsey categorized “activities” into 7 categories: people management, professional work, work that requires interaction, unpredictable physical labor, data collection, data processing and predictable physical labor. According to their analysis, predictable physical labor in the accommodation and service sectors is most likely to be replaced by machines (Fig. 4). However, McKinsey concluded that every human job involves unpredictable, specialized, or interactive tasks, so only 5% of the profession will completely be replaced by machines, and the rest will not be completely replaced. Whether this opinion is right or wrong, there is no question that machines will replace humans in many activities in the future. People need to accept that they will have to coexist with machines, adapt to change, and evolve to become better as a result.

### **New Human Capability: Connectivity, Creativity**

In 2012, *The Economist* described the coming world as “The Realms of GAFA” (Fig. 5). GAFA stands for the four leading global IT companies: Google, Apple, Facebook, and Amazon, and *The Economist* described them as “kingdoms”

**Fig. 4** Technical automation potential. (McKinsey 2017)

(The Economist 2012). The age of all four companies combined is less than 100 years old, and with the exception of Apple, these IT companies were only founded in the 1990s. Nonetheless, GAFAs has tremendous influence over many areas of the global industry as predicted by *The Economist*, and their influence only seems to be growing. This is because the key driving force of the 4IR is data and these companies hold the majority of the world's data.

Within the 4IR, it is important not only to collect data but also to create new values by linking and utilizing data. This is the process by which humans find meaningful connections with creative ideas and perspectives in the world of data where data is as numerous as the sand on the beach.

In the next 10 years, a trillion sensors will be able to collect all the data in the world and the 7 billion people of the world will all be connected via the Internet. For new growth industries such as O2O businesses, wearable device industry and autonomous car industry, the connection of data will play a key role in creating value. Even in traditional industries such as agriculture and manufacturing, new value will be added through expansion of data connectivity. The combination of new values will become more diverse starting with data-to-data connections and ultimately expanding to service-to-service connections → company-to-company connections → ecosystem-to-ecosystem connections.

Fig. 5 The realms of GAFA. (Source: The Economist 2012)

Fig. 6 Expansion of data connectivity

The key to this expansion is the “removal of asymmetric information” (Fig. 6). Traditionally, companies have focused on the internal ownership of information and technology, and blocked external access to critical information. In a situation with “asymmetrical information,” only the information provider can carry out one-way communication, so there is a lack of feedback about the product or service from customers. However, the recent expansion of data connectivity makes it possible for not only businesses and consumers to communicate flexibly, but also companies and consumers to communicate among themselves. Information can be used selectively and influence others’ decision-making. It can also allow for the incorporation of various ideas into the development of new products and services. Ultimately, interactive communication creates new values through collaboration, convergence, and communication. In an ecosystem of interactive communication, it is necessary to

**Fig. 7** An artwork by robot artist <Einstein> Source: 2016 Robot Art Competition <http://robotart.org>

accept external ideas and capabilities rather than trying to develop them internally, and then have the insight to match them with changing needs and trends. Connectivity is really the combination of human sense and knowledge.

Fig. 7 above won first place at a global art competition in 2016. This competition was for robot artists and the portrait of Einstein was also drawn by a robot. Up to now, most people have been concerned about a robot-dominated world, but agree robots would never be able to compete with human creativity. So then, how should we process the painting of Einstein above? It is difficult to judge the extent to which robots will penetrate our world. Could a time where humans appreciate and purchase robotic artwork be coming?

This is not the only example where robots have invaded the creative realm of humans. In a new field of media called “Robot Journalism,” robot journalists deliver news instead of human journalists. The *Washington Post* even created an AI journalist called Heliograf to write and report news in real time at the Rio Olympic Games. Although such news is limited to delivering facts, future AI articles may be able to embody human emotions.

In addition, there are robot composers, novelists, and robots that communicate with humans, proving robot activity can expand into diverse fields. AI technology combined with Big Data and IoT aims to provide not only objective thinking and rationale but also human creativity and emotion as well. In the era of the 4IR, how originally will AI be able to express human creativity?

In fact, there is a key technology to achieving this – machine learning for AI. Put simply, machine learning can be described as “the machine version of human perception and cognitive processes.” When humans perceive sounds or objects,

they use sensors such as their eyes, nose, and ears to collect data related to sight, smell and noise that get sent to the brain to be processed. In order for machines without brains to recognize and perceive things, complex algorithms and calculations are required. Machine learning is part of this process where machines increase their accuracy through repetition.

Recently, machine learning has become more popular because of the development of Big Data technology that can process vast amounts of data accumulated on the Internet, as well as the development of computing technology to handle the data. Deep learning is one method of machine learning that recognizes more complicated and diverse situations by implementing a multi-layered, neural-network-shaped algorithm. The drastic development of AI has resulted in robots with recognition and judgment capabilities similar to humans' (although they go through a different process than humans). There are continued attempts to extend the scope and depth of learning to give human-level creativity to robots.

There is, however, a way to protect the creative work scope of humans in the 4IR. It is to draw out even more creativity in the midst of discomfort. Korea Advanced Institute of Science and Technology professor Jae Seung Jung, who is a master of bio-brain engineering, said, "Coincidental creation, as in the 'Eureka moment' is only possible with humans." Computers do not have the competence to come up with ideas related to B while looking at data for A. For the computer that is filled with data related to A, information related to B makes it uncomfortable. Moreover, it is impossible for the computer to create a completely new C by weaving A and B together. We cannot expect computers to have a Eureka moment as Archimedes did in the bathhouse. The ability to draw coincidental results from unrelated fields is limited to human capabilities.

Within the 4IR, the role required of humans and its corresponding capabilities will be redefined. We have to build a framework for development in order to coexist with AI, robots, and computers and continuously work to shape the boundaries that define human roles. Connectivity and creativity are the core competencies that highlight the need for human capacities.

## **Labor Market Restructuring**

The report, *Future of Jobs*, published at the World Economic Forum in 2016, predicted that the 4IR would eliminate seven million jobs and create two million new jobs, resulting in five million job cuts. It states that the jobs with the greatest decrease in jobs are mundane office work and production jobs, and jobs that will see the greatest increase are related to business, finance, management, computers, etc. (World Economic Forum 2016).

There are also warning signs that the 4IR could lead to job reductions and the polarization of job quality. Oxford University's Frey and Osborne (2013) predicted that 47% of US jobs and 42% of German jobs will disappear within 20 years due to automation, especially for skilled labor. They argue that technological innovation will replace the labor force within the next few decades. In particular, the

employment rate of the highest- and lowest-skilled workers has not changed much, but middle-skill jobs that require simple and repetitive tasks are easy to automate and is expected to decrease.

On the other hand, Germany, which is spearheading the 4IR, predicted through political, economic, and educational policies that the “Accelerated Digitization Scenario” will lead to a rapid increase in productivity and a sharp decline in unemployment rates (Federal Ministry of Labor and Social Affairs 2017). They predict 750,000 jobs will disappear from 27 sectors (e.g., retail, paper/print, public administration, etc.), but one million new jobs will be created in 13 sectors (e.g., IT, R&D, etc.). As a result, 250,000 new jobs will be created.

Just as the future of technology, industry, and business in the 4IR cannot be accurately predicted, the resulting changes in the world of work are even more difficult to predict and ambiguous. In the end, it is important to figure out how to create more jobs within the 4IR rather than debate over whether it will lead to an increase or decrease in the number of jobs. We need to consider which sectors will create more jobs, what can be done to speed the growth of these sectors, and what kind of education and training will people need to develop new competencies required in the future.

First of all, you can expect new technologies to create new jobs. Examples include artificial organ manufacturing experts, avatar developers, space travel guides, smart transportation system engineers, shared asset value specialists, and advanced science and technology ethics scholars. The technology sectors that are rising in importance due to the coming of the 4IR need more manpower. Regardless of educational background, IBM is calling people who are adapting to the era of digital revolution “New Collars,” and has filled a third of their workforce with such workers at their US headquarters. New collars are experts in AI, cloud and computers, and belong to a separate category of workers from blue and white collars. IBM has also set up a “P-Tech School” to nurture their own new collars. P stands for Pathway. Talent in this new field cannot be distinguished via existing industrial classifications and cannot be nurtured by traditional educational programs.

In addition, we can predict the increase of jobs that form as a result of the convergence of different knowledge and domains. Some examples include technical writers, user-experience designers and hologram exhibition planners. Change does not happen on its own, but is premised on human efforts to connect new technologies and changing businesses in different ways and to think in an integrated way. In other words, the “complex problem-solving ability,” “social technology,” and “system technology” discussed at the World Economic Forum are areas where human “connection and convergence” must be applied.

Moreover, jobs will become highly specialized and segmented in the future. Jobs such as robotic engineers, retirement planners, virtual reality recreation designers, and climate change experts that cover multiple fields can be even more specified and segmented. An emerging economic trend called gig economy (contracting temporary workers based on immediate needs) shows that in the future, jobs can be further subdivided by occupation and sector type.

In the future of the world of work, companies can be more expected to hire suitable talent and manage them more efficiently, and people can be more likely to work according to their skills and expertise and also enjoy a higher quality of life more than at present.

---

## Conclusion

The Fourth Industrial Revolution will bring about changes to the global industry from three perspectives. The first is the radical advancement in technology. The Fourth Industrial Revolution has begun with the accumulated advancement in innovative digital technologies over the last decades (e.g., AI, Blockchain, IoT, 3D printing). Innovative technologies are developing significantly further to impact the global industry, business, and human life.

The second is breaking boundaries of industry and business. Changes such as product-technology convergence, manufacturing-services convergence and alternative industries to destroy traditional boundaries or create new boundaries are also happening simultaneously. Companies that develop their competitiveness in order to adapt to changes will survive while those that fail to do so will be edged out of the market.

The third is changes in economic processes such as shared economy and a platform economy. A shared economy pursues “collaborative consumption” by sharing not only goods but also time, ideas, and technologies. The shared economy is drawing attention as a new solution to “excess production” in a modern society. A platform economy goes beyond a traditional method of transaction (1:1) to include transactions involving multiple players (N:N). Platforms differ by types and purposes, from online transaction platform to a DIY manufacturing platform.

The Fourth Industrial Revolution will influence the role of humans, its corresponding capabilities, and skills required. Human activities will expand in the areas where humans’ capabilities and skills required such as connectivity and creativity work importantly and create new values, such as R&D, design, ideation, marketing, and services. In addition, humans should develop themselves to live together with advanced technologies of the Fourth Industrial Revolution. Humans will improve their capabilities or even create new capabilities accordingly. Complex problem-solving ability, social technology, and process technology are capabilities that humans should improve or create from now on.

Under these circumstances, the labor market is expected to restructure. In the short term, middle-skill jobs will decrease or undergo significant changes. In the long term, high-skill and low-skill jobs will also decline, be replaced, or change. However, close attention should be paid to a new labor market in which new kinds of jobs are created, whereby humans will be able to take new opportunities in the new labor market.

Education should clearly convey the changes in our society and industry in the future. Starting with the concept of the Fourth Industrial Revolution, education should make students understand the massive impact of the Fourth Industrial

Revolution, including the impact of key technologies and changes to global industry and human life caused by such technologies. Second, as stated earlier, the role of humans, its corresponding capabilities, and required skills should be understood. Detailed methods and content of education should be also developed in each domain. Third, students should be taught about the ongoing labor market restructuring. They should learn how new roles, capabilities, and skills of humans can be naturally used in the new labor market. Furthermore, it is also an important role of education that encouraging changing attitudes to have a new value to labor in life such as the gig economy and to coexist with robots and AI.

## Abstract

The importance of transitioning toward a greener economy, which is part of the sustainable development agenda, has been recognized throughout the world. This chapter analyzes greening initiatives at the regional, government, and industry levels to understand the current and desirable role of partnerships for pushing the greening of economies to a new level. Intergovernmental collaboration between ASEAN countries that deal with environmental issues and countries' initiatives illustrate the ways challenges have been addressed individually and through coordinated efforts. At the industry level, greening measures are also adopted driven by CSR policies and targets to decrease cost of running operations.

The chapter suggests conceptualization of current and future actions for greening hotels in Hong Kong through a shareholders' value framework that

enables a clarification of strategies required for improvement in a systematic manner as well as identifying ways in which partnerships between TVET and the hotel industry can contribute to innovations for greening. It is a useful tool that allows hotels to focus attention on current and future actions that can bring green development for a company. Although this set of actions has been formulated in the context of Hong Kong, they can provide useful guidelines for the hotel industry throughout the Asia-Pacific region.

## Introduction

The importance of transitioning toward a greener economy, which is part of the sustainable development agenda, has been recognized throughout the world. Overall, debates on this issue are closely linked to the increased use of renewable energy, a shortage of resources and their increased prices, technological development and innovation, new markets, changes in manufacturing practices, and consumption patterns. At the state level, increased challenges related to the above issues, and climate change, have been high on the governments' priorities. The sustainable development goals (SDGs) adopted at the United Nations Summit in September 2015 reaffirmed many governments' commitment to green economic growth. A new index that accounts for the notion of sustainable growth, called the Global Sustainable Competitiveness Index (GSCI), was developed to measure the sustainable productivity levels of a country's economy with respect to environmental stewardship and social sustainability (Solability 2016). (The Global Competitiveness Index [GCI] that has traditionally been used to measure economic development has been reviewed.)

Overarching policies and plans that aim to support the development of low-carbon economies reflect these specific greening priorities in the Asia-Pacific region. Such examples as *the National Action Plan for Haritha Lanka Programme* (Sri Lanka), *the Vietnam Sustainable Development Strategy for 2011–2020*, *the Vietnam National Green Growth Strategy*, *the National Action Plan for Climate Change and its Eight Missions in India*, *the Law of the Republic of Indonesia No.17/2017 on the Long-Term National Plan 2005–2025*, and *the Green Development policy* approved in 2014 by the Mongolian government highlight these governments' commitment to greening their countries' economies and indicate an increased understanding of "important interlinkages between the environmental resource base, economic systems and social development" (UN 2012, p. 50). These green growth models adopted by governments and which are focused on the ideology of "beyond GDP" (European Commission 2009, 2013) can be illustrated by taking the example of China. The law that introduced a circular economy in 2008

decoupled economic growth from resource consumption and pollutants but simultaneously pushed the development of a new economic model that can help China to achieve sustainable development (Greeneconet 2017). *The 12th Five-Year Plan for Economic and Social Development of China (2011–2015)* (The Central People's Government of the People's Republic of China 2011) put forward a circular economy as the key strategic focus for the development of the country. This economy minimizes waste by using the outputs of one industrial process as inputs for another.

Greening of economies also necessitates structural alterations to the countries' labor market through changes to existing jobs and the introduction of new jobs. Therefore, new competencies for work in a restructured environment have been gradually introduced into education and training at different levels, including technical and vocational education and training (TVET). To ensure that skills development meets the demands of green growth and promotes a more inclusive future, it is particularly important to recognize the challenges industry is facing and to support its needs (including policy environment) before attempting to address skill gaps.

Considering the nature of sustainable development challenges, the creation of partnerships has been identified as an important measure for making more rapid progress toward addressing environmental degradation and achieving SDGs. Inter-governmental cooperation, and other coordinated efforts at different levels, can deliver the best solutions for the pressing challenges of green growth. Therefore, this chapter focuses on the role of partnerships in supporting the greening of economies as well as skills development at different levels. It examines partnership initiatives on the part of the Association of Southeast Asian Nations (ASEAN) (the *intergovernmental level*), analyzes some greening trends in the development of the ASEAN economic community, as well as its attempts to include green skills in training standards. Then this chapter unpacks challenges and measures taken at the levels of *government* and *industry* in Hong Kong (a Special Administrative Region, China) and illustrates issues related to partnerships and skills development using an example from the hotel industry. Findings of the study (*Greening skills in Hong Kong: Effective Partnerships between vocational education, government and industry to support greening of economy (2016–2018)* funded by the Research Grants Council of the Hong Kong Special Administrative Region, China (Project No. HKIED 18,601,515)) are presented in the form of a framework that reflects the ways hotels currently manage greening in order to create stakeholder value. The study also puts forward greening approaches for the future by focusing on internal developments as well as external influences and support. This innovative way of clustering activities provides clear guidelines for hotel managers on how to address the multiple challenges involved in the greening of the hotel industry in the context of Hong Kong. Although the results of this study are a contextualized account of greening, the proposed actions clustered within the framework can be used in other contexts to inform green changes in the hotel industry. In conclusion, this chapter argues for the need to strengthen partnerships for greening at all levels to guarantee the effective implementation of sustainable development goals in the region, including the development of skills needed for greener economies.

## Partnerships for Green Development and Green Growth in ASEAN

### ASEAN Economic Community and Labor Market Restructuring

The Association of Southeast Asian Nations (ASEAN) is a vibrant community that includes 10 member states with a total of more than 600 million people from Brunei, Indonesia, Cambodia, Laos, Malaysia, Myanmar, the Philippines, Singapore, Thailand, and Vietnam.

The ASEAN Economic Community (AEC) Blueprint (ASEAN 2007) called for the transformation of ASEAN into “a single market and production base, highly competitive, equitable economic development and fully integrated into the global economy and the global marketplace” (ASEAN 2007). This single market will support the implementation of existing economic initiatives, such as accelerating regional integration in priority sectors; facilitating the movement of business people, skilled labor, and talent; and strengthening institutional mechanisms. Findings from an ILO and ADB (2014) study calculated a change in GDP under the ASEAN Economic Community scenario using data from 2015 as a baseline. Most of the ASEAN countries would experience a gain in GDP between 2015 and 2025; however, the increase in GDP is likely to be different between individual countries. It is predicted, for example, that Cambodia will experience the largest increase of 19.9% by 2025, while Indonesia is predicted to gain 2.5% in GDP. In general, it is predicted that the lower-income ASEAN member states will experience the greatest change and will have the highest GDP growth relative to the baseline, since increased regional trade will benefit consumers and producers in these countries.

Significant changes to the labor market caused by closer trade integration under the establishment of the ASEAN Economic Community (AEC) in 2015 will lead to an increase in total employment by 2025 (ILO and ADB 2014 modeling). Around 14 million additional jobs could be created by that date. Indonesia, for example, will create an additional 1.9 million jobs over the baseline (1.3% of total employment) (ibid.). The AEC Blueprint recognizes the importance of the free flow of skilled labor. Therefore, intensive mobility and the exchange of labor within the AEC market require human resource development strategies, so people’s competencies and skills can be recognized. Mutual recognition arrangements have been signed for several occupations, including engineering, nursing, architecture, surveying, medical and dental practitioners, and accountancy. There is, however, a need for further guidelines that can be used as a reference for recognizing individual competency and skills. This will help to deal with such HRD issues as (i) human resource recruitment, (ii) project requirements, (iii) qualification compliancy, and (iv) competence/skill standard (Bateman 2016).

Inter-ASEAN labor migration rose substantially between 1990 and 2013: from 1.5 to 6.5 million (ILO and ADB 2014). Malaysia, Singapore, and Thailand account for 97% of these inter-ASEAN migrants. Around 50% of migrants in these countries come from a single country of origin: Malaysians travel to Singapore, Indonesians to Malaysia, and Myanmaris to Thailand. The majority are low- and medium-skilled

workers. It is predicted that migration within ASEAN will continue the same patterns, primarily in manufacturing, construction, fishing, and domestic work.

## Green Growth of ASEAN

The enormous challenges involved in developing an integrated market of goods, services, and labor in ASEAN have not drawn attention away from the need for the sustainable development of the AEC. In addition to the ASEAN Economic Community (AEC) Blueprint (ASEAN 2007), the ASEAN Socio-Cultural Community (ASCC) Blueprint 2025 (ASEAN 2016a) was also adopted by the member states. It has a special section on sustainable development (Section C) that calls for an increase in “policy and capacity development and best practices to conserve, develop and sustainably manage marine, wetlands, peatlands, biodiversity, and land and water resources.” Sustainable development has been a shared concern for the ten member countries. Since 1977, ASEAN has promoted environmental cooperation among its members. Currently, ASEAN’s environmental cooperation focuses on four priority areas of regional importance that are suggested in the “Sustainable” section of the Blueprint (ASEAN 2016a):

- C.1. Conservation and sustainable management of biodiversity and natural resources strategic measures
- C.2. Environmentally sustainable cities strategic measures
- C.3. Sustainable climate strategic measures
- C.4. Sustainable consumption and production strategic measures (pp. 10–13)

Realization of these measures will lead to labor market restructuring of all member states, although the levels of change (the introduction of new jobs and the adjustment of existing jobs) are different in each country.

The document states:

The ASCC envisions the achievement of a sustainable environment in the face of social changes and economic development. . . . The objective of this Characteristic [Sustainability] is to promote and ensure balanced social development and sustainable environment that meet the needs of the peoples at all times. The aim is to strive for an ASEAN Community with equitable access to sustainable environment that can support its social development and its capacity to work towards sustainable development. (ASEAN 2016a, p. 10)

ASEAN countries have started mainstreaming various climate change and green growth priorities into their national development plans because economic growth, human well-being, and environmental performance are inseparable. Evidence from the region shows that environmental degradation has already begun to undermine human well-being and economic growth. For example, the number of deaths from outdoor pollution and the costs associated with medical treatment have been increasing in ASEAN countries. Indonesia leads the ranking, with almost 65,000 deaths in 2010, and the costs associated

with medical services are now around US\$50,000 million (OECD 2014). Therefore, the model based on “grow now, clean up later” does not work.

Overall, ASEAN countries have moved down the global sustainable competitiveness index in 2016 compared to 2014. In 2016, the ranking range was between 33 (Malaysia) and 125 (Cambodia), but in 2014 the range was between 24 (Singapore) and 117 (Philippines) (Table 1). However, three ASEAN countries moved up the scale – Malaysia, Brunei, and the Philippines. This is largely related to the emphasis these governments put on the greening of their economies (e.g., the Malaysian government put forward strategies for developing green technologies and supports the green skills training provisions stated in the Roadmap on Green Technology, prepared by the country’s National Green Technology Centre). (The Malaysian government recognizes that technology is one of the key drivers for green economic growth. *The National Green Technology Policy* was launched in the country in 2009 to provide directions for development, including growing the **green technology industry**. It stated that there should be minimal environmental degradation and have zero or low greenhouse gas emission, should be safe to use and promote a healthy and

**Table 1** Global sustainable competitiveness index (ASEAN)

Country	Sustainable competitiveness index 2014		Sustainable competitiveness index 2016	
	Rank	Score	Rank	Score
Malaysia	42	45.9	33	47.4
Brunei	53	44.8	46	46.5
Indonesia	35	46.1	57	45.0
Singapore	24	47.4	60	44.7
Laos	61	44.1	67	44.2

Philippines	117	39.4	97	42.0
Thailand	101	40.5	100	41.6
Cambodia	88	41.8	125	39.2

Source: Extracted from the sustainable competitiveness index 2016 – SolAbility (2016) by the author

improved environment for all forms of life, conserve the use of energy and natural resources, and promote the use of renewable resources (Ministry of Energy, Technology, Science, Climate Change and Environment 2009).)

The future of ASEAN economic development and human well-being in member states depends on policies and actions that benefit both economic development and environmental performance. The OECD (2014) reviewed the most recent medium-term development plan for each ASEAN country. In addition, two green growth plans led by the Ministry of Planning were reviewed: Singapore Sustainable Development Blueprint (2009) and the Vietnam National Green Growth Strategy for the period 2011–2020 and results are summarized in Table 2. (Note by OECD (2014): There are some inconsistencies between the Singapore documents reviewed. While other documents in Singapore consider climate change mitigation as a key priority, Singapore’s Sustainable Development Blueprint includes no specific objectives or strategies for reducing greenhouse gas emissions.) Countries tend to focus on

**Table 2** Environmental priorities at the policy level

	Cambodia	Indonesia	Lao PDR	Malaysia	Myanmar	Philippines	Singapore	Thailand	Vietnam
Resilience to natural disasters/adaptation to climate change	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes
Sustainable forest and land management	Yes	Yes	Yes	Yes	Yes	Yes	No	Yes	Yes

Energy efficiency	No	Marginal	Marginal	Yes	No	Yes	Yes	Yes	Yes
Climate change mitigation	No	Yes	No	Yes	No	No	No	No	Yes

Source: OECD (2014)

The medium-term development plan for Brunei Darussalam was not available online

A “no” indicates that the objective did not appear in the plan – although it may have been listed as a challenge (but with no details about how to address it) – or may appear in a stand-alone sectoral strategy

A “yes” indicates that the objective appeared in the plans and is therefore considered mainstreamed

climate change adaptation, forestry and land management, and a reduction in pollution. Less consideration is given to climate change mitigation.

Thus, a more proactive approach is required from the government side. Furthermore policy analysis by the OECD (2014) indicates that more policy measures are necessary to deal with environmental issues in ASEAN. Some Southeast Asian countries have already established institutions for the design and management of green growth strategies. However, within the new ASEAN Economic Community, increased coordination between sectors, between sub-national authorities, and across the region is required. Based on four strategic objectives (C1–C4) in the ASEAN Socio-Cultural Community Blueprint 2025 (ASEAN 2016a), nine areas of cooperation have been established, but these also require attention in terms of skills development and recognition:

1. Nature conservation and biodiversity
2. Transboundary haze pollution
3. Environmental education
4. Chemicals and waste
5. Environmentally sound technology
6. Environmentally sustainable cities
7. Coastal and marine environment
8. Water resources management
9. Climate change (ASEAN 2016a)

The emphasis on cooperation here reflects an understanding that there is a need for transboundary collaboration if environmental issues are to be addressed effectively. Some examples of environmental partnerships in the Greater Mekong region illustrate this approach. Intergovernmental partnership includes:

- (i) Developing national environmental policies and strategies in Cambodia, the Lao PDR, and Vietnam
- (ii) Supporting the application of sound environment management policies and tools – including the launch of Myanmar’s environmental impact assessment procedure and environmental quality guidelines – applying land use planning simulation modeling in Cambodia and the Lao PDR, and industrial pollution projection modeling in Cambodia and Myanmar
- (iii) Jointly developing a transboundary biodiversity landscape monitoring and evaluation framework
- (iv) Creating transboundary conservation plans for rare species
- (v) Promoting fuel efficient technologies, eco-driver training, and improved logistics measures – successfully tested in the Lao PDR and Vietnam and under way in Thailand (ADB 2017, p. 72)

These existing initiatives are good examples of the expansion of intergovernmental collaboration in the nine identified areas.

Thus, ASEAN partnerships that address environmental challenges are visible at the policy level: jointly adopted documents have started to affect labor market restructuring. However, more work should be done about the systematic development of human resources by formulating policies that stipulate required skills. For example, in order to deal with waste management, a number of actions are required. They include:

- Introducing controlled and sanitary waste management services and enhancing quality of work in the informal waste management sector
- Building and servicing biogas plants to provide eco-friendly and economical fuel for lighting and cooking, in place of kerosene
- Building and servicing composting plants to convert waste into natural fertilizers that can replace the costly chemical based or petroleum-based fertilizers that can pollute groundwater reserves (ILO 2014)

The development of skills and competencies that underpin effective job performance in these areas should be included in different types of training and should be a priority for designing the TVET curriculum targeted at waste management occupations.

It is not just those areas that are directly related to the environmental sector (typically air quality, nature conservation, environmental assessment, waste management, water quality, renewable energy, forestry, etc.), all industries should become greener. Traditional sectors, such as agriculture, contribute 24% of the direct greenhouse gas emission worldwide, industry contributes 21%, transport 14%, and buildings 6.4% (Intergovernmental Panel on Climate Change 2014). Therefore, measures to make these sectors greener will also impact on jobs and skills requirements. Considering that for seven out of ten ASEAN countries agriculture is the first priority for development (ILO and ADB 2014), particular attention should be given to the greening of this sector. Other priority sectors for growth are transport, construction, and infrastructure (ibid.). TVET that develops greener skills for these priority sectors, environmental industries, and strategic areas for ASEAN environmental cooperation is a crucial contributor when it comes to dealing with actual and potential skill gaps in the region. The process incorporating green skills into the TVET curriculum can be called the “greening of the TVET curriculum.”

## Green Skills Development

As outlined previously, the environmental sector (or green industries) and all other industries require the greening of skills, which should be addressed in TVET and industry-based training programs. Therefore, ASEAN’s commitment to establishing mechanisms to support labor mobility through mutual recognition of education qualifications and to improve TVET quality and accessibility must include greening initiatives. Regional policies, such as Guidelines on ASEAN Good Agricultural Practices (ASEAN GAP) (2006) and Guidelines on ASEAN Good Aquaculture

Practices (ASEAN GAqP) (2015), were established as acknowledged common standards with minor national differences. They are mainly aimed at preventing or minimizing environmental risks in agriculture and aquaculture production (The ASEAN Secretariat 2015).

These common standards should be reflected in training programs across all ASEAN countries. Such initiatives as Regional Model Competency Standards (RMCS), developed by ILO (2016) in consultation with employers, governments, and workers (specifically for agriculture and aquaculture), include green skills. Currently, the RMCS has incorporated both environmental and safety requirements for performance in each unit of competency. These requirements are made explicit in the introduction section of the standards (ILO 2016).

In terms of further developments, based on this example, competency standards for occupations in the nine areas of environmental cooperation (ASEAN 2016a) could also be developed and should include green skills. (Green skills – those skills related to reducing environmental impact and supporting economic restructuring with the purpose of attaining cleaner, more climate resilient, and efficient economies that preserve environmental sustainability and provide decent work conditions (Pavlova 2018).) Green skills should also be visible in the ASEAN Qualifications Reference Framework (ASEAN 2016b) and reflected in ASEAN Guiding Principles for Quality Assurance and Recognition of Competency Certification Systems adopted by the 24th ASEAN Labor Ministers Meeting (Bateman 2016).

Environmental education, as one of the areas for cooperation for ASEAN countries, should also address the development of generic green skills (see Pavlova 2018 for a more detailed discussion):

skills [that] are required in almost all occupations in order to understand and appreciate the issues and demands involved in greening economies. These generic skills facilitate the preparation of the future workforce to understand issues of green growth (including environmental, social and economic aspects), interpret environmental legislation, increase energy and resource efficiency, and enable the processes involved in greening the economy. (Pavlova 2018, p. 343)

In addition, personal qualities, attitudes, and behavior that can have a positive effect on green practices in workplaces should be introduced and developed through education.

This multidimensional approach for including green skills in training standards, which underpins the environmental collaboration among ASEAN countries, facilitates the effective realization of plans that are adopted.

This section analyzed issues of partnerships for green economic restructuring at the policy level of the ASEAN Economic Community and ASEAN Socio-Cultural Community and discussed their implications for skills development. The partnerships reflect a commitment between ten countries to catch up with the sustainable development agenda by strengthening intergovernmental policy measures related to green growth and sustainable development. Although the first steps in the harmonization of training standards that include green skills have been done in the region, more effort is required to address the issues related to green skills development in

order to support ASEAN environmental collaboration. The following section examines the issues and challenges for partnerships for greening in the specific context of Hong Kong.

---

## Partnerships for Greening in Hong Kong

### Policy Initiatives

In the face of climate change and the rising recognition of the importance of sustainable development at a country level, governments are taking measures to transition toward a greener economy, which is “*an alternative to today’s dominant economic model*”; it promotes sustainability, social equity, financial stability, and prosperity (UNEP 2018). The Hong Kong government is not an exception (e.g., Lam, 2013). Many initiatives and programs have been launched in Hong Kong SAR to facilitate changes in the environmental industries (HKPC 2017), waste management (ENB 2013), and transportation sectors (EPD 2017). In the *Hong Kong Climate Report 2015*, the government set a target to reduce Hong Kong’s carbon intensity by 50–60% by 2020, compared to the level in 2005 (ENB 2015). In the Hong Kong’s Climate Action Plan 2030+, the government adjusted the target to reduce the carbon intensity even further by 65–70% by 2030. To achieve this, suggested strategies include filling in knowledge gaps, encouraging innovation, enhancing partnerships with private sectors, and raising community awareness (ENB 2015). The Chief Executive’s 2017 Policy Address referred to a need to develop green finance and green tourism (Lam-Cheng 2017). The financial and tourism sectors are two major industry sectors in Hong Kong, which contributed 17.6% and 5% to the GDP, respectively (CSD 2017), and so their greening can definitely contribute to transitioning the local economy to a greener model, which is “*low carbon, efficient and clean in production, but also inclusive in consumption and outcomes, based on sharing, circularity, collaboration, solidarity, resilience, opportunity, and interdependence,*” according to the definition developed by the United Nations Environment Programme (2018).

### Greening of the Hotel Industry

At the policy level, the Hong Kong government is committed to establishing favorable conditions for greening the economy. To examine the impact of this political environment on industries, this section presents some results of a study *Greening skills in Hong Kong: Effective Partnerships between vocational education, government and industry to support greening of economy* (2016–2018) that focused on greening several industries, including the hotel industry. Semi-structured interviews and surveys, as well as analysis of secondary sources, provided data for this study that is a rich qualitative account of greening the hotel industry in Hong Kong and the role of partnerships. Survey design and development of interview questions

were informed by an analysis of existing literature (e.g., Cedefop 2010; Per Capita 2010; OECD 2011; Strietska-Ilina et al. 2011; ADB 2012; Schmitz and Becker 2013; The Research Base 2014; Baumgarten and Kunz 2016) as well as previous research by the team members (e.g., Pavlova 2014, 2015, 2017; Maclean et al. 2017). A specific focus on partnerships (types of partnerships, levels, reasons for partnerships, and levels of satisfaction with results, barriers, and contributions of different partners, as well as types of engagement) in designing the survey was informed by research from Griffin and Curtin (2007), ETF (2013), and Smith et al. (2017).

The focus of the semi-structured interviews with four hotels in Hong Kong included the following themes:

- Environmentally friendly practices
- Types of skills required for green restructuring and staff training
- Different aspects of partnerships for greening
- Measures to improve collaboration for greening

In order to ensure the richness of collected data, hotel management staff who had high levels of awareness about greener practices were interviewed.

Overall, 21 surveys were distributed to hotels in Hong Kong and 2 to guesthouses. Four responses were received from hotels. Researchers followed up with phone calls to those hotels that did not respond. This follow-up strategy raised the response rate to 100%, and we were able to establish that the notion of greening is still relatively new for hotels in the Hong Kong context, as many stated they are not currently undertaking relevant practices (e.g., environmental friendly measures, greening skills development, and partnerships for greening) that would be of interest to this particular research study. *This is an important finding in itself as it highlights the need to improve greening policy implementation into hotel practice.*

### **Greening Practices**

In Hong Kong, the inclusion of sustainable business practices into the hotel's operation most often fell under the umbrella of corporate social responsibility (CSR) and focused on presenting a more socially responsible image of the company. In one hotel a CSR team had been established that included senior members from different departments, and it aimed to look at opportunities in relation to three pillars: diversity, education, and environment. One hotel did not have a CSR team, and the other two had well-established CSR strategies where community empowerment and issues of company's sustainability were among important concerns. Three of the interviewed hotels belong to two hotel groups that had launched corporate guidelines or an environmental sustainability strategy with a set of goals that stressed the promotion of environmental stewardship. For example, some targets include achieving a 2% energy consumption reduction with year-on-year targets, reducing water use per guest per night by 25% and reaching a 40% recycling diversion rate. Thus, these chain hotels followed the corporate policies established at their headquarters. However, only one interviewed hotel focused on more environmentally responsible purchasing practices. The other three reported an absence of guidelines

on sustainable procurement with the exception of seafood. To implement these guidelines, two of the interviewed hotels that belong to a hotel group set up a green team or green community to address CSR issues relevant to the environment. They meet regularly (quarterly/monthly) to brainstorm key environmental/sustainability issues within the hotel that can be addressed by different hotel departments. The director of engineering, for example, mainly dealt with issues related to energy consumption, and the head of the food and beverage department focused on waste management; however, the team overall focuses on cross-departmental solutions.

Neither of the hotels developed an overall greening plan for different operations with specific targets for one or several years. Current processes involve the identification of a single issue and then addressing it. One hotel stated that their focus for the coming year would be waste management; this is aligned with a government priority. Hotel A stated “To raise awareness of food wastage, continuous year-on-year campaign, associates are aware of the ‘icon’/‘mascot’ of food wastage. We are looking into solutions to further expand our food wastage recycling program.”

All four interviewed hotels have a range of environmental strategies in place, although economic return and cutting costs are the major drivers for such initiatives. The corporate environmental and sustainable management practices require a high level of buy-ins and engagement from board member/s or top management. Common green initiatives across hotel practices include asking guests to consider not having their sheets changed every day; recycling soap, paper, glass, coffee cups, used oil, and waste; installing LED light and motion sensors; supporting green community groups; and purchasing sustainable seafood. In addition, one interviewed hotel installed heat electronic pumps in guest rooms and the swimming pool to save energy and cut costs and also decided to observe Earth Hour. Another offered electric transportation options to its guests and established a huge vertical garden in the lobby, and one built an aquaponic system to grow herbs for catering services. Hotel B stated in the survey: “The company is 100% committed in recycling and reduction in use of utilities for all daily operation activities.”

## Challenges

The hotel industry faces a number of recurring challenges on the journey to greening. First of all, *limited budget* and *marketing concerns* are the biggest obstacles. To promote the green features of a hotel, it is important for hotel management to understand what kind of products and services consumers look for in a green hotel. However, this is not known. For instance, the corporate guidelines for some hotel chains discourage reuse, especially at the luxury hotels. Thus, corporate guidelines can reduce the flexibility of a hotel to develop greener solutions. Tight budgets make it hard to install motion sensors or other devices that help reduce energy or support community groups. Second, there is a need to establish a *dedicated green team* that oversees and supports all greening policies and practices within a hotel. The third challenge is *hygiene and food safety*. One hotel reported that they have been trying to replace bottled water with glass jars, but because of hygiene concerns, the top managers had not supported the measure. Another hotel stated that they do not donate food or keep it for another round at the buffet section due to hygiene concerns.

Fourth, a *lack of space to handle waste and extra manpower required* to facilitate operations can be factors that hinder the full incorporation of waste management measures. Another issue is a *lack of government support*, particularly in terms of funding and the difficulty in navigating through the myriad of funding sources and the means to apply for them. There is also a paucity of recycling companies, so it is difficult for hotels to find a partner. Several hotels experience difficulties with recycling soap. This is due to the high admin costs associated with running this operation (due to logistics difficulties) or because recycling companies have limited capacity. For these reasons, these activities have ceased in two hotels. The Hong Kong government also does not have any promotional strategies for the greening of hotels. The next challenge relates to the *limitation of hotel facilities*. If a hotel is located on several floors of another building, then the management of that building organizes waste management and air-conditioning regulations, so it is difficult for the hotel itself to initiate improvements. In addition, if the hotel is old, sometimes it is not possible to incorporate innovation solutions due to existing hardware limitations. *The distance between a hotel and collecting companies* can have a negative impact on a hotel's ability to recycle. Recycling companies would not travel far as this increased operational costs.

In addition to the *lack of regulations from the government, staff attitudes* can mean people resist change and do not want to leave the comfort zone of their usual practice. Furthermore, a *lack of training* from the hotel association, combined with limited training opportunities within the hotel (some hotels only have one person instead of a training team so, for example, it is not possible to provide staff training on how to organize a green banquet), is an additional challenge. *Induction training* for new staff usually *does not include any issues related to greening the workplace*, but might include some corporate values. One hotel organized a 30-minute orientation for staff to improve their environmental literacy. Two hotels have developed some green training materials for in-service training workshops, but the *nature and volume of these materials is very limited*. However, hotels use intranet, posters, and social media to announce green initiatives. A company's Facebook page tends to attract a larger audience, so there is a need to *use more engaging platforms*.

## Existing Partnerships for Greening

Key features of partnership interactions for greening outside a hotel can be analyzed in terms of components, relationships, and functions (Ranga and Etkowitz 2010). The following key features have been identified through the study:

Components (key external partners):

- Government departments/offices
- NGOs in Hong Kong
- Private companies
- Industry/business associations
- Professional associations
- Universities/TVET institutions

**Relationships:**

- Supply chain connections (value to local industry supply chain)
- Mobilization of social, physical, environmental, cultural, etc., capital
- Civic engagement (involvement in working parties, committees in communities)

**Functions:**

- Creation and development of new learning infrastructures/environments
- Leadership capacity building (within institutions to lead partnerships)
- Innovation and creativity in relation to community
- Skills development and transfer in the local community

Hotels in this study have established close links with government offices (e.g., Environmental Bureau, Environmental Protection Department – Glass Container Recycling Program for the Hotel Sector) and NGOs (e.g., Food Angel, Salvation Army, Foodlink) to handle food waste, collect, and recycle plastic and paper, and they work with private companies (e.g., On Kee [HK] Environmental Recycling Ltd., recycling companies at eco-park partially supported by the government) to recycle soap and recycle food waste into biodiesel or fish food. Informal links with other hotels to share good practices were also visible throughout this study. Partnerships with universities and other organizations for staff training: teams or individuals have been sent to undergo external short training for upskilling, for example, engineers attended workshops at Hong Kong Productivity Council (HKPC) and China Light and Power Co Ltd.; kitchen staff go to CityU scope, PolyU, or HKPC to gain a certificate for hygiene management. The importance of receiving external training is well acknowledged. Training exposes hotel staff to new ideas that can help drive innovation and familiarize them with the latest trends in the market. In addition to skills training, some staff enroll in master's degrees at the universities. Hotels also support NGOs and communities to promote greening and social development: Oxfam Trailwalker Hong Kong and Local community in Tai Kwok Chui (to collect unwanted toilet paper and plastic); and they work with the Hong Chi Association to provide volunteer services for children with intellectual disabilities.

Some hotels acknowledged that their representatives have been invited to present at educational institutions (both universities and TVET) and to engage in supporting university research at their hotel. Partnerships between VPET and the hotel industry are mainly limited to internship training places for students (usually for 3–6 months) (e.g., ERB, VTC, HKUSPACE, PolyU, Hong Kong Community College [PolyU HKCC]); students' visits to hotels, TVET teachers gaining industry experience, and the provision of feedback on student skills.

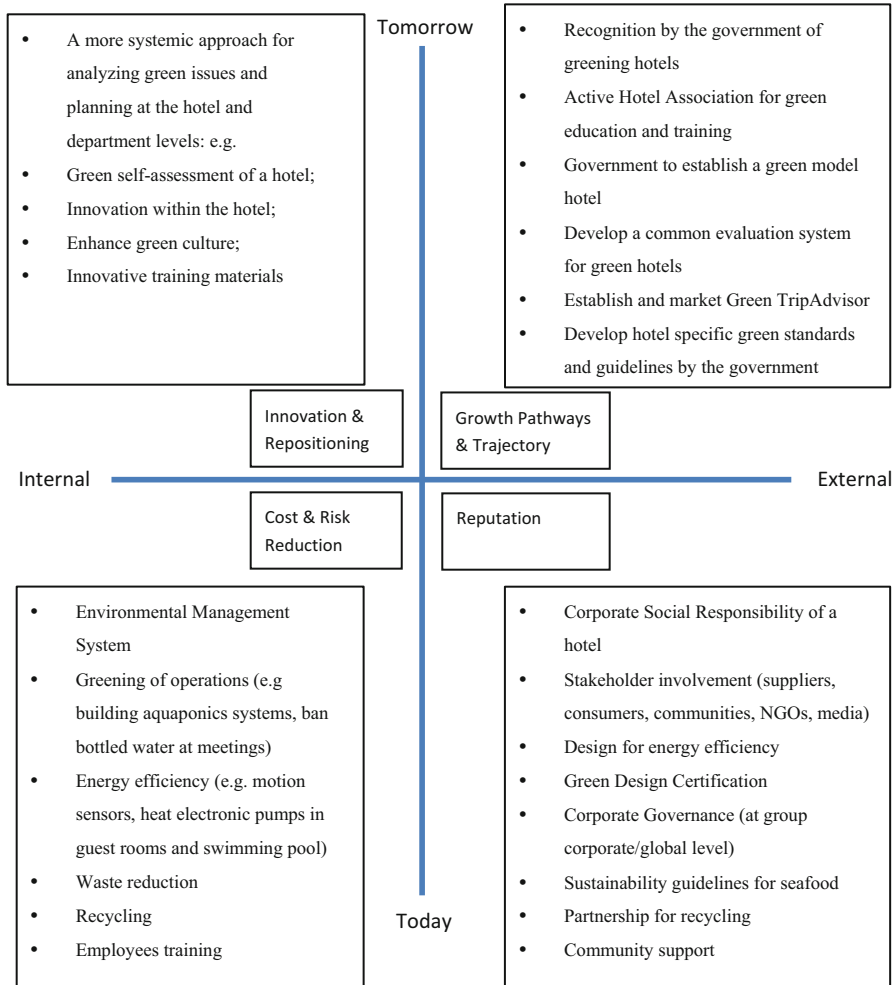

The most important perceived reasons for partnerships are community benefits, recommendations by the government, and environmental sustainability policy and practice in the hotel (all 33%). The second most important reasons include environmental sustainability policy and practice in the hotel (67%) and positive reputation (33%). Therefore, hotels' internal policies and practices, government recommendations, community benefits, and good reputation are the main reasons for green

collaboration that results in the “ability to deliver coordinated packages of services to individuals or organizations,” “achieve community’s recognition of hotel’s green initiatives,” “support innovation in staff learning in terms of green skills inclusion and greening in general,” and “build additional capabilities in hotel staff in terms of greening skills and knowledge.”

## Suggestions

Interviewees identified a number of conditions for effectively greening the hotel industry. They mainly agreed that both *customer push* and *governmental push* could play a significant role. The *establishment of a sustainability team* is the best means of pursuing a green agenda within a hotel. A *change in mind-set* for the public and employees has been identified as even more important than a particular set of skills. Positive and strong attitudes toward environmental protection and personal beliefs are powerful motivators for people and stimulate them to becoming proactive in implementing environmental friendly practices. A paradigm shift is imperative to drive talks into walks so that a lot of green initiatives implemented are well received and accepted by hotel staff and the public. For example, in terms of food waste recycling, it is extremely important not to contaminate waste with other products (e.g., napkins) because it reduces the amount of protein in waste, making it impossible to produce quality fish food from the waste. No particular skills are required from staff dealing with waste management but a positive environmental attitude is, so a person can behave in the appropriate manner. One hotel reported that only 50% of guests opt not to have their bed linen changed every day. At the time of the interviews, all participating hotels were identifying opportunities to raise environmental awareness in the community.

In conceptualizing current and future development for the greening of hotels in Hong Kong, a shareholder values framework designed by Hart and Milstein (2003) can be applied to present the findings of this study (Fig. 1) to ensure a multi-dimensional view. In Fig. 1, the vertical axis in the model reflects the company’s need to manage today’s business while simultaneously creating opportunities for tomorrow (short-term results vs. expectations for future growth). This model links strategies and practices to the creation of stakeholder value. The horizontal axis reflects the company’s need to grow and protect internal organizational skills and capabilities while simultaneously infusing the company with new perspectives and knowledge from the outside. Internally, hotels need to develop or acquire skills, competencies, and technologies that reposition the company for sustainable development and to keep pursuing environmental strategies such as pollution prevention and waste management to create shareholder value for existing business through cost and risk reduction. On the other hand, along the vertical axis, sustainability governance, stakeholder engagement, CSR initiatives, and transparency are external actions that hotels should look at in a bid to lower environmental impacts across the value chain and to enhance legitimacy and reputation. To improve hotels’ future performance, it is important to articulate clear directions for future growth and

**Fig. 1** Greening the hotel sector. (Source: Author)

supporting conditions through involvement of different stakeholders. This is where partnership with education (including TVET), government, civil society, and other industries plays a critical role in including shareholder value into a company’s operations and increasing hotels’ confidence in selected activities (Hart and Milstein 2003). Partnerships for innovation and green growth are essential for achieving a sustainable future. The quintuple helix model (Carayannis et al. 2012) identifies (1) academia/TVET (the education system), (2) industry (the economic system), (3) government (the political system), (4) society (media-based and culture-based public), and (5) the natural environment as the five entities responsible for *knowledge and innovation generation, dissemination, and usage*, which can be applied to the hotel industry context for the purpose of identifying ways partnerships can be

developed. (In this quintuple helix model, academia contributes by ensuring quality of knowledge through a process of approval by “hierarchically established peers”; industry contributes by producing applicable knowledge; and government contributes by assuring social accountability during the process of knowledge management. The interrelations between academia, industry, and government constitute a national innovation system of knowledge production and dissemination based on cooperation and interaction. In addition, society represents the “media-based and culture-based public” that plays an important role in knowledge interpretation and transfer. Every aspect of the national innovation system is under the influence of social reality, which in turn significantly depends on public media and culture. Finally, the natural environment is the outermost context of the quintuple helix model. The addition of this dimension highlights the challenges and constraints that link knowledge innovation with the environment itself (Pavlova 2018).) Industry, government, and society have already been important partners for hotels. However, it is argued here that TVET can also be a significant partner involved in *knowledge and innovation generation, dissemination, and usage* (despite the fact that currently TVET and the hotel industry do not have extensive partnership links). Based on the data collected from this study in the future, TVET can be an active partner for helping the hotel industry to address activities stated in the upper part of the framework and dealing with environmental issues identified by hotels, such as:

- Provide training for green upskill/develop training materials for hotels’ internal staff training, including video-based materials.
- Provide support for applied research, such as the development of green/sustainable procurement guidelines; green operation guidelines.
- Establish innovative recycling companies, e.g., recycle soap and coffee cups.
- Design and support the implementation of creative approaches toward working with the local community to recycle/collect plastic and paper and develop environmental awareness.
- Set up a pilot/demonstration project on green hotel operations.
- Develop publicity for “Green guest experience in Hong Kong.”

Thus, these possibilities for collaboration are related to a number of future actions included in Fig. 1 that require innovative solutions to advance the greening of hotels. Although the bottom part of the framework presents “today’s” practices that exist in those hotels that took part in the study, some activities still present a challenge for hotels, and not all of them currently exist in all hotels. All interviewed hotels have been focusing on the bottom part of the framework, by looking at short-term solutions and existing services. However, suggestions proposed during interviews about making the hotel industry greener are included in the upper part of Fig. 1. They are explained in some detail below.

### **Growth Pathway and Trajectory**

**Recognition by the government of greening hotels:** award schemes or a charter scheme on the green practices of hotels will help hotels to devote more attention

to greening. Private companies, such as CLP, has an award program – CLP GREENPLUS – for the hotel sector that awards companies for excellence in smarter and greener energy use. The government can implement similar charter or award schemes to reward different aspects of greening, for example, the Charter on External Lighting whereby participating companies commit to a reduction in external lighting and in turn receive certificates and media coverage.

**Active hotel association for green education and training:** to serve as a platform for sharing best green practices, given its strong network, and to develop training for green practices, such as learning how to sort waste or organize a green banquet.

**Government to establish a green model hotel:** the creation of a green model hotel can certainly “create noise amongst peers,” and the model hotel could provide strong evidence to showcase the benefits of implementing green practices. This hotel can be established through collaboration between hotel and university/TVET and will require strong government support in order to explore and incorporate green practices. It will serve as a best practice model to demonstrate to peers that greening is a positive initiative and to show how it can help reduce costs.

**Develop a common evaluation system for green hotels:** an evaluation system related to the performance of different environment aspects of hotels, with ranking of well-performing hotels, can be a motivation for the industry to go green. As the evaluation system and ranking will be accessed by the public, hotels would be more willing to put effort into greening in order to maintain or improve their public image.

**Establish and market a Green TripAdvisor** platform, like TripAdvisor, on green hotels so guests can share their opinions. Comments from guests are powerful indicators of business performance, so they drive internal performance. Such a platform is a good way to encourage the industry to adopt green practices. However, the platform should be well advertised and very familiar to the public.

**Government to develop hotel-specific green standards and guidelines:** although the majority of hotels are trying to develop a green corporate culture, they all acknowledge this might take a long time, but *clear government regulations* on different aspects of hotel work can bring hotels to greener practices quicker, as all members of a hotel board would need to comply and a top-down model for greening would be reinforced. Any standards, such as energy and water use, level of recycling, and guidelines on procurement, will convince board members to comply and to fully implement green initiatives. Environmental regulation is the most effective means to green the industry and is commonly seen as the strongest and fastest motivator to achieve that goal. Other suggestions include the creation of a catalog of environmental products for the hotel industry that contains a wide range of environmentally friendly energy- and water-saving products.

The above measures can introduce new perspectives and knowledge from outside the hotel industry, so it can be open to new perspectives. These can help formulate a clear vision of a future growth path and trajectory.

## Innovation and Repositioning

### A More Systemic Approach for Analyzing and Planning at the Hotel and Department Levels

The development of a systematic approach for analyzing, planning, and implementing green initiatives in the hotel industry starts with the formation of a managerial-level green team that supervises the management of initiatives as well as ensuring all related departments and teams are fulfilling their roles and responsibilities with respect to greening. Hotels can adopt an environmental management system as an overall strategy for ensuring green initiatives become a part of regular policy and practice in the hotel. An environmental management system is a cycle of planning, implementing reviews, and improving greening processes and actions. It ensures those actions “meet its environmental obligations and continually improve its environmental performance” (BEC 2008). A widely adopted example is ISO 14001 which is an “international standard which specifies the requirements of an environment management system” (BEC 2008). An environmental management system, combined with innovation and the education of staff, will form a systemic approach to the greening of hotels.

A systematic approach for analyzing and planning at the hotel and department levels includes many elements. Those that were discussed in interviews are referred to below:

#### 1. Understanding the Process of Greening in Hotels

**Green self-assessment for a hotel:** Conduct a review on the environmental impacts of operations and the effectiveness of current green practices. In order to examine the environmental impacts, hotels need to identify the environmental aspects of different processes in their operations, e.g., use of water and electricity and the disposal of food and other waste. Identifying environmental impacts helps with planning and designing specific green initiatives. Current green practices should also be reviewed in order to measure their effectiveness and identify how they can be improved to achieve better environmental performance.

#### 2. Planning for Greening

**Innovation within the hotel:** Adopt innovative methods and clean technology to green hotel operations. For example, one of the interviewed hotels in Hong Kong pioneered their own aquaponics system, which is a closed-loop farming system that combines fish farming and herb growing. Another innovation that is more common in the overseas hotel industry and that has not yet been implemented in Hong Kong, includes, for example, using green products for hotel rooms and facilities and adopting new technology (e.g., waste disposal tracking technology, energy management system)

#### 3. Implementing the Greening Plan

**Enhancing green culture and applying innovation:** Cultivate awareness among all levels of staff to facilitate the smooth implementation of green initiatives. Environmental awareness, understanding of environmental issues, and a

receptive-to-change mind-set among staff are equally important for the greening of the industry. A top-down approach in the corporate culture for the adoption of green measures is essential if all staff are to be engaged, regardless of level, so they comply with new policies and practices related to greening. This can also create opportunities for bottom-up approaches for innovation. The development of green culture requires the development of green skills (see above and Pavlova 2018).

**Innovative training materials:** Consolidate current and newly introduced practices on greening by creating more training courses for green initiatives. Apply innovative approaches for the development of training materials to be used in hotels. For example, video resources can increase the flexibility and consistency of training and cut costs related to inviting in external trainers.

#### 4. Monitoring Processes and Assessing Results

An evaluation of green initiatives is necessary to ascertain their effectiveness. External professional consultancy services could conduct environmental audits and report on environmental performance. Alternatively, green teams could perform this evaluation internally.

The above measures will support the development of skills, competencies, and innovation for repositioning hotels for future growth. The implementation of the “innovation and repositioning” part of the framework identifies internal processes required for the greening of hotels.

Considering the complex and multidimensional nature of greening hotels, hotel managers need to oversee all four dimensions instead of focusing on just one or two. There is a need to address current issues of waste management, energy saving, and the increased environmental efficiency of day-to-day operations, but this should not distract attention from the reorientation of portfolios toward new technologies and practices, new partnerships, and skills development approaches within and outside the company. Addressing these multiple challenges related to all four dimensions can provide opportunities for business growth. Furthermore, the identified strategies and practices can improve the overall performance of hotels.

---

## Conclusions

This chapter analyzed greening initiatives at the regional, government, and industry levels to understand the current and desirable role of partnerships for pushing the greening of economies to a new level. Intergovernmental collaboration between ASEAN countries that deal with environmental issues and countries’ initiatives illustrates the ways challenges have been addressed individually and through coordinated efforts. Policies adopted at the regional and state levels to tackle issues of greening have been designed to stimulate change in different economic sectors. Therefore, there is a need to emphasize the development of human resources strategies that support these initiatives and address the needs of a changing labor market. A number of guidelines and competency standards have been developed at

both ASEAN and country levels in the Asia-Pacific region as a basis for curriculum design in TVET where skills related to environmental protection are included.

At the industry level, greening measures are also adopted driven by CSR policies and targets to decrease the cost of running operations. However, the industry (and in this chapter the case of the Hong Kong hotel industry has been discussed) feels that more support from the government is required and that stronger partnerships with different stakeholders can significantly improve the greening of this industry.

Conceptualization of current and future actions for greening hotels through a shareholders' value framework enables a clarification of strategies required for improvement in a systematic manner as well as identifying ways in which partnerships between TVET and the hotel industry can contribute to innovations for greening. It is a useful tool that allows hotels to focus attention on current and future actions that can bring green development for a company. Although this set of actions has been formulated in the context of Hong Kong, they can provide useful guidelines for the hotel industry throughout the Asia-Pacific region.

In terms of required skills, a *change in the mind-set* of the public and employees has been identified as a basic requirement to achieve greening change in the hotel industry. Positive and strong attitudes toward environmental protection and individual standing are even more important than a particular set of skills. Therefore, generic green skills that facilitate the understanding of issues of green growth (Pavlova 2018) should be included in TVET and workplace training programs. In addition, for the hotel green teams, training in specific skills is required to facilitate technical innovation.

**Acknowledgments** The work presented in this chapter was fully supported by a grant from the Research Grants Council of the Hong Kong Special Administrative Region, China (Project No. HKIEd 18601515).

## Abstract

This chapter draws on the *Further Education in England: Transforming Lives & Communities* project, commissioned by UCU. This research project aims to understand and provide evidence of how the further education (FE) sector is vital in transforming lives and communities in twenty-first-century Britain. The research provides learners, teachers, family members, and their communities with the opportunity to tell their stories, linking the distinctness of FE to the impact it has on individuals, society, and the economy.

The research provides evidence of how further education offers a “differential space” (Lefebvre H 1991) that can subvert the prescriptive, linear spaces of compulsory education and lead to critical spaces for transformative learning. The study proceeds from an understanding that educational practices are positioned as ideologically imbued, driven, and shaped by policy. Indeed, the model of curriculum can determine whether education is an emancipatory or oppressive process.

While productivist approaches to vocational education and training support and perpetuate ideologies that legitimate and authenticate prescribed knowledge, reproducing inequality and injustice through the practices employed (Ade-Ojo G, Duckworth V. 2016; Duckworth V, Smith R 2017b) transformative teaching and learning shifts to a more holistic and dynamic approach. It seeks engagement with learners through a purposeful acknowledgment of their cultural background and biography and nurtures critical insight into education as a socially situated process. Transformative teaching and learning is orientated to affirming agency and as such has a ripple effect that impacts on learners' families and their communities.

This chapter draws on a range of theoretical perspectives to provide an appropriate and illuminating framework to explore the themes around transformative teaching and learning that have emerged from the evidence. Among these, hope, space, egalitarianism, and symbolic violence feature strongly. Learners' experience of symbolic violence (Bourdieu and Passeron 2013; Duckworth V 2013) was a key focus of the analysis. This symbolic violence consists of labeling individuals, reifying social division and the current (dis)order, and stymying creativity through the erasure of critical insights. It seeks to locate "failure" within the individual as a determining and essentialist aspect of their identity thereby thwarting the development of empowering learner agency. Transformative learning spaces move beyond the symbolic and institutional violence that often shapes learners' understandings of themselves within the educational context and into a transformative critical space, restoring participants' hope and enabling them to transcend the internal and external influences and violence that have shaped their learning journey to date.

The chapter suggests that in challenging inequalities in learners' lives and communities, adult education and vocational education and training should reflect a transformative pedagogy, providing a curriculum that is culturally relevant, learner-driven, and socially empowering (Ade-Ojo and Duckworth 2016; Duckworth and Smith 2017a).

**Introduction**

Nationally and internationally, globalization and technological change have intensified economic competition, motivating governments to increase national growth, productivity, efficiency, and innovation. The discourse that supports and underpins this competitive economic environment is driven by a neoliberal approach to learning societies which privileges individual over collective learning. As part of this, the focus of education according to neoliberal discourse (Ade-Ojo and Duckworth 2015, 2016) is to provide a flexible, adaptable, and skilled workforce to make countries competitive in the globalized economy. Thus, education is

positioned as a commodity that, within existing social conditions, is more accessible to some groups than others. As such, education can be seen to support and entrench existing social, economic, and social inequalities.

An overview of the political climate in England and recent key policies is helpful in contextualizing the study. Since the 1980s research and debates surrounding class can be seen as being side-lined in political discourse. Indeed, traditional notions of class loyalty and solidarity, in many ways, were torn apart under Thatcherism. In 1997 New Labour came to power. Under this government, neoliberal approaches dominated and the notion of a classless society was seen and heard in their rhetoric of meritocracy and equal opportunities (Petras 2000). Central to the neoliberal vision, the opening up of health, education, and other public services to competitive marketization was underpinned by a rhetoric that foregrounded choice as empowerment (Ball 1993). Under this premise, individualism and self-improvement were promoted as ideas – in an echo of the eugenicist views that epistemologically underpin the concept of IQ (Gould 1996) – that “talent” is based on inherent ability rather than originating in privilege. As a principal organizing feature of society, marketization positions choice centrally: indeed, in neoliberal ideology, the agency of the individual is reduced and confined to exercising choice. However, there is overwhelming evidence that in economically unequal societies, choice is monopolized by those with enough resources/capitals and those who are at a structural disadvantage (e.g., those lacking economic capital) have fewer or no choices at all (Gewirtz et al. 1995; Whitty et al. 1998; Lauder et al. 1999; Archer and Leathwood 2003; Reay 2004; Ball et al. 2000; Ball 2010; Duckworth 2013; Duckworth and Smith 2017a). Viewed as a competitive ladder of opportunities/choices, the education system in England positions VET as a route for learners adjudged not to be “academic” which in this case means learners who at 16 fail to achieve a national benchmark of attainment. As such, VET can be viewed as an educational trajectory that offers a low level of choice and agency.

Almost two decades ago, New Labour’s *The Learning Age* document supporting Britain’s drive for business and commerce noted that: “Learning will be the key to a strong economy and an inclusive society” (DfEE 1998: 3). Four years later, another key government policy document, *Success for All*, stated how the government’s goals should be “social inclusion and economic prosperity” (DfES 2002: 9) – this exemplified New Labour’s Third Way and its discursive attempt to connect market capitalism with a social justice agenda. A more recent report, this time from a conservative-led coalition government: *Fixing the foundations: boosting Britain’s productivity* (BIS 2015) illustrates the resilience of market rhetoric and its continued adherence to a view of education as, primarily, an aspect of human capital development.

*Over the last century, productivity growth has gone hand in hand with rising human capital, as more people have become educated, and to a higher level. However, the UK suffers from several weaknesses in its skills base that have contributed to its longstanding productivity gap. . . Results from the OECD show that England and Northern Ireland are in the bottom four countries for literacy and numeracy skills among 16–24 year olds. (BIS 2015: 23)*

This neoliberal imaginary, featuring a league table of national economies, provides the backdrop for recent educational policy in England. The recent relaunch of apprenticeships provides a good illustration of the impact of this. The government has redesigned and re-launched apprenticeships as the primary vehicle for bridging a perceived gap between education and work for a large section of the nation's young people. This latest version of apprenticeships signals a move away from previous approaches to VET that were designed for delivery by colleges and other further education providers. The new apprenticeships instead take a more work-based learning approach with employers very much "in the driving seat" (BIS 2015: 23–26) as regards content, design, and the focus on relevant skills.

Globalization, competition, and rapid progress of technology have also contributed to a shift in the nature and patterns of working life and employment. The current plans for the UK remain ambitious: in 2009, the UK Commission for Employment and Skills (UKCES) stated:

*It is our ambition to be one of the top countries in the world – for jobs, for productivity and for skills. A World Class economy, built on World Class skills, supporting World Class jobs and businesses. We should aim to be in the top quartile of OECD countries in all three – jobs, productivity and skills – by 2020. This means being in the top eight countries of the world. Our future prosperity depends ultimately on employment and productivity: how many people are in work and how productive they are when they are in work. Skills are essential to both. If we are to become World Class, we must raise our game to match the productivity, skills and jobs of the best. (UKCES 2009: 6)*

The passage above provides strong evidence of the "disenchantment of politics by economics" that Davies (2014) sees as a quintessential ideological achievement of neoliberalism. Ethical scruples are pushed aside and political considerations are neutralized by the common-sense assertion of the importance of government policy that focuses on the three hegemonic pillars of a "World Class economy": jobs, productivity, and skills. What is striking is that each of the terms in itself remains unexamined. For example, simply increasing the number of jobs available might hold little value if these jobs are low paid and do not connect with or rely on education and training (as is the case in England in 2017 see Thompson et al. 2016); meanwhile, productivity as a decontextualized and dehumanized economic term that is often used in comparing the UK to other nations (see OECD 2017) but whose exact meaning remains so obscure it has assumed almost metaphysical properties; finally, 'skills' appears to be a term which attempts to fix a generalized label onto a dynamic and shifting quality of human potential as defined (multifariously) by employers in a massively wide range of contexts.

The "knowledge economy" concept that emerged during the New Labour period of British politics (1997–2010) has to some extent been replaced by a renewed focus on "skills." "Skills" appears to be a term whose meaning is strongly influenced by conceptions of social class. When connected to educational discourse, it operationalizes education as a conveyor belt for the production of a flexible, adaptable, and skilled workforce to make countries competitive in the

globalized economy. Neoliberal policy rhetoric promotes an instrumental model in which “employability” in the labor market provides the key to social inclusion. “Employability” – currently a trending education policy term – is part of a simplistic and reductive formula that conceptually connects education and training to a “readiness to work” (Boden and Nedeva 2010: 49–50). Employability has acquired a central role in policy, strategy, and the student curriculum that blurs over the complexity of the relationship between vocational qualifications, learners’ intentions, destinations, and actual employment opportunities in the jobs market and ignores the broader debate around the different purposes of education (see, e.g., Biesta 2010). One aspect of the transforming lives project involved exploring the ways in which vocational education could offer transformative opportunities that moved beyond “productivist” notions of the education/work relationship (see Dean’s account below).

The notion of aspiration also appears as a subtheme in the policy discourse on choice. Aspiration, like talent and motivation, is usually thought of as being immanent in individuals: a characteristic that can be shaped by choice. The individual can choose to have aspirations and can choose what aspirations to have. As such, an absence of aspiration or limited aspirations are blameworthy attributes. From a neoliberal perspective, that conceptualization of aspiration ignores geographic constraints and the differing levels of capital accruing to different levels of the social strata that the marketized landscape offers to individuals; the same perspective sees aspirations as the responsibility of the individual, once more refusing to engage with the social factors and forces that may shape people’s ability to aspire and what those aspirations are.

Despite the dominance of the neoliberal skills discourse in policy, and the policy documents that position further education as a key part of a national skills-delivery mechanism, there has been a reduction in government funding for colleges in the last decade. For example, as part of the Coalition Government’s “austerity” measures, in the period 2009–2014, courses for adults lost around 35% of funding (UCU 2015). A redirection of finance towards Apprenticeships is taking place within a longstanding “bums on seats” funding environment (Smith 2007: 43) that has been heavily criticized for leading to “spoon-feeding,” “gaming,” and a narrowed curriculum (O’Leary and Smith 2012; Smith and O’Leary 2013; Wolf 2011).

This research provides evidence that despite the instrumentalization of the curriculum in further education colleges, transformative learning is still taking place. Recognizing the power of education, and the enactment of the curriculum, to reproduce rather than challenge social inequality, offers a frame for understanding learners’ narrative accounts of their educational and personal journey. The *Further Education: transforming lives and communities* (<http://transforminglives.web.ucu.org.uk/>) research project sought to unfold learners’ narratives, the overarching aim being to recognize and understand their narratives against the backdrop of wider socio/economic/political and historical contexts (Goodson and Sikes 2001; Goodson 1992; Duckworth 2013; Duckworth and Smith 2017a: 17). The research cuts across the grain of the skills policy discourse, providing a picture of stubborn seedlings taking root in very stony ground.

## Theoretical Connections: Freire, Bloch, Lefebvre, and Bourdieu

This research was informed by a standpoint that connects critical theory to education theory and, specifically, critical pedagogy (Brookfield 2000; Darder et al. 2009; Duckworth 2013). Critical pedagogy draws primarily on the work and writing of Paulo Freire whose seminal book *Pedagogy of the Oppressed* expressed the need for a radical change to the traditional “front-end loading” approach to teaching and learning that he characterized as a “banking system of education” (Freire 1996). Freire’s work, founded on his educational experiences with indigenous people in Brazil, is important as it takes social inequality as a given and articulates an emancipatory and consciousness-raising role for education in the light of a socially inequitable context.

The research project drew on Freire’s work and on the tradition of critical reflective practice (Brookfield 1995) which utilizes the interrelationship between past, present, and future. The rekindling of hope, the re-alignment of perspective (called “perspective transformation” by Mezirow 1990), and a subsequent resurgence of agency are all features of transformative learning. The project sought to gather learners’ narratives to illustrate how further education in England provides experiences of transformative learning. Freire (1996) argued that critical educational practice is not a specific methodology to be applied without insight but rather one that emerges when tutors can practice teaching from a critical perspective and have the time to reflect on their pedagogy. Critical pedagogy shifts away from teacher-directed, top-down, commonly imposed, and standardized assessments that prescribe the same for all students, regardless of their ability, values, ethnicity, history, their community requirements, or their specific contexts. Instead it takes an egalitarian approach, whereby there is a sharing of power between the teacher and the learner in learning, the curriculum, and its contents and methods.

Critical pedagogy resonated within the research as it provided an explanatory picture for teachers’ approaches as they strove to provide educational environments in which transformative teaching and learning could take place. This meant challenging the “abstract space” that further education has become. Policy discourse that uses the notion of a “sector” reifies a generalized perception that colleges are somehow interchangeable and that the diverse contexts in which colleges are situated can be ignored. In this way, further education space is “produced” as “dominated space” (Lefebvre 1991) to be manipulated in the service of the neoliberal aims of producing human capital for industry.

Critical pedagogy necessarily involves engaging fully with local context – while maintaining a wider perspective. It utilizes Freirean “culture circles” (Freire 1996) – discussion groups in which educators and learners come together in dialectic engagement for consciousness raising, liberation, empowerment, and transformation. Education for liberation provides a forum open to the empowerment of learners, teachers, and the community, while also providing opportunities for the development of those skills and competencies without which empowerment would be impossible. Such emancipatory practices encourage autonomy and critical thinking, opening up

spaces where learners and communities can ask questions, analyze, and subsequently work through meaningful strategies to enhance their situation.

The research identified how transformative learning is a product of critical pedagogy. A key aspect of transformative learning is its focus on learners developing a critique of hegemony and inequality. Freirean “conscientization” allows people to understand that their educational disadvantage is not of their own making, but often of social and cultural forces beyond their control. In this study, hope is an integral aspect of the transformative learning environment. Rather than simply being an articulation of a daydream, this hope is connected to the realignment of perspective that learners experience regarding their position within wider society and how their prior educational experiences may have been inflected by these structural forces. In this sense, the work of Ernst Bloch can be seen as useful in illuminating how hope is fundamental in settings in which transformative learning takes place:

*Desire, hope, anticipation, orientation towards the future: the central Blochian concepts all involve a potentially precarious relationship to the now.* (Ni Dhuill 2013: 157)

Bloch positions hope centrally as a key motive force in history through which the subject acts on reality. For him hope is “indestructibly grounded in the human drive for happiness and. . . has always been too clearly the motor of history” (Bloch 1986: 443). In terms of transformative vocational learning, the “now” is located in the classroom and is part of the “differential space” (Lefebvre 1991) offered in further education settings in which teachers help learners re-orientate themselves as active agents able to shape their own narratives rather than having (e.g., skills) narratives imposed on them. First in this comes an acknowledgment that learners’ educational histories may have damaged their hope; followed by an acknowledgment that a spark of hope remained – enough at least to encourage them to walk through the front door of a local college (or other institution) and back into a classroom. From there, supported within an affirmative learning environment, learners began a sometimes daunting but ultimately rewarding journey in which they (re)constructed a positive learning identity and reconnected this and educational experience to a personal future. This future sometimes took the form of a vocational course and sometimes the form of a job or specific career trajectory.

In this way, hope can be seen to connect past to present and then link both to a specific future through the enactment of renewed agency. Viewed through this lens, critical pedagogy becomes an articulation of Bloch’s theories as pedagogy that is fine-tuned as mediating action between learners and the future. Bloch’s work focuses on “the darkness of the lived moment” as containing within it the potential for positive transformation. Bloch’s theories reach beyond the entrepreneurial tropes of the neoliberal imaginary by extending and connecting the individual to the collective, not just in a primarily competitive relationship but in a relationship of solidarity and egalitarianism. Bloch’s resurrection of hope becomes necessary in a neo-liberal landscape in which alternatives are rubbished and ridiculed and while, despite the 2008/9 financial crisis, the Thatcherite dictum that *There Is No Alternative* continues to resound.

Lefebvre's triadic conceptualization of space as "conceived space," "perceived space," and "lived space" (Lefebvre 1991) provided an important final theoretical strand to make sense of the data. Conceived space here links to the abstract space of further education as reified by policymakers. Lefebvre sees abstract space as:

an apparent subject, an impersonal pseudo-subject. . . and – hidden within it, concealed by its illusory transparency – the real subject, namely state (political) power. . . (Here), lived experience is crushed, vanquished by what is 'conceived of'. (Lefebvre 1991: 49–51)

VET and further education can both be viewed as "abstract spaces" generalized, objectified, and instrumentalized by policy makers. Against this abstract space, in a striking echo of Bloch's potential contained in "the darkness of the lived moment," Lefebvre counterposes "differential space":

abstract space carries within itself the seeds of a new kind of space. I shall call that new space 'differential space', because, inasmuch as abstract space tends towards homogeneity, towards the elimination of existing differences or peculiarities, a new space cannot be born (produced) unless it accentuates differences. (Lefebvre 1991: 52)

In this way, Lefebvre theorizes the potential re-appropriation by ordinary people of abstract space. This theorization facilitates an understanding of how the version of further education envisaged in the neo-liberal imaginary of policy makers contains within it transformative learning environments.

The research focused on the learners and their educational journeys as experiential illustrations of the impact of social inequality and education's role in either reifying or challenging this. Bourdieu's concept of cultural capital was useful in exposing the transmission of wealth and power and incorporating ideas about how those in a position of power, who Puwar (2004) describes as "insiders," reproduce and maintain their domination. Bourdieu's fields of social, cultural, and economic power overlap and feed into each other, singly and together offering a valuable framework for understanding the historical formation and reproduction of the research group in this study. His concept of symbolic violence emerged as a powerful tool for explaining how transformative learning works often in contrast to earlier educational experiences.

---

## Findings

Data from the project provided a range of evidence about the different constituents of transformative learning environments. One key element relates to the way in which the curriculum relates to the learners' biographies. For most learners, this was as simple as being accepted for who they were:

*My self-esteem and confidence wasn't what it was when I was eighteen. (Now) I'm comfortable in my own skin. And that's something to do with equality. And people at Northern*

*College accepting you for you. . . And just that right to speak without being interrupted. I found that, like, so powerful. And being really listened to as well.*

This theme of acceptance and affirmation was echoed by others, sometimes it was expressed in terms of the relationship that was formed with the college staff. Anita, a learner who went from dead-end jobs to a social work qualification, expressed this in these terms:

*My tutors are the ones that have got me here. They've got me this far. I don't know where I would have been without Judith and Margaret. . . They didn't push me, they encouraged me. They never once doubted me. They encouraged and they made me grow. Through that, I've been able to inspire my kids.*

Here another aspect of transformative learning is evident: that is the intergenerational ripple effect. Anita's renewed hope and agency has had the knock-on effect of providing an environment in which her children feel motivated and able to connect their educational achievements to their *becoming-biographies*. It is revealing to contrast this with the assumptions about learner agency within the neoliberal skills discourse. To return to the image used in the *Building the Foundations* policy document (BIS 2015):

*Professional and technical education provision. . . needs to be refocussed to deliver the higher level skills that employers need. Strong institutions are needed to support this ambition. . . . The government will. . . invite some colleges to become prestigious Institutes of Technology to deliver high-standard provision at levels 3, 4 and 5. . . Institutes of Technology will be sponsored by employers, registered with professional bodies and aligned with apprenticeship standards. The government will empower National Colleges, Catapults, and elite professional institutions to design each route, alongside employers and professional bodies. (BIS 2015: 25–26)*

This passage comes from a section of the document entitled *Putting employers in the driving seat*. The overview here is of policy that aims to change not just course content but also the structures and cultures of colleges better to meet employers' needs. Notable by its absence is any mention of learners' needs, hopes, or requirements. The inference here is that employers' needs are the priority and that the curriculum as it stands is failing to meet to them.

In curricular terms, this position is in direct opposition to the kind of differential space that characterizes the transformative teaching and learning environment. Transformative learning necessitates a curriculum in which the learner takes a central position, certainly at the start of a course and then, as autonomy and confidence grows, less pervasively. The research evidence on this is encapsulated well by one of the teacher participants. In one research conversation, Jez talked about his passion for teaching Level 1 and Level 2 Business students. The learning environment Jez sought to establish in the classroom reversed the low expectations that many of his students brought with them from their prior educational experiences. A principal technique Jez used was to foster autonomy. Interestingly, he uses the same metaphor as the *Building the Foundations* document.

*I don't see it as me and them. . . . We are all one. . . . we work together, so when they are driving their own bus, initially, I'm driving it. I'm showing them where the gear stick is, I'm showing them where the steering wheel is. But as their confidence builds, as they get more familiar with. . . the expectations. . . I place on them, they take over the reins, and they start driving the bus. So they dictate which way they want the course to go on, what units they want to do within the course. . . that's a huge step for some of the under-privileged learners that I come across – to be given that power.*

The egalitarian approach here is not about the teacher ceding authority in the classroom. But rather, in her/him using that authority to establish a particular environment in which a traditional uni-directional, transmission-orientated power dynamic is replaced by one which is more differentiated and collective and which requires learners to take on a role of responsibility in making decisions about the curriculum. Whether or not this might meet the “needs of employers” appears to be beside the point as this curriculum interweaves curriculum content with personal development. Jez was, however, convinced that without his approach, many of the learners would not have succeeded on the course to start with.

Another participant, Dean, offered an insight into how a transformative teaching and learning environment could meet an employer's needs while also acting as a catalyst for personal and professional development. In Dean's case, his employer liaised closely with the college to ensure a construction curriculum that was appropriate. But the employer relied absolutely on the expertise and the affirmative approaches adopted by the college teaching staff. For Dean then, attending college meant overcoming the significant barrier of a lack of self-confidence.

*Given the opportunity to further myself, that's a no brainer. But then coming to college, that first day, I was like: I'm not sure I can do this. . . . It's changed me. I can do things. I am capable. It's changed me and like things are possible. The first day I started I had no computer skills. . . . Now I feel like I've got a bit of respect. It's definitely life-changing. . . . Even with the kids, I went to parents' evening. . . . I ended up chatting (to the teacher) more about me than about (my daughter). . . . I've been promoted to be site manager. It's been an amazing turnaround.*

Simon, the managing director of a construction company and Dean's employer talked about the importance of “growing” his own talent and revealed a holistic approach to this kind of education that demonstrated a full commitment to his employees, many of whom he has seen flourish as a result of returning to study. Simon saw construction as a vocation and a career with opportunities for personal growth and the development of skills and knowledge.

*I've built a five year course – when people say an apprenticeship, (normally) it's two years. I've been absolutely saddened by the attitude of the industry where it is encouraged and rewarded to collect as many apprentices as you can, massive intake then after two years, you take an eighteen year old and you say: I'm sorry there's no future with us. . . . The driving force for us is, you pass and do your apprenticeship with us and you are guaranteed a career. That's part of the deal. . . you work hard for me, you work hard for the business and we will look after you and we will guarantee you a framework.*

Within Simon's contribution, there is an explicit criticism of other employers' existing attitudes to state-funded VET – an attitude that seems to exploit it as a form of state-subsidized labor that can be jettisoned once the funding is used up. It is possible that that is a default position for employers towards VET initiatives under existing marketized arrangements. Simon's approach is very different and, through the transformative experiences on offer at the college, seeks to connect the success of his company with the personal development of the employees. In his case, there is space alongside the learner and the teacher on the "driving seat" and his is an enabling rather than a dominant role.

Transformative pedagogies are a response and an antidote to the symbolic violence experienced by many learners in their compulsory education. The power of symbolic capital and what is valued and why in different fields offered an insightful avenue of enquiry into the experiences of the learners in this study. It allowed for a further understanding of the symbolic violence the learners were subjected to and its impact on their lives. Indeed, drawing on the learners' narratives, it was possible to identify features of symbolic violence that were embedded in their everyday life. This allowed for an exploration of the different forms of violence that can co-exist and indeed support one another, each interacting with and amplifying each other.

The relationship of symbolic violence to learning and the impact it had on participants' sense of themselves as effective and successful learners emerged strongly from the data. The symbolic violence that the learners had experienced was often hidden because it triggered feelings of shame in the individual. Adam provided a powerful example. Adam was a 16 year old who was excluded from his local school and explained how one reason for this was that he had anger management problems:

*In school I was getting angry quite a lot. I was punching walls... I used to think I was dumb all the time in school. I had no hopes at all...*

The knock-on effects for Adam's family and home life were significant. His mother described how she received phone calls every day and sometimes had to leave work in order to pick her son up from school. Adam's sense of being "dumb" and ignored was, in his mind, connected to teachers' labeling as coming from a particular estate with a "reputation": this created negative expectations that meant his identity as a learner was severely compromised:

*I was in a lesson and I was there with my hand up asking for help and there was another person with their hand up asking for help. I'm the naughty one and he was a good lad and I was quite naughty. So (the teacher) went straight to him and then another person put their hand up and then another person even though I had my hand up. And he kept going round and round until after nine people then he come to me. And that was why I was getting angry... Everyone just looks at you and they think Oh yeah... They judge a book by its cover and you shouldn't do that.*

In Adam's story symbolic violence is observed as an outcome of the way the teacher relates to and interacts with the learner. As with Anita – who talked about

being put “in a box” – symbolic violence takes the form of an ongoing assessment of “ability” that shapes social interactions between teacher and learner. At this point, it is necessary to revisit Bourdieu’s original conceptualization of symbolic violence.

Bourdieu and Passeron (2013: 3–68) write about the symbolic system that education draws on to inculcate and impose meanings on learners. They see education as imposing a standard culture whose values reflect the social structure and the power relations that underpin it. In other words, education perpetuates inequality and a stratification of individuals in a way that serves to replicate existing social inequalities.

Bourdieu and Passeron argue that there is a “twofold arbitrariness” in pedagogic action (ibid. 5–6). The first arbitrary is the power underpinning pedagogic authority; the second is the “cultural arbitrary” that the pedagogy seeks to impose. Pedagogic action can only take place with pedagogic authority which he sees as:

a power to exert symbolic violence which manifests itself in the form of a right to impose legitimately (which) reinforces the arbitrary power which establishes it and which it conceals. (Bourdieu and Passeron 2013: 13)

Pedagogic action for Bourdieu and Passeron constitutes symbolic violence because it entails the imposition of arbitrary meanings and cultural values on learners. But while Bourdieu and Passeron dismiss the possibility of a critical pedagogy which foregoes symbolic violence, seeing no pedagogic action as “culturally free” (ibid. 17), their model is very transmissive. It adopts a view of educational experiences as experiences in which learners are recipients rather than co-constructors of meaning. Bourdieu and Passeron see education as affirming the cultural background of some children while delegitimizing that of others. In this sense, pedagogic action imposes a recognition of the legitimacy of the dominant culture on members of dominated groups, classes, and individuals, but it also imposes on them by the inculcation of exclusion, a recognition of the illegitimacy of their own culture.

So how is it possible to theorize transformative teaching and learning in the light of Bourdieu and Passeron’s thinking on symbolic violence and the “twofold arbitrariness of pedagogic action”? One way is to see transformative teaching and learning environments as directly addressing the twofold arbitrariness of pedagogic action at the heart of the notion of symbolic violence. The first arbitrary: the power underpinning the pedagogic authority is addressed through the egalitarian relations that the teacher strives to establish. The second aspect: the “cultural arbitrary” that pedagogic action seeks to impose is addressed through the inclusion and (even) centrality of learners’ biographical experiences in the curriculum. Evidence from learners and teachers in the research repeatedly returns to these characteristics, and learners’ narratives in particular repeatedly contrast transformative learning environments with prior educational experiences in which they felt judged and labeled in a disabling way.

## Conclusions

The research findings underscore how the neo-liberal assumption that individuals are free to determine their own pathways is severely tested by evidence about the impact of structural and historical inequalities: gender, race, class, and other markers of identity that clearly shaped the learners' educational journeys. This research shows educational institutions are not neutral in the value placed on the accumulation of capital and its transmission, and teachers also play a role in this. One way in which this happens is that learners from disadvantaged backgrounds are not considered to have the right attributes to progress (Archer and Leathwood 2003; Burke 2006). Indeed, many of the participants in this study were faced with exclusion underlining how choice for the "excluded poor/dispossessed working class is, mostly, a myth" (Byrne 2005: 141).

However, this evidence of symbolic violence was in each case counterbalanced by the research participants' narratives of transformative learning in further education settings. It would be a gross generalization to claim that all or even most further education teachers typically "set right" the mistakes created by school teachers. But the instrumentalism of policy discourse about VET has not extinguished the potential for further education to offer transformative learning experiences. There is research evidence that suggests that teachers isolated within managerialist institutions "spoon-feed" learners to achieve targets and ensure the flow of funding (e.g., Literacy Study Group 2008). However, the project evidence so far indicates that transformative teaching and learning experiences do exist. The "second chance" educational opportunities offered by further education by definition follow on from prior educational experiences, and the evidence from this project is that further education can offer a "differential" rather than a "dominated" space. Despite the instrumentalism of the neoliberal skills discourse and the inhibiting effect that this has on teaching and learning in colleges, transformative learning still happens – though there is little detailed evidence about its extent.

A vital ingredient of the transformative learning environment is its orientation towards nurturing hope in learners. Hope and the idea that education might relate positively to one's agency, future life experience, and socio-economic position is undermined by symbolic violence as theorized by Bourdieu and Passeron. In Bloch's terms, transformative learning environments act on and catalyze learners' hope. They identify the points of entry and potential movement in learners' lives in the world, the "openness of the object-based background" within "the darkness of the Now," and help learners identify a way forward, the potential of an "outflow" (Bloch 1986: 289).

The project research uncovered the stories of learners who were able to change the way they interpreted their experience (Duckworth and Smith 2018) as a stage in the revitalization of their agency as learners; this then led to transformation. The learners' narratives revealed how making sense of their structural positioning as adult learners in a society based on inequality of opportunity and choice enabled them to challenge the prescriptions of symbolic violence and move their lives forward.

With the seeming demise of neoliberal policies and the gloomy prospects they offer: of ongoing austerity; of the never-ending spiral of increased productivity in a world of finite natural resources; of performativity as a mediation of this; of the obliteration of truth in the name of market expedience; and of the subjugation of human beings to economic ends; – in this context, what is needed is a shift in the understanding of policy makers away from the determinist and instrumental vision of education that objectifies learners in the service of the neoliberal project of despair. Instead, an acknowledgment of the importance of further education as a “differential space” for critical reflection, renewal, and hope is necessary. This would enable further education practitioners to move away from competence-based models and the spoon-feeding approach necessitated by current funding arrangements to holistic approaches (see Morrish et al. 2002; Feeley 2007) informed by dialogic care (Duckworth 2013, 2014) that can provide more of the transformative learning opportunities found in this research and for the resurrection of hope.

## Abstract

The purpose of this chapter is to evidence the shortcomings of large-scale assessments and the new shift toward capability-oriented indicators. Focusing on the international data on adult skills (PIAAC) and its impact in forging VET (vocational education and training) policies, we assume that current VET systems are confronted with many challenges that arise from the interaction of two sources. On one hand, VET policy focuses mainly on employability which is insufficient to grasp wider benefits that education entails – as postulated by many

educational (i.e., Nussbaum, *Creating capabilities: The human development approach*. Harvard University Press, Cambridge, MA, 2011; Boni and Walker, *Universities and global human development: Theoretical and empirical insights for social change*. Routledge, London, 2016) and a considerable smaller education and work scholars (i.e., McGrath and Powell, *Int J Educ Dev* 50:12–19, 2016; Egdell and McQuaid, *Soc Policy Adm* 50:1–18, 2016). On the other hand, the underpinnings of the objectives and designs of VET should adapt to the socioeconomic consequences of the Great Recession. The chapter focuses on the PIAAC and most concretely to the Spanish case as an example of how the Great Recession becomes an open license to fast- and short-term strategies that favors employment regardless of its quality and long-term consequences and values education and youth role in society in relation to their contribution to boost the economy. The chapter recognizes the urge for seeking fast solutions that shift the unemployment rates but alerts to the overlooked aspects with some of those measures in relation to VET. In fact, this chapter is a call to policy-makers and academics toward the importance of rethinking education on the basis of new information basis of judgment that are human-centered.

## Introduction

The importance of international large-scale assessments for education policy and research has emerged in the last decades. Processes of international assessment are embedded in the broader context of the so-called globalization of educational data (Mundy et al. 2016), expressing the need of a numerical-based expertise. These have fostered comparative analysis and evaluation among countries and have been embraced by main international organizations. Large-scale international comparative surveys are designed to offer quantity-based measures that help policy to foster skills seeking to improve national evaluation. Broadly defined, those represent surveys of knowledge, skills, and behaviors that help to better understand how those are related to educational, economic, and social outcomes (Kirsch et al. 2013). There are different examples such as the OECD Survey of Adult Skills, Programme for International Student Assessment (PISA), the Progress in International Reading Literacy Study (PIRLS), or the Trends in International Mathematics and Science Study (TIMSS), among others. The Program for the International Assessment of Adult Competencies (PIAAC) is part of the OECD Survey of Adult Skills and is considered the largest and most innovative international assessment of adults' skills (Kirsch and Lennon 2017). This is the first international large-scale computer-based assessment of adult population skills in 33 countries. Moreover, PIAAC has large sample size and include three domains of adults' skills.

The conceptualization of each assessment and the decisions about which skills domains and which target group should be assessed are temporal and strategic.

Like all concepts in the social sciences, the act of constructing measures implies a selection of dimensions (in Ancient Greek *κατηγορία*) (in Latin “category”.) which should be operationalized and thus leads to a simplification of the object of study. This means a transformation of some qualities into a metric which is not just a technical process but an important feature of social life (Desrosières 2008; Hacking 1999). This process is generally called commensuration and has been largely examined by different historians, statisticians, sociologist, and philosophers (Espeland and Stevens 1998). However, the selection of what counts as relevant information and how the information is processed is a crucial topic that rarely has been noted in the educational large sets through a Capability Approach. A main point in Amartya Sen’s Capability Approach is the concept of informational basis of judgment (IBJ).

The informational basis of judgment identifies the information on which the judgment is directly dependent – and no less important – asserts that the truth or falsehood of any other type of information cannot directly influence the correctness of the judgment. The informational basis of judgment of justice thus determines the factual territory over which considerations of justice would directly apply. (Sen 1990: 111)

For instance, the skills domains that PIAAC assesses and identifies as competences are part of a non-deliberatively discussed, but unanimously taken for granted, as foundational for maintaining competitiveness in a global knowledge economy, increasing the flexibility and responsiveness of labor markets, stimulating workforce participation, and dealing with issues of population aging (Schleicher 2008). While its main focus is to collect information about skills, PIAAC also collects data on educational, socioeconomic background and demographic of the respondents, as well as information on their labor market situation and participation in both formal and informal training.

Having noted the strategic importance of large-scale assessments such as a PIAAC where foundational skills are assessed, the interest in using this particular one and taking Spain as country of reference is the following. The global economic crisis and its large impact beyond economic spheres have proven that there is no simple way of fixing problems through economic stimuli. Particularly, Spain is a paradigmatic example. It has been well reported how the implications of the 2008 global crisis in Spain have had negative effects on employment, social equity, labor conditions, and health. With indicators scoring among the highest of the EU in terms of corruption, youth unemployment, and early school leaving (OECD 2017), the country’s best bet has been to embrace the EU and OECD slogan of “more skills for better jobs” (OECD 2013a).

The unequal impact of the crisis that considerably affected the workers with lower skills (Felgueroso 2016) has increased the awareness for training needs. There is a hope that better skills can lead to improvements of Spain’s economy, and this brings back to the traditional equation of skills, jobs, and growth that the human capital advisors have been claiming for decades. In terms of education, it puts vocational education and training into a new light, while for the education policy agenda, it gives greater relevance to the outputs of large-scale and comparative analyses.

The revival of a longtime neglected path of education, VET, has been noted by the European Commission as well as by the Spanish legislative attempts to influence the economy through modifications of the educational system.

Member States and other stakeholders (have to) put into practice the reforms needed to exploit the potential of VET for growth [...] Skills are a key driver for growth, employment and competitiveness: they lay the foundation for productivity and innovation. (European Commission 2012: 1–4)

The main difference of the Spanish educational system with others lies in the particularly low number of students in VET. This inevitably affects the employability and competitiveness of our economy, limiting the life choices of many young people. (LOMCE 2013, sec. XIII)

In this quote, one can read how the concept of development, understood primarily in economic terms, is the main reason for fostering VET. Additionally, the particularity of Spain is that despite an estimated increase of 4 years of schooling in the period 1980–2010 (De la Fuente and Domenech 2014), and tripling the percentage of higher education graduates during this period (Felgueroso 2016), the share of participants in adult learning in Spain remains below the OECD average. Additionally, Spain has the third lowest average number of years of schooling in the OECD, just ahead of Portugal and Mexico (De la Fuente and Domenech 2014).

The challenge of this chapter is to use PIAAC, a large-scale assessment designed under a human capital framework, to explore the potentialities of it in another framework: the Capability Approach (CA). While data is increasingly being centralized in VET systems within the human capital framework, the CA offers a human-centered approach that shifts the focus of importance from economics to human development.

While vocational education and training is and needs to be linked to broader social functions, this chapter looks at the value of the skills beyond its direct economic return. To do that, the chapter departs from a large body of literature that reveals the benefits of the Capability Approach as far as it allows for a paradigm shift from a focus on economic growth and national income to a focus on human well-being (Robeyns 2005; Walker and Unterhalter 2007; Tikly and Barrett 2011). Concretely, the chapter sets on the emerging group of authors that recognize the importance of the Capability Approach for VET. As Powell and McGrath (2014) have argued, the value of a human-centered approach in the study of VET implies a shift from the “productivist” approaches that have traditionally dominated VET policy. McGrath (2012) on his research about VET argues about the urge of leaving aside income generation and economic growth indicators that see VET as a means to achieving those, for imagining VET through the capabilities lenses where the concept of development is broader and economic growth is seen as necessary but not as a unique paradigm. Powell (2013) in her review about the VET institutions asks the core question about how the informational sets to evaluate VET are chosen. Following that line of research, this chapter looks at the Spanish data of the Program of International Assessment of Adult Competencies (PIAAC) and poses questions

about how it will change if the capability lenses would have been included in the design of the PIAAC's survey.

Focusing on the Spanish case, and more concretely on the PIAAC indicators of political participation and social participation, this chapter expands classic VET and skills development evaluations. The analysis through a capability perspective aims to explore the relationships between unemployment and training participation and VET qualifications. It explores how having a VET qualification affects a broad range of issues such as income, political participation, and personal factors. The chapter uses seemingly unrelated regression methods to test for this set of effects and compares the data and results of Spain with the 16 OECD countries from which good quality data are available. By doing so, we intend to contribute to the use of comparative international data beyond a mere competitive scheme based on rankings and consider a plurality of VET outcomes. Therefore, we contribute to the design of a more effective and socially fairer educational policies. The chapter ends with a current picture and evaluation of the genuine opportunities that VET students in Spain have to contribute to the economy in terms of skills such as effective work, as well as to societal aspects by being a first-generation immigrant student, breaking gender work stereotypes, or being socially and politically active.

In conclusion, this chapter focuses on two questions:

- What does a capability perspective add to the design of PIAAC?
- What does PIAAC tell us about the implications of education in the building of a society?

The structure is as follows, the first section introduces the Capability Approach and its added value as a normative framework for a large-scale assessment. The second explains the selection of data and the methods used for the data analysis. The third presents the evidence using some concepts of the Capability Approach. Finally, a fourth section concludes with recommendations for further analysis.

---

## **How Can the Capability Approach Contribute to the PIAAC?**

The CA, developed by Amartya Sen and Martha Nussbaum, assesses well-being in terms of people's ability to function and whether they are provided with the real opportunities – the capabilities – to choose the lives they have reason to value. This implies that an evaluation cannot be done merely in terms of outcomes, understood as the beings and doings of a person – such as working, studying, or being politically active. But rather, such evaluation will require looking at the capability space. The vector of capabilities or capability space are the combinations of valuable outcomes (*functionings*) that a person holds the possibility of achieving (Sen 1993: 31) – such as having the conditions for freedom of speech, having the conditions to attend education, having the opportunity for accessing a decent job, etc. So, capabilities are opportunities or freedoms to achieve what an individual reflectively considers

valuable. Capabilities focuses on “what people are actually able to do and be and contrasts with other approaches to evaluation in which the emphasis tends to be on what people possess or do not possess, have done, or how they feel” (Brunner and Watson 2015: 5). As expressed by Powell and McGrath (2014), the Capability Approach provides a normative framework alternate to the output and efficiency measures usually centered on *functionings* (be these resources, qualifications, or abilities) as conventional VET evaluations do. The authors argue that these measures (2014: 133) do “not give us enough information on individual well-being as individuals might achieve the same functioning (for example a FET qualification) but have significantly different abilities to convert these into a functioning (for example employment).”

The most interesting aspect of this approach is putting to the forefront the individual and her/his desires alongside the context that shape the previous ones. The CA is a normative framework that differs from human capital approaches that measure skills or personal attributes without further digging into the aspect of context or personal diversity as pillar of social justice. The social justice principle that guides any CA design is equality of capabilities.

The information sets that guide current educational assessment are part of political strategies targeting at unemployment, poverty alleviation, and economic growth (McGrath 2012). This entails that the results obtained from a large-scale assessment as PIAAC will target education reforms for pursuing better results which are believed to lead to economic growth. Within the remits of this chapter, the CA aims to move from a human capital-centered approach to a human-centered one. As such, this chapter analyzes the PIAAC data to establish to what extent a person is able to construct his or her “capability space” and in what terms have his or her individual and social context influenced the preferences and choices taken. As noted by Unterhalter (2017: 2) “the precision claimed for measurement may actually obscure the importance of what is not measured. There is thus a tension between what is easily measurable, but may not be significant, and what is of major importance, but cannot be measured.” This requires a broader informational base than traditional performance measurements, which are solely based on level of education, background, or economic context, and we are aware of the limitation that a quantitative analysis has in that aspect.

Difficulties in engaging in indicators have raised a number of discussions about the processes and selection of variables and information (Fukuda-Parr et al. 2014). As Unterhalter (2017) in her article about the limits of what is measurable points out, the discussions about measurement in education “have become part of a discourse of regulation linked to new public management, rather than a process to enhance democratic participation and review of decision-making” (Unterhalter 2017: 4).

In spite of this deficiency, the benefits of using the CA are present as it explores and links arguments of skills with issues of equity and sustainable development. The CA helps to formulate important questions at the individual level, in terms of how preferences are being formed, as well as at the policy level, in terms of what kind of development we are seeking to foster. Reformulating Sen’s famous question addressed in his Tanner Lecture of 1979 “Equality of What?” (1982), the role that

the CA can play in this chapter as rethinking PIAAC is to ask “skills for what?” and at the same time present a social justice basis in which a developed society as one where individuals enjoy a broad space of capabilities as an alternative to the current human capital discourse that has inspired PIAAC.

There is a general consensus that without the right skills, people are left at the margins of society, technological progress does not translate into economic growth, and countries cannot compete globally (Barro and Sala-i-Martin 1995; Hanushek and Wößmann 2008). Regardless, a society is composed of citizens which are not merely workers producing economic outputs. CA provides a people-centered approach which considers the capability/opportunity space of everyone in relation to personal, social, and environmental aspects. Understanding sustainable development as something more holistic than economic growth, the CA stresses the importance of freedom of choice and the need to cultivate an active society that reassures the opportunity of each member to lead a meaningful life. From this, besides the concept of functioning and capability, two other concepts are key: the conversion factors and the aspect of agency.

The concept of conversion factors are aspects that enable, influence, and constrain the beings and doings of an individual (Robeyns 2003). Sen (2009: 255) identifies four factors that affect one’s choices and conversion of capabilities: personal heterogeneities (age, gender, disability, proneness to illness), physical environment (environmental conditions, including climatic circumstances, such as temperature ranges, or flooding), social climate (social conditions, public healthcare, community resources, policies and practices, public educational arrangements), and relational perspectives (patterns of behavior in a community that can affect one’s choices and capabilities). Everyone may vary greatly in their needs for resources or abilities to achieve their valued capabilities (Nussbaum 2000: 68). Therefore, the approach takes each human being as an end and rests on the idea of ethical individualism, which takes every individual as a subject of their own lives and “primary objects of moral concern” (Brighouse and Swift 2003: 258).

Agency is a key concept that intertwines with the aspect of freedom as well as with other capabilities such as the capability for voice (Bonvin 2012). As Sen remarks, people need to be understood as “active participants in change rather than passive and docile recipients of instruction or of dispensed assistance” (1999: 281). Thus, an agent is an individual who is willing to have a shared responsibility for building a process that ensures everyone’s capabilities to decide, to self-determine, and to bring about change in the world (Crocker 2008). Concretely, capabilities can be generated through individual efforts and collective processes, and, similarly, agency can be individual as well as collective (Ibrahim 2011). Here, the collective agency means individuals responsible for the development and empowerment of their own community and country (Crocker 2008). These two aspects of conversion factors as well as collective agency force us to see the individual with the duty of being a builder of the context where he or she belongs.

Consequently, the four concepts outlined briefly above are capability, as space of valuable opportunities; *functionings*, as valuable outcomes; conversion factors, as individual, social, and environmental conditions that influence in the ability of an

individual to transform resources into valuable outcomes; and agent, as someone who is leading change. These require an intersectional data approach which goes beyond the analysis of numeracy or literacy skills. Henceforth, the contribution of the CA is to expose the need to have a social justice framework since the moment of the design of the survey. It is relevant to know what the skills of people are but to act upon those one needs to consider data outcomes as the result of choices and then investigate the relation of those with their aspirations and contexts.

---

## What Is PIAAC? Data, Methods, and Shortcomings

PIAAC is a large-scale assessment that seeks to test adult skills. The antecedents of this program were the International Adult Literacy Survey (IALS) (1994–1998) and the Adult Literacy and Life Skills Survey (ALL) (2004–2006). Global assessments of this kind are becoming more and more influential in international policy-making and are an important tool in the reform of education and training systems (Grek 2010; Meyer and Benavot 2013). Moreover, they are rapidly establishing themselves as a tool of governance that can influence the decisions of the actors involved (Desrosières 2002; Espeland and Sauder 2007; Grek 2009). In this chapter, we consider PIAAC as a source of valuable information for comparative analyses but do not repeat discussions concerning the reliability of adult skills measurement (Further information on measurement can be found in Gebhardt and Adams (2007), Goldstein (2004), and Svend (2011).). For a broader discussion on this topic, we refer the reader to Goldstein (2015) and OECD (2013b).

For the purposes of this analysis, we limited the sample to the population aged between 25 and 55 years. We restricted the analysis, therefore, to central age groups, to have the best estimate of the social outcomes of the active population. Older cohorts were excluded because they are likely to have experienced very different socialization process through the school system and they are likely to be out of the labor market. Younger cohorts were excluded because they are still attaining their highest education level. A robustness analysis confirmed the relevance of this sample restriction (In the Annex, “[Determinants of Social Goals. Reference Is Spain. PIAAC 2012, Population Aged 25–65 years](#)” and “[Determinants of Social Goals. Reference Is Spain. PIAAC 2012, Population Aged 15–65 years](#)” show the results for the population between 15–65 years and 25–65 years. The results are very similar except the effect of age is lower, and it has a less accentuated logarithm shape when younger and older cohorts are included.). We use the first wave of PIAAC to ensure comparability between Spain and the rest of the OECD. In fact, the field work of the two waves of PIAAC was made between 2012 and 2014; this has an effect in terms of labor market participation and other aspects of the interviewees. Australia was excluded from the analysis owing to the public unavailability of data, while data on Russia were omitted for reasons of data quality and the absence of certain crucial variables used in the model.

The final analytic sample consisted of approximately 75,000 individuals with full availability of data. Discrepancy between the sample sizes is given by the different

number of missing values among the dependent variables. Political efficacy was the dependent variable with higher missing values which account for 1.8% of OECD and Spain samples. The objective of the model was to disentangle the effect of education, parental background, migration status, labor market status, and adult skills on different social goals or outcomes.

We use ordinary least squares regressions, although given the nature of the outcome variables, ordered logistic regression could be considered more appropriate. However, we prefer OLS vs. ordered logistic regression for two reasons. First, the former regression model needs more sample size compared to OLS; and, second, there were small cells between categorical predictors and dependent variables which represent a shortcoming in using such method. Finally, by comparing the results of one set of predicted values versus another, we obtained similar results using OLS and ordered logistic.

Following the PIAAC framework, foundational skills assessed in this survey are a core set that is assumed to be essential for “an individual to function in the knowledge economy” leaving aside concepts such aspirations, choices, or agency that we noted above as central from a capability perspective.

PIAAC is presented as having the major advantage of gathering the key skills to “function in society, to achieve one’s goals and to develop one’s knowledge and potential” (OECD 2012). Moreover, these skills are considered relevant for acquiring higher-order skills and to facilitate the retraining of individuals. In keeping with this objective, PIAAC adopts a “competence” approach – where competence is defined as the ability to apply knowledge and skills across environments and in interactive contexts that involve understanding, reflection, and judgment (OECD 2012) – and explores whether people are able to implement their knowledge in multiple contexts.

The skills domains assessed in PIAAC are literacy, numeracy, and problem-solving in technology-rich environments. The first two domains are evaluated using items distributed across three main task characteristics (medium, context, and aspect) and differentiated between paper and computer-based questions. PIAAC uses item-response techniques (IRT) to generate ten plausible values of each domain examined. The resulting scores do not allow an interpretation at an individual level, because the derived scores are not the individual results of the tests. The proxies of adult skills are strongly correlated, with an individual-level correlation between numeracy and literacy (problem-solving) of 0.85 (0.76). In the data analysis, we use literacy and numeracy, because the domain of problem-solving was not implemented in all the countries in PIAAC.

Additionally, PIAAC offers data on a few items of social outcomes. In the models presented in this chapter, we have included three out of the four existing proxies. Apart from the items included in our models, political efficacy, social trust, and cultural participation, there is also general health status. These are subjective self-reported measures coded in a 5-point Likert scale with positive cardinality. The items collect information whether:

- The respondents believe in having no influence on government (political efficacy)
- Whether they trust few people (social trust)

- Or their involvement in cultural and voluntary work for nonprofit organization (cultural participation)

Almost six out of ten respondents reported of not being involved in cultural activity for nonprofit organization (see “[Descriptive Statistics of the Social Outcomes](#)”). While those are not considered as skills or competences per se, they are presented in PIAAC as relevant for enhancing society’s well-being. Following the human capital logic that more education leads to higher returns (Hanushek et al. 2015), PIAAC expands classic market outcomes such as productivity or earnings to nonmarket outcomes such as civic participation or health.

---

## **An Analysis Using the Capability Approach**

The Capability Approach, as a response to the limitations of assessments that measure education in an uncritical, linear (cause-consequence) and homogenous perspective, has been extensively discussed and used in the literature (Walker and Unterhalter 2007). Using CA, this chapter extends the evidence by inquiring other social aspects and that are strictly linked with skills. The human capital approach lacks attention to other social goals and attaches a mere instrumental value of education measured on the base of individual and collective advantages such as employment or income returns (Oreopoulos and Salvanes 2011). However, its logic still defines evaluation instruments and, hence, policies (or vice versa). The main findings on the relationship between education in its different forms (i.e., years of attainment, skills, and adult lifelong learning) and the four different social outcomes measured in PIAAC are “that for EU average estimations proficiency in literacy, numeracy and problem-solving in technology-rich environments and participation in adult lifelong learning programs are positively and significantly associated with the probability of reporting high social trust, believed to have some impact on the political process, participating in volunteer activities and reporting good health” (EC 2014: 8). Hence, more years of education have a positive impact as citizens become more politically or socially engaged and healthier. While those results can be taken as good news, the data about the impact on a plurality of social goals and their distribution is limited. Thus, in terms of analyzing issues of equity and social justice, a study on adults’ skills should include questions addressing aspects concerning choices (not only nonmarket outcomes). Consequently, attending to the limitations of the data available, the capability lenses do not take numeracy and literacy as a simple limited outcome, but look to other social goals of adult skills.

Despite the constraints of analyzing a survey, conceived under a given framework, this chapter analyzes three social goals reported in PIAAC of adult skills using capability lenses (the same model is reported in the annex in “[Determinants of Social Goals. Reference Is Spain. PIAAC 2012, Population Aged 25–65 years](#)” and “[Determinants of Social Goals. Reference Is Spain. PIAAC 2012, Population Aged 15–65 years](#)” for different age-cohorts. For a matter of readability, throughout the text, we present the results comparing Spain with the OECD (Spain excluded).

All the tables are available upon request to the authors.). Table 1 summarizes the results: the coefficients refer to Spain, and a dummy variable is included allowing comparing with the OECD average (Spain excluded). The size of the estimated OEDCs indicates the extent of divergence in the outcome variables between OECD and Spain.

As pointed out by different national and international reports, Spain scores below the OECD average in numeracy and literacy results (MEDC 2013). As the literature has pointed out, in Spain there is a high share of lower educated adults particularly in older cohorts, and this correlates with lower level of skills (Gustafsson 2016). Nevertheless, younger cohorts also report lower level of skills compared to OECD members (Valiente and Scandurra 2015). In Spain, poor parental education background and lower access to education qualification play an important role in adults' skills formation and labor market access (Calero and Choi 2017). These are similar results to Italy another South-European country assessed in PIAAC. Nevertheless, postsecondary education access in younger cohorts in Spain is similar to that of OECD partners.

Looking at the individual conversion factors such as age, gender, and immigrant status, the results show some interesting insights. Older cohorts tend to have lower social trust but higher cultural engagement. Gender differences are presented, while women have lower level of skills, they have higher level of social trust, political efficacy, and cultural engagement. The results show that women, in the same circumstances as men, perceive higher social trust and belief in political efficacy and cultural engagement than men. There was insufficient information about why women scored higher in these areas, therefore it is not possible to conclude that the difference is due to higher education attainment of women in Spain in the considered age group (as the human capital logic tells us) or if it is the result of lower expectations and hence adapted preferences.

Other adscriptive conditions, such as being a migrant, have negative associations with numeracy and literacy (Isphording 2014; OECD 2000), although no significant difference is shown in terms of social outcomes. Important differences are presented in terms of parental education, as individuals with a poor educational background tend to have lower level in all outcome variables considered. This is particularly interesting considering that parental background is recalled from the time respondents were 15, showing long-term effects after 10–40 years. Parental education is one of the most important drivers in the acquisition of numeracy and literacy, and it has a strong association with individual education attainment in all OECD countries in the PIAAC study (Scandurra and Calero 2017).

As higher education attainment is associated with higher levels of social outcomes, having a tertiary degree between 0.112 and 0.228 in the social outcomes assessed in PIAAC. However, breaking that logic again, the attainment of a vocational education and training has a nonsignificant effect on social outcomes. While the attainment of VET has a positive effect ranging between 10.7 and 16.8 points advantage, respectively, in literacy and numeracy, however its educational purpose is requires a critique. This leads to questioning the type of skills being fostered in VET and broader social goals connected to such types of education. In every social goal assessed in PIAAC, there are big differences in terms of educational attainment. This means that educational attainment is highly correlated with adult skills and social outcomes. Compared to a lower secondary education, having attained tertiary education entails approximately 0.2 standard deviations for social trust and political efficacy and 0.11 for cultural engagement. Similar effects are reported when

comparing employed versus unemployed population or skilled versus elementary jobs. These differences are large and statistically significant. The statistical fit of the model (R-squared) is low for the three outcome variables social trust, political efficacy, and cultural engagement, accounting between 5% and 7% variation of those items.

Other social factors impede the consecution of similar outcomes based on gender, migration, and parental background. This difference might also relate to social, economic, and cultural cleavage that the education and training system partially fails to reduce. Crocker (2008) highlights that for a well-functioning society, “individuals and collectives (need to) have the freedom to make choices for themselves” (p. 163). Thus, these aspects should be present in the survey for a deeper analysis of adult skills formation and their social goals to help drawing policy measures and assessing the aspect of choice and individual preferences formation.

A relevant point to recall for interpreting the data is the period of data collection of PIAAC. The chapter uses first wave PIAAC data, which were collected in 2012. Therefore, it compares 16 of the OECD countries that participated in PIAAC within the same wave. We excluded countries of the second wave, for the time lag between the survey waves. The period of the assessment is very relevant because it was when the economic crisis was at its most harsh, and this had implications in terms of labor market participation and a plurality of social goals. Specifically, for Spain, during this period job losses were concentrated in low-educated low-skills workers, which before the Great Recession were attracted by a booming labor market particularly rich in low-skills occupation (e.g., real-estate; construction). This has implied a high rate of early school leavers and lower participation in VET students. (According to the data of the Ministry of Education the number of enrolments in VET in Spain has increased around by 40% since the 2009–2010 school year. Further information can be found at the Ministry web: <https://www.mecd.gob.es/dms/mecd/servicios-al-ciudadano-mecd/estadisticas/educacion/no-universitaria/alumnado/FPI/Nota-14-15.pdf>.) Those low-educated workers were the first to lose their job and found it increasingly difficult to get back into employment as the economic crisis affected them the hardest the labor market. At the same time, different political events took place, as the political 15 M movement in Spain spread a wave of pacific protests in the biggest Spanish cities. In this period, Spain experienced a dramatic economic downturn which is persisting as the labor market is relentlessly recovering the pre-Great Recession level. Overall, this has generated a human toll, as Stiglitz (2008) put it, which Spanish population is still paying nowadays.

Additionally, this period was a period of social change and increasing political involvement, with strong political discontent and mass protests. Some examples of this are the civil movements such as *Los Indignados* (the outraged) along with the *Plataforma de Afectados por las Hipotecas* (PAH). (This is a civic and social movement which defended at-risk or evicted people and support people who had financial difficulties to pay their mortgage.) Those were born as organized forms of social and economic discontent during the Great Recession. Their support was intense and, although it is hard to come with estimates of such support, a fifth of

Spanish population (seven million) participated in some way, and it had an approval of four out of five of the population (Barnett 2011). These expressed the level of mass protest of the Spaniards against the society they were living in. The demand for another type of society, where people could be heard, can be seen, using Bonvin (2012), as an expression of their suppressed capability of voicing or demanding fair opportunities, spaces, and outcomes.

---

## Some Conclusions and Further Thoughts

Capabilities has been applied internationally to elaborate policy recommendations (Bonvin and Farvaque 2004) and even to conceptualize indicators (the Human Development Index). It is clear from the literature that there is a growing interest in operationalizing the Capability Approach but also that at the policy level, the paradigms have a slower path for being changed. This chapter did not aim to be a prescription on how to employ capabilities for large-scale assessment surveys. However, it tried to present its basic features as well as potential contributions for the design as well as analysis of measurement surveys such as PIAAC.

The use of the Spanish case helps to illustrate how the human capital paradigm falls short of assessing the drivers and the outcomes of skills in a much broader extent. The Capability Approach offers a normative framework that puts the people at the center and shifts from economic outputs to human value ones. In the analysis, we have seen the limitations to apply the Capability Approach to a survey that has been done under a different framework due to the lack of information on some core aspects that the CA requires in terms of outcomes. The focus on the processes seeks for further methods to collect data that enable to collect individual plans to lead a valuable life. This implies to change the informational basis of judgment and take people as ends. In research, it is a change from objects to subjects of the study.

The consequences of applying a human-centered approach in the design of PIAAC are not necessarily focused on the type of skills assessed, but rather on the reason for choosing it. An adult skills assessment with a CA framework could provide a new Informational Basis of Judgment which still interrogate what skills are being acquired and also would seek to identify the variables that influenced the individual ability to transform resources into choices (conversion factors), the array of valuable options at hand (the capability space), the autonomy to lead a decision (agency), and the value that the individual gives to the final outcome (functioning). If these key aspects would be incorporated into an adult skills study, its potential will be far richer providing additional and informative tools, switching its practical use from a country comparison on education and labor skills to a tool that present and underline the different processes of skills formation. This could be broader educational debates by mobilizing and articulating all public policy spheres.

## Abstract

Human development in various forms is central to addressing South Africa's socioeconomic challenges and building an inclusive society. In the earlier phases of the democratic era in South Africa, TVET and skills development policies have been shaped by a reliance on human capital theory assumptions which present the relationship of education, skills, and the labor market in a linear way. This was in the context of macroeconomic policies that were geared toward prioritizing the interests of global capital in addressing developmental goals. Skills development and TVET policies are still largely geared toward driving competitiveness, growing the economy, and meeting the skills needs of capitalist employers. What we see is a growing paradox in the whole skills issue, whereby a so-called surplus labor of unemployed people exists, many of whom have different kinds of skills but are regularly told that they are “unemployable” as their skills cannot be deployed within the current economic configuration. Developmental objectives such as reducing unemployment and increasing access to the labor market have also not made the desired impact. This chapter shows that the capabilities perspective can enrich the discourse of skills development and TVET in South Africa by inserting an approach of human freedom and social justice, which is often

overlooked in policy analysis given the dominance of human capital theory assumptions about the relationship between skills and development. This chapter problematizes the binaries of *productivism* and *developmentalism* that have come to shape TVET and skills development discourses by arguing for a better understanding of the conceptual questions that shape our approach to these questions. It does so by engaging with different approaches to Amartya Sen's work which derive from a broad range of theoretical traditions. The chapter concludes with a discussion of four limitations of the capabilities approach: (1) influence of the changing character of work; (2) under theorization of power; (3) instrumentalist representation of the notion of *functionings*; and (4) lack of attention to ways in which VET can reproduce class inequalities.

## Introduction

Technical and Vocational Education and Training (TVET) has recently occupied a prominent position in the international development agenda driven by institutions such as the World Bank and the International Labour Organization (ILO) as well as in developing countries such as India, South Africa, and Bangladesh. TVET in South Africa is widely seen as a tier of education that has the potential of contributing to skills training at the intermediary skill level and being a catalyst to growing the country's economy while providing better employment opportunities for the youth. The Department of Higher Education and Training's (DHET) White Paper on post school education and training (Republic of South Africa 2013) envisages an integrated post school system in which articulation between the various levels of the higher education and the training system in South Africa are encouraged. The White Paper also aims to expand the numbers of students enrolled in TVET which is quantitatively smaller than the university system which is more popular among the South African youth as a post school education option.

The literature on vocational education straddles a tension between two kinds of outcomes, one is the *productivist* orientation that emphasizes direct links between education and the labor market and the other is *developmentalist* (Anderson 2009; McGrath 2012b), which seeks to address the role that education is to play in social and community development challenges. According to Anderson (2009, cited in McGrath 2012b: 3), productivism is premised on two key assumptions:

1. Training leads to productivity, leads to economic growth (training for growth).
2. Skills lead to employability, lead to jobs (skills for work).

The developmentalist logic, on the other hand, argues for a greater role in poverty reduction, human rights, and human capabilities, all of which relate more to

inclusion rather than the market-led approaches of the World Bank (Powell 2014). This chapter problematizes these binaries by arguing for a better understanding of the conceptual questions that shape our approach to TVET and skills development. There is a significant body of TVET and skills development literatures which have pointed out the limitations and reductionism of neoliberal and human capital theory assumptions (Tikly 2013; Powell 2013, 2014; Wedekind 2014; Ngcwangu 2015).

This chapter seeks to engage with these discourses and problematizes both the productivist (in section “[Reforms of Skills Development and TVET Sectors in South Africa](#)” of this chapter) and the capabilities perspectives (see section “[Engaging Capabilities Perspectives](#)” below). It argues that the capabilities perspectives provide a useful insight into questions of learning within TVET by providing a humanizing discourse. However, one of the limitations of capabilities within TVET is its inability to account for political economy questions such as the nature of changes to labor processes, power, and reproduction of class inequalities. The chapter addresses the following points: (1) the reform of skills development and TVET sector in South Africa; (2) the capabilities perspectives; and (3) limitations of the capabilities perspective. Engaging with these aspects allows the chapter to unpack systematically the challenges facing TVET in South Africa and the limitations of the capabilities approach in addressing these challenges.

---

## Reforms of Skills Development and TVET Sectors in South Africa

Powell (2013) argued that skills development research in South Africa needs to move toward a more theoretical direction given that previous scholarship has tended to be more quantitative and did not foster the development of a strong research community. Most attempts at theorizing the skills question in South Africa have either prioritized the need for a skills system that responds to market requirements and employer “needs” (Bhorat 2004, 2005, 2008; Bhorat et al. 2013). Others have taken a more critical perspective based on the argument that the economy is in crisis resulting in growing unemployment especially among the youth, meaning that skills and TVET policies should prioritize a wider range of social concerns such as poverty, inequality, community development, and social redress (Powell 2012, 2016; Vally and Motala 2014). These conceptualizations have grown in complexity given that the mandate of public policies on the post school education sector has largely been dominated by employer requirements in the corporate sector. This is, however, not only a South African problem but also an international one. McGrath (2012a) notes the weakness of TVET theory in general and laments the way in which productivist theories have dominated.

South Africa has been experiencing a process of “de-industrialization” since around the mid to late 1990s. International development institutions such as the World Bank and the Organisation for Economic Co-operation and Development (OECD) have made many proposals suggesting that developing countries must enhance VET in order to address problems of development. These institutions often overlook the complexities arising from capitalist restructuring of the economy as well as the nature of changes in the labor market.

The transition from apartheid to democracy in South Africa resulted in bureaucratic changes to the skills system and the related policies of the state. This era saw the institutional establishment of the Sector Education and Training Authorities (SETAs), the National Skills Fund (NSF), and the National Skills Authority (NSA) as platforms for stakeholder engagement on skills development. The National Skills Development Strategy (NSDS) is one of the policies introduced by the post-apartheid government, it is intended to provide a strategic framework and objectives of how the state, business, and labor can work together to enhance skills development in South Africa.

In a review of the first phase (1 April 2001 and 31 March 2005) of the NSDS, Kraak (2008) highlights numerous challenges such as limitations of data; lack of articulation between SETAs, TVET colleges, and universities; and lack of political will and capacity to make substantial changes to broader skills development policies. There have been a number of iterations to public policy on South African skills development since the ushering in of the democratic government. Here again the South African context echoes the international experience with TVET literature in the UK speaking of transformation fatigue and the TVET sector in India having a similar experience (Bathmaker and Thomas 2009). In South Africa, these different iterations have all been underpinned by a need for redress, employment creation, and equity. Some examples include the Accelerated and Shared Growth Initiative of South Africa (ASGISA) and the Joint Initiative on Priority Skills Acquisition (JIPSA) initiatives, which were seen as cornerstones to accelerating skills development and economic growth in South Africa. The focus on ASGISA and JIPSA was indicative of the assumptions that have underpinned skills development in South Africa which are the same assumptions that underpin TVET.

The Department of Higher Education and Training (DHET) launched a *White Paper on Post School Education and Training* (PSET), which identifies the youth unemployment problem as the main challenge to be addressed through building an integrated post-school education and training system. The *White Paper* proposes increasing access to TVET colleges as part of addressing the problem of high numbers of youth unemployment:

Government expects that TVET colleges will become the cornerstone of the country's skills development system. Headcount enrolments increased from 345,566 in 2010 to an estimated 550,000 in 2013; enrolments are expected to increase to one million by 2015 and 2.5 million by 2030. (Republic of South Africa 2013: 13)

The DHET aims to exponentially increase the number of TVET enrolments by 2030 to around four million. The possibility of such targets being reached is debated continuously by policy makers as access and interest in TVET is informed by a range of factors, including culture and attitudes to education. Many young South Africans are geared more to university education as it is perceived as a direct route to middle class occupations and careers. TVET policy in South Africa and other countries is increasingly confined to "responsiveness" to employer requirements and the promotion of "employability" (Ngcwangu 2015).

According to Wedekind (2014: 60), both the concepts of responsiveness and employability can be linked to human capital theory (HCT, that is, the investment in education and training that raises productivity, leads to economic growth, and improves individual life chances), which dominates discussions about education and development. The philosophical basis of human capital theory draws from some economists' emphasis on the returns to education and the prospects of improved salary earnings in the labor market due to the levels of education attained. However, these economists tend to reduce the value of education merely to its relevance in the economy rather than as being a good in itself. Education reduced only to its economic purpose results in a lack of attention to the ways in which it reproduces and maintains inequality.

Powell and McGrath (2014) argue that by emphasizing the quality of life and well-being of individuals, the capability approach offers a normative framework alternative that challenges what they call the "dominant consensus" which emphasizes the output and efficiency measures usually applied to social evaluation, particularly of vocational education programs in three ways. First is that it challenges the focus on narrow employability which, in turn, are underpinned by productivist assumptions of the relationship between education and work. Second is that it puts the wellbeing of the learner at the center of concern. Third, while recognizing the limitations and enablement of structure, it recognizes the agency and voice of TVET learners. The next section of the paper discusses six critical themes that emerge from capabilities perspectives that are critical in shaping our understanding of capabilities and how it is being applied to the study of VET.

---

## Engaging Capabilities Perspectives

As understood by Sen (1999), human capabilities have to be judged and aligned with substantive freedoms enjoyed in order to lead a kind of life that can be valued. "In this sense poverty must be seen as the deprivation of basic capabilities rather than merely a lowness of incomes" (Sen 1999: 87). Vocational Education and Training (VET) scholars (Powell 2012, 2013; Tikly 2013; McGrath 2012a, b; Bryson 2015) use the capabilities approach to argue that education can provide a basis of learning for life, rather than learning for work by expanding the basis of education which then enhances the entire human capability of those in vocational education and training. Powell (2013), borrowing from Sen, maintains that a distinction between "capabilities" (opportunities), what a person can do, and "functionings" (doing), what a person actually does, is necessary in order to understand the life that a person actually lives and a person's well-being. By this, we see in the capabilities perspective a humanizing discourse which seeks to transcend a narrow functionalist approach to VET. While there are many perspectives that emerge out of the capabilities literature, this chapter now examines six critical themes which emerge from the capabilities approach literature that are useful in locating the South African case within the international context of discourses over the application of capabilities within TVET.

The *first theme* considers agency as central to the capabilities perspective. It is a view that places agency at the center of education and human development. By so doing, the capabilities perspective seeks to transcend the aspects of vocational education and training research which are structuralistic and quantitative. The capabilities approach is also closely aligned to a social justice perspective which aims to put the needs of people first. “By putting the needs of people first – rather than the needs of the economy – the capability approach brings to the forefront of VET and skills development discourse the importance of social justice, human rights, and poverty alleviation” (Powell 2013: 2).

The *second theme* considers the centrality of individual capabilities, collective capabilities, and collective intentions. These approaches seek to interpret Sen’s commitment aspect of the self in collective intentionality terms, to explain his view of “identification with” social groups, and then use social identity theory’s distinction between relational and categorical social group identities to explain a general relationship between individual and collective capabilities (Davis 2015). Other contributions such as Ibrahim (2006) use the capabilities approach to highlight the importance of collectivities by using examples of self-help to demonstrate how the poor can act together to expand and exercise new “collective capabilities”. This is a response to critics of the capabilities approach being too individualistic. As she says,

The expansion of collective capabilities not only requires the use of agency freedom (i.e. individuals pursuing goals other than their own), but also involves the participation in a collectivity. The main differences between individual and collective capabilities are therefore the process through which these capabilities come about and their potential of benefiting the collectivity at large. (Ibrahim 2006: 404)

The link between vocational qualifications and the labor market is tenuous, as qualifications do not always necessarily match with available jobs despite human capital theory assumptions that TVET provides stronger pathways into the labor market. Two perspectives emerge within the capabilities literature to address this dimension of TVET; *One* is Powell’s (2016) attempt to transcend the “black box” of the relationship between VET and work, instead Powell focuses on the relationship between VET and unemployment given that in the South African context, the demand for skilled and semiskilled occupations are in decline. Powell suggests that VET’s focus could be more on building the solidarity economy in the face of the decline of formal labor markets particularly in the private sector (Powell 2016: 4).

The *third theme* from Wheelehan et al. (2015) proposes the use of vocational streams and productive capabilities, which focus on the broad-ranging knowledge, skills, and attributes that individuals need for a number of occupations within an industry.

Productive capabilities are premised on the development of the person in the broad context of their vocational stream rather than on training them for specific tasks and roles. The starting point is ‘what kind of worker’ is required to support innovative workplaces. The findings from our research and the literature more broadly are that work is changing

rapidly: rather than focus on the tasks and roles defined for current practices within work, workers need adaptive capacities to adapt to change and emerging practices. (Wheelahan et al. 2015: 34)

These two perspectives problematize human capital theory assumptions about linear relations between education, work, and the labor market. Both Powell (2016) and Wheelan and Buchanan (2016) draw on capabilities to show the importance of the individual to be trained not only for individual tasks but for broader vocational streams and considerations of training for a solidarity economy given the declining demand for skilled and semiskilled work in the case of South Africa.

The *fourth theme* is a more polemical strand of literature on capabilities which is concerned with the extent of Marxian influence in Sen's capability approach and the effect of this influence to elucidate the central issue of freedom. On one hand is a view that shows convergence between Sen and Marx's perspectives. Qizilbash (2016: 1209) explores specific claims made by Sen which are prefigured in the works of Marx and John Stuart Mills. These are arguments where Marx himself uses concepts such as "capacity" in his own writings and the concern that development should free human beings from the shackles that restrict them, or give them opportunity to flourish. On the other hand is a view that points out divergences and flaws in Sen's attempts to use Marx's ideas to inform his theory of justice. Fraser (2016) argues that Sen resorts to a methodological individualist approach of choice that Marx rejects. His search for positional objectivity is undermined by the power of capitalist ideology and ruling class interest (Fraser 2016: 1194). In essence, these tensions illustrate the complexities of understanding the Marxian influence on Sen's ideas of capabilities.

At the core of Fraser's critique is a concern that many left intellectuals have of development about the prospects of attaining social justice in conditions of capitalism and whether that is not in and of itself reformist. This is found in the distinction between "abolishing rather than persevering capitalism" which according to Fraser (ibid.) is treated as eclectic within Sen's work. It is within these vicissitudes of polemical and pragmatic ideas that the capabilities approach has been engaged and also how further attempts at theorizing the role of VET in development is being conceptualized.

The *fifth theme* are those scholars who have emphasized the intersection of gender, youth, and VET from a capabilities perspective. Fogues and Cin (2018) combine gender and capabilities literatures to tease out the hegemony and traditional notions that place women and men in different positions in society, determine the extent to which social, political, and economic opportunities that are available to both genders qualify the freedom they can have (Fogues and Cin 2018: 13). The importance of the gender dimension of capabilities research is that it engages with aspects of human society that critically shape marginalization and a range of other injustices. In the South African context, the gender dimension to social injustice was captured within the liberation movement under the notion of "triple oppression" which relates to the gender-class and race aspects of apartheid and colonialism. In this way, the capabilities literature engages with an important

feature of South African society, which cannot be isolated from the general study of VET in the country.

The dominance of the idea that VET can be a solution to youth unemployment is dominant among many governments and is closely linked to economic orthodoxy which places the market at the center of all development in society and seeks to minimize the role of the state in development. Fogues (2014) shows in the case of Spain that the employability discourse came to be deployed in state policies as part of the responses to the financial crisis of 2008, which resulted in huge job losses in the construction sector. VET subsequently returned to the national agenda under the prism of the human capital discourse. As in many other countries, the Spanish government placed much hope in VET's role in reducing unemployment. However, Fogues cautions against an overoptimistic belief in VET as a solution to youth unemployment and states "The idea that more VET will translate into employment or the higher productivity of a country, calls for reassessment. Attention needs to be paid to the pillars and values sustaining the educational system and hence the focus on which skills are developed and for what purposes. A CA to education represents the students and their values as ends in themselves, not as means for economic growth" (Fogues 2014: 10). The value of the capabilities approach is that it seeks to transcend the prescriptions of human capital theory as they were expressed through the employability discourse in Spain.

The *sixth theme* unpacks the dilemmas of the "recognition and redistribution" within theories of distributive justice. In analyzing how welfare systems facilitate cultural justice more effectively, Yamamori (2004) draws on Nancy Fraser and Amartya Sen's works. Yamamori sees Fraser's (1997) notion of "redistribution and recognition" dilemma as contradictory. At the core of this dilemma was the challenge since the 1960s and 1970s of bringing the politics of recognition (identity, race, gender, sexuality, and ethnicity) into battles over the redistribution of wealth and power. Central to Nancy Fraser's critique of theories of distributive justice is that they ignore the issues of recognition. Robeyn (2003) contends that Fraser's critique is not justified in relation to Sen's capabilities approach by "incorrectly assuming that Sen's capability approach cannot accommodate issues of recognition, Fraser has not appreciated that the capability approach can actually meet all the requirements she holds a theory of social justice should meet" (Robeyn 2003: 21). At the core of arguments against Fraser is the view that Sen's theory of capabilities can be used to accommodate both recognition and redistribution.

This synthesis of some thematic areas in the capabilities tradition points to central themes that scholars have picked up on and are relevant in making theoretical sense of the challenges of applying VET within the South African context. Questions of youth development, distributive justice, collective capabilities, individual capabilities, agency, and the centrality of identity are all crucial to discussions of VET in South Africa. The post school education policies in the post-apartheid era in South Africa (as shown in section "[Reforms of Skills Development and TVET Sectors in South Africa](#)" above) seek to address these themes in various way. What follows is a discussion of limitations of the capabilities approach in which I identify four critical issues.

## Limitations of the Capabilities Approach

There are aspects of the capabilities approach that do not adequately address important aspects of political economy that shape the formal labor market and inform the preexisting social relations. A simple definition of political economy is that it relates to the influence of unequal power on the distribution and defining of scarce resources. While inequality, class, race, and social distribution are central to political economy, the overarching frame of defining political economy rests on the questions of power and ideology (Balwanz 2014). The major limitation of the capabilities approach is its inability to account for the concrete realities of the capitalist labor market, in particular the changing dynamic of work itself. I have identified four limitations which I will discuss briefly below.

*Firstly*, one of the most mythical and often speculative issues within VET is the domain of work. It is important because most VET research is oriented toward strengthening links with the formal labor market and structuring the learning within VET toward these forms of employment. The essential relationship between worker and employee is regulated by the power of who decides about production, the skill content of work, and even the time it takes to produce. Technology, for an example, has a great impact on the content of skill in production and declines in the industrial workforce. Hlatshwayo (2017: 24) in his insightful study of Arcelor Mittal (formerly Iscor) (As part of the apartheid state's policy Iscor which was a state owned company was privatized in 1989. Its unbundling occurred in 2001 as a result iron ore mining was taken over by Kumba Resources. In 2006, the company was taken over by Arcelor Mittal Group.) in Vanderbijlpark, south of Johannesburg, describes how the impact of the privatization of the company coupled with the introduction of Lean Production techniques (This is a production technique underpinned by a philosophy of elimination of waste, workforce reduction, and cost reduction; it is associated with a range of industrial strategies linked to what is called "Post Fordism".) has resulted in a huge number of job losses. His findings show that between 1989 and 2015 about 46,642 jobs were lost in its plants throughout the country. Close to 10,000 jobs were lost between 1989 and 2015 at the Vanderbijlpark plant alone.

A crucial point that Hlatshwayo makes is that formal education was used as a tool for exclusion of many workers in the process of the restructuring of the company. As he states:

Lean production and technological changes led to the development of criteria for excluding many workers by management and it entailed a level of formal education being used as a tool for this purpose. This had less to do with workers' skills and 'trainability'. In fact, those workers who remained at the plant spoke about how new machines and computers did what is regarded as 'appropriating diagnostic and cognitive skills from workers in the production process.' (Hlatshwayo 2014: 131)

These changes in industrial production affect, in particular, the vocational areas that are prioritized within VET research such as apprenticeships and artisanal trades. Elsewhere in this volume, Powell and McGrath (2019) state that VET in South Africa was historically orientated to industrialization since the early period

of the twentieth century. This had made the goal of VET more directed toward employability and close connection to the world of work. However, the world of work has changed significantly; as a result those historically strong links between VET and work are more fluid as capital finds different ways to produce which don't require labor interventions that we have become traditionally accustomed to.

A *second* limitation of the capabilities perspective in VET is that it undertheorizes the question of power. Power is reproduced through class formation given the capitalist structures of modern societies. In his notion of "sites of class compromise," Wright (2000) identifies three spheres within which class struggles occur and class compromises are forged:

- (1) The sphere of exchange concerns the labour market, and various other kinds of commodity markets; (2) The sphere of production concerns what goes on inside firms once workers are hired and capital invested. Conflicts over the labour process and technology are the characteristic examples; (3) The sphere of politics – Class conflict and class compromise also occur within the state over the formation and implementation of state policies. (Wright 2000: 964)

These spheres of class compromise are the spheres in which VET and skills development regimes take shape. Within capabilities, the discussion over power and class does not pay sufficient attention to the importance of unequal power relations. The "opportunities" aspect of capabilities which Sen (1999) refers to does not explain how power influences the access to those opportunities, given the preexisting social relations. The employability agenda within VET has tended to overlook the various ways in which social structures contribute and perpetuate class reproduction. The proponents of the employability discourse have tended to overlook the structure in which VET occurs, as a result disarticulating the notion of opportunities from class and structure.

The *third* limitation is related to the notion of functionings (doings). The discourse of employability is strongly influenced by the notion of *functionings* as achievements. The usefulness of the functionings perspective is that it explains the centrality of the individual and their actual potential to better their lives. Emirbayer and Mische (1998) argue that human behavior is shaped by both internal and external attributes within society and that internally behavior is shaped by consciousness. On external causes of behavior, their theory explains how human interactions with the surrounding social world shape their behavior. Within the capabilities perspective, the danger is that the *functionings* are presented in an instrumentalist way that does not sufficiently speak to structures that shape the achievements or struggles for self-sustainability, for example, of VET graduates and young people generally in the society.

There are powerful social forces that are restructuring the very basis of our lives, thereby impacting on the functionings portrayed in capabilities. The labor market in the current phase of capitalist development is showing signs of a deepening crisis of employment, insecurity, and fragmentation which is characterized by a growing *precariat*, a stratum of workers who are precariously employed as casualization and informalization of labor is increasing. The term *precariat* as used by Standing

(2011) which is based on a combination of *proletariat* and *precariousness* that defines those whose position in the labor market has been reshaped by the changing capitalist structure in the economy. For capabilities to speak to such complexities, it must go beyond a mere moralistic approach to an approach that seeks to understand actually existing capitalism as it necessarily is.

The *fourth* limitation of capabilities in relation to VET and the employability discourse is its inability to recognize that VET in many ways can reproduce class inequalities as opposed to overcoming them. According to a Statistics South Africa report on poverty trends, “Poverty levels in South Africa rose in 2015. When applying the upper-bound poverty line (R992 per month, approximately \$69 US dollars) more than one out of every two South Africans were poor in 2015, with the poverty headcount increasing to 55.5% from a series low of 53.2% in 2011. This translates into over 30.4 million South Africans living in poverty in 2015” (StatsSA 2017: 14). These staggeringly high levels of poverty as well as inequalities frame the structural context in which VET must be understood in the context of South Africa and many other developing countries.

The framing of VET and skills policy (see section “[Reforms of Skills Development and TVET Sectors in South Africa](#)”) is underpinned by the assumption that VET will contribute to addressing the triple challenges of poverty, unemployment, and inequality. Powell and Mcgrath (2019: 2) argue that “the employability agenda functions as a form of structural violence by locking youth into a cycle of poverty and then reinforcing this structural violence by persistently and stubbornly insisting on preparing learners for a formal labour market that simply has not and probably will never employ the majority of them.” The capabilities approach tends to adopt a more instrumental approach to the crisis rather than appreciating the structural nature of the causes of high levels of poverty and unemployment. As Bonvin argues, “It is not only a matter of redistribution or of developing employability, but of acting simultaneously on all components impacting on the conversion rate. In the case of labour market policies, for instance, this requires a combination of redistributive, supply-side and demand-side policies” (Bonvin 2018). The four limitations I have outlined point to a need for a deeper focus on questions of political economy that are based on power, class conflict, and inequality of distribution of resources in order for the capabilities perspective to make a stronger contribution to our study of VET.

---

## Conclusion

This chapter has sought to locate the question of skills development and VET within a context of the contestations within the literature on capabilities. While acknowledging the value of the capability approach, the chapter has argued that it falls short of addressing the ways in which VET reproduces and maintains inequality in that it has ignored the political-economic context of TVET. What has been shown in the chapter are the combinations of pragmatic and polemical considerations in conceptualizing the role of VET in development. The structural changes in the global economy presently have had an impact on the availability of employment in

the formal labor market resulting in a decline in skilled and semiskilled occupations. The VET literature tends to ignore this dimension and lacks an appreciation of this in the political economic context.

In the South African context, the sense that structural change is crucial to build a more equitable post school sector has been acknowledged within DHET policies since 2009. However, this recognition does not necessarily translate to a capabilities perspective, which emphasizes the importance of human well-being within human development policies or programs. In engaging with the capabilities perspectives, I have sought to show its limitations and also its strengths within TVET and skills development sectors. Powell and McGrath (2014) expose the weaknesses of output- and efficiency-based evaluation systems. For TVET to truly contribute to development, there needs to be a stronger appreciation of the wider role that TVET and skills development can play without being necessarily confined to dominant market logics and human capital theory assumptions.

The limitations of the capabilities perspective and the employability discourse is the tendency to overlook political economy questions that are related to changing labor processes, power, and the reproduction of class inequalities. The deepening capitalist crisis is showing that the historically close relationship between VET and the world of work through structured pathways to employment is undergoing fundamental shifts. These factors should be taken into consideration in the further development of the capabilities literature in order to connect to wider societal questions that circumscribe the conditions in which VET developed.

## Abstract

The chapter shows how a capability approach to vocational education and training (VET) marks a clear departure from human capital theories. After a brief presentation of the capability approach (CA), it analyzes in greater detail the two notions of “capability for education” and “capability for voice” and what they entail for VET. Specific emphasis is placed on the issues of timing (giving enough time to learn) and voice (taking account of the trainees’ aspirations and viewpoints) and on the necessity to consider VET as having both adaptive and transformative objectives (creating not only efficient workers and rational consumers but also active citizens able to form their own aspirations and to push them within public debates), as well as intrinsic and instrumental value. This also requires going beyond the all too frequent focus on the supply side of VET (equipping trainees for the market) and integrating also the demand side (equipping the market for trainees, i.e., asking firms and employers to take due account of the trainees’ needs and aspirations). The chapter is based on the findings of four

Vocational education and training (VET) is mainly conceived in productivist terms, stating that (a) the increase in skills necessarily results in increased productivity and enhanced economic growth and (b) developing skills or employability leads to creating jobs. This is very much in line with human capital theories, where the increase in skills is envisaged as the key to both unemployment and economic growth. This agenda is often accompanied by the necessity to increase flexibility on the labor markets, so that markets are allowed to define their own terms for professional inclusion and thus to clear the problem of unemployment and poor economic growth. In this view, such a focus on VET has the ability to generate a new virtuous circle between economic efficiency and social justice or the concern for egalitarianism. While Keynesian economics insisted on demand-side measures to support the creation of jobs (investment programs) and the purchasing power of citizens (via cash benefits for those unable to work), the new conception insists on employability and productivity as the drivers of economic prosperity: if skills are increased, this results in more employable and more competitive workers, which in turn will boost the competitiveness of firms and of the national economy, allowing them to create jobs and integrate a higher number of workers paying contributions and ensuring the financial sustainability of the welfare state. Thus, the driver of economic success is no more the demand-side intervention of the State, especially during economic crises, but the increase in skills and employability. Human capital development is presented as the solution to unemployment and sluggish economic growth in the context of globalized knowledge economies. This can be seen in the European employment strategy calling for the development of so-called flexicurity (Bonvin et al. 2011) or in the Social Investment Package adopted in 2013, where social policies are to be complemented (or substituted in some cases) by educational policies. In other words, the objective is not to protect people from the market but to equip them for the inclusion in the market (what Streeck has termed “supply-side egalitarianism” in his 1999 presidential address to the Society of Advanced Socio-economics). Thereby, human capital theories are envisaged as the solution against social exclusion and for social cohesion.

However, this conception entails a specific conception of VET that is mostly instrumental to economic purposes. This is one of the main reasons why this conception has raised sharp criticism, as it was accused of “reducing people and the environment to the status of human and natural resources for economic exploitation” (Anderson 2009: 44). This coincides with a specific view of what training and work should be, which has been accused to be too individualistic (with its emphasis placed on individual employability), too short-term (focusing on immediate

outcomes rather than lifelong processes), and too much insisting on paid employment (thus excluding other human activities and producing gender inequities), on the role of public institutions and providers in matters of education and training (McGrath 2012). This chapter proposes an alternative conception to VET, which emphasizes its potential contribution to the development of human capabilities. It draws on the results of four successive EU projects, namely, the CAPRIGHT project (FP6 2007–2010), the WorkAble project (FP7 2009–2012), the SoCietY project (FP7 2013–2015), and the ongoing Re-InVEST project (H2020 2015–2019). The first section “[Distinguishing Human Capital and Human Capabilities Approaches to Education and VET](#)” distinguishes between human capital and human capabilities approaches to education. The second section entitled “[The Capability Approach in a Nutshell](#)” briefly presents the capability approach and its main components. The two following sections successively introduce the concepts of “capability for education” (section “[Capability for Education and Its Implications for VET](#)”) and “capability for voice” (section “[Capability for Voice and What It Entails for VET](#)”) and identify what they entail for VET policies, insisting on the necessity to integrate the demand-side when talking of employability (McQuaid and Lindsay 2005) and to take more account of the key issues of time and voice. The final section, entitled “[Conclusion: VET as the Real Freedom to Access “Second Chance Education”](#)” concludes and places a specific emphasis on the notion of VET as “second chance education” and what its implementation implies if the capability perspective is taken seriously.

---

## **Distinguishing Human Capital and Human Capability Approaches to Education and VET**

To grasp the differences between human capital and human capabilities, reference is mainly made to three contributions dealing with this issue within the field of capability studies, namely, Amartya Sen, Ingrid Robeyns, and Melanie Walker (see also Walker and Unterhalter 2007; Rajapakse 2016). Sen carefully distinguishes between the accumulation of human capital and the expansion of human capability (Sen 1997, 1999). While the former aims at enhancing productivity or production possibilities, the latter focuses on the ability to lead a life one has reason to value, thereby implying that valuable lives may include aspects beyond mere participation to productive activities. In his words, human capital is defined mainly with regard to its indirect value, that is, the (mostly economic) objectives it allows reaching, while human capabilities also relate directly to the notion of valuable life (learning to read, to communicate, being able to choose in an informed way or to form one’s preferences in a more autonomous way, etc.). In this latter perspective, the benefits of education do not boil down to “its role as human capital in commodity production” (Sen 1997:1959). Yet, in Sen’s view, the two perspectives are not incompatible but complementary. Indeed, the capability approach includes the human capital view and takes a broader view on the issue of education and VET and their contribution for human development. Sen also emphasizes a second difference between both conceptions, which relates to the way they envisage the relation between economic

growth and human development: while the human capital approach considers human beings as means for the purpose of enhancing economic growth, the capability perspective reverses the relationship and sees in economic growth an important means for pursuing human flourishing. Both components are considered as important, but not in the same way. This is not to invalidate the perspective of human capital but to insist that economic growth is not an end per se but needs to serve the purpose of human capabilities enhancement. “This is because human beings are not merely means of production (even though they excel in that capacity), but also the end of the exercise” (Sen 1997:1960). Finally, Sen points out that education does not aim exclusively at economic development but also at social change: for instance, female education reduces gender imbalances, basic education improves the quality of public debates, etc. In sum, there are other instrumental roles to education than the enhancement of economic productivity.

Drawing on Drèze and Sen’s insights (2002: 38–40), Robeyns (2006) aptly summarizes these points by insisting on three main dimensions. First, education has an intrinsic role and not only instrumental aims: one may learn for the sake of knowledge, even though that may not bring further advantage to oneself. Second, education has a range of instrumental roles that include other functions than the mere augmentation of economic productivity. Third, education may have an impact at individual level (increasing one’s competitiveness on the market but also enhancing one’s ability to participate in a public debate, opening one’s mind to other ways of living, thus opening opportunities to break with cultural or social norms) but also at collective level (opening possibilities for the creation of new markets but also taking part in social change toward a more cohesive or fair society, etc.). In her view, human capital approaches do not allow taking seriously these three dimensions, in so far as they focus on the instrumental value of education and on its economic returns, both at personal (esp. increased productivity, higher wages) and collective level (increased competitiveness, contribution to GDP growth). Thus, the human capital perspective favors a view of education as an investment that delivers high individual and collective economic returns, which calls for targeting education and VET expenses on those people who are able to deliver the highest returns. This may, for instance, imply that “money spent on education – if it is conceptualised as an economic investment – is better spent on boys/men than on girls/women” (Robeyns 2006: 74) in contexts characterized by a traditional gender division of labor within a family: in such a perspective, what would indeed be the point of educating young girls if these are to privilege, at a later stage of their life, educational tasks within the family over economic achievements on the labor market? This mainly takes place because the intrinsic value of education as well as its noneconomic instrumental values at personal and collective level are not sufficiently recognized within human capital theories. By contrast, the capability approach gives all these dimensions their due place and takes proper account of the intrinsic value of education and its noneconomic contributions to individual and collective human and social development (see also Cockerill 2014).

Walker (2012) pushes the comparison between the two approaches one step further. She insists that both conceptions rely on varying anthropologies, i.e., diverse

conceptions of what human agency and human flourishing mean. On the one hand, human capital theories envision human beings as economic producers and citizen-consumers, mainly concerned with the maximization of their own utility calculated along a cost-benefit line. This anthropological view, it is claimed, holds for all human beings, which also implies that education policies are mainly a matter of setting up the right financial incentives for people to behave in the expected way. At the micro level, then, people are expected to privilege education that will increase their competitiveness and productivity; at the macro level, educational investment should be made in favor of people who promise to deliver the highest economic returns. Education is here envisaged as “adaptive,” in so far as it provides the competencies required by the labor market. By contrast, the capability approach insists on the existence of irreducible human diversity: people’s reasons to value do not coincide with maximizing utility but include other possible motives beyond economic accumulation or enrichment, such as participation in society and democratic debate, willingness to increase cohesion or to contribute to the creation of more equitable societies, or other forms of altruistic behavior. In this case, education as a process is also conceived in a different way: it is not something one receives passively (i.e., knowledge that one has to learn and that has been selected beforehand according to the labor market requirements); it is considered as an active process whereby people do not only acquire competencies or knowledge but learn to become learners by themselves, as well as active citizens participating not only in the labor market but in politics and society. Such education is not simply adaptive but potentially transformative as it allows questioning taken-for-granted views and perspectives. While the human capital approach aims at creating productive workers and efficient consumers, the latter aims at fostering reflective citizenship, which would also apply to the labor market (going in the direction of calling into question the subordinate position of workers within the employment relationship). Walker suggests that education should aim “to form the kind of human beings who can contribute to shaping the kind of society which values human capabilities, who want to contribute to capacity building and a society and public culture, which can sustain capabilities for all” (Walker 2012: 392). In short human capital theories aim at adapting people to the requirements of the labor market, with a view to reducing unemployment rates and allowing everyone to contribute to overall economic growth. The capability approach, on the other hand, views education in a much more encompassing manner, as a way to contribute to the creation of citizens able to act for a more capability-friendly economy and society. In one case, educated people are receivers in so far as they acquire competencies that are useful for economic competitiveness and growth; in the other, they are certainly receivers, but they are also “doers and judges” (Sen 1985) in so far as they are active participants in the educational process – Walker advocates the use of participatory and discussion-based pedagogic methods – and able to voice their own views about what should count as appropriate education.

Table 1 briefly synthesizes the main differences between both approaches as emphasized above.

**Table 1** Human capital vs. capabilities approaches

Approaches	Human capital	Capabilities
Role of education	Instrumental role	Intrinsic and instrumental
Types of instrumental roles	Economic (personal and collective)	Economic and social (personal and collective)
Underlying anthropology	Homo economicus	Human diversity
Link to the labor market and society	Adaptive: Creating workers and consumers	Transformative: Creating citizens able to discuss and question prevailing norms and practices
Relationships between human beings and the economy	Human beings as means to economic growth	Human beings as the ends of economic growth

Source: Own elaboration from Sen (1997, 1999), Robeyns (2006) and Walker (2012)

It is important to emphasize that all three authors referred to in this initial section do not sustain that human capital theories should be discarded altogether. Rather, they should be supplemented by other approaches to education in order to leave more space to other functions and roles of education and VET. This perspective is also endorsed by Chiappero-Martinetti and Sabadash (2014), when they advise integrating human capital theories and the capability approach (CA) conceptually and methodologically. The next sections go further in explaining what a CA approach to VET entails. After a brief presentation of the CA, they will develop along the two key notions of “capability for education” and “capability for voice.”

## The Capability Approach in a Nutshell

The capability approach is a normative framework developed by the economist and philosopher Amartya Sen in order to rethink the meaning of human development. Rather than economic growth (which is at the core of human capital theories), human development is defined as the expansion of the real freedom one (i.e., each and every member of a given society) has to lead a life she/he has reason to value. This is the very definition of the notion of “capability,” which sets the yardstick to assess the quality of public action in all domains. In other words, an appropriate public action should aim at developing not only the citizens’ economic capacity but their real freedom to lead a valuable life. The approach is based on two main distinctions: on the one hand between commodities and capabilities and on the other hand between capabilities and functionings (Sen 1999; Bonvin and Farvaque 2008; Bonvin 2012). The former emphasizes that the possession of commodities or material resources is not enough to enjoy the real capability to lead a valuable life. For instance, a disabled person will certainly have fewer capabilities than an able-bodied one even though both have control over the same amount of resources, in terms of available income from a job or a welfare transfer. This takes place because they do not have the same ability to convert these resources into capabilities or real freedoms to lead a valuable life. This differential in what Chiappero-Martinetti and Sabadash (2014) call the

conversion rate requires correction, either via an increased amount of resources for the most vulnerable people or via a direct intervention on the parameters that impact on the conversion process. Following Robeyns (2005), there are three types of such parameters: the individual ones, relating to personal features, capacities, aspirations, etc.; the social ones, which point to the sociocultural context (social norms, institutions, etc.) and what it permits different groups of people to be and to do; and the environmental ones, which designate all geographical, climatic, infrastructure, etc. parameters. For the sake of simplicity, we consider here that the conversion rate of each and every person depends on the amount of resources she has command over, his/her individual capacities or features, and the socioeconomic, geographic, etc. context in which she/he lives. Thus, equalizing capabilities in such a perspective (or more realistically reducing inequalities in capabilities or allowing all people to reach a minimal threshold of capabilities) requires equalizing the conversion rate via appropriate action on the whole configuration of resources and individual and contextual conversion factors. It is not only a matter of redistribution or of developing employability but of acting simultaneously on all components impacting on the conversion rate. In the case of labor market policies, for instance, this requires a combination of redistributive, supply-side, and demand-side policies.

The second distinction emphasizes the difference between capabilities and functionings. Sen defines functionings as actual beings and doings, that is, what people actually are and what they do, whereas the capability set encompasses all potential functionings that people may reach, that is, what they could be or what they could do. In the capability perspective, the objective of human development calls for the enhancement of capabilities or real opportunities to lead a life one have reason to value; by contrast, insisting on functionings would miss the “freedom” component of the capability approach, i.e., it would impose on people one vision of the “good life” and of what they should be or do rather than leaving them free to make their own choice about this. For instance, unemployed people should not be forced into specific functionings such as accepting any job or following activation measures against their will; rather, their capability set should be expanded, leaving them free afterwards to make their own choice among available opportunities. Of course, the boundary between capabilities and functionings is not so straightforward when it comes to implementing public action: one could for instance imagine that constraining people to follow a training session at time  $t$  might well increase their capabilities at time  $t + 1$ . Such issues are complex and do not allow for clear-cut solutions. All the same, the principle that capabilities should be given priority over functionings remains an important feature of the capability approach. Crucially, the expansion of human development as freedom (Sen 1999) also necessitates that people’s voice and aspirations are taken seriously both in the design and implementation of public action, i.e., they should be actors of these processes and not simply receivers. This calls for a participative – and non-paternalistic – view and practice of public action, in which the beneficiaries’ capability for voice is duly taken into account (Bonvin 2012). This accounts for the very strong emphasis on democracy within the capability approach (Sen 2009).

We now come to see how this approach can be implemented in the field of vocational education and training. We thus draw the implications of the two distinctions briefly summarized above in this field.

---

## **“Capability for Education” and Its Implications for VET**

Capability for education or VET can be defined as the real freedom to choose a vocational training program or curriculum one has reason to value. In Sen’s perspective, this requires taking as a departure point real and concrete individuals. These may be characterized by different socioeconomic backgrounds or statuses, a great variety of previous – negative or positive – schooling experiences, as well as a diversity of conditions with regard to health, family situations, social integration, material well-being, etc. Thus, in terms of capability for education, some people enjoy a wide range of positive conversion factors that will allow them to pursue an educational path they have reason to value, while others are affected by negative conversion factors that impede them to develop and implement valuable educational trajectories. In the latter case, these parameters (e.g., bad health, precarious standard of living, isolation, etc.) act as obstruction factors impeding the conversion of the formal right to education into a real freedom to pursue the educational path one has reason to value. These differences result in very unequal degrees of capability for education. Empirical analysis (e.g., Otto et al. 2015, 2017) allows observing the persisting existence of such differences despite all of the efforts deployed in the direction of human capital development in OECD countries. We contend that the CA allows, on the one hand, grasping more adequately the mechanisms underlying such inequality vis-à-vis capability for education (going beyond the views emphasizing the lack of motivation of potential learners and blaming them for that suboptimal outcome) and, on the other, suggesting avenues toward equalizing capability for education for all.

The CA suggests that, when interpreting capability for education in terms of individual conversion factors, other dimensions than motivation should be included. In the WorkAble and the SoCIetY projects, three main aspects were emphasized in this specific regard:

- The desire to be trained or to follow an educational path may be significantly reduced by previous negative schooling experiences as was illustrated notably by the Swiss case study (Bonvin et al. 2013; Rosenstein et al. 2015). In many such cases, school was perceived very negatively; as a consequence, training programs proposed to vulnerable job-seekers are often assimilated to these previous negative experiences and thus perceived unfavorably. This, however, did not mean that these people were not motivated to learn, rather that they did not want to learn in this “classical” way.
- The capacity to be trained or to follow vocational training programs may also be impeded by weak levels of literacy and numeracy, or by a poor knowledge of the local or national language(s). The WorkAble project thus emphasized the

difficulties faced by migrant people when it comes to completing a vocational curriculum (Kjeldsen and Ley 2015).

- The availability for training is unequally distributed among the diverse categories of population, so that lone mothers, for example, cannot be available for training programs if their participation into such measures coincides with losing the income they get from a job in the labor market. Thus, the lack of an adequate replacement income for trainees may translate into unavailability to train, even though there is a high appetite and capacity for vocational education and training.

However, both the WorkAble and SocIEtY projects emphasized that these dimensions do not depend exclusively on individual factors but on the way these combine with the issue of resources and contextual conversion factors. Indeed, empirical research shows that the people who have no willingness whatsoever to learn are very few and that the desire to train seems rather to be impeded by certain institutional characteristics of the educational system. These include, for instance, early selection procedures, which tend to produce strong negative reactions against the schooling system, where the weakest or most disadvantaged categories of pupils feel discriminated by their teachers and by the representatives of the educational system at large (Bonvin et al. 2013). Such negative experiences are then reported onto all educational programs; this explains to a large extent why some vulnerable adults are reluctant to participate in all kinds of formal education leading to apprenticeship or academic diplomas. In their view, those are linked to school and all the bad experiences connected with it, and many of them prefer to get a bad job poorly remunerated than to restart what is perceived as the revival of a negative past. Hence, one of the main findings of the WorkAble project (Otto et al. 2015) is that to stimulate the desire to train three main actions are required: first, to delay selection procedures later in the curriculum so that, in the first place, such negative experiences, connected with the necessity to perform better than others at an early stage of one's schooling career, are not allowed to take place; second, to valorize informal learning, i.e., training taking place in informal arenas and along less standardized rules, which may include participative pedagogy or on-the-job training based on learning by doing; third, awarding formally recognized qualifications on the basis of prior field experience acquired (i.e., experience accreditation schemes as can be found in Belgium, France, or Switzerland). When designing VET programs, these three aspects should be given due attention, i.e., such programs should not be based on early selection, on an exclusive focus on formal learning, and they should be open to alternative formula allowing the validation of field experience.

In the same way, the capacity to learn should not be interpreted as a matter of individual assets or deficiencies that would exclude all possibilities to train for certain vulnerable people. As a matter of fact, empirical research showed that alternative pedagogical modes could be developed with a view to setting up more progressive or step-by-step ways of learning for the people needing more time to acquire knowledge and skills. Beyond this issue related to the pace of training, this requires that less "prestigious" skills or qualifications also enjoy adequate

recognition in the context of knowledge economies: not only high academic or technical qualifications but also less exceptional skills and professional know-how, which are necessary for the smooth functioning of the economy, should be recognized as valuable. Empirical research indeed showed that most people are willing and able to learn, but not all of them in the same way and with the same ambitions; thus, VET systems should be designed in a way to attach value and social recognition to all these forms of training. Moreover, the WorkAble and SocIEtY projects also emphasized that education should not focus only on the acquisition of skills that are defined as necessary to participate in the labor market (Kjeldsen and Ley 2015). Rather, it should also include the capacity to form one's opinion or preferences autonomously and not being simply forced into compliance with dominant social norms. In such a perspective, following Nussbaum (2010), education should aim to create not only productive workers – however important that aim is – but democratic citizens able to decide autonomously on their way and trajectory of life and to participate in the public debate upon what the good society should be. This calls for the rehabilitation of the humanities within education, which means that vocational education and training should not focus exclusively on professional skills but also include more general democratic skills that are equally important for the good and smooth functioning of the economy and the workplace. Both of course are not incompatible and should rather be conceived as necessary complements one to the other.

These two first dimensions – desire to train and capacity to learn – relate to what Appadurai calls the “capacity to aspire” (Appadurai 2004) or to project oneself in the future. Educational systems should be devised in a way to restore such capability to aspire when it has been severely diminished by negative schooling experiences or previous life trajectories marked by cumulative disadvantages. Developing this capacity to aspire enables individuals to imagine a different future that would be better than their actual living conditions (Baillergeau and Duyvendak 2017; Borghi 2017). This implies that educational systems should aim at deconstructing adaptive preferences whereby vulnerable people get resigned to their poor living conditions. One objective of vocational education and training should then be to restore the desire to train and develop the capacity to learn. This is also a key rationale for teaching humanities alongside professional skills.

Finally, availability to train heavily depends on institutional conditions. This is illustrated by the Swiss case study in the WorkAble project (Rosenstein et al. 2015). This focused on a specific program in canton Vaud that was developed in the 2000s and targeted at vulnerable young adults without training. Empirical observation showed that 70% of young people on welfare in this region had no certified qualifications. At the same time, for them, starting a training program meant losing their entitlement to welfare benefits, which made it impossible to envisage such an alternative in most cases. Thus, the canton introduced a system of training grants in order to secure the entitlement of people starting an apprenticeship to receive an amount equal to the one they perceived when on welfare. In other words, the institutional device was transformed in order to make training an option as valuable and sustainable (in financial terms) as being on welfare. In more general terms,

income support features as a necessary condition to guarantee the equal right to second chance education to all categories of potential beneficiaries. In its absence, only those who can financially afford losing one's revenue or cash transfer will be able to follow training programs. This applies not only to vulnerable youth (as in the Swiss case investigated) but more generally to all disadvantaged people. Also, this requires that childcare support is available at a bearable cost to all people or families who would need it in order to restart a training program. In all such cases, institutional support is needed to promote and "materialize" availability to train.

Thus, capability for education depends on the whole configuration of resources and individual and contextual conversion factors: it is not only a matter of individual motivation or capacity but of how educational systems are designed and what resources are devoted to this end. In other words, developing individual competencies, aspirations, and availability goes hand in hand with the presence of sufficient resources and appropriate social and institutional conditions. In the CA perspective, these should aim at making all people able to choose their educational paths, whatever their sex, nationality, social origin, age, etc. This calls for revising educational and VET systems according to issues of equity (equal access), appropriateness (designing curricula that can integrate and attach proper value and recognition to all desires and capacities to train), and non-fragmentation (multiplying the existence of bridges between curricula, also at later stages, in order to implement in an equitable and appropriate way the objective of lifelong training, allowing for instance trials and errors). More widely, this requires (a) a view of vocational education and training as a public good, whose quality and accessibility are guaranteed to all members of a given society; (b) that no one is discriminated against for whatever reason; and (c) that education is considered both as an end in itself and as a means toward professional and social integration and citizenship. All these factors follow from the notion of "capability for education" when the issue of conversion is taken seriously.

A key issue related to VET is the respective role of the market and the State in the implementation of vocational education and training as a public good. Empirical analysis conducted in the SocIETy project showed many different situations in this respect: while some countries insist on academic education and leave limited space to vocational training (e.g., France and Sweden), others place strong emphasis on dual apprenticeship. Among the latter, two situations can be distinguished: one relying on market mechanisms in order to create sufficient and adequate apprenticeship places (mainly Switzerland and Germany – Dahmen et al. 2017; Bonvin and Dahmen 2017) and the other giving more importance to the intervention of the State (e.g., Austria and Italy). The comparison of these cases show contrasted results: on the one hand, the reliance on market mechanisms seems important to guarantee that the content of training is adjusted to labor market requirements (this increases the likelihood of professional integration); however it is more problematic in terms of access to apprenticeship as the entry into vocational training depends on the employers' willingness to hire. On the other hand, increased State intervention via the introduction of youth guarantee programs certainly facilitates access but sometimes makes such access mandatory, thus interpreting youth guarantee programs in

workfarist terms (Atzmüller and Knecht 2017 for the case of Austria). The evidence collected in the SocIEtY project does not allow any definitive conclusion as to the superiority of the market or the State in terms of “capability for education.” It rather shows that both have their pitfalls and assets and that an adequate combination would probably be the most appropriate solution.

---

## Capability for Voice and What It Entails for VET

Capability for voice is the real freedom to express one’s wishes, expectations, desires, etc. and make them count when decisions concerning oneself are made (Bonvin 2012). Appadurai (2013) links it with the issue of the capacity to aspire: “Analyses and researches have widely recognized that a durable and more equitable development asks to reinforce and exercise the capability of the poor for voice. However, what has not been adequately recognized is that for ‘voice’ to be regularly and effectively exercised by the poor, in conditions of radical inequalities in power and dignity, requires permanent enhancements of their collective capacity to aspire” (Appadurai 2013: 213). Thus, there is an interdependent relationship between capacity to aspire and capability for voice; in other words, the exercise of voice is crucial to the expansion of capabilities, provided however that it relies on an adequate degree of capability to aspire, i.e., to build one’s own projects or preferences for the future and to pursue them. At the core of the WorkAble project lies the postulate that the individuals’ capacity to aspire also depends on the exercise of capability for voice, in so far as voice allows questioning prevailing norms and preferences that all too often may have a deleterious impact on poor people’s capacity to aspire. Thus, a key issue is the ability of people to form their own preferences and aspirations rather than endorse those of others, in line with social norms or expectations. To sum up, the development of capabilities requires the ability to construct one’s preferences (capacity to aspire), to voice them and make them count (capability for voice). The educational system has a crucial role to play in this respect. The issue, then, is to assess to what extent the vocational educational and training system recognizes and promotes the voices and aspirations of the trainees (see Powell 2012 for an examination of this issue in the case of South African students).

This encompasses two complementary issues: first, to what extent are trainees allowed to voice their concerns and aspirations, and to what extent are these seriously taken into account when designing and implementing VET programs? Second, does vocational education and training genuinely prepare trainees to voice their concerns and defend them efficiently at a later stage in their life, i.e., in the labor market and in society at large? The former issue relates to the place of voice and aspirations within vocational education, while the latter concerns voice and capacity to aspire as the objectives or ends of education and VET.

The WorkAble and the SocIEtY projects show that in most instances vocational education for vulnerable people is envisaged as a part of activation strategies, where entitlement to cash benefits or any other kind of financial help is conditioned upon

the acceptance of deploying one's best efforts to find an apprenticeship place (Otto et al. 2015, 2017). In such a context, the frequent use of notions like "autonomy," "project," or "contract" seems to imply that beneficiaries' voice and aspirations are taken seriously, i.e., that they are the true authors of their professional project and benefit from the help of local welfare agents to this purpose. However, empirical research unveils a more contrasted reality, as the Swiss case illustrates (Bonvin et al. 2013). Oftentimes, "autonomy" is used by local agents in charge of activating people as a criterion to select those vulnerable people that are the most apt to become autonomous, i.e., to find an apprenticeship after completing a preparatory period and, thus, become independent from welfare support. This suggests that "autonomy" is not considered as the final objective of the program but as a selection criterion at the entry. Hence, the logic of welfare intervention tends to reproduce that of the labor market, which also selects the most competent people and excludes the others.

Beyond this issue of selection at the entry, there is also that of the place and recognition left to the voices and aspirations of vulnerable people within the program. In certain countries (like Switzerland or Austria), the people who have successfully passed the selection stage are entitled to receive significant individualized support to help them become autonomous. Oftentimes, this support is divided into two stages: first a preparatory one where people learn the necessary skills and behaviors in third-sector associations (which get subsidies for this) and second the vocational education phase taking place in "normal" firms, when people are considered sufficiently prepared for this purpose. As the Swiss case illustrates, there is the possibility to negotiate many aspects at the preparatory stage of the program: while finding an apprenticeship is the indisputable objective to be pursued, the pace at which to reach this objective, the kind of preparatory training to be provided, etc. are tailor-made and adjusted to the vulnerable people's needs and, to some extent, to their aspirations. Their voice is taken into account and has some impact on the content of the preparatory programs. Regarding aspirations, however, the situation is often more complex, as local agents insist on the realistic and realizable character of the vulnerable youngsters' project; in their view, this implies the necessity to "cool down" their aspirations when they are too high (Goffman 1953). After completing the preparatory stage, some young people are hired as apprentices by employers on the private labor market. Thus, the preparatory stage also translates into a selection mechanism, insofar that those vulnerable people who fail to comply with the expectations of the labor market actors are not accepted into the next phase of professional integration. In many cases investigated in the WorkAble and SocIEtY projects, welfare local agents took very seriously their role as labor market intermediaries, insisting on sending only the very best among the vulnerable people to potential employers, also with a view to defending the image of efficiency of the welfare agency.

During their apprenticeship or vocational education program, vulnerable people can still receive support with regard to schooling, personal, social, and professional matters; however the kind of support received varies greatly along the topic concerned: while the content of support related to personal, social, and schooling matters can in most instances be discussed and negotiated with the trainee, the

professional issues require him/her to adapt to labor market demands and to the employer's expectations. Indeed, whereas the personal coach acts as an advocate of vulnerable people with regard to personal, school, and social issues, she/he strives to convince them to comply with the employer's expectations when it comes to professional matters. This illustrates a divide that could be observed in nearly all case studies investigated during the WorkAble project: voice and aspirations can be taken into account when it comes to personal or social problems or even, though to a lesser extent, to schooling issues, but both the rhetoric and the practices focus on adaptability when labor market requirements or conflicts with employers are concerned. This entails that, within vocational education and training, there are dimensions for which capability for voice and capacity to aspire are legitimate and others for which notions like "cooling down" or being "realistic" prevail. Not all voices and aspirations are legitimate and recognized within vocational education and training programs but only those that comply with the employers' expectations that seem not to be negotiable in most cases observed (Otto et al. 2015, especially pp. 200–355 where all case studies of the WorkAble project are presented). Under such circumstances, the objective of adaptability takes precedence over that of "capability" or real freedom to have a job one has reason to value. In other words, in most cases, the objective of VET is to instill the "correct" adaptive preferences (teach people how to behave, what objectives are realistic, etc.) rather than allow them to construct their own aspirations and be able to voice and pursue them efficiently.

This tension can be observed in the ambivalent use of certain terms within the programs targeted at vulnerable people. For instance, the notion of "project" has a very different meaning whether it is used by local agents to designate a short-term precise commitment toward the future professional career (the so-called "realistic and realizable" project) or by the beneficiaries who refer to a fuzzier notion that comes closer to a declaration of intention (like a life project). The gap between these two notions points to the importance of leaving enough time in order to translate an aspiration or vague project into a "realistic and realizable" project. However, this time is most often not given to the vulnerable people, and the notion of "project" is used as a criterion to select the most apt vulnerable people and help them into vocational education and training.

In short, the issues of voice and aspirations within VET programs for vulnerable people are affected by two main ambivalences. First, definitional ambivalences concerning notions like "autonomy" or "project" imply that these notions are oftentimes used to select the best beneficiaries, those that are the most able to comply with official expectations. Then, voice and aspirations are allowed to flourish only when they fit in the institutional framework or when they are in line with labor market requirements. This entails a view of vocational education as mostly instrumental to the development of productivity and competitiveness. Second, while there is some margin for maneuver and interpretation with regard to the preparatory stage and to personal and social issues, such is not the case with the part of vocational education and training that is provided at the workplace. As a matter of fact, VET for vulnerable people most often aims at preparing them to comply with the employers'

expectations; as such, its adaptive function (creating efficient producers) prevails over its transformative potential (creating citizens able to express their voice and make it count, even in the workplace). The limited place and recognition granted to voice and aspirations within vocational education systems for vulnerable people also negatively impacts on the objectives of developing the trainees' capacity to aspire and capability for voice. It somehow seems that the economy needs efficient workers and producers, and not active citizens, and that VET systems as they are have endorsed this view to a large extent.

---

### **Conclusion: VET as the Real Freedom to Access "Second-Chance Education"**

This chapter has set up to show the implications of the capability approach for vocational education and training, with a specific focus on vulnerable people. After a brief outline of the CA, it has presented in more detail two specific notions – “capability for education” and “capability for voice” – and drawn their implications in the field of VET. As such, it has unveiled what is at stake when moving from a human capital approach to education and VET to a capability perspective on these issues. In particular, such a move requires considering the following key aspects:

- (a) Take proper account of human diversity with regard to capacities, willingness, and availability to train and adapt the content and rhythm of education accordingly. That calls for designing tailor-made educational paths, with a specific emphasis placed on an appropriate timing and on recognition of the trainees' voice and aspirations.
- (b) Recognize that VET can pursue a multiplicity of objectives beyond fostering economic productivity, that it has both an intrinsic and instrumental value (Robeyns), and that it should aim at being adaptive and transformative at once (Walker). Most importantly, it should be acknowledged that VET should not only create efficient producers and rational consumers but also active citizens able to form their own aspirations and preferences and to make them count within public debates.
- (c) Guarantee access to vocational education and training to all those who consider it as valuable, whatever their age, sex, prior education, etc. This requires going beyond selective market mechanisms and their tendency to exclude the most vulnerable. This also entails that the logic of State intervention should not replicate the market mechanisms but aim at implementing education as a public good effectively accessible to everyone. Guaranteed access to VET should however not coincide with a duty to train, as can sometimes be observed in activation strategies.
- (d) Ensure that trainees are at the same time receivers and actors of VET, i.e., that they receive adequate knowledge and are encouraged to put into practice their theoretical and practical skills. A variety of pedagogical methodologies is advisable in this respect.
- (e) Make sure that such principles are also implemented at the workplace and within firms where on-the-job training is provided.

These dimensions pave the way toward the implementation of a requiring conception of educational justice, where the necessary development of human capital is complemented by the enhancement of human capabilities, thus calling for a combination of the empowering and emancipating conceptions of vocational education and training. The empirical findings of the WorkAble and the SocIEtY projects have shown that educational measures inspired by the CA perspective may boost the trainees' willingness and motivation to train. As such, the CA perspective on VET may be the most promising avenue toward reconciling educational justice and economic efficiency.

## Abstract

This chapter provides an overview of a curriculum development journey of the AdvDip (TVT), a program designed to prepare South African TVET lecturers as progressive pedagogues. It responds to Akoojee's (2016) call for "radical revisioning" that truly transforms the TVET system. In considering contextual realities linked to poverty, inequality, and human development, a humanizing pedagogy (Freire 1993) and the capability approach (Sen 1980) is used as these are deemed to be responsive alternatives to the standard educational and economic frameworks. The chapter begins with an exploration of the current TVET landscape against the background of prevailing contextual realities; then the

curriculum journey is described through an overview of events that resulted in the choices made toward a suite of modules that aim to cultivate a progressive pedagogue. Finally, the chapter ends with an overview of Africanization and decolonization imperatives integrated into the curriculum design so as to ensure the inclusion of indigenous perspectives. It is hoped that through the enactment of a humanizing pedagogy and a capability approach, TVET lecturers develop the kind of transformative teaching and learning praxis that position them as agents of hope and change and of those who are able to promote social justice, equality, and human well-being.

**Keywords**

TVET lecturer development · Humanizing pedagogy · Capabilities approach · Curriculum transformation · Vocational pedagogy and decolonization

An education is truly “fitted for freedom” only if it is such, so as to produce free citizens, citizens who are free not because of wealth or birth, but because they can call their minds their own . . . It is relatively easy to construct a gentleman’s education for a homogenous elite. It is far more difficult to prepare people of highly diverse backgrounds for complex world citizenship. Curricula [development] aiming at these ideals fit no general mould. (Nussbaum 1998, pp. 293 & 295)

---

**Introduction**

In educational settings where the contextual realities of poverty, inequality, and human development must be considered, a humanizing pedagogy (Freire 1993) and the capability approach (Sen 1980) have emerged as responsive alternatives to standard educational and economic frameworks. This is true for South Africa where national policy proposals have reinforced the crucial role of education in social and economic development, providing the necessary rationale for radical revisioning. However, Akoojee’s (2016, p. 1) recent assessment of the TVET strategy in relation to key constructs of development theory concludes that “while the developmental rhetoric contained in the White Paper (DHET 2013) is plausible, creative tinkering of the system is unlikely to lead to the radical re-visioning necessary for a truly transformative TVET system.” Hence, in an effort to reconceptualize policy for TVET lecturer development, and to get closer to the radical revisioning advocated for by Akoojee (2016), this chapter describes a TVET curriculum development journey as one effort toward such an ideal.

For more than two decades, a number of South African educational institutions have grappled with the creation and implementation of renewed curricula informed by a social justice agenda. More recently, the #FeesMustFall movement (2015/2016) demanded an Africanized and decolonized curriculum as a national imperative for all Higher Education Institutions in South Africa. In addressing these and other imperatives, the Faculty of Education at the Nelson Mandela University chose to

embark on an 18-month revisioning journey that culminated in the adoption of a humanizing pedagogy (Freire 1993) as its underlying philosophical ideology. This is appropriate given South Africa's colonial and apartheid history where "reconciliation processes are needed to heal the effects of trauma (since) an array of conflicting differences, power relations and embedded interests, fears and anxieties intersect with educational processes" (Keet et al. 2009, p. 109). In addition, the faculty's revisioning journey sought to build community and address a dehumanizing apartheid legacy, acknowledging its continued presence in education in South Africa today. Zinn and Rodgers (2012, p. 76) confirm that a dehumanizing legacy has been "adopted wittingly and unwittingly into relationships within educational arenas which mirror and depict hierarchies of power, cultures of compliance, fear, as well as a suppression and loss of voice." Through an intensive process of "mutual humanization" (Freire 2005, p. 46), the faculty's vision, mission, and curriculum framework were crafted and implemented in all aspects of faculty life.

Therefore, when the authors of this chapter were tasked with the development of the Advanced Diploma Technical and Vocational Training [AdvDip(TVT)], our approach was to consciously strive to break with historical precedents where vocational education and training programs were formulated "within an outmoded and inadequate development paradigm aimed at providing workers for the economy" (McGrath 2012, p. 625). Our aim was to not only ensure a humanizing approach to the design of a curriculum but to develop progressive TVET lecturers who place the well-being and aspirations of TVET students at the heart of teaching and learning. In this regard, the AdvDip(TVT) at the Nelson Mandela University was developed at the intersection of two complementary theoretical frameworks, namely, a humanizing pedagogy (Freire 1993) and a capability approach (Sen 1980).

This chapter is a description of that journey. It begins with an exploration of the current TVET landscape and the contextual realities that provide a justification for the choice of the theoretical frameworks. Next an overview of events on how choices were made toward a suite of modules that make up a program aimed at the cultivation of a progressive vocational pedagogue is shared. Finally, the chapter concludes with an overview of Africanization and decolonization imperatives that are being addressed to ensure the inclusion of indigenous and other knowledge forms in the curriculum.

---

## The Current TVET Landscape

In South Africa, as is the case internationally, there is – at a macrolevel – a strong belief that the vocational sector stands in service of the economy to such an extent that it completely ignores the needs of individuals in the sector. It was therefore imperative that we gain an understanding of the unique challenges that emerged from the TVET context. Consequently, we regard an understanding of the broader TVET landscape as a foundational principle to emerge from our work, because this insight provides an integral and vital perspective of the unique landscape in which

teaching and learning must take place to empower lecturers to prepare students adequately for a variety of vocational occupations.

It seems even today, South African strategies for post-school education and training (PSET) continue to give emphasis to the significance of TVET that meets the skills needs of the labor market (McGrath et al. 2010; Allais 2012; Powell 2014; Maluleke and Harley 2016). At the center of these strategies lies the notion of improving the employment opportunities for students in the formal labor market (McGrath et al. 2010), which is assumed to be necessary for economic growth, development, and global competitiveness. However, this human capital (Schultz 1961) discourse is under increasing attack as unemployment levels continue to rise (Weir-Smith and Ahmed 2013). Simultaneously, the world is witnessing increased levels of education among graduates never seen in history (Brown et al. 2001; Vally and Motala 2014), and yet, many remain unemployed.

Internationally, TVET is associated with globalization, intermediary skills, “human capital” (McGrath 2005; Schultz 1961), and employability paradigms (Gazier 1998; Hillage and Pollard 1998) aimed at a focus on the relevance of skills to market demands or the lack thereof. The skills mismatch debate has been going on for decades (Wedekind and Mutereko 2016), but there is inadequate evidence to claim that there is a direct relationship between education and employment. Gamble (2013) and Wedekind and Mutereko (2016) argue that there is no clear-cut relationship between employer needs and the curriculum because unemployment is a macroeconomic issue that cannot be addressed in the classroom. Therefore, the argument that continuous training is not a solution to economic problems holds some truth (Baatjes et al. 2014).

Based on the notions of human capital development, curriculum and pedagogy in TVET institutions are linked increasingly to the requirements of industry and national economic interests (Baatjes et al. 2014). TVET educators are encouraged to adopt a largely instrumentalist view of curricula, intended to provide students with specific job skills, knowledge, behaviors, values, and attitudes essential for an employable, skilled, and socialized workforce. This human capital orientation to TVET has silenced alternative views that argue for education’s role in developing various forms of critical citizenship and social and environmental justice in a democratic society (Baatjes et al. 2014).

In grappling with a “culture of silence” (as described by Freire 2005, p. x), we were drawn toward a broader purpose of education that considered critical consciousness and the development of the human being as a foundational principle. Thus, a humanistic philosophical orientation and a capability approach appealed to the transformative and responsive curriculum development work in which we wanted to engage with when developing the AdvDip(TVT). In this regard, the tenets of a humanizing pedagogy (Salazar 2013) align well with the two core normative claims of a capability approach, namely, the freedom to achieve well-being is of primary moral importance and that human beings should be afforded real opportunities to do and be what they have reason to value (Robeyns 2016, p. 1).

It appears that of the few institutions that offer formal academic programs for the preparation of lecturers for TVET colleges in South Africa, most have chosen the

dominant human capital and instrumentalist approaches (Baatjes et al. 2014). In contrast, the Nelson Mandela University in South Africa has embraced a transformative pedagogy also known as a humanizing pedagogy rooted in the Freirean tradition together with a capability approach for the development of our AdvDip (TVT). The intent is that the political nature of such teaching would situate TVET lecturers as agents of transformative change who understand contextual realities and embrace social justice, freedom, and democracy by placing human well-being at the forefront of curriculum and pedagogy.

---

## Contextual Realities

Statistics South Africa (2017) reveals that 20.2% of South Africans live below the food poverty line, translating into roughly 23 million people. The Gini coefficient for South Africa is calculated to be approximately 0.65 in 2011, showing among the highest levels of inequality in the world. This means that the share of national consumption between the richest and poorest remains wide. Black South Africans earned on average only about one-fifth as much as their white counterparts in 2016 (Statistics South Africa 2017) with unemployment being the main driver of poverty, while years of schooling contribute as the second most significant driver of poverty. The major contributor to the poverty situation of the youth, aged 15–24, in South Africa was educational attainment. In other words, their poverty was a consequence of not being in school. We see a further exacerbation of poverty where no one else in the household is either employed or employable. The growing problem of youth unemployment in South Africa is, therefore, a major concern.

The unemployment rate in South Africa increased to 27.7% in the first quarter of 2017 (Statistics South Africa 2017). It is the highest jobless rate in our country since 2004 as unemployment rose faster than employment and more people joined the labor force. According to recent estimates, more than 5.9 million South Africans, often poorly skilled, leave the school system every year in search of jobs in local employment markets, which are not expanding fast enough to create jobs. Many of these job seekers lack the requisite skills employers want. Without employment-related skills, school leavers cannot benefit from even the minimal employment opportunities that may be available to them. It is within this context that attention shifts to the TVET sector as economic guardians since it is thought to be a major source of intermediate skills development that could address mass youth unemployment and its highly racialized distribution (Table 1).

From the table it is clear that the vast majority of students (about 92.5%) enrolled in the sector are Black African (DHET 2015) who represent the historically disadvantaged and who continue to struggle with the kind of socioeconomic challenges described above. Therefore, central to lecturer preparation is a consideration of the kind of student who accesses TVET.

For this reason, throughout the development of our program's contextual realities and how they impact the lives of TVET students and their education became another foundational principle. This emancipatory approach to education that places the

**Table 1** Number of students enrolled in TVET colleges by qualification category and population group, 2015 (DHET 2015, p.32)

Qualification category	African	Colored	Indian/ Asian	White	Other <sup>1</sup>	Reconciliation	Total
Report 191	479,160	27,920	2080	7899	262	2143	519,464

<b>Total</b>	<b>650,419</b>	<b>39,621</b>	<b>2617</b>	<b>9996</b>	<b>362</b>	<b>34,865</b>	<b>737,880</b>

Note 1: Report 191 refers to the NATED programs, N1–N6. It is a part-qualification

Note 2: NSC refers to the old National Senior Certificate (which is equivalent to Grade 12)

Note 3: NC(V) refers to the National Certificate (Vocational) Levels 2–4

Note 4: “Occupational qualifications” refer to qualifications associated with a trade, occupation, or profession resulting from work-based learning and consisting of knowledge unit standards, practical unit standards, and work experience unit standards

Note 5: “Other<sup>2</sup>” in colleges refers to all other skills development programs

Note 6: The Department of Higher Education and Training uses the racial descriptors: “African,” “Colored,” “White,” and “Indian/Asian” for planning, monitoring, and funding purposes. The Department places on record that these racial descriptors, which characterized apartheid policies and practices in the past, are being used to provide historical context and comparisons as well as to describe the effects of present policy and practice

Note 7: “Reconciliation” refers to numbers created to balance the totals

Note 8: “Other<sup>1</sup>” refers to population groups other than the groups mentioned

vocational aspirations of TVET students at the heart of teaching and learning adheres to the call made by Brown et al. (2011, p. 27) for, “an alternative orientation to vocational education especially where poverty, inequality and unemployment must be viewed in the context of a deeply rooted neo-liberal economic system.” Thus, a humanizing pedagogy at the intersection of the capability approach was considered appropriate for the development of the AdvDip(TVT) because both frameworks offer an approach to education that is centered on human agency, thereby debunking the widespread deficit notions of TVET students in particular and the TVET sector in general.

In the section that follows, the complementary nature of the frameworks is explicated on as a theoretical orientation to curriculum development, before a more practical overview is provided of how these theoretical ideas were used in program development.

---

## The Intersection of a Humanizing Pedagogy and a Capability Approach

A humanizing pedagogy defines the purpose of education as “the liberation of oppressed populations” (Freire 1993, p. 13), because it seeks to interrogate the pedagogical interrelationships between culture, economics, ideology, and power

critically. In doing so, it advocates for an approach to teaching and learning that deeply nurtures the development of critical consciousness. Since critique is a central concept in a humanizing pedagogical approach, it serves as a powerful lens of analysis from which social inequalities and oppressive structures can be unveiled, deliberated on, and transformed. A humanizing pedagogy requires educators to assess inequalities and to address directly the reality of marginalized students who are taught to believe in their own inherent deficit and to accept, without question, standardized knowledge. Hence, the critical dialogical approach of a humanizing pedagogy seeks to counter the traditional “banking model” (Freire 1993, p. 14) of education. It does this by advocating for the development of lecturers who are prepared to engage in an ongoing reconfiguration of curriculum while simultaneously making central “the lived histories of their students” (Freire 1993, p. 15).

A capability approach similarly advocates for education as a, “process of becoming and for providing people with options that allow them to shape their future” (Andres and Chavez 2015, p. 20). Initially proposed by Sen (1980) and further developed by Nussbaum (Nussbaum and Sen 1993), this approach argues that, “economic wealth is only one facet of human well-being and that if a sole focus on aggregate wealth maximisation occurs, then deprivations suffered by many would be ignored” (Anand and Sen 2000, p. 2039). In other words, there would be “a failure to consider the opportunities that people do or do not have for maximising well-being” (Alkire 2008, p. 76). Hence, the opportunity to achieve capabilities is an imperative if education is to be designed to enable valued “functioning” such as “knowledge, social relations, critical thinking, imagination, empathy, recognition, respect, enjoyment from the active participation in learning, autonomy, confidence to form and argue an opinion, active citizenship, deliberative dialogue, and economic opportunities” (Walker 2008, p. 459).

Thus, as a direct complement to a humanizing pedagogy, a capability approach to education privileges human dignity and well-being over economic growth. Powell and McGrath (2014, p. 17) bring into conversation TVET education as “potential for self-actualization” and on “learning as a life-long process.” Their view is supported by the Human Development Report (2010, p. 86) which explicates that, “the expansion of people’s freedoms to live long, healthy and creative lives; to advance other goals they have reason to value; and to engage actively in shaping development equitably and sustainably on a shared planet.” In this sense, people are both the beneficiaries and drivers of human development. Thus there is an alignment between a capability approach and a humanizing pedagogy, because “well-being, justice and human agency are at the heart of the capability approach” (Powell and McGrath 2014, p. 19).

While we may ascertain the value of a humanizing pedagogy against contextual realities, it is also incumbent upon critical educators to examine the nature of economic inequalities and the problematic role of market-driven education policies. Inherent in such examinations is the need to interrogate critically how macroeconomic trends impact life at the colleges and how it creates sites of resistance. These principles require educators to create class consciousness and to unpack the idealist assumptions and social implications of the college sector as the great equalizer in a system driven by the dictates of profits rather than human needs.

In addition, Freire's dialogic approach to education supports a capability approach in that, "capabilities cannot be generated from consultations with experts or business representatives but must take heed of the voices of all relevant stakeholders" (Powell and McGrath 2014, p. 20). According to Tikly (2013, p. 6), "different interests define capabilities differently." Therefore, fundamental to the capability approach is the processes for determining capabilities. A simple process of consensus building is not sufficient; instead account must be taken of critiques as to how consensus is formed particularly when there are imbalances in power, as well as of the fact that human beings are agents of change rather than just its beneficiaries (Powell and McGrath 2014, p. 20).

Both the capability approach and a humanizing pedagogy take into account the rich cultural capital of marginalized students who are plagued with deficit notions. A capability approach to TVET requires account to be taken of, "the personal, social and environmental factors that limit freedoms not only to access TVET, but also to learn, such as sexual harassment or minority group discrimination within the TVET environment, lack of access to sanitary facilities for girls and women and absence of facilities for disabled persons, or textbooks in non-first language vernacular" (Tikly 2013, p. 9). Furthermore, if TVET is indeed a second choice, as many claim it to be, then there is a need to understand why this is so and a means to address the deprivation of freedoms that makes this so must be found (Powell and McGrath 2014, p. 19).

Hence it is within these theoretical underpinnings that the program development journey undertaken by the Nelson Mandela Faculty of Education is described more practically. To set the scene, a brief overview of the sequence of events that led to policy framing of the AdvDip(TVT) is shared, before a more in-depth discussion is provided on the content and pedagogy for the suite of modules in our AdvDip(TVT) program.

---

## Toward Radical Revisioning of Curriculum

### An Overview of the TVET Journey

In 2011, the Eastern Cape Socio-Economic Consultative Council (ECSECC) (<http://www.ecsecc.org/programmes/project/post-schooling>, accessed 5 July 2017) facilitated the implementation of the Vocational Education Orientation Program (VEOP), a 30-credit (This SLP is credit bearing which means that students may offer the credits toward an appropriate vocational qualification.) short learning program (SLP) for TVET lecturers. We reviewed and adapted the curriculum provided and premised the development of our version of the SLP within a humanizing pedagogy. A research paper (Rudman and Meiring 2018) involving this offering reports that the humanizing components of the program had a powerful, lasting transformational effect on the TVET lecturers who completed the program. Hence, this finding is a significant affirmation for the humanizing approach we have chosen for the AdvDip(TVT).

As national efforts were underway to assist universities to develop common curriculum structures that informed the development of the AdvDip(TVT), it became clear to us that the collaboration with all stakeholders, the adoption of a humanizing

pedagogy, and a capability approach were an imperative. These would dispel deficit notions of the sector, and it would provide a resurged focus on the decolonization of the curriculum. It would also enable considerations for defining a vocational pedagogy for an African context and infuse the inclusion of technology toward sustainable development through TVET lecturer preparation.

The promulgation of the Policy on Professional Qualifications for Lecturers in Technical and Vocational Education and Training (2013) saw the establishment (at national level) of a DHET-funded collaborative effort to develop a framework for the AdvDip(TVT). The Centre for Researching Education and Labour (REAL) at the University of the Witwatersrand facilitated the processes, bringing together a consortium of ten universities who managed to publish the product of this collective effort in 2016.

Hence, collaboration became one of the foundational principles of our work on the AdvDip(TVT). We consciously sought partners internationally, elsewhere on the continent and locally who could share this journey. On the international stage, we established a collaboration with Carl von Ossietzky University in Oldenburg, Germany, researching the German models of work-integrated and workplace-based learning. We also engaged with Prof Bill Lucas at Winchester University in England, researching the basic tenets of a vocational pedagogy and we met with colleagues at the University of Aberdeen, researching blended learning practices, ICT learning platforms and lecturing at a distance. This journey provided us with an opportunity to benchmark ourselves in terms of international comparability.

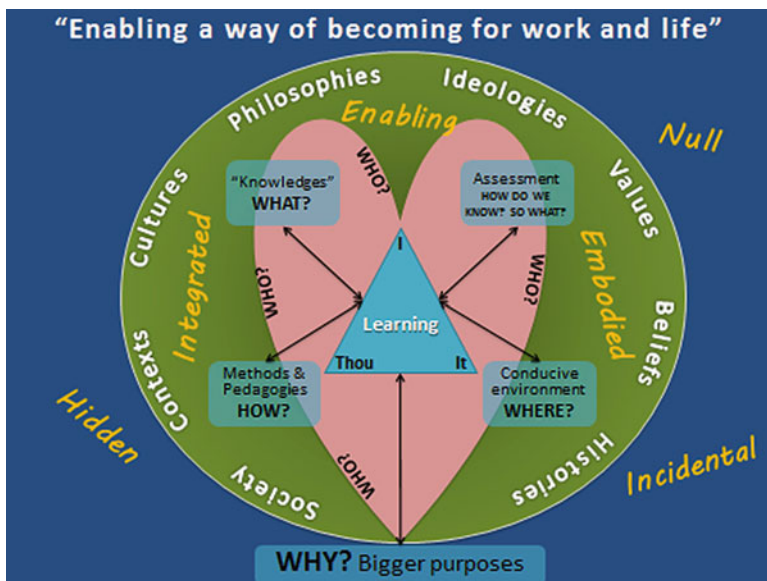

As we were developing the qualification, we also established collaborations with the academic leaderships of the three TVET colleges we planned to serve: South Cape, East Cape Midlands, and Port Elizabeth TVET Colleges. The purpose of these collaborations was to ensure that we reflected their voice in the curriculum content and that they would also take ownership of the program.

On another level, we also explored on-campus inter-faculty collaborations, as Nelson Mandela University is a comprehensive university. We are acutely aware that all the faculties have well-established networks with business, commerce, and industry. We needed access to these networks if we were going to deliver on our work-integrated and workplace-based learning spaces of the program.

## Program Development

A critical guiding post for the curriculum development was the faculty curriculum design framework. While exploring the framework that considers “learning” to be at the center of the curriculum, the “instructional triangle” adapted from an essay by David Hawkins (1974) was one of the conceptual tools that influenced our thinking about teaching and learning. The “I-Thou-It” (Hawkins 1974) interaction had a direct bearing on the approach we considered as fundamental to the development of the AdvDip(TVT), aimed at preparing lecturers that serve the TVET sector.

As argued by Hawkins (1974), we believe that the relationship between teacher (I) and student (Thou) differs from other caring relationships because of the presence of the third element (It) – the curriculum. The “It” is something outside both the teacher and student,

**Fig. 1** The Nelson Mandela Faculty of Education’s Humanizing Curriculum design framework

which provides a shared and vital focus for their relationship and interaction. This three-part relationship supports both the development of an understanding of the content and the development of human relationships central to a humanizing pedagogy. This plays out in what we fondly refer to as the “heart of the WHO” – in other words, who we are, who the lecturers are, and who the TVET College students are (Fig. 1).

What was a significant consideration for us in terms of the “heart of the WHO” is what Baatjes et al. (2014, p. 93) bring to light as an “oppressor-oppressor dichotomy” where TVET lecturers are themselves marginalized as educators, while they in turn deliver an instrumentalist curriculum to marginalized TVET students. Hence, the call they make for progressive lecturers is addressed in our program through the constant nurturing of a humanizing and capability orientation that aims to (re)shape how lecturers view the role and purpose of vocational education, the perceptions they have of their students, and the ways in which they facilitate learning.

The purpose statement for our AdvDip(TVT) reads as follows (Nelson Mandela University Form 2):

The purpose of this qualification is to develop and deepen the teaching competencies of TVET lecturers by:

- Promoting critical and inquiry-based dispositions with regard to the foundations of education as well as the technological industry/workplace spaces in which they specialize
- Placing an emphasis on practical learning by exposing and engaging lecturers to both classroom-specific and industry/workplace-specific environments

- Sensitizing lecturers to the unique and complex challenges in the sector so they may engage in socially responsive ways to the diverse TVET student profiles
- Strengthening the foundations of a vocational pedagogy grounded in a humanizing pedagogy and capability approach
- Practicing a vocational pedagogy which reflects the requisite professional values, ethical conduct, justifiable decision-making, and leadership
- Embracing a personal philosophy of teaching and learning underpinned by a strong theoretical foundation of a vocational pedagogy within a humanizing and capabilities framework

A suite of ten modules were designed in relation to program purpose. They are named and briefly described in Table 2.

**Table 2** An overview of the modules designed for the AdvDip(TVT) at the Nelson Mandela University Faculty of Education

Core modules	Overview of module
Philosophical perspectives in education	Provides an overview of philosophical orientations to education from a historical perspective focusing on the key principles of critical pedagogy and humanizing pedagogy, enabling students to develop a personal philosophy for teaching and learning in the field of vocational education
Psychology of education in a vocational context	This module is nested within an inclusive education paradigm, and it provides an overview of the barriers to learning confronting students in the TVET sector, so that lecturers may develop an understanding of and appreciation for their students' holistic development
Vocational education for social change	Sensitizes lecturers to the unique world in which the TVET system functions, in order that they may understand the sociopolitical and socioeconomic realities that shape this sector. It is envisaged this will prepare them for the central role they play as agents of change to develop of a socially just society
Historical developments in vocational education	Provides a brief overview of the history of post-school education and training (PSET) in South Africa to give students a better understanding of the current TVET context. It is envisaged that this may empower students to make informed decisions with regard to the implementation of the program's curriculum and practice in their current context
Curriculum studies and assessment practices	Provides an overview of theories that underpin different approaches to a practice-based curriculum and the implications for pedagogy and assessment inherent in the different approaches, as a means to support student learning and aspirations
Pedagogical perspectives in TVET	Conceptualizes a vocational pedagogy for the TVET sector by taking into consideration the imperatives for sustainable developmental practices, the varied contextual realities, as well as the needs of the sector and adult vocational education learners

(continued)

**Table 2** (continued)

Core modules	Overview of module
A professional identity for a vocational lecturer	Engages lecturers in examining the formation and re-formation of her/his own professional identity in the broader context of a vocational pedagogue
Designing a vocational pedagogy	Pulls together the various philosophical perspectives and theories of knowledge in curriculum implementation in relation to the existing contextual realities, so that students may make informed decisions about designing an appropriate vocational pedagogy
Critical discourses in TVET	Provides an overview of national policies that have impacted the sector in South Africa post-1994 so that lecturers may contribute to critical discourses impacting the contextual challenges that bedevil the sector
Practical learning – Teaching practice	Gives lecturers the opportunity to demonstrate in real-life and simulated environments the requisite knowledge, skills, and attitudes (PCK) that reflect those of a pedagogue practicing a humanizing and capability praxis through both practice and research engagements
Practical learning – Workplace-based practice	Gives lecturers the opportunity to gain experience in the industry(s) served by the subject discipline(s) they lecture, so that they may align the workplace and their subject discipline through the lens or workplace as a site of learning

## Toward Cultivation of a Progressive Vocational Pedagogue

The *Philosophical Perspectives in Education* module introduces TVET lecturers to the theoretical foundations of a humanizing pedagogy and the concepts of Ubuntu as an African philosophy so as to encourage lecturers to find ways to tap into the agency of students and the socially useful knowledge that impact their lives (Salazar 2013). In addition, *Critical Discourses in TVET* and *Vocational Education for Social Change* are open-ended modules that explore the contextual, socioeconomic, and policy challenges currently facing the TVET sector. In these modules, TVET lecturers are invited to raise issues that are of interest and direct concern to them in their current experiences at TVET colleges. In so doing, the deficit perceptions of students are challenged and redirected toward a capabilities framework. At the same time, lecturers are empowered to create democratic spaces for teaching and learning by applying appropriate pedagogical tools that enforce active learning that is inclusive of divergent views (Hyslop-Margison and Sears 2010, p. 57). Hence, the program as a whole seeks to prepare a progressive, critically conscious lecturer who is able to exercise a holistic, democratic praxis against an enforced instrumentalist curriculum.

We subscribed to Roberts (2000, pp. 13–14) interpretation of Freire’s use of the term pedagogy as a “complex philosophy, politics and practice of education that demands of educators a clear ethical and political commitment to transforming oppressive social conditions.” The pedagogical orientation throughout our AdvDip (TVT) seeks to role model through praxis a radical reconstruction of teaching and learning by engaging lecturers with various lenses (Tenets of a humanizing

pedagogy (Zinn and Rodgers 2012; Salazar 2013), issues linked to a vocational pedagogy (Lucas et al. 2012), and Sen's (1980) capabilities framework are explored throughout the program.) into the TVET world so that they can develop their own vision on how to transform it.

Since we interpret Freire's pedagogical perspective as a way of living in the world rather than merely technical pedagogical practices, modules like *Pedagogical Perspectives in TVET, Curriculum Studies and Assessment Practices*, and *Designing a Vocational Pedagogy* link pedagogical and curricular resources as well as assessment to the lifeworld of marginalized students. This is done by exploring with TVET lecturers various "landscapes of learning" (Wenger-Traynor et al. 2015), including "social landscapes generated in disenfranchised communities and often not valued by formal education processes" (Catts et al. 2011, p. 11). Such an approach should result in an evaluation of South Africa's oppressive colonial past and the lack of value given to black education in general and their indigenous knowledge in particular. This is supported by the *History Developments in Vocational Education* module and forefronted across the entire program so as to interrupt patterns of exclusion and the present orientation to vocational education which perpetuates class divisions reproducing the economic and social inequality still evident in South Africa today.

In addition, throughout the AdvDip(TVT) program and especially in the *WBL module*, TVET lecturers are given the opportunity to explore both the formal and informal sector as sources of employment and learning for TVET students. Such explorations not only increase the range of social and occupational possibilities but also support opportunities for lecturers to view TVET education as one that promotes intellectual growth, vocational enrichment, and social improvement. Powell and McGrath (2014, p. 17) speak of an education that leads to the "capacity to aspire" without which freedom amounts merely to a choice between current available options. Education should therefore enable valued functionings (Walker 2008) and effect social change, "since a capability is power to do something" (Sen 2009, p. 19). Hence, the AdvDip(TVT) aims to sensitize lecturers toward a capability approach with the prospect that a "capability is an opportunity that brings with it a responsibility...to expand the capabilities of the poor and disadvantaged" (Walker et al. 2009).

In this way our curriculum design sought to address a resurgence in the belief of human potential, resiliency, and agency based on a humanizing pedagogy and a capability approach, by providing TVET lecturers with multiple opportunities to grapple with common understandings of a humanizing pedagogy and the possibilities for a capability approach in TVET education and its concomitant implications for identity, pedagogy, curriculum, and praxis.

## **Engaging with Vocational Identity and a Vocational Pedagogy**

Our program is designed at present to serve two cohorts of lecturers: firstly academically qualified but professionally unqualified TVET lecturers who are already teaching in TVET colleges and secondly new graduates that intend teaching in the sector in the future. Therefore, in designing the program, it was important for us to

reflect on how to prepare experienced lecturers without assuming that they are “deficient” in some or other way. In this regard, Wheelahan’s (2010) caution that there is no one idealized notion of a TVET teacher needed consideration.

The imperative toward interrogating what it means to be a TVET educator is located in the *A Professional Identity for a Vocational Lecturer* module. This module explores the dual identity dilemma that TVET lecturers face, namely, that of a professional educator and also that of business or industry professional. In this regard, a change in orientation for lecturers is required since there would be a need to unpack the process of integrating the theory and practice of a TVET curriculum that “faces both ways” (Barnett 2006). Through reflexive processes and autobiographical/ethnographical explorations, this module personalizes the dual identity dilemma as it concerns individual lecturers and how this might feed into their approaches to *Teaching Practice* and *Work Based Learning* modules.

Supporting the notion of lecturer identity is the *Designing a Vocational Pedagogy* and the *Curriculum Studies and Assessment* modules which are both designed to explore the theoretical constructs and conceptions of a practice-based curricula because for TVET, “work is the curriculum” (Boud 2001, p. 5). Therefore, lecturer preparation both in curriculum theory and in practice (*Teaching Practice* and *Work Based Learning*) provides TVET lecturers with conceptual and practice tools that enable them to mix different forms of knowledge drawn from empirical (conceptual) and nonempirical (situated in the everyday) domains. This prepares them to understand how knowledge progression and occupational progression can be developed through the curriculum they teach. In addition, the idea that TVET has to do with knowledge production in the workplace opens pathways for conversations on the nature of work and “how people learn in, from and through work” (Blom 2016, p. 6). In this deliberation we include a reminder from Gamble (2012, p. 9) that “neither craft, nor trade is a homogenous concept and these are understood differently depending on the system in which one works.”

In this regard, “learning by doing” describes vocational pedagogy too simplistically, obscuring the fact that “there is no one definitive notion of a vocational pedagogy” (Wheelahan 2010, as cited by Gamble 2013, p. 221). Lucas et al. (2012, p. 14) reflect that since “pedagogy is undeniably complex, it leads some agencies to focus on controllable factors like the nebulous notion of teacher quality.” Hence we utilize the vocational pedagogical perspectives identified by Blom (2016, p. 5) for the South African context to prepare TVET lecturers with the tools needed to design vocational pedagogical approaches for the TVET curriculum they teach.

Finally the imperatives for an Africanized and decolonized curriculum in Higher Education meant that there was a need to explore alternative ways of knowing in relation to TVET curricula and the preparation of TVET lecturers.

## **An Africanized, Decolonized, and Responsive Curriculum**

Decolonizing and Africanizing the university curriculum much less that of TVET has been challenged by institutional complexity under which curriculum change is pursued.

For TVET lecturers, the curriculum for their students is provided, and they have a limited role, if any in the design of TVET curriculum. However recent TVET student protests lament on an outdated curriculum, and during the #FeesMustFall campaign, False Bay TVET college joined fellow students from Higher Education Institutions in the western Cape at a summit entitled “Students as Partners in Nation Building” to deliberate on transformation, decolonization, and democratization of Higher Education (False Bay TVET College News 2016). This indicates that the decolonization and Africanization conversation has also begun at TVET colleges in some provinces.

Despite “multilayered struggles,” what is useful according to Jansen (2017, p. 5) is an “expansive imagination when it comes to thinking about curriculum work.” This approach will be adopted with TVET lecturers in our program. We have considered Liebowitz’s (2017, p. 98) charge that “social realism has separated knowing from doing, learning from experience and cognition from emotion,” because this has direct relevance to TVET where “work is the curriculum” (Boud 2001, p. 5). Like university curriculum, in the TVET curriculum, the domination of western knowledge has also marginalized alternative and indigenous knowledge forms. Hence, there is a need to acknowledge and bring into dialogue the relevance of indigenous knowledge where possible. Since the curriculum designed for the AdvDip(TVT) is much more than content, critical engagement with lecturers brings “rival knowledge traditions responsive to real life experiences” (Jansen 2017, p. 5). These will be included wherever possible. It is envisaged that social dialogue will provide opportunity for personal and social change opening the curriculum of the AdvDip(TVT) to flexibility and sharing within a kind of praxis that lecturers can also explore with TVET students in their own classrooms. In this way, not only pedagogical but also cognitive justice (a normative position that advances the equal treatment of all forms of knowledge) will be attempted through all of the modules offered in the AdvDip(TVT) at Nelson Mandela University.

---

## Conclusion

In this chapter, we share with an international audience the journey that a South African university – Nelson Mandela University – has embarked on to radically revise the AdvDip(TVT) that prepares TVET lecturers. Although it remains imperative to develop a well-educated and skilled workforce, we collectively need to acknowledge that there is much more to TVET than simply training workers. We are of the view that we need to cultivate progressive lecturers who, through their practice, activate students toward enabling capabilities so that they can choose a life they have reason to value and to reach higher aspirations. Our philosophy is that human well-being precedes economic development and growth, as articulated through the humanizing pedagogy and capability approaches to education adopted in program development.

Our journey toward the development of the AdvDip(TVT) demonstrates our intention and effort to shift from human capital and conventional banking approaches to education and move toward a humanizing, liberatory, and democratic approaches that support human agency. Therefore, we intend, through the enactment

of humanizing pedagogies and a capability approach, to cultivate TVET lecturers who see themselves as agents of hope and change in society and as lecturers who seek to promote social justice, equality, and human well-being through their transformative teaching and learning praxis.

## Abstract

More than one billion people globally are making a life outside of the formal labor market. This chapter draws on original research in South Africa to argue that many people are *making a life* outside of the market in accordance with a set of values which fundamentally contest core assumptions embedded in dominant discourses about the relationship between learning, labor, and having a good life. People we spoke with argued that their *making a life* was characterized by concrete labor (or doing) and radical humanism and saw these elements as constitutive features of their well-being and instrumental to their well-being improvement. This chapter shares this research, explains the making a life framework, and then draws on this framework to explore its relationship with human agency and capability. In this exploration, the chapter notes that while structural perspectives often emphasize the (very real) agency-freedom constraints facing poor and working class people, a making a life framework

demonstrates the inherent agency and humanity expressed by people enduring often extreme hardship and importantly offers a new perspective for interpreting human agency – inclusive of the self-defined efforts of people to make their own lives better and on their own terms.

## Introduction

This chapter makes three arguments:

- Formal vocational education and training not only does not help; it actually harms a large number of people.
- A “making a life” framework built around the concepts of concrete labor, radical humanism, and caring can be used to understand how the more than one billion people living outside formal labor markets take care of their own well-being, needs, and interests. The “making a life” framework draws on theorizing presented in Baatjes (2018).
- Capabilities scholars could draw on the “making a life” framework to broaden their understandings of human agency, as well as understandings of the conditions, circumstances, and ways in which human potential, in its varied manifestations, unfolds.

The preponderance of scholarship on VET policy and practice is grounded either in human capital and productivist logic or, alternatively, a full-throated critique of dominant paradigms. Critics of productivist logic have found it analytically useful to situate and understand VET within the broader social and economic structures in which it is located. Such contextualizing has resulted in scholarship identifying the rigidity of class structures and the extent to which social structures and unequal power perpetuate class inequality and relegate, in many countries, vocational training and manual labor to second-class and lower-income status (Vally and Motala 2014). However, if this frame of reference and model of social relations are taken as static, one seems to face either an analytical cul-de-sac (e.g., scholarship promoting TVET for class mobility within an inherently unequal set of social relations) or is forced to make naïve claims about the potential of VET or human agency to transform structural poverty, inequality, and joblessness. Notably, the failures (and rejections) of capitalism have created new material and analytical spaces – labor taking place outside of formal markets – that can be drawn on to develop new understandings of human labor and, concomitantly, new expressions of human agency and human potential. These interstices (Holloway 2010), or rather, what is happening in them, are the focus of this chapter.

This chapter draws on data collected during the Emerging Voices 2 (EV2) research project. The project (described in the next section) reached people in over

20 poor and working-class communities in rural and peri-urban areas in South Africa. People we spoke with told us about what mattered to them and how they met their human needs on a day-to-day basis. People told us about their concrete labor, that is, their activity which met their human needs and was measured in its use value. Peoples' lived experiences and their reflection on their experiences conveyed a radically human orientation, that is, a privileging of humanity, investment in interdependent and caring relationships, and resistance to oppressive forces. What we learned through this research was an orientation to "making a life" and "well-being" that was significantly different from the normative model conveyed in modern capitalist society and conveyed through formal institutions of education.

These findings matter for two reasons: (i) productivist economic and educational paradigms have not and are unlikely to resolve poverty, unemployment, and inequality and (ii) the share of people and families making a life outside the formal labor market accounts for one-fifth of the world's population. In South Africa, nearly half of South African families live below the poverty line, and unemployment, using the broad definition, is equal to 37%. Youth unemployment is much higher at 67% (Stats SA 2017). Finally, South Africa has one of the world highest levels of economic inequality. These indicators remain little changed in the two decades following South Africa's transition to democracy. More troublingly for human capital adherents, higher levels of educational attainment and TVET certification in the general population do not appear to have addressed unemployment and poverty and joblessness in rural or urban areas. Nearly 50% of South Africans live in informal urban settlements or rural and remote areas, and over 20% of the labor force is "informally employed" (Stats SA 2015; Wills 2009). At a global level, nearly two billion people, almost one in five people, work in the informal sector (Neuwirth 2012). Based on our research, efforts to formalize (from a social, economic, or educative perspective) so-called informal labor arrangements amount to the misapplication of a normative model to phenomena that is, by structure and definition, positioned outside of the dominant logic of markets and formality. For the medium term at least, widespread exclusion and massive informal labor systems will continue to be a daily lived experience for nearly 20% of the people on our planet. While the EV2 research elicited new ideas and perspectives, this chapter does not in any way seek to romanticize the lives of the people with whom we spoke. People we spoke with talked about the material hardships of poverty, including hunger, ill health, and insecure living conditions; poor access to basic services; and insecurity, powerlessness, and loss of hope. However, in sharing how they "made a life," people also spoke of the extent to which human needs, interests, and relationships shaped their labor and daily lives.

This chapter elaborates on the three arguments outlined in the first paragraph and, based on these arguments, reflects on possibilities for agency- and capabilities-related thinking in a "making a life" framework. This chapter does not suggest that research findings in any way resolve critical issues facing formal VET. Instead the chapter hopes that information shared limits the harm inflicted by education and opens new spaces for thinking about more humane living and the labor which sustains it.

## Learning Malpractice! Schooling That Harms People

This chapter draws on data from the Emerging Voices 2 research project: a 3-year project funded by the Department of Higher Education and Training in South Africa and implemented by the Education Policy Consortium. Research was conducted by three university-based research centers (the Centre for Education Rights and Transformation at the University of Johannesburg, the Nelson Mandela Institute at the University of Fort Hare, and the Centre for Integrated Post-School Education and Training at Nelson Mandela Metropolitan University) and the Centre for Education and Policy Development.

The purpose of the research was to reimagine post-school education (In - South Africa, the term post-schooling refers to post-secondary schooling and can include university, TVET, and adult education and skills training.) so that it would better serve the needs and interests of poor and working-class communities in South Africa. In addition to interviewing and holding dialogues with students and staff in VET colleges, universities, and Adult Education and Training (AET) centers, the research team also visited several large number of informal education organizations and organizations in which nonformal learning took place (Baatjes 2014) and conducted workshops in communities to get a better sense of how people solve the daily problems and challenges that they face in different parts of South Africa.

One of the things people told us was the extent to which dominant developmental paradigms and institutions, including formal institutions of education, not only did not serve their interests, but actually *harmed* them. Many people told us that their experience in formal education, including secondary school, VET, and adult education psychologically harmed them, leading them to feel stupid, slow, or worthless. This harm came from classroom experience (i.e., disrespect from teachers and lecturers, repeated experiences of failure), inadequate public support (TVET colleges and AET centers that are poorly resourced, have inadequate infrastructure, and do not have sufficient or sufficiently qualified staff), and dominant discourses and labor market signaling which confer second-class status to blue-collar work, VET colleges, and AET centers. One TVET college lecturer notes:

We get so many grade 11 learners coming here and wanting to enroll. . .and we have to ask, why not complete grade 12???? They will cry. They studied for the grade 11 three times. They don't want to go back there. Even when you look at their reports there are circles, red marks showing that they did not pass this and this. (FETC Lecturer, Gauteng)

TVET colleges are regularly described as “dumping grounds” – a characterization to which, unfortunately, education officials contribute. During the period of the EV2 research, Mathanzima Mveli, the director general for the Department for Basic Education, stated that the rationale for the introduction of a Grade 9 leaving certificate is for “those learners who have mild to moderate intellectual disability and who can't go beyond Grade 9 academically” (SAFM 2015). This argument was drawn on to justify efforts to direct “slow learners” into secondary-equivalent courses at TVET colleges. Unfortunately, because many of the costs of attending TVET colleges are

shifted onto students, a large share of students enrolling in TVET college do not complete a degree – leaving them with neither a secondary certificate nor the TVET college equivalent. Many youth and adult learners, identified as failures multiple times, and observant of the fact that their academically more successful peers have access to better resourced, better run, and better respected educational institutions, indicated that they begin to believe that they may be “less than” or become depressed about being able to change their own future.

People also told us of the harm and disillusion that came from the false promise of education: the promise of a path to a better life and to jobs and lifestyles which do not exist. In one student dialogue, a technology student observed, “Education was once called a key to success but now. . . No. (Student, University of Technology, Gauteng). Research participants capture the “cruel optimism” identified by Berlant (2011) – where the promise of material wealth and status following graduation meets less glamorous labor market realities. In South Africa, people we spoke with in numerous communities associated the unmet expectations of education and labor market success with loss of hope, the use of alcohol and drugs, self-harm, and violence among youth. One male adult learner told us:

Children don't see the purpose of matriculating; those who do write and pass matric sometimes end up on the streets. This means that we have high rates of alcohol and drug abuse, promiscuity, teenage pregnancies and crime. There's no sport, our youth don't know how to relax. (Bluelilliesbushes, Eastern Cape)

For first-generation college graduates who are not able to find a job, the feeling of failure may hit especially hard as family members helped pay for higher studies and expected them to get well-paying jobs. Recent graduates from poor and working-class backgrounds who do find jobs often struggle with high levels of student loan debt and expectations of supporting extended families.

Many people we spoke with provided an incisive analysis of their dilemma but also great difficulty of identifying an alternative. People recognized that high structural unemployment (including ongoing retrenchments in manufacturing and mining industries) meant that their chances for finding a job were slim. As a result, many were drawn to further education and certification as a means to improve, if only slightly, their competitiveness in the labor market. People identified “giving up” as the only alternative to participation in education. It was only when we stepped outside of “formal” spaces that alternatives were identified. It was people outside of the formal system who identified the extent to which people (in formal education) were schooled into someone else's logic of what it meant to make a life – part of which included being dependent on someone else to give you a job. (Peter Hessler, in reflecting on teaching at a University in Fuling, China, thousands of miles away makes a similar observation; he writes of a conversation with an uneducated Chinese worker, a photographer, “I realized that as a thinking person his advantage lay precisely in his lack of formal education. Nobody told him what to think, and thus he was free to think clearly (Hessler 2001 p. 173) . . . the more I thought about this, the more pessimistic I was about the education my students were receiving.”) An adult educator we spoke with said that we need to eradicate the mentality that “I must go

to town to be employed” (Adult Educator, Gauteng). Students we spoke with talked about how their experiences of going to school iteratively distanced them from their past and their lived experiences. Upon returning to their communities, they found themselves unable to relate to others and often became reliant on others in order to be able to meet their basic needs. Ironically, for these students, formal education and the expectation of the results of formal education (i.e., a job and a paycheck) created in them a dependency on others which did not exist previously. One interviewee recounted, “this mother in the township is selling fatcakes and sending all her kids to varsity. . . and some of those kids are coming back home and living with her” (Local Activist, Orange Farm, Gauteng).

Of course, many students have also benefitted from their participation in VET and AET education in South Africa. TVET colleges reach over 700,000 students in South Africa: many students benefit from their participation in TVET college courses. For example, Powell (2012) and Needham and Papier (2011) offer recent positive examples of VET improving the lives, agency, and aspirations of youth and adults from poor and working-class communities. However, the EV2 data show that VET and AET also harm a large number of youth and adults in South Africa. As this chapter will later argue, one of the greatest harms is the extent to which formal schooling appears to construct in students a narrowed and diminished agency capacity and, because of this, a truncated understanding of the fullness of human potential which could be developed.

---

## **Making a Life: Doing and Radical Humanism**

As noted earlier, while part of our research focused on the experience of formal schooling, a significant portion of the research involved collecting data on how people in poor and working-class communities “made a life.” Many people we spoke with were busy meeting their basic needs – getting food and water; engaging in informal trade and service activities to generate income; farming; working with, taking care of, and relying on others (family/community); finding creative ways to get electricity or ensure shelter and comfort; and thinking creatively about ways to better their lives. It is worth noting here that people we spoke with did not distinguish between “making a life” and “making a good life.” Their daily labors and efforts were, by and large, consonant with their own understandings of well-being. People we spoke with often would offer a holistic assessment of the extent to which their activities and life met their well-being, needs, and expectations. In so doing, people we spoke with, most of whom did not have formal sector jobs and many of whom lived in circumstances of poverty and hardship, offered a framework for making a life that fundamentally contests core assumptions embedded in dominant discourses about the purpose of education and the relationships between education, labor, and making a good life. Put another way, people we spoke with rejected the abstract and normative understandings of labor and markets in favor of concrete activities which responded to and met human needs. In communicating their experiences, people lead us to a scholarship on concrete labor, “doing,” and radical humanism. In dominant discourse, informal economies and so-called marginalized populations are defined from elite perspectives. Using a making a life framework allows us to see that people

who are “marginalized” are not simply eking out an existence on the margins of society, needing to be “empowered” or trained to be integrated into the mainstream economy; instead, many of the groups we worked with are actively and purposefully creating lives outside of mainstream economic logic and reoriented toward meeting human needs (Baatjes 2014). (The making a life framework also builds on the concept of perfiguration, which differs from sustainable livelihoods in that people we spoke with were not only engaged in securing their livelihoods but engaged, often, in a broader struggle to build a different kind of society (CIPSET 2018).)

## Doing

The making a life framework is grounded in Holloway’s interpretation of “doing.” Holloway identifies doing as our “free conscious activity” necessary for the production and reproduction of social life; “doing” is a constitutive feature of our being and, simultaneously, an expression of our humanity. Our “doing,” our daily activity, corresponds to meeting our human and social needs for sustenance, shelter, health, warmth, and companionship, as well as addressing other matters and meaning we define as important to us. Holloway’s conception of “doing” aligns with Marx’s interpretation of concrete labor – labor measured in terms of its use value or the extent to which it contributes to meeting human needs. In Holloway’s interpretation, labor that is directed to meeting human needs is also humanizing; all doing is laden with human meaning. This doing is contrasted to Marx discussion of abstracted labor and alienation. Holloway writes, “labor, as alienated labor, is a separating of ourselves from ourselves, a tearing asunder of ourselves and our activity” (Holloway 2010, p.88). Because exchange value creates a relationship between commodities (and not people), the alienated labor used to produce the things being exchanged becomes abstracted, and our social relations become shaped by exchange value. (This section on “doing” draws on the work from Anne Harley (University of KwaZulu-Natal), including a brief write-up on Holloway’s work in *Crack Capitalism* as well as several exchanges during the process of writing “Learning for Living.”)

The distinction between concrete and abstract labor was evidenced time and again in our research with formal institutions and systems and informal, outside the market, organizations. While many students and young adults offered humane reasons for their interests in particular areas of study or job, they were, time and again, confronted with the inhumane logic of the market. The job market hired less-qualified workers who could be paid less and more easily fired; students, desperate for income, sought any form of job, regardless of whether it spoke to their interests, and we came across many examples of people who held onto jobs that made them sick or depressed rather than follow an alternative path which could promote different forms of well-being. The common thread in the life stories people shared with us was the extent to which they privileged the exchange value of their labor over other human needs and priorities.

Alternatively, it was from people and organizations operating outside the market, where labor was more closely connected to meeting human needs and where people did not make the distinction between working and making a life: they were simply

making a life, with their doing a constitutive part of the whole. Many people we spoke with talked about the care and attention they put into their daily activities: they saw themselves as enmeshed in structures of care and interdependence and, from their experience, identified a new (old) humanizing logic for making a good life. Holloway argues that doing exists “within, against, and beyond” capital and that doing is a part of our ontological nature. Doing is expressed within experiences of abstract labor, pushes against alienating labor to construct meaning/combat meaninglessness, and, as identified above, is expressed in the absence of market logic and forces. An approach to living and learning that recognizes “doing” as an ontologically fundamental, and fundamentally human impulse, could allow for new thinking in VET and application of capabilities thinking.

## Radical Humanism

What people told us also conveyed elements of radical humanism. A radical humanism philosophy privileges humanity (human beings, human needs, human interests), recognizes the collective rather than individualized nature of being human, and is active in its struggle against the oppressive social relations to, in the words of Fanon, the “right of every person to be a person amongst other people” (Fanon, cited in Pithouse 2011). Theorizing on radical humanism draws largely on postcolonial literature, including the work of Fanon. Neville Alexander, writing on “racial capitalism” in South Africa, and Fanon, on the colonial experience in Algeria, both identify “being dehumanized” as one of the central experiences of living as a person of color under colonial structures. A radically human philosophy rejects individualized conceptualizations of humanity and instead argues that the collective struggle against oppression is one way of reclaiming humanity.

People we spoke with were not ignorant of their own oppression and dispossession. Many people we spoke with, drawing on their lived experiences, offered an incisive critique of neoliberal policies, capitalism, and development. Neoliberal capitalism bred joblessness, inequality, and insecure living and working conditions and perpetuated dehumanizing and undignified conditions in work and life. So-called “development” was the spreading of a mythology and programs which often benefited the elite and enriched the powerful at the expense of the poor. Development was bulldozing informal settlements because land was sold to “develop” middle-class housing in Port Elizabeth; development was the perpetuation of a severely unequal schooling system. People routinely observed the contradiction of government claims toward solving unemployment amid ongoing retrenchments in manufacturing and mining industries and structural labor market changes related to the displacement of labor by capital and the increased casualization of work (Hlatshwayo 2014; Balwanz and Ngcwangu 2016). For many people, the path toward a radically human philosophy came from their rejection *by* the dominant system (e.g., dispossession, unemployment, low power status) or, alternatively or concomitantly, their rejection *of* the dominant labor market model.

Baatjes (2014) among others identified a large number of movements, collectives, and community organizations organized around community needs, drawing on

community capabilities (see Powell 2016) and expressing radically human values in their work. Even outside of formal organizations, people we spoke with who were living outside the market routinely privileged discussion on human needs, interdependence, and caring and, often in routine but meaningful ways, rejected the oppressive relations fostered by market living: people grew their own food, worked their own hours, sought connection to or were involved in maintaining local culture, and made more decisions for themselves about what they needed to do and what was important to them.

Like “doing,” a radical humanist positionality does not seek to “solve unemployment” or provide comment on promises or critiques of a human capital orientation. Rather, we can use the lens of radical humanism to understand how people actually make their lives and define and find well-being in the midst of economic and social hardship. People we spoke with told us about the values they expressed or hope to express in their lives and futures – people sought equality, ubuntu, and dignity; several organizations were oriented toward social justice; others were simply organized around local capacities and needs related to health, care, education, food production, or small-scale service and goods production for income.

Holloway’s conception of “misfitting” helps describe what we’re seeing. Holloway notes that misfitting is a “constitutive element of a capitalist society.” Holloway continues, “if we did fit in completely and were completely dominated by abstract labor and capitalist reproduction, then we would no longer be human” (Holloway and Susen 2013). Here Holloway helps us to connect the incongruity between dominant discourses and formal experiences of people and the lived experiences of making a (good) life which people told us about. Education harmed a lot of people we spoke with, in part because education was premised on an inhumane market logic that was practically and experientially repulsive to many people, “misfits” so to speak. In moving outside of the market, many people gained or regained their capacity for “doing” and the (re)construction of their humanity ontologically linked to use-value activities. Similarly, people’s work and, bluntly, economic and social vulnerability fostered an expression of radically humanist values: their activities took on an assertion of being and humanity, in part because of the dependence of life on them. So what does this matter to scholarship on capabilities and VET?

---

## Rethinking Agency and the Exploration of Human Potential

I think . . . tertiary education . . . to be a civilised way of slavery. It teaches on how to build another person’s dream rather [than] to teach one to actually make use of the resources around them so that they can adjust a very independent living. (University student and YRLA researcher, Eastern Cape).

We tell them [youth] this is your future. No one is going to live it for you. You decide. (Founder, Youth Development Program, Gauteng).

This section of the *handbook* challenges authors to discuss how capabilities perspectives could inform policy and practice in vocational education and training. I draw on the making a life framework and focus my analysis on the issue of agency

to make three observations. First, I argue that we need to understand the agency to be mediated and shaped by context and social relations. The making a life framework offers a different social field for conceptualizing agency and its varied expressions – as well as framework for making a comparative analysis of agency-suppressing features of dominant social fields. Second, contrary to some strands of capabilities thinking, I argue for a definition of agency which places less emphasis on “deliberation” and “purpose” and better appreciates the lived, present-based, experience of doing. To conclude this section, I argue that educators and scholars ignore structuralist critics who mostly emphasize what is not possible within a predefined and restrictive model of social relations, step outside of capitalist spaces and logics, and do whatever is in our power to promote the expansion of human agency and thereby the unfolding of human potential.

A fundamental contribution of an agency-focused capabilities approach to scholarship on human development is that the approach places agency, one’s capability, and the scope of this capability to act at the center of conceptualizations of human development. (In this section, I draw largely on the scholarship of Sen and Crocker on an agency-focused capabilities approach.) Capabilities approaches, which promote a normative perspective on human development, are often paired with a theoretical perspective for understanding social reality. The same must be done for understanding agency. Recent scholarship in comparative and international education, drawing on critical and sociological perspectives, understands agency, one’s capability to act, to be dialectically related to one’s spatiotemporal social context (Emirbaryer and Mische 1998) and mediated by the norms and rules of the social fields in which human relations are enacted (DeJaeghere et al. 2016a). Our agency-space, the socially constructed space in which we are (and imagine ourselves to be) capable of acting, and the constriction or expansion of that space are necessarily grounded in and mediated by our material and socially constructed contexts (Balwanz 2015). Recent scholarship related to young adult participation in work and livelihood education programs in East Africa argues the agency to be ontologically positioned in relation to others – that human agency cannot be understood outside of an understanding of one’s social relations (DeJaeghere et al. 2016b). (It is worth noting that this research contests the pervasive individuating logic of capitalism and formal education while at the same time suggesting that the ability (and structural interest) of capital to weaken human agency and social relations explains the resilience of capitalist structures.) I will argue later that this conceptualization of agency has implications on how we understand the expression (or suppression) of agency in different social spaces.

An increasing number of scholarly articles in the field of education and human development draw on capabilities thinking; as a result, the issue of the agency, and its role in human development, is a prominent topic. My own thinking on agency has evolved over time – away from the “development economics” conceptualization of Sen and Crocker and toward pragmatist and phenomenological schools of thought. Capabilities thinking grew, in part, out of Sen’s reflections on *Well-being, Agency and Freedom* (1985). In this lecture, and later on in *Development as Freedom* (1999), Sen identifies human freedom (agency) to be a constitutive feature of our

human well-being, and, at the same time, Sen and, later on, Crocker and Robeyns (2009) ground their definition of agency to phenomena of *deliberation* and *purpose* as well as to the ends of agentic action, well-being, or ill-being achievements. Crocker (2008) provides the end result of a means-privileged conceptualization in his identification of four dimensions of agency which emphasize self-conscious determination and disciplined and deliberative action based on a preconceived understanding of how action will have a desired “impact on the world” (Crocker 2008 p. 10). Were that we, and our worlds, and the phenomenon of “realized agency success” so neat and well-reasoned. Problematically, this strand of capabilities thinking appears to have brought a homo economicus into our understanding of how human potential unfolds. American pragmatists and phenomenologists offer a different interpretation of the expression of agency in a social context. Emirbayer and Mische’s (1998) understanding of the expression of agency is that:

action not be perceived as the pursuit of preestablished ends, abstracted from concrete situations, but rather that ends and means develop coterminously within contexts that are themselves ever changing and thus always subject to reevaluation and reconstruction on the part of the reflective intelligence. . . . (p. 967–978)

Put another way, “action happens.” Our action needs not necessarily be purposeful or the result of our reflective intelligence. Sometime, this is the case, and, as good educators, we hope that actors engage in reflection, post-action. A second observation by Emirbayer and Mische (1998) is that, even in post hoc analysis, our instrumental and existential rationales for (or understandings of) action are analytically inseparable. (In some instances, agency that is overly projective in nature and (see Frye 2012) also privileged instrumental rationales, which in some contexts truncate present expressions of agency.) Both observations broaden the conceptual space for understanding of human agency and, I argue, place a greater emphasis on freedom of action in a non-self-conscious present, in which the oppressive rules, norms, and social relations constituting social fields fall away. Research from Balwanz (forthcoming) on three holistic youth development programs argues that the social fields created by the programs create spaces where youth, in the words of one participant, feel “good and free because I can be able to express myself and talk about reality.” Often, it is not in the moment, but after it, that people realize that they have done something. Some of them think, maybe I could do that again. In other cases, someone else tells you – hey you did that, and you think, I guess that’s right. These present, messy, lived experiences are starting to look like the “free conscious activity” that Marx argues is a part of our species characters.

The above discussion on agency can help to explain the different experiences of the people who spoke with us. People in formal VET and AET programs were, by and large, situated in social fields in which rules, norms, and expectations were defined by others; they were defined by others and by what they could not do (i.e., academic failures, apply here); they were in spaces which demonstrated and reinforced structural and material inequalities in society and social relations and which were oriented

toward neoliberal- and market-oriented (individuating and dehumanizing) conceptualizations of agency, human potential, and well-being. Given these conditions, is it any wonder that many people physically leave or psychologically tune out or, alternatively, exercise some form of voice, or resistance, that reflects their lack of belief, or unwillingness, to buy into the dominant model (Giroux 2001)? A capabilities perspective, if located within a system and social reality framed by the dominant discourse, would appear to provide the same result as human capital approach: agency is defined in terms of responding to market logic, capabilities are defined and valued by capital, and human needs, values, and our ontological characteristics are token “priorities” which are bent toward and subsumed by the capital’s demand for efficiency and profit. Embedded in the dominant discourse, a capabilities approach proves at best irrelevant and, at worst, harmful for a large share of people in poor and working-class communities. Formal institutions of education, largely refracting social and economic reality of late capitalism, enforce a particular, and particularly narrow, understanding of human potential and human agency. A broader exploration of human agency and human potential requires that we look further.

These reflections return us to the Emerging Voices 2 research. People making a life outside the market found new ways of organizing human production and learning, which narrow (or eliminate) the (artificial) space between knowledge, lived experience, and practice. Importantly, this different set of conditions required action (labor) that was more directly connected to its use-value (meeting human needs) as opposed to its exchange value. People who were making a life appeared to demonstrate, and act, with an agency-freedom not common within market logic spaces. Instead of focusing on or perceiving of themselves as passive victims (or beneficiaries) of structure, people had articulated and were enacting a new way for making a life (Powell). People talked about freedom from oppression of capital: the importance of “having a skill” so as not to depend on an employment to get by, being able to grow their own food (which was better, cheaper, and more readily available than that from the market), of preferring to oversee their own small shop, and of caring and support activities. Each is an expression of agency, unfolding in response to lived experiences and human need.

The making a life framework broadens the conceptual and practical space for thinking about and acting on agency. This matters because (partially complete) interpretations of social reality, in defining the oppressed from the perspective of their oppressors and dominant understandings of human development and well-being, place too great an emphasis on structural constraints and the implications of their removal. Too great a focus on this particular (elite) conceptualization of structure may prematurely foreclose exploration of human agency development – the ‘heterogeneity’ and ‘doing’ – that Holloway sees in interstitial spaces. The creative, humane, and life-affirming examples of “making a life” people shared with us suggest a need to place greater emphasis on and take more seriously the issue of human agency. I argue that educators and scholars ignore structuralist critics who mostly emphasize what is not possible within a predefined and restrictive model of social relations, step outside of capitalist spaces and logics, and do whatever is in our power to promote the unprescribed and undifferentiated expansion of human agency and thereby the unfolding of human potential.

## Conclusion

To date, few efforts have been made to conceptualize how human conditions of concrete labor and interdependence, conditions manifest within and beyond the capitalist structuring of society, could be drawn on to extend understandings and applications of capabilities approaches in technical and vocational education and training (TVET). This chapter has drawn on empirical research and a making a life framework to share some reflections on the application of a capabilities approach to VET. People we spoke with, most of whom did not have formal sector jobs and many of whom lived in circumstances of poverty and hardship, offered a framework for making a life that fundamentally contests core assumptions embedded in dominant discourses about the purpose of education and the relationships between education, labor, and making a good life. Based on this research, this chapter claims that education “harms” a large number of people that human agency is contorted and made inhumane through market-oriented systems and that new application of a capabilities perspective, and particularly of human agency, could draw on the observations of human nature evidenced in the making a life model. This initial work offers a starting point for further research and theorizing.

It is important to continue to make an argument that the “making a life” conceptualization matters. In our research, we justify this approach by observing the large (and growing) number of the global working population living outside the market and of the extent to which the proposed framework reflects their lived experiences, inclusive of connecting nonmarket model labor to humane impulses. As noted earlier, people’s work and life were not only about securing their livelihoods but also involved a prefigurative element in which they actively and purposefully sought to create a new society beyond the mainstream economic logic (Baatjes 2018; CIPSET 2018). In this chapter, we connect this framework to an understanding of agency expansion – however, applications are not limited to theorizing new directions with a capabilities approach.

This chapter closes with a word of skepticism on the extent to which formal VET can actually truly promote concrete labor and radical humanism. In our research, formal systems appear to be so completely enmeshed in neoliberal logic and structures of power that they will inevitably reshape humane and agentic impulses in the direction of capital. In the absence of structural shifts in the labor market and society, there may not be sufficient resources within formal VET to support such a paradigm shift. Thus, for the time being, clever educators may need to continue to look for interstices and the misfits within, against, and beyond their own institutions.

**Abstract**

One of the advantages of a human development approach to thinking about skills development is its ability to highlight the importance of inequality and marginalization compared to the orthodox human capital approach. The case of the occupied Palestinian territories (oPt) is particularly valuable in showing both the effects of marginalization and inequalities but also the possibilities for improving human development through Vocational Education and Training (VET).

The context of the occupied Palestinian territories (oPt) adds additional layers of marginalization and inequalities, creating different context-related vulnerable groups. Within such a context, highlighting VET's contribution to human development and reducing inequalities are paramount, as well as acknowledging structural challenges faced within such a context.

In this chapter I draw on my doctoral work, in which I consulted over 1000 people through a graduate survey, focus groups with students and trainers, and interviews with VET management, teachers, and government officials.

I combine human development and capabilities' perspectives with insights from gender and development theory and intersectionality accounts to address concerns about structure and agency. This extensive dataset and these combined theoretical resources allowed me to explore how vulnerable learners are able to make genuine progress in achieving their valued functionings in spite of the multidimensional challenges they face.

I will define the context-related vulnerabilities, as other inequalities, and test their attraction to VET, as well as the intersectionality among the different inequalities. Achieved functionings are also analyzed according to the defined inequalities and vulnerability.

The analysis and findings reveal that VET has acted as an effective tool for achievement of human development and reducing inequality. It will also define evaluative methods for impact assessment of VET within a human development approach.

**Introduction**

The UNESCO (2012) Third International Congress on TVET, held in Shanghai, agreed on a vision of a “transformative TVET” and called for a better visibility and support for TVET as an integral part of the post-2015 international education and sustainable development agendas, accordingly, UNESCO (2015) recommends that TVET's role goes beyond the productivist agenda:

TVET contributes to sustainable development by empowering individuals, organizations, enterprises and communities and fostering employment, decent work and lifelong learning so as to promote inclusive and sustainable economic growth and competitiveness, social equity and environmental sustainability. (p.2)

This vision introduces the shift toward a human development agenda, concerned with individuals as well as organizations and society, and with a clear emphasis on social equity. In a context of marginalization, particularly, the impact and outcomes of VET supersede that of economic development and contribute to human development. Hence this chapter adds value in assessing VET's contribution to human development, contributing to the international debate and international scholars (Anderson 2008; McGrath 2012; Powell 2012, 2014; McGrath and Powell 2014, 2015; López-Fogués 2012, 2016; DeJaeghere 2016) and validating this contribution within a context of marginalization.

In the next section, the specific context of Palestine is presented. This is followed by the theoretical and conceptual framework used in this chapter and then the methodological approach. Following which, I present my findings in the form of a developed capability list. This capability list is based on Powell's (2014) list with the added gender and marginalized lens. *The capability list Powell 2014/Hilal 2018* (Hilal 2018) is preceded by the aspirations as well as valued and achieved functionings of the VET learners. The chapter will also present the assessment of achieved aspiration by the graduates, followed by the conclusions that summarize how VET contributes to human development within a context of marginalization.

---

## The Context

### The Overall Context

The Palestinian territories have a unique status in being, on the one hand, under military occupation while, on the other hand, preparing for state building. This status has resulted from a series of treaties with the Israelis since 1993 that provided a temporary agreement aiming at ending the occupation of the territories. These treaties, known as the Oslo Accords, handed over services such as health, education, and social welfare to the Palestinians. The treaties allowed for the existence of the Palestinian Authority (PA) in governing Palestinians in the oPt. It also resulted in the division of the West Bank into different zones. The failure to end occupation and the ongoing violations of human rights after more than 20 years have created a humanitarian crisis and increased vulnerability of the Palestinian population. The UNOCHA has long identified the occupied Palestinian territories' status as one of a "protracted protection crises." In their 2016 annual report, they explained that:

The humanitarian context of oPt is unique amongst today's humanitarian crises and remains directly tied to the impact of the Israeli occupation, now in its 50th year. The occupation

denies Palestinians control over basic aspects of daily life, whether they live in the Gaza Strip or in the West-Bank, including East Jerusalem. Their ability to move unimpeded within their own country, to exit and return, to develop large parts of their territory, build on their own land, access natural resources or develop their economy is largely determined by the Israeli military. (UNOCHA 2017a, p.1)

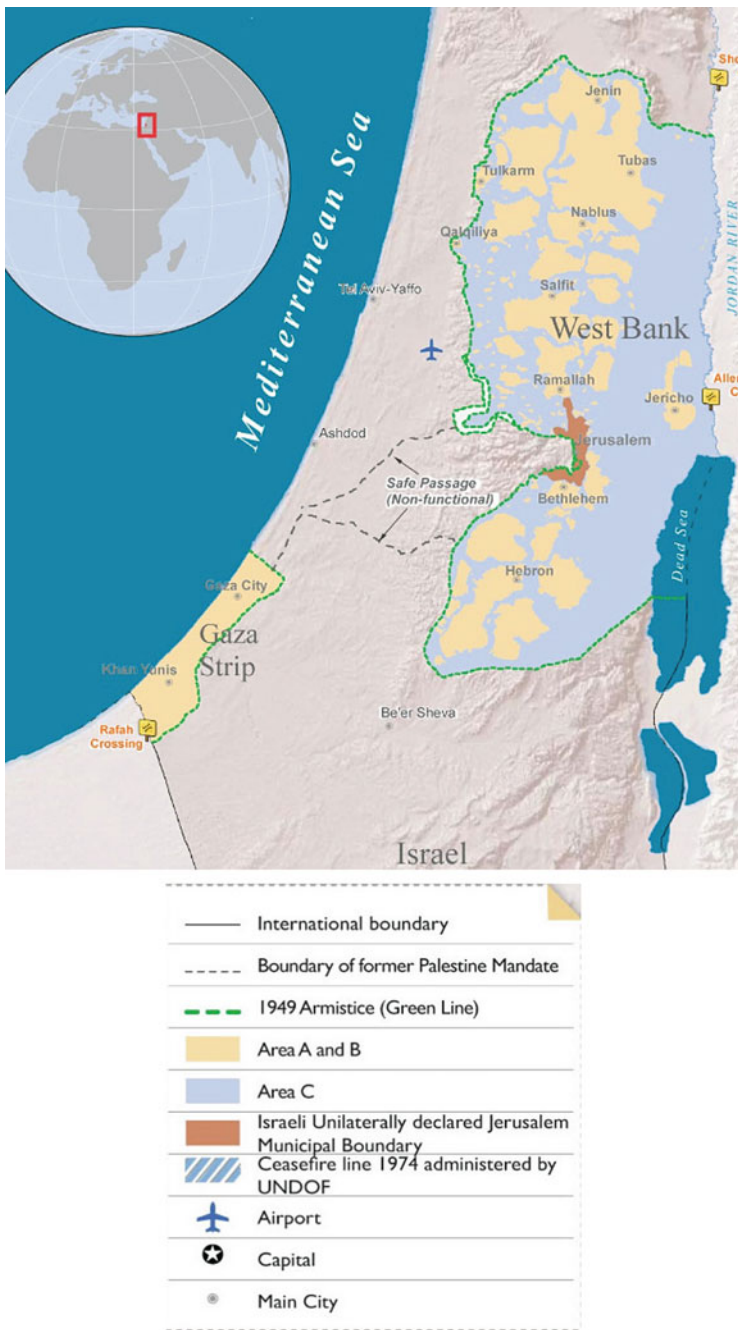

The oPt consists of three different zones, the West Bank, East Jerusalem, and Gaza, that are separated from each other (The “occupied Palestine territories” (oPt) is the name that describes its realities before 1993, the existence of the PA. This was replaced in UN documents and in PA official documents in 2012 by the designation “The State of Palestine.” I will use oPt here following (Hilal and McGrath 2016, p.88), as “occupation is a continued reality and statehood an aspiration.”). Access of people and goods are restricted as the UNOCHA (2017b) map below indicates. The West Bank is further divided into zones A, B, and C, where C (constituting 60% of the West Bank) is almost all under the control of the Israeli military, adding additional vulnerable groups in need of humanitarian protection (UNOCHA website could be accessed for more information: ([www.ochaopt.org](http://www.ochaopt.org))). (Map 1).

The United Nations Conference on Trade and Development (UNCTAD) (2016) noted the effect of the military occupation on the people and on the economy. It argued that occupation imposes a heavy cost on the economy of the Occupied Palestinian Territory, effectively halving its size. UNCTAD (2016) stated:

[M]ilitary occupations typically involve the exploitation, impoverishment, marginalization and displacement of the occupied people, as well as the destruction of their assets and appropriation of their resources. Equally damaging are measures and policies by the occupying Power that undermine the capacity of occupied people to access and utilize their resources, move freely within their homelands and conduct normal trade, economic and social transactions with neighbours and trading partners. (pp.7–8)

Clearly such status has affected the whole population, with special emphasis on those directly affected by the context as defined by UNOCHA various reports, being those that have been subjected to certain measures, living in Gaza, Area C, and East Jerusalem, in Jordan Valley, and in seam zones (near the wall or in military-gated community). In addition to refugees and internally displaced people, families lost breadwinners due to this status. It also affected females differently. As Abdo-Zubi (2006) explained, the role of patriarchy is exercised on Palestine Women in its internal and external forms. The “internal” form is exhibited through expressed norms, traditions, practices, and perceptions, and the “external” form is expressed through political violence practiced by the Israeli occupation, both are main forces of marginalizing Palestinian women. Section “[Marginalized VET Learners](#)” will indicate how VET is attracting male and female youth from these categories and how it plays a role by contributing to the eradication of the marginalization effects noted through impoverishment and disempowerment.

**Map 1** The oPt overview map (UNOCHA 2017b)

## VET in Palestine

Various church-related and nongovernmental actors have provided VET in Palestine since 1948, as well as the United Nations Relief and Works Agency for Palestine Refugees (UNRWA). As hundreds of thousands of Palestinians became refugees, VET was provided as an additional humanitarian assistance for skills development that could lead to employment and family support.

In 1994, the PA resumed their authority over education following the Oslo Accords. This responsibility entailed unifying the fragmented education systems between the West Bank, under Jordanian rule between 1948 and 1967 and following their systems, and the Gaza Strip, which had been under Egyptian rule during the same period. It also entailed rebuilding the schools, curricula, teacher development, and infrastructure of schools after their neglect during the period of Israeli control of education, 1967–1993.

Currently, VET is provided mainly by governmental and nongovernmental institutes and the UNRWA and is governed by two ministries: the Ministry of Education and Higher Education (MOEHE) and the Ministry of Labour (MOL). Amidst the strength of VET providers and their response to the Palestinian context, TVET governance and structure in Palestine is fragmented, and structure is unable to respond to its needs and implement its strategy effectively. This is aggravated by weak accountability linked to the overall context (Hilal 2013; Leney and Jweiles 2014; Kuhail 2015).

---

## Theoretical and Conceptual Framework

This chapter relates to the growing account on VET's contribution to human development (HD), beyond the orthodox human capital approach. Activated by McGrath's (2012) call for VET's need for a new theory and the work of McGrath and Powell, the account presents studies from South Africa, Spain, Palestine, and Tanzania (Anderson 2008; McGrath 2012; Powell 2012, 2014; McGrath and Powell 2014, 2015; López-Fogués 2012, 2016; Hilal and McGrath 2016; DeJaeghere 2016).

The human development approach is concerned with the lives of people and their well-being, as well as their freedom to choose the life they want, as presented in the work of Sen (1985, 1990, 2000, 2004). Sen defines capabilities and functionings as potentials and achievements of being and doing. Nussbaum (2003, 2011) has included the social justice prospects. She argues for capabilities based on entitlements and rights that would lead to equality, with human dignity as their core. Nussbaum (2000) has argued that unequal human capabilities contribute to unequal social and political circumstances. In this regard, Robeyns (2003) has also noted that the inequalities in achieved functionings reflect inequalities in capabilities, in turn reflecting social setups and obstacles.

Central to my research is the work of Powell (2012, 2014) on *Expanding the Capability to Aspire* and her work on capability lists for VET learners in

South Africa. This chapter develops further this work by integrating the inequality elements and particularly as experienced within the context of marginalization.

Hence, I will be presenting the *Powell 2014/Hilal 2018 capability list* (Hilal 2018), as well as the validated and measured valued and achieved functioning of VET graduates in the case of Palestine.

I also borrow from gender and development (GAD) theory, the notion of empowerment, which is essential in the case of inequality and marginalization, presented in the work of Kabeer (1994, 1999, 2008, 2010, 2015). Kabeer (1999) locates the core of empowerment in the concept of “power,” in terms of “the ability to make choices.” Thus, she describes empowerment as a process that can bring change to the disempowered who has been denied the power of choice. Kabeer’s account of “choice” is central to understanding empowerment. Choice is related to conditions surrounding a person or group and the consequences these have on the range of available choices and the capacities to act upon them. Kabeer further argues that achievement of capabilities and functions would not necessarily achieve empowerment without also developing the sense of agency. I complement the understanding of GAD with an intersectionality approach that explains the multilayers of inequalities, developed by black feminists (Davis 1983; Crenshaw 1989; Collins 1989, cited in Hilal 2018) who have highlighted the intersectional inequalities between race and gender, noting that gender inequality analysis alone is insufficient to analyze gender inequalities in a given society.

My work also engages with political economy arguments and specifically the work of Brown et al. (2001) on the need for “social transformation” to achieve the aim of a high skill society. Their work suggests an increased role for government and social partners and the political will for skills upgrading. In this regard, the chapter analyzes how adopted policies are used to reduce or reproduce inequalities.

Using these three approaches and theories were essential for relocating VET within development theories and approaches by placing the focus on human development. Yet, while the question of inequality requires the addition of theories such as the GAD and intersectionality that tackle inequalities, a political economy lens provides for the assessment of the structural analysis and enabling policies for achievements.

---

## Methodology

The chapter utilizes data and analysis from my PhD research, which has used a combination of qualitative and quantitative methods. Methods used included VET graduate survey, semi-structured interviews, focus group discussion (FGD), and review of documents. Data was collected during 2015, with the exception of interviews and FGD in Gaza in 2016, when Israeli permit to enter Gaza was granted.

A total of 764 graduates filled the survey, a representative sample of VET institute graduates from governmental and nongovernmental institutes with wide geographic spread and gender representation. The research has also consulted with 487 persons through interviews and FGDs.

All in all, 1240 persons were consulted through the research (11 graduates were subtracted as they participated in both the survey and the FGD), 33 VET institutes participated (as management, teachers, students, and/or graduates participated), head of 8 directorates and teachers of general schools participated, and officials from 2 ministries and 2 employers' representatives, as well as 10 employers and several community representatives, participated.

All the tools used were developed from the theoretical framework outlined above which supported the identification of the themes of the discussion and the analysis. Piloting and validation of the survey was conducted which was analyzed using the SPSS software package. The qualitative data was documented, tabulated, and analyzed along the interview themes raised during the discussions. Quantitative and qualitative data were triangulated. Data was also presented in comparison with relevant national data as Figs. 1 and 2 indicate, while the empowerment indicators were listed according to the research theoretical framework.

Capabilities were tested through the survey and the qualitative methods. It is presented as percentages of achievements. Collected data was cross-checked with relevant national data and presented (Figs. 1 and 2). Key concepts based on the theoretical framework of the research were presented as statements to be rated on a five-point Likert scale; the agreement or achievement was sometimes presented as aggregated responses of "satisfied/agreed" and "highly satisfied/agreed" on these scales (Figs. 3 and 4).

---

## Marginalized VET Learners

Marginalized groups in oPt were identified based on various studies and researches, regarding the different marginalized groups including UNOCHA (2014, 2016) identification of the marginalized and Ministry of Social Affairs (2014) identification. Research investigated VET learners according to marginalization and intersectional marginalization.

### **The identified marginalized groups in oPt are:**

- (a) Socially marginalized groups, e.g., youth, women, and people with disabilities.
- (b) Economically marginalized groups such as the poor, the unemployed, and the vulnerable workers.
- (c) Academic dropouts and potential dropouts.
- (d) Marginalized by the context of the occupation. Furthermore, the context has its own effects on all the other marginalized groups.

The first three groups are shared globally, while the fourth is specific to the case of Palestine.

**VET attracts the marginalized:** The results indicate that VET is attracting the marginalized within the context of "a protracted protection crisis" of a military occupation and human rights violations. Specifically, VET is attracting the different marginalized individuals, groups, and communities, with regard to the

**Fig. 1** Expectations of youth upon graduation from VET – percentages

context-related marginalization, poverty and economic status, gender, and social conditions, as well as attracting the low achievers, potential dropouts, and dropouts.

The findings indicate that when VET learners enroll, they suffer multilayered and intersectional marginalization, confirming the theories of inequalities and intersectionality. Inequality, in terms of power relations and limited access to, and control over resources, which is structured and intersectional, was the

**Fig. 2** Labour Force Participation Rates (LFPR) of graduates in comparison with national figures for youth and the overall national figures (Source of the national data: National 2015 Labour Force Survey (PCBS 2016))

**Fig. 3** Employment and unemployment rates of graduates in comparison with national figures for youth and the overall national figures (Source of the national data: National 2015 Labour Force Survey (PCBS 2016))

**Fig. 4** Percentages of VET graduates in agreement or high agreement to “Power With” indicators due to VET and work

experience of most of the VET learners when enrolled. Hence, they are often disempowered and impoverished.

Most VET students and graduates are subject to some form of inequality and in most cases to intersectional inequalities. Palestinian youth who were affected by context-related inequalities in the form of being from vulnerable localities, those directly affected by the context, refugees, or experiencing other context-related inequalities, were attracted to VET. Evidently, the last group intersected with poverty, as a result of loss of land, resources, access, and sometimes the very lives of family members, all of which clearly affected their financial and economic status and their well-being.

Students and graduates affected by gender inequalities and social hardship cases were also affected by other sorts of inequality, including poverty. It was evident that

most of the single females came from poor families, while those that were widowed or divorced were also affected by poverty. On the other hand, more male students and graduates were low achievers and affected by economic or social hardships through this medium. Females faced an added level of inequality through social attitudes that underpinned their marginalization.

Students and graduates affected by economic inequality, meanwhile, were also attracted to VET, as two out of three graduates were from households with income below the poverty line when enrolling (The national poverty line is calculated using the PCBS poverty line (PCBS 2011), and the East Jerusalem poverty line was according to Israeli National Insurance Institute (2010)). These groups also intersect with the remaining inequalities; and it was evidenced that poverty vertically intersected with all other inequalities in different forms.

---

## The Capability List Responsive to Inequality and Marginalization

Findings presented here are grounded in the capability approach and starts from the ideas of “aspirations as capabilities” and “listening to VET learners’ aspirations” according to Powell (2012, 2014). The examined capabilities and functionings are based on the understanding of Sen’s (1992) capabilities as real opportunities for acts of “being and doing” of the valued functionings, which as defined earlier has been extended to include processes and agency. The capability list is in line with Nussbaum (2003) work for “central human capabilities” based on human rights and social justice, and with Robeyns (2003) work that included gender elements.

This section will list aspirations as valued functionings stated by the VET graduates themselves and will then investigate capabilities, valued functions, and achieved functionings. Building particularly on Powell’s (2014) list for VET, I will add gender, marginalization, and political economy lenses.

The capability list I am presenting adopts defined capabilities by Powell (2014) to be responsive to the gender and marginalized and adds related missing ones. The details of which are presented in the next section of this chapter. The capability list also adds the additional columns of valued functionings that defines the valued functionings for policymakers. These valued functionings are based on a political economy understanding of the economy of skills, which relates to measures and policies that would lead to the achievement VET learners’ functionings and aspirations. It has the added advantage of presenting an agenda for accountability.

Alike to Powell (2014), the list follows the five criteria mentioned by Robeyns (2003) of having explicit formulation, methodological justification, sensitivity to context, and different levels of generality, while the last criterion of exhaustion and nonreduction implies that listed capabilities should include all important elements.

The list emphasized the capabilities that matter for the poor (Kabeer 2015) being employment, income, and skills; hence generated income is added; this is especially important for the poor given the lack of a formal social security system in Palestine, which is the case in many of the Global South countries.

The list also adds the other forms of unpaid work based on my investigation into the recent literature body on work of feminist economist (Ferber and Nelson 1993; Folbre 1994; Himmelweit 1995; Akram-Lodhi 1996; Gideon 1999, cited in Power 2004) and resonates with Robeyns' (2003) list for gender equality which similarly includes unpaid work.

In addition, the list includes elements for transition to the World of Work (WOW). The WOW elements that are relevant to gender and poverty are as indicated through my previous work (Hilal 2011, 2012) and are in line with UNESCO (2012) transformation plan and the recommendations of UNESCO (2015).

Moreover, the list reflects Kabeer's (1999) empowerment framework used based on work and the developed social empowerment indicators, part of these indicators resonates with Powell's (2014) capability list for VET.

Finally, the list adds the context relevant aspiration of mobility. With mobility also reflecting the social restrictions related to power over mobility-related decisions, security and protection are also added.

Hence the developed list is gender sensitive and encompasses poverty and context-related elements. The list has 10 dimensions of VET capabilities.

The methodological justification included predefining the aspirations through the previous work of the researcher (Hilal 2009, 2011, 2012) addressing VET male and female graduates and other unpublished work. The survey was filled by the 764 male and female graduates. The fields were complemented by open part in the survey for additional aspirations and by qualitative interviews and focus group discussions with different groups.

The Powell/Hilal capability list is illustrated below; the listed functionings included in the list were extracted from key findings discussed in details in the coming section of this chapter (Table 1).

---

## **Valued and Achieved Functionings of the Graduates**

### **Aspirations of the VET Graduates: Valued Functionings**

Graduates were presented with 13 possible areas of capabilities that they might be expected to achieve upon graduation. These areas were developed based on my long experience in TVET and previous research work (Hilal 2009, 2011, 2012), in addition to the international VET and capability literature. Graduates indicated their level of agreement with the various statements, thus expressing their valued functionings, as demonstrated below.

The valued functionings expressed by graduates included income generation (87.6%) and employment (82.1%), as would be expected of youth who are impoverished and facing a situation of high youth unemployment, which is even higher among the marginalized youth. This is in line with the importance to the poor of human labor, skills, knowledge, and abilities that Kabeer (2015) has noted in her work on poverty.

**Table 1** The Powell/Hilal capability list: Powell (2014) VET capability list with focus on gender and inequality

Dimensions of VET capabilities and valued functionings that matter to FET college students in South Africa (Powell (2014))		Dimensions of VET capabilities and valued functionings that matter to VET students in Palestine, with a focus on gender and inequalities (Hilal (2018))	
Dimensions of VET capabilities	Valued functionings	Dimensions of VET capabilities	Valued functionings for graduates
	Being fairly remunerated		Able to find employment opportunity
Economic opportunities that matter	Earning a living wage	Economic opportunities that matter for all	Able to find employment opportunity that matches qualification
	Having employment stability and security		Able to start own work immediately or after gaining experience or opt for a flexible work mode
	Having access to fair and equal opportunities to career progression		Earning a living wage
	Able to make a valuable contribution in the workplace		Positive working environment in the workplace (space, relations)
	Able to take pride in their work		Working regulations (outside the labor law)
			Skills enabling nonmarket work
	Nonmarket work carried out by choice		Nonmarket work carried out by choice
			Valued functionings for policymakers (VET-related policies and measures)
			VET graduates' access to employment and self-employment rates compared to national youth figures
			Decent work agenda implemented
			Economic policies that encourage entrepreneurship
			Norms, rules, and resources facilitating different choices of work

*(continued)*

**Table 1** (continued)

Dimensions of VET capabilities and valued functionings that matter to FET college students in South Africa (Powell (2014))	Valued functionings	Dimensions of VET capabilities	Valued functionings for graduates	Valued functionings for policymakers (VET-related policies and measures)	
		care by choice; unpaid work (home caring, voluntary)	Skills enabling a variety of work modes		
		Economic resources for poverty reduction and well-being	Generate income to support family –poverty reduction Own income for independent choices and well-being		Access to finance and income generating activities Social protection system
Active citizenship	Inclusion in political and institutional decision-making	Active citizenship (Power With)	Enable creation of new family	Inclusive citizenship	
			Gain increased respect within own community		
	Strong sense of their own effective agency		Become a resource for own community		
			Knowledge and understanding of the problems of their community Participate in public life Organize in social group memberships, unions, chambers		

Confidence and personal empowerment	Being encouraged to live a full life	Confidence and personal empowerment (Power Within – sense of agency)	Gain confidence in technical and financial skills and know-how	Social skills and communication skills among employed and non-employed graduates
	Being able to encourage others to live a full life		Gain self-confidence in abilities and self	
	Having a range of futures as possible aspirations		Improve communication skills Having a range of futures as possible aspirations	
Bodily integrity	Being free from attack and physical harm, including sexual assault, and from the fear thereof	Bodily integrity	Being free from attack and all sorts of violence and from fear and psychological effects	Combating violence against women and the marginalized
	Being safe from the psychological trauma of attack on your person or other members of the family or community or anyone else		Being free from violence and collective acts against their communities Being able to have free mobility to education, training, work, and services	
Senses and imagination	Developing an understanding and love of the creative arts	Senses and imagination: developing creativity	VET develops artistic talents	Promoting creativity
	Participating in and enjoying in sport that promotes physical wellbeing		Appreciation for VET for developing creativity	
			Appreciation for VET for being practical oriented	

(continued)

**Table 1** (continued)

Dimensions of VET capabilities and valued functionings that matter to FET college students in South Africa (Powell (2014))		Dimensions of VET capabilities and valued functionings that matter to VET students in Palestine, with a focus on gender and inequalities (Hilal (2018))	
Dimensions of VET capabilities and Recognition and respect	Valued functionings	Dimensions of VET capabilities	Valued functionings for graduates
	Being treated as a dignified human being	Recognition and respect	Being treated as a dignified human being
	Having self-respect Not being discriminated against for being a VET graduate Not being discriminated against for any reason including religion, gender, race, physical handicaps, and age		Having self-respect To respect the choice of selecting VET Community recognition – steadfastness and identity recognition
			Valued functionings for policymakers (VET-related policies and measures) Access to VET for all regardless of gender, physical handicaps, religion, marital status and age, or being a victim of status (political prisoner, refugees, IDP) Facilitating positive attitudes of learners and communities to VET

Upgrade skills and qualifications throughout the life course	To have the opportunity to study and learn throughout their lifetime	Upgrade skills and qualifications throughout the life course	To have the opportunity to study and learn throughout their lifetime	Access of VET graduates to further education and lifelong learning
	Having the learning skills required for further study	Having the learning skills required for further study	Having the learning skills required for further study or continual upgrading	
Occupational knowledge	Having the qualifications needed for entry into the labor market	Enabled transition to WOW through awareness, preparation, and connections for all	Occupational knowledge and skills for employment	Youth transition period to employment is minimized
	Having the skills to do a good job		Occupational knowledge and skills for self-employment	Encouraging social partnerships and WBL modes
	Having the learning skills that allow for experiential learning in workplace		Awareness and preparation for the WOW Connection to employers and work-related actors	

Graduates were also expecting that VET would provide them with better status and a certificate (85.2% and 95.4%, respectively). This is surely connected to the disempowerment of youth and marginalization, as well as to aspirations to acquire a better status and to overcome their intersectional and multilayered inequalities.

Their aspirations included self-awareness and assertiveness, as well as social engagement, in addition to gaining skills to continue their education. These aspirations are illustrated in the figure above. They varied according to the variables of marginalization (gender, refugee's status, marginalized localities).

Graduates living in context-related vulnerable localities had the highest aspiration with regard to employment, and more females had expectations with regard to employment than males. While the desire to generate income was high among all groups, it was highest for those living adjacent to the wall/seam zone and in Jerusalem inside the wall.

The coming parts will illustrate achieved functionings with regard to work, income, and transition to the world of work, including technical skills, as well as personal skills for empowerment and community interaction, and "achieved aspirations," as perceived by the graduates.

### **Capability 1: Economic Opportunities that Matter**

Findings indicate that most of the graduates have participated in the labor market and most of them have achieved their aspiration of employment (see Fig. 2). Moreover, the Labour Force Participation Rate (LFPR) was much higher than the overall national figures and national youth figures within the same age group, while the proportion of VET graduates outside the labor force was much lower, indicating the enabling access of VET to employment.

Findings have also indicated that the expansion in the achievement of employment opportunities was considered significant for gender and marginalized groups, in specific the context-related marginalized localities.

Although achievements were higher than national figures for the marginalized, the gaps in achievement imply *inequalities in capabilities* as noted by Robeyns (2003, p.85). Some of the female graduates who were unemployed have indicated the social-related obstacles to their employment presented through social attitude towards their role and abilities.

Moreover, obstacles to achievements were also noted due to obstacles related to decent work agenda (specifically low pay, long hours, other work regulations, and conditions), according to ILO (2012) indicators. Obstacles were also due to the context-related accessibility issue.

### **Capability 2: Domestic Work and Nonmarket Care by Choice**

The survey results indicate that over one in four VET graduates were involved in voluntary work and around one in three graduates in housekeeping/domestic work,

with a higher involvement of those outside the labor force indicating that graduates are productive even if they were not participating in the official formal labor force.

Overall, three out of four of the VET graduates were outside the labor force and actually working in nonmarket work. Results varied according to gender, since most of the graduates involved in voluntary work were male (91% to 9% females) and most of those involved in housekeeping and domestic work were female (77.5% to 22.5% males).

As a sum-up, results indicate that VET enabled market and nonmarket work through skills gained, yet social barriers and choice limitation upon females restricted the realization of their capabilities. Therefore, almost all VET graduates (97.4%) are actively engaged in work and sometimes in multiple paid and/or unpaid work.

### **Capability 3: Economic Resources for Poverty Reduction and Well-Being**

Sen (1998) emphasized that enlarging a person's "functionings and capabilities to function" is an essential element in human development and for expanding people's economic, social, and political choices. Emphasizing the use of resources such as income, clothes, food, or other goods to achieve the valued functionings and hence well-being. In our case, the poor and disempowered youth are longing for income to contribute to alleviating their families' poverty, to pursue their own life, and to achieve their plans and aspirations such as starting a new family or starting a new business. Hence, income is not an end but rather a means to achieve the other valued functionings. Resources are added following the feminist economists' discourse.

With regard to achievement, results indicated that over half of the graduates are *contributing to their family income* (two out of three male graduates and almost one out of three of female graduates), which in turn contributed (in addition to other factors) to improved financial status of one in two of the households and sustained financial status for 44% of them.

This finding is important within the context of the impoverishment of the Palestinian people due to the prolonged military occupation. The negative effect of such a context was highly apparent in the lowered contribution of graduates who are marginalized by these context-related factors and limited to family income and in their abilities to reduce poverty.

Another important finding indicated that one fifth of the *VET graduates were able to start new families* upon graduation. More important is the fact that most of the male VET graduates were able to support their new families and almost one in three female graduates were able to contribute to their newly started families, although their contribution was lower.

This functioning is part of the opportunities VET provides and reinforces the argument that poverty is not simply about income but includes *access to economic*

*resources*. Many VET graduates were able to generate resources for poverty reduction, by utilizing their skills to produce items for home use, minimizing the household cost of living, and increasing its resources.

### **Capability 4: Active Citizenship**

Active citizenship is identified by Powell (2014) as linked with inclusion in decision-making, a sense of agency, and the mobilization of resources for change. Here I draw on the concepts of the empowerment and the achievements of graduates in these areas to identify the capability of active citizenship. The empowerment framework is used to define active citizenship through “Power-With” indicators. The graph below illustrates the achievements of graduates of active citizenship due to VET and work.

Results indicate the importance of VET as a route to status and a way to gain respect from the community. This was expressed by the graduates; they specified the use of skills gained and work and income as a means to increase respect and being a resource for their community. Robeyns has also included respect as a main capability on her list; she defined it as *to be treated with dignity* (Robeyns 2003, p.71).

Participation in public life was also achieved by graduates. It was more important for male and female youths in marginalized localities, as percentages reached 87% in marginalized localities, with a 19% difference to the remaining West-Bank areas. This result is reasonable within the context of these localities, since space is squeezed by the occupation measures and people are confined within their own space.

Participation in public action was higher among youths in marginalized localities, especially those near the wall, as there are community actions to protect their existence.

### **Capability 5: Confidence and Personal Empowerment (Power Within)**

**The Power Within – Sense of Agency:** Confidence and personal empowerment encompasses one of the main empowerment elements. This definition departs from Powell’s (2014) definition, as it is linked in this capability list of VET to Kabeer’s (1999) empowerment framework where the “Power Within” is defined as “their sense of agency” (Kabeer 1999). Kabeer sees agency as “more than observable action as it also encompasses the meaning, motivation and purpose which individuals bring to their activity, their sense of agency, or “the Power Within” (p.438).

The results indicate that 80% of the students had developed their “Sense of Agency” or “Power Within” or developed their inner power as a result of their experiences in VET. They developed more confidence in skills and know-how, in

abilities and own-self, followed by communication skills, and, to a lesser degree, in financial capacities, as the graph below indicates.

The achieved agency was higher for females, those living in marginalized localities, specifically in Gaza and adjacent to the wall, and for refugees. This reveals the positive effect of VET on those who had lost their resources due to their context, with VET providing them with new resources through which they could achieve paid and unpaid work and income generation (Further discussion of these empowerments (Power Within and Power With) within the overall empowerment framework is presented in my thesis (2018) and my paper (2017).) as well as have greater confidence (Fig. 5).

**Having a Range of Futures as Possible Aspirations:** Graduates indicated a range of options, including continuing their education, work, work and continued education, have their own work, work from home, being self-employed, volunteering, doing unpaid caring and housework, or alternating between paid and unpaid work.

### Capability 6: Bodily Integrity, Safety, and Mobility

In the Palestinian context, bodily integrity, safety, and mobility are interrelated, following Nussbaum (2003) and Robeyns (2003).

Palestinian male and female youth are facing various forms of violence as a result of the military occupation, and as noted by the World Bank (2010) report on gender dimensions:

The violence resulting from the occupation has led to loss of life, land, property, and free movement of people, and has fragmented social space, a key source of material and moral support especially for women. (p.13)

**Fig. 5** Percentages of VET graduates in agreement or high agreement to “Power Within” indicators due to VET and work

Shalhoub-Kevorkian (2008) has noted the effect of violence on girls and women commuting to education; she noted:

The results show that the covert and overt acts of political violence against Palestinians has transformed Palestinian gender relations in complex, contradictory, and diverse ways while both militarising and violating their right to education. (p.179)

UNICEF (2016) has documented that the children are subjected to violence when attempting to reach their schools within the marginalized localities. Attacks against communities in the form of closures, siege, isolation, curfews, zoning, etc. also violate the right to move freely and subject all members of the community to various sorts of violence and violations.

The PCBS (2012) National Violence Survey in the Palestinian Society indicated that half of Palestinian families were subjected to direct violence from the occupation or settlers during the period preceding the survey. Domestic violence is also high in the community due to various factors including the effect of the military occupation (PCBS 2012) or, as Abdo-Zubi (2006) put it the “external and internal,” the “militarisation and internal patriarchy.”

Hence, all these young males and females would value having their bodily integrity, being protected from violence, free from fear and violence, and with the ability to move and commute to their VET institutes or work freely.

## **Capability 7: Senses and Imagination – Developing Creativity**

The practically oriented vocational training promotes physical well-being; VET learners have indicated enjoyment of the practically oriented VET.

Moreover, most of the VET graduates that had positive attitudes indicated that “VET provides opportunities for creativity” (82%). Teachers and counsellors in various VET institutes mentioned the artistic sense or talents of students enrolling in certain related vocations, such as beautician and ceramics. In this sense, VET training helped them develop their appreciation for arts and related skills. Creativity and innovation as an outcome of TVET is emphasized by the Palestinian TVET strategy (MOEHE and MOL 2010, p.6).

## **Capability 8: Recognition and Respect**

**Being Treated as a Dignified Human Being, Having Self-Respect, and Not Being Discriminated Against:** To be treated with respect, dignity, and without discrimination came out from various interviews and discussions with students, communities, parents, and teachers, often in terms of granting graduates’ rights in the labor market. Female students added granting equality in the household and the community.

**Better Status to Achieve Equality:** Significantly, most VET graduates (85%) indicated that they aspired to a VET that would provide them with a “Better Status” and (95%) aspired to receive a certificate. These results were largely similar between the groups, indicating that the role of VET aspired to by the graduates was to provide a certificate and a status in a Palestinian community that provides a lot of respect for education and certificates.

**To Respect My Choice of Selecting VET:** This was also part of the discussions that came out from students and graduates, as noted by a female graduate:

We need to show how much we work and tire ourselves; we need to show that we love our vocation to our families to get their respect towards our choice, plans and accomplishment.

**Community Recognition – Steadfastness and Identity Recognition:** Community recognition came out clearly in the Palestinian case and the marginalized localities. This was noted for localities of East Jerusalem inside the wall, where the presence of Palestinians and the Palestinian economy is threatened and localities are shrinking year after year, as noted in the context.

### **Capability 9: Upgrade Skills and Qualifications Throughout the Life Course, Including Continued Education and Continued Upgrading**

The ability of students to continue their education and to have enabling skills for lifelong learning challenged the negative perception by some of the traditional educationalists and some parts of the community that VET is a dead end. As noted through many interviews and discussions, continuing education is challenged by policies, resources, and attitudes. Almost one in four graduates who were outside the labor force were continuing their education during the survey period, that is, 4 years after graduation. Moreover, most of the VET graduates with a positive attitude toward VET (84%) think that “VET provides opportunities for self-development.”

### **Capability 10: Enabled Transition to WOW Through Awareness, Preparation, and Connections**

This capability resembles Powell’s (2014) eighth capability (Occupational Knowledge) with a marginalization lens. The suggested capability adds other relevant resources to “occupational knowledge” for the poor and marginalized for entry into the labor market. It includes linkages to the labor market that enhance connections for the poor and the marginalized as an important resource for entering the world of work. The capability was also rephrased to reflect the need of the marginalized youth for the quick transition into the world of work, in line with international VET literature and recent UNESCO policies.

**Having the Occupational Qualifications for Entry into the Labor Market:** Most graduates (81.3%) expressed “To gain skills that enable me to work” as one of the reasons for joining VET, indicating how graduates perceive of VET as a tool for enabling transitions to the workplace. Most graduates interviewed were very appreciative of the qualification gained, and most of those employed have acknowledged its effect in helping them to enter the labor market.

**Occupational Knowledge and Experience for Self-Employment or Opening a Business:** Results indicated that 7% of VET graduates are employers compared to the national figure of 6.4% and that for youth of 2.3%. It was part of their aspiration; those that wanted to start their business immediately were more pronounced in marginalized localities with fewer opportunities for employment.

**Awareness and Preparation for Transition to WOW:** More occupational knowledge and skills preparation are needed for the marginalized within a limited opportunity context. “Having the learning skills that allow for experiential learning in the workplace,” as Powell (2014) noted, can be expanded to real-life on-the-job learning through training schemes such as apprenticeship training or work-based learning (WBL).

Some of the graduates had participated in WBL schemes through internships, traineeships, and school-based apprenticeships. WBL provided opportunities for employment for many graduates, as 8.1% found employment in same place of training before graduation. These percentages were doubled for females and higher for those living in marginalized localities.

**Connection to Employers and Work-Related Actors – Connections in Finding Employment:** Results indicated that the most common ways of finding employment for those living in marginalized localities, in specific, those adjacent to the wall or in seam zones, were connections coming through training placements, indicating the importance of connections for the marginalized.

**Transition Period for Employment:** The results indicated that most of the graduates found employment within 1 year of graduation (79%) and 62% within 6 months of graduation. This suggests an easier transition than other Palestinian youth, comparing favorably with national figures (PCBS 2016).

---

## Achieved Aspirations and Empowerment

The aspirations expressed by graduates have been listed already as having achieved functionings. This section will examine the achievement of these aspirations as assessed by the graduates themselves. The achievement of aspirations is linked with achieved functionings and empowerment and is a measure of the graduates’ satisfaction with their accomplishments in regard to achievements, well-being, and empowerment.

Graduates’ assessment of their achievement reflected the change achieved in their lives based on their aspirations. Whereas some have fully achieved their aspirations,

**Fig. 6** VET graduates achieved aspirations

others had achieved them partially and are still working to achieve them, while a few did not achieve their aspirations. Graduates noted the structural challenges to their achievements (Fig. 6).

Results indicate that only one in ten graduates achieved their aspirations in full. This percentage increased and sometimes more than doubled, when the capabilities of graduates were turned into functionings, or the aspirations were realized in such a way as to lead to poverty reduction and empowerment and, also, when empowerment was achieved. These results show that graduates from marginalized groups are more inclined to perceive that their aspirations have been met which supports Kabeer's (1999) notion about "empowering the disempowered." In short, the effects of VET are more appreciated by those who were previously disempowered.

**Structural Challenges:** Structural challenges presented an important obstacle to the achievement of functionings, capabilities, and aspirations. The main structural challenges for graduates include mobility, social restrictions, economic restrictions, and others. Part of these challenges is related to the increasing effects of the military occupation, in specific the mobility and the part of the economic restrictions to employment, income, and economic opportunities, while others are related to the decent work agenda. Social restrictions are mainly related to the patriarchal nature of the society and to family responsibilities.

**Achievement of Aspiration Over Time:** A comparison of the results of two of the institutes with same institutes' graduates surveyed in 2011 (Hilal 2012) indicated a decline in achievement of aspiration. These results reflect the increased structural barriers and obstacles faced due to the occupational measures and their effect on the overall context during those years.

---

## **Conclusions: VET Contributed to Human Development and Reducing Inequality**

The research findings have indicated that within "a protracted protection crisis" context governed by military occupation and human rights violations, VET is attracting different marginalized individuals, groups, and communities and enabling them to realize some of their functionings and aspirations.

Within such context, graduates were able to express their aspiration to achieve part of their capabilities and functionings according to their aspiration. The results

indicated that the actual achievement of functionings aspired to by the graduates such as employment and income generations increased their self-assessment of achieved aspirations.

Results have also indicated that when empowerment was gained, this increased the achieved aspirations. Achieved aspirations increased due to marginalization variables. This difference could also be explained through Kabeer's (1999) notion of "empowering the disempowered" and hence the personal comparable achievement. As such, highlighting the importance of empowerment measure for the marginalized is borrowed here from GAD theory.

As such the chapter has clearly noted the contribution of VET to human development and to reducing inequality and marginalization through achievement of VET learners' functionings and empowerment.

The chapter has presented the *VET capability list* (which is part of my doctoral work) (Hilal 2018) that is based on Powell (2014) VET capability list, with the inclusion of the marginalization element. The developed capability list (*Powell 2014/Hilal 2018*) could be used as a tool for monitoring and evaluation of VET's contribution to human development.

Finally, the chapter has presented the contribution of VET to human development in a marginalized context, thus adding to the ongoing discourse materialized through the call of McGrath (2012). An added contribution is that it presents a new theoretical framework that includes GAD and political economy within the capability approach, highlighting the importance of the marginalized lens when tackling VET learners and the importance of increased accountability to ensure learners' achievement of their aspiration.

## Abstract

Vocational education and training had been a popular choice for women learners in the English Further Education sector. However, policy makers and policy researchers have characterized these women learners as providing a poor return on investment due to their failure to enter immediate employment. As a result, there have been significant cuts to funding. Such policy processes have not engaged with why these women returned to education and what they stood to gain from participation. This major absence is the focus of this chapter. Framed using a capabilities approach, women learners were asked why they had returned to FE and how they were going to use their knowledge and training. Using capabilities as a lens reveals a nuanced and complex picture of how education helps them to expand their well-being, agency, and freedom achievement.

## Context

English Further Education (FE) colleges have historically offered a variety of vocational (VET) and academic courses to a broad range of learners, including mature adult learners. Until recently adult women learners formed the majority of all learners in the English FE sector; many of these were engaged in VET (Skills Funding Agency 2012). This was primarily due to funding targeted toward reducing social inequality and unemployment. This trend has been reversing since 2009 with stark cuts to adult funding which can largely be attributed to dominant policy discourse for VET which prioritizes human capital approaches that measure the return on public investment (Psacharopoulos 1987). As such, policy research using these narrow values views adult learners by what they are held to lack; this has been more specifically aimed at women who are deemed as failing to meet the employability goals of VET (Jenkins et al. 2003; Jenkins 2006; Blanden et al. 2012). Such an emphasis renders adult learners who do not enter the workforce immediately after training as a “poor return on investment” (Blanden et al. 2012). Yet the voices and experiences of women learners are absent from these accounts, and very little is understood about why women choose to re-engage with vocational education as mature aged learners and what they hope to acquire from doing so.

The voices of women who reenter education at lower vocational levels in the FE sector are relatively scarce (Parr 1996; Wright 2013). They are more prevalent in relation to academic programs such as Access to Higher Education courses (Merrill 2000; West 1996; Waller 2010; Brine and Waller 2004) or basic skills programs (Duckworth 2014; Biesta et al. 2011). Arguably, this reflects the low status of FE and VET within the English education sector, coupled with dwindling learner numbers of mature aged students. Women learners are often framed in the empirical research as struggling to navigate the structural constraints within education (Brine and Waller 2004; Waller 2010; Reay et al. 2002) or within the home (Parr 2000; Merrill 2005; Gouthro 2005; Daniels 2010). Although such barriers are highly relevant for understanding the experiences of women learners, little consideration is given to how (and if) women use their agency to achieve their aspirations. Furthermore, the absence of women learners’ voice in the VET and FE sector renders them invisible in policy debates that need to go beyond employability measures. This chapter outlines how using a capabilities lens to consider learner aspirations offers a more nuanced understanding.

There is a growing body of empirical and theoretical literature in education which utilizes human capabilities approaches (CA) to evaluate inequalities (Walker 2003; Unterhalter 2007, 2012; DeJaeghere 2016). In the VET context, capabilities have been emerging as an alternative discourse to human capital approaches for skills development where learner voice is central (Powell 2012, 2014; McGrath and Powell 2015; Lopez-Fogues 2012, 2016). Capabilities can best be described as an ethical person-centered approach for evaluating inequalities, which prioritizes “human flourishing” (Sen 1999). The central tenets of capabilities are individual well-being, freedom, and the freedom to shape their own development. In the context of VET, capabilities show promise methodologically for empirical work

where learner voice is lacking and for considering learners as empowered agents of their own education (McGrath and Powell 2012; Lopez-Fogues 2016; Tikly 2012). Using narratives from adult learners in the English VET sector, this chapter draws on the capabilities approach to consider learner aspirations and critically evaluate to what extent they are realizable in the current policy context.

---

## Theoretical Framework Underpinning This Research

Thus far I have briefly discussed the context and critically considered how the literature informs the central research questions. I will now outline what CA has to offer as a theoretical frame. The capabilities approach is an evaluative framework for social justice and equality that goes beyond some of the narrow economic policy measures highlighted earlier. Even though Sen is careful to acknowledge the importance of economic security, he stresses that capabilities approaches offer a broader framework than instrumental outcomes alone; rather, they value the multi-dimensional and complex nature of individual lives (“[Vocational Education and Training Beyond Human Capital: A Capability Approach](#)” by Bonvin, this volume). Essentially the individual voice is at the heart of its enquiry which seeks to understand what “they have reason to value” and in the process highlights the dissonance between their goals and those held by policy makers. Central to the CA are *capabilities (or the capability set)* which broadly represents what an individual is able to do or be (Sen 2005: 153) from a range of options. Underpinning the capabilities approach are individual aspirations which are the goals or the future they imagine for themselves. Aspirations will be discussed later, but women learners who choose to return to education have vocational, economic, personal, social, and family goals in mind. Realizing such aspirations (and in the process developing their capability set) in education is contingent on the degree of agency an individual has and how they use it, along with the freedom to live the life *they* have reason to value.

The capability approach is particularly suited to this enquiry as it is underpinned by a feminist epistemology. It seeks to challenge inequalities that affect women’s lives by focusing on the complexity and multidimensional nature of women’s lived experiences (Sen 1999; Alkire 2002; Robeyns 2005; Nussbaum 2011; by Hilal, this volume). Although Nussbaum has insisted that a prescribed “capabilities list” is necessary to determine the basics of “a good life” for women, the justification that Sen gives for refraining from using such a list in favor of determining “capabilities” within the context is more appropriate for this research. This is complementary to other feminist research approaches where women’s voices are not only central, but there is a general avoidance of imposing too much structure onto the research (Smith 1987; Reinhartz 1992; Harding 1998;). Capabilities approaches are closely aligned to the thinking of feminist economists who insist that dominant masculine approaches to economics render the important caring and domestic work that women do invisible (Donath 2000). Despite progress toward gender equality in the west, it is important to raise the issue that women still bear the burden of the caring

responsibilities; consequently this impacts on their freedom to live the life they choose (Nussbaum 2000: 146). This is important because a lack of freedom and agency is compounded by women's economic dependence which affects the opportunities they have to leave unhappy relationships (Sen 1999). Education is one way that "active agency" can be achieved by women, giving them alternative choices and the opportunity to become economically independent or increase earning power and thus giving "positive force to women's voice and agency through independence and empowerment" (Sen 1999: 191). Moreover, education is critical for promoting other capabilities or what has been termed a "fertile functioning" (Wolff and De-Shalit 2007 cited in Nussbaum 2011). The CA focuses on the life that an individual has reason to value which emphasizes the social injustices and inequalities they experience. Furthermore, because their individual voice is central, it challenges the ways that policy goals are inscribed upon them, thus treating them as a homogenous group. Using the capabilities approach to frame the narratives in this study enables an ethical, person-centered, agential, and nuanced account of what women learners gain from their studies.

---

## The Study

Thus far, I have focused on contextualizing the research and how capabilities could contribute to our understanding of women learners' aspirations. Now, a brief outline of the study follows. The voices and experiences of women learners from the empirical research are central to this chapter; 21 women generously shared their reflections about their life history, educational journeys, and the chosen course of study. The women featured in this chapter were aged over 25 years old (Students aged 25 are classified as "adult learners" by the funding body and have specific funding arrangements.) and on full-time vocational or prevocational courses of study in Further Education colleges in England. The sample was diverse, representing different educational backgrounds, social class, race, ethnicity, religious beliefs, marital status, socioeconomic status, and sexual orientation. Adult women learners came from a wide range of geographical locations which gave some insight into how local context impacts learning experiences, employment, and gendered traditions. Learners were studying on full-time programs leading to specific vocational outcomes (such as hairdressing, nursing, teaching assistant, administration, social care, beauty therapy, or animal management) or on prevocational ESOL (English language skills alongside vocational taster courses).

Life history narrative interviews along with life grids were used (Abbas et al. 2013). This approach facilitated a rich understanding of learners' educational biographies, why they had returned to education and their aspirations. In particular the interviews focused on the extent to which learners were able to use their freedom and agency to achieve their aspirations and how these developed over time. Interviews were conducted with learners at the start and end of their course; some learners agreed to be followed up after their courses also. Meeting with learners over time

enabled them to engage in a reflective dialectic about their educational biographies, developing a greater appreciation of what they had achieved in life.

---

## Research Findings and Discussion

Earlier, I gave a brief outline of the concepts of the capabilities approach. The remainder of the chapter will focus specifically on learners' aspirations, well-being, and freedom. Although these constructs are discussed separately, they must be viewed as interrelated.

---

### Learner Aspirations

Learners were asked to discuss their aspirations and what they had valued about their VET course in addition to gaining new qualifications. Aspirations are key to the capabilities approach as they relate directly to the extent individuals can use their agency and freedom to imagine a better life (Sen 1999; DeJaeghere 2016 and Hart 2012) or are able read "a map of a journey into the future" (Appadurai 2004: 76). Hart describes it as the conscious and unconscious motivations that are indicative of individual or group commitment toward an end point (2016: 326). A functioning aspiration can be viewed as the freedom to aspire and the capability to achieve from a range of options (Hart 2016). Even though educational aspirations reflect an individual's present and future goals, these are not formed in isolation but in the thick of social life with the needs of self and others in mind (Appadurai 2004; Hart 2012, 2016). Unlike the empirical research by Hart (2012) on youth aspirations, the aspirations of adult women learners have not received such attention, as promoting their ongoing educational attainment is likely to be of less policy interest. Aspirations are particularly important to consider though in relation to this research as they "act as signifiers of what has meaning and value for us" (Hart 2016: 336).

Accounts of how aspirations are formed in relation to education are epistemologically and ontologically complex. Even though Hart acknowledges that they are "future orientated, multidimensional and dynamic" in relation to the social context, her typologies suggest a binary approach where aspirations are described as true or adapted (individual or collective). Although DeJaeghere is in agreement with Hart that aspirations are dynamic and future oriented, she is critical of Hart's typologies claiming that aspirations operate at a more complex level where: "aspirations and agency creates an ongoing dialectic between structures that constrain and potential openings" (2016: 12). Furthermore, drawing on her longitudinal empirical work on young women's educational aspirations in Tanzania, she highlights how agency and aspiration are determined in relation to gendered constraints which in turn make trajectories more fluid than Hart suggests. Also, she rejects the notion that culture acts as an inhibitor for change for women arguing that gendered norms are dynamically changing and women (in the Tanzanian context) are becoming more agential in their own lives. By foregrounding women's agency and aspirations in this way, we

gain a nuanced understanding of how women challenge structural constraints to live the life they have reason to value. The learner biographies and narratives suggest that women's aspirations grow out of a sense of deep dissatisfaction with their lives which many described as a turning point. Even though goals for their future directed learners' investment in their present educational trajectory, their past educational and employment experiences were significant in their present and future aspirations.

Learners' initial aspirations often mirrored policy goals of gaining vocational qualifications and going into more highly paid employment. This was particularly evident when speaking to women where the vocational opportunities were highly specific such as in teaching, nursing, hairdressing, and beauty therapy.

Rosa spoke about how she had worked in youth work and social care but had always wanted to be a nurse. Currently working in the social-care sector, she aspires to achieve more for herself, her family, and her community. She is very focused on training as a means to gaining the qualification outcome, explaining:

Nursing is my heart's desire, to be a nurse. . . . I want to get this qualification so I can do a nursing degree

Similarly, Precious is driven by achieving her vocational aspirations – in her case she is not looking to gain higher qualifications; she just wishes to change career direction. Also working in the care sector, she has always wanted to work with children but lacked basic skills as well as the confidence to go back to education. She explains how having improved her basic skills facilitated her entry onto a course for teaching assistants:

I absolutely love children, it is something I have always wanted to do. I will get this qualification even though it is hard for me [language wise] and work in a school hopefully next year

Achieving the qualification aim is directly related to improving the capability set which is a tangible measurable outcome. Yet learners' educational aspirations were broader and more complex than those of policy makers and funding bodies; rather, women used their agency to overcome personal difficulties such as gaining freedom from poverty, oppression, and abuse. This was not only a priority for themselves but their families too.

Emma explains how she:

. . . wanted to be a dog trainer, something I am good at and they do the course here – they don't do it at many places. That has been really important. It will give me the freedom to move away, support myself and my daughter financially

Similarly, Safina expresses her deep gratitude saying:

I was lucky to get a place here at this college, I mean I came here with no qualifications really. I wanted to be a hairdresser. This will help me towards my dream of opening up a little salon with my daughters and granddaughters

While such aspirations are crucial for freedom and well-being, they are invisible in human capital policy critiques that focus on employability, qualification outcomes, and economic independence. Aspirations in these examples are driven by a desperate need to live a better life than they have been.

As discussed earlier, aspirations for many were synonymous with the program choices that were available. Women learners describe that they had unconsciously chosen courses based on what the local offer was, which FE college they preferred, travel time, cost, course hours, and how they could integrate this into their personal lives. Frequently course choice did not always compliment their overarching goals, but they had taken a “best fit” approach – this reflects the very complex needs of adult women learners who are juggling work, relationships, financial hardship, and child care. Moreover, learners reflected how a lack of qualifications from their compulsory schooling had formed part of their decisions to join specific courses at colleges where they felt they could *fit in* better with the academic aspects of the course.

Chloe selected her course based on the college she felt most comfortable to attend having been on some short courses at the college as part of her recovery from chronic mental health problems. Although she hadn't reflected on the course offer, she said:

I don't know whether I would have chosen this course if I hadn't wanted to come here. I want to be a counsellor or psychotherapist eventually. They do those kind of courses at other [FE] colleges, but I came here because I felt comfortable . . . . I was still very fragile after my divorce and the mental abuse that I had suffered and wouldn't have had the confidence to do it. It might have affected my university offers but I figure some offer is better than no offer at the end of the day

Whereas Kathleen had aspired to do the same course at a different college, she describes how:

. . . . The practicalities of getting my daughter to school or nursery makes this one much closer to go to and that is important. Plus I don't think they would have been so helpful with my grammar and spelling! My lack of qualifications as I missed a lot of school, means that I am probably better off here

These vignettes emphasize how gendered inequalities affect women's freedom and agency to choose their educational trajectory, without being hindered by gendered norms, caring responsibilities, poverty, and oppression.

It became evident that aspirations change over the duration of the VET programs. Occasionally learners chose to pursue a different path on completion of their course than they originally planned or completed more courses to improve their capability set.

Emma's goal of becoming a dog trainer expanded as she realized:

I could be so much more successful if I went into higher education, my options would be greater – I could go into management. I am really pleased I have been accepted onto the Degree in Animal Management here

Women learners often start out with tangible goals and fairly clear ideas of their trajectory (into further education or employment), but this can change as opportunities to study further or in new areas open up. Learners reflect that while they value increasing their chances of employment or gaining a new career, this is only a small part of what they gain, placing more value on expanding the intrinsic personal gains and assert how this has helped them to broaden their capability set.

If in Appadurai's words the "capacity to aspire is being able to read a map of how to get there" (Appadurai 2004), then what support was available to learners to help them achieve their aspirations? Even though women learners could discuss their aspirations at length, some were unaware of exactly which path they needed to take in order to reach their goals. There was a lack of pre-course information in some areas meaning that some learners were unaware that they did not have the crucial entry requirements to progress onto further programs of study. The students who were most clear of the routes that they had to take were those doing vocational courses which gave them access to medical degrees, hairdressing, or beauty therapy. Yet for learners on other courses, achieving their aspirations had been hampered by confusion about what their options were for further education and employment.

Jane joined the advanced teaching assistant's course, but she had not realized how important it was to have maths at GCSE if she were to gain a job. Reflecting:

I wished I had known this before starting the course, it is going to mean I will take longer to get into the workplace. I'm doing it [maths] now but if I fail it could take me another year. . .

Not only did learners suffer a lack of pre-course advice about essential qualifications, they were often unaware of qualification progression routes until the end of their course. Jane noted:

we got to the end of the year and then they told us about an advanced foundation degree and I am confused which route to take I thought all I needed was this qualification?

This lack of clarity about routes into vocations was a common theme, particularly for migrant learners who found navigating the English VET system difficult. This was exacerbated by the lack of availability of English (ESOL) courses which are a prerequisite to vocational programs at FE colleges and universities. They struggle to gain essential advice that will help them to achieve their high aspirations; instead they settle for whatever work gives them the most security and sometimes, in the process, sacrificing their personal goals.

Soha, a migrant from Pakistan, had been learning English and completing a teaching assistants' qualification. She already held a teaching degree from Pakistan but explained:

I have had to start from the bottom, it is difficult – as well as not having good English my degree isn't recognised here. I thought it better to work as a teaching assistant and still be in school than to spend years getting a new qualification. This will give me time to look after my children around work too

Aspirations were frequently narrow and oriented toward working within a particular vocation without necessarily considering long-term career progression and employment opportunities. However, the route toward achieving these aspirations was not always straightforward for a number of reasons. These vignettes emphasize the extent to which women's agency and freedom impact upon their aspirations where their capabilities can be limited or expanded. Some learners' aspirations grew resulting in them becoming more agential in their own lives; this was evident in the ways they spoke of wanting more for themselves and being prepared to work longer to achieve this. Yet all too frequently, women learners were not always aware prior to enrolling on a course and the pathway toward achieving their full aspirations. This resulted in learners taking longer to achieve their end goal or lowering their aspirations; this was particularly the case for migrant learners. Importantly though, in the most part women's aspirations were formed not only in relation to fulfilling self-interests but taking into account those of significant others. While at the heart of individual aspirations is achieving personal goals for women learners, they are contingent on factors such as time, location of course, finance, and the impact on dependents. This for many involves choosing the "best option" which is not always the most appropriate for achieving their highest aspiration. Sadly many of these women have sacrificed their education and career to meet the practical needs of others their whole life.

---

## Freedom to Do or Freedom From

Freedoms are a central tenet of the CA, which in essence represents the opportunities a person has to live the life they have reason to value. Freedoms or non-freedoms existed in all sorts of ways for the learners in this research and could be traced back through their biographies. They can be thought of as those impacted on by the private sphere (domestic, marital arrangements, finance, and as a child) and those within the public sphere (social economic and political freedoms). Freedoms represent the real choices that are available to an individual (opportunity aspect) and how individuals (are able to) use that agency and choice (process aspect). In addition, Sen goes on to define political, social, and economic freedoms as "instrumental freedoms" (1999: 38), which are highly relevant to this topic as it directly contributes to the extent a person has to achieve well-being and agency achievement or to live the good life.

The degree of freedom and therefore agency that women have in the private sphere can have a dramatic effect on the life that they are able to live (Sen 1999; Nussbaum 2011), particularly having the freedom to expand capabilities through education. Even in the west where significant progress has been made toward gender equality, multiple non-freedoms within the private sphere continue to thwart women's opportunities. The freedoms of women learners in this study were frequently hampered by bearing the burden of caring and domestic responsibilities; poverty; lack of opportunity; low education; and oppressive relationships. For some, this had affected their formative years in education resulting in educational

biographies that some women described as disappointing. In their youth, many were “young carers” before adulthood, characterized by being partly or fully responsible for domestic and caring duties. This often meant missing out on compulsory schooling or leaving education altogether. Some women reflected on this as a necessary sacrifice, one which was made for the good of the family – sometimes this was done willingly, but not always.

Kathleen missed school for long periods of time as her family belonged to a traveling community. She describes how she missed school:

Because they [her parents] drove us around, they saw education as nothing to them. We went to school when we could but it was never important to us, to be honest

As an adult, now living in the settled community bringing up her daughter alone, Kathleen has valued the freedom of being able to re-engage with education and gain qualifications in hairdressing which she never imagined would be possible. It is important for Kathleen that these qualifications expand her freedom and opportunity to work within a skilled trade.

Safina also missed much of her secondary education, failing her GCSEs (secondary education), because she was required to look after her family:

my mum was not well, coming from a big family, being the second eldest and a girl I had to forget what was happening [at school] and just help out with the house and cooking an everything. . . Then at thirteen my mum came home and said I was engaged, I could not have said yes or no. So I just had to follow that

Fractured family relationships and divorce affected educational freedom in childhood. Emma explains how she carried the burden of domestic responsibilities as her father was depressed and this impacted on her freedom to make friendships:

He was heavily depressed when we came back from the US, so he didn't do much work and that. I had to cook all the time. I didn't have much of a life when I was in high school. I think this made it difficult for me to maintain friendships and I was bullied a lot

In families the burden of educational sacrifices was frequently placed on daughters leaving their male siblings free to complete their education and subsequently gain economic freedom. This was not a culturally specific phenomenon but one that affected a variety of class, race, and ethnicities. This is not to suggest that women should not care for their family or a criticism of cultural norms; rather, these are the reflections of women learners about their own freedoms to learn in adulthood.

Upon reaching adulthood freedom in the private sphere was closely associated with intimate relationships, caring responsibilities, and their economic independence. Women shared stories of living in high-risk situations where domestic violence, suffering emotional abuse, and partners who were involved in criminality were the norm. This was often exacerbated by substance or alcohol addiction, mental health problems, and poverty. This affected the freedom of women with children the most substantially, as they spoke of the added responsibility of caring for and protecting

children in stressful circumstances. Lack of economic freedom due to caring responsibilities, lack of child-care support, unemployment, or low-paid employment combined to have a significant negative impact on women's freedom to engage in education. These issues are complex; some women cited violence, oppression, and fear in the private sphere as reasons for not pursuing their educational aspirations sooner, whereas others explain how education offered a means of gaining freedom from the abuse.

Amy shares how she tried a number of times to re-engage with education so that she could realize her aspiration of working with children in a nursery but:

I had to leave my child-care course [when I was younger] because I was in a violent relationship. ... Unfortunately when I met someone else, I went back to college and was in a violent relationship again! He would always tell me I would make nothing of myself. So I thought not only will I show you [I can do it] I will prove it to myself and I did

Amy considered herself fortunate as she had the support of her family, who were able to help her with child care to facilitate her return to college and offer support with temporary housing during her separation.

Emma was motivated by a combination of wanting to escape from her ex-partner who was in prison and gain better employment opportunities that prompted her return to college:

My daughter's dad is a lunatic. . . I didn't realise until I was having her, so I left him when she was six months old. He is violent and has been in jail ever since. I did lots of jobs that were really demanding and poorly paid. He is coming out [of jail] soon. I want to move to another country [with our daughter] so we are safe. . . . There are opportunities for me in this line of work internationally and that makes me feel empowered

Targeted state provision of education, welfare, health-care, social-care, and child-care support can provide opportunities for women to expand their capabilities. The extent to which women are supported by these *instrumental freedoms* in the public sphere was linked to the freedom that women experienced in the private sphere. The women in this study shared how they had utilized opportunities or instrumental freedoms provided by the state to return to education with a view to gaining freedom from negative oppression (negative freedom). Specialist support and funding from the state made it easier for women like Chloe who had wanted to come back to college for some time, explaining:

I started to have ideas that I could do what I had thought about doing years and years ago. But I put it on hold for the family. Because the relationship at the time was quite a controlling relationship, [this] obviously made my anxiety and depression a lot worse. So when I was able to come into the level 2, for two nights a week I was able to get away from my husband and children and it gave me the opportunity to reflect on how things were at home. Once my confidence was built I became stronger and I was able to leave that relationship. I got stronger thanks to the college

Even when women use their agency to return to education, they often have to juggle low-paid insecure work, full-time study, and precarious child-care support

from family or friends. This was particularly prevalent for migrants who worked in care work on low-paid zero-hour contracts at unsociable times; for many this involved working nights and then coming straight to college/work placement from work. Precious a single parent had migrated to the UK almost 10 years ago and had aspirations of working with children; she enrolled on a course to become a teaching assistant at her local FE college. In order to support herself and her two children, she works night shifts as a carer on a zero hour's contract. She describes the strain that this places on her:

I think it is stressful. Like today I just finished a nightshift at 8.30 am, then I have to come here for 9 am and work again later on a night shift. When I get home tomorrow from work I will go straight to my school placement. Now I have to go home to cook dinner and try to get some sleep

Precious explains that she is desperately seeking freedom in the form of financial security and time to fulfill her parental role in the way she chooses for herself.

Similarly Ana migrated to the UK 3 years ago with her newborn son to live with her mother. Ana enrolled at college first of all to do an essential English language course, before progressing onto an adult apprenticeship in business and administration more recently. She describes her desperate financial situation:

I work two jobs now on top of my college course, because I can't afford to live on the apprenticeship wages with my son – who is at nursery full time. The fees for nursery cost me a lot – we are in debt and rent arrears. I just hope I get a job that pays me enough at the end. I don't want to be rich I just [need] to have enough money to live on!

Although in the short term women learners experienced financial and personal hardship, by exercising their limited freedom and agency, they were aspiring to build a better future for themselves and their children. Their narratives emphasize how crucial it is that adequate support structures are provided for women and their families to live flourishing lives. Sen defines these as “instrumental freedoms” (1999), the support provided by the state for health care, education, child care, welfare benefits, and social care which are critical to overall freedom. In many of the cases observed in this research, instrumental freedom was found to be lacking or acting to disadvantage women in a number of ways. Funding cuts have impacted on the affordability of vocational education, particularly making it difficult for women who were not in receipt of the “right benefits” or had previously completed a similar level of education in their youth found access to courses difficult. There were very long waiting lists for language courses especially; this resulted in delayed progression onto vocational courses and affected integration into the community. In addition, recent cuts to welfare have impacted on women the most, especially single mothers. Policy has driven the urgency with which mothers need to gain employment after having children or face cuts to welfare payments. In theory, this agenda supports mothers back into work through subsidizing child care, yet the most recent increase in child-care funding is only available to those on permanent contracts meaning that women like Precious who are employed on zero-hour contracts do not

benefit from the child-care support. Furthermore, this narrow focus on gaining employment even if it is unfulfilling or exploitative denies women, particularly those who do not have other financial support, the opportunity of “decent work.”

---

## Well-Being Achievement

The achievement of well-being is often an unintended benefit of expanding one's capability set. The learners in this study had often suffered or were suffering from complex physical and mental health conditions such as anxiety, depression, and fibromyalgia when they started their programs of study. This is an ongoing challenge for many women like Chloe and Emma as they continue to live stressful lives. Yet they share how learning and having a more hopeful future have helped them to improve their mental health and in turn their well-being. Safina's story acts a powerful reminder of how education can transform well-being:

If I hadn't have come here I would be six feet under by now— I would have taken my own life. I had tried before. I honestly think that coming on this course, gaining skills, feeling worthwhile has saved me from suicide. I was so low and now I feel that I have something to live for again

There were a minority of women who managed to overcome mental health difficulties but described how physical disabilities continued to be a major constraint. Amy has a disability caused by chronic pain with associated depression. Her reason for returning to college was initially to reduce the social isolation she was experiencing. Once she engaged with college and gained the support she needed for her mental and physical health, her mental well-being improved. However, she is concerned about her progression into university to train in youth support work because of her physical disabilities:

It sounds *bizarre* saying this, but if there were people with visible disabilities at uni I would feel happier. I want to be accepted. I don't want to be friends with everybody because that's not real life. I want to be accepted, I want them to accept my disability

She also has concerns of how her disability may affect her future job prospects and employability, but in gaining further and higher qualifications, she has more choices open to her. Amy described how she would not have been able to continue work in a nursery or classroom due to her disabilities whereas having the opportunity to train for a more desk-based support job made returning to employment more realistic for her.

Near the end of their course, learners' reflections on what they had valued about their course revealed how they had valued the improvement to their self-esteem, self-worth, self-confidence, and self-belief. Surprisingly, learners were not conscious that they needed to improve these aspects of themselves or that they would gain such benefits from returning to education. This point emphasizes the multidimensional

nature of what learners can gain both explicitly (qualifications) and implicitly (personal gains) terms.

Chloe was ambivalent about starting a course at college, reflecting how:

It [the experience] has been amazing I don't know how else to say it. If you had have asked me that three years ago I couldn't see past my life. It's helped me to find me

Debbie echoes this narrative; she returned to college having withdrawn from university when she was much younger because she lacked confidence in her ability and this was not helped by negative comments from her family. She describes how coming to college has not only given her qualifications but:

Confidence . . . . Self-belief so even if someone does say to me you won't be able to do it. I can say if I put in enough effort I can do anything

---

## Conclusions

So far this chapter has presented the case for using capabilities as a theoretical lens for thinking about what women learners stand to gain from vocational programs in the English Further Education sector. I have argued that the dominant discourse of VET inscribes policy goals of employability and human capital accumulation onto learners, without considering why they return to education and what they hope to gain from doing so. Even though economic security is important for well-being and freedom within the capabilities approach, it extends beyond this as it considers the multidimensional nature of lived experiences. It places women's agency and the freedom to live a decent life at its heart. Focusing on women's well-being and freedom achievement has the potential to offer a more comprehensive view of the multidimensional nature of poverty and how it impacts their lives.

A dissonance between individuals' accounts of their aspirations and policy goals was noted; seemingly, aspirations were broader and more complex than the instrumental policy goals of employability. Although learners' aspirations were formed in response to present and future goals as Hart (2016) suggests, their past experiences were crucial in the formation of their aspirations. This reflected the impact that their negative educational experiences and long-held aspirations for a particular vocation had on their current aspirations. In agreement with DeJaeghere (2016), learners' aspirations were dynamic, emergent, and nonlinear. Women's agency and freedom to choose often resulted in what I have termed "best fit" aspirations, whereby women selected courses while placing the needs of dependents, partners, and financial well-being above their aspirations. Critically though, vocational road maps for adult learners are very often unclear, and there is a lack of pre-course support advice available to them. This significantly affected their opportunities to find "decent work" that is sustainable and regular and gives them freedom to access other support mechanisms such as subsidized child care. Although it has not been debated here, this

calls into question whether spaces on vocational courses should simply be matched to the employment opportunities available to learners. Yet by taking such an approach, education becomes purely instrumental and does not value women's expression of agency and freedom which has all too often been hampered by gendered inequalities.

The capabilities approach offers a broader account of women's lived experiences which aids our understanding of how they are able to use their agency and freedom to fulfill their aspirations. Women learners frequently explained how they had missed out on school as they had to stay at home as "young carers." In capabilities terms, this represents a "lack of freedom" to achieve their capability set (in other words gaining an education) which has implications for their freedom across the life course. Education offered the potential for some of the adult women learners to gain more freedom and agency to improve their lives, by being able to escape from abuse, gain employment, or do something for their well-being. Women's freedom and agency to achieve their aspirations to gain decent work are negatively impacted by issues such as in-work poverty, cuts to welfare and child-care benefits, and insecure work. This is exacerbated by the gendered inequalities they face within the domestic sphere where they all too frequently carry the burden of care and domestic responsibilities often without support. I have argued that this is compounded by a lack of language courses for newly migrated learners who experience these inequalities most severely. The lack of freedom some women face throughout their lives is what makes opportunities to gain skills and decent work so important, yet at the same time non-freedoms continue to hamper women's immediate conversion of qualifications into higher status employment.

Women learners choose to return to education and VET courses for complex reasons; the capabilities lens enables us to unpack what their aspirations are and what they gain from pursuing education in the broadest sense as agents of their own lives. Women learners often spoke of "wanting a better life" not just for themselves but their families too. Gendered inequalities which had blighted many women's lives meant that they achieved more from education than the chance of economic security; rather, they gained freedom to escape oppressive relationships, hope for their future, and became more agential in their own lives. Even when learners were not able to pursue employment immediately, their VET course had impacted their lives in immeasurable ways. Pursuing education had enabled them to (re)claim their lives as they improved their mental health, confidence, self-esteem, and well-being. Learners' children in particular benefitted from this transformation as women felt more confident in helping them with their school homework and dealing with the school. As a result learners had not only raised their aspirations for themselves but for their children too and better understood how to support them through their education. I have argued using the capabilities lens that narrow human capital measures and policy goals ignore what women stand gain from pursuing VET over and above employment. Rather, women's achievement of agency, freedom, and well-being cannot be quantified simply in economic terms nor can the positive consequences it has for their children, families, and community.

responsibility to achieve employability and, in contexts where unemployment benefits exist, to prove that they are trying to achieve employability as a prerequisite for accessing social benefits.

This chapter draws empirically from 30 interviews undertaken with young people living in urban townships in the Nelson Mandela Bay metropolitan in Port Elizabeth as part of the research program of the *Research Chair: Youth Unemployment, Employability and Empowerment* at Nelson Mandela University, South Africa. The research work was initially funded by the Education, Training, and Development Practices Sector Education and Training Authority (ETDP SETA).

Drawing on the capabilities approach, this chapter shows that the employability agenda, with its associated emphasis on income poverty, serves in reality to ignore the multiple capability deprivations that affect South African youth living in low socioeconomic status urban townships. In contradiction to policy narratives that posit employability as a solution to poverty and youth unemployment, the chapter highlights from the lived experiences of these graduates the ways in which the employability agenda functions as a form of structural violence that locks youth into a cycle of poverty and then reinforces this structural violence by persistently and stubbornly insisting that VET prepare learners for a formal labor market that simply has not and probably will never employ the majority of them. Of great concern is the ways in which the employability agenda potentially limits the capacity of VET to expand the agency and active engagement of these young people in informal sector livelihoods and in community development.

In light of the Sustainable Development Goals (UN 2015), which emphasized the expansion of VET systems in developing contexts, this chapter argues that the employability account (and particularly narrow versions thereof) is simply not fit for developing contexts where VET is necessarily targeted toward social equity, the reduction of gender disparities, community development, poverty alleviation, as well as to human capital development and economic growth.

Vocational education and training · Employability · Capability approach · Youth unemployment

Very few issues in vocational education and training (VET) have gained as much interest as that of graduate employability. Interest in the work-readiness of the VET graduate and the economic contribution that they might make has been a concern for much of the past century. The neoliberal turn of the early 1980s, however, led to the spread of a new account of employability that exploded onto the policy terrain. In this new account, employability is positioned as key to labor market insertion and as central to both economic productivity and to social policy addressing poverty and unemployment (Maclean and Ordóñez 2007; McGrath 2012; Powell 2012). At the heart of the employability agenda is the individual's responsibility to achieve employability and, in contexts where unemployment benefits exist, to prove that they are trying to achieve employability as a prerequisite for accessing social benefits

(Crisp and Powell 2017). In the employability discourse, the role of the state is to provide access to education and training targeted at employability and, where employment benefits are available, to ensure that unemployment benefits are made available to only the “deserving poor,” i.e., those who have proven their efforts toward employability (Bonvin and Farvaque 2005).

Formal VET historically was closely linked with apprenticeships. Thus, in an important sense, it was targeted at supporting existing employment relationships rather than creating them. The demise of apprenticeships across much of the world (itself a consequence of neoliberalism) (Fuller and Unwin 2014), together with increasingly fractured education-to-work pathways (Evans and Furlong 1997; Ball et al. 2000), has accelerated the preoccupation with VET graduate employability. Massified college systems and new student finance regimes offer what policy has touted as “equality of opportunity” to young people but which has been proven to not provide “equality of outcome” (Field et al. 2007). Rather, the youth labor market is seen as highly competitive, and it is understood that this competition begets “losers” at a far greater rate than it does “winners” (Fenton and Dermott 2006: 205).

This chapter draws empirically from one element of the research program of the *Research Chair: Youth Unemployment, Employability and Empowerment* at Nelson Mandela University, South Africa, led by Lesley Powell and from research work that was funded by the Education, Training, and Development Practices Sector Education and Training Authority (ETDP SETA). We draw here on data from in-depth interviews undertaken with 30 unemployed youth (aged between 18 and 30) living in urban townships in the Nelson Mandela Bay Metropolitan area in the Eastern Cape. The sample was stratified into three equal-sized groups according to terminal qualification achieved: those who had completed secondary school, college, or university. In this study we sought to determine the ways in which unemployment is experienced, understood, and lived; the attitudes that these young South Africans have regarding work in both the formal and informal sectors; and the ways in which they attempt to access the formal labor market and/or make a livelihood in the informal economy.

Drawing on some of the thinking tools of the capabilities approach, we will show that the centrality of employability, with its associated emphasis on income poverty, ignores the multiple capability deprivations that affect South African youth living in low socioeconomic status urban townships. Following Bonvin (2012: 10), we assess the policy framework of employability against individuals’ “capability for work,” i.e., their real freedom to choose the job that they have reason to value. Adopting this broader social justice framework allows us to draw from the experiences of these young people the implications of employability for VET and particularly for a VET system that, in terms of policy rhetoric, is directed toward poverty and unemployment alleviation.

This chapter forms part of a broader body of work that examines the role that VET plays and can play in intervening in poverty and does so by engaging the voice and experience of VET students and youth. In our previous work (McGrath and Powell 2015; Powell 2012; Powell and McGrath 2014), we showed that despite institutional and sectoral inefficiencies and challenges, and notwithstanding the difficulty of accessing the labor market, South African TVET college learners

contradict the negative view held by Foster (1965a, b), Oketch (2007), and Psacharopoulos (1994) of VET in Africa. Instead of avoiding VET, as Oketch suggests is the norm for youth in Africa, or having a negative opinion of VET, these South African TVET college students spoke powerfully and emotionally of the empowerment that the college enabled in expanding their confidence, their self-esteem, and, importantly, their “capability to aspire” to a life that extends beyond that of their parents (or beyond their parents’ cultural capital) (Powell 2012, 2014; Powell and McGrath 2014, 2019).

This chapter draws from interviews undertaken with a different cohort by reflecting the experiences of unemployed youth after graduation (from school, TVET college, or university). By so doing, it serves as a counterbalance to our previous work in that it essentially presents the other side of the coin: while our previous work focused on the aspirations of TVET college learners and the extent to which TVET colleges were enabling or constraining these ambitions, this study examines the actual and real-life experience of graduates. Notwithstanding this difference, both studies draw on youth who live in low socioeconomic urban townships in South Africa, and both cohorts experience multiple capability deprivations that affect their well-being, their flourishing, and their functioning or achievements (Powell and McGrath 2019).

What is also clear is that both studies, coming at the concern from different directions and with research undertaken with very different cohorts, serve as powerful critiques of the employability orthodoxy. Our previous studies, which drew from interviews undertaken with TVET college students ( $n = 80$  over an 8-year period), showed that the employability agenda is far too individualistic to enable learner aspirations to contribute to the development of their communities and is far too limited to address poverty (understood as multidimensional capability deprivations) in any meaningful way or, for that matter, to reflect the aspirations of TVET college learners which “extends beyond that of empty slates enrolling in [TVET] colleges in the anxious hope that they will be filled with the skills needed to become productive future workers” (Powell and McGrath 2014: 224).

The limitations and violence of narrow accounts of employability are equally clear from the present study. Just as with TVET college students, the lived experiences of these graduates critique the ways in which the employability agenda potentially limits the agency and active engagement of these young people in community livelihoods and in community development. Moreover, it critiques the ways in which the employability agenda functions as a form of structural violence by locking youth into a cycle of poverty and then reinforcing this structural violence by persistently and stubbornly insisting on preparing learners for a formal labor market that simply has not and probably will never employ the majority of them. According to SACCI, JET, and NBI (2016) and Papier et al. (2017), between 70% and 45% of TVET college learners will be unemployed after graduating, depending on whether they graduated from a NATED or national curriculum vocational qualification and the number of years post-graduation. Of great concern is that the employability agenda exists as a form of symbolic violence by entrenching a set of aspirations that for most TVET college students are simply not attainable and, to add insult to injury, reinforces this symbolic

violence by convincing these youth that actually it is they who are responsible for and therefore deserving of their fate.

We begin the chapter by providing the research context which highlights the importance of this issue for VET in South Africa and globally. This is followed by a brief review of the employability agenda and its significance. Thereafter, we draw on the lived experience of the participants, which highlights the complex strategies that young people use to make a living and the structural barriers that they confront. In the penultimate section, we examine the implications of these lived experiences for VET and particularly for the employability agenda that underpins VET.

While the focus is on South Africa, the chapter has global relevance as it addresses the role of VET in development. In particular, and in light of the Sustainable Development Goals (UN 2015) which emphasized the expansion of VET systems in developing contexts, it questions the orientation of VET systems by arguing that the employability account (and particularly narrow versions thereof) is simply not fit for developing contexts where VET is necessarily targeted toward social equity, the reduction of gender disparities, community development, poverty alleviation, as well as to human capital development and economic growth.

---

## The Context

A reason for establishing the *Research Chair: Youth Unemployment, Employability and Empowerment* lies in the staggeringly high levels of unemployment and particularly youth unemployment in South Africa. Of the 36.1 million South Africans who are of working age, 5.4 million are unemployed, and at least 15 million are not economically active because they are discouraged from finding a job (StatsSA 2015). Such problems are long-standing and all evidence indicates that they are intractable. Intertwined with high unemployment are extreme levels of poverty and inequality. More than half of South Africans (55.25% according to StatsSA 2017a) live below the poverty line (R992 per month, around \$69 US dollars), and one in five lives in dire food poverty (below R441 per month, around \$33 US dollars). South Africa's Gini coefficient is 0.65 (expenditure) and 0.69 (income) (StatsSA 2014), making it one of the most unequal countries in the world. These are persistent and interrelated problems that affect the well-being of millions of South Africans, including the 3.3 million young South Africans who are not in employment or education and training (StatsSA 2017b).

It is important to note that unemployment is not unique to South Africa and neither is youth unemployment. According to the International Labour Organization (ILO), about 192 million are unemployed globally and unlikely to ever enter the labor market (ILO 2018). Heightening the crisis is that this number is likely underestimated as it excludes people who are not actively seeking work, ignores millions of slum dwellers and disregards those who live in developing contexts for whom there are no reliable statistics. The ILO warns that unemployment is amplified in rural and developing countries and that women and young people are disproportionately affected (ILO 2015). Following the international trajectory, South African women, youth, and people living in rural areas are the greatest affected.

Where South Africa differs from the international trajectory is the degree of youth unemployment. In South Africa, the unemployment rate of youth (defined as 15–34 years) is roughly double that of adults, approximately 36% and 16%, respectively (StatsSA 2017b), resulting in South Africa having one of the highest rates of youth unemployment in the world.

The orthodoxy states that unemployment (understood mono-dimensionally, as work in the formal sector) leads to poverty (also understood mono-dimensionally, as income poverty). In the South African context, there does appear to be at least some correlation here. Data from 2014/2015 showed that the poorest 40% of the population accounted for a mere 12.4% of total national income but accounted for 71.9% of the unemployed (StatsSA 2017b). However, the reality is that both concepts are far more complex, and their interrelationship is inevitably also much more complex. For instance, this simple linear relationship between poverty and unemployment ignores the poverty-inducing effects of indecent work and the multi-dimensionality of poverty that affects access to and outcomes from education and training opportunities.

The South African President, Cyril Ramaphosa, has argued that:

To turn this situation [high unemployment] around, our economic policies need to prioritise and focus on South Africa's youth. Our policies must be judged on the extent to which they create more employment and education opportunities for young people. (Ramaphosa 2017)

Policies to address South African youth unemployment are centered on improving employability through education and training, particularly VET and skills development training. In line with President Ramaphosa's emphasis, employability as a policy absolutely "must be judged" not only on the effectiveness of its instrumental implementation but also on its central tenets: "the extent to which [it] create[s] more employment and education opportunities for young people" and, most importantly, on whether such employment and education opportunities are meaningful. In the language of the capabilities approach, it must be judged on the extent to which it expands valued capabilities (i.e., meaningful opportunities and the freedom to choose therefrom) as well as valued functioning (achievements that matter to the well-being of people).

---

## The Concept of Employability

Although employability appears to be a conceptual child of neoliberalism, its history is far longer (Gazier 1998). Gazier argues that the first form was "dichotomic employability" that had its roots in centuries-old notions of the "deserving" and "undeserving" poor. In its reworking of such notions, dichotomous employability sees the unemployed as "shameful," lacking in both the intelligence to compete successfully on what is presented as the "level playing field" of the labor market and the discipline and fortitude to persevere through education and job seeking till employment is secured. Elements of this account are clearly still present both in how the unemployed are presented in popular discourse and in the ways that they internalize this shame.

In the 1960s this notion of employability was (partially) replaced by what Gazier describes as "manpower employability." This was strongly rooted in the then emerging human capital approach underpinned by the rational planning of labor markets (termed "manpower planning") which was understood as the best approach to overcoming youth unemployment. While the central role of the state in this process has in some countries been somewhat reduced, the more recent phase of "initiative employability" retains a strong belief in human capital and in centralized skill planning mechanisms, even if these also display strongly marketized elements. What has changed is a return to and intensification of moral judgments regarding the "undeserving poor," which is particularly evident in political economies with meagre social systems such as the United States and in countries such as the United Kingdom that are working toward rolling back the welfare state. In this account, it is the duty of the individual (and also, although to a lesser extent, education and training providers) to ensure that they gain and maintain employment and obtain new employment when required by market forces (to paraphrase Hillage and Pollard 1998). In this sense, employability can be understood as "a set of achievements, understandings and personal attributes that make individuals more likely to gain employment" (Knight and Yorke 2003: 5).

The employability drive is both a manifestation and an outcome of the rapid changes associated with globalization and neoliberalism since the 1970s (McGrath et al. 2010). A shift away from manufacturing and related skills in the North, alongside the rightward movement of parties of the left, has led to a hollowing out of the kinds of skills and jobs traditionally associated with VET, to increased precariousness and indecent work, and to this discourse of employability that puts the blame for unemployment on the deficiencies of youth and particularly the most vulnerable among them. In this way, employability emphasizes individuals' responsibility to develop and transform themselves into employable and "deserving" citizens (Bonvin and Farvaque 2003; Bonvin and Galster 2010; Bonvin 2018).

The validity of the employability discourse in its Northern heartland is thus in need of critique and resistance. Its validity in Southern settings appears even more untenable. Nonetheless, VET discourse in countries like South Africa is thoroughly colonized by this notion, most typically through the formulation of "skills for employability" (cf. McGrath 2012) and "skills for poverty reduction" (Powell 2014). This version of employability locks into the central tenets of Human Capital Theory (HCT) (cf. Bonvin 2018). As we have argued elsewhere, the skills for employability discourse can be seen as part of a broader discourse of productivism. Following Giddens (1994) and Anderson (2009), we suggest that VET is imprisoned in a view that only the economic domain matters (McGrath 2012; Powell and McGrath 2014).

We have already noted the widespread international decline in apprenticeships, which is offset by a sharp rise in public vocational programs that are pre-employment located. An important distinction in HCT is between two types of training: (i) *specific training* which increases productivity within specific firms and (ii) *general training* which increases productivity across all firms and which provides the basis upon which *specific training* might take place. In HCT thinking, the costs of *training* are to be carried primarily by those who accrue the most benefit. As such, the costs of *specific training* are largely to be carried by firms and the cost

of *general training* primarily by individuals. There is some argument for the state to also contribute as there are societal as well as private gains. The outsourcing of *initial training* from firms to the state means that the costs and responsibility have steadily been removed from firms. This together with employers stepping back from *specific training* has resulted in the costs falling on young people (and the state) rather than on employers, as HCT ordains.

The power of the concept of employability, underpinned as it is by HCT, is precisely that it allows a masking of key tensions. These include the tension that exists between the responsibility of the individual (to be employable), the responsibility of the state (to enable employability through education and training and labor market regulation), and the responsibility of the firm (to invest in their current and future employees). It also elides the role(s) of the state regarding economic growth and the well-being of citizens through placing employment, no matter how bad, at the center of social as well as economic policy. A further blurring takes place as NGOs, philanthropies, and community activists often are supportive of the concept as it appears to address the lived experience of youth dealing with unemployment, precarious employment, and the lack of decent work. As Schultheis (2009: 77) puts it:

The concept of employability . . . *thanks to its remarkable ambiguity* . . . has crept into numerous policy statements and programmes aimed at promoting job creation and combating unemployment, is perhaps the concept which most tellingly expresses this idea of human resources that are flexible, mobile, with no attachments and no history [and] always young.

Framed within neoliberalism, skills within the employability agenda are narrowly defined as those required by industry and commodified as an individual asset in a competitive labor market. In spite of its policy and practical purchase, however, employability is deeply contested with a growing literature highlighting the problem with these accounts for human well-being (Powell 2014), poverty alleviation (Powell and McGrath 2014), vocational knowledge (Wheelahan and Moodie 2011), equity (Vally and Motala 2014), and, ironically, also for employment and economic growth (Allais 2012). Underlying this literature is a deeper concern that spotlighting the supply of “skills” serves to deflect and distract from deeper structural inequalities that are the fundamental causes of unemployment and poverty (Vally and Motala 2014).

---

## **The Inadequacy of Orthodox Notions of (Un)employment and Employability**

The concepts of employment and unemployment, while useful for statistical comparisons over time and space, are too binary and static to reflect the fluid and complex lived lives of the young people who participated in the study.

In South Africa, the official labor force survey identifies a person (aged between 15 and 64) as employed if they worked for an hour or more in the week prior to the survey being undertaken and unemployed if they did not. In addition, to be considered unemployed, an individual must regard themselves as being able to work,

must desire employment, and must have actively looked for work in the 4 weeks preceding the survey. As Steyn (2016) puts it, “it’s harder than you think to be unemployed in South Africa – even though the unemployment rate has recently reached a record high of 26.7%” (par.1). An individual is considered a “discouraged worker” if they indicate that they have not worked for an hour or more in the week preceding the survey and that they have not looked for work in the four weeks prior to the survey, despite the fact that they would like to work. A distinction is then made between the “narrow” definition of unemployment (excluding the “discouraged”) and a “broad” definition (which includes the “discouraged”). The “narrow” definition conforms to ILO norms. However, the question of who should be considered “unemployed” is highly controversial in South Africa where academics have proven that there is little to distinguish the searching and the non-searching unemployed and that the broad definition of unemployment presents a more accurate picture of unemployment in the country (Posel et al. 2012).

While labor statisticians can see clear distinctions between different definitions of unemployment, neither the broad nor narrow definitions appear of much relevance to the young people with whom we spoke. Rather, their experience pointed toward a series of theoretical weaknesses of this orthodoxy.

## The Quest for Decent Work

The young people appeared to be more closely attuned to the tripartite purpose of employment as described by Sen (1975): the *production aspect* (the outputs of things that are needed), the *recognition aspect* (the self-identity, self-worth, and meaning that comes from being engaged in something worthwhile), and the *income aspect* (the livelihoods earned). Sen argues that not all work provides all three aspects to individuals. Taking the impact aspect alone, young people considered themselves as “unemployed” despite having worked for an hour (and more) in the week preceding the interview, regardless of what statisticians may think.

For example, Khanyisa, a school graduate, had worked for 14 h in the previous week but self-identified as unemployed. (Pseudonyms reflecting the gender and cultural orientation of the person’s name are used throughout the study, and, where necessary, details of their lives are altered to preserve anonymity.) When asked to clarify this, Khanyisa’s response was very clear, and challenging of the orthodoxy.

You can’t call that work! Look, it’s a piece job that one. He pays R20.00 an hour. There’s no contract. I don’t even know when I’ll be working next. Sometimes it’s once a week and sometimes it’s more than that.

Khanyisa distinguished between what he calls “career work,” work that leads to long-term employment in an area that is worthy of being regarded as a career, and what he called “step-ladder work,” precarious work that enables survival while looking for “career work” but that also possibly opens the way to “career work.” When speaking of his current work, he explained that:

It's just a job, a piece job. It's not a career. It's not real work. I can't say that I'm working. This week I'll work maybe on Monday and on Saturday, but it's not even guaranteed. I'm still in the process of hustling for proper work. Something that I can do every day. Even if it's not a permanent job, just so that I know what I am waking up for and so that I can know that there is some place that I have to go to each and every day.

De Jaeghere (2018) examines education and training interventions that aim to support entrepreneurship. She finds that two different types of programs exist. On the one hand are those programs targeted toward poverty alleviation for what she terms “necessity entrepreneurs,” and on the other hand are programs that target job creation and economic growth, directed toward what she terms “opportunity entrepreneurs.” This may be seen as parallel to Khanyisa’s account of two types of work.

Khanyisa’s account reflects the 1.4 billion workers (almost half the global workforce) who are in vulnerable jobs (ILO 2018). These workers have little, if any, access to social protection support, labor protection, health support, work-based education and training, and work safety and are, for the most part, women and youth (ILO 2018).

Khanyisa continued his interview by indicating that for him “real work” would be an internship related to the area in which he had undertaken a post-school diploma. He was less concerned about the salary or the income that might be offered than with being given an opportunity to gain the experience and to prove the skills that he has. As he explained:

I need them because I need the money, but they need me. They haven't realised yet how much I can help them because I know the system that they use. That is exactly what I was trained on. It's just a pity that they didn't take me. I was proposing that they sign me up even if only for a few months and then I can prove myself. I just wanted them to give me a chance, but if you don't have that experience they won't take you unless they've seen that you can do this thing.

Implicit in his statements is an understanding of employment as an activity that engages you daily and that advances you along a “career path” toward sustainable and meaningful work. In this sense, Khanyisa rejects the precarious and short-term work that he is currently doing as employment and considers himself as unemployed.

## Valued Work

The application of the capabilities approach, with its insistence on a distinction between capabilities and functionings, emphasizes the importance of functionings (or achievements) that matter to people and capabilities (or meaningful opportunities) that people have the freedom to choose from and by so doing also on the structural enablements and barriers that affect capabilities and functionings. Importantly, it characterizes a profoundly different ontology of the human being to that encapsulated in Human Capital Theory and related versions of employability (cf. Bonvin 2018). Instead of the focus being on the human being solely as a producer, it is on human flourishing. The commitment to human flourishing

certainly includes what Bonvin and Galster (2010) describe as “the capability for work” but is far broader. As Drèze and Sen (2002: 7) put it, the “bettering of a human life does not have to be justified by showing that a person with a better life is also a better producer.” Langa, who had completed 1 year of his TVET college qualification before having to find work, explained this well:

I need work, yes, but I also do work as a musician, as an artist, as an activist. I’m also a husband and a father. I registered an NGO last year because we want to make a space for young artists to come together and to share their work. I am so many things but when I sit down in front of somebody or when I send my CV off all they see is this poor person who needs a job.

The capabilities approach insists that human beings, including these unemployed young people, be seen as active agents with a multitude of skills that might be invisible to the eye of the employability agenda but which is recognizable when examined through the social justice framework of the capabilities approach. Schultheis (2009: 73) argues this well when he says that:

Within the capability approach, the targeted person functions as active players, responsible for their own lives and equipped with a multiplicity of valuable skills which hitherto were only latent and invisible to the eyes of those who viewed the problem of precariousness from a traditional, a priori negative standpoint. Instead of a catalogue of shortcomings . . . [the capabilities approach then takes the] actual individual, including his or her background, current situation, needs, dreams and expectations as the starting point to determine which personal aptitudes and skills can be mobilised to develop a project for the future.

Every young person interviewed expressed a desire to contribute to their communities. Walker’s (2008: 483) definition of “active citizenship” as “action in the world [and] understanding society and your contribution to society” most aptly describes the responses provided by many of the students. These young people highlight the importance of understanding the challenges facing individuals who live in their community and of contributing to uplifting the lives of these individuals through providing models of success, through encouragement and inspiration and through providing access to skills or to facilities. Many have taken active steps to contribute to their community either by working on or with projects/programs or by speaking to NGOs and politicians to request assistance for a youth development project.

## **The Rise and Costs of Internship**

The orthodox definition also cannot deal with an increasingly important group in South Africa and in many other economies. Interns are typically deeply engaged in work, often get recognition and respect from being engaged in work, but either earn very little or no income from their work or find themselves in work environments where they are learning little other than making coffee, photocopying, and sweeping. One such person is Busiswe, a vocational college graduate. Having completed the compulsory component of her qualification, she proceeded to work

as an intern at a local school. She worked daily at the school for 2 years. During that time, she did not earn a stipend, travel allowance, or any salary of any kind. Now having worked at the school for 18 months, the required period to complete her qualification, she was ready to leave her “employment” and to look for a “proper job.” Unlike Khanyisa, Busiswe has a workplace to attend daily and the respect that comes from making a contribution at that workplace. However, she said:

I can't afford to be employed there anymore. They give me money for taxi fare and I come every day to do all the filing and data capture and I also help with the administration work at the school like collecting the monies. I enjoy the work, but I need to leave because I need money now.

Despite Busiswe's experience, and the experience of thousands of other young people, internships are widely sought by TVET college graduates as they are a required component for the completion of their diploma. College students complete their theoretical component (which takes a minimum of 3 years for NCV students) and are required thereafter to undertake an 18-month internship as a prerequisite for their qualification. Sourcing these internships is mainly the responsibility of the TVET college student as it is they that bear the consequences of having either completed or failed to complete their 18-month internships. Students are supported in their attempts by college student work placement offices that negotiate internships on behalf of the college graduates. They are also assisted by funding that is made available by the SETAs and by the Department of Higher Education and Training. In 2011/12, for example, DHET together with the SETAs supported the placement of 11,953 graduates into internship positions (Powell and Wedekind 2015). Notwithstanding these support structures, Powell and Wedekind (2015) show that the placement of college interns (from both the public and the private TVET colleges) continues to be a problem and that 21,000 students were not placed in internship the year prior to publishing their report. Mandisa, a TVET college graduate, captures this well when she states that:

... for now, I want, if ever I could get, an internship and then work because in order for me to get my diploma I have to get an internship so I can get my diploma in business management.

## **Informal Work**

There has been a long debate regarding how labor market statistics capture informal work (cf. Charmes 1999). Perhaps, due to the specifics of the South African context, we encountered young people who work part-time in the informal sector but self-classified as unemployed either because, like Khanyisa above, they do not regard the work as “real work” as it does not represent work that they aspire to or because they are underemployed.

Langa, a college graduate, spoke for the first 15 min of his interview of the different jobs that he has had and explained that a factory where he had worked for the past 5 years had recently closed down. It was only some time into the interview that he shared what he called the “artist in me.” He explained that he made some of his

livelihood as a music producer. He owns a small recording studio that contains old but solid equipment that he has put together slowly over the years. The studio provides a space in which local artists can cut their demos at a reasonable cost, way below what they would pay at a commercial studio. He described the studio as being fully booked with young artists who are in need of demo recordings but also explained that it was recently burgled, which had been a serious business setback.

Zoleka, a young woman who works as a home baker, explained that she saw herself as “employed in the informal sector” as she “earns enough off the baking” even though this would not feature in official labor statistics as being employed as she does not always work the required 1 h per week. At the same time, she also self-identified as “unemployed” because she was not fully employed. This self-identification also arose from an intention to work in the future for a year or two in a commercial bakery “to see how they do things.” Her long-term goal, though, was to expand her own business. As she explained:

In one way I regard myself as unemployed because I don’t earn enough yet to live off and also because I’m not that busy. I wake up at about 9.00 o’clock and then I clean up and start work. I wake up earlier if I have a big order but most of the time I don’t have to. But I also see myself as self-employed as I’m building up my business. I have a piece of land that we can use to setup the business and I’m hoping to build a place on this piece of land. Maybe I can employ one or two people who realise that money isn’t going to flow in and it will be a good business because here in the township there is no one who is baking. You have to go to the main road if you want to buy cakes.

## The Invisible Work of Caring

The relationship between labor market statistics and care work is another long-standing debate (Waring 1988). Almost a third of the participants reported family responsibilities, either as a parent or for younger or older relatives. In all these cases, they expressed their desire and need to start working but also concern about how they would manage a full-time job while caring for others. In the employability debate, there is no sense of how the state has hindered these young people’s employability by underproviding caring services, nor any sense of the unequal gender burden of caring and its impact on labor force participation. Yet, these responsibilities negatively affect the respondents’ ability to study, their ability to apply for work, and their freedom of movement to attend interviews should they secure such. Busiswe, a college graduate, commented:

I want a job. I’ve been applying because I need a job, but I don’t know what I’m going to do with my nephew when I get a job. My brother must go to work and there’s nobody to look after him.

Izinyoka, another TVET college graduate, finds herself in a dire situation. Izinyoka completed her electrical engineering qualification and then her internship. Although she is a qualified electrical technician, she cannot easily leave her mother to go to

work as her mother needs her to care for her. She has also had real difficulties trying to find work which she has been trying to find for 9 years after completing her internship. She describes this as “not [being] a piece of joy, this sitting at home doing nothing.”

### **Actively Seeking Work and Being “Discouraged”**

The econometric definition excludes all those who have not looked for work in the past 4 weeks. Of the 30 respondents, only 5 indicated that they had applied for any work (or even “looked” for work in the newspaper or on the Internet) in the previous month. The reasons for this are varied and relate to both the resource constraints and the multiple strategies participants used to find work, which differ from conventional and formal notions. Instead, many believed that it is social “connections” through friends, family, and faith that are the key to being successful at securing work. Khanyisa, a school graduate, argued:

You need connections. Somebody who knows you and who can bring you in to the company. Sometimes you find that you do have what it takes to work in a particular area, but if you don't know the right people who can bring you in then you won't get in. Even while I'm doing my jobs at the bar, as I'm wiping a table I'm talking and smiling at people. I'm asking people for connections. I'm thinking that maybe there will be a channel. I'm looking for a channel.

Loyiso, a 27-year-old school graduate, explained that he stopped applying for jobs almost 7 years previously. His main reason was the cost of applying for jobs, mainly of data costs both for Internet searches of job advertisements and for emailing applications. An added cost was the emotional one of sending out applications and of never hearing back from the companies. Loyiso described this process as soul destroying and ineffective as he received no response to the hundreds of applications that he sent out. After much effort, he decided to restrict his applications to:

... asking people who are working if they will assist in getting me a job and letting me know if there is a vacancy at their work. I remind them every time I see them and I give them copies of my CV. I haven't heard anything yet, but I don't think that there is anything otherwise they would have told me.

Loyiso's approach is very different to the approach used by Nobusi, who is also a school graduate. Nobusi is a young mother and, since becoming unemployed 3 months before the interview, was treating applying for a job as a job in itself:

I wake up every day with things that I have to do to apply for jobs. Sometimes I walk from the one side of the main road to the other and go door to door to ask about work. Other times I look on the internet and then I apply. If I see something I finish my application and then I walk from the township to the company to give my application in myself. Other days I apply at job agencies.

Nobusi explained that the previous day she had traveled to the airport to meet with the manager in order that she might submit her application in response to an advertisement for an administration position. Being told that the manager was not available, she made an appointment for the next day when she planned to walk again to the airport (about 1½ h) in order that she could hand-deliver her application. She wanted the manager to get to know her and to see how much effort she had put into the process.

It was clear that the language of “being unemployed” was understood very differently to the orthodoxy. Instead of representing the absence of wage labor as is the orthodoxy, it appeared to represent the gap between aspirations for long-term and sustainable work and the need to engage in short-term, precarious jobs. This points to the need for a much broader conception of what constitutes work and the lack of work.

---

## **The Costs of “Winning” or “Losing” in the Employability Game**

### **The Costs of “Losing”**

Sen, when speaking of the multiple ways in which “unemployment batters lives,” argues that “at the individual level the penalties of unemployment can be enormously more serious than income distribution statistics suggest” (1975: 159). He lists these penalties as including the loss of personal freedom and social exclusion, the decline and degradation of skills, and the psychological harm and suffering caused by diminished self-esteem. The moralizing language of the orthodox employability account, and the assumptions that underpin it, exacerbates this, with dire consequences for unemployed youth.

Loyiso, a school graduate, expressed how his unemployment affects him emotionally. When asked how he was, he responded by saying:

I’m good, but actually I’m not really good. What’s good is the fact that I get to wake up, eat and sleep. That I get to live with my mom and my younger brother is good, but ever since matric finished everything has been messed up. I still have to find a job. I have to feed my mother, my brother is still young and he looks up to me. He needs me to do things for him. I’m trying. I’m really trying. I don’t know what is going on in my life.

He described in his interview the hopelessness and helplessness that he feels about his life. He expressed the pressure that he feels to provide for his new son. Unemployment means he cannot do this and so “stops me from being a man.” Loyiso reflected that this is not only an internal process. Rather, he suggested that his mother’s attitude to him depended on his labor market performance:

The only time she gets to be nice to me is when I get a job. When I got a casual job, I earned R1000. I took the money home and that was the only time that she was nice to me. When the contract at the job ended that’s when things went back to normal at home again. It’s very frustrating, sometimes now she leaves the house without leaving anything at home to eat.

Northern notions of dichotomic employability are exacerbated by South Africa's colonial and apartheid legacy with their notion of the "lazy native" which was used to justify the legal exclusion of black South Africans from equal access to education and training, the economy, and social services. In recent years, both President Zuma and one of his ministers repeated this trope of "laziness," which has gained much purchase in the media (see, e.g., News24, 25 March 2015 and Northern Cape, 20 April 2015). Such an individualizing and deficit-laden language deliberately ignores both the structural effects that constrain youth livelihoods and the considerable agency that young people show in seeking to improve their lives. In uncritically working within this paradigm, the VET system is perpetuating a series of structural and symbolic violences against the youth it is supposed to be serving.

The multiple deprivations that these young people experience have enormous consequences for the amount of time that they have available to apply for work, let alone do formal work. The business of living absorbs large amounts of time and energy. Carrying water to their shack for washing and cooking, doing their washing (mostly undertaken by hand) and watching it while it dries so that it is not stolen, hustling for food, and finding someone to borrow money from for taxi fares are all activities that could easily take up a day of activity. Far from being lazy, these young people are working hard, extremely hard, and just barely getting by.

### **The Costs of "Winning" in the Employability Game**

The employability agenda presents employment simplistically as a substantive freedom that allows people to live the lives that they value. While the capabilities approach mainly emphasizes the positive possibilities of work, it is also very aware that work is not always contributive to human flourishing. This is well captured by the 2015 *Human Development Report*:

Many people are in work that restricts their life choices. Millions work under abusive and exploitative conditions that violate their basic human rights and destroy their dignity, such as child labourers, forced labourers and trafficked workers. Such corrosive and exploitative activities shatter human development. And millions of domestic, migrant, sex and hazardous-industry workers make their living in ways that are dangerous, also eroding their well-being. (UNDP 2015: 40)

An analysis of the work experiences of this small cohort of young people shows that every single one who has work experience gained that experience by compromising on acceptable working conditions in ways that were damaging to their well-being. Many of our respondents reported racism, bullying, and long hours. All reported severe underpayment including, in some cases, no payment. This supports Borat et al. (2010: 2) who found that the rate of minimum wage violation in South Africa is "disturbingly high . . . [with] 45% of covered workers paid wages below the legislated minimum, whilst the average depth of shortfall is 36% of the minimum wage." Nobusi said that she worked in the hotel industry for a period but, despite having to

provide for her daughter, eventually had to leave as she just “couldn’t take it no more.” She described her work experience as follows:

We worked every day, weekends and public holidays, for R2 400 [around \$181] and were given four days off a month. We worked from seven in the morning to eight or nine o’clock at night. We stayed there at the hotel because it was far from everything and they fed us. The accommodation that they put us in was dirty, it had no electricity and no water. The food that they fed us was the same every day and often the food was rotten. The bread had fungus on it because they would give us the bread that was left over from the guests from the day before. I tried to stay for the money, but then eventually I had to leave because I couldn’t take it no more.

Despite being employed in a large multinational company which may, in the future, have offered training and career prospects, Khanyisa also chose to leave because he felt his dignity was under daily attack by his manager who humiliated him by shouting at him in front of customers and colleagues (cf. Powell 2014).

Many had experiences with internships. While internships are understood as necessary for college graduates to complete their qualifications, they are also seen as a way in which companies exploit youths from lower socioeconomic backgrounds to work for either a reduced salary or, as in Busiswe’s case, for no salary at all.

The distinction that Khanyisa makes between “career work” and “step-ladder work,” what we’re terming “survivalist work” (or precarious work) and “career work,” is precisely between work that advances and takes one’s life forward and between work that maintains current capability deprivations or, for that matter, enhances these capability deprivations by putting one in situations that do harm to long-term aspirations and perhaps also to long-term well-being. Sehnbruch (2008) determined from her study in Chile that workers regarded what she terms “quality employment” as work that is rewarding, fulfilling, and secure but also work that widens rather than narrows meaningful future opportunities in the labor market.

The capability to work is couched in terms of having available an array of meaningful work opportunities and the freedom to select from these. This is clearly not the experience of these young people. Rather, they are distinguishing between meaningful and decent work: “opportunity work” (hard to secure) and often indecent (but sometimes available) “survivalist work.” For many of the respondents, employment was as much about capability deprivation as it was about achieving wage income and gaining work experience. Existing in a position of vulnerability, as all the youths who participated do, they have little choice but to select between two forms of capability deprivation: unemployment and the subsequent loss of income and other deprivations or exploitative, and often abusive, employment.

---

## What Does This Mean for VET?

This chapter ends by addressing the core question of what the foregoing means for VET practice and policy. While the preceding discussion has not been directly focused on VET, the context of VET has been part of the background. The young

people who participated in the study shared core experiences and perspectives with implications for VET that are worth discussing as each raises, from a different perspective, the limitations of the employability agenda in addressing the multiple capability deprivations they experienced.

The first relates to the costs of participating in VET. In policy terms the emphasis has been on expanding educational access through rapidly increasing participation. However, poor students face social and economic challenges that affect their learning experiences in ways that policy has not adequately understood. Some respondents indicated that they dropped out of their studies because the financial costs of traveling to and from college and of feeding themselves while they were studying were simply too much. For one participant this was mainly about transport costs. For another it was about staying out of work for another 2 years and finishing his qualification or leaving to work in a low-level job in the hope that it would expand into a better opportunity in the future. To some extent this choice was also driven by the fact that he had recently become a father and had decided that he needed to work in order to support his child. The point is that youth make calculations on whether they are going to study or continue with their studies. As we explain in greater depth elsewhere (Powell 2014; Powell and McGrath 2014, 2019), these calculations should not be interpreted within the narrow confines of personhood depicted in rational choice theory and nor are these simply about deciding between different pathways or institutions. Instead, it is about how they conceive of VET as a way of advancing their “life projects” (or life goals) where “life projects . . . [represent] an end that is desired, . . . and some notion, however imprecise, of the course of action through which to accomplish it” (Archer 2003: 6).

The second issue arising reflects the way that the employability agenda has orientated VET toward work that is narrowly defined as formal sector work. This stems from the history of modern public VET systems, which is linked to industrialization and in developing contexts also to colonialism. In South Africa, like much of the colonized world, VET was linked to the formation of the modern economy in the early 1900s. Many of the stories presented in this chapter point to an almost complete disconnection between the assumed reality of formal sector work and the actual labor market experiences of young people.

The employability agenda completely ignores the multiple capability deprivations that limit VET graduates from converting “capabilities” (in this case, their qualifications or skills) into meaningful employment. The strongest sense held by these young people was that it was not education and training that enabled jobs, but rather the existence of jobs combined with the ability to access these in the labor market. For most of these young people, this was to be achieved through “people who you know” (social capital) and, of course, into jobs that actually exist. Thus, many of these young people “looked for work” by going to visit friends and family in the hope that they could benefit from the social capital of their network. There was a sense that the best way to access work, rather than “looking for work,” was to be pointed toward work by somebody who could “bring you in.” The work experiences of this small sample suggest that this sense is not totally distorted as the vast majority of the work experiences that these young people shared in their interviews was accessed through networks.

The experiences of these young people highlight clearly the weakness of current VET evaluation. The emphasis is on getting VET graduates into the labor market and measuring progress toward this through employment rates, rather than on the extent to which employment is in itself potentially a choice between two capability deprivations (discussed above). As such, the current policy and public rhetoric assume that employment (no matter how indecent or exploitative) is “good” and completely ignores the quality of the work or the extent to which the work has the possibility to both extend and inhibit capability expansion.

Linked to this as the third concern is the quality of the work that exists. In the absence of a basic universal income or some form of social support grant for unemployed youth, it is necessary for any VET employability agenda to consider work as existing across at least these two dimensions: (i) meaningful decent work which we’ve called “opportunity work” (hard to secure) and (ii) often indecent (but sometimes available) “survivalist work.” It is also necessary for VET institutions to face head on that work, for many of their young graduates, will be the result of selecting between two forms of capability deprivation: unemployment and the subsequent loss of income and other deprivations or exploitative and often abusive employment. Bonvin and Galster (2010) argue that “real freedom” represents the ability to choose to not work for wages that are below a living wage and to negotiate the working conditions of employment and the opportunity to pick from a range of jobs. In short, the capability for economic opportunities that matter depends not only on individuals having the occupational skills and knowledge to access these but also on these opportunities existing in the labor market. The dominant dialogue on this problem focuses on the occupational skills and knowledge of young people (the supply side) but completely ignores the limited opportunities that exist for “real work” in the formal labor market (the demand side). Ignoring these realities, and persisting in selling the lie, “dream hard/work hard and all your efforts will be repaid,” belies the reality and exists as a vicious form of structural and symbolic violence.

Further exacerbating this problem is the insistence that young people complete 18 months of internship training that they are responsible for sourcing. This potentially puts the TVET college graduate into the situation of having to accept simply any position that can count as an internship no matter how exploitative, how abusive, or how limited the actual experiential training component of the internship and no matter the costs. Young people report working for years for no income whatsoever and needing to “afford” the internship as they are required to self-subsidize their meals, their accommodation, as well as their travel to and from their internship workplace.

The fourth implication for VET emerged from those young people who are actively engaged in the informal sector. In these cases, three indicated that they do not wish to go to VET as they did not believe that either the qualification or the learning they would acquire would take their life project forward. This was either because the college didn’t offer programs in an area that interested them or because such programs were targeted toward large-scale industry rather than toward the small-scale production occurring in home industries and community

entrepreneurships. This may be due to adaptive preferences or perhaps an awareness of the slim chances of securing decent work in the formal sector, but for those aspiring to the informal sector, they expressed little aspiration toward formal sector work.

Linked to the above is the distinction made between “learning” and acquiring a qualification. Those who are working successfully as entrepreneurs in their community indicate that they learn all the time. In this sense, their obstacle is not a limit of skill but of being able to access other people who are similarly learning (with the benefits that come from being part of a community of practice) and the limitation of accessing the information (here the biggest obstacle was Internet access and data costs). When Langa was asked what the local college could do to help him take his life aspiration forward, he laughed and said:

The best thing that they can do for me is to make an internet café available with printers and free data. I can go there to do all my learning and my printing. I can also arrange with others who are interested in [the particular occupational field] to meet me there so that we can spend time together on YouTube and Google reading and sharing what we are learning.

Other than providing lip service to entrepreneurship, VET has largely ignored work that happens in the informal sector and also learning that happens informally. While quantitative research shows that the informal sector is not necessarily a first choice for youth from lower socioeconomic contexts (Banerjee et al. 2008), the findings of our study suggest something different. Many of the young people who participated expressed a keen desire to work in the informal sector mainly by “starting their own business” in an area of work that they were interested in. These young people noted the increased independence that it provided, the possibility of creating employment opportunities for others, and the benefits of “not working for a boss” as big advantages of being able to make their livelihood in the informal sector. Notwithstanding this, formal VET in South Africa (and in much of the developing world) has completely ignored the informal sector as a possible employment route (Yamamoto 2012).

The fifth issue relates to the notion of “vocational” that underpins the college sector. Every single respondent expressed the desire to contribute to the development of their community. The VET system, however, is locked into a productivist discourse of work and human capital investment at the individual level that cannot comprehend nor respond to young people’s agency and aspirations that are far more broadly human and collective. While arising out of a very different cultural and historical moment, some of the Northern liberal vocational traditions (of theorists such as Dewey and Kerschensteiner) and indigenous knowledge tradition (see, e.g., Odora-Hoppers 2002) appear to be far more useful than the orthodoxy in their concerns with not just the technical dimension but also the moral, cultural, and social aspects of vocational learning that can make it civic, humanistic, and spiritual.

This concern with the embedded notion of “vocational” goes to the heart of what VET means in developing and in postcolonial contexts and emphasizes the importance of opening debate on what a decolonized VET system might look like. If we

agree with Keet (2014) that it means “‘writing back’ against the ongoing colonialism . . . that permeates education . . . [and] refers to ‘everyday acts of insurgency’ which regenerate indigenous knowledges, epistemologies and ways of life” (Keet 2014: 23), then we can no longer be content with a VET system that grows from an anglophone root and which continues to regenerate itself within the same framework.

Zoleka’s understanding (and life) speaks of this disjuncture as she describes her “vocation” when she talks about her role as a baker in her community:

It’s about spreading love. Spreading God’s love. When someone is born in my community, I am there with my cakes. When someone gets married, it is me who is there. Anything that happens in this community, I am there. So I see my job as bringing joy and also comfort when it’s needed. It’s not only about cakes, it’s about being that joy.

The employability orthodoxy ignores the skills and capacities that these young people have and denies the skills existent in the communities and families in which these young people live. This is a critical area for any decolonizing agenda. Zoleka, for example, had consciously chosen to not study further and to use the opportunity to learn from her grandmother instead. As she describes it:

I gain more knowledge at home and practising than I would at the college. It’s not hard to follow a recipe and to spice it up to make it your own. Most colleges would teach me what I already know or they want me to learn on big mixers and machines. That doesn’t help me. For me it’s about managing my oven and making sure that I get the most profit from the way in which I arrange my oven. It’s about making sure that the small kitchen is always clean and hygienic even if you’re in the middle of a big order. It’s about always being friendly because tomorrow that is the person who will need a birthday cake. You can definitely learn but you always need to find someone who is better than you and who can help you. Right now, and for me, that person is my grandmother. She is also a baker. She used to make money from her baking but she stopped baking because she’s too old now and that’s why I started. She sits in the kitchen with me. She lets me do things and if I don’t do it correctly she will help me.

---

## Conclusion

It is clear from the above that while work most definitely matters, the orthodox “skills for employability” agenda simply does not hold within a social justice framework. While it has been presented as a win-win situation for all, the reality is that it has served to maintain unequal access to education, to knowledge, and to work and has done so by doing nothing to challenge the broader structural inequalities that constrain the lives of young South Africans. Moreover, the agenda has served to ignore the decline in secure formal sector jobs and the education and training needs of those living and working in the informal sector.

Despite the good intentions of many who work in VET, through its silence, public VET has become complicit in this structural violence that maintains and perpetuates extreme inequalities and poverty in South Africa and through its symbolic violence

has served to further reinforce it. We recognize that structural and symbolic violence cannot be overcome only by the subaltern developing capacity to “speak for themselves.” Rather, it demands structural change that includes economic, political, systemic, and institutional change. This chapter – together with our previous work on VET (see particularly McGrath 2012; Powell 2012; Powell and McGrath 2014; McGrath and Powell 2019) – exists as one small step toward addressing the invisibility and the dominion of silence around the lived experiences of South Africa’s poorest post-school youth and the complicity of VET in perpetuating this silence and potentially reproducing inequalities.

In conclusion we insist that any VET system targeted at poverty alleviation has to take seriously its obligation of creating pro-poor institutions. What that might mean in terms of its lecturing staff – what they have to know, what they have to understand, and the form of empathies that they would need to embody – is still unclear, and the same is true regarding the curriculum, pedagogy, learner support, and institutional cultures. We do not know what this means mostly because we have not attempted to find out. It is imperative, therefore, that VET begins to take these challenges far more seriously, as they are key to what it would mean to make VET “transformative” of work and society as envisaged by the Third International Congress of 2012. However, at the discursive and policy levels, we need first to break out of the straightjacket of the failed notion of “skills for employability.”

## Abstract

Entrepreneurship education and training have emerged as a set of skills central in many developing countries' education/training policies and in the Sustainable Development Goals (SDGs) for ensuring employment and contributing to economic development in a global, and precarious, economy. In dominant global development discourses, entrepreneurship education and training is nearly ubiquitously framed in neoliberal terms used to address poverty and promote economic growth, but these approaches do little to address the social and economic inequalities that many youth in sub-Saharan Africa face. This chapter puts forth a postcolonial perspective to expand a capability approach used to identify critical capabilities necessary for sustainable livelihoods and well-being. Such an approach considers social and economic inequalities as they affect the education-work nexus, and it reframes notions of work and development around

well-being for youth in their communities. The chapter then draws on a 5-year study of an entrepreneurship training program for marginalized youth in Tanzania to examine which capabilities and conditions emerged to support their livelihoods, address inequalities, and foster inclusion and well-being. Recognition, being regarded as an equal and being able to participate equally in society, and community care, contributing to and receiving care from others in the community to ensure self and others' well-being, were two critical capabilities that emerged to support their livelihoods and well-being. These capabilities and conditions offer a heuristic for framing and designing entrepreneurship education to address not only unemployment but also the inequalities that underlie the education and unemployment problems for youth.

**Introduction**

In a changing global economy with expansion in some sectors and contraction in others, as well as precariousness in employment in many labor sectors (ILO 2015), governments and global institutions have turned toward advocating new knowledge and skills that can simultaneously promote economic growth, reduce unemployment, and alleviate poverty. Changes in the global economy have acutely affected employment opportunities for youth. The global recession of 2008 resulted in high unemployment particularly among youth. The number of unemployed youth grew considerably during the economic downturn between 2007 and 2012, reaching a peak in 2013; the unemployment rate of youth has once again increased in 2016, with 35% of the total unemployed worldwide being youth. While the percentage of unemployed youth in sub-Saharan Africa is considerably lower than the global rate, those employed are not necessarily in good working conditions (ILO 2012, 2016). Presently, the world has the largest youth demographic ever, comprising more than 30% of the working age population in many countries. Even though there has been an overall increase in jobs and employment in many countries, such as in sub-Saharan Africa, youth make up a larger percentage of the population in many of these countries, and therefore, the percentage of employed youth has actually decreased (Elder and Koné 2014). Relatedly, unemployment continues to remain high for certain groups, such as women and those in urban areas, in sub-Saharan Africa.

Unemployment rates are only one measure of a larger set of issues related to education for sustainable work for youth. Many countries in sub-Saharan Africa have had a decade of economic growth, but changes in the percentage of those in poverty have been less apparent. Many youth are considered to be in working poverty – either living in extreme or moderate poverty despite working. Nearly 75% of youth in developing countries who work are classified in working poverty, with this number growing in part due to increasing rates in sub-Saharan Africa (ILO

2016). In addition, fewer high-skilled jobs in the formal labor market are being created precisely at the time when there are a greater number of educated young people seeking employment (Elder and Koné 2014). Thus, obtaining a secondary or even tertiary education does not necessarily translate into a better job with higher pay and more benefits, at least in the short term. While many policymakers and donors use these statistics to argue that unemployment is the most pressing problem for youth today, inequality in terms of educational outcomes and, in turn, access to sustainable work opportunities are also problems. Thus, while skills development and entrepreneurship education have been proposed as ways to address the unemployment problem, these education reforms may not necessarily address the inequalities in employment opportunities or well-being unless alternative frameworks are considered.

The global development agenda, the Sustainable Development Goals (SDGs), has put learning new knowledge and skills for work as a key solution for these complex problems. Donors, such as the World Bank, have also begun to give particular attention to skills training for growing the informal economy and for poverty reduction, in contrast to earlier initiatives aimed at the formal economy (King and Palmer 2006). Entrepreneurship is one set of skills that is deemed useful in both the formal and informal sectors and advocates believe that it is important to teach at all levels of education (ILO and UNESCO 2006). Goal 8 of the SDGs states that entrepreneurship and job creation are key to achieving decent work and economic growth; and Goal 4, the education goal, has as one of its targets to substantially increase the number of youth and adults who have relevant skills, including technical and vocational skills, for employment, decent jobs, and entrepreneurship. In the past decade, entrepreneurship education and training has greatly expanded as a policy initiative in the global agenda and in many countries. For instance, in sub-Saharan Africa, Mozambique and Rwanda have national initiatives to implement entrepreneurship education across all levels of education (see, e.g., Honeyman 2016; Chissale 2016).

Entrepreneurship education as proposed in the global agenda and many governments' policies is believed to be relevant for everyone. There is an assumption that such education and training can benefit the economy and help get people out of poverty even though both research and experience show that only a small portion of people will start and maintain profitable enterprises and even fewer enterprises create new jobs. Possibly because of gaps between economic growth patterns and continued high rates of poverty and unemployment, entrepreneurship education and training have been increasingly targeted at youth living in under-resourced communities – one's with a limited formal economy, high rates of food and material poverty, and a lack of other social benefits, including quality education and health care. Given this nearly ubiquitous focus on entrepreneurship education, particularly for youth, it is important to examine if or how it can stimulate employment opportunities, alleviate poverty, and prepare young people for complex social changes in their communities.

The aims of this chapter are twofold. First, the chapter shows how the dominant approaches to entrepreneurship education, if it is to address educational,

employment, and other social inequalities faced by marginalized youth, need to be reframed. A postcolonial perspective is used to inform a capability approach to entrepreneurship – one that gives attention to understanding economic and social inequalities and to achieving inclusion and well-being. Second, drawing on an empirical study of entrepreneurship education for marginalized (not employed nor educated) youth in Tanzania, the chapter discusses capabilities that might be fostered to achieve greater equality and well-being. These capabilities arose from a study of youth's livelihood practices over a 5-year period, and they show how entrepreneurship skills and attitudes were adapted to the economic and social contexts in which they live.

The chapter is organized in the following sections. The next section will briefly examine some assumptions of two common approaches to entrepreneurship education and training – those for economic growth and poverty alleviation – and how they do not necessarily address inequalities. The following section will draw on postcolonial scholarship to consider how economic and social relations perpetuate inequalities, particularly referring to scholarship on education and employment in sub-Saharan Africa. The chapter then draws on an empirical study of an entrepreneurship training program in Tanzania to illustrate specific historical, political, economic, and social conditions that reproduce inequalities and influence youth's educational and economic opportunities. The following section considers how a capability approach can be used to frame the linkages between education, economic development, and social equality differently than the two common approaches to entrepreneurship education and training. The final section discusses examples of specific capabilities that were fostered through the entrepreneurship training programs that allowed the Tanzanian youth in this study to be included in their communities and to secure a sustainable livelihood. This framework and analysis suggests that skills development and entrepreneurship education programs need to give consideration to social relations that exclude youth from meaningful and valued education and work.

---

## Two Dominant Framings of Entrepreneurship Education

Entrepreneurship education and training programs have proliferated in the past decade (see, e.g., a review of programs by Valerio et al. 2014; Cho and Honorati 2014), suggesting that entrepreneurship has emerged as a real solution to education-employment problems. While entrepreneurship education and training is commonly defined and taught as a combination of technical and business skills with attitudes and values, such as resiliency and risk-taking – often referred to as non-cognitive or life skills – the groups targeted and the desired outcomes differ depending on whether the aims is to promote growth or alleviate poverty. Until recently, we knew little about entrepreneurship education and training programs for youth, nor whether – and how – they foster job creation or future employment (Chigunta et al. 2005). In addition, the purposes of entrepreneurship education have shifted from those of earlier vocational and skills training programs, from applying one's

knowledge and skills to a job to using entrepreneurial knowledge and skills to create jobs. Entrepreneurship education is also regarded as important for preparing young people to respond to economic and social changes, meaning a changing and precarious economy rather than working long term within a trade or sector of the economy (ILO and UNESCO 2006).

There are two dominant approaches to entrepreneurship education found in development organizations' programs and strategies. The first approach is oriented toward "opportunity entrepreneurs" and aims to foster job creation and economic growth. The second targets "necessity entrepreneurs" and seeks to alleviate poverty. These distinctions between opportunity and necessity entrepreneurs and the goals of economic growth and poverty alleviation are not rigid, and both types of programs teach similar content, but the target populations and overall outcomes may be different. Entrepreneurship education programs for youth cut across these two approaches because they regard youth as not yet opportunity entrepreneurs, but with some potential to be so in the future. These two approaches, their assumptions and desired outcomes, are explained below.

Entrepreneurship education and training programs supported by international agencies, such as the World Bank and US Agency for International Development (USAID), aim to promote economic development and job creation. This approach to economic development is based in a dominant discourse of human capital, innovation, and economic expansion. For example, the US government's Global Entrepreneurship Program states the link between entrepreneurship and economic growth this way: "Entrepreneurship is now recognized as one of the strongest drivers of global job creation, with an important impact on economic growth and political stability" (Bohoney 2011). Supporters of this approach assume that we can teach entrepreneurship skills and mindset to anyone to be an entrepreneur, and that entrepreneurs, with a supportive private sector and business environment, can then create jobs and foster economic growth. But the empirical support for achieving outcomes of enterprise development and job creation is less solid.

This form of entrepreneurship education tends to target "opportunity entrepreneurs" – those who already have business knowledge or experience – and provides them with additional training and seed money. Entrepreneurs in these programs are taught to be resilient, risk-taking, and innovative; business mentors offer support and advice on how to turn innovative ideas into money-making ventures in new markets. These programs may also promote policy change that supports private sector and business friendly regulations. The program content and curriculum, including business knowledge, entrepreneurial skills, such as marketing and identifying value chains, and an entrepreneurial mindset, are being adapted from these programs to teach to youth, including marginalized youth who may not work in a formal labor market or have access to many consumer markets. Those who support and implement youth entrepreneurship programs hold the belief that teaching the business skills and the entrepreneurial mindset will allow youth to create new enterprises and in turn promote economic development. Many programs targeting youth, however, do not provide the necessary economic or social supports, such as seed money or youth-centered financial services or regulations, that young people need to get

started in a precarious economy. As a result, youth (and other marginalized groups) may start a micro- or household enterprise, but their ability to engage in the formal economy or high-value value chains is much more difficult than for “opportunity entrepreneurs,” who are the real targets of these programs.

This approach to entrepreneurship education reflects a neoliberal agenda in targeting individuals to become successful entrepreneurs by integrating them into a global capitalist economy. Governments’ role in fostering such entrepreneurship is relegated to ensuring the freedoms of individuals and delimiting obstacles to private enterprise and growth. But when such programs are taught to marginalized youth who are not given the freedoms or supports afforded to “opportunity entrepreneurs,” such as having access to the formal labor markets or formal financial services, entrepreneurship education and training is used to instill individual responsibility for their economic futures and resiliency in the face of economic instability and uncertainty. There is a disconnect between the assumption that entrepreneurship education and training can address the problem of unemployment by providing job creation and expanding businesses and the reality that most youth will not start new enterprises that are able to grow, at least in the short term. These programs do not often account for high business failure rates; rather, they assume that perseverance will result in eventual success. Still, the assumption persists that by educating youth, they will become entrepreneurs and increase their incomes.

Despite the rhetoric and many programmatic efforts to teach and support entrepreneurship for the purpose of economic growth, a recent World Bank report, *Entrepreneurship Education and Training Programs around the World: Dimensions for Success*, acknowledges that most jobs are created in the in formal economy (Valerio et al. 2014). Valerio et al. (2014) show that programs targeting necessity entrepreneurs – those who have to start a micro- or household enterprise in order to survive – often do not result in improving income, employability, and growth, particularly long-term sustainable growth. The evidence from various studies led the authors to conclude that programs for “vulnerable groups” are a means to poverty alleviation rather than as a means to “[foster] entrepreneurs and entrepreneurship” (p. 83). Thus, a second approach to entrepreneurship education aims to foster poverty alleviation, particularly among youth and marginalized groups. This “pro-poor” approach hopes to ensure the rights of the poor to have a decent livelihood by developing household or small enterprises in order to earn and cover basic needs, and in turn, addressing inequalities. These education and training programs tend to be short-term and nonformal, with most training focused on starting household enterprises or engaging in the informal economy. There is less evidence, however, of the long-term effects of such programs on getting the “poor” out of poverty and having sustainable livelihoods.

Programs targeting youth living in poor economic conditions are often labeled youth livelihood programs that may be directed toward workforce development and employability, and they also teach similar skills and mindsets as entrepreneurship programs. These programs often incorporate an explicit entrepreneurship component to start one’s own microenterprise as an alternative to working in the formal economy (see Butler et al. 2012). For example, the USAID’s Education Quality

Improvement Program (EQUIP) 3 is designed to address youth livelihoods through workforce development, education, and engagement in the economy to improve the school-to-work transition. Their program documents state that it “evolved to incorporate new components . . . [including] entrepreneurship” (p. 135). Preparing youth to work in the informal economy has emerged as the desired outcome for many of these programs, and evidence is increasingly showing this to be more probable than getting employment in the formal sector (Valerio et al. 2014).

These programs target “at-risk” or “poor” groups for training, but by focusing on developing enterprises in the informal economy, they can perpetuate status differences by relegating marginalized youth to the sector of the economy that is most unprotected by government social programs. Proponents of youth livelihood programs claim that targeting “at-risk” youth – those who are out of school or unemployed – not only reduces poverty but also prevents social ills by responsabilizing youth to engage in productive work in the informal economy. In this model, less attention is given to the regulations that affect youth in conditions of poverty in distinct ways, including addressing barriers to securing financial resources for youth who have little access to financial institutions. While there is some recognition by the ILO and the World Bank of the complicated environment in which youth secure jobs, and while they stress that other factors beyond the individual need to be accounted for, a considerable emphasis remains on youth and their efforts to overcome their own poverty (Elder and Koné 2014). In effect, these programs target youth’s skills training rather than labor market reforms and employment programs as the way out of poverty (Robilino et al. 2013). If these dominant approaches – that of creating or expanding businesses for job creation or starting household enterprises to alleviate poverty – do not account for social and structural inequalities that many youth face in order to work and have a sustainable livelihood, how can we reframe skills development and, more specifically, entrepreneurship education programs to consider some of these constraints?

---

## **A Postcolonial Perspective for Skills, Work, and Development in Local Economies**

If skills development and particularly entrepreneurship education and training are to address these entangled problems of economic development in globally marginalized economies, poverty alleviation which is not addressed solely through economic growth, and poor quality of education, a vestige of a colonial system that reproduces certain forms of knowledge, then educators and program designers need to consider the political-economic factors that have perpetuated and exacerbated such problems (Vally and Motala 2014). A postcolonial perspective allows us to examine these problems through an historical and political-economy lens, setting the problems of a country’s economic, social, and educational development in dialectical relationship to global economic development and relations. This means, for instance, that an examination of inequalities that keep some people out of the formal labor force is important to consider in policy and program design. This includes examining

economic and trade policies required by international financial institutions that have limited development in some labor sectors or changing education systems, influenced by domestic policies and international aid requirements, that don't allow many to complete secondary schooling.

A postcolonial perspective also calls for critiquing and reframing dominant discourses about development and particularly the assumptions about the centrality of economic growth for development (Escobar 1995). It calls for considering other perspectives and ways of framing development in social, cultural, and moral terms. Finally, a postcolonial perspective does not position one part of the world apart from others, as if it were culturally different, or what Spivak (1990) has called "worlding." This means that the context of Tanzania discussed as a case in this chapter is not unique or distinctly a Tanzanian version of reframing entrepreneurship education. Rather, it offers an example of how to consider the historical, political, economic, and social influences that call for alternative framings of the linkage between education, work, and social and economic inclusion and development. While there are some historical and social conditions that are unique to Tanzania, the use of a postcolonial framework and the capabilities and conditions discussed later in this chapter serve as a heuristic for considering social and economic inequalities and valued well-being outcomes in relation to implementing skills development and entrepreneurship education programs in other contexts.

A postcolonial perspective allows for examination of underlying economic and social inequalities that may have started in precolonial and colonial times and persist in different forms today (Tikly 2004). An underlying cause of the need for skills development, particularly for youth, is that some youth either have not completed their formal education or may not have learned the skills and knowledge required to work in different formal labor sectors. Inequalities in educational participation and quality of learning are a historical problem, and they continue to manifest in educational and learning outcomes today. For instance, a large percentage of youth in sub-Saharan Africa, and more specifically Tanzania, have historically not completed secondary education, which is deemed as a requirement for entering the formal labor market. During colonial rule, the less than 10% of the school-age population who completed secondary education in Tanzania were prepared for positions in the colonial government, and this orientation to secondary education continued even in the early years of decolonization. More recently, global and national agendas call for "Education for All," and the full participation of all youth in basic (including secondary) education. But in 2013, 34% of youth continued onto secondary education, and the completion of secondary education is still restricted to a select group who can pass the exams and pursue higher education, less than 50% of those who study through form 4 (Grade 10) in recent years (United Republic of Tanzania 2013).

By not completing a secondary education, youth in many countries are further excluded from societal membership because they are unable to secure work in the formal labor market. Ferguson (2013) refers to this as "work membership," recognition and inclusion in society based on being employed or participating in wage labor. One of the dilemmas facing many countries in sub-Saharan Africa is that while their economies have grown, the increase in jobs has tended to be in low-wage labor

(Elder and Koné 2014). Therefore, opportunities to work in the formal economy are extremely limited. Ferguson also suggests that analyses of development in sub-Saharan Africa need to account for social inequalities that are interlinked with economic inequalities. For instance, by not completing a secondary education, they are unable to participate in the formal labor market, which further excludes many from other social benefits and relations.

A postcolonial perspective also reframes the idea and outcomes of development beyond that of economic growth and situates meanings of development in local values and contexts. For example, in Mains (2012) examination of young men's post-educational lives in Ethiopia, he found that social relations were important for not only creating opportunities for work, particularly through entrepreneurship and self-employment, but they shaped how these young men, who could be regarded as idle without work and without hope, could be included in society. More than the economic contribution that these men made to their family and community, their social relations with others particularly through reciprocal giving of food, gifts, and social support were critical to their and their families' well-being and to being included members of society. In this example, participation in the economy and society is possible through social relations with community members, and this participation and the resultant well-being was as important as working and contributing economically.

Development in many local contexts must also be conceptualized beyond the overused binaries of "developed" and "underdeveloped," particularly in relation to a global capitalist economy. Gibson-Graham (2006) reminds us that global markets dominate economic relations and development, but they are not the sole types of economic activities within countries. They assert that there are many kinds of markets, but they also argue that our knowledge production and policies tend to privilege global capitalist markets. By conceptualizing markets as a singular global capital economy, we silence community, social, and moral aspects of markets that may not operate with the same norms as global capitalist markets. Therefore, reframing an analysis of skills for development needs to account for different kinds of economies, including the social and moral aspects of economic participation and development. The next section now turns to specific educational, social, and economic inequalities affecting youth in rural Tanzania.

## **Education and Work in the Context of Rural Tanzania**

The colonization and decolonization of Tanzania has had profound effects on the conditions that continue to shape education and work today. Colonization particularly affected Nyerere's approach to nation-building and economic development, based in African socialism, or what came to be known as *Ujamaa* in Tanzania. Nyerere's regime aimed to redress illiberal and, to a degree, liberal colonial governing regimes that had excluded many from education, work, and the fruits of development and, in its place, establish African values and policies in efforts to unify the nation politically and develop it economically without international and colonial

influences. Pan-African Socialism resisted a capitalist market economy that was increasingly evident in political discourses and in economic practices because Nyerere and other African leaders believed it caused inequality and underdevelopment. Attending to social and economic rights, which had been unequally provided under colonialism, was central to Africanization efforts of the early postcolonial governments. Nyerere (1968a) articulated this approach to political and economic inclusion in his writings on *Freedom and Socialism*:

The economic growth must be of such a kind, and so organised, that it benefits the nations and the peoples who are now suffering from poverty. This means that social and political development must go alongside economic development – or even precede it. For unless society is so organised that the people control their own economies and their own economic activity, then economic growth will result in increased injustice because it will lead to inequality both nationally and internationally . . . Political independence is meaningless if a nation does not control the means by which its citizens can earn a living. (p. 88)

Education was a primary tool of the state to foster self-reliance. Education was not only to develop the nation economically but socially and politically. Importantly, education for self-reliance cultivated an ethos among those who were educated to contribute to their community, and reciprocally, that the community would contribute to the education of its members through building and supporting schools and nonformal programs.

The education provided by Tanzania for the students of Tanzania must serve the purposes of Tanzania. . . . It must encourage the development of a proud, independent and free citizenry which relies upon itself for its development, and which knows the advantages and problems of cooperation. It must ensure that the educated know themselves to be an integral part of the nation, and to recognize the responsibility to give greater service the greater the opportunities they have had. (Nyerere 1968b, p. 74)

Nyerere's policies increased education participation, particularly at the primary level, but labor market and economic growth was more uneven. In the 1980s, facing economic and political crises, Mwinyi's new government shifted away from socialist policies toward privatization and decentralization, influenced by the International Monetary Fund's structural adjustment program (SAP). Still, some of the ethos of *Ujamaa* – political, social, and economic development for Tanzanians themselves – live on. Tripp (1997) shows that with the economic recession in the 1980s, many workers' wages collapsed, and household and small enterprises grew to provide for financial needs. In addition, economic liberalization required by the World Bank and International Monetary Fund promoted more privatization, including fees for education and health care (Samoff 1987). Despite these shifts toward expanding the private sector, Tripp (1997) argues that liberalization did not erase a community ethos of social support and development: "Even with increased market activity, the moral-economy rationales have not given way to the more market-oriented ones" (p. 127). While this ethos of community economic and social life in Tanzania has shifted over time and space, youth in our study reflected some of these influences in the kinds of economies and communities they valued.

In the local context of rural northwestern Tanzania (Kagera District) where a nonformal entrepreneurship training program was implemented (2012–2017), various persistent forms of economic and social inequalities affected out-of-school youth in particular ways. First, while education is valued for self-reliance and the work opportunities it purportedly can offer, youth who participated in this nonformal entrepreneurship program had been unable to complete their secondary schooling, often due to a lack of financial support. Being out-of-school left these youth struggling for the identity and status that education gives. For those who do not continue onto or complete secondary schools, further training is necessary in order to secure a livelihood, even in the informal economy.

The economy throughout Tanzania and particularly in Kagera is still primarily based on subsistence agriculture. Approximately 95% of households in Kagera engage in food crop and subsistence agriculture, such as growing vegetables and bananas or raising cattle, and some cash-crop production, such as coffee. In addition, less than 10% of households are employed in their own nonagricultural business, and 5% of the population is employed in a growing industrial sector of mining, manufacturing, gas, and construction (NBS 2014, pp. 113, 120). Kagera has been known as a region long engaged in the international economy, with coffee and bananas as key crops, though their prices are often volatile on the international market. Thus, those who farm these crops are often among the poorest households. Many households in this region live in poverty and are subject to either trading on volatile international markets or making a subsistence living in local markets.

It is important to consider how, then, people can get out of poverty and engage in sustainable work in these economic conditions. De Weerd (2010) examined why some households in Kagera, particularly those that were not assumed to move “out of poverty” given their initial assets, did improve, while others that were predicted to do so did not improve. He found that farmers and traders who improved their wealth and assets had not only diversified earning activities, but they also had strong social networks of people both within and outside the villages allowing them to trade and move food crops across the country. They often worked with apprentices as couriers between farmers and traders. Those whose income and assets grew did not depend on physical capital, but rather the continued trust of their *tajiri* (rich benefactor/boss). In addition, a *tajiri* benefits from the apprentice’s knowledge of local markets; and the apprentice, with additional material support from the *tajiri*, often enters into the trade him/herself. Those who had fewer social networks often ended up in mining or fishing, both of which are less secure earning sectors (De Weerd 2010). These social networks and supports were less common for women, particularly those who were widowed or divorced as most were not able to claim inheritance rights through the husband’s family, thus leaving them more vulnerable to poverty. It appears, then, that consideration needs to be given not only to education or work opportunities but the kinds of social relationships that enable work and sustainable income.

For out-of-school youth trying to secure a livelihood, there are few sectors and trades to engage in, and those, such as agricultural goods or mining, are subject to uncertainty and volatility in national and international markets. For youth excluded

from many social groups, the practice of apprenticeship is critical to not only learning a trade but also getting connected within and outside the community. This case of entrepreneurship education for these youth offers one specific context and set of personal, social, and economic conditions to consider how entrepreneurship education and training can be reframed from a capability approach.

---

## **A Capability Approach to Entrepreneurship Education and Training**

Neither Sen's nor Nussbaum's capability approaches are explicitly informed by postcolonial perspectives; Sen's scholarly work does, however, draw on historical and postcolonial perspectives of inequalities in India (See Sen 2009). In contrast, some scholars have argued that Nussbaum's liberal universalism specifically negates postcolonial scholars' critiques of dominant ideologies and ethnocentrism (see, e.g., Charusheela 2008). Nevertheless, there are potential alignments to postcolonial perspectives with regard to their commitment to redressing inequalities in all its forms and in setting capabilities and the achievement of well-being within an examination of economic, social, and personal conditions that are influenced by a history of colonialism. In contrast to the dominant approaches discussed above that frame skills development, and more specifically entrepreneurship education and training, a capability approach draws attention to fostering equality and achieving valued well-being, in addition to economic outcomes (Sen 1992, 1999). Educating for youth livelihoods from a postcolonial informed-capability perspective goes beyond sustaining life on the verge of poverty and tries to create pathways to stable, more equitable, and sustainable earning opportunities and overall well-being in an unequal global economy. Applying such a perspective to entrepreneurship education and training would require that entrepreneurial activities are not limited to, or rely primarily on, the informal economy in order to achieve sustainable development and well-being. Informal economy work is, in essence, economic activity that is unregulated and unsupported by government policies, such as social benefits, that further exacerbate economic and social inequalities (Balwanz 2012).

Applying a postcolonial informed-capability approach to entrepreneurship education suggest what Naudé (2012) has argued: that governments need to create policies to reduce necessity entrepreneurship. From this approach, government social policies need to attend to historical inequalities and ensure that disadvantaged individuals and their households do not have to incur all the financial risks that can result from poor financial service, trade, or labor market policies. Such social policies might include job creation and labor market expansion; wage and labor market protections including equitable access to sectors and social security. These are regulations that are not typically associated with entrepreneurship in its neoliberal form (Balwanz 2012; Naudé 2012). In addition, social policies and programs need to promote greater gender equality, given the gender inequalities that often exist in access to land and credit and, at the same time, the overrepresentation of women in the informal economy. Policies and programs directed at youth would include paid

apprenticeships and employability programs. Without these social supports and protections, informal employment is not an attractive option for future livelihood and well-being. From a capability approach, these policies and social supports are necessary components of entrepreneurship education and training programs that must go beyond individual training to address structural inequalities. As DeJaeghere and Baxter (2014) conclude:

Without governments committed to leveling the playing field, necessity entrepreneurs will not succeed as they transition out of programs and into competitive and struggling market-places. The chance of failure and its associated risks are far greater for youth from households and communities with limited and fragile safety nets. (p. 75)

Naude's (2012) discussion of a capability approach to entrepreneurship does not attend to the role that education can play in fostering aspirations and valued well-being. Beyond macro-level policy changes, a capability approach to skills development and entrepreneurship gives attention to fostering aspirations and valuing alternative futures for diverse youth (Powell 2012; DeJaeghere 2016). Too often, formal education does not promote alternative choices and opportunities for youth, particularly in systems where colonial educational approaches to abstract knowledge and high stakes testing persist. Entrepreneurship education, from a capability approach, might help youth identify what they value for their livelihoods and futures, rather than being something they have to pursue out of necessity, with no alternatives. Such an approach would also foster aspirations that give youth meaning in their lives and not only the pursuit of money. Powell (2012), in her study of South African youth pursuing vocational and technical education, sought to understand what youth valued and why they chose vocational/technical education. She found that "For these students, colleges are not simply an opportunity to access the labour market; colleges are an opportunity to gain satisfying work in workplaces where they will be respected and where they can make a contribution" (p. 21). From this perspective, education and training programs need to account for what young people value for their futures that is more than the economic gains from work.

What kinds of conditions and capabilities would such a framing of entrepreneurship education attend to? The next section draws on an analysis of a 5-year study of youth livelihoods following their participation in a nonformal training program. In this context of rural Tanzania, many youth developed capabilities to pursue sustainable and meaningful livelihoods; two critical capabilities that emerged in this context are discussed here. The intent is not to offer a list of capabilities that ought to be fostered in and through all entrepreneurship education and training programs; rather the value of a capability approach is to understand the conditions and processes that can support well-being and reduce those that constrain choices and opportunities for well-being (See DeJaeghere and Lee 2011; DeJaeghere and Baxter 2014; DeJaeghere 2016). Therefore, this discussion of these capabilities and conditions offers a heuristic for skills development and entrepreneurship education programs for youth in other contexts.

## **Which Capabilities and Which Conditions Are Important for Sustainable Livelihoods and Well-Being?**

Two critical capabilities supported youth's sustainable work and well-being toward a fuller, more complete life and toward greater equality in society. These capabilities are what Nussbaum (2011) might refer to as combined capabilities – ones that include the internal capacity to be or act along with the social, political, and economic conditions that allow one to act upon and fulfill their well-being. Elsewhere, I refer to these capabilities as “social relations” (DeJaeghere et al. 2016), meaning they are formed and enacted in social life and are not individually held or cultivated; in turn, these social relations enhance youth's ability to claim social and economic well-being in society. While I don't draw on Nussbaum's notion of a universal list of capabilities, I agree with her point that capabilities are not only internally held, but are fostered in relation to conditions in society.

One of the capabilities and conditions that was important for youth's livelihoods and well-being was recognition. Recognition, similar to what Nussbaum calls affiliation, was important for these youth to be socially included in society. Recognition includes being regarded as an equal human being, and importantly, that youth have equal worth and the ability to participate in economic and social life. This capability is a particularly challenging one as youthhood is premised on becoming, and not yet being, an adult (Durham 2000), and therefore, youth are often not yet able to participate in the social, political, and economic life in communities and society. This capability was perhaps so salient for these youth because, having not completed secondary school, they felt excluded in their society and community.

One of the ways that youth livelihood programs seemingly foster this capability is through the non-cognitive skills of self-esteem and confidence. These “skills” aim to help young people see and believe in their own value as individuals. But a non-cognitive skills approach falls short because it does not attend to how others value youth and see them of equal value. Recognition, different from self-confidence, is not individually learned or held; it is fostered through changing social relations with others in one's community (and country) that allow for marginalized youth to be valued and included equally in education, work, and social and political life. To foster youth's recognition requires programs to involve community members with youth so that adults see the social and economic value that youth offer (DeJaeghere et al. 2016).

Many youth who participated in a nonformal entrepreneurship education program stated that they acquired greater recognition, even though this was not a direct aim of the program. One young man who had trained to be a mason but also had several other household enterprises stated the changes toward being recognized and included in this way:

My role has changed. I can now participate as a community member. As the person I was – in a low ... situation ... they see that person as someone who cannot contribute to the community. If you have something, they think, ‘this one can contribute’ ... I am now recognized differently from before. They were seeing me, but they didn't see as a person who could contribute to the [community].

This young man gained a new status in the community and he saw himself, and others regarded him, as a community member. Because he was earning money, which he had not been able to do before the training program, being a community member allowed him to contribute to the community. In this sense, recognition has both social and economic dimensions. Another young woman, who had been living on the street in part due to conflicts with her stepmother, recounted a changing role in terms of respect from others and being able to support her family.

Last year was hard; I had to depend on myself and I didn't have any money. But this year I'm doing great. I am respected by people and getting my own money. I am helping my family ... my family is depending on me.

Her social inclusion, in terms of now being respected in the community and supporting others and her family, was equally as valuable to her as the economic gain from her work skills and her enterprise.

This capability did not emerge simply from being educated or trained. Recognition involved being seen as an "educated" or "skilled" person; it also required developing new kinds of relations with people in the community. Youth in this livelihood program were able to develop these relationships through apprenticeships, program recognition, and peers and adults introducing them to potential employers, customers, and other trades workers. Youth livelihood programs do not necessarily develop recognition; if they are to do so, programs must emphasize more than skills needed for work. Programs need to also consider in what ways and how youth are not valued in the community and how they can foster greater appreciation of youth and what they contribute to their communities.

A second capability and condition that was important for these youth's work and well-being was community care. Community care for these youth meant giving and receiving from others in the community as well as a broader ethic to ensure the well-being of all. Community care includes reciprocity, a form of social and economic relations practiced by many in these Tanzanian communities. Data from the longitudinal study showed how this ethic shaped young people's motives for their work, and their decision-making in use of profits. The young woman above goes on to clarify how her skills and enterprise helped others:

I see those [in the community] who don't have work and I am ready to help those who don't have work or I can supervise so I can give him a little money ... So the community respects me as I can support other youth.

Again, this capability is not one that can be individually taught and learned through a training program; it is embedded within the social relations of communities. While reciprocity is typically associated with moral economies (and often assumed to be part of traditional societies) in which a concern for the good of all and the future health of everyone is important, feminists, such as Yuval-Davis (2011) and Gibson-Graham (2006), have argued that care and reciprocity are important for

ensuring social inclusion and economic well-being in diverse economies and societies. Such an ethic helps ensure that one's work and enterprise are socially useful. Treat (2014) assert that there are many ways to make a contribution to society, and "we should not assume that contributing toward the profitability of a business is the only way or the best way – or even necessarily a good way" (p. 183). Relatedly McGrath and Powell (2016), citing Klein, call for "growing the caring economy, shrinking the careless one" (p. 13), economies that take into consideration short- and long-term well-being of self and others. Such community care should not replace social policies, such as health insurance or labor regulations, but this ethos can fill gaps where these policies are insufficient, and it provides a local mechanism for enacting social policies by seeking to ensure that all can benefit from policies and programs.

Community care can be cultivated through skills development and livelihood programs, but it requires concerted attention that goes beyond an individual profit orientation of many entrepreneurship education programs. Programs can start by creating positive group relations among peers by sharing information, ideas, and working together to develop their livelihood aspirations. When many youth from this program struggled to create their own enterprises, this entrepreneurship training program realized it needed to help foster group businesses so that they could support each other to develop related business skills, share customers, and engage with community members, including financial service providers who often did not want to risk lending to individual youth. In addition, programs should give attention to how they support the development of reciprocal and sustainable relationships between youth and community members through internships/apprenticeships and through community groups, such as saving and lending groups that are common in these communities in Tanzania. This youth livelihoods program also emphasized reciprocal and equitable relationships between employers/apprentices and youth by not paying either for their involvement in the program, and instead emphasizing what they gained socially and financially through the relationship. For example, apprentices gained from youth skills, which often allowed them to earn more in their trade, while youth gained new knowledge, skills, and networks from apprentices. One community-based trainer summarized the effects of youth's skills and work in the community in this way:

The community sees the program as having a lot of impact, as they contribute to the community and they employ their fellow youth, also they have helped to even lift up their families . . . it doesn't just help the youth alone, but also the community.

Developing capabilities and conditions of recognition and community care can go some way toward changing community practices, norms, and structures to foster sustainable and meaningful work for youth. These local practices can also be used to enact policies that could further allay economic and social inequalities that affect youth. Without these capabilities, these youth were vulnerable to working in environments where they were taken advantage of, given inadequate pay, and unable to garner the social supports to care for family or those in need.

## Conclusions

Entrepreneurship is one set of skills that is being promoted through global agendas and national educational and training policies in response to a precarious economy, high youth unemployment, and poor quality education. Underlying the problems of unemployment are economic and social inequalities that perpetuate exclusion of many youth from their communities. If such “skills” are to foster sustainable livelihoods, one that foster greater well-being for individuals as well as communities (McGrath and Powell 2016), then donors, policymakers, and educators need to rethink the purposes and mindset taught and learned in these programs. The dominant approaches to entrepreneurship education and training presume that learning technical, entrepreneurial, and non-cognitive skills will enable self-employment, profit-making, and resilience among young people to succeed in precarious economies. But because many young people, particularly in poor and under-resourced communities, are excluded from social and economic life, these approaches to skills development for work need to also attend to the social conditions that exclude youth in society.

Using a postcolonial informed-capability approach allows educators and researchers to consider how social conditions affect youth in a particular program and community. In a nonformal livelihood program in Tanzania, recognition and community care emerged as two important capabilities and conditions to enable livelihoods that promoted greater well-being. These capabilities were critical so that youth’s skills and work were not directed to pathways that have dead ends – those in which they could not make enough money to ensure their and others’ well-being.

Skills development programs that enable social recognition allow youth to be seen and treated with equal value in contributing to and benefitting from their community. In addition, fostering an ethos and conditions of community care ensures that youth’s skills and work are regarded as contributing to the community, ensuring their own and other’s well-being. Community care also attends to longer-term sustainability of their livelihoods by integrating their work within the community and contributing to the social and economic development of the community. These types of social relations, or “skills,” are not commonly included in entrepreneurship education programs. A capability approach to skills development and education programs can reveal inequalities youth face that constrain their ability to participate in social and economic life of societies. Such an approach also helps international development practitioners and educators to design program with consideration of local social and economic relations that shape youth’s work and livelihoods. Program designs would include attention to moral and local economic values, such as reciprocity, in addition to notions of competition, profit, and resilience that shape many entrepreneurship education program designs.

If the skills that youth learn and the work they do are indeed to contribute to the human development of future generations, as called for in the SDGs, then the orientation of entrepreneurship education and training should be toward those social relations and capabilities that foster the social and economic well-being of self and others.

## Abstract

From a capability approach, the Technical and Vocational Education and Training (TVET) component of the global agenda for sustainable development represents a major tool for cultivating the equitable agency capacity of individuals to participate in the labor market and to rethink their reality in and out of work, modify it, and make it more suitable to their desired development scenario.

In this sense, some teachers use project-based learning methodologies to show their students how to formulate and put development alternatives into practice. This introduces students to the experiences of agents of change and active development initiatives.

This chapter seeks to contribute to these efforts by sharing some conclusions drawn from an empirical research on development initiatives in different countries. They concern some of the challenges and constraints that these initiatives face to be sustainable, as well as the strategies that they use to confront such challenges.

These reflections which teachers could incorporate into their project-based learning methodologies place special emphasis on political-economic factors that influence how objectives are defined and how the development agenda is implemented. We analyze factors that influence the decision-making process, power relations, and the potential of each individual or group to implement and negotiate their initiatives under conditions of equity.

## Introduction: TVET as a Tool for Cultivating the Agency Capacity of Students Toward Sustainable Development

**Technical and Vocational Education and Training (TVET)** has been greatly influenced by the imperative of sustainability, the qualitative element of the global development agenda. Many education stakeholders evaluate TVET in terms of the skills and knowledge it transfers to its recipients, ensuring them employment opportunities and satisfying the needs of the labor market.

Many others consider that TVET also has potential to aid the forging of a sustainable model of development, by helping the students rethink the world of work so that they can modify it and render it more suitable to their desired development scenario (Fien and Wilson 2005; Maclean and Pavlova 2014; Tsang 2012; UNESCO-UNEVOC 2006). Such approaches have been causing “a shift in focus from short-term to longer-term development needs, from expansion of systems to their transformation, and from contributing to economic growth to an added concern for social equity” (UNESCO 2012, pp. 1–2).

The gradual reconceptualization of TVET, emphasizing the need to improve its **quality** by making it more compatible with the aspirations underpinning sustainable development models, suggests that it can be a useful instrument to cultivate what the capability approach calls people’s capacity for **agency** (Nussbaum 2012; Sen 2000), that is, a person’s actual power to:

1. Make effective use of available development opportunities (education, health, etc.) throughout their lives – according to their own aspirations and needs
2. See themselves as active agents and not only passive beneficiaries – with interests, responsibilities, and initiatives to transform societal arrangements to pursue and safeguard opportunities for themselves and the community

Sustainable development **requires** enhancing people's capacity for agency.

It requires **development initiatives** have the capacity and conditions to create interventions that are actually sustainable.

This is true for the development initiatives of individuals, local, national and international governing bodies, and organizations of all types and scale. It is also the case for initiatives which contribute to this process from distinct domains, for example, in combating poverty, health, education, and environmental protection.

Sustainable interventions require political and financial resources, know-how, work, as well as the socialization of ideas, experiences, and training. This applies not only for initiatives already underway but also for those about to join work teams or formulate new initiatives – the recipients of TVET.

The skills, competencies, and knowledge acquired through TVET programs should include those that foster people's capacity for agency. Such programs should motivate students to learn how **development initiatives** that affect their lives or aim to change their conditions are put into practice, how to identify the political-economic factors that make sustainability difficult, and how to tackle such problems.

Learning from the achievements and difficulties of these experiences will strengthen students' capacity to influence the development process in a more sustainable way, through any of the labor areas they join.

---

## Methods Used to Introduce Students to Alternatives for Development Change and Stimulate Agency

TVET educators from different fields (schools, universities, workshops, companies, etc.) use versions of **project-based learning** that link the learning of skills, knowledge, and competencies with civic and critical education. These help prepare students to get involved in the realities and possibilities of the human development field. Normally, this is through studying a problem of social interest, doing research on the problem, writing a proposal for its solution, and sometimes even carrying out an intervention.

One of these methods is service learning, which is based on the assumption that the preparation of students should be achieved through combining service with learning, by working for the benefit of the community. Students are asked to analyze the problems of a community and then devise and implement potential solutions. However, according to Chang (2015), this can become top-down and elitist unless teaching is embedded “with community members and spaces toward collective self-determination” (p. 31).

Other project-based learning methodologies such as place learning, experiential learning, or field trips rarely involve action research work with communities and are usually rather passive. Yet they often share with service learning the conviction that preparing a student to become an agent of change requires that he becomes familiar with the practical, concrete, and subjective experiences that complement what is discussed in the classroom.

Such experiences allow an abductive learning process, constructed from interleaved processes of deduction and induction, in other words, a process that

allows the continuous transition from particular experience to theory and vice versa (more on these methodologies in Buck Institute for Education 2017; Claiborne et al. 2017; Edutopia 2017; Evers and Wu 2006; The Glossary of Education Reform 2013; Wilderdom Outdoor Education 2005).

In this way, schools and vocational training centers around the world formulate programs and activities linked to development initiatives often motivated by national curricular policies (Eurydice 2012; Furco 2010; Skinner and Chapman 1999). These programs (which are of differing duration, depth, and even level of commitment) seek to familiarize learners with the challenges they will face when building viable and sustainable alternatives, generating empathy with the initiatives' ends and preparing them for that vocational choice.

Students from the K.R. Mangalam School in India, for example, were brought to talk with students from a school for disadvantaged children and were invited to donate school supplies to encourage their capacity for charity and empathy (K.R. Mangalam World School 2014).

In Ireland, Schools Across Borders invites students to research issues of local or global interest such as poverty, child labor, and environment. Students then identify development initiatives that work toward solving these problems, establish contact with their leaders (e.g., scheduling online calls), and develop outreach projects among the student community (Schools Across Borders 2013).

In a similar vein, Kids Go Global Canada invites students to access an online platform where nongovernmental organizations that welcome their participation detail their work and projects. Students have to choose an initiative, explore the issues, get in touch with the NGO, and help it get financial support by devising promotional campaigns (Kids Go Global 2017).

The United Arab Emirates Sustainable Schools Initiative promotes hands-on school field trips offered by supporting organizations (public and private) that enable students to apply transdisciplinary and problem-centered approaches to reduce the national environmental footprint (Global Environmental Education Partnership n.d.).

The MediAction Project in Morocco, in partnership with local associations, established five training centers to teach young people mediation and dialogue skills to aid social cohesion (Akar 2016).

Some higher education institutes also partner with development initiatives, offering students the opportunity to practice their skills while serving the needs of those initiatives. Graduate students of the Milano School of International Affairs, Management, and Urban Policy, for example, collaborate with local organizations and communities in New York City. In this way, they put the participatory facilitation and dialogue skills previously learned in their theoretical courses on participatory community development, popular education, and critical pedagogy into practice (The New School Collaboratory 2016). A course at the Ibero-American University in Mexico City used to guide its law students to offer free consultations to civil society organizations on how to manage tax deductibility and, through this, learn about the challenges involved in practicing their profession in this area of development (Fortalece Legal n.d.).

These are just a few examples of the different ways TVET recipients are brought closer to the experiences of agents of change who, through their initiatives, are proposing their own version of what sustainable development should

mean. These approaches seek to reinforce different knowledge, skills, and abilities (empathy, professional development, etc.) that, ultimately, are expected to increase students' **capacity** for **agency** to change the process of development for both themselves and the world, once they are incorporated (or reincorporated) into their working life.

In this sense, these activities and programs would have an important added value for the enhancement of the agency capacity of the learners, if they were also used to acquaint them with the factors that impinge on the agency capacity (power) of the visited initiatives to effectively provide sustainable development alternatives and with the means by which they sort them out.

---

### **The Importance of Creating Awareness About the Agency Capacity of Development Initiatives**

As implied in the main international consensus documents on this matter (see, e.g., UNCED 1992, or WCED 1987), **sustainability** is a quality that can describe the global process of development when the initiatives through which it is carried out offer solutions that are:

1. *Integral*: that respond to the different developmental contexts in which they are inserted and where they have an impact both locally and globally (political, environmental, social, economic, cultural)
2. *Relevant for all*: relevant to the needs, views, interests, conditions, and working approaches of the different actors involved, in both present and future generations
3. *Equitably appropriated*: that recognize the right, capacity, and responsibility of the different actors affected by them to decide and control the processes of design, implementation, and evaluation of the initiatives

However, though most development initiatives address issues of interest to the international community (e.g., lack of access to education, pollution, poverty), the challenges they encounter to achieve sustainable results in the terms described above are quite different. Initiatives vary in their roles, responsibilities, philosophies, working approaches, and in the actors involved (with their distinct needs, priorities, interests, and perception of problems). They also vary in the resources and incentives they have available, in the socioeconomic, cultural, and environmental contexts with which they have to contend and in the legal and socioeconomic framework in which they have to operate.

In addition to these contextual structures and factors, the agency capacity of development initiatives to provide sustainable solutions also tends to be constricted by their strong reliance on external financial resources. These, in addition to being scarce, are often accompanied by a series of conditions that limit their authority on the design and implementation of their own projects. For instance, some funders, in order to address their own accountability pressures, establish funding criteria that are not necessarily relevant to the local agents' interests; another example are budgets

that favor certain areas of development to the detriment of others (making it difficult to implement integral interventions), etc. (Blaak 2013; Gillies 2010).

Moreover, the processes of decision-making, management, and implementation of all development initiatives are affected by external political actors and regulations. Often these share interests with and are sources of support for the initiatives; other times, either due to group interests or to the growing tendency to make vertical and standardized policies in order to guarantee minimum gains in the procurement of general rights, the external actors end up forcing the initiatives to adjust their interventions to criteria that are not always adequate to the context of implementation, or are not in line with the values and aspirations of the beneficiaries, making it difficult to implement interventions that are relevant for all. This is what happens, for instance, with many standardized and punitive evaluations that aim to achieve global sustainability goals (Jansen 2012; Mason 2011).

As such, this **political-economic** context often forces development initiatives into a permanent state of negotiation, cooperation, and conflict, during which decisions are taken about the design and implementation of their projects (Leftwich [2006], cited by Kingdon et al. 2014). This, in turn, impacts the sustainability of initiatives.

The political-economic context frequently pushes initiatives to develop ways to compensate for the challenges posed by their **dependency** on external factors and actors by increasing their capacity to:

- (a) Decide what is in their best interest and what is not
- (b) Identify the problems they face, given their specific context, and the available resources – human, financial, structural – to bring about the necessary changes to solve them
- (c) Execute their projects in harmony with the needs of the sustainable development agenda at the global level

Thus, the invention and implementation of these mechanisms are crucial to improve the initiatives' agency capacity (their de facto potential) to solve their problems in a sustainable way (Szekely 2015).

This is why, when TVET students learn about the challenges faced by development agents while formulating and implementing sustainable solutions and with the measures they devise to overcome these challenges, their own capacity for agency is enhanced. They can then transform the labor market through existing or self-created initiatives toward sustainable development.

---

## **What to Observe During Project-Based Learning Exercises and Field Trips to Development Initiatives to Create Awareness of Their Agency Capacity**

This section outlines issues that might be observed during project-based learning exercises and field trips to development initiatives, issues that can help students learn how initiatives deal with their dependence on external factors, actors, and resources and build their agency capacity to ensure sustainability.

These reflections draw on the results of a study, carried out between 2012 and 2017 (Study sources of support: <https://wp.me/p8EZH0-Qy>), on the experiences of development initiatives working on diverse areas (rural development, education, environmental procurement, social participation, tourism, etc.) which operate in different parts of the world, namely, The Solar Night Schools Program operated by the Barefoot College in India ([www.barefootcollege.org](http://www.barefootcollege.org)); Amigos de Calakmul ([www.amigosdecalakmul.org](http://www.amigosdecalakmul.org)), Mercado Alternativo y Economía Solidaria ([www.tumin.org](http://www.tumin.org)), Red de Multitruque Tlaloc ([www.redtlaloc.blogspot.mx](http://www.redtlaloc.blogspot.mx)), ChildFund International Mexico ([www.childfund.org](http://www.childfund.org)), Centro de Ciencias de la Complejidad ([www.c3.unam.mx](http://www.c3.unam.mx)), Banco del Tiempo de Guadalajara ([www.lacoperacha.org.mx/banco-tiempo-guadalajara.php](http://www.lacoperacha.org.mx/banco-tiempo-guadalajara.php)), Ectagono ([www.ectagono.com](http://www.ectagono.com)), Fortalece Legal ([www.proyecto fortalece.org](http://www.proyecto fortalece.org)), El Refugio ([www.elrefugiozacatlan.com/index.php/es](http://www.elrefugiozacatlan.com/index.php/es)), and Bosque de los Arboles de Navidad ([www.bosquenavidad.com](http://www.bosquenavidad.com)) in Mexico; Fundación Escuela Nueva ([www.escuelanueva.org/portal1/es](http://www.escuelanueva.org/portal1/es)) in Colombia; and Projeto Saude e Alegria ([www.saudeealegria.org.br/in](http://www.saudeealegria.org.br/in)) in Brazil. The study included bibliographic research, telephone interviews, and field visits, using methods such as observation, open-ended interviews with key agents and beneficiaries, documentary reviews, etc.

Clearly, the diversity of contexts in which these development initiatives operate precludes generalization of the efficiency of their mechanisms used for cultivating agency capacity for sustainable development. However, the experiences of these initiatives allow us to reflect on the challenges they face when creating projects that intend to be relevant for all, integral and equitably appropriated. They also show the kind of decisions that must be taken in order to minimize and resolve their dependency conditions. From these elements, this author formulated a list of topics and questions drawn from these experiences, which are proposed here as a guide for a better understanding of the phenomenon, as a learning tool, for those TVET educators who visit or work in cooperation with development initiatives.

## Self-Awareness and Planning on Agency Capacity

An initiative's ability to deliver sustainable results is greatly determined by the level of awareness that its executors have about its own degree of agency and its potential trans-generational impact. Therefore, the extent to which they have defined spaces, moments or other measures to reflect and take decisions upon these issues, can sharply affect the design of the working model, as well as the allocation, motives and long-term planning of the funds.

### What to Observe?

- Self-awareness on agency level:
  - How aware are the implementing agents of who is actually taking the decisions about the design, implementation, and evaluation of their initiative? For example, themselves, the State, the beneficiaries, and the donors?
  - How aware are they of how the above condition affects the initiative's capacity to solve its problems, both in terms of global sustainability and of its particular conditions?

- To what extent have they mapped the external factors that help or hinder their performance? For example, external evaluations, restricted funds, national legislations not relevant to their local context, corruption practices, related social movements, etc.
- Have they evaluated the level of dependence that the initiative has on those external actors and factors?
- Have they evaluated the resources they have and the strategies they could implement to reduce such dependency? (without undermining others' needs) For example, funds, technical capacity, collaborations, etc.
- **Self-awareness on trans-generational impact:**
  - To what extent does the initiative design its own model, plan the actions, and distribute funds to solve the causes of its target problematic in the long run?
  - Have the implementing agents considered who has the capacity to ensure the effectiveness of their project and working methodologies in the long term and even to scale them up? For example, the initiative itself? The State? The beneficiaries?
  - What role has the initiative chosen to play to make better use of its resources and have a more sustainable impact? For example, a network orchestrator (who forms and coordinates networks of related initiatives), a local capacity builder (who works on strengthening the capacity of beneficiary agents to gradually take the direction of the initiative), a demonstrative experience creator (who formulates model experiences that can be later scaled by the State or another agent with greater capacity), etc.
- **Spaces, moments, and other mechanisms for reflection and planning:**
  - What physical and temporary spaces has the initiative designed to reflect on its agency capacity and trans-generational impact and to discuss and decide on relevant strategies for their strengthening? For example, weekly meetings for strategic planning, annual self-assessments, areas in charge of bringing about institutional analysis and integration, etc.

## **Mechanisms to Ensure Equitable Ownership**

For many development initiatives, enable that all stakeholders can negotiate their design, implementation and evaluation processes in terms of equity, requires them to reduce their dependence on external resources and expertise, and to create structures and techniques that allow and encourage local participation, organization and negotiation.

These structures give the initiative a wide a view as possible of the problems they face. This enables actors to suggest coping strategies and offer feedback to the initiative, aiding its planning, flexibility, and adaptation. They can also help balance global and local needs and deal with both endogenous and exogenous accountability pressures

**Box 1 Alternative Currencies**

Several initiatives in Mexico have chosen to use alternative currencies to reduce their communities' dependence on the national currency (the peso) and to strengthen their capacity to satisfy local needs.

The Banco del Tiempo de Guadalajara established a system for people to exchange services using time as a transaction currency and save their conventional money for other expenses.

The Mercado Alternativo y Economía Solidaria initiative in Veracruz and the Red Multitruque Tlaloc in Mexico City printed vouchers with an equivalent value to the Mexican peso. They aim to encourage local production and economic exchange by distributing an initial amount at no cost to participants, who commit to spend that money on the businesses of other partners, and to receive the alternative currency in at least 15% of the payments to their own products.

The hostel El Refugio in Puebla accepts and encourages the practice of bartering with customers (in addition to paying with conventional money). This allows them to exchange lodging for advertising, solar panels, wine bottles, and even work.

In all these cases, the use of alternative currencies (vouchers, time, direct barter) has helped to minimize their reliance on external resources that do not flow easily through their communities. It has also helped the communities to encourage and strengthen the production of local services and products, with a view to creating a stronger economy for the future generations. Moreover, all initiatives provide a space where participants can discuss and negotiate issues such as the rules for transactions and the members, products, or services that should be included in the project to ensure that the different needs are met (e.g., assemblies, fairs, face-to-face negotiations).

They can provide transparency to the decision-making process. This can increase the trust of the different actors involved (commonly undermined by fear of corruption or abuse). Chiefly, they can help create the conditions for the beneficiaries of the initiative to become agents of their own development: defining strategies, distributing roles and responsibilities, and providing the necessary resources or work to implement the initiative – thereby helping to reduce its dependence on external financing and increasing its possibilities of survival.

To stimulate local ownership initiatives, use a variety of techniques:

- Decentralize the management of their funds and responsibilities.
- Use participatory techniques in the design and implementation of all stages of their projects.
- Promote the creation and strengthening of local leaders and organizations.

- Design feedback mechanisms that ensure that all voices are well represented.
- Encourage the education and technical training of local actors.

To guarantee equality of conditions in negotiations between different agents, initiatives often:

- Create projects of common interest that motivate cooperation.
- Establish trusts involving both beneficiaries and donors to ensure that the different interests in question are well negotiated and respected.
- Systematize the value of the services and resources provided by their communities/actors and use this local resource to, for example, establish parity funds that take into account the value of these contributions.

### **What to Observe?**

- How equitably are the rights and responsibilities shared between local and external actors during the negotiations on its design, implementation, and evaluation?
- What institutional, ideological, and financial mechanisms has the initiative designed to ensure equitable ownership?
- What types of structures and techniques for local negotiation, organization, and participation have the initiative designed or encouraged? How do they work?
- Are there any obstacles that prevent it from being equitably appropriated?
- How does the initiative handle the situation?

### **Mechanisms to Ensure Relevance for All**

A major challenge for development initiatives is to ensure that their interventions are relevant to the needs, cultural values, interests, and working approaches of the different actors affected by them: the immediate beneficiaries, the organizations that support them, the neighboring, national and international communities, and the present and future generations.

#### **Box 2 Local Capacity Building**

ChildFund International works with marginalized children and their communities in over 30 countries through partnerships with local groups and organizations. Its specific purpose is forging the communities' agency capacity to sustain development initiatives in an agreed period of time.

To that purpose, ChildFund invests in hiring personnel that help find businesses willing to refund those operational expenses and invest in

*(continued)*

**Box 2 Local Capacity Building** (continued)

capacity building programs for the communities. The enterprise does this by matching each donation to the initiative by its employees through the “matching gift program” organized by its human resources department.

With this income, ChildFund’s main office operates as a capacity builder, creating and empowering local branches (all as separated civil associations) by training them to get funds, manage programs, establish cooperatives, increase social participation, etc.

The enterprise and ChildFund make an agreement with the community organized as a local civil association, to produce results in a certain period of time (10, 20 years). If there are no results (measured by periodical evaluations), the funding is stopped.

In short, the partnership contemplates an exit plan for both the enterprise and ChildFund’s main branch, with the intention of promoting a decentralized development program with long-term impact.

This is for two reasons:

1. Ethics that seek to extend opportunities for development, to improve quality of life for every person, making sure that the benefit of one does not compromise that of the others – such as the one that underlies the capability approach.
2. Our interdependence has revealed that the fate of every person, community, or nation affects the opportunities of others, including those of future generations – a pragmatic reason.

To warrant relevance for all, specific measures must be taken:

- Actions to adapt global agendas to local contexts and vice versa
- To neutralize vertical policy schemes
- To customize “best practices” to the particular context where they are being implemented
- To plan initiatives taking into consideration the interests and needs of those groups traditionally discriminated against by their communities, etc.

Some initiatives do this by incorporating local knowledge, resources, and motivations into national curricula (with complementary materials, community engagement projects, bilingual education, etc.). This is known as intercultural education. Others focus on detecting and addressing specific factors that prevent certain groups from benefiting from health, employment, and other programs, by forging local participation structures. Still others do so by encouraging the leadership of traditionally discriminated actors, etc.

### What to Observe?

- Who is being benefited by the development initiative?
- Whose interests or needs may be affected by it?
- How compatible is the initiative with the development priorities at a global level and how much with those of the immediate beneficiary community?
- How do exogenous factors (such as donor terms of reference or national legislations) limit the initiative's capacity to ensure the relevance of its interventions not only globally but also locally?
- To what extent are local principles, knowledge, and values taken into account in the initiative's design and evaluation?
- To what extent do the efforts of the initiative facilitate or hinder the way for future generations?

In other words:

- To what extent is the initiative investigated relevant to the conditions and interests of all the different actors affected by it?
- Is the initiative interested at all in having this plural relevance?
- What institutional, ideological, and financial mechanisms has it devised to this end?
- Does anything prevent the achievement of relevance for all?
- How does the initiative deal with the situation?

### Box 3 Participatory Mapping

Projeto Saude e Alegria works with socially and geographically excluded populations, many of them of the caboclo indigenous-descendants group, in the Brazilian Amazon region of Western Para State.

The initiative organizes programs for community health, forestry, education, culture, and communication.

All are designed and monitored through a technique for local participation, organization, and negotiation called participative mapping: community members meet with implementing members of the initiative to draw up a map of their region, bring together all available information to build a geographic database, and make an in-depth diagnosis of local conditions, challenges, conflicts, problems, and priorities.

The mapping serves as a "document of reality" that provides a basis to program the regional development initiatives of both the Projeto Saude e Alegria and the government, to ensure good land management, permit territorial regularization, and promote the sustainable use of resources. It also serves to identify local elements (e.g., objects, animals, topics of interest to the inhabitants) that can be used to adapt textbooks and other educational materials to the local circumstances, making them more relevant to the community's immediate reality.

## Mechanisms to Ensure Integral Interventions

Integral development solutions are more likely to be sustainable than stand-alone interventions. They also help minimize the dependency of initiatives on external resources.

The life of the people and the communities with which development initiatives work is integral: many factors – political, environmental, economic, cultural, etc. – influence both the generation and significance of their problems, as well as the capacity of each person to capitalize the development interventions aimed at solving them.

Comprehensive solutions recognize and address this diversity of factors, as they are aware that neglecting one can prevent people from taking advantage of the service, opportunity, or facility provided by the initiative.

Addressing the different dimensions that affect the target problematics of development initiatives allows different behavior to emerge and reduces the possibilities for the resurgence of the original problems.

Initiatives can strengthen the transversality of their institutional responsibilities and the interrelationships between their programs. This allows mutual reinforcement, and the benefits obtained in some areas can have a positive impact on others. This includes the distribution and sharing of funds and other human and infrastructural resources (which often are easier to obtain for work on certain development areas than others).

For these reasons, several initiatives foster the integrality of their projects by implementing models that provide a set of integrated services (health, education, etc.) and by ensuring a systemic design for their interventions where all actors and factors are addressed.

Other initiatives establish institutional areas specifically responsible for promoting the connection between their programs. Others ally with other initiatives that work with their same target populations, sharing information and resources. Several foster integral interventions by forging mechanisms for different forms of local participation (local organizations, assemblies, etc.), to identify the different factors affecting the problems with which they work in their particular context.

Others seek to strengthen local economies to meet the different needs of their target communities. There are also those that invest the funds collected for a specific individual or group in programs for the integral development of the community to which these individuals or groups belong.

### What to Observe?

- To what extent has the initiative typified its target population (its context, its various interests, and its particular needs)?
- What mechanisms does the initiative use to map the different factors that affect the problem of interest (economic, nutritional, social, cultural)?

- How comprehensively does it address these factors?
- Are there any obstacles that prevent the initiative from assuring the integrality of its intervention? For example, restrictive terms of reference, funding accountability pressures, etc.
- How does the initiative deal with these obstacles?

#### **Box 4 Association of Initiatives (Partnerships)**

Bosque de los Arboles de Navidad (hereafter BAN) is a social enterprise in Mexico's southern state of Puebla whose main economic activity, the sale of Christmas trees, is complemented by a series of programs that seek to promote ecological awareness and conservation, environmental education, and local socioeconomic development.

Two types of collaboration are promoted to satisfy diverse needs and ensure the integrality of the project and, with it, a greater projection and attractiveness without the need to invest extra resources:

##### *1. Close collaboration with other social enterprises, based on mutual benefits*

One offers walks, retreats, and tailor-made talks for companies' employees in the BAN territories, which brings extra resources and publicity. A nearby hacienda offers hotel lodging and camping services, cultural visits to local history and geography museums, parks for the protection of local species, and extreme sports facilities. The hacienda not only offers several of these services for free to BAN customers but also sends its own customers to visit BAN's initiative. In exchange, BAN gives them free saplings from its nursery and discount coupons for the purchase of Christmas trees and offers them talks about the sustainable management of forests and walks through the nursery and the forest.

Another company organizes school visits that are recognized by the Ministry of Education because they are designed to reinforce the teaching of subjects of the curriculum such as science, environmental education (garbage management, rainwater harvesting, etc.), civics, etc. The visits represent an extra income for BAN, who in addition to the talks also gives free trees of the nursery to each student.

##### *2. Collaborations with the local population based on mutual benefits*

BAN provides the facilities for a Christmas bazaar that gives merchants the opportunity to sell their products. Although the income that BAN receives from them is barely enough to maintain the place and does not represent a monetary gain, it increases the attractiveness of the trees sale for the people coming from other parts of the country. The same thing happens with the Christmas food market. In this case the vendors, mostly local, are not charged rent.

*(continued)*

**Box 4 Association of Initiatives (Partnerships)** (continued)

Moreover, BAN gives permission to local collectors to gather and sell the garbage they generated, which in turn helps it to keep the facilities clean. It also gives permission to local shepherds to bring their lambs to pasture, which benefits BAN because in so doing they cut and fertilize the grass where the trees are planted. In addition to these collaborations, which help increase the project's impact by creating environmental awareness in different sectors of the population (companies, schools, families), BAN promotes and scales its model through environmental awareness talks and technical training courses on the installation and maintenance of nurseries, rainwater harvesting systems, etc. This is being offered free of charge to peasants and to the national and foreign organizations that visit its initiative.

---

**Conclusion**

Finding solutions for sustainable development is of utmost urgency for each and every inhabitant of this planet, including TVET recipients and their descendants.

As such, it's important that the TVET learning processes incorporate elements that familiarize students with the alternatives of social change undertaken by development agents around the world through their initiatives. They should also acquaint the students with political and economic factors, considerations, and measures that strengthen or limit their agency capacity (power) to carry out interventions that are integral, relevant for all, and equitably appropriated – i.e., sustainable.

Learning how to inquire about these issues through the interaction with firsthand sources will help TVET students to better understand the importance of the global sustainable development agenda, its conceptual and practical implications, and the concrete means and strategies they can incorporate into any working area in which they choose to participate.

This will strengthen their own agency, which will permit them to take advantage of, question, and modify the labor and other societal arrangements that affect their quality of life or, even, to create new alternatives.

**Abstract**

Many low- and middle-income countries face strong pressures to expand their technical and vocational education and training (TVET) systems and enhance their quality. Funds are obviously needed to achieve this, but while there tends to be a lot of focus on how much funds are needed (or, rather, the focus is usually on how little funds TVET currently receives), there tends to be much less of a focus on how TVET funds are allocated within the sector and the role that various allocation approaches can have in incentivizing TVET reform priorities (e.g., access, equity, quality, relevance, employment outcomes). This chapter addresses the following key questions: Where does TVET funding come from? How are TVET funds spent? How are TVET funds currently allocated? What roles can financing play in achieving TVET reform and national policy objectives? How can countries create the right environment for TVET financing?

---

---

**Introduction**

Many low- and middle-income countries face strong pressures to expand their technical and vocational education and training (TVET) systems and enhance their quality, at the same time as facing spending pressures on basic and higher education. As this demand increases, the need for sustainable financing for TVET becomes more urgent. However, there needs to be greater awareness that countries don't just need sufficient and predictable revenue streams to fund training programs, but perhaps just as importantly they need to have in place appropriate financing mechanisms that are themselves strongly linked to achieving reform policy objectives (e.g., of making TVET systems more accessible, equitable, efficient, demand-driven, responsive, and relevant). In other words, countries don't just need to be concerned with raising enough funding to finance TVET reform, they need to make sure that the financing approaches themselves promote the goals of TVET reform.

This chapter aims to address the following key questions with regard to the financing of technical and vocational skills development reform:

- Where does TVET funding come from?
- How are TVET funds spent?
- How are TVET funds currently allocated?
- What role can financing play in achieving TVET reform and national policy objectives?
- How can countries create the right environment for TVET financing?

## Where Does Funding Come From?

In most low- and middle-income countries (LMICs), TVET funding typically comes from three main sources: government budgets, student fees, and the private sector. In addition, other sources might include employee contributions, private donations, income generating activities, and external assistance (e.g., official development assistance (ODA) and official loans). Funding portfolios of TVET providers across countries and across types of provision varies, but in general for the majority of public TVET providers in LMICs, government funding is the most significant source of funds, while student fees are the most significant source of funds for private providers. Meanwhile, training for employees in private firms is almost entirely paid for by that firm.

### Government Funding: Via Grants and Direct Payments

In most LMICs, government funding is the most significant source of funds for public TVET providers. Salaries of most (sometimes all) staff working in public TVET providers are typically paid directly by government. Recurrent costs are typically borne by either an annual budgetary payment or by ad hoc or recurrent monthly grants.

### TVET Funding from Official Development Assistance and Other Official Flows

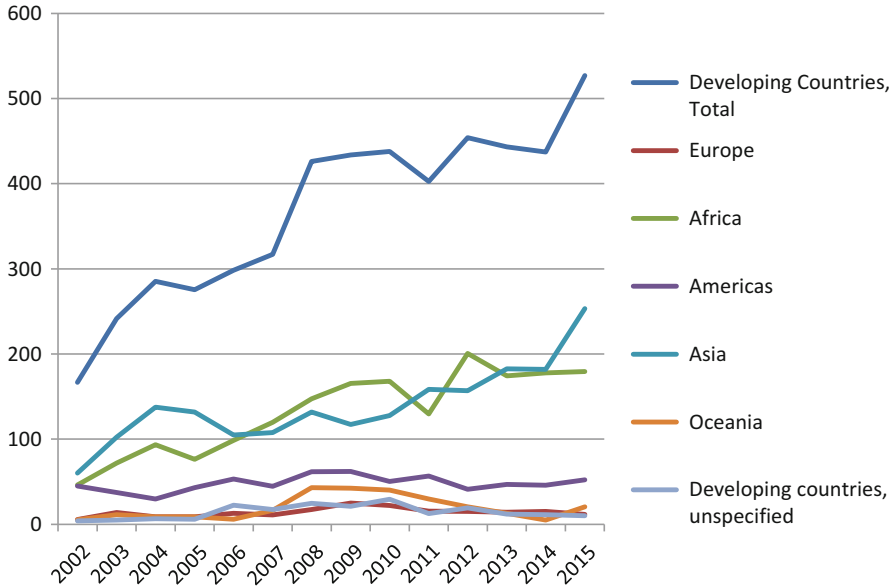

#### Official Development Assistance

Between 2002 and 2015, official development assistance (ODA) to vocational training (“Vocational training” as defined by the DAC’s Creditor Reporting Service (CRS) code 11330 which covers both formal and informal pre-tertiary TVET (OECD 2016). ODA to TVET via the DAC CRS (cf. King and Palmer 2011; Palmer 2015a)) in developing countries increased overall by 215%, from US\$167 million in 2002 to US\$527 million in 2015. Africa and Asia accounted for the bulk of this increase (Fig. 1) and in 2015 ODA to vocational training in Africa and Asia accounted for 34% and 48%, respectively, of all ODA to vocational training to developing countries (<http://www.stats.oecd.org/>).

Regarding ODA support to tertiary and professional-level TVET (OECD CRS code 11430 “Advanced technical and managerial training”) over the 2002–2015 period, total disbursements to developing countries were in the US\$100–150 million range (except for a peak in 2003 and trough in 2004–2006) (Fig. 2).

Reliance upon ODA for TVET, most of which is grants in-aid, varies considerably among LMICs; there is a marked difference between the comparatively low level of dependence across most East Asian countries (with the exception, perhaps,

**Fig. 1** ODA to vocational training, 2002–2015 (Constant 2015 US\$ millions). (Source: based on data from <http://stats.oecd.org>, accessed 20 Dec 2017)

**Fig. 2** ODA to tertiary and professional-level TVET, 2002–2015 (Constant 2015 US\$ millions). (Source: based on data from <http://stats.oecd.org>, Accessed 20 Dec 2017)

of Cambodia, Lao PDR, Myanmar, and Timor-Leste) and South America and the much higher levels in some of the Pacific Island and sub-Saharan African countries.

**Other Official Flows**

Certain types of official sector transactions are not regarded by the OECD-DAC as ODA as they do not meet the ODA criteria and are therefore excluded from ODA tables. These are classified by the OECD as “other official flows” (OOF). OOF are “Transactions by the official sector with countries on the DAC List of ODA Recipients which do not meet the conditions for eligibility as Official Development

**Fig. 3** OOF to vocational training, 2002–2015 (Constant 2015 US\$ millions). (Source: based on data from <http://stats.oecd.org>, Accessed 20 Dec 17)

Assistance, either because they are not primarily aimed at development, or because they have a grant element of less than 25 per cent” (OECD 2018).

OOF to vocational training have increased significantly since 2002 and in 2014–2015 averaged US\$208m per annum (up from an average of US\$20m per annum 2002–2003) (Fig. 3). About half of the OOF to vocational training in the 2014–2015 period went to South America, with 95% of this to Argentina and Colombia (both IBRD loans). About 40% of all OOF to vocational training went to Asia (with most to China, India, and Sri Lanka – a mix of Asian Development Bank and IBRD loans). In Africa, the only significant OFF in 2014–2015 was to Morocco (IBRD loan) (<http://www.stats.oecd.org/>).

OOF to tertiary and professional-level TVET remains relatively insignificant for the majority of countries, despite there being an overall increase from an average of US\$20m per annum in 2002–2003 to US\$42m per annum in 2014–2015; only a handful of countries (in 2014–2015) benefit from OFF to this higher level of TVET, most notably Mexico, Panama, Argentina, and Colombia (<http://www.stats.oecd.org/>).

## TVET Funding from Private Resources

Funding for TVET from private resources can come in the form of students’ fees, enterprise financing, private training provision by institutions, faith-based and NGO donations, and the sale of goods and services. These are examined in brief below.

### Student Fees

Most public and private TVET providers appear to levy fees, but their contribution to overall provider revenue varies considerably between and within countries, and according to type of provider.

## **Enterprises/Industry**

Funding for TVET from formal sector private enterprise and industry can take several forms, including private firm contribution to formal institution-based TVET provision (either in cash or in-kind), private sector funded training funds, and the firm-financed training for own employees (either in-house or outsourced). In addition to formal sector firms' contributions, private enterprises operating in the informal economy are also themselves providers, and self-funders, of training for their employees, though most of such training is (by definition) informal and on-the-job.

## **Enterprise Contributions to Formal Institution-Based TVET Provision**

Typically, financial cooperation between private enterprise and formal TVET institutes is not significant in many LMICs. However, there is some collaboration between private enterprise and formal TVET institutes but often little indication of the extent or scope of this cooperation. Such cooperation might take the form of student attachments/internships in enterprises (perhaps part of a more formalized "dual training system"), as well as employer participation in curriculum development or participation on institution governance boards.

## **Private Enterprise-Financed Training Funds**

Many large and small LMICs across the world operate private enterprise-financed training funds. Enterprise training funds are intended to provide incentives to increase in-service training of workers within enterprises (Johanson 2009). They are typically financed by an industry training levy, a dedicated tax on enterprises principally used to raise funds for training purposes. They are typically based on a contribution of a certain percent of a company's salary bill, with the levy amount decided either by government (in consultation with industry) or via a more collective agreement. The levy is normally paid by the company itself (not the employee). The broad rationale for them is that: firms receive benefits from training (e.g., higher productivity of a trained worker, increased earnings) for which they should pay at least in part; firms, if left to their own decision-making, may under-train; the incentive for enterprises to invest in training for their employees is lacking when they fear that these employees might be lured away by another firm; and training funds raised from a levy help to provide some predictability in the overall funding of training.

LMIC interest in establishing training funds remains high. In addition, many development partners try to stimulate the setup of such funds in LMICs through an initial injection of external donor financing (e.g., DFID and SDC in Bangladesh). Where such funds are set up as part of development cooperation activities, and where donor funding (grants/loans) makes up the bulk or all of the initial source of funds, long-term sustainability of the fund can be a challenge. Ensuring government ownership and buy-in to the fund during setup is key, as is government's role in identifying sustainable funding sources, and enacting required legislation.

**Fig. 4** Percentage of firms offering formal training, by region/country grouping. (Source: <http://enterprisesurveys.org/>, Accessed 21 Dec 2017)

Where countries do decide to explore the introduction of a training levy, several points could be kept in mind (cf Horne 2014), including the purposes which it is desired to achieve; whether a training levy is apt for such purposes and if so which type of levy; how to build support for a levy among stakeholders, including firms and trainers; the method of collection, its likely feasibility in the local economy, and the cost; the balance between giving a general boost to training with discretion on types of training left to firms and targeting specific training needs; how to build in ongoing review of the scheme and periodic evaluation of results; how to ensure transparency of collection and allocation; and the governance of the levy (who controls the money). For a discussion on private sector training funds in the Pacific, see Palmer (2015b).

### **Firm-Financed Training for Own Employees**

Formal enterprises in LMICs also represent an important component of supply in training markets and directly finance training activities, including through enterprise-based training (in-house professional development, apprenticeships) or paying the fees of external providers.

On average, formal training by firms in high-income countries (38–40%) and in Latin America and the Caribbean (43%) is much more common than the world average rate (of 34%). Meanwhile, formal training by firms in the Middle-East North Africa (MENA) region averages less than 20% (Fig. 4).

The regional averages hide often wide intra-regional variations:

- In the MENA region, only 3% of firms offer training in Jordan, while 29% in Tunisia do.
- In sub-Saharan Africa, only 9% of firms in Sudan offer training, while 55% in Rwanda do.
- In East Asia and Pacific, only 2% of firms offer training in Timor-Leste (the lowest rate in the world), while 79% in Samoa and China do (joint highest rates in the world).
- In Latin America and the Caribbean, only 2% of firms in Suriname offer training (second lowest rate in the world), while 74% in Ecuador do.

### **Training for Informal Sector Enterprises**

International experience shows that the smallest enterprises, especially those operating in the informal economy, are the least likely or least able to be able to provide their own training or to invest in it.

Meanwhile, it is known that informal economies in many – but not all – LMICs are larger than formal economies. For example, as a percentage of nonagricultural employment, informal employment in East and Southeast Asia (excluding China) is 65% – almost identical to that of sub-Saharan Africa (66%) (Vanek et al. 2014).

The sheer scale of the informal economy in many LMICs, combined with what is known about informal training in some regions (e.g., West Africa, South Asia), suggests that in many LMICs in other regions, which have large informal economies, informal on-the-job training and learning is taking place. More research on the financing of training in the informal economies would be very useful.

### **Faith-Based and NGO Donations**

Direct funding from mosques, churches, other faith-based organizations, and NGOs appears to be a relatively insignificant current source of funding for the majority of TVET providers. However, in some LMICs, this understates the essential role that this has played in establishing TVET providers.

### **Sale of Goods and Services**

The sale of goods and services is also a relatively insignificant current source of funding for the majority of TVET providers. There are exceptions to this generalization of course.

---

## **How Are TVET Funds Spent?**

### **TVET Expenditure: Recurrent and Capital**

The bulk of recurrent expenditure among most TVET providers in LMICs typically goes on staff salaries and other overhead costs. In many cases, TVET teachers are remunerated from the national payroll, not from TVET institutes directly.

Expenditure on scholarships and stipends as a traditional form of student support is not uncommon and takes many forms across countries (ranging from a subsidy for all to very targeted payments based on clear criteria). Of course this does not apply to all LMICs.

With the majority of expenditure on salaries and running costs, there is often little left for staff development, training materials, buildings, and equipment.

## **TVET Expenditure and Equity**

A fundamental aspect of a successful TVET system is the access it provides to trainees from a wide range of social backgrounds, ages, and geographic areas. The majority of all LMICs are likely to exhibit some degree of inequitable access to TVET, mainly related to gender, geography, and disability – though the severity of this will vary and needs research. Various forms of financial assistance schemes aimed at mitigating disadvantage exist.

## **Expenditure (In)efficiencies: What Unit Costs Tell Us**

Unit costs can illustrate inefficiencies in TVET systems. High unit costs might signal inefficient use of resources or the higher costs to reach certain groups. Differences between cost per student and cost per graduate for some courses indicate inefficiencies related to course completion: the narrower the difference, the more likely that providers are achieving high course completion rates.

---

## **How Are TVET Funds Currently Allocated?**

TVET financing mechanisms (Box 1) have the potential to influence the achievement of national TVET reform objectives related to effectiveness (e.g., quality of training and labor market outcomes of trainees), efficiency (e.g., outputs per unit cost), and equity (e.g., the degree to which people from different backgrounds and locations have access to good quality training). This section briefly examines the financing mechanisms that are currently used in various LMICs.

### **Box 1 What Do We Mean by TVET Financing Mechanisms?**

TVET financing mechanisms refer to:

1. The administrative ways funds are allocated, e.g., grants, scholarships, loans, training vouchers, grants from training funds, etc.
2. The criteria applied to these ways – e.g., targeted/untargeted, directly linked (or not) to policy objectives. Financing mechanisms can be strongly linked to achieving policy objectives of making TVET systems more accessible, equitable, efficient, demand-driven, responsive, and relevant.

The diversity, and often fragmented governance, of TVET systems results in a fragmented approach to TVET financing. In many LMICs, the TVET system remains fragmented with multiple government ministries on the one hand and a private training market, firm-based enterprise training and donor-funded ventures on the other. These, and other, multiple sources of TVET funding are allocated to multiple TVET providers via multiple financing mechanisms. Where countries have fragmented TVET systems, with weak TVET governance and coordination arrangements, they inevitably also have fragmented TVET financing arrangements – which lead to inefficiencies.

## **Direct Public Payments to TVET Institutions**

The financing mechanisms used by government to transfer funds to TVET providers can affect institutional behavior and the way funding is used (Johanson and Adams 2004). For example, funding can be based on historical expenditure (e.g., a grant to cover training materials, equipment, logistics, etc.), where no account is taken of performance and grants are simply allocated based on the previous year's expenditures; inputs (e.g., the number of students), with or without incentives to increase student enrollment; outputs (e.g., the percentage of students graduating or achieving a specified minimum standard), where incentives exist to improve such metrics; or outcomes (e.g., the percentage of graduates finding employment or becoming self-employed within 6 months of graduating), again where incentives exist.

In many (perhaps most) LMICs, historical allocation and input-based funding approaches (which are not linked with any incentive) are the dominant modes of direct public operating grant payment to providers, and the ways these function serve to reinforce a supply-driven training model. In other words, “most public funds are transferred and spent without regard for performance. Good performance reaps no reward, and poor performance suffers no penalty” (ADB 2014: 50).

There is little evidence of output-based financing mechanisms being used in many LMICs – e.g., little attention is paid in financial planning or budgeting discussions to course completion rates, unit costs, graduate outcomes, or employer satisfaction – though there are of course exceptions (many of which seem to currently be attached to donor-funded TVET interventions rather than “home-grown”).

## **Financing Policies and Incentives at Provider Level**

Financial system barriers inhibit flexibility, expansion, and sustainability at provider level. Many LMICs appear not to have devolved much financial authority to managers of public training institutions; decisions on spending are centralized, and most providers are unable to retain revenue from tuition or fee for service at the institution.

Where fees contributed by students are not retained by public TVET providers, there are limited incentives at provider level to increase student numbers. Similarly, where providers are not allowed to retain all (or the majority of) profits from the sale of goods and services, there is limited incentive to generate funding from such sources.

By contrast, private TVET providers that retain fee income have a direct incentive not only to increase student numbers but also to ensure that the training delivered is seen as relevant. Similarly, public and private providers that retain income from the sale of goods and services have a direct incentive to generate more such funds.

### **Financing Mechanisms Related to Individuals: Loans, Scholarships, and Stipends**

The existence of student loans to help individuals to finance TVET study appears limited, but there is insufficient information on this to be able to say for certain.

Scholarships and stipends to study TVET exist in many LMICs. While they have some equity benefits, some lack alignment with labor market needs and can come with high actual and opportunity costs.

### **Financing Mechanisms Related to Private Enterprise**

#### **Allocation Mechanisms of Private Enterprise-Financed Training Funds**

It was noted above that many LMICs operate private enterprise-financed training funds, with most of these funds resourced via a levy. These training funds typically have three ways by which accrued funds are allocated (Johanson 2009):

- Cost reimbursement schemes – approved training costs are reimbursed up to limit of levy paid.
- Levy-grant schemes – grants for enterprises to fund training, based on specific criteria (not only levy contributors).
- Exemption-based schemes (also known as train-or-pay) – liable enterprises are exempt from paying the training levy up to the amount they spend of training directly.

Training funds, of course, can be hybrid, using more than one such allocation scheme.

#### **Development Partner Financing Mechanisms and Modalities**

The majority of all development partner financing for TVET across LMICs is in the form of grants (transfers in cash or in-kind for which the recipient incurs no legal debt). Project-type interventions are by far the most common financing modality used.

## Public-Private TVET Financing Mechanisms

Public-private partnerships (PPPs) in TVET (Box 2) serve two main functions, only one of which is directly related to financing. Typically, they serve to:

- Promote cost-sharing: Private sector resources – in the form of direct funding, in-kind support, or direct provision – complement public support for national TVET systems and are a key component of sustainable financing for TVET.
- Increase collaboration with the private sector (e.g., in directing/governance, evaluating) can help achieve TVET policy objectives (e.g., making the TVET system more demand-driven, responsive, and relevant).

### Box 2 What Are PPPs in TVET?

PPPs in TVET refer to collaboration between the public and the private sectors with the objective of developing the technical and vocational skills of individuals. These skills can apply both within and outside of the formal labor force.

#### Types of PPPs in TVET

##### Public support to private training provision

- Public funds, including scholarships, vouchers, grants, and subsidies, are made available to private providers (on a competitive basis) to supply TVET.
- Governments provide public facilities to private providers to supply TVET.

##### Private support to public training provision

- Direct private financial contributions to public TVET system or institutions, including (but not only) as part of corporate social responsibility (CSR) – e.g., scholarships and grants.
- In-kind support from enterprises: Provision of trainee internships and public TVET staff training placements; provision (or donation) of used equipment or training materials.
- Enterprise participation in governance, planning, curriculum, and assessment (at provider/national level).

##### Joint public-private funding and delivery of training

- Co-funding from public and private sectors, and delivery of training by both public and private providers (or public-private providers), often brokered by an intermediary organization

## What Role Can TVET Financing Play in Achieving TVET and National Policy Objectives?

As noted above, TVET financing plays an important role in leveraging TVET reform in desired directions. All LMICs have country-specific objectives and priorities and should consider a mix of financing mechanisms that can help achieve these

objectives, while giving consideration to the country's enabling environment for TVET financing – and the extent to which it will facilitate or hinder the functioning of specific financing mechanisms (see later, this chapter). LMICs should also recognize that as their TVET reform objectives change over time, so their financing mechanisms need to change. Korea provides a great illustration from the East Asia region of how a country's TVET financing mechanisms have changed as national TVET objectives changed (see Lee 2016).

## **Policy Objective: To Use Resources More Efficiently**

**Try to avoid displacing private funding with public funding** – a key concern in any state-supported or co-financed training scheme is to try to avoid paying for something that private individuals or companies would have paid for anyway in the absence of state support (this section draws heavily on Palmer (2015b)).

**Rationalize funding** – efficiencies could be created where funding was rationalized, including via incentives to providers to merge and reduce overheads, or by creating an overarching body to oversee TVET financing. Making better use of existing resources by identifying and addressing current inefficiencies (ADB 2009), including through unit cost and cost-benefit analysis, is as important as trying to increase the overall resource envelope.

**Encourage an integrated training market** – an approach worth considering is for a government to shift from using public finance only to fund public TVET to being a purchaser on behalf of trainees and communities and to view the training providers in the market, public and private, in an integrated way, such that public funds could support both public and private providers. Various financing mechanisms can be used to encourage an integrated training market, including, for example, the use of grants, vouchers, or scholarships that are available on an equal basis to both public and private providers.

**At the national level, the establishment of a national training fund, or a national skills development fund, can also encourage the development of an integrated market** (Johanson 2009). National training funds are typically financed by enterprise levies but may also be based on public subsidies or donor financing. If used strategically, national training funds can help to orientate entire TVET systems in the direction of agreed national priorities. Johanson (2009) identifies three types of training fund:

- Preemployment training funds – to create a supply of well-trained individuals in the labor market
- Enterprise training funds – to increase the incidence of training within firms
- Equity training funds – to train specified target beneficiaries (e.g., unemployed, women, youth, those in the informal sector)

The disbursement mechanisms for national training funds depend on the type of fund. For example, preemployment and equity training funds might typically have disbursement windows that are able to fund various quality-assured providers,

including public and private training institutions, and specified target beneficiaries. The most effective training funds are those that are largely autonomous bodies with strong employer and worker representation and are soundly managed with clear and transparent allocation mechanisms (Johanson 2009). Sectoral, or industry-specific, training funds are an alternative to national (centralized) funding models (Johanson 2009) and may be more suited to contexts where a particular sector is dominant (e.g., tourism, extractive industries) and employers want a more sector-specific arrangement.

**Aligning financial incentives with desired effects through results-based financing.** Results-based financing (RBF) is an approach that can help motivate stakeholders involved in training and post-training support toward achieving specific TVET-related reform objectives. RBF rewards the delivery or achievement of specified targets through financial incentives upon verification that the predefined results have been delivered (World Bank 2015). RBF is also known as performance-based financing when it targets the supply side (inputs and outputs) and sets incentives for providers to deliver good performance. For example:

- Inputs – e.g., per student financial rewards to give incentives to increase the number of students
- Outputs – e.g., incentives linked to the total number or percentage of trainees completing training or to the percentage of trainees completing training from marginalized groups

Another form of RBF is where the financial incentive is solely linked to the outcomes, or results, e.g., incentives linked to the percentage of trainees in employment 3 or 6 months after completing a course or the percentage of trainees who pass a recognized skills test after completing course.

Some LMICs are starting to use financing approaches as a means to promote increased performance and results, though the practice is not common and often introduced or led by development partners at country level.

As noted earlier, most financing for TVET delivery in formal vocational training providers remains supply-driven (unlinked to any performance criteria); funding is provided based on numbers of enrolled students or based on historical expenditure. Such funding approaches do nothing to incentivize improvements performance or results, such as in the quality or relevance of training provision, providers' ability to reach harder-to-reach groups (e.g., women, rural communities, ethnic minorities, people with disabilities etc.), or to deliver specific outcomes.

However, there are a number of limitations and considerations to address when thinking of using RBF approaches (especially output- and outcome-based approaches) to help achieve TVET reform goals; for example, they require reliable information systems, as well as greater provider capacity and autonomy. Such conditions may not be present in some LMICs (Box 3).

### **Box 3 RBF in TVET: Limitations and Considerations to Address When Thinking of Using This Approach in TVET Projects**

#### **Design considerations**

- **Defining “results”** – results should be concrete, measurable, and achievable within a realistic time horizon.
- Linking financial rewards to indicators creates **risks of gaming and/or cheating**.
- **Monitoring and verification may add significant costs**.
- **Government engagement and ownership** – needed to support program sustainability and scalability.
- **TVET provider autonomy** – the level of centralization of the TVET system can be an important factor in the success of an RBF program. Providers need the ability to innovate in order to seek ways of achieving agreed results more efficiently and effectively. Providers also need to be able retain any incentives linked to achieving agreed results. Thus using this modality with public providers in a highly centralized system may be more challenging, and private providers may sometimes be more suited.

#### **Operational factors and constraints**

- **Pre-financing** – most outcome-linked RBF projects require implementers to pay for the program themselves, before they are reimbursed and only when the agreed outcomes are achieved. Pre-financing may prove challenging for some providers, and such an approach may be met with resistance.
- **Capacity building** of service providers and of government ministry staff is key to RBF approaches; such capacity building may cover how to achieve expected results, financial management, procurement, results-focused program design and management, and monitoring/evaluation/verification.

#### **Contextual considerations**

- Some RBF mechanisms rely more heavily on private sector delivery; therefore countries that have more favorable policies regarding public-private partnerships may more readily be able to use such financing approaches.
- Most RBF approaches require reliable information, monitoring and evaluation, and quality assurance systems, which may need to be strengthened as part of any use of RBF approaches.

Source: based on World Bank (2015)

## Policy Objective: To Raise Relevance

**Restructure public provision** – So that public providers have more autonomy, more incentive to respond to local demand, more incentive to perform. For example, input-based financing approaches with the provider allowed to retain tuition fees or incentives to generate and retain income through the sale of goods and services at the provider level.

**Expansion of private provision of TVET** – Governments could encourage such an expansion, for example, by:

- Making TVET scholarships available across the spectrum of quality-assured public and private providers on equal terms
- Offering tax incentives to promote the growth of private TVET
- Setting up a competitive fund with grant windows open to both public and private providers
- Providing indirect public financing for private TVET

**Align TVET scholarships to labor market needs** – Increase the number of TVET scholarships that are linked to labor market needs.

## Policy Objective: To Raise Quality

**Create more reliable funding streams for expenditures related to the quality of TVET** – more predictable flows for expenditures such as the development of occupational standards, training packages, curriculum, and teacher training are needed.

**Use competitive funds to stimulate innovation and quality improvement** (ADB 2014: 44) – both public and private TVET institutions should be able to compete for funds.

## Policy Objective: To Increase Access

**Increased public funding of TVET is an obvious way to increase access** (ADB 2014: 45), either through the supply of more places or targeted fee subsidies. This may not be possible in some LMICs.

**Private provision is a powerful way to increase access among those able to afford it.** “Private provision reduces pressure on public funding to pay for expansion of enrolments” (ADB 2014: 45).

**Input-based financing mechanisms** with the provider allowed to retain tuition fees – as noted above, these can provide powerful incentives to increase enrollment.

## Policy Objective: To Promote Equity

**Improving access to and completion of a quality primary and secondary school education will help make access to postsecondary TVET programs more equitable.** International experience shows that the most disadvantaged young people do

not make it into formal TVET programs as they drop out of formal schooling before entry. For many, affirmative actions in TVET (e.g., scholarships) may come too late to assist disadvantaged students (ADB 2014: 46). Policy makers interested in promoting equity in TVET should therefore also examine financial support policies for disadvantaged students at lower levels in the education system.

**Allocate funds directly to students rather than institutions.** Financial transfer mechanisms that allocate resources to institutions are less effective in closing equity gaps because the institutions rather than the individuals receive the funds. In contrast, programs that support students and their families directly are more likely to be effective in increasing participation (ADB 2014: 46). Giving vouchers to disadvantaged individuals to use in a training institution of choice is one way to do this. In contexts where vouchers are not feasible, incentivizing TVET providers to enroll/graduate disadvantaged students would be the next best option.

**Enhance targeting of disadvantaged students to help them to “catch up.”** This might be through:

- **Better targeted scholarships/fee waivers** – targeted financial support has a key role to play in mitigating disadvantage, and policy makers might consider reviewing their approaches to scholarships, including introducing more targeted approaches based on verifiable criteria, where these do not exist. Ensuring that financial assistance measures have transparent selection mechanisms is also needed (World Bank 2016).
- **Student loans for TVET** – student loans with repayment from postgraduation earnings or mortgage-type loans could be explored on a pilot basis in many LMICs (especially those with large informal economies). However, the administrative and for income-contingent loans, the tax collection capability in LMICs may limit the use of this mechanism.
- **Work and study options** – increasing opportunities for concurrent work and study would help some disadvantaged individuals to access TVET, as they would be able to pay their way through the course. However, this approach is regarded by some as a “rather discriminatory dual-track option” (ADB 2009:12).

## **Policy Objective: To Mobilize Non-state Resources**

**Stimulate private investment in TVET** (the framework for this subsection draws on Palmer (2015b)) – through incentivizing private enterprises to train own workers and contribute to overall reform efforts, encouraging PPPs, and the expansion of private provision.

### **Incentivizing Private Enterprises to Train Their Own Workers**

- **Enterprise-financed training funds** – Many LMICs already have skills development funds that are resourced via private enterprise financing (mostly via training levies), but the experience in at least some of these countries (e.g., Fiji, Jordan, Malawi, Mongolia, Papua New Guinea, Malawi, to name a few) shows that fund functionality is often sub-optimal. Indeed, introducing such training

levies may not be feasible in some LMICs, especially those with large informal economies, e.g., where countries do not have a sufficiently large formal sector to justify the costs or where tax collection capabilities (e.g., to collect payroll levies) are weak (especially for informal firms). Furthermore, convincing employers that a training levy is not just “another form of taxation, to be spent by inefficient government bureaucracy” (ADB 2014), requires clear and transparent processes regarding the objective of the levy, how the levy is collected, and how the funds are disbursed. The best levy systems are those controlled by employers (*ibid*). Simplifying both the (levy) collection and (grant) disbursement methods will mean that employers are not discouraged, e.g., by lengthy procedures and bureaucracy.

- **Tax incentives and education** – Tax regulations and liabilities can affect companies’ decision to train workers (OECD 2014); tax incentives (typically tax credits or tax allowances) can be used as a means to encourage company investment in staff training. However, international experience suggests that tax incentives are unlikely to work well in countries where formal industry is not well-developed (and where small enterprises make up a bulk of all private enterprises) and where administrative or organizational capacity is weak (including tax collection capability) (Dunbar 2013; OECD 2014). This may imply that such approaches are not well suited to some LMICs.
- **Education and training leave in companies.** Mechanisms that regulate periods of temporary leave (paid or unpaid) from the workplace for the purpose of education and training can encourage employee skill upgrading. Where a company gives paid leave to an employee to undertake training, they are making a direct financial contribution. Even where unpaid leave is granted, the company incurs indirect costs (as a result of the employee not being present and the possibility of having to pay for a temporary replacement). As with tax incentives, above, such a mechanism is less suited to small (informal) enterprises that cannot afford staff to take off such time. Nonetheless, for formal medium and large enterprises in LMICs, introducing such regulations – where they don’t already exist – may be a useful step to take.
- **Training vouchers for companies.** Grants allocated to companies in the form of vouchers, which part finance training, can be another mechanism to stimulate private sector investment in training. Training vouchers can be purchased by enterprises at a discounted price to introduce an element of “cost-sharing”; for example, a training voucher worth US\$250 might be sold to companies for US\$125. However, in the absence of targeting, such vouchers may simply be purchased by companies that would have paid full cost-recovery for training anyway.
- **Payback clauses to encourage enterprise-financed employee training.** Payback clauses are essentially agreements between an employee and an employer regarding training that has been financed at the employer’s expense; the employee is obligated to stay with that company for a set period of time (e.g., 1–2 years) after completion of training or else repay all or part of the cost of training. Again, a mechanism more suited to formal and larger companies.

## Incentivizing Private Enterprises to Contribute to Overall TVET Reform Efforts

- **Stimulating in-kind private sector resources.** Marshaling in-kind private sector resources for TVET may be another option for governments to explore. For example, the involvement of the private sector:
  - On TVET institutional boards
  - In (establishing) sector skills councils and TVET coordination bodies
  - In helping to define curricula and determine skill needs
  - With regard to offering internships, apprenticeships, or other work placements for both students and staff of TVET institutes
- **Private sector corporate social responsibility toward TVET.** Tapping into company corporate social responsibility agreements might be one way to access corporate grants for TVET from large formal companies. For those LMICs with extensive natural resources, or where tourism revenue is relatively significant, there may be scope for such agreements including the requirement of private firms to support TVET providers within their sphere of operations (in cash or in-kind).
- **Private investment in TVET capital projects.** Private funding of capital projects for public TVET may be feasible in certain cases, if, for example, the new buildings have a specific income stream associated with them. Dormitory construction is a case in point, if students are to be charged economic rents (Horne 2014).

## Encouraging PPPs and the Expansion of Private Provision

As noted above, PPPs can promote cost-sharing and can also increase private sector collaboration. However, there are some considerations for LMICs to take into account when deciding whether or how to adopt PPPs in TVET (Box 4).

### Box 4 Considerations Whether to Adopt PPPs in TVET

Governments need to create conducive policy, regulatory, and administrative climate in which private financing can flourish alongside public financing. For example:

- The **regulatory environment** needs to facilitate, not hinder, the establishment and operation of private training providers.
- National **TVET information systems** and **labor market information systems** need strengthening so that policy makers can help direct private investment away from areas that already experience public overinvestment and toward areas that experience private or public underinvestment.
- **Quality assurance and accreditation systems** need to be able to regulate and assess agreed minimum standards of public and private providers.

(continued)

#### Box 4 Considerations Whether to Adopt PPPs in TVET (continued)

- **The “private” in PPPs can often mean larger, formal firms;** governments need to encourage intermediaries or associations to bring smaller enterprises into PPPs.
- **Government staff capacity and skills** need to be sufficient to be able to contract private TVET providers.
- **Private TVET providers’ capacity** needs to be improved, e.g., by facilitating access to capital, so that they can deliver quality TVET.
- **Publicly funded incentives**, such as subsidies or tax concessions, are one mechanism to promote the private education and training sector.

Sources: Maclean et al. (2012) and Palmer (2015b)

#### Other approaches to mobilize non-state resources for TVET

- **Retention of internally generated funds at the level of the TVET institution** – the sale goods and services, where revenue is retained is another viable option (see Palmer 2015b).
- **Supply-side financing through tuition fees** – In many LMICs, it is noted that there is only limited scope to increase TVET funding through enrollment fees and that doing so (in the absence of increased targeted financial support) would have negative equity implications for disadvantaged groups. However, in some countries this may be an option, provided that targeted needs-based scholarships or stipends are provided for those that can’t pay. Where cost-sharing is expanded, it has been noted that trainee interest in the quality, relevance, and cost-effectiveness of training increases (ADB 2004).

### How Can Countries Create the Right Environment for TVET Financing?

TVET financing approaches don’t function in isolation of other TVET reform efforts, and governments need to create a conducive policy, regulatory, and administrative climate in which various financing mechanisms can function and where private financing can flourish alongside public financing. This includes (but is not limited to), for example (from Palmer (2015b)):

- **Establishing and strengthening national TVET coordination mechanisms**, where they don’t exist, that can coordinate demand and supply and financing mechanisms to achieve specified policy objectives.
- **Ensuring the private sector has control of allocating funds raised from private sector contributions.** To crowd-in private sector financing, the private

sector needs to be directly involved in creating a better system, e.g., in determining the allocation of funds raised (from private sector contributions), involvement in governance, in developing curriculum, in informing training provision.

- **Decentralizing governance of providers** – where full decentralization is not possible, partial devolution, including, for example, the ability to retain self-generated revenue, might be considered.
- **Strengthening TVET quality assurance and accreditation** – needed to facilitate the functioning of some financing mechanisms (e.g., vouchers or allowing private provider to compete for public funds).
- **Improving TVET information systems** – essential for most financing mechanisms and needed in order to align funding to identified need. For example, careful targeting of financing mechanisms at specific beneficiary groups can help to reduce the percentage of individuals or companies who would have taken the training anyway and paid for it themselves. For careful targeting to take place, it is essential to know which groups (categories of people or enterprises) are currently under-investing in training. Targeting does not only have to relate to which groups or categories of people or enterprises should be the priority, but it can also refer to which types of skills should be the priority. To know this, it is necessary to have adequate labor market information systems.
- **Improved tax collection systems** – tax collection capability is particularly important for payroll levies, income-contingent loans, and tax incentives to companies and individuals.

Lastly, countries wishing to adopt various TVET financing mechanisms need to give due consideration to their country's historical, social, and political contexts and assess how these may act as enablers or barriers to the use of certain financing mechanisms.

---

## Conclusion

Agenda 2030 has signaled the increased prominence given to TVET internationally. TVET has been a rising national priority in many LMICs for over a decade. While much of the focus of discussion on the financing of TVET tends to focus on how the resource envelope for the sector needs to be widened (and what effect such a widening might have on the funding the available for primary and secondary general education), significantly less focus has been paid to how TVET funds are allocated within the sector and the role that various allocation approaches can have in incentivizing TVET reform priorities (e.g., access, equity, quality, relevance, employment outcomes). This aspect of TVET financing needs much greater consideration at both national and international levels as countries strive to achieve the Agenda 2030 goals related to TVET.

## Abstract

Raising skills levels, reforming education and training systems, and improving qualifications systems are among the policy priorities of most countries around the world. A particular concern for many countries is improving the relationships between education and training systems on the one hand and labor markets on the other. Increasingly, qualifications frameworks have been seen as a useful policy tool to achieve these and other goals. Since the mid-1990s, when the first national qualifications frameworks were established in Australia, England, New Zealand, Scotland, and South Africa, interest in implementing qualifications frameworks in other countries has been growing rapidly. In most cases, they have been strongly focused on the reform of technical and vocational education and training. This chapter reflects on 15 years of research into this policy, including two large international studies. It finds that despite limited evidence of success, there is still fairly strong continued support for the frameworks. In some instances, outcomes-based qualifications frameworks have been found to distort education

and training programs and lead to practical complexities. This is partly because governments have sometimes assumed that a qualifications framework can be a generator of learning and skills, instead of a mechanism for framing *existing* provision. The chapter argues that the continued popularity of qualifications frameworks as a reform mechanism seems to be symptomatic of the ways in which transitions from education to work are in flux in many countries, coupled with fragmented and complex systems of vocational provision in some countries. Even where such systems are not overly complex, they have possibly weakening relationships with work.

## Introduction

Qualifications frameworks have become a feature of education and training policy landscapes around the world in the last 15 years. They have been introduced with the hope that they can contribute in national efforts to raise skills levels, as well as to improve the interface between education systems and workplaces. It is also hoped that they can assist employers and education institutions to recognize the skills and knowledge that workers have gained at work, which could improve workers' chances to obtain promotion and to access further education and training. Policy makers sometimes introduce qualifications frameworks in the hope that they will be a tool to reform the way education and training are delivered, improve the ways in which people can access education, and improve how people can move from one part of an education and training system to another. In many countries, qualifications frameworks have been introduced specifically to reform technical and vocational education and training (TVET) and to raise its status. Policy makers have hoped that they will give more power to employers and give governments a tool to manage the quality of provision.

What is striking about this policy phenomenon is that despite substantial differences in economic contexts and education and training systems across the world, similar reasons are given by policy makers for the introduction of qualifications frameworks. In addition to the goals listed above, they are seen as vehicles to improve relationships between different sectors of education and training, as well as between different countries, and to support learners to move between sectors and to enter or reenter education and training.

The rapid growth of this policy mechanism has taken place despite a lack of evidence that qualifications frameworks have actually achieved the policy goals described above.

This chapter reflects on 15 years of research into this policy, including two international comparative studies. It starts by presenting the history of the emergence

of qualifications frameworks. This is followed by a brief overview of research findings about the achievements of this policy mechanism. The research findings appear contradictory: policy makers seem to continue to support qualifications frameworks, but there is little evidence of success. What partly explains this contradiction is that qualifications frameworks represent a range of different kinds of reform intervention. Another possible reason for continued support for qualifications frameworks is that they are symptomatic of flux in education/work relationships, although they can't improve them in the ways hoped for by policy makers.

---

## The Rapid Growth of Qualifications Frameworks

Qualifications frameworks are a global phenomenon. Currently, about 142 countries are involved in developing frameworks (ETF, Cedefop, and UNESCO Institute for Lifelong Learning 2013). A UNESCO report (Keevy and Chakroun 2015) argues for the need for world reference levels for qualifications. This is despite the fact that as recently as 2004, only five national qualifications frameworks existed, together with a larger number of competence-based vocational education and training frameworks sometimes limited to one or more industry or occupational sector. How did this policy mechanism grow so fast?

In discussions about qualifications frameworks, the term qualification is generally used to refer to any formal credential that recognizes learning of prescribed knowledge and skills. This in itself is a recent phenomenon. Previously, the term qualification was mainly limited to the certification of knowledge and skills acquired for specific professions and skilled trades. Examinations taken at school and university were in the main referred to as certificates, degrees, and diplomas. Qualifications within professions and skilled trades have linked education and training systems to workplaces at least since the nineteenth century in many countries, but, until the middle of the twentieth century, they mainly covered relatively small sections of working populations. These qualifications arose from the specific needs of employers, as well as from control exerted by professions and trades on entry to particular occupations. Because they emanated from different types of work, they were developed with little, if any, connection between them. Most were closely linked either to apprenticeships controlled by guilds or to the specific colleges and other educational institutions providing the programs that led to the qualifications. This is partly why TVET provision tends to be the most complex of all educational provision – and consequently, the main area qualifications frameworks have been introduced to reform.

In the 1970s and 1980s, governments worldwide increasingly were influenced by the idea that education and training could be an important instrument of economic reform. The policy focus in developed countries shifted from full employment through combinations of welfare policies, state spending on infrastructure, and state-driven industrialization (Chang 2002; Crouch 2011) to controlling inflation, regardless of the effects on employment (Harvey 2005). Collective welfare provision started to be reduced in many of the countries where it previously existed, under the

influence of neoliberal economic policy (Crouch 2011). Countries which had never had extensive welfare provision did not build it in this period. Education started playing a prominent role in social policy, as policy makers shifted the onus from governments attempting to create and stimulate jobs to individuals making themselves “employable” (Tomlinson 2009). In this context, it was increasingly believed that economic competitiveness and development were dependent on the skills of the labor force, although with little clear evidence about the nature of skills required and how they would be utilized to lead to economic development. Conversely, weak economic development came to be blamed on the lack of appropriate skills in the labor force in many countries around the world (Brown and Lauder 2001). The notion of an “education/labour market mismatch” became a dominant trope of education policy reform (Brewer 2013). Thus, over the past 30 years or so, considerable focus has been placed on the reform of education and training systems in general, on technical and vocational education in specific, and on the ways in which education and training interact with labor markets (McGrath 2012; Allais 2014).

It was in this context that the idea of *qualification frameworks* covering all qualifications began to emerge. One of the earliest was the English National Vocational Qualifications (NVQ) framework launched in 1987.

The English National Vocational Qualifications were a model for many countries around the world, first in the competence-based training system in Australia and then directly and indirectly (via the Australian system) in other countries. The first fully comprehensive qualifications framework was launched in New Zealand in 1992, and a similar one was launched in South Africa in 1995. These early frameworks drew their intellectual inspiration from competence-based teacher training models that had been established in the United States (Allais 2014). A major idea underpinning these frameworks was that learning outcomes and competences could be specified by employers to create more *demand-driven* education and training, which policy makers hoped would end what they believed were education and training systems inappropriately dominated by education providers. In South Africa, learning outcomes were also seen as a way of transforming the apartheid education system into a more democratic, accessible, and socially just system (Allais 2011b).

The framework in France could also be argued to be an early model of a national qualifications framework. What is currently recognized as a qualifications framework, the National Register for Professional Certifications (*Repertoire National des Certifications Professionnelles*, or RNCP), is to a large extent the same qualification system that has been in place in France for further education and training since the early 1970s. This framework derives from a regulated occupational labor market and strong collective bargaining which has historically enabled the French system to relate qualification levels explicitly to levels in the workforce and has acceptance in further education and training (Di Paula 2015; Allais 2017a). Similarly, the grids which describe qualifications in all countries (as discussed further below) could be seen as early qualifications frameworks. However, as a policy reform mechanism, the term usually invokes a policy mechanism more similar to the models emerging in the English-speaking countries described above.

In the late 1990s and early 2000s, vocational frameworks were developed in Caribbean Island states, modeled on the competence-based training model that underpinned the original British National Vocational Qualifications (Allais 2017a). In the same time period, through the “Bologna Process,” the idea of levels and learning outcomes was introduced as part of a process of aligning higher education systems within Europe (Ravinet 2008; Bologna Process Coordination Group for Qualifications Frameworks 2009). In 2008 the European Union adopted the European Qualifications Framework, which led to most countries in Europe as well as many countries surrounding Europe, countries which trade with Europe, and countries receiving European aid for TVET, introducing qualifications frameworks. This shifted qualifications frameworks out of the English-speaking countries in which they originated.

In many countries, qualifications frameworks or competence-based frameworks have often been limited to TVET systems. Europe shows a different trend, arguably because the idea of learning outcomes and aligning qualifications emerged through the Bologna Convention which was focused on higher education systems. Most European countries are developing frameworks that encompass the entire education and training system, or in some instances the entire system except for the school system. But even where frameworks are comprehensive, TVET is still a factor that needs to be considered separately by researchers. One reason for this is that school and university provisions tend to be relatively more straightforward in terms of qualifications available. The educational provision that exists outside of these systems – at colleges, in workplaces, in nongovernmental organizations, and so on – is generally far more complex and sometimes fragmented. So, in nearly all countries, there is concern with TVET qualifications: a desire to reform them, to improve their quality and raise their status, and to reduce complexity and fragmentation. Further, frameworks often operate differently with regard to TVET than how they operate for school and university qualifications. There is a greater emphasis on developing competence statements for lower-level vocational qualifications than for the qualifications for other components of education systems. TVET is also a specific consideration when examining qualifications frameworks because a major focus of frameworks in many countries is trying to build relationships between TVET qualifications and other qualifications – and in some instances, it is precisely the competence-based qualifications which are developed for TVET that make movement from TVET to higher education difficult (Wheelahan 2009). For all these reasons, examining qualifications frameworks means examining TVET systems in specific.

---

## **What Is Known About the Achievements of Qualifications Frameworks?**

There is little published scholarly research on the impact of qualifications frameworks. In 2005 Michael Young (2005) provided an overview of qualifications frameworks internationally, which concluded that all countries implementing

frameworks have faced difficulties. More recently David Raffe's (2012) overview of the research literature argues that while the evidence is still inconclusive, the impacts of qualifications frameworks have been less than expected, have often taken many years to appear, and have been negative as well as positive. The remainder of the limited body of published research tends to corroborate these general positions, either discussing problems experienced or expressing concerns and reservations (Bouder 2003; Ensor 2003; Granville 2003; Keating 2003; Phillips 2003; Raffe 2003, 2011, 2012; Young 2003, 2005; Bohlinger 2007, 2012; Brown 2011; Lester 2011; Lassnigg 2012; Méhaut and Winch 2012; Allais 2014; Hupfer and Spöttl 2014; Gössling 2015; Pilcher et al. 2015).

Two comparative studies of the impact of qualifications frameworks were commissioned by the International Labour Organization. The first compared qualifications frameworks in 16 countries (Australia, Bangladesh, Botswana, Chile, Lithuania, Malaysia, Mauritius, Mexico, New Zealand, Russia, Scotland, South Africa, Sri Lanka, Tunisia, Turkey, and the United Kingdom excluding Scotland) (Allais 2010). The second attempted to examine more specifically the labor market impact of frameworks in six countries (Belize, France, Ireland, Jamaica, Sri Lanka, and Tunisia, as well as the regional framework in the Caribbean) (Allais 2017a). Both studies suggest that there is limited evidence of success but fairly strong support for the frameworks. The 16-country study concluded that qualifications frameworks have not provided a quick fix or simple solutions to the complex problems facing countries in relation to education, skills development, and employment. Some minor positive impacts were found, particularly in Scotland (Raffe 2011) and to a lesser extent Malaysia (Keating 2011). The follow-up six-country study had similar findings. It argued that many of the frameworks were hardly functional; there were mixed views from employers; and there was little evidence of increased mobility across education systems.

The one area in which frameworks seem to have achieved the most success is in getting different stakeholders to communicate better with each other. What this could imply is that the *process* of introducing a framework and getting people from different kinds of education institutions to talk to each other more about what their programs involve, as well as getting people from education institutions to talk to people in other sectors of society, might be more important than the policy which is ultimately developed.

The disconnect between empirical evidence and policy-maker aspiration in researching qualifications frameworks could partly be the result of the nebulous nature of frameworks. Pilcher et al. (2015) argue that it is almost impossible to evaluate these frameworks because there is no way of developing a clear yardstick for measurement. What also makes it difficult to make sense of the research into qualifications frameworks, as well as of advocacy statements for qualifications frameworks, is that different countries seem to use the term to describe rather different reforms (Allais 2011a). Understanding exactly what policy makers mean when they talk about introducing a qualifications framework is complex. The following section discusses some of the different understandings of what a qualifications framework is.

## What Is a Qualifications Framework?

The simplest way of understanding a qualifications framework is as a nationally accepted framework or grid of levels and/or qualifications and qualification types, sometimes for all qualifications and sometimes for specific sectors. Diagram 1 below shows such a framework, describing qualifications in Ethiopia.

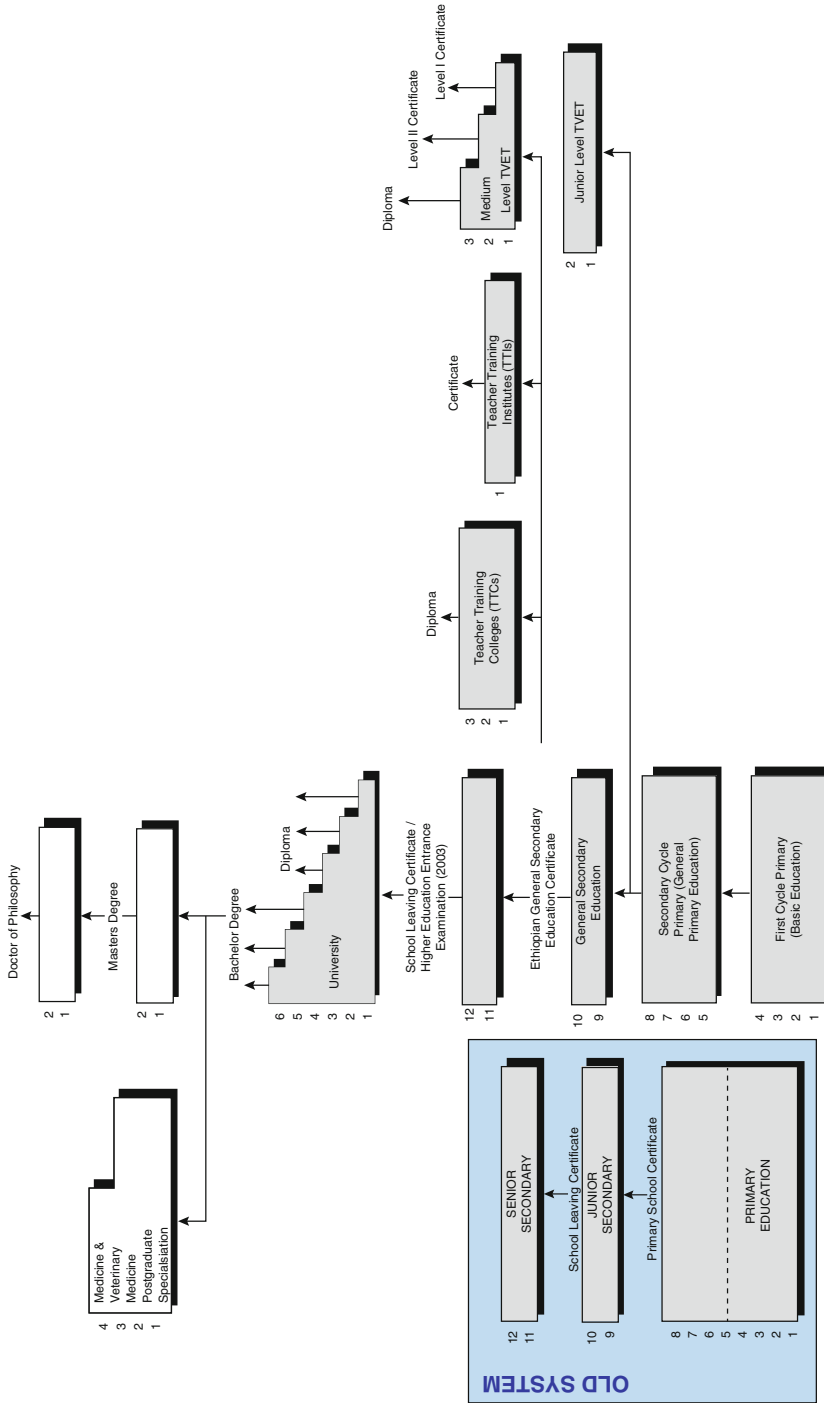

Diagram 1 shows the main qualifications that are offered in different parts of a national education and training system and how they relate to each other. Seen like this, a qualifications framework is not a new thing: most countries have some classification of the main qualifications available. However, even at this relatively simple level, creating a single framework for a country is not simple to capture in a single diagram. One issue is that relationships from one qualification to another are not always straightforward. When a country has a large amount of different types of qualifications on offer, relating them to each other can be very complex. If the institutions involved in provision are not involved in the process, and if they have autonomy over admissions and/or if there are limited places available for a particular course of study, a framework may show on paper that there is the possibility to move from one qualification to another, but the opportunities for students to actually follow this path may be limited.

Another issue which is often highly contested is the degree to which and ways in which qualifications are equivalent to which other qualifications. Here the idea of levels comes in – an idea which is not clearly captured in the grid above. One of the changes that has been introduced through the idea of qualifications frameworks is to superimpose a set of qualifications such as seen in Diagram 1 onto a grid of levels, as seen in Diagram 2 below.

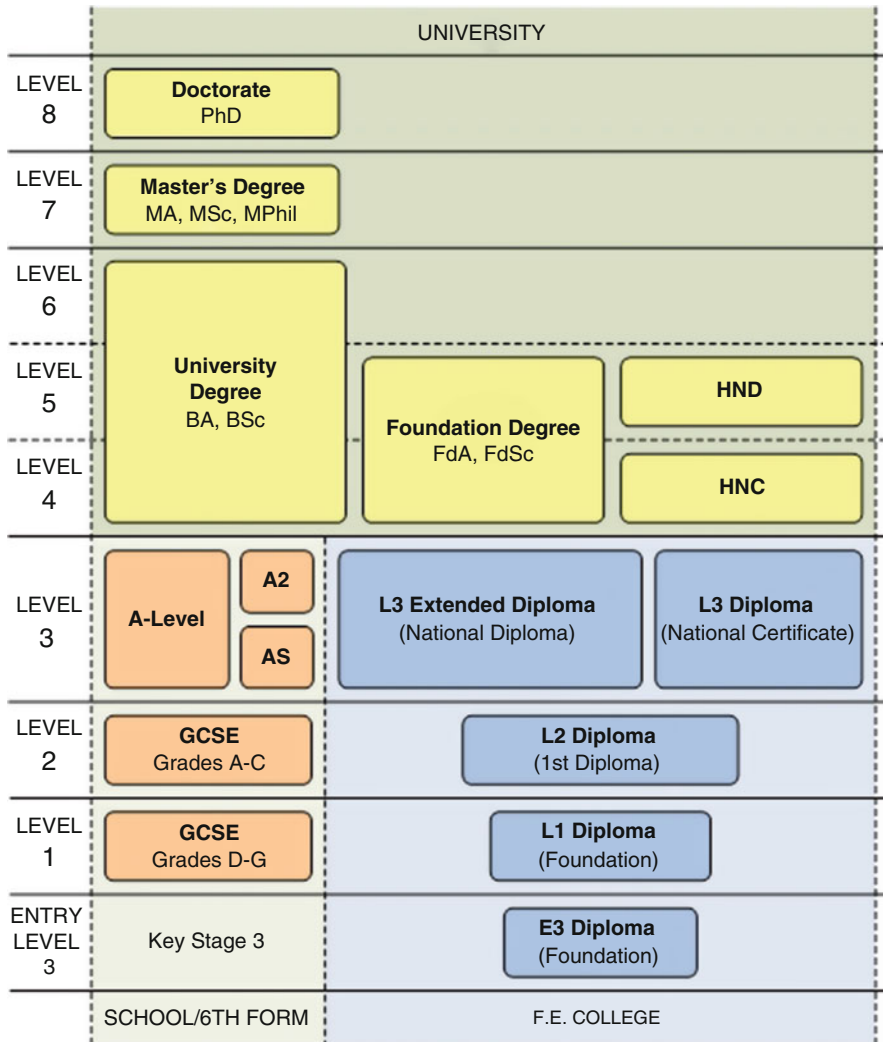

Diagram 2 shows not only the different types of qualifications available but also which level in the national system each type of qualification is on. When two qualifications are placed on the same level, there is the implication of some degree of equivalence or comparability among qualifications at the same level. However, as discussed below, what this possible comparability actually means in practice is complex.

Most frameworks today have levels, with the numbers of levels varying between 5 and 10, depending on whether or not the framework is for the whole education and training system or only a part of it. It is through this notion of levels that policy makers hope to raise the status of TVET qualifications. The idea is that once a qualification is placed on a specific level, it will be clear that it is in some substantive sense equivalent to other qualifications at that level. However, simply having levels does not remove contestation about which qualification belongs at which level, nor does it automatically ensure that qualifications at the same level are really valued or believed to be equivalent in any meaningful way.

To develop a shared understanding of what each level means, most qualifications frameworks have “level descriptors.” These are intended to capture in a generic way the kinds of knowledge, skills, and abilities that qualifications at the respective levels are supposed to represent. Level descriptors are intended as a guide for clarifying equivalence and rationalizing qualifications systems. They are also seen as

**Diagram 1** Qualifications in Ethiopia. (Source: Baudy 2008)

**Diagram 2** The UK qualifications and credit framework. (Source <http://www.accreditedqualifications.org.uk>, accessed 29 Nov 2017)

mechanism to increase transparency of qualifications systems – the ways in which qualifications are understood by the outside world – because they are intended to help everyone to know what it means when someone has obtained a level 2 or a level 6 qualification. They should also, in theory, assist to ensure that qualifications are broadly “comparable.”

Again, the reality proves far more complex than as a policy aspiration. Consider Box 1 below, which provides examples of level descriptors from qualifications frameworks around the world.

**Box 1 Examples of Level Descriptors****Six types of descriptors in Tunisia**

The qualifications framework in Tunisia has six types of descriptors of learning outcomes: complexity, autonomy, responsibility, adaptability, knowledge, know-how, and behavior.

**Five “characteristic generic outcomes” in Scotland**

The Scottish-level descriptors specify “characteristic generic outcomes” for each level (except level 1) under five headings: knowledge and understanding; practice (applied knowledge and understanding); generic cognitive skills; communication, ICT, and numeracy skills; and autonomy, accountability, and working with others. They were developed based on preexisting descriptors for the different sectors.

**Eight “domains” in Malaysia**

Malaysia has eight domains of descriptors: knowledge; practical skills; social skills and responsibilities; values, attitudes, and professionalism; communication, leadership, and team skills; problem-solving and scientific skills; information management and lifelong learning skills; and managerial and entrepreneurial skills.

**Ten types of “competencies” in South Africa**

South Africa has ten for the higher levels of its qualifications framework: scope of knowledge; knowledge literacy; method and procedure; problem-solving; ethics and professional practice; accessing, processing, and managing information; producing and communicating of information; context and systems; management of learning; and accountability.

**Concise and detailed descriptors in Lithuania**

Levels are defined not only by competences but also by types of activities. There are concise and detailed level descriptors. Concise descriptors are for general information purpose, and qualification levels may be described briefly. A concise descriptor of level includes characteristics of activities, content and acquisition of qualification, opportunities for further learning and qualification development, and types of the recognition of qualifications. Comprehensive descriptors are for the usage for different experts (designers of VET curricula, experts involved in the assessment of competences and awarding of qualifications, experts responsible for the recognition of qualifications acquired abroad, etc.); levels are described comprehensively with detailed indicative characteristics of the level of qualifications. Descriptors of levels are based on two parameters. Each parameter contains three criteria.

**Ten “indicators of professional performance” in Russia**

In Russia, ten most important indicators of professional performance were identified to formulate descriptors – work with information, reflection, ability to learn, business communication, responsibility, motivation, setting

(continued)

**Box 1 Examples of Level Descriptors** (continued)

up goals, independence, ability to teach, and breadth of views. The development of the abovementioned indicators from level to level of education makes the main content of descriptors. Descriptors were developed according to the following accepted rules:

- A descriptor at each level has to be independent of other descriptors. Only at the place of transfer to a higher level, a descriptor has to correlate with the descriptors of higher and lower levels.
- Descriptors have to be defined in the affirmative grammar form.
- They have to be concrete and clear; words with abstract lexical meaning can't be used ("good," "narrow," "acceptable," etc.).
- They can't contain professional slang; they have to be understandable for nonprofessionals.
- They have to be formulated in a short form to provide clear understanding of the essence of the given level.

Source: Adapted from Allais (2010, p. 78)

When one reads the level descriptors from different countries around the world, it is fairly quickly apparent that they are complex and not particularly easy to understand, thus immediately raising questions about their role in improving "transparency." The reason for this is that it is not straightforward to capture in an abstract generic form the kinds of things that specific qualifications aim to teach. The many different types of categories for level descriptors are in itself an indication of the difficulty of an attempt to capture what an educational "level" means. Markowitsch and Luomi-Messerer (2008) provide a fascinating discussion of some of the complexity involved in developing level descriptors in Europe, showing not only how it was difficult for policy makers to agree on terms but also that once terms were agreed on, they were not necessarily interpreted in the same way by different people in different contexts. More recent research conducted in Ireland shows that there was contestation about what it meant when a qualification was allocated to a level, and the extent to which qualifications on the same level could and should be regarded as equivalent to each other (Marock 2015).

On top of this visible complexity, there is little empirical evidence that level descriptors have enabled decision-making about the location of qualifications on frameworks, or about credit transfer, with the exception of Scotland, where there is some limited evidence that they have assisted with professional judgments (Raffe 2012). It seems likely that decisions about which qualifications belong at which level are likely to be based on the relative power of institutions, as well as already accepted implicit levels within the country, particularly where high-stakes decisions are involved (Allais 2010).

Another issue with levels and level descriptors is that they are seen as a ladder, or a hierarchy. The framework in Ireland, shown in Diagram 3 below, is represented as a fan, in an attempt to escape this kind of representation.

**Diagram 3** The Irish National Framework of Qualifications. (Source: <http://www.nfq-qqi.com/>, accessed 28 Nov 2017)

The visual representation of the qualifications on offer in Ireland attempts to move away from a hierarchy and the presentation of qualifications as a simple ladder which can be moved up.

So the above discussion shows that there are many different ways in which qualifications in a country can be graphically represented and related to each other.

But qualifications frameworks are also more than representations of qualifications on paper (or in cyberspace). They include systems, institutions, and relationships between institutions. In some instances, qualifications frameworks have been introduced with and through the creation of new institutions, such as through laws which create qualifications authorities – for example, in Botswana, Mauritius, and South Africa (although South Africa later amended this, to create legislation for the framework in its own right). Not surprisingly, qualifications frameworks as well as the jurisdiction of qualifications authorities in some countries have overlapped with or been inconsistent with other laws and regulations of education and training as well as work (Allais 2010).

In some countries, a central part of the introduction of a qualifications framework has been the creation of new structures to develop competency standards, occupational standards, or outcomes-based qualifications. This has mainly been the case for qualifications frameworks focused on TVET, where the policy aim has been to get industry to lead these processes, to create industry-specified standards which are not linked to specific educational institutions or curricula. The original frameworks in South Africa and New Zealand are exceptions because, in their initial forms, structures separate from education institutions were created to develop learning outcomes for all education and training qualifications, not only for TVET qualifications. Both of these frameworks collapsed in their initial form and have been substantially changed and simplified (Phillips 2003; Allais 2007a, b; Strathdee 2011), and there is little evidence of success even for frameworks focused only on TVET systems, either in terms of

improving the involvement of industry in qualification design or in improving the employment prospects of graduates from the new qualifications (Allais 2011c, 2017a). Generally, employer involvement is limited and trade union involvement practically nonexistent. In many countries, in practice, the work of designing outcomes or competency standards is outsourced to consultants. Further, outcomes or competence statements tend to proliferate over-specified, detailed, unwieldy, narrow documents which are supposed to be the basis for assessment (Wolf 1993, 1995; Young 1996, 2009; Gamble 2004a, b; Wheelahan 2008; Wheelahan 2010; Allais 2012a, 2014). In some instances, this has led to newly designed competence standards or qualifications not being used at all and, in others, to narrow forms of assessment which drive fragmented learning experiences, or to the marginalization of the knowledge that learners can acquire (Allais 2007b; Wheelahan 2010).

Another issue which policy makers focus on in many countries is the use of qualifications frameworks to support recognition of informal skills. Policy makers in developing countries in which there are small formal regulated labor markets have been particularly interested in how frameworks can assist workers in the so-called informal sector (e.g., Young and Allais 2013). There are two separate issues to consider here, from a research perspective. The first is the extent to which frameworks helped people to have their skills documented. The second is whether or not obtaining formal certificates or recognition has helped their prospects in the workplace or has assisted them to access formal education. There is very little, if any, published research on either issue. Colardyn and Bjornavold (2004) provide a descriptive overview of the various systems which exist within Europe and show successes in some countries in terms of systems for the recognition of skills, but with limited reference to how qualifications frameworks have or have not assisted this endeavor.

The 2010 ILO study of qualifications frameworks in 16 countries found some small-scale examples of recognition in Australia, Botswana, Chile, Mexico, Scotland, South Africa, and Sri Lanka, but the numbers were small – in general not more than a few thousand individuals (Allais 2010). There was even less evidence about the value of such certificates to the individuals concerned. The Chilean study showed that the worker organizations involved in pilot programs had positive views about their experiences and that the workers felt proud of their certificates. However, the certificates were not always recognized by educational institutions. In Botswana, through the vocational qualifications framework, standards were developed for traditional dancers, and a group of traditional dancers were assessed, found competent against the standards, and given certificates. However, given that they were already working as traditional dancers and were not given access to any other training or educational programs based on the acquisition of these certificates, it was hard to see what advantage it gave them, other than a sense of accomplishment, as in the Chilean case.

What is missing in this area is research which can quantify what the problems are in terms of people not being able to access work, promotion, or further learning and the extent to which obtaining a certificate will solve these problems. For example, the problems may be that courses are too expensive, or that training is not available, or that individuals don't have enough time off, or that despite having gained some skills on the job, they lack the educational background – for example, literacy and

numeracy – to actually cope in formal learning. Further, in countries with small formal labor markets, certification is unlikely to be a requirement for employment or promotion. It could be the case that skills can assist self-employed people to be more productive, although even here there is a lack of clear evidence (Adams 2009), but in any case, the issue then becomes one of access to education and training.

Qualifications frameworks have also sometimes been introduced as mechanisms to reform the delivery of education and training – often with a focus on privatization, which was particularly the case in the reform of vocational education through learning outcomes in the United Kingdom (Wolf 2002; Young 2009) and competences in Australia (Whelehan 2008, 2009). This is often linked to accreditation mechanisms and systems, as well as proposed changes in assessment systems. The hope is that the outcomes-based qualifications or competency standards will be a benchmark against which institutions conducting assessment or providing education and training can be contracted and evaluated or quality assured. This idea has proved particularly problematic in the developing world, where the assumption that bureaucracies which are performing poorly in terms of delivering training are well positioned to contract it out and evaluate the quality of provision seems to have no basis (Allais 2007c).

The above discussion shows that clearly, there is no single policy mechanism that is represented by the term “national qualifications framework.” This creates difficulties in terms of linking the claims made about qualifications frameworks with evidence of success. However, one clear distinction is between frameworks that are seen as a *generator* of learning and skills and those that are seen as a way of framing *existing* provision. It is clear in the latter role that more successes can be seen.

Some researchers have developed typologies and classification systems, to try to organize different qualifications frameworks into categories (Raffe 2003; Tuck et al. 2004; Young 2005; e.g., Raffe 2009; Allais 2007b, 2010, 2011a). These typologies are useful when they highlight how different frameworks are from each other. They are less useful when they are seen as “models” that policy makers can select, source, “plug in,” and expect to create changes in their educational landscape (Allais 2017b). Because there are so few frameworks which are fully developed and implemented, the typologies run the risk of creating the impression of a well-established policy mechanism. For researchers, it could be argued that typologies are theory-heavy based on very limited empirical data. Further, policy reforms which look quite similar on paper can take very different forms or play very different roles in different contexts. What adds additional complexity is that this area of policy tends to be dominated by jargon which can become complex and opaque to outsiders, thus making people less likely to want to or be able to contribute to debates.

---

## Conclusion: Symptom or Solution?

Given the weak evidence in favor of qualifications frameworks achieving the policy goals associated with them, why have they become such a growing educational phenomenon? I suggest that the emergence and popularity of qualifications frameworks should be seen as a symptom of underlying social phenomena.

Higher education enrollments globally have shifted from a fraction of a percent of the age cohort in 1900 to about 20% of the cohort by 2000 (Schofer and Meyer 2005). Levels continue to rise, with some countries approaching 80% of young people in higher education, if nondegree programs are included (Collins 2013). Rising educational levels affect education/work relationships and place more pressure and higher expectations on all parts of education and training systems. Researchers have used the term “education arms race” (Livingstone 2014; Halliday 2015) to describe the phenomenon whereby individuals are obliged to obtain ever higher qualifications in order to get a foothold in the labor market, even when such qualifications have no bearing on the actual work done. This inevitably leads to difficulties for those aspects of education systems aimed at preparing people for mid-level work. Add to this picture widespread acknowledgment that qualifications are a weak proxy for skill (e.g., Guile 2010) and the fact that qualification inflation is weakening this link. Work is changing rapidly, and the ways in which labor markets are structured are also changing. Youth unemployment rates are high and rising.

In this context of changing labor markets and changing workplaces, building and sustaining TVET systems become increasingly difficult, and, as discussed above, in many countries, it was extremely fraught already. It is almost impossible to build strong training programs that prepare people specifically for constantly changing jobs; countries in which work has historically been more fragmented or less regulated have tended to have weaker TVET systems (Allais 2012b).

In short, the continued popularity of qualifications frameworks as a reform mechanism may be symptomatic of new disconnects between education and work which are aggravated by qualification inflation, rising youth unemployment, and declining occupational labor markets, particularly in contexts where vocational provision is complex and fragmented (In Allais (2012, 2014), I provide some other possible explanations). And qualifications frameworks may continue to be popular because they promise to offer simple solutions to these very real and complex problems and give some feeling of agency to policy makers in beleaguered education and training systems.

## Abstract

The mismatch between the demand and supply of skills is a global concern. The private sector, being the principal user, has a critical role in skills training. However, in many developing economies, e.g., India, the role of the government is more prominent than the formal private sector. This tends to create a

supply-driven TVET system, rather than a demand-driven one. The private-sector involvement is limited to private-sector training partners and does not really bring the employer's skin in the game holistically for skill development.

Employer ownership of institutions to impart skills can be a key differentiator and provide competitive advantage for a country's skill base. The moral hazard problem of employers (of "I train, you poach") is a key impediment for employer ownership, one of the ways to address this moral hazard problem is the proposed "reimbursable industry contribution" (RIC). Other key methods for enhancing ownership can be by internships or on-the-job training (e.g., apprenticeships), technology contribution, gifting/sharing of machinery and equipment to vocational schools, first right on phased-out equipment and machinery (before being scrapped), providing experienced trainers, designing curriculum, and finally ensuring assessments are as per their needs.

Skills are the software of business and the industry its hardware. The hardware is only as good as the software makes it. The formal private sector understands this software best; it knows when to repair, how to update, and what its future requirements will be; hence, a more intensive and holistic role of the private sector in skill development is required.

**Introduction**

In a global race for talent, skill mismatch and shortages are a key concern; a pressing need is felt to have the right strategies and ownership of stakeholders to fulfill the skill needs of individuals and industry and fulfill the overall development goals of the government (WEF 2014).

Changing workforce demographics, demographic advantages and disadvantages of different countries, protectionism, and rapid automation are trends impacting macro policy on skill development. Jobs and skills (UNDP SDG, Goal 8 2017) rightly dominate the development agenda of most countries, and hence solving the crucial problem of "who should be in the driver's seat for skill development" is the key to the productivity of youth, firms, and countries.

Individuals and industry are the principal beneficiaries of skill development, which leads to their improved efficiency, output, and incomes. Hence, it is only natural to expect that the role of individuals and industry in the skill development ecosystem would be highest among all stakeholders. However, in many developing economies, the role of the government is more pronounced than that of the primary customer/beneficiary. Governments concerned with the lack of participation of the industry respond by acting with a welfare mindset, swimming in waters where they do not belong and barely understand. While there is a focus on reducing government's role in most business activities to improve efficiencies, it is ironic that there is

an enhanced role of the government in skill development. Over the years, a key input for private economic benefit – skills – has slowly been turned into a welfare measure. A case in point is India where government investments into skill development are skewed to more than 99% (CAG, GOI 2015) of the total spending for skill development in India. A government-financed technical and vocational education and training (TVET) system is a supply-driven system, which may lead to youth being trained in irrelevant skills, over-training/under-training, or training not leading to jobs. A demand-driven system that is financed and managed mainly by employers (with the government playing a policy-making, a regulating, and a gap financing role) is likely to avoid these problems.

Industry often complains that (a) not enough trainees are emerging from the VET system, (b) the quality of training institutions is so poor that the trainees either are not employable or have to be retrained by employers, and (c) skills which are provided do not match the specific skill needs. However, in day-to-day work, businesses pursue the primacy of policy priorities in land, taxation, capital, etc. as means of business incentivization, and the intangible “skills” come later on.

Most developing countries after independence adopted a state-led import-substituting model of industrialization, with the state often playing the role of a capitalist in the absence of a large entrepreneurial class with access to capital on the scale required. Accordingly, the state-led vocational education and training system (VET) was similarly put into place. That system survived for over half a century. This period was also marked by an expansion of the formal employment, but on a scale nowhere close to that required, given that the numbers joining the labor force looking for work was much larger. The result was the growth of a large and growing informal sector, with similarly rising informal employment among those who left agriculture in search of nonagricultural work, or those with a modicum of general education/technical education who sought work in industry or modern services. In this informal sector, all skill development took place on the job, given that the skills required for the technology in use in such informal employment were of a low order. This is the kind of economy that is normally found in most developing countries, to a larger or smaller degree. The share of informal employment may vary between regions in the developing world (share of informal employment in total employment in Latin America and the Caribbean is about 50%, in East/South East Asia about 60–70%, but much higher in sub-Saharan Africa (80–90%), and in India 93%), but the system of VET is not hugely different in the main, given that (including the majority of upper-middle income countries of Latin America) the existing, entrenched skills funding model emerged at a time when a state-led model of industrialization prevailed in countries, but today's globalized and fast-changing economic realities need better models to ensure local populations have skills and job opportunities (Johanson 2004).

Developing countries, while wanting to leapfrog, riding on the demographic dividend are characterized by low level of education in the workforce. For example, in India, estimates suggest (based on its Ministry of Statistics and Programme Implementation, Government of India – National Sample Survey 66th round, 2009–2010) that 49% of the workforce has primary education or less (27% of

which are illiterate), 16% are middle school educated (up to class 8), 19% are secondary schooled (i.e., up to class 10), and only 8% are graduates and above. Therefore, how does it vocationally skill/upskill/re-skill a workforce that predominantly has little education becomes a key question, to the extent that even acknowledging and recognizing their skills through some form of recognition of prior learning is a daunting challenge. Basic education provides a base to impart skills; skills have three dimensions (Mounier 2001): cognitive skills, a foundation of general skills for general citizenship such as literacy, numeracy, and general educational competence; technical skills, needed to perform particular tasks for pay, such as recognized trade or professional skills; and behavioral skills, personal skills to perform as an employee, usually subordinate roles in the production process or the provision of a particular service which is a crucial step.

Before taking steps to respond to the skilling challenge of this second decade of the twenty-first century, developing countries need to keep in mind two sets of challenges they face simultaneously. One, most of them have a significant informal workforce, in self-owned enterprises, tiny enterprises, or microenterprises. The workforce here has low levels of education and similarly low levels of vocational skills. Two, the developing economies have a dynamic, technologically advanced, relatively capital-intensive (though small) formal sector of enterprises, where much higher levels of education and skills are required (in sub-Saharan Africa, this sector is mostly foreign-owned, though not so in South Asia). Navigating the pitfalls of creating a skill development ecosystem that caters to the needs of different types of enterprises, with varying levels of technology, is a huge challenge for policy makers.

In countries where the size of the labor force is rising well into the next few decades (especially in South Asia and sub-Saharan Africa), young entrants into the workforce will be unable to meet the new challenges of a globalized labor market in the absence of growing levels of skills. For aging populations like Singapore and Japan, the need for a competitive workforce will further increase already high levels of skill-based immigration. Clearly, demand-aligned skills financing forms the only pivot for realizing such skill needs in the countries from where such emigration is originating.

The main thrust of the argument of this chapter is as follows. As compared to the Germanic model, the Anglo-Saxon model provides less opportunity for employers to be involved in skill development, in other words, less opportunity to have “skin in the game.” For countries that have adopted the Anglo-Saxon model, e.g., India, there is a good case to increase employer ownership by ensuring employer ownership in each pillar (schools, colleges, vocational training organizations, ministries implementing training, in-plant training) of the TVET system; this can be achieved through a combination of hard and soft means, for example, a financial contribution from employers that is reimbursable on fulfillment of training (proposed as the reimbursable industry contribution (RIC)) and in-kind contributions (e.g., by providing technology). We make a case for more concrete private-sector involvement by these methods to address the skill and job problem.

This chapter is organized as follows. Section “[Anglo-Saxon and Germanic Models of Skills Financing and Their Applications in Developing Countries](#)”

examines two models of skill development that seem to prevail across the globe, which are also being adopted in the developing world: the Anglo-Saxon and Germanic models. Section “[Case Study of India](#)” analyzes the case study of India (which has effectively followed the Anglo-Saxon model). Section “[Reimbursable Industry Contribution: Initiating a Means to Increase Private Skin in the Game, Quantitative Expansion, and Quality Improvement](#)” examines the proposed reimbursable industry contribution as a key tool for employer ownership and provides steps to implement it. Lastly, section “[Private Sector Contributing In-Kind and with Technology](#)” discusses in kind and soft approaches for employer ownership, e.g., contribution by technology.

## Anglo-Saxon and Germanic Models of Skills Financing and Their Applications in Developing Countries

In respect of private-sector participation in TVET, different countries in their own unique context and requirements use two broad models – the Anglo-Saxon and the Germanic models (Table 1).

**Table 1** Summary of the contexts of development of TVET in the two models

Anglo-Saxon model	Germanic model
The production relationship is characterized by nonintervention approach to the market process	The production relationship is community based with trade unions, employers, and government working together in a tradition of reciprocal responsibility
Primacy of economics	Primacy of society
Freedom takes precedence over security; additionally social security was developed later in the nineteenth/twentieth century	Social security was developed early and more completely in Germany
Skills in Anglo-Saxon model <ul style="list-style-type: none"> <li>(a) Are an individual attribute or property</li> <li>(b) Are associated with tasks and jobs rather than occupations set within an industrial context</li> <li>(c) Are associated with physical/manual mastery or ability</li> <li>(d) Have no particular association with a knowledge base</li> </ul>	In Germanic model, Kompetenz (competence) consists of <ul style="list-style-type: none"> <li>(a) Fachkompetenz – expert knowledge</li> <li>(b) Personal kompetenz – one’s own potential and to develop one’s life plans</li> <li>(c) Sozial kompetenz – social relations to realize personal competence</li> </ul>
The Anglo-Saxon model has a narrow interpretation skills	Skills are based on Beruf (occupation). It has the following: a body of systematically related theoretical knowledge (Wissen) and a set of practical skills (Können). It factors the social identity of the person who has acquired these skills

Source: Derived from Bercusson et al. (1992), Mückenberger (1998); p. 37 et seq., and Clarke and Winch (2006)

## Germanic Model

Nations like Germany have shown that employer ownership of skill development can be a key differentiator and a competitive advantage for a country's skill base. They have avoided building a TVET system that is supply-driven and government-led (which is too often a problem in many developing countries) and developed a demand-driven, formal industry-led model. In Germany 86% of the total cost of VET in Germany is met by the private sector, with only the remaining 14% coming from the government.

Germany's TVET system has been heavily based on apprenticeship that has evolved over centuries. Over time their reputed TVET system has transformed into a very flexible and stable system. The graduates are highly skilled and enjoy increased labor market access and incentives. Both the industry and the trainee gain in an economically stable and profitable situation. Loyalty to a company means the return on investment of training has already been paid with two-way benefits.

Germany's TVET system has great appeal, unlike most other countries where TVET systems lack attractiveness. In Germany, TVET covers between 50% and 60% of an age cohort. The reputation of TVET institutions' graduates is excellent, and their job opportunities with corresponding high salaries lead to the attractiveness of the system. The most important feature of the system is the role that companies play – it is basically a company-driven system. The companies share 75% of the costs of training, while 25% comes from the government, which allows apprentices and trainees to be paid a salary that increases from year to year. Modular qualifications were introduced in order to make it easier for young people to enter training and gradually progress in qualifications. They are aimed at socially disadvantaged young people and those who find learning difficult (ADB 2013).

The TVET system allows permeability along several pathways, and students can also switch from one channel to another, such as from TVET to general education or vice versa. Another unique feature is the task sharing among companies, industry chambers, public institutions, and TVET schools. The TVET system is very integrated; students spend 1.5 days in school and 3.5 days in actual workplaces. The Employment Opportunities Act of 2010 introduced training bonus, a financial subsidy that decreases the cost of initial vocational training and is provided to employers that offer additional training places for young people (UNESCO–UNEVOC 2013).

In sum, the Germanic model is characterized by two main qualities. One, the state delivers the framework and support for VET, and, two, occupation is the organizing principle for VET. It delivers a curriculum, the didactics and methods of learning and the institutional setting. Actors negotiate and organize VET with a holistic approach.

## Anglo-Saxon Model

In the Anglo-Saxon model, the state plays only a marginal role for VET qualifications. It is a liberal model like in England and the dominion countries

(Australia, New Zealand, Canada). The qualifications are supposed to be made by the private sector with little or no intervention of the state. In implementation however, it is seen that the development of qualifications is outsourced to consulting companies, and hence it is not made by the industry itself; at best they are consulted and provide desk validation to these qualifications.

Bilateral donor agencies (e.g., of Australia, the UK) through their governments have shaped the model and promoted its spread among Anglophone ex-colonies in the developing world.

The concept of Germanic occupation plays only a marginal role for VET qualifications in the Anglo-Saxon model. The liberal model of England and France and such Anglo-Saxon countries has a more modular approach instead of a holistic approach like the Germanic model.

Education in Africa, Asia, etc. has been influenced through an extended period of colonization. For the last 10 years or so, the Anglo-Saxon countries, following the example of England and Scotland, Australia, and New Zealand, have been implementing vocational qualification frameworks not only in their own but introducing them in many African/Asian countries as well. The borrowing of these foreign qualification models to be implemented in general education systems in Africa and many Asian ex-British colonies does not bode very well for the future of skill development (ADEA et al. 2012).

We take the example of India in the next section, which is predominantly an Anglo-Saxon one for a more thorough analysis of the model.

---

## Case Study of India

The case of India is provided below to provide a detailed analysis of the key issues on employer ownership and financing of skills. There are five pillars of skill education in India: (a) vocational education in schools and higher education, (b) vocational education by National Skill Development Corporation's (NSDC) private vocational training partners (VTPs), (c) public and private industrial training institutes (ITIs), (d) in-plant training by companies, and (e) the skill development schemes of the various 16 ministries of the Government of India (GOI).

Post-liberalization of the economy, while the private sector has thrived and grown, their involvement in skill development has not grown proportionately. Overall the general tax revenues are used to fund public and private VTPs. The government funds all preemployment training in India for every pillar of the VET ecosystem. The Ministry of Human Resources and Development (MHRD), GOI, funds vocationalization of education in the secondary school system. The Ministry of Skill Development and Entrepreneurship (MSDE), GOI, funds vocational technical institutes called industrial training institutes (public ones) and regulates the private ITIs. Sixteen other ministries of the Government of India fund their own skills training programs. The National Skill Development Corporation is funded completely by MSDE till now, which in turn funds the private VTPs and also

provides for training costs through a government program called Pradhan Mantri Kaushal Vikas Yojana (PMKVY).

In India, the Right to Education Act, 2009, makes 8 years of schooling compulsory. Vocational education in schools is offered optionally in classes 9–12, mainly for employability aimed at the service sectors. This vocational education is roughly based on India's National Skills Qualification Framework (NSQF), initiated from early 2014. The NSQF consists of ten levels. Levels 1–3 in service-oriented courses are running in 3006 schools to go up to 6,000 schools (by end of 2017). The total students enrolled is 225,000 (MHRD, GOI 2016). This effort is not entirely new. School vocationalization has been tried before without notable success, and still the intent and the practice of the current school vocationalization differ; but whether it is limited to guidance or real work skills is not clear. However, vocationalization in schools has brought private training providers to a very limited extent to the school ecosystem.

Vocational education in the higher education system is at its infancy with the primary motive being to remove the terminal character of early vocational education and to provide for vertical mobility. Bachelor in Vocation (B.Voc) courses have been introduced in 150 colleges in India. However, the long-standing traditional divide between skills and education still remains in society, and there are clear disconnects between skills and knowledge.

The second pillar of India's VET system is the industrial training institutes (ITIs). The Craftsmen Training Scheme (CTS) implemented by the industrial training institutes (ITIs) is run by government as well as private institutions. A total 13,105 (government 2,293, private 10,812) historically formed the foundation of the vocational system in India. While vocational education in its current form is relatively recent, the ITIs have existed since the beginning of the 1960s. They provide training primarily for manufacturing job roles. Industry has also supported/adopted ITIs; in the last decade, World Bank funding was provided to modernize ITIs. However, while there are regular industry complaints of nonrelevant curriculum, it must be noted that the ITIs have modified curriculum twice over the last 6 years even while industry ownership has not been too prominent (Mehrotra 2014). The presence of private ITIs does not reflect the participation of the employer but only indicates the business opportunity for private service providers in skill development. An attempt to create Industry Management Committees (IMCs) to run the ITIs has had moderate success. The ITIs offer long-term courses but are overshadowed in the numbers trained by NSDC VTPs who churn out more numbers; however, this is only the case because the latter offer short-term course not exceeding 4 months in length. However, studies suggest that ITIs remain the best that the industry has today for hiring of skilled workers (Mehrotra 2014).

India's National Skill Development Policy 2009 adopted a demand-driven sectoral approach to skill development and envisaged participation of employers in a key role in articulating and meeting skill demand. The NSDC was created as a "market maker" to catalyze private investment. A National Skills Qualification Framework (NSQF) was created, which envisaged a common standard for skill development across the country, consistent with a demand-driven skill development. However, employer adoption of NSQF has been limited as noted in a recent report (MSDE, GOI 2016) of the

Government of India. Sector Skill Councils were created as “employer-led bodies,” but they were all incubated with government funding from NSDC, with negligible contribution by employers. The peripheral employer involvement and ownership by actual employers (as opposed to private training providers) are reflected in poor placement percentages and courses not often used, even though they are supposed to have been prepared with industry’s supposed “involvement.”

In the NSDC-funded PMKVY (the flagship Pradhan Mantri Kaushal Vikas Yojana), the trainees are provided with short-term training. Training providers are affiliated by Sector Skill Councils (SSCs) which conduct both classroom and practical training as per industry-recognized National Occupational Standards. The certification is done by independent assessing bodies accredited by SSCs and the placement done by sectoral employers. The total training capacity is 2.4 million per annum (after about 5 years of operation of the scheme, including its predecessor STAR). The NSDC intended as a public-private partnership, which had a vision of private ownership, has not delivered and still depends on government funding. The NSDC VTPs were funded for a skills training business model, but no market-led model is followed, and they are dependent on government funding. NSDC was supposed to conduct skill demand gaps studies, but such studies as have been conducted are inadequate and cannot be relied on for planning. NSDC gives targets to SSCs, which were supposed to be industry owned. NSDC’s targets to training partners are based on splicing its own targets (provided to them by the Ministry of which NSDC is a part). More than 1,850 qualification packs, prepared by consultants, are too narrow and not understood well by stakeholders. Trainings happen on convenience and budget of the VTP not based on demand, resulting in skewing to training for job roles with little capital costs. With a fervent chase for numbers, the quality of training has deteriorated, and the short-term training is not translating into jobs. Youth, now armed with a government skill certificate, are now shifting the blame onto the government.

The fourth pillar of the VET system is the training conducted by other central government line ministries. Each ministry has its own skill targets and own programs and budgets for skilling. The Ministry of Skill Development and Entrepreneurship is the nodal Ministry for Skill Development. However, in addition to MSDE, there are 17 other ministries/departments, which are conducting vocational training. In 2015–2016, of the total trained, 58% was accounted for by MSDE, while all other ministries combined together trained 42% of the total students.

The last pillars of the formal VET system are enterprises themselves, or at least those firms that conduct in-house industry training. However, this is done only by large enterprises. Not surprising that a World Bank survey of enterprises in India found that only 16% of enterprises in 2009 conducted such training, in comparison to 85% in China (Mehrotra et al. 2017). In India the small and medium enterprises hardly train at all, but they form the majority of all registered firms. The lack of a training culture in the enterprises which value getting work done over getting work done in a proper manner has compounded the skills problem in India.

In-firm training financing is, according the same World Bank survey, confined to merely 36% of formal Indian firms. This is in contrast to 52% in Russia, 51% in Brazil, and 51% in Mexico. The important question as to why firms in India (and

many developing countries) prefer not to provide in-firm training can be best understood theoretically as a “moral hazard” problem combined with a “free rider” problem. For instance, firm A bears the cost of setting up the infrastructure needed to provide training, as well as hires professional staff to provide the training, while firms B, C, and D do not. Therefore, firm A runs the risk of losing its trained staff to its competitors. Firm A faces, in other words, a moral hazard since the free labor market is such that other firms will free ride upon its investment. As a result, no firms are willing to make the investment in in-firm training. Moral hazard becomes a generalized problem of all firms.

Another form of financing is corporate social responsibility (CSR) governed by an Act and applicable to only companies with an annual turnover of Rs. 1000 crore (146 mn USD) or more. The Act encourages companies to spend at least 2% of their average net profit in the previous 3 years on CSR. However, the provision in the Act is “indicative,” not mandatory.

CSR is a very suboptimal solution; classifying skill development in the category of CSR activity assumes that skill development is not directly profitable or beneficial to the company in its core business. Many large companies are already undertaking skill development activities, as the company requires skilled manpower that no one else can provide. Putting skill development into the category of CSR enables such companies to transfer the costs of normal skill development activities the firm was running in any case earlier and pass them now as CSR activities, substituting for other equally worthwhile activities (e.g., health, sanitation) eligible for CSR under the new 2% requirement. Besides, since this law is for companies with an annual turnover of Rs. 1000 crore (146 mn USD), that means it is not applicable to medium-sized companies, let alone smaller ones, entrenching the current position that small and medium enterprises are not conducting training. Finally, since skill development is an activity that will be undertaken by the company for meeting its own requirements for skilled people, the training hence may be overly specialized and may leave the trainee not particularly employable if he was to move jobs.

## **The Huge Challenge Posed by India’s Growing Labor Force**

The reason why the above ecosystem and its financing method will not be able to meet the current and future needs of India’s rapidly growing labor force is twofold. One, it is not growing as fast as the labor force is growing (and which will grow even faster in the future); two, it is not training workers, potential or current, to the quality required to meet the evolving industry needs as India’s economy, which is the fastest-growing large economy in the world that is rapidly diversifying its product and production technology range.

India’s demographic dividend will peak by the 2030s, with the additions to the labor force increasing between now and 2030 and then falling thereafter. However, the financing, largely hitherto dependent on government and more recently multi-lateral financing (World Bank 2017), will not be adequate. The predominant skilling option that has been provisioned by the National Skill Development Policy 2009 (and its revision in 2015) for the four million youth who entered the labor force

since 2012 has been the short-term courses through NSDC. These courses focus on narrow skill sets (MSDE, GOI 2016) and hence have limited utility; better holistic high-quality training to a large number of new entrants is required. The number of new entrants will increase beyond 4 million per annum to about 10 million by 2025 and even further to 12 million per annum by, as more young people get educated (MSDE, GOI 2016). Given the growing education level of these youth, they will not join agriculture but look for nonagricultural work.

In addition, there will be those leaving agriculture looking for work; between 2004–2005 and 2011–2012 as many as five million people per annum on average left agriculture, and similar numbers will continue to leave agriculture for the next 15 years or so, all looking for nonagricultural workers. All these older workers abandoning agricultural work will need to be trained; otherwise, the quality of the workforce cannot improve. But the kind of training to be imparted to them will be different than for those young with education who are fresh entrants into the labor. Finally, there are the already unemployed (2% of the labor force, according to the Ministry of Statistics and Programme Implementation, Government of India –National Sample Survey (MOSPI, GOI 2017), 2011–2012 (NSS 2011–2012)), who will need jobs and hence may need better training than they currently have. In other words, the skilling challenge is huge and will only grow. Hence, the need for more funds and a new financing model for India for skilling has acquired paramount importance today; a reexamination of the financing model of government-alone financing for the skill ecosystem is in urgent need for a revamp.

Voluntary financial commitment from employers has not worked out. The past government-only funding model has lost its relevance. Much more funds are needed for the growing numbers to be skilled, and the government alone cannot meet these costs. The government has other commitments, especially financial requirements to improve the quality of both school and tertiary education, which has experienced massification, with a precipitate decline in quality of learning. Building a skill ecosystem to train poorly educated youth is like building a house upon a sandy foundation.

It has become clear in this process that putting employers in the driving seat in SSCs can only happen by employer-incentivized participation in the financing of the system. However, there is a limit to the extent of general tax revenues that can be mobilized for skill development, given the need to keep the fiscal deficit under control on the one hand and the multiple very important drafts on resources from health, education, and infrastructure investments, which is the responsibility of the state.

---

### **Reimbursable Industry Contribution: Initiating a Means to Increase Private Skin in the Game, Quantitative Expansion, and Quality Improvement**

From the above discussion, it is clear that unilateral financing by the government does not meet the sectoral employer skill needs. For all these reasons above, operationalizing a National Training Fund with employer participation with a

meaningful economic rationale is required. One of the key ways to bring all employers onto a common platform for skills financing by addressing the moral hazard problem (“I don’t skill my workers as you will poach them, and vice versa”) is a “reimbursable industry contribution” (RIC). It is a hybrid financing mechanism linking financial benefits for employers to elicit key compliance for skill development and a more intensive employer role. The normal mechanism of such “skin in the game” for employers is where industry makes a financial contribution, which is a reimbursable percentage of the payroll bill. This goes into an earmarked fund for training purposes, over which industry ideally exercises control. Industry benefits when it conducts in-house or preemployment training, since they are reimbursed the costs of such training, at least partially.

Such hybrid financial mechanism can provide a steady and protected source of funding for training, particularly in the context of unstable public budgets. In 62 countries of the world, payroll training levies are the principal source of financing for training funds and have been part of their system for many decades (e.g., in Brazil since 1942). Early training funds (e.g., Brazil) tended to be single purpose aimed at financing preemployment training. Others are focused on expanding the volume of in-service training within the enterprises. There are 17 countries in Latin America (including Brazil), 17 countries in sub-Saharan Africa (including South Africa), 14 in Europe, 7 in Middle East and North Africa, and 7 in Asia that have such similar funds (Johanson 2004).

The systematic use of industry financing by such a large number of countries with good skill development systems is encouraging. However, they can be improved and incentivized further by remodeling into a proposed “Reimbursable Industry Contribution to demand side needs.” The RIC should be applicable to any registered large, medium, and small private and public enterprise. To ensure demand-linked skilling, sector employer bodies would need to capture the skill needs of the industry by an online submission of a “requirement of skills” and “annual training plan” agreed by the employers with the sectoral employer body, through consultation formally conducted by them. This would be a part of the submissions for reimbursement in the RIC framework. The RIC is intended to work on the basic principle of “you pay, you benefit.”

Global evidence suggests that such RIC financing mechanisms work with private sector being able to manage the contribution. The government control is seen as inefficient and bureaucratic, and the private sector does not find worthwhile the time and effort to access such funds for skill development. This is a very important concern. However, this concern can be addressed by the private sector being in complete control of the allocation of funds. For example, sectoral training funds (as in Brazil) enable industry to completely manage the funding, without government control. The huge advantage of the private sector managing the levy and the training is that there is better alignment of the skills with private-sector needs. This has remained a major problem of the skill ecosystem for the last half century. The sectoral employer body will be the channel for grant management, mandatory grant, continuous learning grant, and an apprentice grant.

## Proposed RIC Model Implementation

The RIC collected can be passed on to the sectoral employer body in proportion to the contribution of their industry members. It is proposed that 20% of the funds can be used for training for the unorganized sector. Such funds could particularly be used in clusters to ensure that their skilled manpower needs are met. The remaining 80% of the funds collected could be used by a sectoral employer body for reimbursements to members as per training plan, for their sectoral body administration and for grant-based funding for small registered enterprises in the organized sector. But this training should be for fresh entrants to the labor force, on project basis only. The rationale for only proposing for fresh entrants is to focus on providing some mechanism for new workers to get started. For current employers, the fund proposes to be used for providing a framework for training but not actual training. The RIC amount could also be used for financial support to learners (to compensate for training leave for workers, lifelong learning opportunities, stipends after training to support apprenticeships, etc.).

The use of funds must be targeted for industry and only for skills required by the industry; self-employment must not be funded by the RIC, as employers provide funds. Funds cannot be diverted to other sources but should be tied to the needs of firms. The RIC will ensure that, as opposed to the current measurement of the performance of sectoral employer body against skewed simple enumeration of output against training targets, the sectoral employer bodies are evaluated by real impact made: actual training plans received, total reimbursements made, and numbers trained and counseled for placement, under the RIC.

The TVET ecosystem (based on the demand side of work) has not matured in many developing countries because of the dependence on government financing and due to lack of participation from employers (as brought out earlier); hence, there is a risk that RIC may be misused or misrepresented by large employers with already existing training capacities. Hence, before implementation, there is a need for a baseline to recognize current level of training in the industries to ensure a baseline data is established for numbers currently being trained. RIC funds should be utilized for reimbursements for training over and above those currently being trained. This will provide all small, big, and large employers a new level playing field. The reimbursements would link to incremental improvement from the baseline and not on the absolute training capacity. This provides employers an incentive to augment existing capacities and ensures that we do not have deadweight training later on. So the levy will be on incremental improvement from current level.

The RIC provides an institutional framework for a steady revenue flow to the sectoral employer body to focus on their strategic objectives. They would be freed from mobilizing resources from here and there, and the rational separation of assessments that has encouraged conflict of interests would also be achieved. The RIC discussed in this chapter is a focused model that provides fresh young labor market members to training program which is owned and run in line with real-time demand needs. It is a hybrid financial instrument, incorporates best practices for industry involvement from across the world, and can be adapted to national specific conditions.

One of the key purposes of the RIC is to ensure adequate financing for qualification frameworks across the globe. Companies would need to follow qualification framework courses to claim reimbursements. With the adoption of RIC in countries and the alignment of sectoral employer bodies on training on qualification framework courses based on International Standard Classification of Occupations (ISCO) codes, there will emerge a global compatibility and help in global migration policies.

The RIC should ideally be an online system that provides for levy calculation, collection, and reimbursement. The entire system could be linked to a real-time labor market information system to ensure financial allocation from the sectoral funds collected under the levy addresses real-time skill needs. There would be monitoring of training quality and content by the ombudsman/national regulator, and a national assessment board should do the assessment and certification at the end of the trainings.

The RIC can benefit the large firms directly. But the small firms may not be able to claim reimbursement since they do not have the financial capacity to undertake enterprise-based training; hence, it is important to ensure that small firms particularly from the unorganized sector who do not have cash flows for training are provided training vouchers, which they can redeem, from nationally approved training providers.

When the government funds the training, the involvement of employers is peripheral. They neither share their requirement of skills with the government nor participate in setting training standards, in-plant training, assessment, or placement. It has been observed that when the employers contribute to training, their intensity of involvement increases many folds in all aspects of training.

A National Training Fund (NTF) at the federal level, e.g., National Skill Development Fund (NSDF) in India, can be created to be an institutional repository of the RIC. The fund will be used for the entire VET system across the country and be managed by sectoral employers by way of sectoral employer body. The sectoral employer body will need to collect credible data from industry through mandated provisions. The government has a key role in being a provider of information about the impact and effectiveness of the RIC.

If the above proposed RIC was to be implemented, government funding should not drop by any means. Government funds from all relevant ministries would also need to be also deposited in the National Training Fund. This would be beneficial, as it would enable planning on a national and sectoral basis, end fragmentation and duplication, and rationalize funding. This would ensure that a holistic mechanism would be put in place for financing skill development across the entire country. In this manner, the government role for social equity-based skills financing would be more effective, and its financial contribution can be more effectively used for disadvantaged groups, women, and the unorganized sector. These are focused purposes due to high inactivity rates of women in workforce in developing countries and would further their meaningful participation in the economy.

### **Key Success Factors for RIC**

Firstly, the RIC would be possible only when we close other suboptimal solutions (e.g., CSR). This has been explained in earlier pages based on the rationale that

classifying skill development in the category of CSR activity assumes that skill development is not directly profitable or beneficial to the company in its core business and hence diverts from the core purpose of improving productivity of the company and a job to the youth.

Secondly, RIC provides a direct link to a monitoring framework linked to a financial goal. Productivity is by far the single most important outcome of skill development and hence can clearly be monitored by the difference made to labor productivity. RIC pushes us to consider this more pragmatically. In the current supply-driven system, this measurement is not well established particularly in developing countries. Efforts to measure quantitative impact in terms of improved productivity is limited and unscientific, and monitoring mostly relies on qualitative testimonies which appear to have impact but are not meaningful to track overall progress at scale.

Thirdly, RIC opens up the skill development domain to not just be an isolated effort in human development. The link with migration policies, job creation policies, labor reforms, wage improvements, and so on can happen best when we have the systems that can talk with each other in terms of data and financial resources. This will give a holistic place for skills in overall development.

RIC ensures that employers cannot complain anymore since it is they who set and run the agenda and their in-house training systems are incentivized for more impact. RIC-type measures make planning of skilling more data centric. For countries in advanced stages of realizing the demographic dividend, the window of opportunity is too small, and more investment for skills that aligns with the sectoral demand is needed. While government has a key role, industries must be provided with the right mechanism for acting on their skill concerns. RIC provides a sustainable mechanism to substantially increase the number of students trained by the industry dramatically.

---

## **Private Sector Contributing In-Kind and with Technology**

### **In-Kind Contributions**

Other key methods for enhancing employer ownership can be by internships, on-the-job training (including apprenticeships), gifting/sharing of machinery and equipment to vocational schools, first right on phased-out equipment and machinery for educational institutions before being scrapped, providing experienced trainers, helping design course curriculum, and finally ensuring assessments are as per their needs.

### **Technology Contributions**

The quality of skills provided can be dramatically improved by the use of technological aids. Since the private sector is the early adopter of technology, it can be a primary means of technology infusion in training tools, monitoring, and assessment. Technology's key role has been felt by political parties who now provide smartphones and tablets as electoral freebies to attract the young people and by

governments trying to provide free laptops and designing tablets to meet costs on scale for the large number of youth. Software companies like Tata Consultancy Services have experimented with computer-based functional literacy to improve adult learning in numeracy.

Industry can help through other ways to provide access to technology for skilling. Technology can help in making personalized and adaptive content and curricula and provide for open educational resources, communication and collaboration tools, and interactive simulations and games. In particular, for skill development computer-aided simulation models that mimic real-life processes can reduce costs providing that simulated work environments can deal with resource availability constraints and augmented reality (AR) and virtual reality (VR) technologies can better learning outcomes. The students and trainees learn difficult concepts easily and interactively through immersive AR-VR and 3-D gamification methods.

The ever-increasing Internet and mobile penetration in India has meant that industry can leverage technologies to capture new demand and supply and build a highly scalable learning networks and platforms.

---

## Conclusion

As compared to the Germanic model, the Anglo-Saxon model provides for less employers' skin in the game of skill development. For countries that have adopted the Anglo-Saxon model, the case of India clearly shows that there is a good case to increase employer engagement by ensuring their ownership in each pillar (schools, colleges, vocational training organizations, ministries implementing training, enterprise-based training) of their TVET system. Employer ownership can be achieved through a combination of hard and soft participation, i.e., a financial contribution that is reimbursable on fulfillment of training referred to as the "reimbursable industry contribution (RIC)" and in-kind contribution, e.g., by providing technology, etc., respectively. Skills are the key to overall economic development and the software of business. The hardware is only as good as the software makes it, and the private sector understands this software best; it knows when to repair, how to update, and what its requirements of the future will be; hence, a more concrete private-sector involvement through the methods proposed can provide better job opportunities to youth and skilled manpower for industry.

**Abstract**

Blending the worlds of education and of work via continued reform of EU vocational education and training (VET) systems has become a key priority of EU policies, especially in the aftermath of the 2008 global crisis. But the objective of strengthening feedback loops between VET and the labor market, most notably via adaptive information systems based on robust labor market skills intelligence (LMSI), is intrinsically dependent on putting in place an appropriate governance infrastructure. Effective skills governance should facilitate stakeholder interaction and promote policy implementation and system learning. This chapter discusses the root of coordination failures, including asymmetric information, externalities, and strategic complementarities in information acquisition that impedes skills governance at both agent and policy levels. It proposes a novel skills governance framework that can be used by policymakers in diverse countries to identify “foundations” of well-functioning labor market information systems. Understanding how skills governance systems in countries are structured, interactions between different parts of the system, and the underlying behavior and motives of social actors is an essential prerequisite for ensuring that well-informed, labor market-relevant, VET reforms can be implemented.

**Introduction**

The gradual strengthening of vocational education and training (VET) policies in the European Union (EU) over the last two decades has facilitated continued reform of national VET systems and has significantly affected the scope and priorities within which they operate. Although the situation varies considerably from country to country, there are now clear indications that the Copenhagen-Bruges process, launched by the Copenhagen Declaration (2002) and revised by the Bruges Communiqué (2010) and Riga Conclusions (2015), has had some positive impact in most European countries (Cedefop 2015a).

Key target areas of the VET reform process in Europe (Box 1) have included the facilitation of greater transparency, quality assurance, and permeability of national qualification systems, as well as the wider recognition of the role of work-based learning, including apprenticeship schemes. A key ambition of these policy levers has been to influence the extent to which qualifications, knowledge, skills, and competences acquired by learners and workers strengthen their employability and, ultimately, to foster mobility, innovation, and productivity growth in EU economies.

**Box 1 European Education and Training Tools and Reforms**

Key European education and training tools and reforms implemented over the past decade include the development of the European Qualifications Framework (EQF), Europass, and European Quality Assurance Framework for VET (EQAVET); there are also common European principles and guidelines on learning outcomes approaches, validation of nonformal and informal learning, lifelong guidance and counseling, and the development of a blueprint for sectoral cooperation in skills anticipation and matching and of a digital skill and job coalition. Following the Council Declaration on the European Alliance for Apprenticeships (EaFA), important efforts have also been made to strengthen the quality, supply, and image of apprenticeships in Europe. A new proposal from the Commission for a Council Recommendation on a European Framework for Quality and Effective Apprenticeships has been recently launched by the European Commission.

In the challenging economic climate that followed the global financial crisis, the objective of strengthening links between VET and the labor market was introduced for the first time in 2008 as a key priority of EU cooperation in VET (European Commission 2008). This “new” objective reflected the need to respond to the employment crisis that was emerging in many member states and, more generally, to make VET systems more adaptive to the continuous and accelerated transformation process of EU economies in a global context.

Developing tools and systems to promote better skills anticipation and matching to labor market needs is identified as a core part of this strategy (European Commission 2010, 2016). In doing so, EU policymakers appear to be well aware that developing a labor market and skills intelligence (LMSI) infrastructure entails a significant governance issue. Good governance is a precondition to ensure optimal information sharing and better use of LMSI in the design and reform of VET policies. A number of policy efforts have therefore been initiated or further developed in recent years, aimed at not only the collection of better LMSI, but, crucially, ensuring that such LMSI can be translated into meaningful policy action (European Commission 2015).

It is the central premise of this chapter that strengthening feedback loops between VET and labor markets in EU countries is intrinsically dependent on putting in place appropriate institutional structures and governance processes that may facilitate stakeholder interaction based on reliable LMSI signals. More effective VET policies do not only require the development of robust LMSI systems but also a well-established skills governance infrastructure that ensures meaningful stakeholder involvement.

Skills governance however tends to be inhibited by marked coordination failures affecting VET and labor market actors. The “chicken and egg problem” of skills matching (employers do not hire because people lack relevant skills; people do not

train because of a lack of job opportunities) cannot be solved in isolation neither by market-led or centralized approaches. New or redefined institutional arrangements for empowering intermediary bodies, as well as adequate and targeted provision of financial and nonfinancial incentives and other complementary measures, should form the backbone of a country's skills governance system.

Before considering the different types of LMSI employed in EU countries and requirements for facilitating skills governance based on LMSI, section "[Challenges for VET Reform](#)" reflects on important challenges affecting the VET reform process in Europe. It considers macro trends as well as informational barriers erected during the implementation of VET and labor market reforms. Section "[Coordination Failures in LMSI and VET Governance](#)" subsequently considers different types of coordination failures that impede the responsiveness of VET to labor market and wider economic and social developments. Section "[LMSI and VET Governance](#)" then discusses the critical role of LMSI for overcoming such coordination failures and describes an analytical framework that policymakers may use to strengthen the skills governance process in their countries. Section "[Conclusion](#)" concludes.

---

## Challenges for VET Reform

### Economic and Social Megatrends

VET policies and systems are confronted with structural challenges that were intensified as a result of the recent financial and economic crisis. Most of these challenges predate the crisis and can be traced back to long-term drivers of economic change.

Demographic changes, notably the aging of the European population, and recent migration trends have implied growing turnover within labor markets but also rising inter- and intra-country labor mobility (Eurostat 2015). Globalization has increased fragmentation of production processes and is expected to continue to link jobs across borders (especially in the common market), affecting not only types of jobs but also tasks required per job (Becker and Muendler 2015; OECD 2017). Technological progress, automation, and organizational changes within the context of a global information society continue to produce significant changes in labor demand (Frey and Osborne 2013; Vivarelli 2015; Arntz et al. 2016). In particular, ongoing digitalization, the Internet of things, artificial intelligence and machine learning, collaborative online platforms, and so forth are expected to affect how and where work will be carried out (WEF 2016; Cedefop 2017a). Similar effects will be produced by other important policy challenges, including the shift toward environmentally sustainable ("green") production methods (a top priority for the EU).

What all these megatrends have in common is that they entail a continuous and accelerated process of economic transformation. They have been and will continue to dramatically change the industrial and occupational employment

structure of European economies, with increased demand in some sectors and specific occupations and decreased skill needs in others (Berger and Frey 2016). But these trends also change the way we work, rendering some skills obsolete while placing renewed emphasis on new skill sets (Cedefop 2017a). All such changes will confront European labor markets with an increasing need for upskilling, as well as the development of new skill profiles and qualifications.

European citizens seem to be well aware of the extent of the abovementioned challenges. Data from the European skills and jobs survey (Cedefop 2015b, 2017b), carried out in 2014 by the European Centre for the Development of Vocational Training (Cedefop), revealed that about half of EU workers think it is quite likely that several of their skills will become outdated in the following 5 years, presumably due to accelerating technologies and skill needs in their job.

### **Awareness, Attractiveness, and Accessibility to VET Policy Reforms**

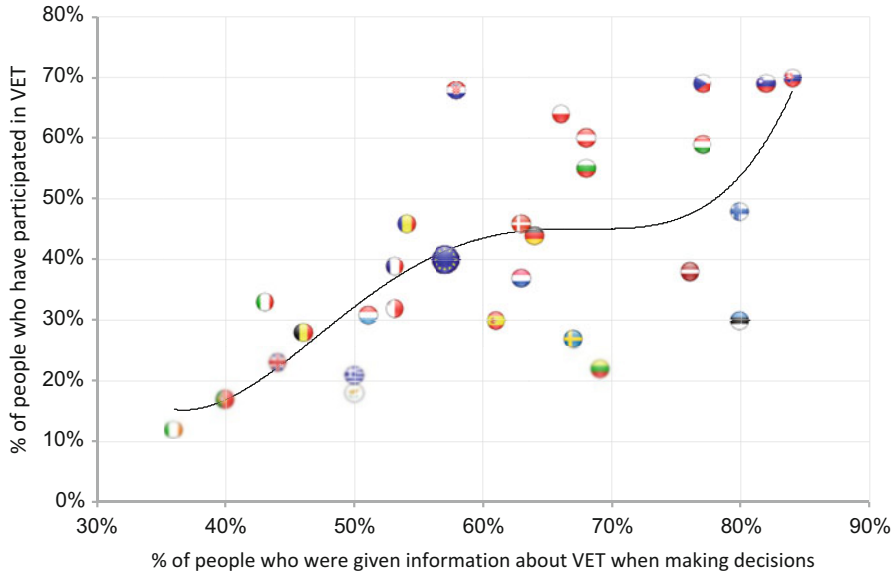

While the potential role of VET policies in addressing the above drivers of change is widely acknowledged, a pervasive challenge faced by VET systems is their lack of attractiveness and low relative esteem in which they are held by employers, individuals, and often policymakers.

As indicated more recently by the first Cedefop European Public Opinion Survey on VET, which interviewed 35,646 respondents (aged 15 and over) in June 2016 from the 28 EU member states, about 7 in 10 VET graduates at upper secondary level agree that general education enjoys a more positive image than vocational education in their country (Cedefop 2017c). This holds despite the fact that a large majority of VET graduates (86%) acknowledge they have learned skills needed by employers in their country and that the overall chances of finding a job if completing vocational education are better relative to general education.

The survey shows that low VET attractiveness is closely linked to imperfect knowledge and awareness of the benefits of VET (e.g., communication about returns on VET courses) and of improvements introduced by ongoing VET reforms (e.g., increased permeability between general education and VET learning pathways).

Figure 1 demonstrates the marked variance in the extent to which EU citizens had received information about VET at the time of making a decision about their upper secondary education. More importantly, it shows a positive correlation between information received and participation rates in VET at upper secondary level.

The relationship above confirms that the effectiveness of VET policy levers also critically depends on the awareness of their existence and potential benefits, which is associated with take-up by end users. A 2014 Eurobarometer survey had already made apparent the relatively low awareness of European tools among citizens (European Commission 2014). For instance, only 9% of citizens in the EU28 area said they know the European Qualification Framework (EQF) level to which their qualifications correspond, and only 15% were aware of the Europass CV, the most

Source: Cedefop VET Opinion Survey (Cedefop 2017c)

**Fig. 1** Relationship between provision of information and participation in VET at upper secondary level, 2016, EU28. (Source: Cedefop VET Opinion Survey Cedefop 2017c)

widespread of European instruments for documenting acquired knowledge, skills, and competences.

Drawing on microdata from this Eurobarometer survey, Fig. 2 displays the outcomes of a summative index that captures the extent to which EU citizens can potentially access and use five relevant policy levers linked to VET reforms, as included in the survey. Although incomplete, the analysis captures a relatively broad spectrum of the prevailing initiatives related to VET reform policies in the EU, namely, recognition of qualifications and various learning experiences acquired in other EU member states, formal validation of different skills and competences within a new qualification, access to career guidance services, and use of information about education and training or career opportunities. Even though this index provides a rough indication of the extent to which citizens are aware of and inclined to use some EU tools integral to the VET reform process, it clearly shows marked differences in accessibility across EU countries.

Cedefop and Eurobarometer surveys provide just few pieces of evidence on the potential role that better labor market information can have in improving VET policy attractiveness and effectiveness. Most of the evidence available on VET reforms and their effectiveness still tends to be based however on qualitative expert inputs and is typically noncausal (Cedefop 2015a). It remains a challenge to decouple the independent influence of VET policy levers on labor market outcomes, given that they are not context- and policy-independent and are typically shaped by a country's socioeconomic and historical context.

**Fig. 2** Access and use of VET reform policy levers by EU citizens, 2014, EU28. Notes: The figure illustrates the average number of (max five) policy levers of VET reform that citizens in each country have simultaneously accessed or used, as described below: (i) recognition of qualifications, qualifications from one's own education or training system can be recognized (i.e., used for work or further education) in other EU member states; (ii) recognition of learning experiences, various learning experiences in another EU member state (studying, working, traineeship or internship, studying online with an institution located abroad, working remotely for a company located abroad) can be recognized within one's own country; (iii) validation of nonformal and informal learning, a combination of skills or competences acquired in different ways (education, VET, and work experiences) can be used to obtain a qualification; (iv) career guidance, citizens have access to a career guidance service; (v) skills intelligence, citizens look for information about education and training courses (including offers of work-based learning such as internships, traineeships, or apprenticeships), career prospects, and recognition options for their skills or qualifications in other EU member states (Source: Authors' analysis of microdata from Special Eurobarometer 417)

While these are common challenges for many policy areas, significant governance issues arise in the specific case of VET and its links with the labor market. These reflect the difficulty of coordination among a number of diverse institutions (higher education, IVET, adult learning) and actors (learning providers, students, employers, workers, social partners, public employment services, policymakers) and highlight why addressing coordination failures is increasingly considered a key strategy of the EU VET reform process in years to come.

## Coordination Failures in LMSI and VET Governance

A characteristic feature of EU VET policy is its multidimensional, multilayered, and multi-stakeholder decision-making process. Since its formulation, the Lisbon Strategy brought together diverse and partly conflicting objectives, including

competitiveness, innovation, employment, and social inclusion. To make Europe the “most competitive and dynamic knowledge-based society in the world,” the ensuing Copenhagen process aimed at improving performance, quality, and attractiveness of VET in Europe through the development of common tools and principles, mutual learning, and the involvement of all relevant stakeholders in the process.

The difficulties of policymaking in such a complex policy background can hardly be overstated. It does not come as a surprise that VET reforms in Europe have tended to be inhibited by nontrivial coordination failures (Box 2), even across countries characterized by a variety of VET governance models (Hall and Soskice 2001) and in well-functioning education and training systems (such as Sweden, see Lindell 2004).

### **Box 2 Coordination Failures in a Game-Theoretic Perspective**

Coordination problems arise when a game has multiple (Nash) equilibria and all players have a common interest in avoiding a non-equilibrium state. To achieve an equilibrium state, agents must come to understand one another’s intentions. Communication can facilitate coordination, which may also sometimes be achieved with the aid of extrinsic signals that have come to be associated with the actions of others.

Coordination failures arise when the inability of VET actors to coordinate their choices leads to inefficient outcomes for all parties, as compared to what would be achieved through cooperative behavior. For instance, both people and firms may refrain from investing in education and training because the return on investment in training largely depends on the investments of others, overall raising uncertainty (Leuven 2005). This may underpin the classical “chicken and egg” problem in labor markets, whereby a substantial share of employers report skill shortages while, at the same time, workers complain about skills underutilization (Cedefop 2015b; Cappelli 2015; McGuinness et al. 2017).

In the case of VET policy, and specifically when it comes to LMSI, coordination failures may take place both at agent and policy levels (Almeida et al. 2012). Key drivers of such coordination failures in LMSI and VET governance include asymmetric information, information externalities, and strategic complementarities in information acquisition (Table 1).

At first sight, coordination failures at the individual level could be theoretically addressed by a central planner analyzing demand and supply of skills. It could identify skill gaps and mismatches and consequently shape VET policy by providing the right information and incentives to individual agents. However, decentralization of VET policies in the EU is not only a political (and administrative) necessity but reflects wider stakeholder needs. This is particularly apparent when it comes to LMSI because of two main reasons.

**Table 1** Drivers of coordination failures in LMSI and VET governance

Individual/market level	Policy/centralized level
Higher transaction costs due to information gaps increase labor market inefficiencies (matching process) and frictional unemployment; they reduce population participation rates and inhibit firms' hiring decisions	Lack of specific information and foresight (sectoral, occupational, local/regional, etc.) does not ensure that individual agents' needs are taken into account and feed into VET policy strategy and actions. This reduces responsiveness of VET policy to labor market needs and the ability to identify areas where collective action is more cost-effective
Information asymmetry gives rise to adverse selection, moral hazard and holdup problems, fostering misallocation of labor, and productivity losses	Lack of structured and regular interaction between the central-/state-level representatives and representatives of the world of work and businesses may generate nonmarket failures (internalities, moral hazard, path dependency, inefficiency, "turf wars" between different public bodies, etc.) that reduce cost-effectiveness of VET and skills strategies
Due to information externalities and knowledge spillovers, employers and workers do not take into account complementarities in the payoff function when choosing their skills investment strategy (Cooper and John 1988). This gives rise to myopia and free-riding behaviors and thus to low skill-low investment traps	In the absence of systematic feedback loops and interaction with relevant stakeholders, skills strategies tend to be set among all possible actions instead of confining them within the realm of feasible actions (constrained by individual actors' beliefs/preferences, actual investment opportunities, etc.)
Lack of information on labor market trends and skill needs at the aggregate level (local/sectoral, national/international) reduce firms' capacity to shape their recruitment and skills strategies, taking into account strategic complementarities with other actors. This increases individual risk-taking and uncertainty of investment in training	Lack of two-way flow of relevant information reduces trust between stakeholders and their willingness to accept compromises and strategies with longer-term horizons. As a consequence, opportunities for mutually beneficial cooperation may be lost Given the multiple and partly conflicting objectives of VET policies and the diversity of stakeholders' interests, the lack of a clear LMSI governance structure may give rise to biased allocation of incentives, rent-seeking behaviors, commensalism, as well as risks of decoupling between beneficiaries and those who bear the costs of public VET policies

First, elaboration of coherent short-, medium- and long-term skills strategies, based on sound analysis of labor market signals, requires a wide spectrum of data and information. This includes qualitative and contextual information that can be effectively collected and interpreted at the level of homogenous entities (geographical, sectoral, occupational, etc.) and by agents more familiar with the specific circumstances of their labor market(s).

More importantly, without a shared and clear structure of LMSI governance, one that involves intermediary nongovernmental actors and bodies, there is no guarantee

that information collected at a central level is correctly translated to actual knowledge and effective decision-making, by overcoming coordination failures and minimizing negative externalities likely to occur at the policy level.

---

## **LMSI and VET Governance**

### **Labor Market and Skills Intelligence Tools in Europe**

Acknowledging that robust LMSI is crucial for addressing different sources of market and policy coordination failures, numerous policy efforts have been initiated or intensified in recent years aimed at the improvement of national skills anticipation and matching information systems. Although information gaps can only partly explain failure in coordinating individual agents' decisions, information systems may reduce uncertainty and bounded rationality affecting learners' and employers' choices, promote labor market mobility, and overcome biased hiring practices by firms. Provision of informed signals on the returns to different learning pathways may simultaneously increase workers' incentives for training and employer's willingness to upgrade production strategies (Booth and Snower 1996; Redding 1996). It may also foster better skills matching (WEF 2014; McGuinness and Pouliakas 2017). Data on future skill needs may contribute to better aligning diverse stakeholder priorities and interests under a commonly accepted future-oriented strategic platform (ETF-Cedefop-ILO 2016).

Reliable LMSI is usually a key ingredient for revising or updating education and training provision in Europe by providing information about desirable course funding/allocation (Bulgaria, Cyprus) or the development of new VET programs and apprenticeships (Austria, Belgium, Denmark, France, Germany). It also feeds into the design of employment and activation strategies by informing or updating occupational standards (UK, Czech Republic, France, Portugal) or the design and revision of training for unemployed and employed workers (Spain, Portugal, Belgium). Moreover, migration policies (UK) and other sector-specific policy goals, such as the transition to a greener or digital economy (Cyprus, Germany), are often in need of reliable LMSI, particularly in relation to occupations that are identified as being "in shortage" (OECD-ILO-Cedefop-ETF 2014; OECD 2016).

Many different approaches and tools of LMSI are hence applied across Europe to measure and/or anticipate skills and labor market trends, ranging from conventional labor market analyses (standard employer and household surveys) to large-scale quantitative employment projections or adoption of skills foresights and other qualitative methodologies (ETF-Cedefop-ILO 2016). In some EU member states, such approaches tend to focus on the macrolevel (e.g., national economy) whereas for others at the meso- (e.g., region, sector) or microlevel (e.g., households, graduates, employers). The time frame covered (short, medium, or long term) may also differ, as are the predominant data sources used (e.g., national accounts, labor force surveys, vacancy data) and the regularity of updates (e.g.,

annual, every few years, ad hoc). Some initiatives aim at better describing the current state of play in the economy or in a given sector/region, while others focus on long-term projections and imbalances of changing skill needs and labor force stocks.

In addition to strengthening survey-based data sources extracting information on skill requirements using a task-based approach (Handel 2017), innovative Big Data or real-time labor market intelligence techniques have been increasingly developed in recent years to measure and decouple emerging skill needs. This includes digital web crawlers that scan across online job advertisement portals and/or individuals' online profiles and resumes (Kuhn 2014; Kurekova et al. 2015a, b; Deming and Kahn 2017). Real-time LMSI complements traditional instruments by filling gaps in existing knowledge of employers' skill requirements, including emerging occupations, newly demanded skill profiles (both generic and occupation-specific), and new qualification/certification requirements. Significant difficulties in the analysis, representativeness, and generalizability of Big Data across labor market populations and economic sectors exist. Nevertheless, the advantage of such data is the possibility of analyzing employers' contemporaneous skill needs (including emerging occupations, newly demanded skill profiles) or detecting individuals' job search strategies in a cost-effective way without the time lags found in traditional administrative and survey data sources.

Generally it is purported that different LMSI techniques complement rather than substitute each other and that best practices are those that attempt to combine quantitative and qualitative elements in order to develop a more holistic understanding of trends (ETF-Cedefop-ILO 2016). For instance, while current skill needs assessments and in-depth sectoral foresights are often easy to set up and execute and can offer greater depth to identifying emerging skill needs, they can only offer an impartial view of the economy and may capture marginal views in terms of emerging skill mismatches (ibid 2016). By contrast, large-scale skills forecasting models may offer a comprehensive assessment of current and future skill needs but are bound by their assumptions and uncertainty about complex economic interrelationships.

## **Governance of Labor Market and Skills Information Systems**

Even though several EU member states have recently initiated or intensified their policy efforts in this area, it is crucially acknowledged that the sole provision of timely LMSI does not suffice for translating it into tangible policy action. Responses of ministry representatives at a global survey of skills anticipation/assessment practices, carried out in 2014/2015, reveal that the challenge of coordination failures is considered a major barrier by EU countries surveyed, second only to lack of resources (Fig. 3).

Addressing coordination challenges is therefore a crucial step in attempting to reform VET systems in alignment with labor market realities. However, the use of

**Fig. 3** Obstacles to the (further) development of LMSI exercises. Notes: Based on the responses of representatives of Ministries of Education and/or Labour in 23 EU countries. One response per country is retained. The figure depicts the number of countries that identified the specific obstacle as a percentage of the total number of EU countries with valid responses to the survey (Source: Author's calculations based on OECD-ILO-Cedefop-ETF 2014)

timely LMSI for the purposes of striking stakeholder cooperation in updating VET curricula, (re)designing training programs, revising (sector-specific) qualification frameworks, and/or incentivizing and funding VET programs is often inhibited. Such intelligence is not always actually disseminated, validated, and streamlined into meaningful policy actions (Sanderson 2002).

Cedefop's reporting on VET policies (2010–2014) shows that even though a growing number of member states regularly monitor employability and labor market transitions of their VET graduates, in many countries, this information is not actually used to inform VET provision (Cedefop 2015a). VET programs, standards, and curricula take account of transition and employability data only in half of the EU+ countries. Only “some of the Nordic countries and the Netherlands have systems with strong feedback loops” (ibid. 2015a).

“Skills governance” (Box 3) is hence increasingly considered to be a necessary precondition to address coordination failures that may prevent LMSI from being effectively transmitted to all relevant actors, subsequently inhibiting the speed and effectiveness of VET reform (Green 2013; OECD 2016).

The skills governance process typically involves diverse education and training, labor market, and other social actors. The constellation of stakeholders involved in commissioning and producing LMSI tends to be quite heterogeneous – in some cases, central authorities such as Ministries of Labour or Education or Public Employment Services spearhead the initiatives, whereas in others it is employers, social partners, VET providers and/or NGOs who produce their own data and information (ETF-Cedefop-ILO 2016). Good skills governance therefore requires the setting up of purposefully implemented institutional frameworks and procedures (financial incentives, regulations, and

digital platforms) to foster feedback loops between VET (sub-) systems and labor markets (Cedefop 2013).

### **Box 3 Definition of Skills Governance**

A skills anticipation and matching information system refers to the process of producing and building on available labor market and skills intelligence with an aim to provide an informed basis for economic development via targeted skills investments by an individual country. “Skills governance” refers to the process of involvement of stakeholders from the public, private, and third sector, from different economic sectors and geographical units, in generating, transmitting, and using skills intelligence for implementing and steering education and training policies. It is comprised of formal or ad hoc institutional bodies, incentive structures, and other procedures in place for steering education and training provision and assuring the quality of training in accordance with available skills intelligence. It comprises a negotiation perspective, which represents the needs of the education system and of the labor market from a short-term, medium-term, and long-term perspective.

*Source:* Author’s elaboration on European Commission (2015).

Different countries are characterized though by different modes of skills governance, which can influence the degree, speed, and penetration of LMSI signals in the policy decision-making process (Meulerman 2008; Robichau 2011; Cedefop 2013; Burns and Koster 2016). These are usually determined by a country’s historical evolution path and sociopolitical context and are embedded in national collective bargaining and welfare regimes. In reality in most countries, different types of governance models are likely to coexist or evolve over time.

Countries with hierarchical (or statist) governance models largely rely on a top-down and regulated approach, in which specific ministries dominate. Although this ensures tighter links between LMSI and policy responses, striking stakeholder consensus becomes more challenging. In market-based (liberal) governance, governments mostly assume an “overseeing” role, seeking to foster competition in public service delivery via contracting-out and performance-based funding. In such a model, independent agencies are more likely to lead the design of LMSI exercises. This can facilitate stakeholder trust but often suffers from weaker translation of LMSI outcomes to policy action and fragmentation of methods and findings. Network-based governance models (including participatory or coordinated approaches) seem best-suited to establish shared consensus among social co-actors. They can foster negotiating and brokering of different interests by placing social partners in the driving seat or in consultative roles, although free-riding problems and insufficient ownership of LMSI design and outcomes are common issues.

Regardless of its form, skills governance is fraught with the challenge of satisfying many diverse interests and accommodating a wide range of stakeholders. Due to the multitude of diverse bodies involved in the process, some may be inclined to be involved in “turf wars,” especially in case of overlapping of competences across various ministerial portfolios (e.g., initial VET, adult learning, employment policy, economic development). The multi-actor landscape may sometimes produce conflicting research outputs and studies, based on incomparable methodological approaches and statistical taxonomies, as it often responds to different target audiences and serves alternative policy priorities (Hantrais et al. 2015). As a result, suggested policies and initiatives may run counter to one another and foster policy incoherence.

In many countries, the skills governance process tends to be loosely coordinated without a clear definition of the role, tasks, and responsibilities of the different actors involved. This often raises complaints from the social partners claiming that their voice fails to translate into actual policy “influence” (Kriechel and Vetter [forthcoming](#)). Stakeholders at the subnational administrative level (regional or local authorities) are also frequently neglected when discussing the findings of LMSI analyses, inhibiting the “reach” of the information to a wider spectrum of potential beneficiaries.

For all aforementioned reasons, the development of a coherent policy reaction and VET reform underpinned on sound labor market intelligence may often be delayed or diluted.

## Strengthening Skills Governance: An Analytical Framework

To overcome such obstacles and move toward a collaborative approach to collecting and using LMSI, appropriate governance settings need to be put in place that will ensure long-term commitment and a synergetic policy outlook among all relevant stakeholders (Greer et al. 2016).

Cedefop’s skills governance framework (Table 2) has been recently set up to provide a starting point for identifying essential elements of EU countries’ skills governance systems (Cedefop 2017d). Despite the marked variation observed in LMSI data and methods and governance models across countries, a number of desirable elements may be identified that constitute “foundations” of a well-functioning skills governance system.

Participation of key stakeholders is fundamental in assuring quality in data gathering, production and analysis of skills intelligence, legitimacy of the results, and coming up with a strategic vision and road map for skills development, based on evidence-based policymaking (Shortall 2013). Clarifying the role of national, local, and sectoral participating institutions within the overall foundation of the system and forms of collaboration and negotiation between them is a critical element in ensuring robust skills governance.

To this effect, setting up sustainable institutional arrangements for stakeholder feedback and validation of LMSI outputs between different government bodies and

**Table 2** Cedefop’s skills governance framework

	Organization	Resources	Stakeholders	Use of information
Foundations	A	D	G	J
	Legal and regulatory framework	Funding and human resources	Cooperation arrangements	Feedback mechanisms
Processes	B	E	H	K

Sustainability	C	F	I	L
	Vision and strategy	Resource continuity	Integration of stakeholder needs	Reputation

Source: Cedefop 2017d

social partners is a necessary building block. Nevertheless, institutional bodies facilitating stakeholder engagement may manifest in many different forms, as is typically observed across European countries. For instance, formal institutional fora include “national education and training commissions/committees” (DK, DE, EE, IE, HU, LT, NL, PT, SK, SE, LV), “advisory boards” (DK,PT), “sectoral skills councils” (CZ, SI, BG, HR, EE, LT, PT, SK, ES, UK), tripartite bodies (FI), and “regional skills platforms/for a” (SE, AT, HR, CZ, DK, HU, PT, SK) (European Commission 2015).

A transparent legal and regulatory mandate, as well as an operational management strategy, offering to national stakeholders a clear understanding of their roles and task responsibilities in both design and take-up of LMSI findings, is also important.

Ensuring that a wider array of potential beneficiaries have access to and can provide feedback on the LMSI produced at higher levels and that such information is customized to meet the needs of a diverse audience constitutes another critical pillar of the framework. In many EU countries, the dissemination of LMSI tends to be a weak link in the governance chain, as efforts often rely on ad hoc communication activities (e.g., publications, events, and awareness campaigns) but lack a systematic or targeted communication strategy based on specific regulation, budget line, and monitoring of the user base. For instance, career guidance and counselors, the most typical “transmitters” of LMSI to micro-agents (job seekers, employers), have been found to be targeted by LMSI dissemination efforts in less than one third of EU countries (ibid 2015).

Finally, the framework places emphasis on the inputs to the skills governance system, namely, the existence of adequate human and financial resources. Specific attention is paid to the capacity of both front and end users involved in the system and on how such capacity is developed over time so as to ensure system continuity.

Even though setting up the aforementioned foundations and formal structures and processes is a necessary condition for ensuring sustainable skills governance, it is

also important for policymakers to carefully understand behavioral traits and interdependencies between the elements underpinning the system. For instance, identifying the rationale for stakeholders involvement (or exclusion), capacities made available to them, and clarifying the nature of their contribution (advisory, consultative, decision-making, passive, or active) are vital ingredients for assessing the overall contribution and quality of stakeholders' engagement. Setting up a credible operational plan may induce stakeholders involvement, subsequently also improving the quality and depth of data collection.

The provision of stakeholder feedback and validation is also dependent on adoption of a strong negotiation perspective providing reassurance that (legitimate) stakeholder interests and needs are taken into account. This is especially the case if validation of LMSI findings constitutes the basis for resource allocation. Customization and use of the outputs of the system by a wide range of user groups will provide credence to the system and subsequently may improve prospects of resource continuity and system stability.

It is often also the case that skills governance systems are, to some extent, hostages to historical contingencies, which may prove hard to address in a short-time period. Therefore, the overall reputation of the skills governance system ultimately hinges on ensuring continuous and adaptive system learning, namely, understanding the reasons why LMSI may lack credibility among system actors and what type of mechanisms may have been set up so as to resolve potential conflicts. Evaluations and impact assessments may provide some of the feedback required, but they are unlikely to take place with any degree of regularity. Therefore, it is important for a well-functioning skills governance system to have other formal or informal institutionalized feedback mechanisms in place.

#### **Box 4 Examples of Skills Governance Systems**

##### *Greece – A newly developed system*

In the midst of a severe economic depression, the Greek government, with the encouragement of the European Commission, began to set up a comprehensive skills diagnosis and anticipation system at national, regional, occupational, and sectoral levels. Setting up the newly established “mechanism of labor market diagnosis” first entailed the drafting of a precise regulatory framework led by the Greek Ministry of Labour. The regulation allocated responsibility for overall methodological expertise to the National Institute of Labour and Human Resources. It sought to engage a wider network of stakeholders into the process (e.g., ministries, public employment service, social partners, regional authorities) by setting up complementary operational components as part of the mechanism, including a coordination committee, a scientific committee, and a larger operational network. After 2 years of implementation, the system produces biannual reports and outputs of what constitute the most “dynamic” (in terms of employment growth) and “high-

(continued)

**Box 4 Examples of Skills Governance Systems** (continued)

quality” jobs in the Greek labor market. Detailed information enabling the design of targeted unemployment policies at local level is provided together with almost real-time labor market intelligence on entrepreneurial dynamics.

Continued reforms are taking place, including a process of further integrating as part of the mechanism’s feedback loops additional relevant ministries (e.g., Ministry of Education, Ministry of Tourism, and Ministry of Immigration). Moreover, continued efforts are made to ensure that the outputs of the mechanism of skills diagnosis can produce policy relevant information spanning across a wide array of policies, such as active labor market policies, apprenticeship design, social protection measures, and migration. Although social partners participated in the initial stages of the development of the mechanism, both in a consultative and executive role (e.g., carrying out quantitative or qualitative analyses of the economy), their long-term involvement, as well as that of regional authorities, has yet to be established in practice. In spite of the potentially wide range of end users of the mechanism (e.g., education providers, employers, guidance counselors, etc.), the current dissemination modes are not yet customized enough so as to achieve that aim.

*Bulgaria – Development of a workforce competence assessment system*

In Bulgaria a project to develop a national skills anticipation and governance system was implemented by the Bulgarian Industrial Association during the period 2009–2014, partnering with the Confederation of Independent Trade Unions in Bulgaria (CITUB) and the Confederation of Labour “Podkrepa.” The project was co-funded by the European Social Fund (ESF), under the Human Resource Development Operational Program, and offered users an overview of available job posts in sectors and regions as well as the key competences and qualifications needed so as to facilitate job seeking and training/lifelong learning decisions. Each competence is linked to qualification levels of the National Qualifications Framework, while “key jobs” per sector are also identified. The MyCompetence platform was developed under the project which allows for future analysis of trends, forecasts, and research.

Continued reforms are taking place to ensure that the outputs of the MyCompetence initiative feed into the design of vocational education training programs and that a multiplicity of data outputs by the Ministries of Labour and Education can be more effectively bridged. Efforts for further capacity building of regional and local authorities in producing and using labor market intelligence and skills anticipation tools are also ongoing.

*Finland – a mature skills governance system*

Finland has a long tradition of participative policymaking and consensual acceptance of forecast results which ensures that skill forecasts are widely used and valued. As part of the National Education Development Plan, the two key forecast tools VATTAGE (steered by the consortium of key ministries) and

(continued)

**Box 4 Examples of Skills Governance Systems** (continued)

MITENNA (the Ministry of Education and Culture) steer education and training in accordance with sectoral developments and vocational education needs for young people. In particular, the MITENNA system translates the results of VATTAGE scenarios (long-term sector-specific labor needs) into learning provision strategies. These provisions are discussed by councils at different levels (national, regional, and local) in order to make adjustments to provisions according to stakeholder views (e.g., the 26 national and sector-specific Education and Training Committees, tripartite bodies in each occupational field, supporting the design and content of upper secondary VET and HE).

A dialogue process is used to develop proposals for the future educational targets. The working group consists of representatives of the Ministry of Education and Culture, the National Board of Education, education research, provincial government, regional councils, the Finnish Association of Local Government, and the Ministry of Employment and Economy. Also the main trade unions contribute to the process, while the different regions are to take into account national and regional forecasts in planning their future strategies and activities. The whole process uses and comments on the long-term qualitative information of VATTAGE and other qualitative and quantitative sources. VATTAGE also sets a common framework for stakeholder cooperation and a sustainable anticipation procedure, which further enhances its reliability and accountability.

**Conclusion**

This chapter has focused on one of the "new" objectives of the VET reform process in the EU, strengthening feedback loops between VET and the labor market. Blending the worlds of education and of work to combat high unemployment and skill mismatch became a key ambition of EU member states, responding to the legacy of the 2008 global crisis. It has been argued however in this chapter that facilitating VET responsiveness in alignment with labor market signals in Europe has been inhibited by significant coordination failures, manifested at both the level of micro-agents and policy. Overcoming information deficiencies, asymmetries, and externalities among education and labor market actors, as well as fostering strategic complementarity between their individual decisions, is an important requirement for

establishing faster adaptiveness of VET policy to structural economic and social trends.

Although several EU member states have now invested heavily in strengthening tools and methods of LMSI, on the grounds that information is a public good that may mitigate market failures, this chapter has pointed out that such efforts tend to fall short of ensuring that LMSI translates into effective policy responses. The absence of or inadequate skills governance has been highlighted as a culprit for undermining the potential LMSI to address coordination failures, especially those arising at the policy level. In this regard, a new framework for assessing and monitoring critical elements of a country's skills governance, recently developed and employed by Cedefop, has been presented here for the benefit of policymakers. The framework is based on the principle that facilitating VET responsiveness via better LMSI is dependent on putting in place appropriate institutional arrangements and procedures that can empower national stakeholders and facilitate and sustain in-depth social dialogue. Understanding the way in which skills governance systems in EU countries are structured, interactions between different parts of the system and the underlying behavior and motives of social actors are an essential prerequisite for ensuring that well-informed, labor market-relevant, VET reforms are implemented.

## Introduction

India's skill requirement calls for millions of individuals to be formally trained and qualified for employment. What underlies an acknowledged dearth of skilled labor, impeding India from reaching its potential, are issues of quality, standardization, and accessibility to skill development, especially to and within existing vocational training programs. The United Nations Sustainable Development Goals (SDGs) reiterated the urgent need for improved inclusion in skill development among socially and economically vulnerable groups to strengthen the prospect of decent employment and income generation, as indicated in the sub-goal of SDG 4 on quality education (United Nations 2015):

SDG 4.4: By 2030, substantially increase the number of youth and adults who have relevant skills, including technical and vocational skills, for employment, decent jobs, and entrepreneurship.

Skill development practitioners and academicians recognize information communication and technology (ICT) as a critical component in addressing issues of inclusivity, quality, and standardized skill development (British Council 2016, Chinien 2003). Discussion of ICT-integrated technical vocational education and training (TVET) primarily takes place in the context of formal training; however, a significant portion of skill development in India takes place along the lifelong learning continuum, outside of the formal context. This chapter, therefore, takes a wider perspective to review how ICT is reforming TVET delivery practices in India across formal, nonformal, and open and distance learning settings.

## TVET Continuum

A major principle of TVET, as per UNESCO-UNEVOC (2013), is that providers must recognize that learning takes place along a continuum composed of formal, nonformal, and informal education. The barriers associated with access to formal

skill development in India are widely recognized and have contributed to a predominantly informally employed labor force. Informal labor systems tend to require people to rely on open and distance learning (ODL) or other nonformal forms of training to acquire skill and employment. UNESCO (2002) defines open and distance learning (ODL) as an “educational process in which all or most of the teaching is conducted by someone removed in space and/or time from the learner, with the effect that all or most of the communication between teachers and learners is through an artificial medium, either electronic or print.” In contrast to formal education, which the OECD describes as structured and learning objectives in alignment with official accreditation bodies, nonformal education (NFE) is generally described as a complementary to formal education, shorter in duration, and flexible structure and can potentially cater to learners’ specialized needs (Schneider 2013). The aspects of short-term training, flexibility in structure and objectives, have lent to the implementation of NFE programs in sidelined communities throughout India (Mitra 2007). This chapter will focus on the role of ICT in training delivery, especially with regard to content development and course delivery.

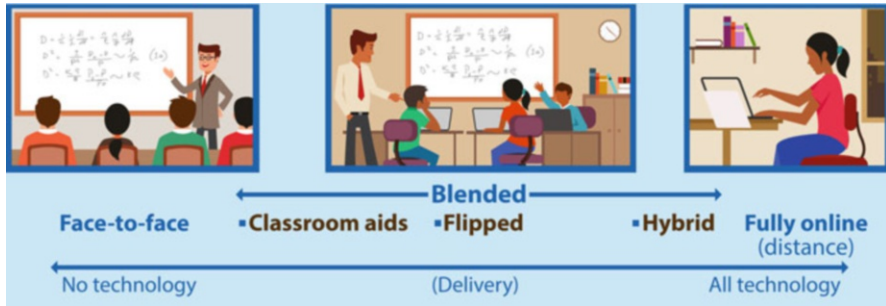

To preface the larger discussion around ICT-integrated TVET across the lifelong learning continuum, the following section will clarify what is meant by ICT for TVET.

## ICT for Teaching and Learning

ICT is a broad term that encompasses radio, television, Internet, mobile, WiFi systems, computer hardware and software, audio and video conferencing, and social media. ICT enables individuals to locate, analyze, share, and present information, knowledge, skills, ideas, and experiences (Latchem 2017).

*Media and Technologies:* ICT in education may be broadly divided into media and technologies. Technology consists of tools and resources used to support teaching and learning. Current educational technology includes devices such as computers, tablets, mobile devices, telecommunications, network, software, massive open online course (MOOC) platforms, learning management systems (LMS), simulators, etc. The key building block of media, on the other hand, are text, graphics, audio, video, and computing (including animation, simulations, and virtual reality) (Bates 2015). There are models that help determine the selection of media for training based on various factors including context and target audience. In the subsequent sections, the term “ICT for teaching and learning” may interchangeably be referred to as “media and technology.” Also, the term “e-content” refers to digital learning resources such as digital textbooks, workbooks, articles, videos, or multimedia.

*ICT-Enhanced Delivery Models:* ICT is used by institutions in a variety of delivery models such as blended learning with technology aids, i.e., using videos, presentations, and similar aids, blended learning with flipped and hybrid classrooms, fully online learning such as distance learning initiatives and MOOCs, and the use of open educational resources (OER) in informal learning (Bates 2015), as illustrated in Fig. 1.

**Fig. 1** Continuum of ICT-based teaching and learning (based on Bates 2015)

### Enabling and Constraining Factors to ICT Implementation

There are a wide variety of factors that influence the success of ICT-enabled training, such as teacher training, pedagogy, technology familiarization, and more, which need to be considered while adopting ICT for teaching and training (Mayer 2014). The literature identifies the following common issues in ICT for teaching and learning: lack of usability and user engagement, which mainly arises from a lack of rigor in the design process and a poor choice of media, and insufficient effort at the institutional level to develop carefully curated e-learning content. Institutions often convert textbooks to online e-books or page turners and expect a change in learning outcome.

The use of evidence-based models for media design that follow learning and design principles such as ADDIE is known to lead to more effective uses of ICT for teaching and learning (Mayer 2014). Higher forms of ICT, such as interactive e-learning, simulations, simulators, and virtual reality (VR)/augmented reality (AR), promote active learning and improve user engagement compared to passive forms of media such as e-books, PowerPoint presentations, and videos. The former forms of technology are considerably more expensive to design and develop; hence, institutions are often required to balance between cost and quality when adopting ICT for teaching and learning. With this background on ICT-integrated TVET, the next section discusses practical instances of ICT for TVET in India along the learning continuum.

### ICT for TVET in India

The integration of ICT and blended learning in schools and other higher and distance education through MOOC platforms like edX, Coursera, Khan Academy, etc., is a globally trending practice. ICT-based initiatives initiated by the Government of India (GoI) Ministry of Human Resource Development (MHRD) such as recorded lectures by experts, MOOCs, online-simulated and remote trigger labs, digital libraries, etc. are a growing school education practice in India. ICT integration at the vocational

training level, however, is an emerging practice in India and not yet widely implemented for reasons that will be briefly summarized here.

Firstly, a distinguishing factor between the integration of ICT in TVET and conventional school education is that the former involves the use of complex, multimodal technologies that are designed to provide hands-on, kinesthetic learning experiences in addition to cognitive knowledge transfer. Secondly, the varying levels and educational qualifications of the target groups add another level of complexity to the teaching-learning process. In India, there are challenging cultural and structural issues, notably the multiple language requirements for the course curriculum (India has over 22 major languages and hundreds of local dialects), a large number of vocational trades, and the costs involved in undertaking large-scale ICT initiatives which are constraints toward developing universal ICT-enabled content for TVET.

Evidence has emerged, however, that demonstrates ICT-integrated teaching and learning lends to improved quality, standardization, and accessible TVET (British Council 2016). Currently, there are multiple governmental agencies such as the MHRD and Ministry of Skill Development and Entrepreneurship (MSDE) that fund the development of open-access media and technology for TVET. This is supplemented by intergovernmental bodies such as the Commonwealth of Learning (COL) and Commonwealth Educational Media Center for Asia (CEMCA) and industry-driven ICT-based skill development solutions promoting the development and the use of open education resources (OER) in distance education. Figure 2 highlights the current ecosystem for e-content and technology for TVET in India. The figure includes initiatives by the GoI ministries and nongovernmental and private agencies that develop and distribute ICT solutions as OER or for paid access.

		<b>Skill India online portal</b> (online courses for registered candidates and public)		

**Fig. 2** E-content and technology ecosystem for TVET in India

*Other ICT Enablement Policies and Initiatives:* MSDE (2015) recognizes the need for innovative ICT-enabled training models and products to address critical gaps in the skills ecosystem. It highlights the case of over one million institutional buildings and 8000 railways stations with adequate infrastructure facilities and extensive optical fiber cable network that may be leveraged for TVET. Google has enabled WiFi in over 110 railways stations around India and has set a target of 400 stations by the end of 2018 (Tiwari 2017). Rollout of 4G data plans starting at \$0.33 per GB and availability of 4G mobile handsets starting at less than \$25 (Rudradeep 2017) have propelled India to high mobile consumption with a projection of 11 GB data consumption per active mobile user per month by 2022 (Borde 2017).

The next section will explore in greater depth various initiatives that support ICT-enabled teaching and learning for TVET, across the formal, nonformal, and ODL training scenarios.

## **Formal TVET Training**

TVET delivery in India through formal institutions is primarily coordinated by the MSDE. Under the MSDE, the Directorate General of Training (DGT) and NSDC are mandated to impart TVET through their network of industrial training institutes (ITIs) and training providers, respectively. While these agencies are under the same ministry, they operate independently and offer different programs. Hence, in this section, the ICT initiatives of these agencies and its training providers will be discussed separately.

### **ICT Initiatives by DGT**

India's ITI system is estimated to be the largest vocational training infrastructure in the country with a training capacity of over three million (MSDE 2017). However, studies indicate that issues such as a shortage of skilled instructors, machinery, tools, and space to teach modern technologies impact the quality of training and employability of its students (Tara and Pilz 2016).

The MSDE introduced several reforms to tackle the aforementioned challenges through initiatives such as the upgradation and performance evaluation of ITIs, the establishment of model ITIs, development of ICT-based teaching materials, professional development of trainers, and launch of space-based distance learning (MSDE 2017).

To ensure standardization of training across ITIs, the National Instructional Media Institute (NIMI), an autonomous body under the MSDE, develops courseware in the form of print material – textbooks, instructor guides, assessment guides, visual aids, instructional videos, and e-learning. DVDs of instructional videos of practical procedures are bundled with the print material and are available for sale to learners and trainers. The print material is available in English and in eight Indian languages. Another major initiative of this agency is the development of an open-access platform which hosts e-books and interactive learning materials for over 60 courses in English (NIMI 2016).

State governments are starting to support ICT-based TVET, such as the Chhattisgarh state's launch of the online learning platform (OLP) to promote ICT-enabled skills training at ITIs and vocational institutions (Skill Reporter 2016). Concerted efforts by stakeholders of the skill development ecosystem to promote ICT-based TVET, such as upgradation of required infrastructure, training the trainer on ICT skills and pedagogy, and ensuring availability of relevant ICT-enabled content in regional languages, are essential to ensure effective adoption. There is a need for further research to better understand the extent to which ICT-enabled teaching and training take place at ITIs and how they can best be introduced given the current infrastructure.

### **ICT Initiatives of NSDC**

The NSDC promotes skill development through the creation of large-scale, high-quality, and for-profit vocational institutions through a private-public partnership (PPP) mode. In addition to financing the skill training providers, the agency works to build the capacity of training providers so that they can deliver high-quality training. The agency supports a network of over 330 private training partners and over 7000 training centers in the country. This agency has undertaken several ICT-based initiatives in an effort to support the sustainable growth of TVET, which will be briefly summarized here.

More than 280 Pradhan Mantri Kaushal Kendras (PMKKs) or modern skilling centers have been set up to create benchmark institutions that demonstrate the aspirational value for competency-based skill development training. Each PMKK center is mandated to have at least one classroom equipped with audiovisual facilities and Internet connectivity to conduct virtual training, interactive sessions, and industry seminars/webinars.

The agency's efforts toward strengthening the delivery of TVET, curriculum, and assessments include various ICT initiatives such as the *India Skill Online Portal*, an online learning portal for skill aspirants to access online content; *Kaushal mart*, an online skilling resource marketplace, which aggregates skilling resources and bridges the demand and supply gap, and *Kaushal e-Pustakalaya*, an Android e-book reader app for reading open-access skill content e-books. While these initiatives are at an early stage, it has set the foundation to build a strong ecosystem for the development and use of quality training content by connecting the training partners and students with content and technology developers.

### **Blended Learning Practices**

The data gathered for this section relies on the author's own survey, interviews, and descriptions of the institutions from the respective organization's publications. Surveys and interviews were conducted of TVET providers in India between August and November 2017. Training providers were selected based on their reported use of technology, confirmed by the NSDC, to which the training providers are affiliated. The survey consisted of open-ended questions pertaining to pedagogy, the use of ICT in TVET delivery, and its perceived advantages and challenges. Out of six surveys that were distributed through NSDC, four training providers provided

responses. Common usages of ICT among the training providers surveyed consisted of projectors to show PowerPoint presentations and instructional videos in the classroom. The survey results demonstrated that the student progress is often tracked using learning management systems (LMS) and assessment portals. This section will now take a closer look at some current examples of blended learning in practice at training centers.

*Technology-Enriched Classrooms:* Following the survey, a visit to a training center of Infrastructure Leasing & Financial Service (IL&FS) – one of the surveyed training providers – was made to observe the use of ICT in training delivery and collect feedback from trainers and students. IL&FS follows a three-part pedagogy system in their TVET delivery referred to as “show and tell, try, and test” (IL & FS 2015). In the initial step, students are shown a video in the classroom using a projector, followed by query resolutions and discussions (“show and tell”). Next, the students try each step of the hands-on exercises while watching the video, till they are able to repeat the step without making mistakes (“try”). Finally, the students are assessed and graded (“test”). The factors shared by the training provider that they found to be critical toward scaling the training model were training facilitators on the pedagogy, availability of well-designed multimedia content, participant handbooks and facilitator’s guides in the local languages, and the physical IT infrastructure. The absence or unavailability of quality content also led the training provider to have a dedicated content development team to create and design instruction content and multimedia modules. Also, they reported that this method enabled students to perform the hands-on exercises independently to a large extent and improved trainers’ productivity as this model reduced considerable redundancy in instruction, allowing them to focus on giving feedback to students. This model was replicated by the training provider across their centers nationwide, resulting in 450,000 students trained in over 100 TVET courses spread over 22 sectors (NSDC and IL & FS, survey and personal communication, October 17, 2017). The model was reported to considerably reduce the training time, improve motivation levels in students and trainers, improve learning outcomes, and reduce training costs.

*Flexible mobile learning:* Training provider SkillTrain (2016) addresses the needs of school dropouts in rural areas through mobile learning. The mobile platform lets students register for free on their portal and take online courses based on lesson plans and downloadable videos on mobile phones. Students are able to learn at their own pace. Assessments are online or through text messaging capability on the mobile phone. For hands-on exercises, the student is required to register with the nearest vocational practice center and then paired with an affiliated workshop or independent practitioner (British Council 2016; Dubey 2016).

### **ICT for Teaching and Learning Physical Skills and for Recognition of Prior Learning (RPL)**

An emerging area of research in ICT-enabled TVET is to adapt high-tech and innovative technologies that were previously utilized for performance training in highly specialized domains, such as surgery and aircraft flying (Akshay et al. 2013; Jose et al. 2014; Ranjith et al. 2014; Aswathi et al. 2016). Simulator-based training

can provide a hands-on experience in a safe environment at potentially lower costs. Introduction of simulators into TVET in India has struggled with the same cost benefit equation that other ICT technologies have done for years owing to delayed returns on investments. With the rapidly increasing number of personnel to be trained in vocational skills even in the formal sector, the benefits in inclusion of simulator-based training is being increasingly recognized by the training institutes and industry in India (Chenoy 2013).

There are several benefits to using simulators in skill training institutes: savings in costs of consumables and instructor contact hours, standardization of training, safety, and the prestige in using technology-based approaches for training (Akshay et al. 2013). Yet another benefit of simulators is in recognition of prior learning (RPL). The reliable assessment of the prior skill level of a candidate can be used to allocate work or training accordingly.

For instance, simulators developed for bar bending and cutting utilize a virtual reality interface and haptic force-feedback that simulate the various skills in rebar bending training. Larsen and Toubro Construction Skills Training Institutes (L&T CSTI) has incorporated these simulators to supplement their skill training programs in concrete-based construction (Menon et al. 2017). The simulators are currently being utilized to train, retrain, and assess recruited personnel in the rebar bending and steel fixing trade. In just under 1 year at two of the CSTIs, the simulators have been trained over 600 rebar bending graduates who have been subsequently employed by L&T.

Prior to the use of the simulators, the CSTI reportedly found it challenging to justify the poor benefit-cost ratio of their training programs owing primarily to the high attrition rate in their bar bending graduates who migrated overseas and to the Middle East for higher-paying jobs. The average cost of training borne by the CSTI for the bar bending course was a little over \$450 per candidate, one third of which is attributed to the cost of rebars consumed in training process. The simulator helps reduce this cost. Another interesting observation is that the simulators are housed indoors which eases the initial hardships the trainees have to endure while training outdoors in the hot sun. The CSTI reports that the reduced hardship helped the candidates to resist the urge to discontinue the program. L&T also shared plans to utilize the bar bending simulators for offering retraining on the construction site and for RPL of the contractual workers who seek employment at the construction sites.

The most widely used virtual reality simulators in the industry in India are welding simulators (Knoke 2016). Welding simulators are being adopted primarily for workplace training, assessment, and RPL purposes by various industries that have a requirement of welding and by training institutes to prepare new welders and offer retraining where required. Students trained using the simulator are able to learn the basics of welding in a controlled environment without exposure to the harsh and challenging conditions of the trade such as smoke, burning eyes, and other severe accidents (Kulkarni 2007). After welding training on the simulators, the students are reportedly more confident and find it easier to transition to the real-time environment (Okimoto et al. 2015). VR welding simulators like the ones developed by SkillVeri

offer a standardized lesson plan to teach a basic skill level with ease and accuracy (Skillveri 2015). All training modules are developed in line with the National Council for Vocational Training standards. For an entry level, 2-week program in welding, the simulator is reported to save more than \$300 per student. From the viewpoint of a training center which prepares students for international certifications, welding simulator becomes an effective mechanism to save cost and time.

Recent schemes of the government to support innovation and manufacturing within the country such as the Make in India initiative have encouraged training institutes and industry to consider advanced technology-based training and skill development. The country looks to ride this new wave created by inclusion of haptic simulators and augmented and virtual reality applications to address its needs in the present and future.

In this section, ICT for teaching and learning within formal TVET scenarios was discussed. The ICT-enabled teaching and learning initiatives for open and distance learning TVET will be discussed next.

## Open and Distance Learning

Distance learning institutes in India have experienced a significant rise in student enrolment, with an estimated ten million currently enrolled (Team Careers, 2017). India's ODL system consists of the Indira Gandhi National Open University (IGNOU), State Open Universities (SOUs), and other institutions and universities which include the Correspondence Course Institutes (CCIs) in the conventional, dual mode. Government and private ODL schools offer a range of skill-based programs. There are currently over 245 institutions that offer courses via distance education, of which about 100 are TVET courses (Vaid 2014).

Public institutions such as IGNOU, NIOS, and other private institutions that offer ODL in India have launched online certificate and diploma courses. They utilize an array of ICT in the teaching and learning process such as MOOCs, OER, education radio, and video broadcasts, among many others. The ICT trend is likely to continue with GoI initiatives like "SWAYAM," an integrated platform and portal for online courses for TVET, secondary and higher education levels. There is strong funding support from the GoI to develop and deploy MOOC courses that meet rigorous development standards and feature built-in monitoring mechanisms to ensure quality. This is further supported by the University Grants Commission (UGC) regulations which now recognizes and allows transfer of credits for courses done online (University Grants Commission Regulation 2016).

*ICT Initiatives of IGNOU:* Established by the MHRD, this institution is one of the largest open university in the world, with three million students enrolled. Sixty-one TVET certificate courses and 53 diploma programs in distance education mode are currently being offered through its network of 3000 study centers across India. Hands-on exercises are conducted at the study centers or through affiliated workshops or industries. The ODL organization uses ICT in various ways to supplement the print-based self-learning materials – such as *Egyankosh* – a national digital

library that houses digitized self-learning print material developed by a consortium of ODL institutions, YouTube channels, wiki pages, blogs, live educational programs through video and audio broadcast channels, teleconferencing, and learning management systems. The institution is in the initial stages of delivering a large number of certificate and professional online courses through the SWAYAM platform (Singh 2017).

The range of its ICT-enabled learning initiatives has enabled better access to learning resources and services, contributed to increased student retention rates and reduced dropout rates (Dowerah and Kanta 2011). However, there are also studies that indicate low adoption of ICT for academic purposes measured in terms of course material download, subscriptions to broadcast/video, and so on. This has been attributed to factors such as lack of awareness, lack of access to Internet services, and quality of the audiovisual content (Awadhiya et al. 2014; Gaba and Sethy 2010). In order to increase the outreach and promotion of ICT-enabled learning, the institution is setting up 5000 digital learning centers utilizing the broadband network created by the government to connect one million villages in India (NDTV 2017). The open university has also signed an MoU with Common Service Centers (CSC), a network of over 200,000 centers with ICT infrastructure across India that will increase the outreach of TVET through open university, its digital learning initiatives, and other services (Hindustan Times 2017).

The following section discusses ICT-integrated TVET delivery practices implemented by nonformal education training providers.

## Nonformal TVET

In India, nonformal education (NFE) has more commonly encompassed programs that address basic literacy, i.e., reading, writing, numeric literacy, and life skills development, supported by the MHRD and Ministry of Labour and Employment (MoLE). NFE programs under initiatives such as *Jan Shikshan Sansthan* (JSS, originally an adult literacy program that caters to tribal groups), the National Literacy Mission, etc. are illustrative of the traditional approach to literacy education. Several of these programs have since evolved and shifted focus to TVET.

*I-Saksham* (2015) is one example of NFE that provides a certificate course in basic tutoring to youth in remote villages. The trained youth, in turn, teach children in their village using digital tablets with learning content sourced from various providers. I-Saksham reported through the distributed survey that their training model has led to improved learning outcomes and reductions in training costs and dropouts, making it possible to scale. Some of the reported challenges were high repair/maintenance costs of low-cost tablets and poor connectivity in these geographies resulting in increased spending on logistics for delivering content, monitoring, and evaluation (NSDC Representative and I-Saksham, survey, October 17, 2017).

While ICT-enabled NFE in India is a recognized research and intervention area with respect to literacy and life skills programs, practical evidence appears less

extensive in the area of vocational training. For example, AMMACHI Labs is an organization that designs and delivers NFE skill development and life skills to women in rural India via ICT (UNESCO-UNEVOC 2017). The organization provides vocational and life skill development through ICT and mobile platforms as a means to women's empowerment. The organization shared lessons learned in implementing nonformal, ICT-based vocational and life skills education:

- *Usability among users with low education attainment and digital illiteracy:* Deployments of the organization's approach (UNESCO-UNEVOC 2017) demonstrated effectiveness in achieving independent and self-paced learning, motivation to learn new subjects, interest in repeated use, recommendation of the course and learning tool to others, heightened sense of self-esteem and confidence, and feelings of personal dignity in connection to learning a skill through technology (Bhavani et al. 2010). Issues of digital illiteracy were addressed by contextualizing the design of TVET e-content and software to the target demographic (Sachith et al. 2017).
- *Flexible deployment scenarios and blended learning models:* Several trials were conducted to explore combinations of student to technology ratios, such as one student per ICT tool (desktop computer, laptop, or tablet) in high-resource settings versus two or more students per ICT tool, in resource-constrained areas. It was found that peer interaction in the computerized classroom helped students overcome their inhibitions to learn and created a safe space for collaborative learning. Furthermore, the sharing of a common experience by learning a vocational trade through computers, the discovery of personal and shared perspectives through collaboration on tasks, and in-class group discussions helped to socially bond learners, which found to be critical toward personal development and a sense of professional identity. The organization's pedagogy was accordingly designed to strengthen a community of learning and practice within and outside the classroom (Bhavani et al. 2010).
- *Required infrastructure and human resource inputs:* The presence of a facilitator, who functions as the center manager and mentor to students, was determined essential. The extent to which a subject-matter expert is actually required was found to be intermittent (depending on the complexity of the course), for periodical hands-on practical training and assessment.

### **Mobile TVET Classrooms**

Mobile, solar-powered classrooms equipped to deliver computerized TVET lend to greater accessibility, flexibility, scale, and inclusion (NITI Aayog 2017). While mobile classrooms could potentially substitute brick-and-mortar infrastructure in geographically remote areas, there are several technical and operational constraints that make it impractical to do so completely. For example, while mobile classrooms are effective in reaching underserved communities, skill development programs often require a greater investment in the targeted community, of a resource that is more economically effective for shorter term interventions. Mobile classrooms do,

**Fig. 3** Conceptual design of the MoVE mobile TVET delivery vehicle designed by AMMACHI Labs © Amrita University

however, allow for less dependency on human resources, greater flexibility in training, increased geographical coverage, and relatively lower investment in operational costs that give this solution a competitive advantage. Effective implementation of TVET, therefore, relies upon carefully planned interventions that take into account the time investment required in the targeted community (Fig. 3).

Very few agencies in India run mobile TVET classrooms (Raghavan 2007). These mobile setups are evolving from substituting conventional classrooms to complementing traditional training (Nagarajan et al. 2012). A few considerations that underscore the evolution of mobile TVET include:

- Changes in the traditional hub and spoke operating model to accommodate dynamic needs from the field.
- The role of the trainer has evolved into the role of a facilitator who is not necessarily a subject-matter expert but a person with the skill set to manage an ICT classroom.
- The ideal vocational courses are those that require less intense TVET hardware.
- An emerging focus on twenty-first century skills training, such as problem solving and design thinking as a complement to TVET.

## Revisiting Promises and Constraints of ICT in TVET

The discussion thus far has demonstrated how ICT-integrated TVET is an active area of practice and research in India. Various ICT initiatives across India's learning continuum were discussed along with their promises and constraints, as summarized below (Table 1). The listed enabling factors summarize current efforts in India that support the integration of ICT in TVET. While these enabling initiatives are still at a nascent stage, they offer promise toward achieving improvements in inclusivity, standardization, and quality.

**Table 1** Summary of promises of ICT along with the constraints and enabling factors

ICT Benefits	Current constraints and enabling factors
Scalability of TVET	<p><i>Constraints:</i></p> <ul style="list-style-type: none"> <li>E-content is not available for a majority of courses despite the demand due to costs associated with the development</li> <li>A requirement for courseware in various Indian languages</li> <li>Internet connectivity issues</li> <li>Poor training practices and IT infrastructure</li> <li>Finances – Initial costs involved in setting up IT infrastructure and licensing of ICT-enabled tools and courseware</li> </ul> <p><i>Enabling factors:</i></p> <ul style="list-style-type: none"> <li>GoI initiatives to develop ICT-enabled open-access resources</li> <li>Promotion of OER by agencies like CEMCA and COL</li> <li>Participation by industry to develop and market ICT tools and courseware</li> <li>Improved internet connectivity through GoI initiatives</li> <li>Opportunities for utilization of existing infrastructure, e.g., CSCs, railway stations, government institution buildings, and resources</li> <li>National level thrust such as digital India mission campaign to provide digital literacy to all Indians</li> <li>Policy support for ICT enablement through the National Skill Development Policy</li> <li>ODL courses through the Swayam portal and other ODL initiatives utilizing ICT</li> <li>ITI modernization efforts</li> </ul>
Accessibility to TVET	<p><i>Constraints:</i></p> <ul style="list-style-type: none"> <li>Socioeconomic barriers to technology access</li> <li>Digital illiteracy</li> <li>Lack of courses in required languages</li> <li>Paucity of training providers serving rural and tribal areas where it is not cost-effective to set up centers</li> </ul> <p><i>Enabling factors:</i></p> <ul style="list-style-type: none"> <li>Digital India initiatives</li> <li>Low cost of 4G mobile data and handsets</li> <li>Mobile TVET and similar innovations to reach remote areas</li> <li>NIOS and open schools initiatives</li> </ul>
Quality of training and certification	<p><i>Constraints:</i></p> <ul style="list-style-type: none"> <li>Lack of well-trained teachers in training and using ICT and subject-matter expertise</li> <li>Lack of availability of standardized and quality content and E-content</li> <li>Quality and suitability of OER</li> <li>ICT-enabled training can contribute to passive learning (i.e., videos and digital texts)</li> <li>Lack of access to active learning tools and courseware</li> <li>High costs of development</li> </ul> <p><i>Enabling factors:</i></p> <ul style="list-style-type: none"> <li>Increased awareness about the use of OER and its advantages</li> <li>GoI focus on Swayam courses by industry and academic experts and private agencies resorting to online training for ODL and the use of ICT for classroom training (as seen by demand)</li> <li>The use of simulators for RPL and certification</li> </ul>

(continued)

**Table 1** (continued)

ICT Benefits	Current constraints and enabling factors
	Mandate for good instructional design frameworks and rigorous focus on quality assurance of content and its periodic revision by industry certified experts Industry involvement in content development Job connect through job portals Effective blends and access to ICT technology Community of learning and practice to sustain aspirations Mobility across vocational and higher education streams

## Preparing Youth for the Changing Place of Work

Even as ICT addresses various infrastructural and pedagogical issues with traditional TVET, a holistic solution must also address some of the biggest issues facing the domain of technical skills development in the near future, the increasing adoption of automation technologies driven by advances in artificial intelligence (AI) and robotics. Many jobs requiring routine cognitive and physical skills, especially in the technical trades, are quickly being replaced by algorithms and machines (World Economic Forum 2016). Success in the vocational trades in this century will mean mastery and constant upgrading of technical and soft skills to fit more advanced and integrated positions.

When technical skills are combined with the 4Cs – creativity, collaboration, critical thinking, and communication, along with pedagogical strategies like project- or problem-based learning (PBL) – peer to peer teaching, and design thinking, it not only prepares students for a career in the technical space but also gives them the essential creative and teamwork competencies needed to succeed in the twenty-first century workplace (Trilling and Fadel 2009). One key enabler for this is the idea of a “makerspace,” a space furnished with rapid prototyping and computational tools that enable the rapid realization of solutions. For this reason, the Indian government’s think tank, NITI Aayog, is in the process of establishing makerspaces throughout India known as the Atal Tinkering Labs (ATL). As of 2017, more than 900 schools have been selected for this program. The NITI Aayog has associated the ATLs with the Self-Employment and Talent Utilization (SETU) scheme to provide pathways to encourage the formation of start-ups.

## Twenty-First Century Skills Workshops in Andhra Pradesh

The twenty-first century skills training workshops organized in Andhra Pradesh in collaboration with the Andhra Pradesh Skill Development Corporation (APSSDC) are the ongoing case in point (Times of India 2016). The workshops focus on creating and disseminating educational tools and curriculum for teaching computational thinking, robotics, and maker skills, along with “softer” skills like social

problem solving. Listed below are the three main technical skills taught in the school workshops:

*Computational Thinking Skills:* With computation merging into almost every area of human activity and vocation, a literacy and fluency in computational thinking is crucial. One method of imparting these skills is through the use of serious games (Unnikrishnan et al. 2016). The game teaches the basic concepts of computational thinking including sequential commands, loops, and conditional branching (ibid). The game was found to have reduced the cognitive “leap” students need to make to understand the basics of computing which makes the valuable skill of programming easily accessible to all.

*Maker Skills:* Rural India is well regarded for its “jugaad” spirit or the ability to come up with innovative products and solutions given highly constrained sources of finance and materials. This spirit must be harnessed and channeled in the present age so that the inventors and innovators of rural India can better participate in the globalized economy and job market. The curriculum for teaching these “maker” skills follows a grounded approach by teaching design and thinking principles through hands-on exercises, 3D modeling, and sketching skills to help design products and practical prototyping skills.

*Robotic Skills:* Work in robotics involves both the abstract skills of computational thinking and the skills of making and engineering. The LEGO Mindstorms kit and the Hummingbird kit are two educational toolkits that are commonly used for introducing robotics to students, with Mindstorms providing a versatile and interactive medium for rapidly creating and designing programmable robotic solutions and the Hummingbird bringing a more arts and crafts approach. These two kits are demonstrating promising success in teaching robotics skills and at the same time allowing robotics to become a social tool for technical explorations accessible to diverse student populations.

---

## Conclusion

ICTs in education and skill development are undergoing a rapid change. As advances in computer graphics, artificial intelligence, and machine learning technologies rapidly evolve, the future of TVET will invariably be impacted by a more sophisticated integration of ICT. Advances in motion tracking through the Leap Motion and Microsoft Kinect, among other technologies, which were primarily made for the entertainment industry, will serve as conduits for artificial intelligence-enabled tutoring systems to understand the students’ context and student performance through multimodal learning analytics (Blikstein 2013). These tutoring systems will then modify content delivery strategies and pedagogical and testing approaches so that every student gets a customized learning experience suited to their needs (Sarrafzadeh et al. 2008). Content delivery will be transformed as the primary media for instruction and communication will shift to cost-effective mobile devices enabled by the spread of 4G networks through the country. This would circumvent the problem of loading media-rich content onto phones and tablets with limited storage

capacity. Technologies being used in social networking sites can be used by content providers to club together students based on their geographical location, interest, etc. so that the virtual learning environment is supported by robust communities of practice in the real world.

Based on the discussion thus far, it is apparent that while ICT-integrated TVET is a rapidly emerging practice across India, further research is required to better understand best practices and replicable delivery models. While the GoI and several industries are strong proponents of ICT-driven solutions, it is vital that their support also extends to investing in monitoring, evaluation, and research-driven development of innovative technology to complement the changing nature of work. Additionally, to prevent unnecessary duplication of efforts that are already costly, a synergy among agencies that develop open-access ICT resources for TVET is imperative.

## Abstract

The latest response in South Africa to social problems associated with youth not in education, training, or employment (the NEET youth) is the intention to roll out large-scale programs of workplace-based learning. The implicit purposes are to improve the employability of youth, to ease the transition from school or learning to work, and to enhance the educational value of learning through authentic, real-life workplace situations.

In support of the above, a study aimed at developing a national policy framework for workplace-based learning was commissioned by the South African Department of Higher Education and Training.

533

Using an educational design research approach, the first phase of the study entailed content analysis of legislation and policies which provide the statutory basis for, and intend to give effect to, a workplace-based learning policy.

Although the “language” of workplace-based learning is highly congruent across all the policies, the hoped for “outcomes” of such policies are very different from actual practice. Policies strongly focus on labor-absorbing activities, while education practices place emphasis on workplace-based activities for purposes of enhanced learning. Policy pronouncements may therefore place unfair pressure on the education and training system to solve the problems of the youth unemployment, a job-scarce environment and poverty.

This contribution tracks the genesis of a national policy framework for workplace-based learning in South Africa. It results in a typology of divergent practices, with differing purposes, which may make it improbable (and perhaps inappropriate) to implement a single, homogenous approach to funding and implementation of workplace-based learning in the country.

## Introduction

The latest policy response in South Africa to the social problems associated with youth not in education, training, or employment (the so-called NEET youth) is the intention to roll out large-scale programs of workplace-based learning. The implicit purposes are manifold: to improve the employability of youth; to ease the transition from school to work, or learning to work; and to enhance the educational value of learning through authentic, real-life workplace situations.

There is a dire need for meaningful policy responses to deal with the looming social problems associated with high youth unemployment. In a discussion document published by the South African National Treasury (2011), it is maintained that, at the time, only one in eight young people under the age of 25 years were employed. In 2017, the unemployment rates of young people in most categories, including the NEET youth, have risen.

Young people without a school-leaving certificate are the hardest hit, with unemployment increasing from 29.9% in 2011 to 33.1% in 2017, while unemployment for those who have attained the school-leaving certificate remained flat at 27.5% in 2011 and 2017, respectively. Graduate unemployment has recently been noted with concern, but in this group, unemployment is relatively low (Van der Berg and Van Broekhuizen 2012). It has nevertheless increased – from 4.4% in 2011 to 7.3% in 2017. In addition, a group categorized as having concluded “other tertiary” (pre-university, post-school education – see Umalusi 2009), also saw a significant increase in unemployment, namely, from 10.9% in 2011 to 17.8% in 2017 (Statistics South Africa 2017, p. 14).

Policy responses have been wide-ranging: a National Skills Development Strategy has seen three iterations since its first implementation in 2001, with a fourth iteration under consideration. Various youth-focused initiatives have also been launched. However, it is only since the publication of the National Development Plan (National Planning Commission 2011), the Social Accords agreed to in support of the Plan (2011–2013), and the South African Department of Higher Education and Training's White Paper for Post-School Education and Training (Department of Higher Education and Training 2013), that the focus shifted particularly to workplace-based learning as a possible solution for youth unemployment.

In 2015, the South African Department of Higher Education and Training commissioned research to develop and establish a national policy framework for workplace-based learning, which was intended to encompass all of the objectives mentioned above, namely, improved employability, transitioning from school and/or learning to work, and enhanced learning.

Using an educational design research approach (Van den Akker 1999), the first phase of the research entailed the detailed content analysis of legislation and policies which provide the statutory basis for, and intend to give effect to, the goal of a national, fundable, workplace-based learning policy framework. It also involved an extensive literature review of learning for, at, and through work (Brennan and Little 1996).

Based on phase one, the second phase involved the drafting of a concept (prototype) policy framework (Blom 2015); the third required interaction with expert groups to refine the policy framework; and the final phase required publication of the draft policy framework for public comment.

The research design appeared to be appropriate, as it succeeded to “develop an intervention to address an educational matter for which no or few guiding principles, ready-made solutions, or guidelines have been found’, since no “how to do” guidelines or heuristics [seem to be] readily available” (Modiega 2014).

This chapter will largely focus on the first phase, particularly on the existing policy instruments that were meant to enable the large-scale implementation of a policy framework for workplace-based learning. Ten non-education-related (inclusive of human resource and economic policies) and seven education and training-related policies were analyzed. It became evident that while the “language” of workplace-based learning appears to be highly congruent across all of the policies, the hoped for “outcomes” of such policies are very different from actual practice at institutions of learning. Policies seem to strongly focus on labor-absorbing activities, while education practices place emphasis on workplace-based activities for purposes of enhanced learning. Policy pronouncements may therefore place unfair pressure on the education and training system to solve the problems of the youth unemployment, a job-scarce environment and poverty.

A single policy for workplace-based learning, however strongly supported by a range of policy instruments, cannot be expected to solve all the problems of youth unemployment, a job-scarce environment and poverty. The struggle for a policy framework that will support and enhance the development and implementation of the integration of education, training and work, for the purposes of learning, and not primarily for the purposes of employment, has just begun (Blom 2015).

This contribution will track the genesis of a national policy framework for workplace-based learning in South Africa. It proposes a typology of divergent practices, with differing purposes, which may make it improbable (and perhaps inappropriate) to implement a single, homogenous approach to funding and implementation of workplace-based learning in the country.

The discussion will start by describing the struggle to come to a common definition for workplace-based learning. It will also assess the extent to which the proposed policy framework could meet the needs of all the potential beneficiaries mentioned above. It will then turn to an analysis of the various policy instruments in relation to the agreed to definition, tracing the extent to which policy intent and practical institutional realities match. The discussion will end with commentary on the likelihood that a single policy framework could meet the needs of diverse expectations.

---

### **Definitional Difficulties: What Is in a Name?**

The first attempt at the development of a system-wide policy framework for workplace-based learning was made by the Southern African Society for Cooperative Education (SASCE) (see <http://sasce.net>), the body in South Africa that seeks to advance work-integrated learning (WIL). This body, affiliated to the World Association of Cooperative Education (WACE) (see <http://www.waceinc.org/>), has been trying to find traction for the practice of cooperative learning in the South African higher education system. Participating institutions involve the six Universities of Technology in the public system and to some extent, Technical and Vocational Education and Training (TVET) colleges.

SASCE has long sought funding support for the management, administration, and training of institutional tutors and workplace mentors in keeping with the needs of their curricula which require experiential learning in workplaces. However, as Ori (2014, p. v) noted, “despite the great strides made in implementing WIL across the Southern African region, WIL has been practiced in a policy vacuum.” Thus, while laudable, this first attempt at a national policy, addressed only a relatively small part of the post-school system, and the South African Department of Higher Education and Training consequently initiated its policy development process.

In the scoping of the study to support the development of the national policy framework, it was found that definitions relating to some form of workplace or work-related learning, abound in South Africa, with the Southern African Society for Cooperative Education, for example, recognizing only work-integrated learning as its definition. However, it was clear that this single definition of WIL excluded many other practices in the country. It therefore appears that definitions stem from a range of practices that have been in existence, in one form or another, for some time, and it is only recently that an attempt was made to bring all forms of workplace-based or work-related learning into one framework.

This was not an easy and, to a large extent, is an ongoing task. This is because it is evident that each definition relates to a range of intersecting issues: some practices

relate to the curriculum (for example, work-integrated learning and work-based education) while others refer to pedagogical devices (for example, experiential learning, job shadowing, and simulated work). Yet others relate to the timing of workplace exposure (such as in-service learning, sandwich programs, and suchlike) and to the locality of the placement (industrial placement or community placement, etc.) (Blom 2014).

Furthermore, the purposes of each of these practices seem to differ. While the curricular practices and pedagogical devices seem to intend to enhance learning, others seek to increase the employability of graduates by concluding some form of workplace-based learning to achieve a qualification. Others are unashamedly about placing a variety of entrants in workplaces to gain experience for employment purposes. These issues are undoubtedly influenced by the target groups it is intended for, and the way in which the practice can be funded.

Nevertheless, in Table 1, a (final) list of practices is provided (based on the typology developed by the South African Department of Higher Education and Training (DHET) 2014a, p. 10).

**Table 1** Workplace-based practices in South Africa

Practice	Purpose	Target group	Funding
Apprenticeship	To achieve a trade qualification	Apprentices	Employer
Learnership	To achieve a registered sector education and training qualification	Learners, usually unemployed	Sector education and training authorities
Internship	To achieve a “legacy” diploma offered by technical and vocational education and training (TVET) colleges	Graduates of technical and vocational education and training qualifications	Employer and/or sector education and training authorities
Student internship category A	To achieve a vocational qualification	Students who have concluded a vocationally oriented higher education program	Employer and/or funder
Student internship category B	To achieve a professional qualification	Students who are busy with or have concluded a professional qualification	Depending on timing, either not funded (teaching) or funded by the employer (nursing)
Candidacy	To achieve a professional designation	Candidates, for example, chartered accountant	Employer
Graduate internship	To gain work experience and improve employability	Unemployed graduates, usually for programs where workplace-based learning is not part of the curriculum	Various, including sector education and training authorities and the National Skills Fund

All of the above practices, except for “graduate internship” reflect current practices. Also, all are, except for “graduate internships,” arguably either considered part of the curriculum or are integral to the achievement of the qualification. However, the extent to which the practices enhance learning as one of the objectives of workplace-based learning was not examined in establishing the typology.

Nonetheless, the following overarching definition was agreed at the time (Department of Higher Education and Training 2015b, p. 19):

Workplace-based learning is an educational and training approach through which a person internalizes knowledge, gains insights, and acquires skills and competencies through experience in a workplace to achieve specific outcomes applicable for employment.

---

## **The Draft Policy Framework and Its Intended Beneficiaries**

### **Not in Education, Employment, or Training (NEET) Youth**

In terms of addressing the needs of the youth not in employment education or training, who either have not concluded their schooling or who have a school-leaving certificate but are not currently registered on a program with a post-school institution, the draft policy framework on workplace-based learning is meaningless. Yet, in all the policy instruments discussed in the next section, the not in employment, education, or training youth feature strongly, suggesting that these instruments have the implicit intention to enable work placement for the unemployed. Clearly, workplace-based learning requires young entrants to be enrolled for, or have concluded a formal qualification, and this is not the case with the NEET youth. It may therefore be more appropriate to rely on other policy instruments such as the “Youth Wage Subsidy” (the Employment Tax Incentive (Act 26 of 2013)) to address the needs of NEET youth (see the discussion document developed by the South African National Treasury 2011). Furthermore, it is telling that the above typology developed by the South African Department of Higher Education and Training (2014) does not have a category to deal with this target group.

### **Apprentices, Learnerships, Student Internships Category B, and Candidacy**

Students enrolled for these programs are arguably the direct beneficiaries of a policy on workplace-based learning. These practices see the workplace experience segment of the curriculum either as an integral part of such curricula (apprenticeships and learnerships) or is considered a prerequisite for eligibility to seek a license to practice (student internship category B and candidacy – see Table 1). These types of workplace-based learning are well-established and, despite critiques in terms of quality, have the necessary infrastructure (including funding, where appropriate), to continue implementation.

## Student Internship Category A

This category is intended to accommodate the needs of students in vocationally oriented higher education programs (usually offered by universities of technology), who are in need of “experiential learning” in keeping with the conceptual frame informing these curricula. Lately, students offering (nontechnical) programs at TVET colleges are also considered part of this target group. This category of students is particularly vulnerable to an unwillingness, on the part of employers, to absorb young, potential entrants to the workplace. A workplace-based policy framework, including a concomitant funding structure, will significantly benefit this target group.

## Unemployed Graduates

Turning to the unemployed graduates, the inclusion of “graduate internship” as a category is clearly included in the typology to meet the needs of this target group, despite the relatively low rates of unemployment. However, it is the pre-university, post-school graduates that will clearly benefit (see Table 1). This target group, (the internship category), numbering at least 39.8% (or 127,436 college students) in 2015 (Department of Higher Education and Training 2017a, b, p. 36) are enrolled for the so-called “legacy” qualifications at public and private post-school TVET colleges. “Legacy” qualifications refer to programs that were meant to be phased out with the reforms introduced in the education and training system in the 1990s, but due to various policy impulses, were retained (but unfortunately seem to remain unreformed and largely outdated).

Nevertheless, in terms of the proposed policy framework on workplace-based learning, it is clear that not all of the current categories are necessarily in need of an additional policy instrument to enable students and/or graduates to successfully achieve qualifications and improve their chances in gaining employment. The categories that are in the greatest need for policy support, however, are also seen to be the weakest in the system. The Swiss South African Cooperation Initiative (2013), for example, states that (p. 56):

Colleges are required, by [the Department of Higher Education and Training]’s formal planning and monitoring framework, to provide [workplace-based learning]. Despite this, colleges are at markedly different stages of [workplace-based learning] implementation and much has still to be done in order for [workplace-based learning] to be institutionalised within the colleges’ structures and systems. The differing capacity of the colleges is a key factor here, but industry’s very limited appetite for [workplace-based learning] at present is also a significant constraint.

---

## (Enabling?) National Policy Instruments

The South African policies developed and enacted since the dawn of democracy in 1994 are lauded as some of the most progressive in the world, particularly in terms of their “nation-building” intentions (Gumede 2008, p. 8). Certainly, policy-making is strongly seen to be “collective interventions directly affecting transformation in social

welfare, social institutions and social relations” (Mkandawire 2001). Thus, the non-education and education policies meant to enable the system-wide implementation of workplace-based learning are awash with positive signals in regards to the practice. This is in contrast with policy development, which in the past, was characterized by silo-based development. These silos often led to policy paralysis because the supporting “institutional logic” (Raffe 2003) was absent, meaning that support for a particular matter was evident in only one set of policies, but lacked support in others.

In the case of workplace-based learning, a deliberate attempt was made to achieve coherence across non-education and education policy instruments. It is evident that these policy instruments largely agree, but the intended outcomes of these policy pronouncements seem to differ substantially from actual practice. Consequently, while “policy breadth” was achieved, (where “policy breadth” refers to the direct and explicit linkages with other measures in the system – see, for example, Raffe 2003; Keevy 2006), in the analysis of the policy instruments, it seems that the outcomes sought, particularly in relation to workplace-based learning for education purposes were conflated: policies largely seek to enable “work”; while on-the-ground practices seek to enable “learning” (Blom 2015).

Ten non-education and seven education policies were analyzed, originally to ensure that “policy breadth” (Keevy 2006) is achieved. It became clear that non-education policies and education and training policies “focus strongly on the economy, and on how workplace-based opportunities could contribute to a more prosperous nation through various labor-absorbing activities” (Blom 2015, p. 19). Institutional practice, on the other hand, tend to address workplace-based learning as a mechanism to enhance learning, in keeping with the purposes of curricula. This is because workplace-based learning is seen to be “about learning, and not about working. Work is the vehicle for learning” (Blom 2013, p. viii).

As indicated in the introduction, this section will trace the policy intentions of the non-education and education policies, and assess each in respect of the agreed definition for workplace-based learning, namely (Department of Higher Education and Training 2015b, p. 19):

Workplace-Based Learning is an educational and training approach through which a person internalises knowledge, gains insights and acquires skills and competencies through experience in a workplace to achieve specific outcomes applicable for employment.

## Non-education Policy Instruments and Workplace-Based Learning

Table 2 outlines the non-education policies that were analyzed (not an exhaustive list).

The *National Development Plan* (National Planning Commission 2011) is arguably the most coherent statement of the “dreams” for the country; in the introduction, these dreams are expressed as follows: “[the] plan is to change the life chances of millions of our people, especially the youth.”

It is an all-encompassing plan, including considered proposals in respect of “education and skills, decent accommodation, safe communities, social security, transport and job opportunities” (National Planning Commission 2011).

**Table 2** Non-education policies in South Africa

Name of policy instrument	Date
The National Development Plan	2011
The New Growth Path	2011
National Skills Accord	2011
Youth Employment Accord	2013
National Integrated Human Resources Development Plan	2014–2018
Industrial Policy Action Plan	2013
Strategic Implementation Projects	No date
Draft National Youth Policy 2014–2019	2014–2019
Turning the Public Sector into a Training Space	2015
The Public Service Human Resource Development Strategic Framework	No date

However, it is evident that the plan is hugely concerned with job creation and that it sees workplace-based learning as a means to achieve these aims, in keeping with the developmental agenda of (economic) growth (Gumede 2008). Furthermore, the plan has a distinct youth focus with the intention “to expand opportunities, enhance capabilities and provide second chances” – one of which is “easy labor market entry” (National Planning Commission 2011, p. 86). However, “education without jobs carries risks of its own” (p. 86), so the economy needs to expand to absorb more labor (Blom 2015). The latter comment, in particular, signals the possibility of a kind of “mission drift” for a national policy framework for workplace-based learning.

Nevertheless, the “language” of the plan includes workplace-based opportunities and placements, learnerships, internships, work experience programs, and service-linked scholarships, and the subsidies envisaged for these, albeit for the purposes of employment creation, rather than for the purposes of learning.

The *New Growth Path* (Department of Economic Development 2011a) in contrast is primarily about the economy (as expected), and the policy document states that the New Growth Path is “the framework for economic policy and the driver of the country’s job strategy” (p. 1). Employment opportunities and a “decent work agenda” (p. 11) is at the heart of the strategy. It nevertheless sees workplace-based learning as a means to “skills development, entrepreneurial opportunities for youth and [placements in] knowledge-intensive sectors such as Information Communication and Technology (ICT), higher education, mining, healthcare, pharmaceuticals and biotechnology” (Blom 2015).

Interestingly, the New Growth Path (Department of Economic Development 2011a) also proposes a parallel system (to other forms of workplace-based learning internships), namely, “youth brigades,” which claim to be have the purpose of exposing “young people to work experience through internships” (p. 34).

Furthermore, the New Growth Path (2011a) is adamant that none of the above is possible without a set of social pacts with all stakeholders involved which comprise an agreement between government, business, and labor to secure mutual benefit – in this case, the improvement of the economy.

Five social pacts were formed following the publication of the National Development Plan (National Planning Commission 2011). The two social pacts, formally

known as “Accords” relevant to the policy framework for workplace-based learning, are the National Skills Accord (Department of Economic Development 2011b) and the Youth Employment Accord (Department of Economic Development 2013).

The *National Skills Accord* (Department of Economic Development 2011b) encompasses “efficiencies, funding and alignment of the skills system with the New Growth Path, the development of a pipeline of new entrants to the various skills fields and support for colleges” (Blom 2015, p. 6). However, it also focuses quite particularly on artisanal training, internships relating to TVET colleges and university of technology graduates, suggesting that it targets the skills system, with the higher education system only included on the periphery.

The *Youth Employment Accord* (Department of Economic Development 2013) is quite overt in its intention: the social problem of youth unemployment. However, the main mechanism to achieve youth employment is through partnerships which involve training, internships, and apprenticeships and “youth brigades” which will provide some work experience and training (p. 18). Once again, it is clear that policy intentions rely heavily on the education and training system to solve the problems presented by youth unemployment. The education and training system is also expected to assist with the transitioning from school to work, by offering second chance opportunities, and by improving the vocational education and training system (Blom 2015).

The *National Integrated Human Resources Development Plan 2014–2018* (Human Resources Development Council, n.d.) is equally focused on the post-school, pre-university sector. Likewise, the *Industrial Policy Action Plan* (Department of Trade and Industry 2013) targets the “significant skills deficit and demand-supply mismatch in many areas of the domestic economy” (p. 8). However, at the time, the policy also aimed to put in place an Unemployed Graduate Work Experience Placement Programme and work readiness programs addressing employability skills and unemployed youth through various learnerships. To this end, the National Department of Trade and Industry has concluded Memoranda of Understanding with selected Sector Education and Training Authorities. It thus displays a conscious effort in aligning the needs of the economy with the needs of the education and training system (Blom 2015).

The *Strategic Implementation Projects* (Department of Economic Development, n.d.) relates to a series of implementation plans to give effect to a National Infrastructure Plan (Department of Economic Development 2012). It strongly relies on workplace-based practices to achieve the aim of the projects, including experiential training, access to workplace training opportunities (for apprentices), and other workplace experience through all public works. The hope was that the alignment of education and training and the infrastructure projects will “lead to a seamless transversal from a learning pathway to workplace assessment and employment” (Blom 2015). There is thus a strong congruence with the purposes of workplace-based learning as an educational practice.

The *Draft National Youth Policy 2014–2019* (Department of Planning, Monitoring and Evaluation 2015), on the other hand “responds to the challenges peculiar to young people in the 21st Century” (p. 6), as youth is finding joining the labor market particularly difficult, especially young women. Solutions to deal

with these challenges include a National Youth Service, public employment schemes; skills development; work exposure measures for on-the-job experience; and internships and learnerships in the public service. Youth brigades and community works projects are seen to have high labor-absorbing opportunities. Importantly, the lack of work experience is seen to be a major constraint in being employed and workplace-based learning is consequently seen as a means to achieve large-scale youth employment. The draft National Youth Policy (Department of Planning, Monitoring and Evaluation 2015) therefore foregrounds work placement which could lead to employment, in the recognition that youth unemployment is a form of social exclusion which is in danger to impact on social and economic intentions (Blom 2015).

To achieve the above objectives, the public sector is seen to provide many opportunities for workplace-based learning. In the *Turning the Public Sector into a Training Space Strategy* (Department of Higher Education and Training 2015a), there is, for the first time, a real recognition of the educational value of workplace-based learning. According to the document, school to work transitions are highly complex, even without the sometimes debilitating South African contexts impacting on youth. This is because nine out of ten organizations will more likely hire someone with experience rather than without. For this reason, in many international contexts, internships, and workplace readiness programs are compulsory parts of education and training syllabuses. The main rationale of the document is to outline how the public service could be turned into a training space, focusing on internships, work-integrated learning, learnerships, bursaries, and traineeships with the Department of Public Service and Administration (Blom 2015).

The final non-education policy instrument to be discussed in this section is *The Public Service Human Resource Development Strategic Framework, Vision 2015* (Department of Public Service and Administration, n.d.). It should be read with the previous strategy as this document also, among other matters, focuses strongly on learnerships, internships, and bursaries for young people, mentoring and coaching for workplace and practical learning.

A few observations emerge from the analysis of the non-education policy instruments that are meant to enable workplace-based learning. First, there is a remarkable congruence in the policies in respect of the importance of workplace-based learning. This is encouraging, as it seems that “policy breadth” (Raffe 2003; Keevy 2006) has been achieved. However, as a second observation, it is clear that while the (current) definition of workplace-based learning postdates most of the preceding policies, the definition favors the practice as an educational practice, rather than a practice that will create employment. Herein lies the (in)congruence of these policy instruments with actual practice at institutions of learning, and consequently the (perhaps) unfair expectations placed on the education and training system to solve the problems of social and economic issues – issues over which the education and training system may not have direct control.

Nevertheless, education and training policy instruments also tend to stray into the realm of dealing with social and economic problems rather than with enhanced learning. These policy instruments are the subject of the analysis that follows.

## Education and Training Policy Instruments and Workplace-Based Learning

Table 3 outlines the education and training policies that were analyzed (not an exhaustive list).

The first three policy instruments, the *National Qualifications Framework Act* (Act 67 of 2008), the *Higher Education and Training Act* (Act 101 of 1997 as amended by Act 26 of 2010), and the *Further Education and Training Act* (Act 16 of 2006 as amended by Act 25 of 2010) represent the statutory bases for the different sectors of the education and training system in South Africa. As such, they predate all of the non-education policy instruments discussed in the previous section. This means that these Acts do not explicitly address workplace-based learning as a focus for policy, even though other policies and regulations, such as policies on the Recognition of Prior Learning, Credit Accumulation and Transfer and Articulation are explicitly mentioned. It is only in the *Further Education and Training Act* (Act 16 of 2006 as amended by Act 25 of 2010) that any mention is made of relationships with workplaces to increase responsiveness to the needs of the economy. In addition, the *Further Education and Training Act* (Act 16 of 2006 as amended by Act 25 of 2010) also clearly makes links with the National Skills Development Strategy (discussed below).

The *Skills Development Act* (Act 97 of 1998, as amended 2008, and by Act 26 of 2010) provides the statutory basis for the *Skills Development Strategy* (Department of Higher Education and Training, n.d.). In fact, long before a policy framework for workplace-based learning was proposed, this Act made provision for learnerships (see Table 1) which was seen to be a key approach to enhance the skills levels of the country through utilizing “the workplace as an active learning environment” where it will “provide opportunities for new entrants to the labor market to gain work experience.” The Act also makes provision for funding mechanisms through the Skills Development Levies Act (Act 97 of 1998 as amended by Act 24 of 2010) and the National Skills Fund. The key focus of the Act and its regulations is on the skills

**Table 3** Education and training policies in South Africa

Name of policy instrument	Date
The National Qualifications Framework Act	Act 67 of 2008
The Higher Education and Training Act	Act 101 of 1997, amended by Act 26 of 2010
The Further Education and Training Act	Act 16 of 2006, amended by Act 25 of 2010
The Skills Development Act	Act 97 of 1998, as amended 2008, and by Act 26 of 2010
The National Skills Development Strategy III	No date
SETA Workplace-based Learning Programme Agreements Regulations	2014
The White Paper on Post-school Education and Training	2013

system of the country – but recently these policy instruments have started including higher education and the workplace-based learning needs of those graduates, through the third iteration of the *Skills Development Strategy 2011–2013* (Department of Higher Education and Training, n.d.), which was extended unchanged until 2018. The strategy has as its explicit purpose to facilitate workplace learning as an integral part of all vocational and occupational programs. It is believed that by establishing effective partnerships between education and training systems and employers to provide for workplace training, it would ensure that skills have real labor market relevance and that young people could gain an early appreciation of and exposure to the world of work (Blom 2015). However, it is quite telling that the strategy seeks to contribute to “. . . a skilled and capable workforce that shares in, and contributes to, the benefits and opportunities of economic expansion and an inclusive growth path,” suggesting that the strategy quite explicitly signifies the dichotomy between workplace-based learning for the purposes of employment, rather than for learning.

Nevertheless, the Regulations for the Skills Development Strategy, namely, the *Sector Education and Training Authority Workplace-based Learning Programme Agreement Regulations*, (Department of Higher Education and Training 2014b) provide for the preparation, submission, registration, and management of workplace-based learning program agreements, and applies to all workplace-based learning programs including apprenticeships, learnerships, internships, internships Category A and B, candidacy, and graduate internships (see Table 1) (Blom 2015).

The final education and training-related policy instrument to be discussed is the *White Paper for Post-School Education and Training* (Department of Higher Education and Training 2013). The White Paper dedicates a full chapter on the issue of “linking education and the workplace.” However, despite being an education and training policy, workplace-based learning is seen to be an approach that will “achieve inclusive growth,” that is, it focuses on the triple challenge of unemployment, poverty, and inequality. It almost primarily focuses on the skills system as a means to achieve growth, only making the concession that the National Skills Fund should, in addition to vocational and technical programs (namely, apprenticeships and learnerships), also fund workplace-based learning of academic qualifications. In addition, there is a nod to the curricular work that needs to be undertaken to integrate theoretical and workplace learning, but renewal and reconceptualization of curricula seems to be limited to Strategic Implementation Projects (Department of Economic Development, n.d.).

Furthermore, in a clear attempt to achieve “policy breadth” (Raffe 2003; Keevy 2006), the White Paper (Department of Higher Education and Training 2013) makes mention of many of the policy instruments discussed in the previous section, for example, the National Infrastructure Plan through the Strategic Implementation Projects and the Public Sector as a recipient of interns.

This policy instrument can therefore by no means be seen to be a policy encouraging workplace-based learning for the purposes of learning, and not for working (Blom 2013).

Thus, while the education and training policy instruments all espouse workplace-based learning as “an education and training approach” (see the definition), the

expected outcomes for workplace-based learning seem to strongly lean to issues of the unemployment and the economy. This is a far cry from workplace-based learning as part of a holistic curriculum which involves “the intersection of work-based pedagogies that originate from research into how people learn in, for and through work, with the further and higher education pedagogies in which the subject-dominant starting point is applied to people at work” (Evans et al. 2010). Therefore, despite espousing workplace-based learning as an educational practice, these policy instruments are much more aligned to the economic policies of the country.

---

## **A Policy Framework for Workplace-Based Learning: An Intractable Ideal?**

In seeking to establish a policy framework for workplace-based learning, an analysis of the statutory, policy, and regulatory instruments was undertaken. Initially, the purpose of the analysis was to determine whether there is sufficient “policy breadth” (Raffe 2003; Keevy 2006) for the successful implementation of a national policy framework. The analysis was largely undertaken due to previous painful experiences, where the lack of congruence of policies across the education, training, and the economic sectors hindered implementation (see, for example, Blom 2006).

In the analysis of both non-education and education and training policy instruments, remarkable agreement was found. Across these instruments, the language and practices of workplace-based learning are easily recognizable, albeit for different purposes. As noted earlier, in general, non-education policy instruments sought solutions for unemployment (particularly youth unemployment) and the boosting of the economy.

The education and training policy instruments, on the other hand, were expected to foreground workplace-based learning as an education and training approach. However, in the analysis, it became evident that the purposes of responding to the needs of the economy and the needs of education are conflated. This confirms the notion that policies are deeply influenced “by a political discourse and more so by the political manifesto of the party that wins the elections” (Gumede 2008, p. 8), suggesting that the education and training policy instruments have deeply bought into the economic discourse, rather than an educational discourse. The analysis therefore confirms that policy and politics “closely interact, often overlap, and in part cannot be separated even analytically” (Dror 2006, p. 81).

This situation does not bode well for a practice which essentially supports an educational methodology which embraces the “extent to which the curriculum reflects the teaching of theory, supported by practice” (Blom 2006). It therefore seems that, presently, current policy instruments completely ignore the curricular implications that need to be addressed when a national policy framework for the practice is developed. This is despite the attempt in the draft policy framework to balance these concerns (Department of Higher Education and Training 2015). The draft policy, for example, states that the value of workplace-based learning lies in “the recognition that workplaces are important sites of learning where new

knowledge is generated and applied knowledge is embedded” (Department of Higher Education and Training 2015).

The policy (in)congruence therefore does not seem so much to relate to the policy instruments intended to enable workplace-based learning but rather between policy and actual practice. The “voice” of education and training institutions, for example, is completely silent in the policy instruments analyzed, which primarily focus on the administrative and funding infrastructure needed to support large-scale implementation. This is despite a deliberate attempt in the policy framework development process, to draw on the expertise and experience of education and training institutions in the country (see discussion on the methodology used to undertake policy development).

Furthermore, in many policy instruments (non-education and education and training related), so-called target markets include the NEET youth. However, unless these young people are in some form of education or training, the current policy instruments are meaningless and will not address their needs. A range of other policy instruments, not discussed in this chapter, seek to deal with this particular group.

Nevertheless, a draft policy framework was concluded in 2015. In accordance to the research methodology, the draft policy framework was meant to be published for public comment and input, which would have ensured that the policy framework addresses actual practice, and could have allowed for the voice of practitioners. However, as of December 2015, the policy development process has stalled – the reasons for this are not clear. Consequently, the system remains in limbo and the practice continues to be implemented in a “policy vacuum” (Ori 2014).

---

## Conclusion

This chapter traced the attempt at the development of a policy framework for workplace-based learning in South Africa. As part of the process, a useful typology for the practice was constructed. While the typology largely captured current practices (with the exception of graduate internships – see Table 1), it was the first time that different subsectors of the education and training system tried to make sense of the similarities and differences of workplace-based learning as applied in different contexts. As a result, the subsectors succeeded to agree that, although the practices, purposes, and concepts of practices vary, there is a common understanding that workplace-based learning is a powerful educational approach that could enrich and complement institutional learning. Thus, the gains achieved through engagement across all subsectors of the system were considerable. Certainly, the practice has firmly been positioned as an important discourse in education and training and seems to have the potential to improve the employability of youth; to ease the transition from school or learning to work; and to enhance the educational value of learning through authentic, real-life workplace situations.

With that in mind, perhaps a policy framework for workplace-based learning is premature. It is clear that there are no shortages of funding instruments and administrative infrastructure to implement workplace-based learning and perhaps, a policy

framework is unnecessary at this stage. This is because funding and infrastructure usually follow policy pronouncements and not the other way around. In South Africa, these have been put in place before a renewed focus on the practice came into being. Indeed, this situation may very well provide the space for education and training institutions to undertake the necessary research and investigation to build workplace-learning as a meaningful educational approach that will enhance learning.

## Abstract

In an era in which policy makers emphasize the need to invest in vocational skills development and improve its orientation towards the demands of the labor market, there is also a growing interest in promoting systems of apprenticeship, by integrating work-based learning into formal VET. Countries with dual VET at the upper secondary level are often considered as “models,” and they have been actively promoting themselves as “lenders” of dual VET in international cooperation. Still, the introduction of apprenticeship schemes in many countries has had mixed results, and even in countries where dual VET had already played a key

role, its adaption to changes in society and labor markets has become challenging. Whereas national qualifications frameworks are now being implemented across the globe, the global diffusion of apprenticeship schemes in formal VET in general, and dual VET in particular, is by no means yet a reality.

## Introduction

Traditionally, work-based learning had been the predominant mode of vocational skills development (VSD) in most parts of the world. In the course of the expansion of educational systems, many countries started to make use of upper secondary schools to develop such vocational skills, while other countries ensured the formal education system concentrated on general education, leaving the development of vocational skills to the world of work. Only in a few countries in continental Europe, such as Germany and Switzerland, did work-based learning become a substantial element of formal vocational education and training (VET) at the upper-secondary level. This type of apprenticeship training has become commonly known as the “dual VET model.”

Today, VET policy discourses in many countries emphasize the need to articulate work-based and school-based learning through apprenticeship training. This might suggest that education systems around the world are broadly moving towards the dual VET model. This chapter, however, argues that this is not the case.

After a discussion of terminology and a brief section on the worldwide decline of apprenticeship training, the chapter provides an overview of the history, recent developments, and challenges of the dual VET model, with a focus on Germany and Switzerland. This country selection is based on the facts that, firstly, Germany is the most prominent example of a dual VET country, and, secondly, Switzerland is the country with the largest share of dual VET at the upper secondary level worldwide (SERI 2017). The chapter follows with accounts of apprenticeship schemes in other OECD countries – notably in England, France, and Sweden – and then discusses the promotion of apprenticeship training and the dual model in international cooperation before discussing challenges at the level of implementation.

---

## Work-Based Learning and Apprenticeship Training

Vocational competences can be acquired at very different sites of learning (the workplace being just one of them), but it is obvious that work-based learning plays a central role in apprenticeship training. Though the terms “apprenticeship” and “work-based learning” are often used in similar contexts, they are conceptually different. The following section serves to address these differences.

## Work-Based Learning

Work-based learning is an integral part of the work process. As with other forms of learning, work-based learning contributes to the acquisition of competences; these may be generic, and thus transferable to a broad range of contexts (e.g., social competences), or specific. Some competences may be so specific as to only be applicable in a single company (e.g., the competence to handle a company-specific software), whereas others may be applicable to an entire industry sector or vocational field (e.g., the competence to handle a CNC machine in metal manufacturing). In fact, it is the latter type of competence that is generally understood to be a vocational competence in a specific vocational field or industry.

Work-based learning is often not guided by formal learning objectives but rather by work-tasks, and it can therefore be informal. Informal work-based learning can occur by observing and imitating more experienced colleagues in the workplace (modeling, see, e.g., Bandura 1972) or by learning through experience (experimental learning, see, e.g., Kolb 1984). Of great importance are also socialization processes within work contexts which can contribute to, for instance, the development of “work ethics” (Heinz 2005).

Work-based learning can also be more formalized. Many larger companies, for instance, have their own training regulations, applied during induction periods where new recruits familiarize themselves with the technologies and processes of their new employer. Work-based training can also be guided by legal regulations which may define employment conditions (e.g., salary and maximum working hours of apprentices) or training objectives (e.g., skills standards and curricula).

In most of the literature, work-based learning is seen to occur in the world of work (workshops, smaller firms, larger companies, public administration). Still, some scholars have written about work-based learning in school settings, e.g., in workshops of vocational schools. One such proponent was Kerschensteiner (1966), an iconic figure in the history of vocational education in Germany.

## Apprenticeship Training

There is no universally accepted definition of apprenticeship training. Still, the following statement by the European Commission reflects a certain consensus among experts and policy makers, at least in Europe.

Apprenticeships formally combine and alternate company-based training with school-based education and lead to a nationally recognized qualification upon successful completion. Most often there is a contractual relationship between the employer and the apprentice, with the apprentice being paid for his/her work. (European Commission 2015, p. 1)

Still, looking at apprenticeships from a more historical and international-comparative perspective, neither school-based education nor the *national* recognition of qualifications are indispensable elements of apprenticeships. In our view, apprenticeship training must: (a) include a strong (and possibly exclusive)

component of work-based training; (b) be based on institutionalized processes that are supported and shared by different actors in the respective geographical area; and (c) lead to a qualification that is socially recognized. Against this backdrop, we distinguish several types of apprenticeship which share these features:

- *Informal apprenticeships*: In many countries, apprentices are trained informally in workshops, mainly in traditional craft trades, without ever undergoing school-based vocational training or a formal test. Still, these apprenticeships are highly institutionalized, often following unwritten rules and regulations that prevalent in their respective sectors and geographical areas.
- *Nonformal apprenticeships*: These include training programs that are regulated by non-state actors, e.g., employers' associations. Work-based training is often complemented by off-the-job training, either within the respective economic unit or outside (e.g., in private training centers). The issued qualifications are not officially recognized but can be of value in the labor market. Early examples of nonformal apprenticeships include those regulated by the guilds in medieval Europe.
- *Formal apprenticeships in upper secondary education*: In this type of apprenticeship training, work-based learning is a fully integrated element of upper-secondary education programs. The training periods in the workplace clearly go beyond short internships and are guided by curricular objectives. We consider this type of apprenticeship training as largely in line with what generally is perceived to be the dual VET model, which we elaborate upon below (see section “[Key Features of the Dual VET Model and Their Larger Societal Context](#)”).
- *Formal apprenticeships on other levels of formal education*: Workplace-based training has an increasing role to play also at the level of tertiary education, and even there it can be organized as apprenticeship training. In most cases, however, workplace-based training should be considered as an “internship,” which may be a compulsory component of a degree program but is comparatively short and not guided by explicit curricular objectives.

---

## The Decline of Apprenticeship Training

For centuries and throughout the world, trades were learnt in the workplace. For much of Europe's history, it was only in a few professions that formalized education and training were required *before* entering the world of work.

In most cases, training in the workplace (e.g., in agriculture) did not lead to any form of what we today would call a recognized qualification. However, work-based training was the basis of recognized qualifications in many of Europe's towns, where, from the High Middle Ages onwards, access to trades was linked to an apprenticeship system that was controlled by guilds. This model had certainly always touched upon only a minority of mainly male, comparatively more privileged urban adolescents. But in some countries, this model could be retained to a certain degree, rendering work-based learning and apprenticeship training important

elements of current VET systems. In most countries, however, the traditional apprenticeship model vanished entirely or lost its importance, for different reasons.

In some countries on the European continent, the guilds' apprenticeship model declined as a consequence of the French revolution, which led to the introduction of economic freedom in many parts of the region. This either meant an entire ban of guilds or their loss of control over access to markets, to which their traditional training system had been intimately linked. Following the decline of the traditional apprenticeship system, many state authorities decided to step in with the establishment of technical and vocational schools, catering to craft trades or emerging industry sectors. The most typical example of this group of countries is France (Tanguy 2000).

Another reason for the decline of the traditional apprenticeship model in some countries was rapid industrialization, the most prominent example being the case of England. Here, the growth of manufacturing rendered work-based training on the shop-floor the standard model of vocational skills development. Industrialists, politically opposed to the increasingly marginalized guilds, did not press for more formalized vocational training, which allowed the government to focus its education policy on expanding basic schooling. Vocational skills development in England and some other Anglo-Saxon countries was therefore, for a long time, left in the hands of private initiative (Gospel 1995).

A third factor was the expansion of educational systems, mainly of school-based upper-secondary education. The consequence was that young people (particularly males) were no longer available for apprenticeships, as they now started to enroll in schools and subsequently moved either into employment in economic sectors where apprenticeship was of no importance, or into higher education. An important example, here, is Sweden, where school reforms from the late nineteenth century onwards were aimed at providing more equal access to opportunities in the labor market and in society more generally. Of particular importance were the reforms in the 1960s and 1970s which rendered the *gymnasiet* the standard type of upper-secondary education, covering also school-based vocational education programs, and led to a decline in the number of young people in apprenticeship training (Busemeyer and Schlicht-Schmalzle 2014). Other examples include transitional and developing countries, in many of which massive educational expansion, particularly at the upper secondary level, is a more recent phenomenon, and one to which the international community, has strongly contributed in the last decades.

---

## The Dual VET Model as a Type of Apprenticeship Training

A few countries retained apprenticeship training to a stronger degree, and made it a key element of upper secondary education, with qualifications recognized in major parts of the respective labor markets and, consequently, by the general public and potential trainees. Generally, some fully or partly German-speaking countries (i.e., Austria, Germany, Liechtenstein, and Switzerland) as well as Denmark and the

Netherlands are considered to have education and training systems in which dual VET plays a key role.

Given the important role both of work-based and school-based education, this type of apprenticeship training became to be known as the “dual VET model.” It represents the most prominent form of formal apprenticeship training at the upper secondary level (see section “[Apprenticeship Training](#)” above). Still, the term is not mentioned in any national law (in their original language) and is, therefore, not officially sanctioned. In the case of Switzerland, for instance, the Ordinance on Vocational and Professional Education and Training regulates “*betrieblich organisierte Grundbildung*” (i.e., initial VET organized at the company level), a term which is then translated into “dual track VET” in government publications in English (see, e.g., SERI 2017, p. 11).

### **Key Features of the Dual VET Model and Their Larger Societal Context**

Dual VET is in no way a unitary concept. It has adopted a range of different forms, even within countries. Accordingly, there is a broad literature on the key features that are common to these various forms (e.g., Euler 2013; Gonon 2014). Based on a review of this literature, we define the following as some of the key features of the dual VET model:

- Work-based learning forms a part of formal VET, i.e., it is an indispensable element of programs that lead to qualifications issued and recognized by state authorities. It takes place in host companies, which thus become a key locus of formal VET. A substantial part of the required learning hours of the VET programs are allocated to work-based learning, going far beyond an internship and often covering the entire duration of the VET program. In Switzerland, for instance, most VET programs require VET learners to spend 3.5–4 days per week in the workplace.
- Work-based learning is complemented by school- or center-based vocational learning.
- Both work-based and school-based training are guided by officially sanctioned occupational profiles and related curricula.
- The curricular objectives are developed in strong cooperation with collectively organized representatives from the world of work (e.g., chambers, associations, labor unions).
- Vocational learners and host companies sign apprenticeship contracts which define mutual rights and obligations. This type of contract is generally regulated not only by the VET laws but also by the labor laws of the respective countries. Given the fact that they profit from the productive work of the apprentices, host companies are generally not subsidized to offer apprenticeship training.
- A part of the formal assessment process occurs in the workplace, with representatives from the world of work operating as examiners.

In much of the literature, dual VET is seen as much more than a mode of apprenticeship training; it is also characterized by its political and social preconditions. Of particular importance are references to the conceptual notion of “*Beruf*” (literally: *vocation*), which is seen to have had a strong influence on the historical evolution of the model, becoming the organizing principle of dual VET, and to be of considerable importance even today (e.g., Deissinger 1998; Schriewer and Harney 2000). As a further precondition of dual VET, many contributions point to a governance structure in which representatives of the world of work have a very strong say, not only in the development of skills standards but also in VET policy making more generally (Gonon 2014).

## Current Challenges and Trends

In countries in which the dual VET model evolved, the traditional apprenticeship model did not so much decline as transform. In short, this was made possible by the facts that: (a) state authorities allowed representatives of the world of work to get involved in officially sanctioned education and training programs; (b) these representatives were ready to do so; and (c) rapid educational expansion pressed these stakeholders to complement work-based with school-based training. Still, the national trajectories were different.

All countries with a strong dual VET model have regularly engaged in intensive debates about it, with some critics fundamentally questioning its relevance for postindustrial societies in principle, and others pressing for substantial reforms.

The quasi-classical argument goes that the occupational profiles underlying the different dual VET programs are too narrow and that there is not sufficient time allocated to general education subjects, restricting the mobility of VET graduates in labor markets (see, e.g., Maurer and Pieneck 2013; Rosendahl and Wahle 2012). Growing intra- and inter-occupational mobility and the accelerating digitalization of workplaces are factors that are currently pushing this discussion to the fore again. It seems, however, that the institutional foundations of dual VET and its key supporters do not allow for transformative change. As a general rule, any reform with the aim of broadening occupational profiles and increasing the number of lessons dedicated to general education will meet with opposition from those employers who profit most from apprentices spending a considerable part of their training in the workplace. In Switzerland, for instance, the most fundamental reform in this respect was the introduction of the Federal Vocational Baccalaureate (FVB) program in 1998, but it was only introduced because of substantial pressure from the side of the universities of applied sciences (Gonon 2013). The FVB allows learners in the dual VET programs to spend, on average, one more day at school per week and to enroll, after successful graduation, at universities of Applied Science. Though the introduction of the FVB was clearly transformative in nature, the growth of the program has started to reach its limits, mainly due to the unwillingness of many employers to allow their apprentices to spend more time at school (Econcept 2015).

A further critical challenge is the positioning of dual VET programs and, even more, of the programs that are open to the graduates of dual VET within an increasingly globalized world of education and training. Both observers and VET authorities in Germany and Switzerland hope that national qualifications frameworks will help improve the status of post-secondary and tertiary level VET programs (AK DQR 2016; SBFI 2014). However, export-oriented, multinational companies tend to increasingly recruit university graduates even for mid-level positions, restricting the career opportunities for VET graduates with non-academic education and training (see, e.g., Hippach-Schneider et al. 2011). Clearly, such signals from the labor market influence educational decisions by adolescents and parents, accelerating an academic drift – even though less pronounced – also in dual VET countries. In fact, the share of young people enrolling in dual VET (as part of all those starting an upper secondary education) has been decreasing in all these countries over the course of the last decades, at the benefit of general education programs (i.e., notably the *Gymnasium*) and more school-based VET programs (Busemeyer and Trampusch 2012).

---

## Reforms of Apprenticeship Training in OECD Countries

In nearly all cases in recent decades where governments of OECD countries without dual VET proposed system reforms, the strengthening of apprenticeship training was emphasized. In the USA, for instance, Bill Clinton, Barack Obama, and, more recently, also President Trump made such propositions. At the national level, plans to strengthen apprenticeship training are often supported by a broad range of political stakeholders who consider the high share of work-based learning to be a guarantee that vocational learning will become more relevant to the world of work and smoothen the transition of graduates into the labor market.

Policy reforms with the aim of boosting apprenticeship training are highly diverse, with different notions of what apprenticeship training actually is, and they are planned and implemented in a broad range of economic and social contexts as well as VET systems. In the following, three different types of apprenticeship promotion shall be briefly outlined.

A first reform type is that of promoting apprenticeship programs which is positioned outside the formal education system but still lead to recognized qualifications. This is the approach followed by England where different forms of apprenticeship training have been developed by successive governments since the 1990s (Euler 2013; Evans and Bosch 2012). As of today, apprenticeship schemes exist at four levels, i.e., intermediate, advanced, higher, and degree level. Though they are referenced to the qualifications framework, an apprenticeship qualification at a given level does, however, not automatically entitle for enrolment in a qualification program at a next higher level.

Common to these types of apprenticeship training in England is a strong component of work-based training that is based on standards developed by representatives of the industry and is combined with training outside the workplace, mostly at private education and training centers. Host companies pay the apprentices at least

the national minimum wage, but in most schemes they are catering to lower skill levels, therefore they are subsidized by the government. The requirements to receive such subsidies are, however, relatively low, which led to a rapid expansion of apprenticeship training at these lower levels. Despite the existence of skills standards, recognized apprenticeship training at these lower levels is often hardly different from informal on-the-job training, with the only difference being state subsidies and access to a qualification. This challenge has also been corroborated by the fact that apprenticeship schemes at lower levels have become a means of recognizing prior learning among existing employees, with very limited additional training being provided. It is, partly for this reason that many observers have bemoaned that apprenticeship, in England, still falls short of providing the labor market with intermediary skills (Evans and Bosch 2012).

A second type of reform is that of strengthening the share of work-based learning in upper-secondary VET, which is otherwise predominantly school-based and places heavy emphasis on general education. Such a reform has been implemented in Sweden since 2010, with the aim of enabling students enrolled in the vocational tracks of the gymnasium to undergo at least half of their 3-year program as apprentices in a company (*gymnasial lärlingsutbildning*) – considerably more than the 15 weeks of internships (*arbetsplatsförlagda lärande*) as part of the regular school-based VET tracks (Panican and Olofsson 2015). Although, in principle, the apprentices follow the same curricular objectives as the students of the school-based VET, the share of general education was reduced, which makes it difficult for the apprentices to directly enter higher education upon graduation from the VET program. Graduates lacking general education are, however, entitled to develop it for free by joining dedicated adult education programs (*Komvux*) (Skolverket 2014). The responsibility that students acquire, defined by the national curriculum in terms of vocational competencies, derive from the VET school, which in reality has little leverage over host companies to train as per the curriculum. Still, host companies are subsidized by the government to offer apprenticeship positions and are not compelled to pay any salary to the apprentices. This reflects the general opinion that host companies help the government to reach its education policy objectives as well as the concern that host companies will not be able to employ apprentices in a sufficiently productive way, even if they work there half-time for 3 years. What is more, the apprentices at upper secondary level are not covered by the national labor law. They are, however, entitled to receive a public training grant (*lärlingsersättning*) that allows them to cover meal and travel expenses.

A third type of approach is that of *strengthening apprenticeships at different levels of formal education, including higher education*. This approach was adopted by France and has come to be known as *formation par alternance*. It covers a whole range of formal educational qualifications, including those at higher education, all of which are otherwise mostly followed in the school-based mode. The scheme thus enables students to spend a part of the training program in companies, with which apprentices sign an employment contract. In contrast to England, the expansion of apprenticeship training was more pronounced at the upper secondary level (*baccalauréat professionnelle*), while remaining modest at the lower levels (e.g., *certificat d'aptitudes professionnelles/CAP* or *brevet d'études professionnelles/*

BEP), a fact which has been criticized for leaving behind those young people who would be most in need of a recognized qualification. In fact, apprenticeship positions in France are considered to be difficult to access for young people, but those who succeed, and finally qualify, are clearly better positioned in the labor markets, compared to their counterparts undergoing exclusively school-based training (Brandt 2015; Sanchez and Zamora 2007).

---

## **Apprenticeship and Dual VET in International Cooperation**

### **Policy Borrowing and Lending in OECD Countries**

As is often the case with policy reforms, their proponents tend to admire what they perceive to be best or good practices in other countries and propose borrowing these practices, or elements of them (Steiner-Khamsi 2012). Apprenticeship reforms in OECD countries are mostly inspired by countries with dual VET, particularly Germany. Although such borrowings appear somewhat obvious to the reforming countries, it is important to underline that Germany has understood itself as a *lender* of dual VET for quite some time. Initially, its focus was on middle-income and developing countries (Barabasch and Wolf 2009), while recently it paid more attention to promoting dual VET also in OECD countries through its platform iMOVE (iMove 2013). In contrast to earlier approaches, this platform also promotes international cooperation as a commercial opportunity for VET providers (such as schools, chambers and associations, and companies), with attractive markets to which German VET approaches can be “exported.”

Promoting its VET system abroad has also become a project of the Swiss authorities. In previous decades international cooperation in VET was left in the hands of the agency in charge of development cooperation (SDC, see section “[Revival of Apprenticeship Training in Development Cooperation?](#)”); now the State Secretariat for Education, Research, and Innovation (SERI) plays a key role. Starting with support to VET in India, it developed a strategy for international cooperation in VET, which supports exchange of experts and a variety of projects. Initially, the authorities had the clear objective of exporting the Swiss dual model. After a series of discussions with different stakeholders, both within and outside the federal administration, a more cautious approach was adopted, emphasizing the need to support policy learning in partner countries and to thus promote the image of Swiss VET abroad, rather than export a model (Jäger et al. 2016). In the USA, this strategy was effective, with important stakeholders referring to VET in Switzerland, not only in Germany (Hoffman and Schwartz 2015).

### **Apprenticeship and Dual VET in Development Cooperation**

Support to the formal VET sector and other forms of VSD has been an element of bi- and multilateral aid to developing countries for a number of decades, but VSD

has not always been accorded the same level of importance. Whereas for some key donors (such as the World Bank) it was a core element of education aid from the 1960s onwards (Jones 1992), support for it waned following the adoption of the Education for All (EFA) and Millennium Development Goals (MDG) agendas in the 1990s and 2000s, which prioritized basic education. Since around 2010, VSD has regained favor, a trend that is reinforced by VSD targets in the Sustainable Development Goals (SDG) which now allow donors to more easily justify support to VSD.

Some donors and multilateral technical agencies have always provided assistance to developing or strengthening apprenticeship training. The following section serves to look at this assistance.

This analysis takes into account that many recipient countries of bi- and multi-lateral aid have their own approaches to apprenticeship, just like OECD countries. Of traditional importance are informal apprenticeships, mostly in the craft sector and other sectors of what has been termed the informal economy, implying that apprentices are trained under conditions of little or no regulation by authorities. Informal apprenticeship schemes have also evolved in industries, e.g., in the manufacturing of garments. Many countries have introduced a legal framework for the employment and training of apprentices, defining the duration of the training period, remuneration, etc. Some countries, particularly in Latin America, have established structures that combine work-based and school-based training for industrial workers, the most prominent example being the National Industrial Apprenticeships Association (SENAI) in Brazil, which has served as a model to other countries in the region.

### **Different Approaches in the Past Decades**

Most important donors supporting VSD in the past decades focused on school or center-based forms of training. From the 1960s up to the late 1980s, the World Bank had assisted formal training of industry workers in dedicated centers, or the development of diversified secondary education, but not apprenticeship schemes. Apprenticeship was addressed by the International Labor Organization (ILO), however. It not only adopted recommendations (e.g., ILO 1956) but also actively supported member countries in the improvement of apprenticeship training, promoting the interlinkages between work-based and school-based forms of vocational learning (e.g., ILO 1959).

Supporting apprenticeship training also became a central goal of German development cooperation. Although, in its early years of working in VET, it had mainly focused on school and center-based training, it began to promote VET projects with work-based training components from the late 1970s onwards. As stated in a 1986 strategy paper, the “underlying principles” (e.g., chambers) of VET in Germany were now seen to be critical for reforms of VET systems in partner countries (Greinert 2001). Underlining the “system orientation” of this approach, the GTZ (today: GIZ) adopted a notion that dual VET was much more than a specific mode of apprenticeship training – one that could only evolve if critical preconditions were in place, requiring reforms of entire VET systems along the lines of the German one. This radical approach, borne by the conviction that the German VET system

was superior to any other, was somewhat softened in the early 1990s, giving way to a strategy underlining the need to transfer only specific elements of the German dual system instead of the system as a whole. But for a number of projects in partner countries, e.g., in Egypt, the development of a dual system along the lines of Germany's remained a long-term goal (Greinert 2001). Evaluations, however, found the new approach ineffective (e.g., Stockmann 1992), and many contributions to the international comparative literature pointed out that dual VET was successful in Germany because of preconditions which were difficult to transfer to partner countries (Caillods 1994).

### **Revival of Apprenticeship Training in Development Cooperation?**

The renaissance of VSD in development cooperation since around 2010 was partly inspired by the need to improve the transition of young people to labor markets in many developing and transition countries. Existing VET systems have, in this context, often been criticized for being insufficiently “demand-driven,” which requires a stronger involvement of the private sector in governance and delivery. Though mainly driven by donor agencies and state authorities in partner countries, the ambition to strengthen the demand-orientation of VET has also been one of the core objectives in the establishment of qualifications frameworks (Young and Allais 2013).

In this overall context of revived attention towards VSD in development cooperation, apprenticeship and work-based training are experiencing a particular renaissance and are often seen to be critical to demand-driven training. Multilateral stakeholders that promote such approaches include the Asian Development Bank, the European Commission as well as the ILO (ADB 2010; European Commission 2015; ILO 2011). Among the bilateral donors with no dual VET system at home, the French development agency explicitly promotes apprenticeship training (AFD 2014), whereas the two largest ones – DFID and USAID – have not declared the promotion of apprenticeships to be an explicit objective of their education strategies, but do, in fact, support forms of apprenticeship training in some of their interventions (see, e.g., DFID 2013).

At the same time, dual VET countries – in particular Austria, Germany, Liechtenstein, and Switzerland – have discovered the promotion of apprenticeship training as a means to position themselves in the field of aid for VSD. References to dual VET as a point of reference for aid in VSD can be found in all these donors' strategy papers, and they also launched a joint donor committee dedicated to the promotion of dual VET in development cooperation (DC dVET 2016). However, it has become difficult for these donors to clearly distinguish their approaches from the ones followed by other donors. On the one hand, there is a broad agreement that a transfer of entire VET systems is not feasible; on the other hand, any attempt to make use of the concept of dual VET in a way that reflects the heterogeneity of contexts in partner countries leads to its being entirely blurred, and indistinguishable from other donors' approaches to the promotion of apprenticeship training and demand-driven VSD. This can be illustrated by looking at the changing arguments in the two latest VSD strategy papers by the German development agency. The 2012 version argued that it was important to base German aid for VSD on key principles of the German

dual VET system, including the dialogue between government and the private sector, and work-based learning (BMZ 2012, p. 25f). In contrast, the 2017 strategy mentions similar principles but brands them success factors of BMZ's intervention strategy – replacing “work-based learning” with the assurance that TVET programs would be “practice-oriented and responsive to labor market needs.” Aware that most donors supporting VSD are arguing along similar lines, references to the “success story” of dual VET in Germany and the low unemployment rates in the country have gained prominence in its strategy papers (BMZ 2017, p. 9f).

---

## Concerns and Challenges

Whereas policymakers tend to promote the strong orientation of apprenticeship training towards the labor market, they are, in many contexts, confronted by many critics. A first concern is equity: in the eyes of many, broadened access to general education contributes to social equity, whereas reforms to strengthen or reinvigorate apprenticeship training would contribute to socially disadvantaged segments of the population being channeled into low-paying parts of the labor market. Apprenticeship training would, in other words, contribute to the reproduction of social inequalities. This concern is certainly relevant, and there is evidence that (for instance in Switzerland) socially more privileged strata of society is not sending their children to apprenticeship training (Keller 2014). At the same time, the same case of Switzerland suggests that an elaborated apprenticeship scheme at upper secondary education provides opportunities for a relatively smooth transition into the labor market for comparatively disadvantaged segments of the young population (SCCRE 2014). Furthermore, the Swiss system shows that it is, in fact, possible to create pathways from apprenticeship training at upper secondary level to higher education and that such pathways can be important in order to ensure the social status of VET in general and apprenticeship training in particular.

A second concern is that apprenticeship schemes can be abused to pay minimal or no salaries to entrants to the labor market, with few wage regulations. This concern is of particular relevance in countries where apprenticeship training is not integrated into a formal education program and where there are low barriers for becoming a host company. A third concern is finally that the expansion of apprenticeship training, e.g., at upper secondary level would lead to a retrenchment of teachers in school-based VET (e.g., Dell'Ambrogio 2015). Though a radical implementation of company-based VET at upper secondary would certainly imply the loss of teaching positions, experience suggests that the expansion of apprenticeship training at this level of education is a slow process.

Whereas these concerns question the legitimacy of strengthening apprenticeship training more generally, apprenticeship schemes are additionally confronted by various challenges at the level of implementation. Two of them deserve mention here.

Firstly, in countries where skill formation is otherwise mainly school-based or left to the private sector, it is difficult to convince companies of the value added of

apprenticeship training. Training apprentices does involve costs, and if they do not remain with the company, these investments are lost. It then remains more attractive to poach trained personnel, including former apprentices, from rival firms.

Secondly, many apprenticeship schemes are not sufficiently attractive to young people, particularly in countries where school-based general education has a high social status and educational credentials are highly appreciated in the labor market. Of particular concern to potential trainees in many countries is the fact that apprenticeship programs have a reduced share of general education, which can lower their prospects of progressing within the general education systems.

Not least because of these two challenges, the share of apprenticeship training has remained low in many developed countries. Quite remarkable are the numbers in France, where the share of apprenticeship training at upper secondary level has gone up to one third (Brandt 2015). But in Sweden, for instance, only 3% of all VET students in 2016/2017 were enrolled in the apprenticeship program (Skolverket 2017). In England, the numbers had been growing fast for some years but given the nonformal nature of apprenticeship training, these numbers could never be seen in relation to enrolment figures at, for instance, the upper secondary education level (Evans and Bosch 2012). In many developing and transition countries, the apprenticeship schemes supported by donor agencies mostly remain insulated and lack sustainability, mostly as companies, with no outside support, have problems benefitting economically from their engagement in apprenticeship training.

To make apprenticeship training more attractive, policy makers have often resorted to lowering requirements or increasing financial incentives. On the one hand, companies engaged in apprenticeship training in many countries have profited from subsidies and regulations for apprenticeship training being lowered, notably in terms of educational contents. This also includes reducing learning hours allocated to off-the-job learning, notably at schools. On the other hand, some governments have started to provide salaries to the trainees (which, in fact, is a further subsidy to the companies) or lowered entry barriers for students to enter the apprenticeship programs. All such incentives have risks involved: a prominent example of their negative effects is England. Here, many companies profited from subsidies, though they had already been heavily engaged in training independently of the public apprenticeship scheme – meaning it had a textbook-like deadweight effect. Others profited from subsidies without training their apprentices. This, in combination with lowered entry requirements for apprenticeship training and comparatively few hours allocated to center/school-based learning, further contributed to a low image of apprenticeship training in the country (Evans and Bosch 2012).

---

## Conclusion

A global diffusion of the dual model is anything but a reality, even though many governments and donor agencies currently emphasize the need to strengthen work-based learning at the upper secondary level. Many work-based learning schemes have emerged in countries with predominantly school-based VET, but these remain

confined to comparatively small segments of their school populations. What is more, countries in which the dual model has been of central importance have seen an academic drift over the last decades, illustrated by declining shares of students undergoing dual VET at the upper secondary level, and reforms that strengthen general education within VET and improve access from VET to higher education.

In contrast to the model of “qualification frameworks” – which was pioneered in England in the 1980s – the system of apprenticeships in formal VET in general and dual VET in particular is definitely not subject to global diffusion, one of the reasons being that it is easier to launch national-level macro-reforms, which entail little commitment on the part of key stakeholders to actually changing the way they do things, than to introduce reforms at the level of training program delivery, which affect the stakeholders more directly and rapidly.

Accordingly, most experts agree that a transfer of dual VET to other countries is virtually impossible and that the establishment of the apprenticeship system in formal VET mostly fails due to the absence of necessary preconditions.

Still, for the dual VET countries, emphasizing their experience with the dual model has become important in positioning themselves in the global landscape of international cooperation in education. And as the following statement by the Swiss development agency suggests, advocating the dual model in development cooperation has been discovered as a means to garner public support for VSD aid:

Position our engagement in vocational skills development as a localized adaptation of the dual model. Stress commons rather than differences in our communication in Switzerland. (SDC 2011)

## Abstract

This chapter will promote the view that without well-functioning careers guidance services for young people and adults, the benefits of other components of TVET reform cannot be fully realized, and a country's ability to achieve Goal 8 of the Sustainable Development Goals is undermined. Targets 8.5 and 8.6 call for full and productive employment and decent work for all women and men, as well as a substantial reduction in the proportion of young people not in employment, education, or training. However, access to decent work requires more than equal access to education, a reformed curriculum, and fairer governance. For people from poor communities, the obstacles are often insurmountable: a lack of social capital prevents

them from negotiating their way through opaque recruitment practices where family connections are more important than qualifications or aptitude, and information on job vacancies and selection criteria are the preserve of the well-informed middle classes.

Careers guidance brings more benefits than simply smoothing and shortening the transition from school to employment for young people. In today's fast-changing, often precarious and turbulent, labor market, workers are expected to change not just job but also career path more than once in their working lives. Periods of retraining or up-skilling are increasingly necessary to remain resilient during economic downturns, leading to frequent movement between education and employment and between jobs. Access to careers guidance is important for workers of all ages as a means of reacting positively to labor market trends and reducing periods of unemployment.

## **Introduction**

This chapter begins by confirming the importance of the Sustainable Development Goals and the benefits which they can bring. It explains that Targets 8.5 and 8.6 are being measured through increased levels of productivity and decreased levels of unemployment, particularly among young people, women, people with disabilities, and members of other disadvantaged groups. Seven actions are proposed which governments could take to have a positive impact on these two measures and the added value which a good-quality careers guidance system can bring to each of these actions.

Consideration is given to three objectives which a good careers guidance system should achieve: providing access to career-long services, contributing toward closing the inequality gap, and contributing toward the achievement of socioeconomic goals, most specifically unemployment.

Desirable design features of a careers guidance service are addressed, both for young people and for adults. The chapter concludes by proposing that increased investment in careers services is justified because they enhance other actions taken to achieve Targets 8.5 and 8.6 and not to do so risks undermining the efficacy of these actions.

---

## **Sustainable Development Goals (SDGs) and the Role of Careers Guidance**

### **The Importance of the SDGs**

In 2015 the member states of the United Nations adopted a set of goals to end poverty, protect the planet, and ensure prosperity for all as part of the Resolution "Transforming our world: the 2030 Agenda for Sustainable Development." Among

these is Goal 8 on Decent Work and Economic Growth which aims to promote sustained, inclusive, and sustainable economic growth, full and productive employment, and decent work for all.

Having goals can bring a number of benefits for development (Sachs 2015):

- (i) Social mobilization – adopting global goals helps individuals, organizations, and governments worldwide to agree on future direction.
- (ii) Peer pressure – the adoption of the goals exposes political leaders to questions on the progress they are making.
- (iii) Networks of expertise, knowledge, and practice – these communities of knowledge and practice come together to recommend practical pathways to achieve results.

It is the last of these which is supported by the inclusion of improved careers guidance services as part of the efforts to achieve Goal 8.

## **SDG 8: Decent Work and Economic Growth**

Within Goal 8, there are two targets in particular with which careers guidance services can help. These are Target 8.5, by 2030, achieve full and productive employment and decent work for all women and men, including for young people and persons with disabilities, and equal pay for work of equal value, and Target 8.6, by 2020, substantially reduce the proportion of youth not in employment, education, or training (NEET).

Official indicators have been developed for the above Targets (UN 2017), and their progress is tracked on the Sustainable Development Knowledge Platform <https://sustainabledevelopment.un.org/>. They cover average hourly earnings, unemployment rates, and the proportion of youth who are not NEETs.

Labor productivity and unemployment rates are both used as measures of progress toward achievement of the eighth SDG. The Report of the UN Secretary General in July 2017 (UN Economic and Social Council 2017) stated that, with regard to Goal 8, labor productivity globally has slowed from an average annual rate of 2.9% from 2000 to 2008 to 1.9% from 2009 to 2016. The Report also painted a worrying picture regarding unemployment with the global unemployment rate standing at 5.7% in 2016 but with youth unemployment at 12.8%. Women were more likely to be unemployed than men across all age groups. In countries with data, more than 10% of youth were neither in the educational system nor working.

In tackling the challenges of raising productivity and lowering unemployment with a view to achieving Targets 8.5 and 8.6, there are a number of possible actions, from which governments may choose all or a combination of some:

- (a) *Invest more in basic education.* In a study of the effect of worker schooling levels on the productivity of South African industries (Burger and Teal 2014), there were robust results showing that schooling has a substantial direct effect on production and that this effect increases as the education level of workers

increases. This supports the findings that increased educational attainment results in increased labor force participation (Access Economics 2006).

- (b) *Invest in skills development.* Technical and vocational education and training (TVET), whether in formal or nonformal settings, is a critical factor in achieving and maintaining high levels of productivity both in the formal jobs market and the informal one. Equipping poor people with skills and knowledge increases their chances of employment but also enhances their contribution to productivity and growth (Marope et al. 2015; Collier et al. undated).
- (c) *Encourage in-company training of employees.* Training, in both technical and soft skills, is invaluable in increasing the productivity of organizations by unlocking potential growth and development (Nda and Yazdanifard 2013). It has a beneficial impact on retention rates, performance levels, and employee productivity which all contribute toward a company's competitive advantage (Sri Divya and Gomathi 2015).
- (d) *Increase female participation in the labor force.* Productivity can be raised and unemployment reduced by enabling women to develop their full labor market potential. This is particularly so in emerging and developing nations where 812 million of the 865 million women worldwide who have the potential to contribute more fully to their national economies live (Elborgh-Woytek et al. 2013). Although female employment rates have increased in most countries, nevertheless, gender employment gaps remain larger than 10% points in 15 of the G20 countries (OECD et al. 2014) and are particularly wide in the Middle East and North Africa (51% points) and in South Asia and Central America (above 35% points) (Elborgh-Woytek et al. 2013).
- (e) *Encourage workers to move from the informal into the formal sector.* In India, for example, the formal sector has the highest level of productivity with total factor productivity being twice as high in firms with more than 250 employees than in those with up to 10 employees (Dougherty et al. 2009). The majority of jobs however are in the informal sector. Young people without junior secondary schooling or who have been trained through a traditional apprenticeship are less likely than their peers to get into formal employment and therefore less likely to benefit from on-the-job training which is carried out mostly by larger, formal sector employers (Adams et al. 2013; EC 2009; Dar et al. 2017; Lee 2016).
- (f) *Encourage geographic mobility.* An analysis of the OECD Labour Force Survey data for 1995–2005 showed that migration rates were twice as high across 15 member states of the European Union than migration was between Indian states. Developments since then, such as the European Qualifications Framework, have further encouraged migration through mutual recognition of qualifications. When labor is highly immobile, as in India, this acts as an impediment to the reallocation of human resources to where they are most needed and best deployed (Dougherty et al. 2009). On the other hand, a mobile labor force will seek to avoid unemployment by relocating to where the jobs are.
- (g) *Encourage labor mobility between occupations and sectors.* Better skills assessment, skills recognition, and retraining strategies for job-seekers help workers to avoid unemployment through being better able to respond to changing demands

for skills in the labor market, as particular economic sectors grow or retract and new technology is introduced (OECD et al. 2016).

## The Added Value of Careers Guidance

While a battery of initiatives will be needed to work on these seven actions, one which should not be overlooked is career-long guidance services, starting in school, continuing through formal and nonformal education and during periods of employment and unemployment, and not finishing until retirement at the end of a person's working life. The OECD defines career development services as services intended to assist individuals, of any age and at any point throughout their lives to make educational, training, and occupational choices and to manage their careers. The relationship between SDG 8 and careers guidance is one of mutual benefit. Careers guidance can be both a direct asset toward achieving the goal and reinforcing the impact of other efforts; the goal itself can draw attention to the importance of good-quality career services and shine a light on an underexploited tool. It could be said that without good careers guidance services, other efforts to achieve SDG 8 may be sub-optimal.

When careers services for learners and for those in work are effective, it has the potential to reduce the costs to both the individual and society of poor careers choices. These include costs of course delivery, time spent on an inappropriate course, and poor productivity in an inappropriate work role (OECD 2004). It should also help to smooth and shorten the process of transition from education to employment and from one job to another. Education and career choices are too important to be the result of ill-informed advice from peers, which is commonly the case in, for example, agrarian societies in Nigeria (Oyinloye 2016).

Taking each of the above seven actions in turn, the contribution of good-quality careers guidance becomes evident.

## Careers Guidance During Basic Education

Careers education in schools is the delivery of learning about careers as part of the curriculum (House of Commons 2017) and is ideally incorporated within good basic education. It aims to help young people to understand themselves and the influences upon them while investigating opportunities in learning and work and making and adjusting plans to manage change and transition (Hutchinson 2013). It enhances general education, gives young people direction and motivation, and opens up the world of work to them beyond their own limited experience and family environment. Careers guidance enables young people to get the best return they can on the basic education they have received and is associated with higher levels of academic achievement (Rice et al. 2015). Careers services are particularly important for the less qualified, the economically disfavored, and other groups in need of support for socioeconomic integrations, such as migrants and refugees (Cedefop 2016).

Starting careers education early helps young people to navigate the proliferation of choices and options offered by the 14–19 education and training system and the

labor market (Acquah et al. 2016 in Moote and Archer 2017). But in this information age it is more important that careers education develop students' motivation and competence rather than providing them with information about different professions. It needs to alleviate the doubts and insecurities that young people go through in choosing their future occupation (Hårle and Lezcano 2016). While it is recommended that careers education starts early for all students (OECD 2004), those who are most at risk of early leaving or are likely to have difficulty transiting to the labor market may require additional support. Schools need to have systems in place for identifying these students and for providing them with extra support from the start of secondary schooling (Rice et al. 2015).

What is clear is that careers education should not be at the discretion of the student as this can reinforce patterns of unequal participation, leading to young people's aspirations and educational and occupational choices being constrained by ethnicity, gender, and social class (Moote and Archer 2017). All young people need access to professional support. While the need for qualified careers advisers and strong links between schools and employers are often stressed, research shows that teachers are the main providers of careers education and need to be at the heart of any long-term strategy for improving careers support (Moote and Archer 2017).

Careers guidance therefore needs to be embedded within basic education, giving it relevance, optimizing its impact, and broadening the aspirations of young people. This can be achieved by using a framework to incorporate careers, employability, and enterprise education into the curriculum at different stages (CDI 2015).

### **Careers Guidance for Progression from TVET into Employment**

Young people developing skills through TVET are generally doing so in order to make themselves marketable to employers and to transition within the shortest space of time after graduation into a significant job which offers security and wages above those of unskilled workers. These objectives will be the same whether a young person has followed the path of mainstream education prior to embarking on a TVET course or whether the young person has arrived at a TVET course having received intermittent formal education and spent periods of time in unskilled work or unemployment. For both cases, there is strong evidence that careers guidance interventions can have a positive impact on their progression and are more likely to be effective if they are provided timeously and by trained professionals (Neary et al. 2015). Effective careers guidance at this stage helps to channel more young people into work for which they have been trained, increases the likelihood of them finding jobs in the formal economy, combats de-skilling which occurs during long periods of unemployment, and maximizes the return on investment made by them and by the state. Employment results achieved by the Underprivileged Children's Education Programme in Bangladesh are evidence of the benefits of including employment support to young people during TVET programs (<http://www.ucepb.org>).

Careers guidance should not be something which is offered just at the conclusion of a training program. A combination of skills tasters, periods of work experience, employability skills, and one-to-one support should run throughout a training

program, building motivation and job search skills (McCrone et al. 2013). Research in the USA has shown that job-seekers who participated in job search interventions were 2.67 times more likely to be successful than job-seekers who did not participate in such programs. The chances of success were highest for those in programs which included teaching job search skills, improving self-presentation, boosting self-confidence, encouraging pro-activity, promoting goal setting, and enlisting social support (Liu et al. 2014). For TVET students, a combination of skill development and motivation enhancement is most effective.

Careers professionals can help to resolve the persistent mismatch, particularly severe in low and middle income of the supply of appropriately skilled workers for available jobs.

### **Careers Guidance for Adult Workers and Learners**

Liu et al. (2014) found job search interventions less effective for middle-aged job-seekers. Unfortunately, frequent periods of unemployment and irregular careers are increasing, particularly for individuals in mid-career. Career guidance has the potential to support learning for career and labor market transitions, provided the particular requirements of adult workers are taken into account (CEDEFOP 2014a).

Workers already in employment rarely have access to government programs, and so their career development needs are not addressed. As CEDEFOP (2008 p. 108) points out “. . .while employers tend to focus their career development effort on what they identify as ‘talent’ groups – managers, future leaders, people with scarce skills (all groups that are in high demand in the labour market) – governments have understandably tended to focus their efforts on people who are unemployed or economically inactive for some reason (e.g., have a disability), or those in employment who have low skills or are disadvantaged in the labour market.” As a result the career development of the bulk of the workforce is largely ignored.

It is critical for the sustainability of employment initiatives, for improved productivity levels, and for developing resilience to labor market changes and the threat of unemployment that the business and economic case for addressing the career development of people in employment is made. It requires career guidance professionals to help people acquire the labor market knowledge and career management skills that they require and to build their social capital. It is often not clear to people in employment that they need career development or that it will benefit them and, as a result, few are willing to pay for it themselves.

Individual employers alone cannot be relied on to provide the careers information which employees need, as the impartiality of their advice may be compromised by their firm’s interests. However, employer input to careers information is important and can come from employer associations, from chambers (British Chambers of Commerce 2016), and from state-run services. Reform of information systems will support careers guidance reforms.

To improve productivity and to counter unemployment, governments require strategies for providing career development support to the majority of the employed workforce.

### **Careers Guidance to Combat the Gender Gap**

Using career guidance to raise the level of participation of women in the workforce faces a number of challenges (Ofsted 2011). From an early age, the majority of girls hold conventional, stereotypical views about jobs for men and women. They retain those views throughout their schooling despite being taught about equality of opportunity, and most girls choose careers along stereotypical lines. Many have limited knowledge and understanding of how choices about courses and careers influence pay and progression routes, and so their success in education does not translate into success in terms of long-term career status and pay. Gender stereotypes affect girls' educational choices from the first time subject choice is required and are particularly strong among girls at the bottom of grade distribution. Girls who are performing well at school are more likely, like boys, to follow their abilities and interests and not succumb to gender pressure (Favara 2012).

Girls with poor educational outcomes are more vulnerable to pressure. Feedback from employers (Ofsted 2011) suggests that confidence is indeed key for girls to make non-stereotypical choices. Employers emphasized the need to extend job interview practice and develop presentational skills. Further suggestions included providing earlier experience of work in a wider range of roles to enable students to make better-informed course choices, increasing the number of role models and mentors visiting schools, and promoting local case studies of young women who have moved beyond stereotypical routes. Websites such as "Career Girls" at <https://www.careergirls.org> can also be used to show successful women in non-stereotypical roles and to explore options.

Innovative careers services with professional staff trained to identify and work with girls who are under pressure to conform to stereotypical subject and career choices could be instrumental in raising the number of women in the workforce and their productivity (Welde et al. 2016).

### **Careers Guidance Toward Formal Employment**

Employment in the informal labor market is generally not a positive choice but rather a fall-back position when efforts to get formal employment have failed. For workers in countries with large informal economies, it is not only where they are most likely to get employment but also where the majority of new jobs are being created. Workers in the informal sector are likely to be less well-educated than those in the public, salaried sector which is where many of the formal sector jobs are in developing countries. Workers in the informal sector are also more likely to come from rural areas where there is less access to training opportunities (Arunatilake and Jayawardena 2010). An inclusive careers guidance system must give workers in the informal sector equal access to its services and, in the absence of formal sector jobs, prepare young people for the reality of informal work.

Although not everyone enters the informal sector out of necessity, in the case of entrepreneurs, informal entrepreneurship is more likely to be conducted by people in lower-income groups, women, those with lower educational qualifications, and those not formally working (Williams 2014). Although some may choose the informal

sector because it offers them better opportunities of upward mobility, others are there because they have no alternative and members of vulnerable groups are more likely to become informally employed during economic downturns (Slonimczyk 2014). The profiles of these workers match those who are least likely to have access to careers guidance.

Introducing careers education into basic education and providing careers guidance and employment services for all school-leavers and people of working age raise awareness of the choices available and helps people to take steps to equip themselves for jobs in the formal sector. Introducing government provision of careers guidance for all must however be seen to be for the public good rather than an effort to support disadvantaged groups (Slonimczyk 2014).

Having workers reluctantly entering into informal employment while employers in many countries are experiencing skills shortages suggests a serious mismatch. As described above, if careers guidance starts early in the school system and awareness of the world of work is built up, then it is more likely that young people will make informed choices which match the needs of the formal sector. Similarly, careers guidance for adults can help to manage their education, training, and careers in ways which guide them toward, and keep them in, formal sector employment.

### **Careers Guidance to Support Geographic Mobility**

The ability of workers to move location in order to find employment is strongly predicated on their knowledge of the labor market. The risk of moving away from their own community to another part of the country or, indeed, to another country must be mitigated by a high level of certainty of finding decent work there. Careers guidance acts as an interlocutor between labor market information (data) which may not always be publicly available or user-friendly, intelligence (the analysis of that data), and job-seekers (LSC 2004).

Careers professionals have to be confident that the labor market information they are using to give confidence to would-be emigrants is valid, objective, and of high quality (LSC 2004). The ability to interpret LMI is a key skill for them and is expected by clients. A 5-year longitudinal case study carried out by Warwick Institute for Employment Research from 2003 to 2008 consistently identified access to LMI as highly valued by adult job-seekers (Bimrose 2012).

There is evidence that young people can become overwhelmed by the amount of information on choices and, as a result, many restrict themselves to a very narrow range of possibilities in order to reduce the anxiety and stress. For young people to genuinely take on board LMI, something more than signposting to information sources is needed, which is where the careers professional adds value (IER 2006).

### **Careers Guidance to Support Mobility Between Occupations and Sectors**

Occupational mobility – the ability of workers to move across a set of jobs – is increasingly important. As it is now unlikely that workers can choose a job for life, it becomes necessary to obtain useful transferable skills which can be deployed in a number of sectors and jobs while applying an understanding of labor market trends.

Careers professionals can help prepare job-seekers for the future by raising their awareness of the skills and attitudes they already possess and those they need to gain in order to be successful, no matter what jobs remain and what new work emerges (LSC 2004). Given that the majority of new work will emerge from the informal economy, careers professionals cannot focus exclusively on formal sector employment. They must also be able to help lower paid workers who (along with the highest paid workers) have the highest probability of leaving their occupations (Groes et al. 2014). They are most likely to switch to occupations with low average wages and to do so when the relative productivity of their original occupation rises, suggesting that new technology and processes may have a disproportionate impact on them. Careers professional should be able to prevent a downward spiral by ensuring that they are aware of all opportunities available to them across sectors and across training programs and of how their transferable skills can be presented as an asset to employers.

---

## Careers Guidance for the Twenty-First Century

If careers guidance systems are to play a role in raising productivity levels and reducing unemployment, so that SDG 8 can be achieved, then it is particularly important that they are designed to meet three objectives:

### A Careers Service for Everyone: Learners, Job-Seekers, and Workers

In the volatile labor market we have come to expect, workers will change job frequently and move in and out of education and training, and the content of their jobs will change progressively. All of this points to a need for, if not “lifelong” then at least “career-long,” guidance services which can be used not only by school-leavers and the unemployed but also by workers in jobs which are disappearing when the economy is restructuring, before they become redundant (Hooley et al. 2015).

The use of ICT-enabled services, such as South Korea’s CareerNet ([www.career.go.kr/cnet/front/eng/eng\\_home.do](http://www.career.go.kr/cnet/front/eng/eng_home.do)), or exploiting social media as in Scotland’s Online Careers Q&A (<https://www.glasgowchamberofcommerce.com/news-media/news/2017/september/27/online-careers-qa-levelling-careers-advice-playing-field/>) makes careers guidance more accessible for workers, learners, and the unemployed.

While delivering human capital gains for individuals, career guidance will also contribute to wider economic gains. These will result not only from building resistance to becoming unemployed but also by ensuring faster transitions out of periods of unemployment (Hooley and Dodd 2015). Careers services can also bring benefits to workers who are in employment but who wish to develop their careers through taking on increased levels of responsibility and delivering higher productivity.

## Close the Inequality Gap

The OECD (2004) argues that a broader market in career guidance could be complementary to public provision and that governments should actively seek to stimulate the growth of nongovernmental careers provision. While doing so, it should regulate the quality of that market to protect the public interest and to build consumer confidence, and interventions from government should address the areas that the private market does not address.

However, it is important to recognize the limitations of private sector markets in careers guidance. Such markets offer greatest access to those who can pay rather than those who need it most. If not balanced by a universal entitlement, it potentially strengthens the capacity of those who can afford to pay to maintain their positional advantage (Access Economics 2006). As we have seen, those most in need of careers guidance are often the most reluctant to access it and least likely to pay for it.

If governments accept that careers guidance primarily serves a public rather than a private function (Bergmo-Prvulovic 2014), then it becomes a higher priority for state funding.

While government funding is essential for the effective functioning of a careers guidance system, this does not necessarily mean that government has to pay for all services, nor does it mean that all individuals should be entitled to the same services. There are strong arguments related to social equity, which suggest that there should be additional targeted services for some groups to address various forms of disadvantage, which points to the need for a variable market in careers guidance (Hooley et al. 2015).

In all countries, but particularly those where recruitment practices depend heavily on social networks, careers guidance can give individuals with weak social capital access to information and contacts that are beyond their own immediate family and friends. It helps them to build social capital, provides access to mentoring, and gives insights on how to penetrate career networks (Hooley and Dodd 2015).

## Contribute to Socioeconomic Goals

Good quality, objective careers guidance can reduce the risk of unemployment for individuals, decrease the possibility of underemployment, and increase the probability of better job satisfaction and higher pay for society as a whole that creates downward pressure on the level of unemployment. It therefore contributes to the two socioeconomic goals with which this chapter is concerned: higher labor force participation and higher productivity (Access Economics 2006).

Focusing in particular on unemployment, informed decision-making arising from good-quality careers guidance can help to address the two main forms. The first of these is frictional unemployment. This is when there are job vacancies which match the number and skills of unemployed workers, but there is a lack of adequate information available to them so either the right workers are not filling the right vacancies or it is taking longer to fill vacancies with the right people.

Careers guidance services have a role to play in addressing that lack of information by sourcing reliable information and ensuring it is disseminated through channels which unemployed people can access.

The second is structural unemployment. This occurs when workers' skills are not a good match for the jobs available, possibly due to outdated skill sets and the pace of change. Careers guidance which identifies current or imminent skills shortage and encourages potential workers to gain skills can alleviate structural unemployment (Access Economics 2006).

These are not the only challenges to which careers guidance can contribute however. Under the three categories of economic, educational, and social, careers guidance has a positive impact on a wide range of policy areas including employee engagement, labor market flexibility/flexicurity, reducing early school-leaving, active aging, and many others (Hooley et al. 2015).

---

## Applying Quality Measures to Careers Guidance

With the above three objectives in mind, consideration needs to be given to the design of a careers guidance system, the features it should have, and the criteria against which it should be measured.

It is evident that countries should aspire to having a career-long guidance system which is coherent and coordinated between its different elements (Hooley et al. 2015). It will need to coordinate services provided through the education system with those provided through public employment services (Morena da Fonseca 2015 in Hooley et al. 2015) and those available in the private sector.

For school-age students, a good careers guidance system will mean that:

- Every school and college has an embedded program of careers education and guidance.
- Every pupil has access to good-quality information about future study options and labor market opportunities.
- Opportunities for advice and support are tailored to the needs of each pupil.
- All curriculum learning is linked to careers and the relevance of STEM subjects highlighted.
- Every pupil has multiple opportunities to learn from employers about work, employment, and the skills that are valued in the workplace.
- Every pupil has firsthand experience of the workplace.
- All pupils understand the full range of learning opportunities available.
- Every pupil has opportunities for guidance whenever significant study or career choices are being made (Summarized from Gatsby 2014).

In an ideal world, every school would be able to provide all of these features. Realistically, in most developing countries, resources will have to be targeted. In that case, the last of the above bullet points is particularly critical as it highlights the

necessity for guidance to be available when choices have to be made which can have career-altering consequences.

A careers service for adults, on the other hand, may be expected to focus more on:

- (i) Delivery: Are people aware of the service and do they know how to engage with it, do they have access to the information they need, and do they have support in using that information to explore options and make choices?
- (ii) Management: Is service delivery planned and maintained, is the competence of staff and the level of support sufficient, and is there continuous quality improvement based on feedback from users? (CEDEFOP 2008)

For adults, the most critical issue is usually to reduce periods of unemployment and to prevent loss of income and a decrease in quality of life. In situations of limited resources, the priority must therefore be to focus on guidance for the unemployed, for those in insecure or hazardous employment, and for the underemployed.

Careers services can be instrumental in bringing young people who left school early back into the labor market. For them and for adults, the most positive results come when there are tailored approaches for individuals, during which skills, attitudes, and preferences are assessed and discussed. Such an individualized approach is more adaptable to highly irregular career paths and has a favorable, long-term, cost-benefit relationship (Cedefop 2014b). In the case of university graduates who exercise a high degree of self-management of their career in most countries, research shows that career self-management measures, particularly networking, are indirectly related to employment success (Okay-Somerville and Scholarios 2015) suggesting that students who are proactive are more likely to meet with success in the job market.

The effectiveness or otherwise of careers guidance can be judged at the level of the education system, at the level of the school, and at the level of the individual student with separate criteria for each (Rice et al. 2015). In all cases, the potential for online tools and social media must be employed for a blend of multichannel delivery which includes face-to-face services and telephone contact but does not depend entirely on them. Not only do the users need skills to navigate a modern careers service, but the careers staff need adequate guidance, information, and skills in communication technology and the effective use of LMI (Cedefop 2016).

---

## Conclusion

Without effective careers guidance, reforms SDG8, particularly the Targets related to employment, will be much more difficult to achieve. Increased investment in careers guidance services is merited because of the enhancing role which careers guidance can play in seven types of action which governments can take to raise productivity and lower unemployment. Without effective careers guidance, governments run the risk that these actions will be sub-optimal and the resources devoted to them underexploited.

To be effective, careers guidance services must respond to the needs of today's workers as they navigate multiple career pathways and wide-ranging education and training offerings. They must deliver career-long guidance to learners, job-seekers, workers in employment, and the self-employed. This will require a blend of ICT-enabled services and targeted face-to-face interventions. As a tool for closing the inequality and gender gaps, careers education needs to start with young people who are still in primary school, to combat choice-constraining stereotyping and limited social networks.

## Abstract

Training levies are an important tool for providing a pool of funding which can contribute to the advancement of human capital. The potential of this type of fiscal instrument is especially important for countries that have unstable public budgets. The review of the existing literature has pointed out that the vast majority of the research work undertaken has followed a qualitative approach.

The content of this chapter is based on a forthcoming report published by UNESCO. The relevant research was carried out under UNESCO's service contract No 4500282170. In this respect, the assistance of Borhene Chakroun, the UNESCO project office for this study, is gratefully acknowledged.

This is because of a lack of the statistical data required to conduct empirical analysis. In order to contribute to the existing body of knowledge, we propose a conceptual framework for calculating the amount of revenue which could potentially be raised by a training levy. This methodology can be applied to forecast the amount of revenue that could be raised by means of a training levy. However, there are other factors that could influence the final outcome achieved by the relevant levy, such as the economic and institutional context and the general conditions of the labor market.

## Introduction

The international community has set an ambitious 2030 Agenda for Sustainable Development. The Agenda calls for an integrated approach to development. Education and training are central to the achievement of the 2030 Agenda. The vision for education is fully captured by Sustainable Development Goal (SDG) 4, “Ensure inclusive and equitable quality education and promote lifelong learning opportunities for all,” although many other SDGs have a reference to education and training in their targets or indicators as well.

In this context, Education 2030 devotes considerable attention to (i) technical and vocational skills development, specifically regarding access to affordable quality technical and vocational education and training (TVET); (ii) acquisition of technical and vocational skills for employment, decent work, and entrepreneurship; and (iii) elimination of gender disparity and ensuring access for the vulnerable. Bearing in mind these initiatives, TVET is expected to address multiple demands of an economic, social, and environmental nature by helping young people and adults to develop the skills they need for employment, decent work, and entrepreneurship; promoting equitable, inclusive, and sustainable economic growth; and supporting transitions to green economies and environmental sustainability.

In order to achieve these objectives, mobilizing the means for implementing the technical and vocational skills agenda is crucial. The role of the private sector is fundamental in this context. The Third International Congress on TVET organized in Shanghai in 2012 considered that “Scaling up existing models of TVET provision to include more young people and adults is not the solution it also involves a paradigm shift that includes the active involvement of relevant actors, such as industry” (UNESCO 2012).

In this chapter, we present the main findings of the review of literature on existing funding methods of technical and vocational education and training (TVET). UNESCO sees TVET as “comprising education, training and skills development relating to a wide range of occupational fields, production, services and livelihoods. TVET, as part of lifelong learning, can take place at secondary, post-secondary and tertiary levels and includes work-based learning and continuing training and

professional development which may lead to qualifications. TVET also includes a wide range of skills development opportunities attuned to national and local contexts” (UNESCO 2016).

Second, we elaborate on a methodology to estimate the amount of private sector resources which could be mobilized by means of a training levy for financing TVET in a given country. It needs to be clarified that resources that are spent by firms to train their own workers, the cost of apprenticeships to students, or any other resources that come from donations from private firms are excluded from our analysis.

The literature review covers a broad scope of reports in order to identify clearly the determinants of the revenue which could be raised by means of training levies. We identify three main types of scheme:

- Revenue-generating schemes
- Levy-subsidies schemes
- Levy-exemption schemes

An important issue which has been encountered while reviewing the existing body of knowledge and developing the methodology has been the absence of previous contributions which conduct a similar exercise to the current project. In this context, UNESCO (forthcoming) goes beyond the existing literature since it discusses the effectiveness of several training levies and proposes a method to quantify its potential.

---

## Training Levies: Notion and Typology

As defined by UNEVOC/NCVER (2009), a training levy is a tax imposed on employers with a view to financing training activities. In other words, training levies are a means to collect funds from employers. The money collected is then invested in the industry in the form of training. The aim is twofold: to support employers that train their workforce and to promote skills development.

An important challenge that policy-makers need to confront is the under-provision of adult learning as a result of market failure or credit constraints (Hoeckel 2008). In this context, where quite often insufficient efforts are being made by the private sector, public intervention is needed to ensure that the necessary amount of lifelong learning takes place. In general terms, training levies are important tools to provide a pool of funding which could contribute to the advancement of human capital (Dunbar 2013). The potential of this type of fiscal instrument is quite important for all economies. However, training levies are known not to be perfectly suited to contexts where there is a large informal economy. This is so since in the mentioned context, they usually benefit only a fraction of the overall private sector, formal and informal, regardless of the degree of development of their economy. The necessity for public sector involvement has been acknowledged by the existing body of literature. For example, Falch and Oosterbeek (2011) analyze

the experience of several European countries in financing lifelong learning. In particular, Falch and Oosterbeek (op.cit.) highlight that in England, making training available at low cost has not been as effective as was expected in generating take-up from low-skilled workers. This contribution also suggests that “deadweight” losses were identified in Switzerland and the Netherlands. In both countries, a voucher system financed training which would have taken place without the system in half of the cases under consideration. The age tax deductions implemented in the Netherlands contributed to the postponement of training activities, since the scheme is not designed to target specific groups, such as low-skilled workers.

Training levies also create a means for undereducated members of society to continue to train and build up their human capital. This could be particularly relevant for the informal sector, which tends to employ workers with low levels of education. In those cases, resources from a training fund could be used to support training for the informal sector, although it is hard to actually mobilize funds from the informal sector itself. Training levies provide a useful tool in a context of market failure and the under-provision of continuing education. Specifically, Hoeckel (2008) and Falch and Oosterbeek (2011) argue that in addition to the benefits that a particular employer receives from having a well-trained work force, training provides wider benefits to the whole economy. Examples of these positive externalities are the dissemination of knowledge across the national employment pool (Falch and Oosterbeek 2011) and greater abilities to innovate (Smith 2001). However, employers might fail to account for these spillover benefits and only consider the increased productivity of their own workforce when assessing the potential benefits of providing additional training.

Despite the potential of training levies to contribute to skills development, the existing literature has also pointed to some distortions that it could create. In particular, levies could raise the cost of employing people, leading employers to either reduce the number of workers they employ or compensate for the additional cost by paying lower wages (Johanson 2009). This report also highlights how unequal access to training schemes “breeds resentment” and how this compromises the principle of “benefit taxation.” Ziderman (2002) also emphasizes that there can be pressure on governments to use training levy funds in areas other than training, particularly when they suffer from serious budget constraints. This diversion of funds would also distort the benefit tax aspect of a training levy.

Another issue that policy-makers need to consider when establishing a training levy is how its effects could differ across sectors and between different-sized companies. A key message from the existing literature is that smaller companies tend not to take up the opportunity to send staff for training. A major reason is that this creates a short-term need to replace the staff while they are attending the training, which can be difficult and expensive. Additionally, they may have cash flow constraints that make it impossible to pay the cost of training upfront (Dickinson and Marsden 2013), even if it will subsequently be refunded. Thus, under certain funding mechanisms, small companies pay the levy but are unable to take advantage of the scheme, as discussed by Johanson (2009). Conversely larger companies tend to use the training opportunities. This inequality in uptake of the

training funded by levies effectively leads to a redistribution of resources from smaller to larger companies and to the exclusion of informal firms.

Policy-makers should also bear in mind administration costs, which if large could dampen the efficiency of a scheme. Some countries, such as Denmark, have managed to keep the costs low, but many less-developed countries with weak organizational infrastructure find that the costs reach excessive levels. This was true, for example, for Kenya and Tanzania. Moreover, large and inefficient bureaucratic systems mean that companies that try to access the funds also incur expenses, even if they are opportunity costs rather than direct costs. This top-heavy inefficiency has been one of the key problems of the Hungarian system of training levies. As Johanson (2009) highlighted, many Hungarian companies believe that the government and trade unions are excessively involved in the actual training provided. This has eroded private sector confidence in the scheme.

For a better understanding of the notion of training levy, a typology to categorize them is provided as follows. In general terms, the amount of revenue which could be raised for training purposes by means of a training levy will mainly depend on the (%) rate at which the levy is set and the base to which the rate is applied, such as payroll (headcount or wage bill), turnover, output, contract value, product value, production costs, or profits. More specifically, three different types of training levies using payroll-based funding can be distinguished:

- Revenue-generating schemes base their funding on a fixed-rate levy per working hour or per employee. The revenue is generally earmarked for regional or sectoral training programs. This type of system is used in Brazil.
- Levy-subsidy schemes (also called levy-grant and reimbursement schemes) use payroll contributions that are centrally collected from enterprises and distributed in the form of grants to set against the cost of training. This strategy has been used in Denmark and Singapore.
- Levy-exemption schemes allow companies to offset the cost of the training they provide or purchase against their tax liabilities. This system has been used in Quebec, Tunisia, and France.

Based on previous evidence gathered by UNESCO, Table 1 provides an overview of the bases used by past and present schemes. It shows a clear predominance of financing through a payroll tax.

UNESCO (2010) reports that assessing the potential of training levies has proved a challenging task. Revenue-generating schemes are arguably the most reliable in generating funding for training in countries where there is a persistent shortage of funding available to promote skills development. They can also greatly reduce the cost to governments of training provision. For example, in Brazil a major body providing commercial training (Serviço Nacional de Aprendizagem Comercial, SENAC) receives 80% of its revenue through levy-based funds, as Gasskov (2002) reported. Johanson (2009) highlights that SENAI (Serviço Nacional de Aprendizagem Industrial), the Brazilian industrial training scheme, has failed to increase participation rates, as has happened for other revenue-generating schemes. This is probably because it

**Table 1** Overview of training funds by type of levy base

Levy base	Country
Company profit tax	Jordan (canceled), Egypt (suspended)
Levy on foreign workers	Bahrain, Marshall Islands
Payroll	Belgium, Bulgaria, Cyprus, France, Greece, Hungary, Italy, Ireland, Netherland, Poland, Romania, Spain, United Kingdom, Algeria, Morocco, Tunisia, Singapore, Barbados, Bolivia, Brazil (for SENAI, SENAC, and SENAT), Colombia, Costa Rica, Dominican Republic, Ecuador, El Salvador, Guatemala, Honduras, Jamaica, Nicaragua, Paraguay, Peru, Uruguay, Venezuela, Benin, Burkina Faso, Central Africa, Chad, Côte d'Ivoire, Guinea, Malawi, Mali, Mauritania, Mauritius, Namibia, Nigeria, Senegal, South Africa, Tanzania, Togo, Zimbabwe

Social security fund	Panama

Source: UNESCO (2015a)

does not offer any incentives to employers to provide additional training (see Johanson 2009 for further details on the Brazilian training funds). Although they have considerable potential, a major issue with revenue-generating levy schemes is their administrative and organizational requirements. They tend to create a lot of bureaucracy. They are typically centralized, and this can lead to inefficiencies. Levy-exemption schemes allow individual firms to select training courses that have clear relevance for their staff, but revenue-generating schemes normally use centrally mandated training bodies and courses, as the Brazilian experience revealed. As reported in Muller and Behringer (2012), previous research suggests that one benefit of implementing a levy-subsidy scheme is that the allocations of grants do not have to provide more benefit to those who have contributed more to the fund, thus this system can be far more redistributive than levy-exemption schemes. There have been successful examples in Denmark and Singapore (Gasskov 2002; Dickinson and Marsden 2013). It is also important to consider “deadweight losses.” To illustrate the importance of minimizing “deadweight losses,” we focus on the United Kingdom. Muller and Behringer (2012) reported that the vast majority of participants used the scheme to provide training that they had already planned on carrying out and would have done even if the scheme had not been in place.

There is no firm prescription for the best design of a training levy. However, our comparison of the different methods suggests that levy-exemption schemes could be the most attractive, since they allow firms to decide what training courses their employees should attend, instead of training being allocated by a central body. However, the existing literature has acknowledged that revenue-generating schemes could be more suitable for developing countries, where opportunities for education are often scarce. The core reason is that this type of scheme has proved to be the most effective way of raising resources.

## Overview of Methodologies for Analyzing TVET Funding Schemes

The vast majority of the existing literature analyzes current or planned TVET funding schemes from a qualitative perspective (Gasskov 2002; Muya et al. 2007; CEDEFOP 2009). Much of the qualitative research carried out takes the form of interviews with local experts such as policy-makers and individuals directly affected by the different training levy schemes. The purpose of these interviews is to shed light on the problems encountered by schemes and on the areas where they have succeeded. In those situations in which data are not available, an alternative approach is to conduct a survey which allows conclusions to be drawn about the efficiency and effectiveness of the schemes based on the respondents' answers.

Moreover, Torres (2012) developed a theoretical framework for education funding. He then applied it to the OECD countries, seeking a better understanding of how funding schemes should operate. The report concluded that there is no ideal system, and the most suitable approach will differ from country to country, since societal attitudes to income redistribution, tax compliance, and the level of underinvestment in education and lifelong learning tend to affect the suitability of the different funding Schemes. Additionally, Hofstetter (2014) conducted a literature review to gather robust evidence on existing TVET schemes in other countries in order to provide some insights into the potential effects of the implementation of a similar system in Nepal. This study identified corruption and the lack of transparency in the system as the main impediments to the success of the Nepal Skills Development Project (SDP).

As was explained earlier, the existing body of literature analyzing the impact of training levies on economies is limited because of the lack of statistical data. Our review of this knowledge revealed that most researchers used a basic quantitative analysis in conjunction with a qualitative approach in order to provide robust results. The statistics typically analyzed are the amounts contributed by companies and the increase in uptake of training schemes. A key reference in this field is CEDEFOP (2009). The CEDEFOP analysis assesses the strength of the different funding methods, with regard to their effectiveness (the extent to which the policy achieves its objectives), efficiency (reasonableness of their costs, user-friendliness, and the administrative burden), and their impact (how much they avoid deadweight loss). A key point of the analysis undertaken by CEDEFOP (2009) is that levels of private investment and participation in TVET were used as dependent variables. However, because of the lack of reliable and available data, composite statistics were used. Neither private investment nor participation in TVET could be measured directly. In order to bypass this problem, the researchers used data from Eurostat's Continuing Vocational Training Survey (CVTS). In particular, this data source provided data on (i) expenditure on educational institutions from private sources, (ii) cost of CVT sources as a percentage of total labor cost, (iii) percentage of employees participating in CVT courses, and (iv) number of hours in CVT courses per employee. Furthermore, this analysis also includes some focus-independent variables. These variables were split into two categories: (i) TVET cost-sharing mechanisms, which represent the method and source through which funding for TVET

schemes is made available to participants, including (among other methods) tax incentives, training funds, subsidies mechanisms, and loans, and (ii) TVET cost-sharing regulatory instruments, which are general rules of the schemes consisting of payback clauses and training leave. In this context the cost-sharing mechanism refers to a situation where the funding for TVET is shared between public organizations and private companies. Contextual variables are also included, i.e., public spending on education, certainty of training investment, technological progress, and labor market equilibrium. Subsequently, some econometric analysis was applied to an unbalanced panel of the 27 EU member states across the period from 1999 to 2006. The lack of reliable data on TVET schemes is the main reason due to which this study focused on the effects of the contextual factors on the dependent and independent variables. The contextual factors affected both the levels of investment and participation in TVET schemes and the mechanism and regulation. This study found that although all the contextual factors have an impact on investments and participation in VET, technological progress is the element that has had the greatest impact.

---

## **Methodology to Estimate Potential Resources for Skills Development**

This section presents a detailed description of the methodology that has been developed to estimate the potential of private sector resources for skills development that could be mobilized by means of a levy. First, we propose a proxy for the levy base. Then we describe the main features of the levy rate. Subsequently, we elaborate on a conceptual framework to estimate the potential revenues that could be raised. Further discussion of our approach is also provided to identify the advantages and limitations of the proposed methodology.

### **Design of a Proxy for the Levy Base**

The empirical evidence gathered for the purpose of the previous section has revealed that the vast majority of the schemes currently in operation are designed to raise funds through taxes that are applied to the payroll (see Table 1 for further details). Ideally, it would be useful to distinguish several broad sectors and use the total payroll for a sector as a proxy for the levy base. This could improve the accuracy of the results, since training levies might present a different behavior in each sector. If that is the case, eventually, aggregated totals would be calculated.

However, official statistics that track the evolution of the payroll through time are unlikely to be available, since some of its components may be difficult to monitor. For example, bonuses can be quite volatile – they can be related to worker productivity, profitability, or other indicators which can vary substantially between two successive periods. In this case, we could approximate the base levy by using the gross annual earnings in the economy (or in a sector if there are available data).

In general terms, our proposed proxy for the levy base, total payroll/remuneration, is preferred to other variables such as turnover since that variable could fluctuate dramatically between two successive periods. However, our proposed methodology needs to be flexible enough to use several proxies for the levy base, since not all the training levies are designed in the same form. For example, in Panama social security contributions are the appropriate proxy, while the value of production is relevant for Brazil (see Table 1).

We can anticipate that the inclusion of a variable with an unstable value will not produce significant results from an econometric perspective. Moreover, variables such as the average turnover or profits in a sector could not provide an accurate representation of that particular industry since they are more firm-specific.

In order to provide estimates of the private resources that could be available for training, two sets of data are needed. First some historical data is needed to estimate the relevant parameters. In addition, some forecast data is also needed to build the baseline. If not enough periods of data on the payroll (earnings) are available for analysis, we could produce the required time series by setting the existing observations to grow at the same rate as sector gross value added (GVA). That is, we make the assumption that wages are a constant fraction of value added for any given sector. For transparency a similar rule would be applied to generate the relevant observations for other variables such as social security contributions.

## Identifying Key Features of the Levy Rate

The levy rate is the level at which the tax is set to fund the TVET scheme. This can be considered as the outcome of a social dialogue, public-private partnership (PPP), or policy decision. The “buy-in” indicator is the spending on training that is financed. Figures reported in the existing literature reveal that the rates across countries and even across sectors are quite heterogeneous. In general terms, the rate applied to payroll is reported to be in the range of 0.1% (Belgium) to 4% (Benin).

In addition, the literature review has revealed that the mean levy rate on payroll in Europe as well as in North Africa is approximately 1%; while Latin America and the Caribbean and sub-Saharan Africa have an average levy on payroll of 2%. Of the countries that apply a levy on payroll, Belgium has set the lowest rate. Focusing on the Belgium case, the Flemish Employment and Vocational Training Service (VDAB) in Belgium is a levy-exemption scheme that caters to 11 different sectors. Flemish employers that invest less than 0.1% of payroll cost in training are subject to a social security contribution of 0.05%. Drawing attention to the African countries, an ambitious scheme is running in Benin, where a 2% levy rate was established, although the rate at which the tax is set is not directly related to a fixed share of the payroll. Other interesting examples are Jordan and Egypt, in which the payroll tax used to be applied to corporation profits. These countries apply a 1% rate, which is paid nationally rather than by one specific industry.

In the case of Latin American countries, two cases should be highlighted. Brazil's SENAR training fund applies a 1% levy on all agricultural goods. The revenues of these

funds are earmarked for rural training schemes. This is a distinctive feature of this scheme. Furthermore, Panama deserves special mention, since its rate is 15%. In Panama, the Instituto Nacional de Formación Profesional y Capacitación para el Desarrollo Humano (INADEH) scheme was introduced in 2006 with the aim of monitoring and implementing programs of vocational and general training as well as managing and distributing public resources allocated for that purpose. The previous training scheme, Instituto Nacional de Formación Profesional (INAFORP), was funded by a payroll levy of 2.7%.

## Theoretical Approach to Estimate Potential Revenues

In general terms, the amount of revenue raised by means of a training levy will depend on two components – the levy rate and the levy base – as shown in formula (1):

$$\text{Revenue raised} = \text{levy base} * \text{levy rate} \quad (1)$$

However, other contributing factors can affect the final outcome. Table 2 focuses on this additional set of explanatory factors.

**Table 2** Explanatory factors of the amount of revenue raised

Factor	Rationale	Relevant variables to categorize each dimension
Economic context	<ul style="list-style-type: none"> <li>Economic contextual factors directly affect the participation of firms in the schemes</li> </ul>	National wealth (gross domestic product – GDP), sectoral value added, productivity, average wages, sectoral employment (number of jobs), etc.
Labor market structure	<ul style="list-style-type: none"> <li>Labor market factors seem to have an impact on TVET (albeit a slight one)</li> <li>Employment rates also affect the levy base since an increase in the proportion of individuals who are participating in income-generating activities will increase the levy base</li> <li>Educational attainment levels of the population also influence the revenue raised. In principle, more skilled workers will be more productive and obtain higher remuneration, which eventually affects the levy base.</li> </ul>	Unemployment rates, labor participation rates, educational attainment level of the population, expenditure on labor market training as percentage of GDP, etc.
Institutional setup	<ul style="list-style-type: none"> <li>Institutional factors such as the size of the informal sector directly affect the outcomes and disbursement of the training funds. The size of the informal sector could also help to explain a low amount of revenue raised.</li> </ul>	Relative weight of the informal economy and the relative weight of the public sector over the total economy

Source: UNESCO (2015b)

Formula (1) can be expanded by including the set of factors described above in order to produce a model where the volume of revenue raised is a function of the levy features – the levy base and the levy rate, the economic context, the setup of the labor market, and the institutional context – as shown in formula (2).

$$Rev = f(LeB, LeR, Eco, Lab, Ins) \quad (2)$$

where *Rev* is revenue raised, *LeB* is the levy base, and *LeR* is the levy rate. *Eco* is a vector which includes those variables that refer to the economic conditions, *Lab* represents a vector which comprises several variables to reflect the structure of the labor market, and *Ins* refers to a vector that captures variables that reflect the institutional context. The sign below a variable indicates the partial derivative of the dependent variable with respect to that variable, that is, the expected direction of the contribution of that variable to revenue raised.

Subsequently, we assume a semilog linear specification of the relationship proposed in Eq. (2) and proceed to estimate Eq. (3):

$$Rev_t = \beta_0 + \beta_1 LeB_t + \beta_2 LeR_t + \beta_3 Eco_t + \beta_4 Lab_t + \beta_5 Ins_t + u_t \quad (3)$$

where the symbols account for the same variables as in Eq. (2), with the exception of  $\beta_0$  which is a constant;  $\beta$  are the estimated parameters, and  $u_t$  is a vector of error white noise process. All the variables are expressed as logarithms, with the exception of those defined as rates. This allows for the interpretation of the parameters as elasticities.

Ideally, we would estimate an econometric model, as shown in Eq. (3), to quantify the contribution of the factors to the actual amount of revenue raised in the past. We can anticipate that the Engle and Granger (1987) cointegration technique will be employed, if the available time series are long enough to produce robust results. The value added of this approach is that cointegration techniques permit us to estimate an equilibrium relationship that describes the behavior of the variables in the long run, along with an error-correction model which explains the dynamics of the variables in the short run. The Engle and Granger (1987) cointegration technique is a two-step procedure. The first step is to estimate the long-run equilibrium relationship by means of ordinary least squares (OLS). Then, the existence of cointegration among the variables is tested by checking the stationarity of the residuals produced by the long-run relationship. In doing so, the augmented Dickey-Fuller test (Dickey and Fuller 1979, 1981) will be applied to examine whether the residuals are  $I(0)$ . In the second step, the short-run dynamics are modeled by estimating a regression in differences, which also includes an error-correction term. The latter variable, which is built as the lagged residuals term of the cointegrating long-run relationship, shows the percentage of disequilibria eliminated between the short-run and the long-run model in each period.

The estimation procedure will follow the “general to specific” modeling strategy (Hendry and Richard 1983). In this we start by estimating a general model where several variables are included, and in subsequent iterations, we eliminate those variables that are not statistically significant until a parsimonious model where all

the variables are significant is reached. However, there is always a risk that the available data is not sufficient to produce robust econometric results. This could happen if there are only a few observations of data. Typically over 30 observations are needed, but this also depends on the stability of the long-run relationship. Indeed, that the literature review identified very few quantitative analyses does suggest that limited data availability may restrict the approaches that can be used. In this case, OLS and simple correlation analysis will be applied.

Subsequently, once the relevant determinants of the amount of revenue raised are identified, we proceed to the estimation of the potential revenues. This stage uses official economic forecast data, such as data published by the International Monetary Fund (IMF), OECD, or the national statistical office, to build a baseline that reflects potential future development of the economy. Then we apply the estimated parameters to three different scenarios – business as usual (BAU), optimistic, and pessimistic – to produce the estimates. A final stage of the procedure is to validate the estimates by checking the residuals. This should show whether the regression error term (actual revenue raised minus model prediction) displays any pattern that might indicate a tendency to bias.

---

## Case Study: Cyprus

This section focuses on the case of Cyprus and use the training levy implemented in the country to illustrate the application of the methodology. Before moving onto the description of the actual estimates, a description of the scheme is provided.

Human Resource Development Authority (HRDA) is the body in charge of managing Cyprus's scheme. HRDA is a semigovernment organization with a tripartite board of directors including government, employer, and trade union representatives. HRDA reports to the government through the competent minister, who according to Regulation 509/2012 is the minister of labor, welfare, and social insurance.

The Cypriot system relies on contributions paid by all employees, with the exception of the self-employed and government workers. By law the Human Resource Development Levy rate cannot exceed 1% of the emoluments paid to each employee. In practice, the levy rate is 0.5% of payroll, with a monthly cap of €4.533 (Regulation 509/2012). Subsequently, HRDA issues grants to employers for approved training as well as allowances to trainees and financial assistance for obtaining training equipment. In general terms, the HRDA subsidizes 80% of the cost of training, although this rises to 100% for "high-priority multicompany training programs."

The training levy is collected by the Social Insurance Department of the Ministry of Labour, Welfare and Social Insurance. Further to the collection of the levy, a commission is paid to the Ministry. This commission has accounted for 0.63–0.73% over the period 2012–14. Cyprus has seen a large increase in the number of benefactors of these grants (growing from 4000 to 54,000 between 1983 and 2005). However, in 2003 only 66% of the total funds at HRDA's disposal went to subsidies (with firms in the construction industry utilizing only 50% of their

contribution). Despite the success of this system, a few limitations need to be mentioned. In particular, the system has not performed as well as expected for low-skilled workers and microenterprises. Both of these categories receive beneficial treatment in the scheme (see also CEDEFOP 2009).

As defined in the HRDA Targets 2015, the mission of the organization “is to create the necessary prerequisites for the planned and systematic training and development of Cyprus’ human resources, at all levels and in all sectors, for meeting the economy’s needs, within the overall state socio-economic policies” (HRDA 2014).

The Authority promotes training by subsidizing 80% of the eligible cost of the programs that enterprises propose, provided the training programs are approved by HRDA. HRDA is the body in charge of managing training funds but is not a training provider. Currently the Authority’s funds come from two different sources: first, the Human Resource Development Levy, which is currently set at 0.5% of payroll, subject to a monthly cap (and as noted above, does not apply to government employees and the self-employed), and second, the European Social Funds (ESF).

An interesting feature of the Cypriot system is its flexibility, which appears to be a key element of its success. The flexibility arises from the fact that HRDA is not a training provider. Instead, training is provided by private institutions, which can adjust rapidly to the changing needs of the economy. Around 150 training institutions are currently operating in the country. Note too that the existing initiatives allow HRDA to finance training abroad. In 2014, HRDA expenditure on human resource development was €21.9 million. Subsidies provided to enterprises accounted for 43.4% of its total expenditure. It should also be noted that although the self-employed are excluded from paying the training levy, this group seem to have shown some interest in contributing so that they can be provided with subsidized training.

For the purpose of this analysis, we focus on the period 2000–2014. This time horizon was determined by the availability of the Labour Force Survey (LFS) data, which started in 2000. Data from Eurostat, HRDA, and the World Bank was collected. The main indicators that were used for this analysis are GDP, average wage, public expenditure on education, employment, unemployment, labor participation rate, educational attainment, tax burden, relative weight of the public sector over the total economy, inflation, GDP deflator, informal economy as a percent of GDP, employees’ remuneration, total wages and salaries, total employees’ social contributions, human resource development levy, levy commission, levy revenues, and subsidies revenue.

However, there are two variables for which some information is missing:

- Data on public expenditure in education (at different levels) are only available for the period 2001–2013.
- The weighting of the informal economy, which is only available between 2008 and 2013. These data were provided by HRDA.

In order to deal with these data constraints, linear extrapolation was used to produce a proxy for the size of the informal economy back to 2000. This might seem

a long period to extrapolate over, but what data exists shows the informal economy to have a relatively constant share of total GDP (around 26% with very little variation), and thus we felt this approach was justified. Additionally, the rate of growth of the last year available was used to fill in missing observations for public expenditure in education.

A preliminary step in the econometric analysis is to apply correlation analysis to identify linear relationships between the variables. In particular, this analysis has revealed:

- (i) The amount of revenue raised by the training levy is highly correlated to variables such as GDP, productivity, and employment, which reflect the economic context and the performance of the labor market.
- (ii) There is also a positive linear relationship between revenue raised and the wage bill (i.e., total wages and salaries).
- (iii) A strong and positive correlation was also identified between the revenue raised and public expenditure on education.
- (iv) A negative linear relationship exists between the revenue raised and the administrative cost of the levy, which is measured by the levy commission.
- (v) A negative correlation was also found between the relative size of the public sector and the amount of revenue raised.

With only 15 years of observations available, there is insufficient information to undertake formal analysis to check whether the various indicators are stationary or not. However, from visual analysis of time series plots, it would seem that most series are nonstationary (with a nonconstant mean and variance over time).

Without a sufficiently long-time series, it is not possible to test for the presence of a long-run relationship using cointegration techniques. Instead, the general form of the models that can be estimated is summarized in Eq. (4):

$$\text{Total revenue} = f(\text{potential revenue}, \text{others}) \quad (4)$$

where *potential revenue* has been calculated by multiplying total employee remuneration in the private sector by the levy rate (0.5%), and *others* includes variables that reflect the economic conditions, the structure of the labor market, and any other elements included in the theoretical framework presented above. An underlying assumption of all these models is that the coefficient of *potential revenue* would be equal to 1 in an “ideal” system with no distortions. A major distortion is caused by the informal economy, which in Cyprus accounted for an average of 26% of total economic activity over the period 2008–2013. Additionally, a cap for employer contributions adds complexity to the system and helps to explain why the parameter deviates from 1. Another element which could explain the deviation is the fact that public employees’ emoluments are exempt.

For the purpose of this chapter, a linear relationship between the variables has been assumed. The relevant parameters that have been estimated using OLS are shown in Eq. (5):

$$\ln(\text{rev}_t) = -0.583 + 1.118 * \ln(\text{revp}_t) + \varepsilon_t \quad (5)$$

where *rev* is the revenue raised, and *revp* is calculated by multiplying employee remuneration by the levy rate.

In the above relationship, the parameter and the intercept are significant, i.e., for each coefficient the probability (p-value) is close to zero so we can confidently reject the null hypothesis that the coefficient equals zero. A 1% significance level has been considered for potential revenue. Preliminary estimates have also found a long-run relationship between the potential revenue that could be raised, *revp*; the level of employment, *emp*; and the relative weight of the public sector in the economy, *pus*. However, the final specification of the model shown in (6) only includes potential revenue as an explanatory variable. Both employment and the relative weight within the economy are not included in the model since they are correlated with potential revenue. A dynamic version of the model presented in (5) was also estimated, although the lagged term of actual revenue was not found significant. That specification of the model presented an estimated parameter for *revp* which was below and close to 1.

As expected, there is a positive relationship between the amount of revenue actually raised and the revenue that could be potentially raised if the existing cap were removed. In particular, the estimates suggest that a 1% increase in the potential revenue will lead to a 1.1% increase in the actual revenue.

The fact that the estimated coefficient is above unity (which we might expect to provide a natural long-run limit) reflects the fact that the cap of the levy has been increasing through time, and, subsequently, the actual revenue has become a rising share of potential revenue. It is interesting to note that, even with the limited time series data available, their graphical representation reflects that there seems to be a pattern in which the ratio of actual-to-potential revenue first rises, then decreases, before rising again to reach a new (localized) peak. The cause of this behavior could involve the periodic increase of the cap and the behavior of firms, although because (to date) the dates of any historical increase have not been provided, this possibility cannot be confirmed.

The process of estimating the econometric model shown in (5) is followed by applying the model in the construction of a baseline and two alternative scenarios. Subsequently, these scenarios are used to calculate the future revenue that could be raised by a training levy.

The relevant forecast for the business as usual (BAU) case is presented in the table below, along with the optimistic and pessimistic cases. In the BAU case, which is consistent with the IMF forecast, it has been projected that HRDA revenue will grow over the period from 2015 to 2020. Similar trends are expected in both scenarios although the amount of revenue raised is different in each one. The IMF Country Report does not include any forecasted data on wages and salaries. In order to deal with this lack of data, the assumption that wages will grow as the same rate as real GDP has been adopted (Table 3).

All scenarios use the model shown in (5) to forecast the available revenue. As the coefficient for potential revenue is greater than unity, this implies an ever-narrowing gap between actual and potential revenue moving into the forecast period. Clearly

**Table 3** Potential private sector resources that could be mobilized for training, 2015–2020

Country	2015	2016	2017	2018	2019	2020
<b>Baseline</b>						
Cyprus (USD 2005 million)	24.0	24.5	25.0	25.6	26.2	26.7
<b>Optimistic case</b>						
Cyprus (USD 2005 million)	24.0	24.6	25.2	26.1	26.9	27.7
<b>Pessimistic case</b>						
Cyprus (USD 2005 million)	24.0	24.4	24.8	25.4	25.9	26.4

Source: Authors' elaboration

such a position cannot continue indefinitely, because ultimately actual revenue would be forecast to exceed potential revenue. However, for the relatively short-term nature of the forecast being considered in this study, such an assumption is considered reasonable. The alternative (assuming a coefficient of unity for the forecast) would naturally result in lower future revenues.

## Conclusion

The literature review has covered a range of different assessments of the effectiveness of training levies which have been implemented across the global economy. The vast majority of the reports which have been reviewed were qualitative in nature. In general terms, levy-based funding approaches are preferred to other types of scheme, such as levy-exemption schemes, although they are not exempt from limitations. The intensity of the impact on the levy-scheme is highly related to contextual factors, as pointed out by the Marsden and Dickinson's (2013) qualitative review and the CEDEFOP (2009) report which demonstrated this finding quantitatively in the context of European countries.

Despite the benefits that have been associated to training levies, special attention should be given to their design in order to minimize deadweight losses and ensure that all firms can benefit from these schemes regardless their size. Although it has been acknowledged that TVETs contribute to improving greater development of human capital, their implementation could introduce distortions that might mean these schemes offset some of their potential benefits. An example of these distortions is that it may be the case that those employers that are paying training levies perceive them as an increase in labor costs which could have negative effects in terms of inflation and employment. If the "cost" of training levies are translated into higher prices, this could also have an impact in terms of firms' competitiveness. In addition to that, the mentioned increases in labor costs could also lead to a situation in which training cost burdens are being faced by employees (through reduced wages). Many of the TVET which have been implemented were underutilized by smaller companies. An important issue to bear in mind when designing TVET is the administration cost, which could get large and reduce the efficiency and positive impact of the TVET.

## Abstract

The restructuring of corporate organizational concepts and the digitization of the working world since the 1980s and 1990s were accompanied by a renaissance of learning at work. Corporate learning is becoming increasingly important for companies particularly in terms of employees' competence development. It is a kind of learning in the process of work, which is connected with non-formal and formal learning both within and outside the company. Additionally, forms of organization of learning combine working and learning while work is taking place in the here and now and apply different models of work-related learning. Digital work expands and intensifies corporate learning by dint of virtual learning components. The competences acquired in corporate learning have to be

acknowledged via a permeable education system in terms of credit increments integrated into formal educational programs. Validation procedures facilitate the assessment, valuation, and certification of informal and non-formal learning. Informally and non-formally acquired competences can be compared to other educational areas and programs through their association with educational standards.

Educational standards for vocational education and training comprise the content, learning place, and staff-related standards of the Vocational Training Act (BBiG) introduced in 1969 and their implementation in recognized initial and further education and training regulations. The classification of standards-based vocational competencies in the German Qualifications Framework (DQR) enables their comparison with educational programs and modules implemented in academic, i.e., tertiary education. The DQR functions as a framework for reference and permeability.

A shift in workplace learning and additional demographic, labor market, and higher education policy developments have led to the adoption of two pathways toward permeability between vocational and tertiary education that are recognized nationwide. The ideal solution is to acknowledge and award competence-based vocational education based on educational standards.

## Introduction

Permeability of the education system should provide the individual with access to formal education and facilitate the transition between different educational sectors. Equal opportunities, social integration, and opportunities for career advancement can certainly be increased by an improved correlation of the education and the employment system. In Germany and in other countries, the permeability between vocational and tertiary education is traditionally being discussed.

The general regulatory framework for permeability of vocational and academic education is currently changing in two crucial ways. Firstly, there has been a reorganization of education systems in many highly developed countries in terms of keywords such as qualifications frameworks, outcome orientation, educational standards, accreditation, competence-based education, validation, and quality assurance (Sloane 2007; Hartz and Schrader 2008; Bolder et al. 2017). The University of Zurich's educational researchers, J. Oelkers and K. Reusser, speak of an "internationally widely accepted change of perspective in education policy," which, in implementing outcome orientation, combines the use of resources and

results, thus making the effectiveness of the education system of the highest priority (Oelkers and Reusser 2008, p. 17).

Secondly, corporate learning has been changing fundamentally since the 1980s and 1990s by dint of new work and organizational concepts, the digitization of work, and workplace learning. Learning in and at work makes a significant contribution to the individual's competence development, and digital and informal learning are continually gaining in importance. Corporate learning is reflected in different models and terms such as work-related, work-based, and workplace learning as well as in different forms of organization of learning. This requires the education system to validate and recognize acquired competences. Recognition can be accomplished via educational standards and qualifications frameworks, more specifically; it is possible for vocationally acquired competences to be credited toward tertiary education courses. Hence, validation of competences or Accreditation of Prior Experiential Learning (APEL) is a highly relevant field of research and development in the international discussion (Bohlinger 2017; ILO 2018).

Before permeability in the educational system and recognition of corporate learning in gaining access to tertiary education are thematized, however, it is essential to provide a fundamental understanding of the companies in which vocational learning is taking place. In this chapter, the activity of public administration, civic, and religious organizations is separate from those of the profit-oriented company, which is the underlying concept here. In organizational research this complies with the usual differentiation between nonprofit and for-profit organizations (Apelt and Tacke 2012). Corporate learning from hereon in refers to actions that involve profit-oriented companies where learning takes place in a field of tension between the economic business goals of the organization and competence acquisition and targeted goals of education.

---

## Permeability in the Education System

The decades-long reform demands made on the educational system to produce more permeability are now presented with a fresh opportunity caused by changes in educational policy and changes in learning in and at work. In Germany and many other countries, the tradition is that vocational and tertiary education are strictly separate from one another. Hence, the vocational and tertiary systems are isolated from one another. After many unsuccessful attempts over numerous years to create more permeability and support for reform and parity between vocational and tertiary education (Büchter and Dehnhostel 2012, p. 69 ff.), system changes are now emerging that promise advancement and success. Clear indications are exemplified, for instance, by education policies that enable access to university without university entrance certificate, the parity of master craftsman's certificates and higher education entrance qualifications as well as the recognition of vocationally acquired competences for tertiary education (among others Buhr et al. 2008; Dobischat et al. 2008, p. 53 ff.; Stamm-Riemer et al. 2011).

The change of perspective in education policy requires a change in the abovementioned perspectives which, in place of input factors of education systems, the control and managing of outcome and result-oriented learning now follows first and foremost. Obviously, these are competence-oriented learning and education plans aligned to National Qualifications Frameworks (Raffe 2012) and the European Qualifications Framework (EQR). Qualifications and competences have been allocated into different levels, and procedures as well as instruments for evaluating competences and providing validation have been introduced. Educational standards are required which can grade vocationally acquired competences based on competence ascertainment and validation procedures for acceptance at tertiary levels of education and thereby foster permeability.

Hereby, the primary objective of comparability and reciprocal recognition of qualifications between the various fields of vocational education and tertiary education may be established. The major question here is what can be compared, evaluated, and therefore recognized. Until as late as the 1980s, practical skills and professional knowledge based on vocational education in Germany offered hardly any means for comparison with tertiary education as the levels of qualifications differed too widely and learning processes and achievements were virtually disjunctive. The forward-looking postulates of the education reform from the 1970s on integration and equality of vocational and general education exposed those limits.

What comprised the change in work, to be discussed in the following chapters, and the change it affected in vocational learning, was an elementary change in the fundamentals and starting point as a whole. Intersections increased between vocational and tertiary education, which led, significantly, to the guiding principle of competence development and the reflexive capacity to act in vocational education. The development of vocational education was caused by changes in socioeconomic conditions in an increasingly digitalized life and work world. The qualification demands of restructured work and organization concepts are – for all their inequalities and contradictions – characterized by higher qualification and holistic demands on competencies (Frey and Osborne 2013; Dehnbostel 2015, p. 8 ff.). They imply changed quantitative and qualitative qualification demands. This is the core reason why the traditional blind alley nature of vocational education became obsolete and why “the permeability of the educational system [...] is, at the present, quite high on the political agenda” (Hanft 2014, p. 123).

In this way reciprocal recognition could contribute to terminating the historically produced separation of tertiary education from vocational educational fields and their inherent and forcefully developed mechanisms of authorization, selection, and exclusion. In their place an interface comes into being between and within tertiary and vocational educational fields with the means for transitioning and accessing those fields. Thus, the recognition and crediting of each prequalification is essential, e.g., vocationally acquired competences gained from specific vocational training courses and conversely tertiary education relating to vocational education. The recognition and crediting of vocationally acquired competences for tertiary education is of primary interest here. This permeability is strengthened and linked to education and development pathways that had once been at the forefront of earlier reform initiatives (subsequently rescinded) calling for equal opportunities and social integration.

## Corporate Learning in the Digitalized Work World

In Germany, the rediscovery of learning in the work process was a turning point in the development of vocational learning. From the beginning of industrial vocational education in the last third of the nineteenth century, the so-called dual system, vocational education was increasingly centralized, systematized, and regulated by simultaneous differentiations (Dehnbostel 2007, p. 14 ff.). The debate on corporate learning on the presupposition of decreasing learning potential and opportunities continued far into the 1980s. This also applied to the industrialization and taylorization of work in the second industrial revolution proceeding into the 1970s. Qualification and learning while at work were persistently considered less acceptable from a didactic methodological point of view but also for economic and work and organizational reasons. As an alternative, valid qualifications were obtained from central educational institutes where learning could be systematic and undisturbed. In reality, formal and organized learning in vocational education continued to increase although the larger part of learning took place at the company.

With the introduction of information and communications technologies and the accompanied restructuring of work and reflexive modernization (Beck et al. 1996; Schultz-Wild and Lutz 1997), a countertendency toward centralization of vocational education loomed. Large- and medium-scale companies in particular supported an increase in learning while at work. They were quick to recognize that learning in modern work processes offers new options for learning and qualification that went beyond Taylorism. This realization outlined necessary prerequisites for innovative work organization and forms of organization of learning (Senge 1993). It returned to a kind of learning that belonged, historically, to the work life that had been impoverished in meaning due to industrially organized structures.

These new learning potentials and learning opportunities at work are attributed to the operational restructuring of the 1980s in the change from Taylorism to process- and innovation-oriented work organizations. The change as well as the work and qualification demands stemmed from a variety of causes, in short by so-called megatrends such as globalization, digitalization of the work world, the process and service industry character, and subjectivization (Dehnbostel 2015, p. 11 ff.). This meshing of megatrends formed new company and work concepts. They fundamentally changed work organization as well as the scope of tasks and task procession. The digitalized work world proceeded into the current developments of so-called web-based concepts of Industry 4.0 and in the Internet of Things and services (Botthof and Hartmann 2015).

A brief look at the history of the industrial revolution shows the technological and work organizational change determined by each of the qualification demands comprising the necessary qualification of vocational learning but leaves it undefined.

From as early as the late eighteenth century and the start of the first industrial revolution, the connection between industrialization and vocational qualification including forms of corporate learning remains open: in England, where the first industrial revolution was pioneered, no qualification concept for the industry's water- and steam-driven mechanization was developed. The countries catching up

on the European continent, France, and later Germany drew up supportive qualification functions (Greinert 1999, p. 23 ff.). The emergence of the dual system of vocational education in Germany was the result of problems arising from traditional vocational qualifications and a reaction to the upheavals in work concepts and work culture caused by the changes of the first industrial revolution. Qualification and vocational educational structures were deemed necessary at a quite early stage but were not considered as a dependent variable of qualification requirements of the companies.

At the beginning of the twentieth century, mass production and Taylorism ushered in the second industrial revolution. Its assembly lines, powered by electricity, created a new reference point in qualification. The qualification models used in the industrial countries were extremely diverse: e.g., the “science of industrial work” in the USA dubbed Taylorism in reference to its inventor and the *dual system of vocational education* created as a new qualification type for the skilled worker in Germany (Greinert 1994, p. 22 ff.).

The third industrial revolution of the 1970s involved the increasing influence of information and communications technology at work, facilitated by the use of microelectronics and digital systems. To what extent the propagated Industry 4.0 from the beginning of this decade (as Fig. 1 indicates) marks a historically and technologically fourth industrial revolution remains to be seen. Core characteristics of this industrial developmental step, characterized by the Smart Factory and the Internet of Things and service, are the online networking of machines, operating means, and logistical systems through so-called cyber-physical systems (CPS), which are basically the principle worldwide (Marwedel 2011). The digital transformation via CPS is characterized by the interaction of artificial intelligence and robotics.

In the digital transformation, a work enrichment and extension takes place, of which the basic structure of digital work processes lies in linking reality and virtuality. Digital work takes place in the reality-virtuality continuum; descriptions of this world of work include terms such as “mixed reality,” “augmented reality,”

“augmented learning,” and “socially augmented learning” (Tönnis 2010; Fehling 2017). The extended reality (augmented reality) is the normality of the future digital working world. The real workplace becomes virtual by introducing mobile terminals and is therefore expanded by creating virtual workplaces. This augmented learning in the process of work joins the physical with the virtual work world. Project-related activities and tasks are learnt primarily through informal real and virtual learning processes. This means at the same time that augmented learning becomes one of the primary work methodologies for professionals in the digital work world and learning at the workplace is actually an organized part of the work methodology.

Hereby contemporary organization and changes in work require qualifications, competences, evaluations, and fundamentally altered learning options that can be correctly described as epochal. The work activities in the digitalized work world combine operative and demanding dispositive tasks. They are largely self-directed, highly flexible, and determined by situations depending on the task in hand and the problems to be solved. The emerging digital competences combine technical with personal and social competences per se. An important approach to the identification and evaluation of digital competences is contained in the five areas of the comprehensive European reference framework for digital competences that defines eight levels (Carretero et al. 2017).

The corporate learning referred to here appears to have less potential for organizations compared to earlier industrial revolutions, since competence development takes place through informal learning in virtually extended work and learning frameworks, which can often be determined technologically and by the corporation’s narrowed perspective. However, this is only one side of corporate qualification, also termed informal further education. The other side is the connection between learning at the workplace with non-formal and formal learning within and without the company that contains numerous qualification concepts and concepts for work-related learning (Dehnbostel and Schröder 2017) and can, to a large extent, be included in corporate qualification.

Finally, the potential of corporate qualifications and forms of learning in the digital age has grown considerably. As in the previous industrial revolutions, national, company, and cultural differences will have a significant influence on the broadly open organization of qualification and corporate learning. The permeability between vocational and academic education is most certainly a vital organization criterion for corporate personnel development and competence development.

---

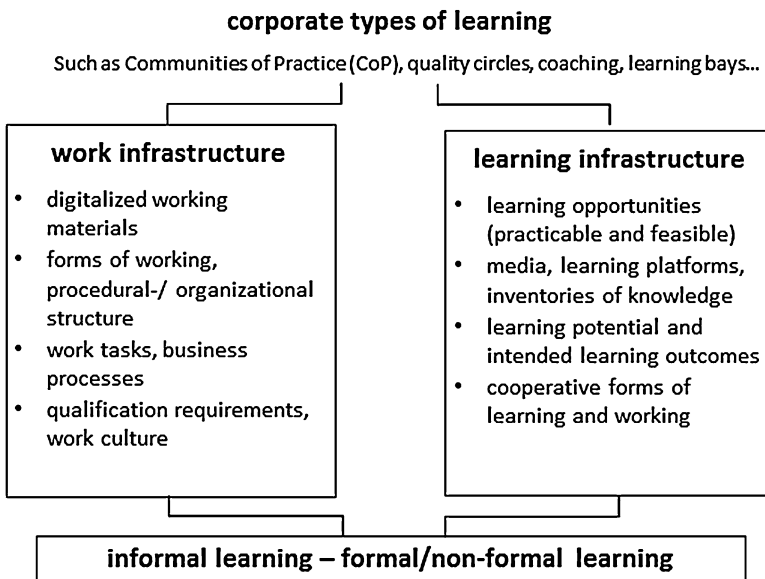

## **Organizational Forms for Corporate Learning**

Newly created forms of organization of learning that take place in the midst of the work process have gained particular importance for corporate learning at work, as they systematically connect formal and informal learning on a high learning level. By contrast with the work methodology, integrated learning constitutes a targeted extension of work around formal and informal learning. They gain in meaning

particularly in regard to the aspects sketched out in the previous chapter on the digitalization of work processes and learning and competence requirements in the organization of work.

Forms of organization of learning connect formal or organized learning with informal and experiential learning. What they have in common is that the workplaces and work processes are extended and enriched by learning systematically and work pedagogic aspects, without being formalized and losing the distinguishing characteristics of informal learning. A framework is consciously created in which learning while at work is promoted and supported by organizations and corporate learning types, e.g., coaching, learning bays, work and learning tasks, and online communities (Dehnbostel 2015, p. 70 ff.). The common structure of forms of organization of learning is depicted in the following illustration (Fig. 2).

As presented in the illustration, corporate types of learning are formed by a double infrastructure: the work infrastructure relates to the work means, work forms, work tasks, and qualification requirements of each work environment and is also embedded in the work culture to which it is related, while the learning infrastructure provides additional spatial, temporal, objective, and personnel resources in an organized framework. Informal learning and formal learning are related systematically on the basis of an interweaving with the work and learning infrastructure. Alongside non-formal learning is also considered to be formal learning because it involves organized learning combined with a learning structure. In the following, two examples of corporate learning types introduced in the 1990s are presented.

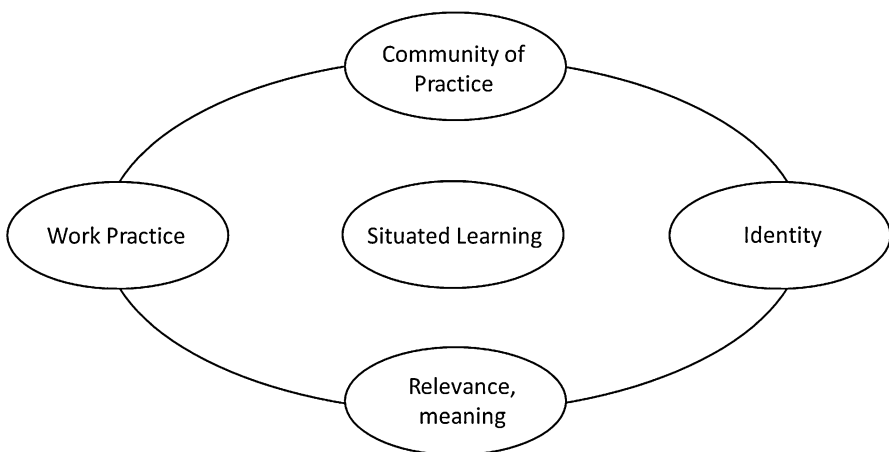

**Fig. 2** Double infrastructure of corporate types of learning (Dehnbostel 2007)

## Communities of Practice (CoP)

With the emergence of digitalization in the modern work world as well as in everyday life, communities of practice (CoP) came about as integrative corporate learning types. They represent a (social) alliance of people, who share common interests and often common life, work, and learning situations. In contradistinction to other corporate learning types, CoP is marked to a high degree by self-organization, equality between members, and learning carried out through and with the group. They overlap with forms of independent or half-autonomous group work.

The communities of practice are positioned within a theoretical foundation as well as in their practical development as a fundamentally situative learning concept (Lave and Wenger 1991; Wenger 1998). It denotes learning through activities and everyday action in a community of practically active people. Through this situated learning, not only knowledge and skills are acquired but also practices, attitudes, and values. In contradistinction to pertinent, cognitive learning concepts, the learning process is embedded in each of the formation conditions and environmental situations and is not separated from it. This also means that learning is not functionally reduced but is in fact a form of enculturation and shall be integrated into each learning and work culture. Four reference categories are fundamental to this process (Dehnbostel 2015, p. 44 ff.) (Fig. 3).

The work practice category signals that the learning process is carried out via live actions and practical experiences in and with the community. The group is a social community, and their individual and collective activities are directed at a common goal. They provide the framework for group learning and mold the learning of the individual. The group as a practitioner community constitutes a community of practice. The identity evolves in a quite often lengthy development of experts as a member of the community. The sense and meaning of learning are developed by placing learning in an authentic and practical context with transparent and shared

**Fig. 3** Reference categories of situated learning (Dehnbostel/Schröder 2017)

goals, and not within an artificially constructed situation that has been designed to initiate learning.

The concept of situated learning is based on experiential learning processes through action within a social context of a specific community of practice and environment. The belonging to a group is supporting and integrative at a social and individual level. Learning and competence development take place between all group members in a common social space. This particularly applies to learning at work: the learning becomes interactive in a binding relation to work tasks and its subsequent organization, planning, and scheduling tasks. Attitudes and values are acquired within the group or the organization via socialization and learning processes. Such an understanding of learning results in another kind of learning than that of institutionalized, formal learning. It is informal learning through which group cohesion, social integration, and participation emanating from its intentional activities lead to learning results.

Online communities as virtual societies represent a current further development of communities of practice (Zinke and Fogolin 2004). Quite long-term work, social and learning relationships emerge from online communities. They are, however, frequently not only maintained in the virtual sense but also supported by encounters outside the Internet or intranet, e.g., sekretaria.de and the Microsoft online community. Online communities, however, do not replace traditional work and communication relationships but extend them. Learning requirements, e.g., for the completing of tasks in temporary work and project groups, can be catered for through online communities that have no equivalent in traditional work relationships.

## Work and Learning Tasks

Work and learning tasks are another example of a work and corporate learning type that has been developed and is also suited to the small- and medium-sized companies. This corporate learning type aims, through its starting point of the work task, directly at the qualificatory requirements of the work and, simultaneously, at the competence development of the employee.

The *work and learning tasks* as a learning method connect work and learning through a didactic transformation of real-work tasks and the fulfillment of the following criteria (Schröder 2009):

1. The tasks satisfy holistic work and learning implementations in which specialist, social, and personal competences are acquired.
2. The processing of tasks takes place with higher self-responsibility and self-direction of continuous training, combined with systematic cooperation with each other and – as long as they make sense in terms of company size – in group work.
3. The learning processes are work and experience related; experience knowledge is gained and linked with theoretical knowledge.
4. Questions on the work design and work organization are reflected upon in a goal-oriented manner and linked to continual improvement processes.

5. Selection and accumulation of work tasks proceed so that they contribute to the achievement of each goal of competence development and further education.

The *model of complete action* is not at the base of these criteria as this is ideally for the vocational school-oriented concept of *learning and work tasks* which is too schematic to depict real-work structures and more fluid work processes. The corporate practice of work and learning tasks follows the logic of work processes and structures that are constitutive. The resources and conditions at hand in the work process will generally be implemented in the accustomed manner in the corporate work. It is crucial for the systematically laid-out work-related learning through work and learning tasks that working and learning are connected and purposefully take place during work processes. Therefore, informal learning is structurally embedded within formal learning and hence can be formalized or counted toward a formal education offer.

Work and learning tasks as a corporate learning type contribute essentially to supporting learning at work and actively shaping and improving work organization. Participants in a work-based qualification obtain scopes of action and degrees of freedom to plan, organize, and evaluate their own work through work and learning tasks. It is especially important that the choice of the work tasks and the didactic methodological support take place with a coach or learning facilitator who takes each individual developmental stage into account thereby avoiding mental over- or underload of the learner. Through self-reflection and the estimation of the learning facilitator, each course of activity is observed and simultaneously supports the competence development and reflective capacity to act. Particularly noteworthy is the dimension of social support, which in collaboration with colleagues and superiors and above all with the learning process guide, can be put into effect. The concept of work and learning tasks was also successfully implemented in action-oriented and work task-related learning arrangements in a virtual work environment (Schröder 2017) and in advanced academic education aiming at the implementation of reform-oriented research projects (Schröder 2014).

---

## Validation of Informal and Non-formal Acquired Competences

It is in the interest of companies and employees to recognize competences that have been acquired through informal and non-formal learning on a broad base and to take them on for a personnel or individual vocational educational development, which so far has only been done by individual companies. For the permeability of vocational and academic education, it is a necessary but not a sufficient prerequisite.

### Understanding Validation

Validation, in a broader context, aims at informal and non-formal paths of learning of acquired education skills and learning results (Dehnbostel 2015, p. 119 ff.). In companies, competences acquired via learning are validated but not the learning itself. The evaluation of informal and non-formal acquired competences must be in

line with qualification standards of the economic sectors, companies, and professions or standards of educational areas such as tertiary education. The guiding idea of the validation of education performances comprises the objective recording and assessment of informal and non-formal acquired competences. In line with the validation goes the acknowledgement and, where appropriate, the recognition of acquired competences on vocational development pathways or general or tertiary education courses. While the crediting aims at the shortening of learning times, formal recognition refers to the degree or graduation. It enables either immediate access to an educational course or awards educational attainment or vocational training degrees, which are often linked to an exam.

Alongside this possibility of a public authority-regulated validation, there are a number of recognitions in companies and the employment market of significance to vocational and further education that are relevant for the professional as well as individual development and career opportunities. Up to now, in Germany, no formal recognitions or accrediting in the educational system exist, in particular: work certificates and employee discussions, assessment procedures, competence analyses and balances, diagnostics and work analysis procedures, and certification by manufacturers and educational institutions.

Educational policy has long since been concerned, above all, with the subject of validation (especially) in relation to the European education policy, which is a conceptual element of the European Qualifications Framework (EQR) and the European Performance Point System for Vocational Education (ECVET). Of current significance is the published council recommendation by the European Commission of 20 December 2012 on the validation of non-formal and informal learning (Official Journal of the European Union 2012). It proposes the “validation of learning results in particular knowledge, skills, and competences which have been obtained in non-formal and informal ways” (ibid., p. 1) and recommends the introduction of national “rules for the validation of non-formal and informal learning . . . until 2018” (ibid., p. 3).

Knowledges and experiences on the evaluation of informal and non-formal acquired competences gathered by 26 European states have been summarized in the publication “European Guidelines for the Validation of Non-Formal and Informal learning” (CEDEFOP 2009) and can be described as a European validation concept. The interest of Europe in supporting national strivings for the introduction of validation systems for informal and non-formal learning is above all politically and economically motivated: comparability and transparency of the national system at European level are of great importance if the general advantage that is resulting from the validation is not limited to certain countries, regions, and sectors but unfolds its effects Europe-wide. Mobility of employees within Europe is therefore supported and is vital for the development of an enterprise’s human resources. A large qualified work force pool is available from which enterprises are able to recruit new employees. From the employees’ point of view, the offer of potential workplaces extends across national borders permitting competences to be assessed in a transparent system.

The European policy on the validation of non-formal and informal learning of 2004 (European Commission 2004) paved the way for the validation guidelines of 2009.

Following this policy, the individual is at the center of the validation process. It emphasizes that a validation of their learning must be conducted on a voluntary basis. The perspective of the individual is addressed specifically within an own chapter (Cedefop 2009, p. 57ff.), which deals with possible subjective reasons for a validation of their own learning so that in the context of the individual the appropriate decisions are made regarding that individual's advice and orientation. The validation of informal and non-formal learning is not possible without an institutional and organizational framework. In the European guidelines, a certification authority at government level is suggested, which can secure official recognition of validated non-formal and informal learning (CEDEFOP 2009, p. 42 ff.).

By means of a central evaluation and validation authority, the development of broader levels of applicable procedures can be carried out. Generally, education and vocational education organizations within the education system are particularly crucial for validation, because they can professionally evaluate the comparability of the standards of informal and formal acquired competences. This outstanding position of the formal system can, on the one hand, however, hinder the development of evaluation procedures that do not rely on formal learning environments.

## Five Step Validation Procedures

Validation primarily measures the learning experiences and learning results of individuals that have acquired those through informal and non-formal ways. This is done in a structured procedure that evaluates and certifies them by comparison with established standards. The standards refer to sectors, professions, vocational or tertiary educational courses, or parts of them.

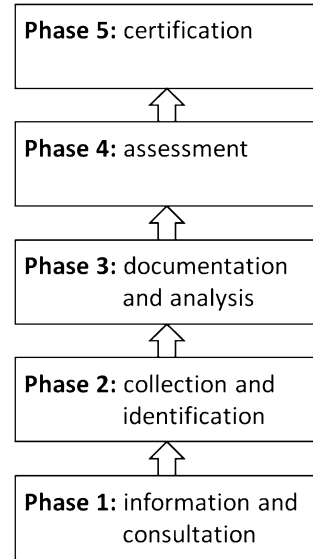

In the validation practice up to now, a five-phase concept for the identification and evaluation of informally and non-formally acquired competencies has been established in Germany and the European Union (CEDEFOP 2009; Official Journal of the European Union 2012; Dehnbostel 2015, p. 110 ff.), which is also at the foundation of the legally secured validation procedures in Switzerland from 2004 (BBT 2009) (Fig. 4).

At the core of the procedure are the three steps in the middle: collection and identification, documentation and analysis, and evaluation. Depending on the objective, the validation can initially be based on either a development-oriented open-ended competence assessment or focus on the assessment of competences which are relevant for the profession and based on standards of professions or educational courses and degrees and are therefore requirement-oriented. In each case the following outlined five phases are carried out:

### Phase 1: Information and Advice

Information and advice given to individuals but also groups on existing possibilities for estimating their competences and having them certified is fundamental for conscious participation in the procedure. Therefore, relevant information and

**Fig. 4** Five phase validation procedures (BBT 2009)

advisory services with addressee-specific structures have to be developed and expanded upon. It can be assumed that the advice structures and offers of regional vocational and further education in use are good enough to continue using.

It is important to note that:

- Different target groups require to be addressed according to their needs, it is especially important to differentiate according to previous education and work situation.
- The advisors accompany the participants in the preliminary stages of validation and, where appropriate, particularly for socially disadvantaged target groups, throughout the entire validation process.

### **Phase 2: Compilation and Identification**

The question that arises is whether or not the advisors should also be responsible for the identification and first evaluation of competences, interests, and the like. In principle, there are indications that a partial separation might be useful, since advisory services are often offered at further vocational education or information and training centers. The validation is carried out later by a separate institutional partner by means of other competence profiles.

It is important to note that:

- Compilation and identification should not only focus on vocational competences but also contribute toward uncovering individual interests and abilities and making them evident. A portfolio which gives detailed information on the development of the participant is crucial for the identification.

- Using different methods like self-assessment and external assessment is recommended when identifying competences and their classification into development-oriented or demand-oriented procedures.

### **Phase 3: Documentation and Analysis**

Documentation and analysis demand professional expertise, i.e., competent experts should be involved in the process. Generally, the documentation is limited to the compilation of documents of the previous phase.

The documentation is the foundation for the analysis; however, it can be supplemented by an interview to extend the basis for analysis. Furthermore, documentation and analysis can also lead to a supplementary qualification at a subsequent intermediate level.

It is important to note that:

- The documentation should be transparent and make an objective analysis possible that subsequently leads to assessment.
- It is preferable to compile the documentation digitally for reasons of analyzability, transparency, and the saving of time.

### **Phase 4: Assessment**

Crucial for the assessment is who conducts it and what qualifications are required to do so. The assessment and the preliminary analysis should be carried out by a single person. The task is particularly demanding since formal assessments of available methods and instruments cannot be applied and transferred. Furthermore, the task includes discussing demands, standards, and results of the assessment with those participating.

It is important to note that:

- The participants are informed from the beginning about the requirements and standards of the assessment.
- Assessment within the validation process should not be based on typical exams but should in fact be assessment criteria related, which need to be developed first with regard to standards that the validation is based on.

### **Phase 5: Certification**

Regarding certification it has to be decided if a vocational, local, or regional certificate is to be issued or whether a vocational degree or a qualification that is based on a qualifications framework classification is documented.

It is important to note that:

- The function and value of the certification has to be specified from the outset for the aim of the validation to be established.
- The certification includes the results of the assessment and, where appropriate, instructions for the recognition and classification in the National Qualifications Framework.

In summary, the validation of informal and non-formal learning can be described as a structured procedure, in which acquired learning and learning results are measured as competences and are subsequently certified. The procedure is conducted in the five sketched-out phases. Furthermore, validation must be undertaken by responsible, authorized establishments. The assessment takes place by reference to standards of a vocation, education courses, education degrees, or qualifications frameworks. In the context of corporate learning and informal and non-formal acquired competences that have been acquired at work, the question is raised which standards and qualifications framework enable the recognition toward acknowledging and accrediting courses toward tertiary education.

---

## **Education Standards and Qualifications Frameworks**

Only the classification of corporately acquired competences as education standards enables their comparison with other educational fields and educational courses as well as their recognition and crediting, whereby the concern is with comparability and recognition between education areas of vocational education and tertiary education. Its starting point is corporate learning and the vocational competences acquired from it. By use of descriptors here, qualifications frameworks offer defined classifications and levels of comparison. Classification levels and equivalence criteria enable competence comparison between educational fields.

## **Education Standards as Premises for Comparability and Recognition**

While in Germany the discussion of educational standards within the general educational system has (only) gained broader attention since the debate has been raised by international educational studies like the Programme for International Student Assessment (PISA), Trends in International Mathematics and Science Studies (TIMSS), and Progress in International Reading Literacy Study (PIRLS), educational standards for vocational education have been established since the Vocational Training Act (BBiG) of 1969 (Schmidt 2003). The specification and continually new training regulations of recognized education and further education are in accord with the BBiG, and therefore guarantee social acceptance of vocational standards and their comparability with the standards of other education areas. For the scholarly part of vocational education, there exists an independent discussion of education standards bound by regulations of the Standing Conference of Minister of Education and Cultural Affairs (KMK) dealing with matters such as framework curricula and the general agreements binding them (Dehnbostel and Lindemann 2007; Sloane 2007; Schmitz 2009), which does not have an immediate impact on the subject matter of vocational learning and the acquisition of vocational competence.

In the context of the already mentioned changes in direction of the educational system, the discussion of educational standards has acquired an important function. A leading contributor to the discussion, education researcher E. Klieme, shows the connection of competence and education orientation of standards to competence

models. Klieme vehemently criticizes standards of purely test-based performance norms and competence lists: “educational standards adhere (ideally) to the goal of education as the development of personality, acquisition of culture and responsible participation in societal development” (Klieme 2006, p. 68).

In theory and practice, there are considerable differences in the understanding of education standards, and their implementation revealed partly contradictory expectations. The question for all education sectors arises over the goals, function, and structure of education standards. The following overlapping basic understandings exist (Klieme et al. 2003; Meyer 2006; Benner 2007; Oelkers and Reusser 2008; Münk 2008):

Educational standards

- Aim to achieve standardization, unification, verifiability, and comparability of competences which the learners have acquired according to certain educational or qualification procedures.
- Facilitate the verifiability as well as the reliable measurability of competences on the basis of performances in terms of successes and failures of the learner.
- Are instruments for the management, control, and surveillance of education and competence development processes as well as instruments for the comparison of education areas and education systems.
- Serve as quality control, quality improvement, and evaluation of the education system.

In vocational education, recognized education and further education regulations in accordance with the vocational education laws (BBiG) present a standard, which actually enables comparability with other education courses and education areas on the foundations of the competence basing of regulations. Introduced in 1969 and revised in 2005, the BBiG is the foundation for educational standards in vocational education. They relate to the vocational principle and are valid for the legally secure areas of vocational education and various forms of vocational further education. In the legal requirements and regulations content, learning location and personnel-related standards are established.

The standards are not set in stone in order for technological innovations and changes in organizational developments to be taken on at any moment in procedures where time can be of essence. For the German system of vocational education, professionalism is constitutive as a structured principle. Standardization examples such as those defined in the framework of the BBiG provide, for the purpose of international comparison, an orientation framework for vocational qualifications (Schmidt 2003; Deutscher Bundestag 2013). In terms of standardization processes, they set the competence and level-related benchmarks of qualifications.

## **DQR as Reference and Permeability Framework**

The introduction of qualifications frameworks is a part of the aforementioned restructuring of the education system. They form a platform for the comparability

of various education courses and education areas and moreover enable reciprocal recognition and crediting.

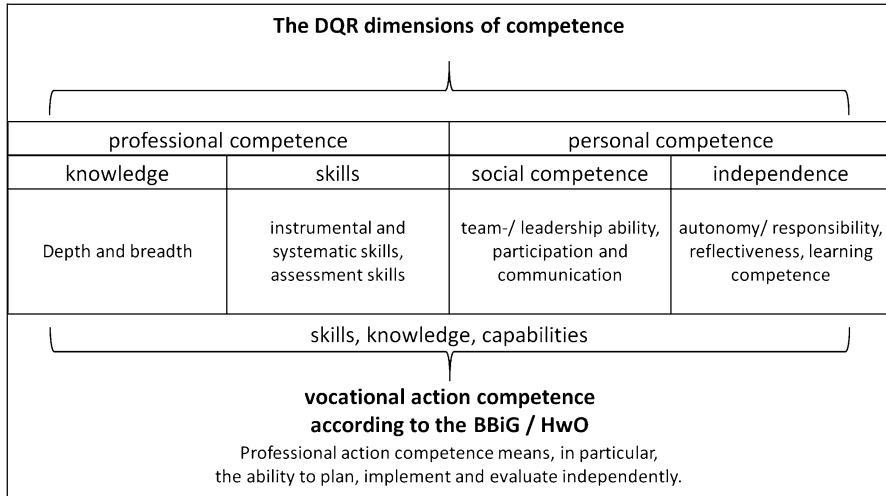

Education courses were previously characterized by content structure, admission prerequisites, and teaching and learning processes, that is to say through elements of an input and process management. Now qualifications frameworks have to enable management by means of learning results and outcome. In national and international contexts, they should not only serve the purpose of transparency and comparability but also – in relation to the validity of qualifications and competences – generate a confidence-building effect. With the help of qualifications frameworks, the use of “knowledge, skills, and competences” shall be optimized (European Union Commission 2005, p. 17).

The DQR is therefore outcome-oriented (AK DQR 2010). It sets out to support the mobility of the learners and employed between Germany and other European countries and in conjunction with the EQR take on the regulations and European comparability with qualifications acquired in Germany. The DQR relates to competences and qualifications that have been acquired in secondary and vocational education, tertiary education, and further vocational education. The improved permeability between the individual education areas is the outlined goal. This means that in the German Qualifications Framework implemented since 2013, “the goal is, to make equivalencies and differences of qualifications for educational institutions, companies and employees transparent and in this way support permeability” (AK DQR 2010, p. 2).

The permeability of vocational and academic education is impeded in this way as for both educational areas differing standards and understandings of competences exist. This is where the DQR comes into play, which – just like the EQR, functions as a translation device to compare the learning outcomes at different educational levels. Underlying the DQR is a general concept of competence with the dimension of expertise and personal competence at its base, which is compatible with competence understandings of individual education areas as well as vocational and tertiary education. At European level, the relevant terms of each national qualification and competence are subsumed in the general understanding of the EQR. Outcome orientation is the structural orientation of the qualifications framework that facilitates the comparison of qualifications and competences.

The compatibility in vocational education acquired competences specified in the DQR has been defined by the authorities responsible for vocational education in Germany (BIBB 2014, 2015). As the following illustration shows, the defined goal for vocational and further education regulations of “vocational action competence,” defined via “skills, knowledge, and capabilities,” correlates with the competence dimensions of the DQR (Fig. 5).

Vocational education in Germany is thereby classified in the DQR, which in turn stands in relation to the EQR and other National Qualifications Frameworks. The comparison of vocationally acquired competences with other educational fields and their recognition and crediting is enabled thereof at a national as well as a European level.

**Fig. 5** Compatibility of vocational activity skills and competence dimensions of the DQR (BIBB 2014)

## Conclusion: Competence-Based Crediting of Vocational Education

In Germany, the change shown in corporate learning and further demographic, employment market, and university policy developments (Buhr et al. 2008, p. 23 ff.; Wolter 2013, p. 197 ff.) lead to options of permeability of how vocational education can be credited toward tertiary education: firstly there is the possibility of entering a university after having successfully completed vocational training via one of various means to acquire tertiary education entrance certificates and the recognition of vocationally acquired competences. Secondly, study is possible for nontraditional student professionals without higher education entrance qualification (A-levels) by means of admission entitlement awarded through recognition of vocationally acquired qualifications studies (Wolter 2013, p. 204 ff., Hanft 2014, p. 24 f.). Realistically, at present, the first pathway accounts for a fourth of all students in Germany; the second pathway indicates a mere 3% of all beginner students (Hanft et al. 2015, p. 13 f.).

The second pathway has been established in 2009 via a resolution on “university access for vocationally qualified applicants without formal high school university entrance qualification” by the Standing Conference of Ministers of Education and Cultura Affairs (KMK 2009). Following that the graduates obtain further vocational training such as “Meister” (DQR 6) in technical vocations and in business administration or are holders of comparable degrees of tertiary entrance qualifications, they will receive a university entrance qualification. In a similar way, this applies for

vocationally qualified applicants without advanced further training who obtain a subject-related university entrance qualification, as long as they satisfy certain prerequisites, e.g., a minimum of 2 years of vocational education and a minimum of 3 years of professional practice in a study course area in a subject that complies with the field to be studied at the university. These generalized rights are based on formal qualification completions and time-limited vocational experience, i.e., this indicates permeability without any previous competence comparisons, validations, and competence recognition.

Regarding the first pathway, for the vocationally qualified with tertiary education entrance qualification, permeability shows itself in part by the acquisition, but primarily in the crediting of informally and non-formally acquired vocational competences. The Standing Conference of Ministers of Education and Cultural Affairs in 2008 prepared a resolution on the “crediting of knowledge and skills acquired outside university education for university studies (II)” (KMK 2008), which was already adopted in 2002 in its first version. Crediting can – as already documented in 2002 – comprise a maximum of 50% of courses and examination performances of a university degree program. In the long run, this is a tenable limitation of permeability as a look at other countries demonstrates.

Even though the obligation of crediting knowledge and skills or competences acquired outside university is taken on by Laws on Higher Education by each state of the Federal Republic of Germany, however, in reality no state or state-wide valid regulations are actually put into effect at university level. Standardized or uniform competence assessment and validation procedures are out of the question. A. Hanft and W. Müskens, two university researchers who practice recognition, ascertain: “As neither the resolutions of the KMK nor the corresponding Federal University regulation outline procedures or standards for crediting, their implementation usually takes place in the form of non-transparent individual case decisions” (Hanft and Müskens 2012, p. 245, Hanft 2014, p. 129).

Nonetheless the regulated crediting of vocational education toward university studies is the correct and crucial development option for permeability to university. Comparisons and equivalences between vocationally acquired competences and degrees on the one hand, and university study courses with competence-oriented modules on the other, should be made the basis of educational standards. A fundamental extension takes place and, in part, also a replacement of current validation and certification procedures, in which permeability between vocational and academic education would, as a developmental perspective, be a regulated part of an overall permeable education system.

At the present time, vocational education in the United States is known as “career and technical education,” and student youth organizations are known as “career-technical student organizations.” The names were changed in 1998 as part of an effort to address the negative perceptions surrounding vocational education. However, for the purposes of this chapter, the terms vocational education and vocational student organizations will be used throughout.

### Abstract

A key part of any vocational education program at the middle school, high school, or postsecondary level in the United States is a vocational student organization (VSO). Funding nationally was first provided for these vocational student organizations with the passage of the Smith-Hughes Act of 1917. A vocational student organization is cocurricular and is meant to complement the curriculum of a particular vocational education content area. Vocational student organizations are offered in conjunction with business and industry and are aligned with business and industry standards. Vocational student organizations allow students to participate in realistic activities that are related to their chosen vocation. These activities can include campaigning and running for an elected office, skill competitions, service learning and community service, and activities that prepare them for college and a career. In the United States, despite the noted value of vocational student organization to the overall student experience, there has been intermittent and, at times, scarce research regarding the relationship of vocational student organizations to student success. This chapter will provide an overview of vocational student organizations, interspersed with relevant research.

### Keywords

Leadership · Competitions · Cocurricular · Success · Competency

---

## Introduction

Vocational student organizations play an important part in vocational education programming in the United States. Broadly speaking, these organizations are built upon four common goals: academic and career achievement, leadership development, professional development, and community service (Virginia Department of Education 2017). This chapter will explore the various vocational student organizations that are an integral part of a vocational education program and the different ways in which students demonstrate success through their participation.

At present in the United States, there are currently more than two million students participating in a vocational student organization (National Coordinating Council for Career and Technical Student Organizations 2017). Students participate in vocational student organizations in order to demonstrate the skills and knowledge that they have learned within a specific vocational program (Zirkle and Connors 2003).

Vocational student organizations are cocurricular in nature, and students apply what they have learned in the classroom in a real-world setting through authentic learning (Aragon et al. 2013; Reese 2011).

In the United States, vocational student organizations were first introduced with the passage of the Smith-Hughes Act of 1917 (Aragon et al. 2013; DeBates and Pickard 2008; Threeton and Pellock 2010; Zirkle and Connors 2003). Although not formally recognized by the Smith-Hughes Act, funding initiatives were established for agricultural teachers including advising and supervision responsibilities of vocational students in agriculture (Vaughn et al. 1993). By 1920, in the United States, high schools had begun instituting vocational student organizations (DeBates and Pickard 2008). Since that time, they have evolved over the years into name changes and expansion to other territories and countries outside the United States. Students can pursue vocational education at the secondary level, and they also participate in vocational education student organizations as part of their vocational education training in postsecondary settings.

Vocational student organizations are described as “cocurricular,” which allows students to extend and apply their learning and knowledge from academic lessons to real-world situations and scenarios making learning more authentic (Aragon et al. 2013). Many of these activities are “extended” learning opportunities, completed by students outside of regular school hours in addition to the learning activities that take place during regular school hours (Stone 2014).

---

## **Overview of Vocational Youth Organizations Within Each Career Field**

Students who elect to participate in a vocational education program also participate in a vocational youth organization that is a part of their chosen program. Vocational youth programs are available to students at the middle school, high school, and postsecondary levels (see Table 1). Students participate in a vocational youth organization that is associated with a career field (agriculture, business, technology, and others) for which they have a demonstrated interest. As part of the cocurricular student organization, students have many different opportunities available to them as they are led by their teacher/adviser. Further details are presented about youth organizations in the following sections.

---

## **Structure of Vocational Student Organizations**

Each vocational student organization has its own structure and operates according to a set of standards, policies, and activities that have commonalities across all the organizations. Vocational student organizations are generally formed into chapters at the local level with advisors and sponsors, with support from state departments of education in the form of state advisors, and with administrative

**Table 1** Secondary and postsecondary vocational student organizations

Technology Student Association	
The National FFA Organization	

and financial assistance (Gordon 2014). The national offices associated with the organizations listed in Table 1 provide policy and curriculum development assistance to the state and local units.

One important component of a vocational youth organization is electing student representatives, with students campaigning for office at local, regional, state, and national levels (Association for Career and Technical Education 2011). A second component of vocational youth organizations allows students access to authentic learning through various skill competitions. In addition, students in vocational student organizations also participate in a diversity of service learning and community engagement activities.

Another integral component of a youth vocational organization is the involvement of the vocational teachers, who serve as advisors for the various chapters at the local, regional, state, and national levels. Teachers as advisors help to promote excellence within each organization by providing leadership and guidance to help motivate students to accomplish different goals of each chapter such as competitions, service learning, and community service. Each of these components is described in greater detail in the following sections.

---

## Student Elected Representatives

As part of their participation in a vocational student organization, students are encouraged to elect representatives who will serve as officers to provide valuable leadership to the organization beginning with the local/district level. Students who want to hold an elected office as a student representative may campaign for an office at each level including local/district, state, and national/international (Fiscus and Hyslop 2008). Students may choose to campaign for a variety of elected offices including parliamentarian, historian, treasurer, public relations officer, vice president, and president. Elected student representatives are valuable resources for a student organization as they make sure that their chapter sets and achieves goals, serve as a role model to other students, and will function as the liaison between the local/district level and the state and national/international associations (BPA 2017).

---

## Competitive Events

Competition among students in a given vocational area of interest is a key component of a vocational youth organization, and students can display their skills competence through various competitions. Competitions occur at different levels, and students who perform at an exceptional level have the opportunity to compete against a broader group of students. Competitions are authentic in nature and are meant to be reflective and indicative of different situations within each career field. These competitions permit students to form solutions to real-world problems according to their own abilities (Litowitz 1995). Vocational student organizations are aligned with business and industry standards, and these competitions can prepare students for careers once they graduate from high school or postsecondary training (Brand et al. 2013).

When it comes to competitions, students can choose to participate in competitive events either individually or as a part of a team (Future Business Leaders of America 2017). Vocational youth organizations also allow students to compete against each other within their respective vocational area. Students are assessed and judged within each competition by industry-recognized judges, and these judges assess them according to a set of indicators (Brand et al. 2013). High-performing students receive recognition for their achievement in front of their peers (Threton and Pellock 2010; Litowitz 1995).

---

## Service Learning and Community Engagement

Service learning and community engagement are also important aspects of vocational student organizations. These important characteristics of a vocational student organization help to define the role of student excellence. Service learning helps to promote and extend civic awareness for students participating in a vocational student organization by allowing students to strengthen their twenty-first-century skills including collaboration and communication (Young 2014). Also, service learning is an experiential opportunity that allows students to put learning that occurs from inside the classroom into practice in the real world by completing projects that contribute to the betterment of the community (Aragon et al. 2013; Reese 2008). Students complete community service projects that are supervised by their teacher/advisor, and the projects are ways to give back to the community through volunteering (Reese 2008).

---

## Teachers/Advisors

Each chapter of a youth vocational student organization has a vocational teacher who also serves as an advisor (Reese 2011; Stone 2014). The teacher/advisor oversees the operation of the youth vocational organization at the local level (sometimes referred to as the regional level) and is also in charge of preparing students for competitions (Stone 2014). They also play an important role in promoting student

excellence through various chapter activities. As mentioned, such competitions can include running for an office, officer training, service learning, and skill competitions at the local, state, and national levels (Gordon 2014). Also, teacher/advisors use their skills to effectively mentor, guide, take initiative, motivate students, and manage each chapter as part of their duties when they are in charge of a chapter of a vocational youth organization (Stanislowski and Haltinner 2009).

Teachers/advisors are responsible for distributing their knowledge and expertise to make sure that students are ready for competitions. The teacher/advisor prepares students both academically and for their career content knowledge to make sure that students understand how to correctly use technical terms associated with each career field (Reese 2011). In addition, leadership is an important attribute of a vocational youth organizations, and teacher/advisors are responsible for modelling leadership to their students (Reese 2008). Teacher/advisors impart the confidence and the ability to perform competently, whether the student is running for an elected office or is preparing for a competition. Teachers/advisors spend many hours preparing students for the functions associated with vocational student organizations (Gentry et al. 2008; Reese 2011). This extra work may be compensated via a supplemental salary, but oftentimes the teacher/advisor does the work voluntarily.

---

## **Types of Vocational Student Organizations**

Vocational student organizations are available in the major content areas associated with vocational education including agriculture, business, family and consumer science, health occupations, marketing, technology education, and trade and industry programs (Taylor 2006). The US Department of Education (2016) recognizes 11 vocational youth organizations that are a part of vocational education programs in the United States. The 11 vocational youth organizations include Business Professionals of America (BPA); DECA; Future Business Leaders of America-Phi Beta Lambda (FBLA-PBL); Educators Rising; Family, Career, and Community Leaders of America (FCCLA); Health Occupations Students of America (HOSA); National FFA; National Postsecondary Agricultural Student Organization (PAS); National Young Farmer Educational Association; SkillsUSA; and Technology Student Association (TSA). Students who choose to pursue a vocational education course or program can participate in the vocational youth organizations associated with that particular course or program.

### **Business Professionals of America**

As a result of research conducted in 1964 by the American Vocational Association (AVA) which indicated a need for a student organization related to business, the Vocational Office Clubs of America (VOEA) was founded in 1966 (Camp et al. 2000). The VOEA changed its name to Business Professionals of America (BPA) in 1988. BPA currently has 45,000 members in over 1,800 chapters in 25 states and Puerto Rico (Business Professionals of America 2017). Business Professionals of America is the vocational youth student organization for

students interested in careers related to business management, office administration, information technology, and other related business fields (Business Professionals of America 2017; Reese 2008). Students also compete in the Workplace Skills Assessment Program which allows BPA students to demonstrate the skills and knowledge that they learned by actively participating in different BPA activities (Reese 2008). The Workplace Skills Assessment also allows students to display excellence within each BPA chapter as they compete against others using the knowledge they acquired related to the field of business.

### **DECA: Delta Epsilon Chi**

Incorporated in 1946, DECA is an acronym that previously stood for “Distributive Clubs of America,” but today the vocational student organization is referred to only as DECA. DECA is the youth vocational organization for students interested in marketing career areas such as hospitality, finance, sales and services, business administration, and entrepreneurship (DECA 2017; Geddes et al. 2016; Reese 2008). At the high school level, there are 200,000 members spread across 3,500 local chapters. There are DECA chapters in all 50 states, the District of Columbia, Canada, China, Germany, Guam, Mexico, Puerto Rico, and Spain (DECA 2017). Students take part in skill competitions related to business management and administration, entrepreneurship, marketing, finance, and hospitality and tourism. DECA competitions are offered at the regional, state, and national/international levels.

### **Educators Rising**

For students interested in becoming a teacher, Educators Rising is the youth organization associated with the career field of education. Founded in 1937 as the student organization Future Teachers of America, Educators Rising prepares students to enter the field of education and also provides them with hands-on learning opportunities including competitive events. At present, 2,400 secondary schools in the United States have Educators Rising student organizations (Educators Rising 2017). Students complete performance-based assessments as competitions where they demonstrate their skills, knowledge, and dispositions as future teachers. Students in Educators Rising also have the option to participate in events at the regional, state, and national levels. Unlike the other student organizations, Educators Rising is not affiliated with a specific vocational education program.

### **Family, Career, and Community Leaders of America**

The Family, Career, and Community Leaders of America (FCCLA) vocational student organization was founded in 1945 and is focused on students interested in the broad career field of family and consumer sciences. There are 164,000 members in approximately 5,300 chapters within 49 states, the Virgin Islands, and Puerto Rico (FCCLA 2017).

When FCCLA was originally founded in 1945, it had a primary focus on the roles and structure of the family (formerly home economics programs). Since then, FCCLA has evolved to prepare students for the responsibilities and challenges of adult life, to promote a greater understanding between youth and adults, and to prepare both men and women for the multiple roles within society today (FCCLA 2017). Students from public and private schools through twelfth grade in a family and consumer sciences course or program can join FCCLA.

### **Future Business Leaders of America-Phi Beta Lambda**

Similar to Business Professionals of America, Future Business Leaders of America (FBLA) is a vocational student organization associated with the business career field. FBLA was developed in 1937 by Dr. Hamden Forkner of Columbia University, with the first high school chapter officially launched in 1942. FBLA is now comprised of more than 235,000 students in nearly 6,000 chapters in secondary schools. A related postsecondary division of FBLA, Phi Beta Lambda, has more than 500 postsecondary chapters with more than 10,000 students (FBLA 2017).

Students who are active within FBLA participate in competitions related to business and career-related activities. The main office of FBLA is located in Reston, Virginia, with five regions across various locations in the United States. There are 60 different student competitions offered, and they cover many different facets of business including technology, public speaking, business, finance, and management.

### **Health Occupations Students of America**

Health Occupations Students of America (HOSA) is the vocational student organization associated with the health sciences career field. Health Occupations Students of America was founded in 1976 and now has more than 200,000 members in the United States, American Samoa, Puerto Rico, Canada, Germany, and Italy (HOSA 2017). Through participating in HOSA, students display their knowledge, skills, and abilities related to the healthcare industry. Student competitions include six different areas: health sciences, health professions, emergency preparedness, leadership, teamwork, and chapter recognition of service and achievement. Due to the rapid technological advances in the health sciences and the corresponding growth in vocational courses and programs in the health sciences, HOSA has experienced significant growth in the number of HOSA chapters and students in the past two decades.

### **National Postsecondary Agricultural Student Organization**

Officially organized in March of 1979, the National Postsecondary Agricultural Student Organization (PAS) was established for students interested in the field of agriculture at the postsecondary level. Membership now includes 1,400 members

from 62 chapters located in 18 states. PAS is available to students in agriculture/agribusiness/natural resources postsecondary programs in approximately 550 institutions across all 50 states (National Postsecondary Agricultural Student Organization 2017). The goals of the National Postsecondary Agricultural Student Organization are to prepare students for career development and leadership activities. Students can choose to compete in different collegiate programs with a specific focus on an agricultural career field.

## **SkillsUSA**

Formerly referred to as Vocational Industrial Clubs of America (VICA), SkillsUSA is the vocational youth organization designed to prepare students for the world of work through various activities including skill competitions and running for an elected office (Camp et al. 2000; Reese 2008). VICA was established in 1965 to meet the needs of students interested in trade and industrial education. SkillsUSA encompasses more than 335,000 students and advisors, organized into 18,000 chapters and 52 state and territorial association (SkillsUSA 2017). SkillsUSA is dedicated to improving the “quality of America’s skilled workforce through a structured program of citizenship, leadership, employability, technical and professional skills training” (SkillsUSA 2017).

## **Technology Student Organization**

Students displaying an interest in STEM (science, technology, engineering, and math) may join the vocational youth organization known as Technology Student Organization (TSA). The Technology Student Organization was first established in 1965 and was chartered as the American Industrial Arts Student Association (AIASA). The name change occurred in 1986, due in part to a greater emphasis on the role of technology (Camp et al. 2000). Students in TSA have the option to participate in competitions either individually or as a part of a team. Students can choose different categories in which to compete including agriculture and biotechnology, website design, dragster design, flight challenge, film technology, computer-aided design (CAD) with 3D modelling, desktop publishing, impromptu public speaking, radio-controlled transportation, or scientific visualization (Technology Student Association 2017).

## **The National FFA Organization**

Originally founded in 1928 and initially referred to as Future Farmers of America (Reese 2008), students interested in agriculture and leadership may join FFA. The National FFA Organization now includes 649,355 student members in grades 6 through 12 who belong to 1 of 7,859 local FFA chapters throughout

the United States, Puerto Rico, and the US Virgin Islands (the National FFA Organization 2017). Students involved in FFA can also run for office and participate in competitive events where they demonstrate their leadership skills related to a career field of agriculture. Students who participate in FFA can also prepare for careers in business, marketing, science, communications, education, horticulture, production, natural resources, forestry, and many other agriculture-related fields.

---

## **Defining Student Success Through Participation in Vocational Student Organizations**

This section of the chapter contains a caveat. Despite the long history of vocational student organizations, there has not been a sustained research agenda examining the relationship between participation in these organizations and student success in vocational courses and programs. This has been cited by several authors and respective studies (Alfeld et al. 2007; Camp et al. 2000; Lankard 1996; Malone 1983; Zirkle and Connors 2003). Much of the research that has been conducted has focused on the area of leadership development. Other areas, such as the acquisition of employability or “soft” skills and positive personal attributes through professional development, technical skill development, and the effects of community service and service learning, have not been researched in significant detail. However, the following discussion will provide some insight into the relative benefits of participation in vocational student organizations and their associations with indicators of student success. The discussion will be partitioned into distinct categories.

### **Leadership Development**

Developing effective leadership skills and exhibiting these skills are a primary goal of participation in a vocational student organization. Students involved in a vocational student organization have reported higher levels of experiences related to leadership through their involvement within their organization (Clark 1978; Hansen et al. 2003). Students have been able to demonstrate leadership by participating in competitions where they display leadership traits that they have learned within their vocational program and student organization (Alfeld et al. 2007; Reese 2011). Many students who were former members of a vocational student organization have obtained leadership roles in such capacities including business, government, and education; one such notable leader who was a former participant in a vocational student organization was former President Jimmy Carter, who participated in FFA (Reese 2011).

A significant portion of participation in a vocational student organization and increasing student excellence is the impact of preparing students to become leaders (Clark et al. 2010; Reese 2008; Townsend and Carter 1983). Students can enhance their leadership skills and acumen by completing competitions and other activities as part of their vocational student organization. Among needed skills for success as a leader are those skills which are identified as “soft skills.” Soft

skills include employability, dependability, teamwork, trustworthiness, and taking initiative, many of which have been enhanced by students participating in a vocational student organization (Ullrich et al. 2007). Students participating in vocational student organizations exhibit and use their soft skills as they compete in competitions, which are also needed to better prepare them for the world of work.

Students in vocational student organizations can develop additional skills related to leadership such as public speaking (Decken 2012). The ability to work in teams and develop teamwork skills has been cited as well, as students learn to work together and create a sense of unity among all members involved in the organization (Blakely et al. 1993; Reese 2010a). Partnerships with other organizations have also resulted in success in the development of student leadership skills. Reese (2008) described the relationship between the Technology Student Association and the DuPont Leadership Academy, in which students learned and demonstrated leadership skills through their involvement in the academy. Students were then encouraged to communicate their newly learned leadership abilities with other members of their chapter.

## **Personal Attributes and Employability Skills via Professional Development**

Alfeld et al. (2007) described professional development as “the acquisition of knowledge and competencies that will be useful for future work in the profession” (p. 5). The development of employability or soft skills needed to be successful in the workplace is perhaps the cornerstone of participation in a vocational student organization. As a cocurricular activity, participation in these organizations’ activities supplements the primary academic and technical instruction found in vocational education programming and provides for the development of these competencies and associated knowledge.

Surprisingly, few studies have examined the impact of participation in vocational student organizations and the development of these attributes and skills. SkillsUSA members found their perceived level of personal and professional development was increased as their participation in SkillsUSA increased (Gordon et al. 1995). The study by Alfeld et al. (2007) found a positive relationship between participation in vocational student organizations and the development of employability skills for the workplace.

Another benefit of participation is the opportunity to network and meet business leaders. Business and industry leaders play an important role in making sure that students are aware of real-world expectations and ensuring students are job ready (Dortch 2014). The practical experience gained through networking increases student excellence through continued experiential learning activities (Threeton et al. 2010).

## **Technical Skill Development**

Needed technical skills for student success, including the development of digital literacy and technical literacy, are emphasized through various activities within the vocational

student organization, as well as how they are connected to specific occupational fields (Stone 2014). Students complete skill-building activities related to their chosen vocational area as part of a vocational student organization. Such activities can include practice for and competition in skill contests (Aragon et al. 2013; DeBates and Pickard 2008; Threton and Pellock 2010; Zirkle and Connors 2003).

Participation in a vocational student organization has shown to have positive impacts on different variables related to student technical skill competency development. Students participating in organizations including National FFA and SkillsUSA have reported increases in technical skills competence as a result of involvement in activities within each vocational student organization (Ulrich et al. 2007). In a student survey, Blakely et al. (1993) found students in FFA felt learning an area of knowledge and developing a skill were important aspects of participation in a vocational student organization.

The area of technical skill development may be a less-emphasized area with respect to vocational student organizations because the development of these skills is a primary focus of a standard vocational curriculum, where a majority of instruction is focused on technical ability (Kuijpers et al 2011). Participation in vocational student organizations may give students the opportunity to display these skills through competitions, but not necessarily as a mechanism for their development, and serve as an incentive for students to develop and enhance their technical competence.

## **Academic Knowledge and Skills**

Students in vocational education programs need to comprehend a variety of information in order to be successful in the workplace. Being familiar with health and safety standards, reading and comprehending the rules and regulations of a given workplace, and being able to demonstrate the correct usage of spelling and grammar and to communicate effectively are imperative (Threton and Pellock 2010). Thus, academic skills such as reading, writing, and computational ability are essential. Participation in a vocational student organization can help to strengthen these skills as students provide evidence of their ability to complete tasks related to each type of vocation through competitions (Threton et al. 2010).

In probably the most comprehensive research study of the effects of participation in vocational student organizations, Alfeld et al. (2007) indicated a positive association when students participated in a vocational student organization among the variables of academic motivation, academic engagement, and grades in comparison to students who did not participate in a vocational student organization. A fairly significant number of studies have examined the relationship of the development of student academic knowledge and skills, including a recent study by SkillsUSA (2017) in which students involved with SkillsUSA reported a perceived gain in grade point average in math, English, and science. Additional studies detailing participation in vocational student organizations and positive effects on student performance when it comes to academic grade point average have also been conducted (Kosloski and Ritz 2014; Manufacturing Institute 2015). Positive gains in student cognitive skills have

been documented by students who participated in the vocational student organization Technology Student Association (Taylor 2006). Increases in a student's grade point average have been attributed to participation in activities where academic learning is contextually relevant and is problem-based (Kosloski and Ritz 2014). The emphasis on the blending of academic learning with vocational student organizations is illustrated by student skill competitions. For example, SkillsUSA has embedded skills related to core academic courses including math, English, and science within its competitions. This allows students to demonstrate excellence in academic skills attainment coinciding with technical skills attainment (SkillsUSA 2017).

## Community Service and Service Learning

Students who participate in a vocational student organization are exposed to a variety of opportunities that prepare them for a career. They can demonstrate civic responsibility and play an active part in bettering the community in which they live through participation in a vocational student organization. Civic responsibility, as a component of a vocational student organization, is exhibited in two major ways, including service learning and community service. Each vocational student organization engages in some form of community involvement, and in a study of state directors, teachers/advisors, and student member, Collins (1977) found that participation provided significant benefits in aiding students to become well-rounded members of society. Alfeld et al. (2007) and Threeton and Pellock (2010) each found some measure of benefit to participation in community service activities through a vocational student organization. Young (2014) discussed the effects of participation and found students to be better prepared for life through the development of skills including collaboration, communication, and project management.

The concept of collaboration for civic benefit is a common theme with most of the vocational student organizations, as many partner with other groups and organizations for community service activities. An example of this collaboration is the national FCCLA annual outreach project, which works with a partner organization to reach into the community and help work toward a cause. Recent efforts have focused on assisting those in poverty and facing hunger and those dealing with the effects of natural disasters (FCCLA 2017).

Unfortunately, this aspect of the vocational student organization experience and how it relates to student success has not been studied in significant detail (Alfeld et al. 2007). Much of the evidence of the effectiveness of these efforts is limited to local outcomes and is anecdotal in nature.

## College/Career Readiness

Participation in a student vocational organization can also help to prepare students for success after high school by allowing them to further develop their interests in a particular career. With a growing concern from employers regarding a lack of

skills for a particular job field (Threeton and Pellock 2010), students participating in a student vocational organization can start to prepare for the world of work and develop their career skills. Students are also exposed to a variety of careers, and in a recent survey, 43% of students in vocational student organizations indicated a willingness to pursue a career in their career and technical field of study (The Manufacturing Institute 2015).

Students participating in vocational student organizations are exposed to a variety of career readiness initiatives including teambuilding, peer networking, and employability skills. Decken (2012) found students who participated in HOSA and related activities felt more prepared to make career decisions, which positively affected their college and career readiness since they were exposed to a variety of experiences.

Students can also demonstrate their desire to further their educational experiences beyond the secondary level through different career awareness activities as part of their vocational student organization. By preparing for competitive events and discovering more about their selected career field, students are engaged in making the determination to continue their education to the postsecondary level (Sun and Yuen 2016). Lifelong learning occurs through the various roles and functions of the vocational student organization and students building an awareness about what motivates them and how this motivation can help them further their careers by engaging and participating in activities of the vocational student organization (Stanislawski and Haltinner 2009).

---

## Conclusion

This chapter has provided an overview of the basic goals and objectives of vocational student organizations, their structure and their organization, as well as an introduction to the various organizations in operation. A discussion of the associations and relationship to determinants of student success to participation in these vocational student organizations was also provided.

As discussed, vocational student organizations are an integral part of a vocational education program offered at the middle school, high school, and postsecondary school level. They are considered cocurricular and are meant to complement the curriculum of a career and technical program. Vocational student organizations were first established through funding from the passage of the Smith-Hughes Act of 1917, and since then vocational student organizations have grown in both the number of organizations and the students who are served.

Despite their long history, and the level of embeddedness in the US vocational system, the relationship between participation in vocational student organizations and their purported impacts on student success has been sparsely researched over the last six decades. Studies of the benefits of these organizations to students have been largely anecdotal or focused on onetime studies in one vocational student organization.

The roles of teachers/advisors in vocational student organizations have been defined and described, yet little is known about their impact on the success

of students. Many teachers/advisors are not compensated for their time with a vocational student organization, and thus, quality of effort likely exists.

It is suggested that a renewed research focus be placed on the participation in vocational student organizations and the resulting effects on indicators of student success. In 2007, the National Research Center began a study (Alfeld et al. 2007) that was cut short due to budgetary and legislative concerns. Thus, no significant study related to this issue has been conducted.

Regardless of these research shortcomings, vocational student organizations still receive significant support at local, state, and national levels, and their presence is keenly felt in the vocational education community. As mentioned previously, over two million students are presently participating in a vocational student organization in the United States (National Coordinating Council for Career and Technical Student Organizations 2017). This statistic is an indicator of the level of interest in having these organizations available to students. However, as this chapter indicates, more information is needed regarding the true benefits of these organizations.

## Abstract

The purpose of this chapter is to contribute to the understanding of skill mismatches, by providing a comprehensive review of the various concepts, dynamic processes, and consequences as well as emerging trends in skill mismatch research. A skill can be understood as either the nature of the skill in itself (work ability or competence) or the individual worker or workforce. Thus, a skill mismatch in terms

645

of the nature of skills is the qualitative discrepancy between what is possessed by an individual and what is needed, whereas a mismatch in terms of the workforce is the quantitative discrepancy between supply and demand of workers. Past researchers have proposed a variety of skill mismatch types according to whether the skills are viewed qualitatively or quantitatively and to the scope in which the mismatch phenomenon covers. The research trends surrounding the concept of skill mismatch have developed greatly since its beginnings when only indirect proxies were used. Now, various research topics on skill mismatch are possible as there is more development in data of skill mismatches.

## Introduction

Since the start of the skill-biased technological change in the economy in 1990, the term skills as “a new global currency” has gained prominence in international education and training policies; many policies emphasize employability of students through the linkage of education and training systems to the labor market to respond to the increasing demand of skilled workforce (Desjardins and Rubenson 2011; Keevy and Chakroun 2015; OECD 2012). However, as the supply for skills has increased due to these policies, another major concern that arose is the problem of skill mismatch, the solution, to which is now deemed as the next important agenda in many countries (Desjardins and Rubenson 2011). As such, the European Commission (2010) has presented mismatches such as skill shortages and skill gaps as some major challenges to be addressed in the labor market, and OECD (2015) has refocused its priority to discussions regarding youth skill mismatch.

Skill mismatch, a very complex and dynamic phenomenon increasingly spreading across OECD countries (Quintini 2011), is a disparity between skill supply and demand, either quantitatively or qualitatively (Cedefop 2009). Interest in the skill mismatch phenomenon began when the supply of college graduates in the United States in the 1970s exceeded the demand in the industry, and the scope of the concept subsequently expanded (ILO 2014). As the unemployment rate of young people increased due to the global economic crisis in 2008, interest in skill mismatch also increased (Cappelli 2015; Cedefop 2015a). In addition, the skill mismatch phenomenon can be seen at various levels, such as individual worker, organization (Cedefop 2010a), and country (Cedefop 2009, 2010a).

However, researchers from different academic fields and various institutions have defined skill mismatches differently. Due to this lack of unified conceptual understanding, problems arise when these concepts are operationalized during studies about skills and skill mismatch, leading to incomparable statistical data (Vallas 1990).

Thus, the focus of this chapter is to review and describe the concept of skills as a multidimensional notion. This is achieved by reviewing past literature including scholarly journals and reports from international organizations, such as reports from ILO, Cedefop, and UNESCO on “skills”, “competence”, “skill mismatch”, and “mismatch”. The aim of this review is to contribute to the growing literature on skills and skill mismatch and to act as a conceptual guideline for empirical research.

## Concept of Skills and Skill Dimensions

### Concept of Skills

There are a variety of definitions and understanding about skills in the literature, which are conceptualized based on different perspectives and purpose of the researches. Skills can either be described as a psychomotor domain of learning, or as a work ability, or as the entire set of workforce skills themselves.

### Skills Described as a Learning Domain

Bloom has identified three domains for developing educational objectives, which are the cognitive, affective, and psychomotor domains (Simpson 1966). Skills, according to some researchers such as Gagne (1949), Mohr (1960), Seashore (1940), can refer to behavior or an action that pertains to only a small part of these learning domains which is the psychomotor domain of learning of Bloom’s Taxonomy of Learning (as cited in Simpson 1971, p. 11). For instance, Pear (1927), one of the earliest researchers to define skill, refers to skill as “the quality and quantity of motor performance of an individual” (as cited in Winterton, Delamare-Le Deist, and Stringfellow 2006, p. 10). Since then, other researchers have started to include not only physical qualities of an individual but also the mental function or cognitive performance of an individual. For instance, according to Hans Renold (as cited in Winterton et al. 2006, p. 10), skill is “any combination, useful to industry, of mental and physical qualities which require considerable training to acquire.”

### Skills Described as Work Ability

Skills could also be viewed as a holistic construct, as it is recently used interchangeably with competence (OECD 2011b) and covers all the cognitive, psychomotor, and affective domains of Bloom’s taxonomy (Cedefop 2013b; Keevy and Chakroun 2015). Skills (or competences) are defined as “the bundle of knowledge, attributes and capacities that can be learned which enables individuals to successfully and consistently perform an activity or task and can be built upon and extended through learning” (OECD 2011b, p.12). This not only describes about what skills are demanded to perform a task successfully, but they also allow for the understanding of how these skills can be achieved and assessed. As the emphasis on enhancing work productivity has increased, skills could be broadly described as ability to

perform a task or a job optimally (Cedefop 2009; ILO 2008; Stoevaks 2017). For instance, Stoevak (2017, p. 11) refers to skill as “the innate or learned ability to apply the knowledge acquired through experience, study, practice or instruction, and to perform tasks and duties required by a given job.” While Welford (1968, as cited in Winterton et al. 2006, p. 11) mentioned that skill is a “combination of factors resulting in ‘competent, expert, rapid and accurate performance’”, he regarded this as equally applicable to manual operations and mental activities. In many researches, skill is mostly defined through the educational-economist point of view, which views skills as a form of human capital. Skills from this perspective are regarded as acquired technical abilities, such as cognitive skills and non-cognitive skills, which contribute to higher productivity in the labor market and also in return able to provide the skilled person with better benefits such as higher wages (Green 2011; Plesca and Summerfield 2014).

### **Skills Described as Skilled Worker**

In the perspective of demand and supply of skills in the labor market, the term “skills” may refer to an individual skilled worker, a group of skilled workers in a firm or in an occupation, or as the entire population of skilled workforce in the labor market. For example, Bejaković and Mrnjavac (2014) asserted that skill shortage appears when the number of individuals with certain skills is lower than the number of jobs requiring those skills, and skill surplus occurs in the opposite situation. Here, “skills” refer to an individual skilled worker. Cappelli (2015) referred to the problem of shortages of engineers or information technology specialists as “skill shortage,” whereby the term “skills” refers to the number of engineers and specialist demanded in the occupation. Similarly, Reymen et al. (2015) have reported a problem of occupation-specific labor shortages or quantitative skill shortages within EU member states, which is a result of the lack of number of jobseekers with the demanded skills applying to recruiting companies. These skill shortages can be alleviated by attracting foreign workers, which also represents a large population of skilled worker supplied across nations and regions. Rothwell (2015) also refers to skilled technical workers as the group of workers working in middle-skilled occupations such as trade workers, technicians, and craftsman.

### **Skill Dimensions and Multidimensionality**

As the previous section has shown, the different conceptualization of skills in literature, this section seeks to clarify the different multidimension of skills. Skill dimensions refer to the different aspects or angles in which skills can be viewed. In the context of vocational education and training, skills are multidimensional in nature as these three dimensions: skill type, skill level, and skill content. Referring to Fig. 1, the number of levels and the extent of the skill type and content are not fixed, but rather they are dependent upon the focus and context of the researchers. More often, a literary research for “skill dimension” or “competency dimension” yields a number of studies that refer only to the skill type as a dimension (Brewer and Coryn 2015; Müller and Turner 2010). However, skills are not one-dimensional, as each skill type could be arranged into hierarchical levels depending on the complexity and the difficulty of the

**Fig. 1** Three dimensions of skills

skills demanded in a job (Chang and Birkett 2004; Na et al. 2003; Stoevaks 2017). While skill type and skill level are more broad and generic, the specific descriptions of required skills within a given level can be understood as skill content.

## Types of Skills

Skill type refers to a number of skills that are grouped together due to their common characteristics or qualities. Various skill frameworks exist, each proposing different lists of skills and their types, as these skill frameworks were developed for certain purposes and according to different national context. For instance, ACT WorkKeys (2014) was developed as a standard for assessing basic skills, whereas some frameworks are developed as a standard reference for curriculum developers to develop curriculum that could cover most of the skills demanded by the industry (CareerOneStop 2017). Thus, it is difficult to generalize the whole list of skills into definite categories. Analysis of several frameworks, as shown in Appendix 1, indicated that there are commonalities in the skill types and these major skill types can be (i) core skills, (ii) industry-specific skills, and (iii) occupation or job-specific skills.

### Core Skills

Core skills are skills which are not related to work performance but are important for lifelong learning, adaptability, and flexibility in work (Brewer and Coryn 2015). Across the frameworks and studies analyzed, it could be seen that core skills can be further clustered into three major groups, which are basic skills, personal and interpersonal skills, and other core skills needed for work. Basic skills refer to the most rudimentary skills that must first be acquired in order to receive further education and training and before a worker can obtain other skills such as other work skills. These include reading, writing, mathematics, and communication skills including listening and speaking (ACT WorkKeys 2014; Brewer and Coryn 2015; CareerOneStop 2017; Casner-Lotto and Barrington 2006; O\*NET Resource Center 2017; O'Neil et al. 1992; SCANS 1991; Stoevaks 2017; UNESCO 2014).

These frameworks have also identified personal competencies which are not only important for a worker to thrive within a workplace, such as self-management, self-esteem, and dependability, but also important in maintaining healthy social relationships with co-workers or clients, such as interpersonal competencies, social skills, honesty, and integrity. An individual's lifelong learning and initiative for learning was also identified as an important skill in several frameworks (CareerOneStop 2017; Casner-Lotto and Barrington 2006; Curtis and McKenzie 2001). Other core skills such as higher complex thinking skills for problem-solving; skills to manage financial resources, time and human resources, and information literacy; and skills to apply technology in the workplace have been commonly identified across all of these frameworks. Some frameworks have included leadership (Brewer and Coryn 2015; Casner-Lotto and Barrington 2006) and fundamental skills in business management (CareerOneStop 2017; Na et al. 2003).

Although core skills are basic, each occupation may demand the same skill with a different level of proficiency. For example, writing skills in SCANS can be divided according to five levels, whereby the first level includes basic recoding of information such as writing a simple job application, whereas level five refers to more complex writing such as writing synthesized information from different sources (Bramucci et al. 2000). Some occupations require level one of basic writing skills at entry level, while other occupations like journalists will require level five of basic writing skills at entry level.

### **Industry-Specific Skill Clusters**

Several frameworks have also identified a skill type that is specific to industry or that is common to occupations within the same industry (CareerOneStop 2017; Na et al. 2003; Singapore Workforce Development Agency 2017). In other words, the skills that are contained within an industry-specific skill cluster can be utilized transferably in several different occupations which stem from a similar family of occupations or professions (Geel and Backes-Gellner 2009). For instance, according to the state of Minnesota (CareerOneStop 2017), a competency model for automation includes two tiers for industry skills, which are industry-wide technical competencies (e.g., design and development life cycles, operations management skills) and industry-sector technical competencies (e.g., context of automation, industrial automation).

Developing industry-specific skills in a workforce has several important implications, especially for labor mobility. Evidence has shown that displaced workers who find new jobs in different occupations of the same industry earn higher than those who switched industries (Weinberg 2001). Industry-specific skills can help reduce the adverse effects of labor market shocks, such as economic failure or occupation becoming obsolete due to advent of artificial intelligence. Moreover, the combination or cluster of skills can be applied in the development of curriculum of an integrated modular training approach for a group of occupation (Randhawa 1978).

### **Job-Specific Skills**

Job-specific skills are also called technical skills (Brewer and Coryn 2015; Stoevaks 2017), vocational skills (Brewer and Coryn 2015), specialized skills (UNESCO,

2014), or occupational competencies (CareerOneStop 2017; Na et al. 2003; Singapore Workforce Development Agency 2017). Job-specific skills are skills required in a certain type of occupation that enable workers to gain benefits in terms of profits or opportunities for better and higher-wage jobs (Brewer and Coryn 2015). Job-specific skills can include specialist knowledge needed to perform job duties, knowledge of particular products or services produced, ability of operating specialized technical tools and machinery, and knowledge of materials (Stoevaks 2017).

## Levels of Skills

Skill level means the position of skills which is assigned to a rank depending on its complexity and its difficulty. Skill levels have a variety of meanings. Depending on the context, it can broadly refer to the skill level based on (i) performance level (Chang and Birkett 2004; Na et al. 2003); (ii) education level, which in earlier researches is taken as an approximate measure skill; (iii) grade level of qualification or certification (Na et al. 2010; Na et al. 2011; Uh et al. 2015); (iv) required skill level to perform a particular occupation or job (ILO 2008; Stoevaks 2017); and (v) the levels or grades that express a successful worker in a National Qualification Framework (Cedefop 2013a, b). Knowing the level of a skill in advance can be useful for measuring skill, assessment and qualification design, education program, and mutual recognition agreement.

### Skill Level Based on Individual's Level of Proficiency

Skill levels could be reflected based on the individuals' level of performance. For example, Na et al. (2003) reviewed about the levels of skills that can be applied during the assessment of a worker's basic competencies and have applied three levels of basic competencies, in their research: high, middle, and low level. These competency levels were derived through a systematic review of various literature including SCANS levels of proficiency, which include five levels from preparatory to specialist and the levels in O\*NET (Na et al. 2003), and are based on the level of proficiency an individual is expected to perform in a task or job.

In another example by Chang and Birkett (2004), the dimension competency includes individual attributes, task performance, and organizational context, which is set on a hierarchical level based on Dreyfus and Dreyfus' (1980) expertise levels (Chang and Birkett 2004). Here, the skills that are expected from a novice worker are less complex than those who are more proficient in the field and have worked for a longer period. Dreyfus and Dreyfus (1980) levels have been used in many researchers for mapping the proficiency level of a worker (Gannon et al. 2016).

### Skill Level as Level of Educational Attainment

Educational levels can serve as an indirect signal for skills and competence (Eurostat 2016). The latest 2011 International Standard Classification of Education has eight levels in total (UNESCO Institute for Statistics, 2012). These levels show the different steps during an educational progression, whereby each step or level has a different degree of complexity and specialization of the content of an education

program. However, the education programs that an individual has participated in or has successfully completed are only an approximation of the skills, knowledge, and competencies mastered at the time of completion (UNESCO Institute for Statistics 2012). It does not include the complete skills obtained outside of the education program. Several researchers (Fouarge et al. 2013; Steedman and McIntosh 2001) have used the ISCED to define low-skilled individuals as individuals who are at ISCED level two or lower or those who completed lower secondary school or lower, as low-skilled or low-educated individuals, in their research. Conventionally, the minimum level of education depicted by ISCED required in an occupation has always been focused more. Therefore, in many researches, skill mismatch was studied using academic ability instead of skill level.

### **Skill Level as Grade Level of Qualification or Certification**

The grade of a qualification is also another aspect of skill level. For instance, in the UK, the NVQ level consists of five levels (UK NARIC 2017), while in Sri Lanka, there are seven levels of National Vocational Qualification (ADB 2011). In Korea, the National Technical Qualification has five levels of qualification which includes craftsman, industrial engineer, engineer, master craftsman, and professional engineer (Na et al. 2010).

Moreover, within a specific qualification level, a particular a certificate can be divided into several levels. Na et al. (2011) proposed three grade levels of basic competencies certificate depending on the passing mark of assessment. For example, those who had obtained a passing criterion of more than 90% in an assessment of basic competencies can be given certificate level 1, while those with a score of over 75% could be eligible for certificate level 2 (Na et al. 2011). Similarly, in Korea, certifications for vocational trainers are also divided into three grades which reflect their skill levels: 1 to 3, depending on the length of their initial training program, participation in professional development programs, and experience in teaching (Uh et al. 2015).

### **Skill Level as Levels in Occupational Standards**

In this perspective, skill level can be determined according to the complexity and difficulty of the required skills to perform a specific occupation (Stoevaks 2017). While some researchers such as Stoevaks (2017) categorize the level broadly to low-level, moderate-level, and advanced-level occupation, the International Standard Classification of Occupations (ILO 2008) offers more explanation on the meaning of skill levels. According to the International Standard Classification of Occupation (ILO 2008), two dimensions of skill are used to arrange occupations into groups which is skill level and skill specialization. The concept of skill level is applied mainly at the top (major group) level of the classification.

However, it is important to note that the main purpose of educational or occupational and skill classifications such as those in the table below was to ease statistical data collection and information. Several problems will arise if researchers rely too much on educational and occupational classification to garner information on skills

because jobs and tasks may not be updated frequently into the ISCO classification (Beblavý et al. 2016; Martinaitis 2010).

### **Skill Levels in a National Qualification Framework**

Qualification framework is a standard instrument to develop and classify qualifications according to fixed criteria in the form of level descriptors (Tuck 2007). It is a framework that can be compared based on the interchangeability of various qualifications in the qualification framework. The levels in NQF represent comparable standards that can be recognized for achieving the level of qualification required to engage in a particular occupation. For instance, EQF and ASEANQF have eight levels, while the Southern African Development Community Qualification framework has ten levels. The number of qualification levels in some countries is determined based on the characteristic and range of their own national qualification system, their own learning outcomes in existing curricula, and programs, based on benchmarking to regional qualification frameworks such as EQF, QF-EHEA descriptors, or Bologna descriptors which is adopted to suit national context (Cedefop 2013a, b) and linkage to Bloom taxonomy or level of learning (Keevy and Chakroun 2015). It is very useful for promoting the movement of people in the global society. It is important to emphasize that skill level is finally considered in comparing and judging this. NQF qualifies a certain level of manpower rather than a complex level of skill, because it is a framework that judges and recognizes a certain degree of difficulty on the assumption that there are various paths instead of one path. Qualification frameworks were developed to facilitate international mobility as it integrates all the skill levels in educational attainment, academic and vocational qualification standards, occupational standards, as well as the levels of proficiency (levels of competency).

### **Skill Contents**

Skill content is the specific component and composition of skills needed in an occupation. ISCO 2008 refers to skill content as skill specialization in each occupation. In ISCO, within each major group, occupations are arranged into unit groups, minor groups, and sub-major groups, primarily on the basis of aspects of the specific skills that are needed in each group (ILO 2008). This skill specialization is considered in terms of four components, which are the field of knowledge required, the tools and machinery used, and the materials worked on or within an occupation.

An occupation itself can be deconstructed into a hierarchy such as job, a task, and an element of a task. Each of this hierarchical level of occupation requires specific components of skills, which includes competencies, as well as tools required, the procedures, and work processes. The competencies are the combination of knowledge, skills, and attitude (Cedefop 2013a), which means that an individual has applied knowledge and skills with their own autonomy and responsibility to perform a task successfully (Cedefop 2013a) (Fig. 2).

Understanding about skill contents and its components have important implications for an individual's acquisition of skills. When creating curriculums for

**Fig. 2** Content of skill by hierarchy of occupation

delivering the skills needed, developers have always focused on trying to develop contents that could deliver the skill type that is proposed in frameworks. However, skill types and its content vary according to levels, and most skill content only refers to broad skill specifications of an occupation or a job. Recently, employer surveys indicate that occupation-specific skills are no longer sufficient to meet the needs of the labor market (OECD 2011a). Thus, for vocational education and training, developers should consider a systematic evaluation of knowledge, skills, and attitude needed to perform a task, the tools, its procedure, and work processes that are required especially for an element of tasks to guide the curriculum development so that proper skill sets are delivered.

## Concept and Types of Skill Mismatches

### Definition of Skill Mismatch

There are numerous definitions in literature, whereby, as summarized in Table 1, each of these definitions has a different focus depending on the nature of the skill data.

Researchers which view concept of skills as workforce have defined skill mismatch as the as the discrepancy between quantity of skilled worker demanded by the labor market and that is supplied (European Parliament 2015; Liu et al. 2016; Manacorda and Petrongolo 1999). While some focused on the number of worker at a particular skill levels (Lundgren and Cohen 1998), others have focused on researching about the discrepancy of demand and supply of workforce having a particular skill type (Holzer 2013).

**Table 1** Skill mismatch defined according to various natures of skill data

Nature of skill data		Definitions	
Quantitative	General	Any imbalance between the demand and the supply of skills (Manacorda and Petrongolo 1999, p.182)	
		A quantitative shortage refers to a situation where labor demand is larger than labor supply (European Parliament 2015, p. 32)	
		Mismatch between the skills supplied by college graduates and skills demanded by hiring industries (Liu et al. 2016, p. 2)	
	Skill level	Mismatch between the skills in demand in the urban labor market and the skill levels of large numbers of the urban poor (Lundgren and Cohen 1998, p. 109)	
	Skill type	Demand <i>for certain skills</i> exceeds the supply of such skills (Holzer 2013, p. 1)	
Qualitative	General	The gap between the skills required on the job and those possessed by individuals (World Economic Forum's Global Agenda Council on Employment 2014, p. 7)	
		Actual mismatch between acquired and required skills (Allen and Velden 2001, p. 436)	
	Skill level	Situations in which workers' skills exceed or lag behind those employers seek (Handel 2003, p. 136)	
		Situation in the labor market where the level of skills of individuals does not match the level of skills required in the jobs (EU Skills panorama 2017)	
		When skills possessed by the workers exceed or do not meet the skills required at their workplace (Perry et al. 2014, p. 138)	
			Actual match between a worker's skill proficiency and the level of skills required by the worker's job (Flisi et al. 2014, p. 1214)
	Skill type	Discrepancy between the skills – both specific and general – possessed by a worker and the skills required by his/her job (OECD 2011a, p. 194)	
Skill level and/or type	A situation in which the level and/or type of skills and abilities of an individual is less or more than the required level of skills and abilities in the job (European Commission 2013, p. 14)		
		Situation of imbalance in which the level or type of skills available does not correspond to labor market needs (Cedefop 2014, p. 231)	
Holistic		Either in terms of excess (over) or deficient (under) qualifications or skills possessed by individuals relative to job requirements (Cedefop 2012, p. 11)	
		Constructed by comparing the skills (or qualifications) of an employed worker with the skill (or qualification) requirements of her job (Pellizzari and Fichen 2017, p. 4)	
		A situation where there is a (qualitative) discrepancy between the qualifications and skills that individuals possess and those that are needed by the labor market (Cedefop 2015a, p. 27)	

*(continued)*

**Table 1** (continued)

Nature of skill data	Definitions
Qualitative + Quantitative	[it] does not only refer to imbalances between formal qualifications and required qualifications in work settings but also to discrepancies between skill demand and supply in a more holistic sense (Cedefop 2009, p. 5)
	[. . .] not only to skill shortages or gaps but also to qualifications, knowledge, and skills exceeding job requirements (Cedefop 2010b, p. 6)
	Skill mismatch refer to when the supply of skills and the demand for skills could be out of synch in either direction. . . A skill shortage is obviously of skill mismatch, and a skills gap could be a general form of mismatch (Cappelli 2015, pp. 252–253)

In contrast, researchers who view the concept of skills as work ability or competence have defined skill mismatch as the difference in the actual skills that are possessed by an individual and the skills required in a job (Allen and Velden 2001; World Economic Forum’s Global Agenda Council on Employment 2014). As mentioned previously, the dimension of skills includes levels, type, and its content; thus, some researchers focus on the mismatch in skill level (EU Skills panorama 2017; Flisi et al. 2014; Perry et al. 2014), while some focus on skill type (OECD 2011a), and others examine the mismatch of a more holistic concept of skills, which is encapsulated in qualifications (Cedefop 2012, 2015a; Pellizzari and Fichen 2017).

More recently, however, reports by institutions related to vocational education and training such as Cedefop have defined skill mismatch from a more integrated perspective, which includes both the number of workforce and the quality of the skill (Cappelli 2015; Cedefop 2009, 2010b). This implies that, in efforts to address skill mismatch globally, vocational education and training institutions have realized that studying about qualitative mismatch is as important as the quantity of desired skill workforce.

### Scope of Skill Mismatches

These definitions have set some boundary or target area which describes the extent to which skill mismatches scope reaches, and this can be shown in Fig. 3. According to Cedefop (2010b), “skill mismatch is a complex phenomenon that affects citizens, enterprises, economies and societies.” This implies that skill mismatch is a concept that could cover both a broad and narrow scope. Some literature reports on skill mismatches data which covers the wider labor market or international (Cedefop 2015b; European Commission 2013; Frogner 2002). As skills are an important capital for both the productivity of organization, skill mismatch concept also covers a narrower scope such as mismatch of skills of a group of workers in a firm and organization (Bennett and McGuinness 2009; Forth and Mason 2006;

**Fig. 3** Scope of mismatch in skill mismatch definition

Jackson and Chapman 2012; McGuinness and Ortiz 2016). Also, it covers a more micro- (Bejaković and Mrnjavac 2014; European Commission 2013; Handel 2003) or individual level (Béduwé and Giret 2011; Kim et al. 2014; Mavromaras and McGuinness 2012; Mavromaras et al. 2015; McGuinness and Sloane 2011; Pouliakas and Russo 2015; Robst 2008; Sanchez-Sanchez and McGuinness 2015; Sloane 2014), which involves the mismatch between individual's skills and those which are required by the organization he is working in.

### Type of Skill Mismatch

Skill mismatch types, in general, refer to both the inconsistencies in the supply and demand of workforce and any occurrence when skill at a particular level or type does not match. The types of skill mismatches investigated in previous studies can be summarized as shown in Table 2 and are categorized according to the scope of the mismatch. Skill mismatch types can vary depending on the topic, scope, and interests of the study.

The type of skill mismatch reported in various literatures include shortage of worker in firm (Forth and Mason 2006; Haskel and Martin 1996; Bennett and McGuinness 2009) or shortage of worker in a macro level (Frogner 2002; Cedefop 2015b; European Commission 2015).

Worker shortage, which views skills as workforce, occurs when the demand of manpower exceeds supply. For example, Bennett and McGuinness (2009) reported that worker shortage had a negative impact on firm-level performance. Cedefop (2015a) argues that there is a difference in worker shortage between European countries and has a negative effect on organizational productivity and performance.

**Table 2** The type of skill mismatch according scope

Mismatch	Scope	Researcher
Shortage of worker	Firm	Forth and Mason (2006); Haskel and Martin (1996); Bennett and McGuinness (2009)
	Macro	Frogner (2002); Cedefop (2015b); European Commission (2015)
Overskilling	Micro	Béduwé and Giret (2011); McGuinness and Sloane (2011); Mavromaras and McGuinness (2012); Mavromaras et al. (2012); Sloane (2014); Kim et al. (2014); Mavromaras et al. (2015); Sanchez-Sanchez and McGuinness (2015)
	Macro	OECD (2011a); OECD (2015)
Underskilling	Micro	Béduwé and Giret (2011); Kim et al. (2014); Sanchez-Sanchez and McGuinness (2015); Pouliakas and Russo (2015)
	Firm	Jackson and Chapman (2012); McGuinness and Ortiz (2016)
	Macro	OECD (2011a); Cedefop (2015b); OECD (2015)
Horizontal mismatch (unmatched skill type)	Micro	Robst (2008); Béduwé and Giret (2011)
	Macro	Robert (2014); Montt (2015)

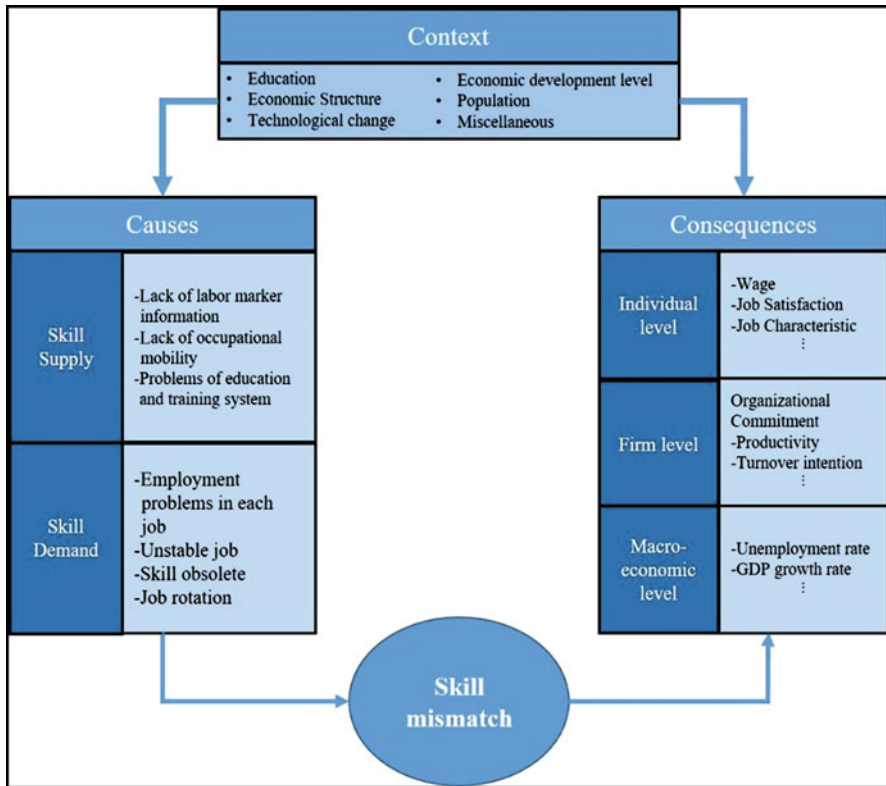

Overskilling and underskilling are another type of mismatch which defines skills according to the qualitative aspect and occurs when the required skill levels are above or below that is demanded, respectively. Much of the studies of overskilling are done at a more microlevel (Béduwé and Giret 2011; McGuinness and Sloane 2011; Mavromaras and McGuinness 2012; Mavromaras; Sloane 2014; Kim et al. 2014; Mavromaras et al. 2015; Sanchez-Sanchez and McGuinness 2015), while only regional institutions such as OECD had reported about overskilling from a macro perspective (OECD 2011a, 2015). In addition to micro- and macro scope of skill mismatch, studies of underskilling also occur at firm level (Jackson and Chapman 2012; McGuinness and Ortiz 2016). Furthermore, in some studies about over- and underskilling, when a particular skill level is unmatched, this is also called vertical mismatch (Béduwé and Giret 2011; McGuinness and Sloane 2011), and when the level is insufficient, this is referred as skill gap (McGuinness and Ortiz 2016).

Horizontal mismatch is a type of mismatch that occurs when a certain type of skill that is demanded is unmatched, and this includes specific type of skills that is encapsulated in a degree major (Robst 2008) or field of study (Béduwé and Giret 2011; Robert 2014).

### Causes and Consequences of Skill Mismatch

Skill mismatch is caused by the imbalance between the supply and the demand of skills, and there are various causes in both skill supply and skill demand side that may contribute to this imbalance (Cedefop 2009; Handel 2003), which is influenced by various contextual factors, as shown in Fig. 4. The consequence of skill mismatch can be seen at various levels, including individual, firm, and macroeconomic, and affects factors such as individual wage, organizational commitment, and workforce unemployment rate (Cedefop 2009).

**Fig. 4** Causes and consequences of skill mismatch

### Contextual Factors

There are several contextual factors that can affect the outcome of skill mismatch including education (Kim et al. 2009), economic structure (European Commission 2013; Quintini 2011), technological change (European Commission 2013; ILO 2014; Perry et al. 2014), economic development level (European Commission 2013; ILO 2014), and population (European Commission 2013; ILO 2014; Perry et al. 2014). The European Commission (2013) found that skill mismatch is consistently influenced by coordination delays and market failures both as a result of complex interactions between skills demand and supply in the market economy and contextual factors. ILO (2014) classifies skill mismatch into two aspects according to skill acquisition and skill requirement and suggested that contextual factors such as economic level and structure, technological shifts, and institutional mechanisms influence skill mismatch. Perry et al. (2014) suggest that skill mismatch increases the demand of certain types of skills because skill change is generally skill-biased in terms of economic structural change, and it has been suggested that gender stereotyping in occupations affects skill mismatch. In addition to this, structural changes

such as the adoption of new technologies and the long-term unemployment rate (Quintini 2011), the phase of business cycle (Gambin et al. 2016; Quintini 2011), and the limits of college education (Kim et al. 2009) also influence skill mismatch.

## Causes of Skill Mismatches

There are various drivers for generating a mismatch of skills according to several researchers and research institutes (Cedefop 2010b; Gambin et al. 2016; Handel 2003; Kim et al. 2009; MERCER 2011; Pavlovska 2014; Quintini 2011). These drivers, as shown in Fig. 4, can be divided into the supply and demand side of the skill.

In terms of skill supply, the causes of skill mismatch include incomplete information on the labor market (Cedefop 2010; MERCER 2011) and education and training system problems (Cedefop 2010; Gambin et al. 2016; MERCER 2011), inadequate investment in training and education (Gambin et al. 2016; Pavlovska 2014; OECD 2011a; Cedefop 2010), lack of intersectoral or interregional mobility (Gambin et al. 2016), lack of information on job seekers (Gambin et al. 2016; Kim et al. 2009), incomplete career counseling and guidance (European Commission, 2013), and lack of preparation for job seekers. Quintini (2011) mentioned about the shifts in unstable job as a cause of skill mismatch, such as time and shift workers, while Pavlovska (2014) suggested that changes in responsibilities at work, the temporality of skills, and the increased demand for working speed were the causes of skill mismatch. The European Commission (2013) presented employment, vacant jobs, job to work, skill requirements and design, recruitment friction, and wage rigidity by division, vocational, and education. In addition, it is explained that when the skill becomes obsolete (Gambin et al. 2016; OECD 2011b, 2015), the skill level in the job and the skill level of the worker are inconsistent and mismatch arises.

Although the causes of skill mismatch are presented in various ways, it is a complicated problem that cannot be confined to either the supply side such as the problem of the education and training system or the demand side such as the employment problem. Therefore, when researching about skill mismatch, it is necessary to give an equal amount of attention to both causes in the demand side and the supply side of the system.

## Consequences of Skill Mismatches

Effects of skill mismatch occurs at various levels including individual level, meso level, and macro level, as suggested by Cedefop (2009) report, while Mauries (2016) distinguishes the consequence of skill mismatch into two perspectives according to individual level, firm, and country level. The individual level mainly deals with the effects of skill mismatch on individual wages, job satisfaction, and job characteristics. Regardless of whether it is temporary or not, the skill mismatch has a negative effect on wages. Firm level mainly deals with the effect of skill mismatch on organizational commitment, productivity of company and organization employing

workers, and turnover intention. For instance, Lim et al. (2017) suggested that organizational commitment is lower where there is mismatch. Similarly, Feldman et al. (2002) suggested that organizational commitment decreases in skill over employment, underemployment, and incomplete employment. Furthermore, Pavlovska (2014) found that one-third of bankers experiencing skill mismatches caused instability and had a negative impact on work productivity. Cedefop (2009) also confirmed that the skill mismatch resulting from skill aging had a negative effect on the productivity of the company as well as underestimated skill. In the case of turnover intention, Cha and Chu (2010) confirmed that workers with overskills had a static effect of 1.5 times more on turnover intention than workers with appropriate skills showing that both the overskill and the underskill directly increase the turnover intentions. Due to the desire to find the right skill and job, the skill mismatch suggests a positive (+) effect on turnover intention (OECD 2012; Sloane 2014).

The macroeconomic level mainly deals with the effects of skill mismatch on the unemployment rate and GDP growth rate of the region or country. For example, Quintini (2011) suggested that the proportion of underskilled worker has a negative impact on the unemployment rate of the United States. Moreover, OECD (2009) concluded that the skill mismatch caused by oversupply of workers with a certain skill enhances unemployment.

This section has been derived from a review of the many studies about the causes and effects of skill mismatches or over education. These interest for an in-depth study about the causes and effects of overeducation and mismatches at individual and a more aggregate levels such as country level or regional level which had initially stemmed from early studies by Freeman in 1976. Freeman had analyzed educational mismatch in the United States between the 1960s to 1970, by examining the match between levels of education of college graduates, with the level of education required by the labor market. These studies were followed by more research of the same topic such as that by Duncan and Hoffman (1981).

---

## Trends of Skill Mismatch Research

Although the interest about overeducation still perseveres to date, with the developments of databases such as PIAAC which enable skills to be measured skill directly, the concept of skill mismatch is now gaining more attention by policy-makers and researchers alike. The megatrends on skill mismatch were examined and presented as follows.

Firstly, in terms of regional perspective, by taking European Union countries as examples, there is a shift of focus from the quantitative to qualitative skill mismatch. Skill mismatches in the EU countries have been developed in a variety of ways according to skills-intensive nature of much economic and technological change (Cedefop 2009, 2010a). The study of skill mismatches in the EU has received renewed attention since the international economic crisis of 2008–2009 (Cedefop 2010a; Flisi et al. 2014). This is due to the deterioration of the labor market due to the slowdown in economic growth since the global economic crisis (Cedefop 2010a,

2014). In Europe, the study of skill mismatch has focused mainly on solving the structural divisions in the labor market and the labor supply and demand (Gregory 2015; Ryu 2014; Zimmer 2012). In recent years, however, studies on the effects of mismatch on labor market performance have been expanded according to the nature of vocational education and training. In addition, research on qualitative mismatches such as skill utilization and proficiency (Allen and Velden 2001; Bender and Heywood 2009) is increasing actively as well as skill mismatch research in terms of supply and demand of manpower.

Secondly, in terms of international organizations, strengthening of education and vocational training as a countermeasure for skill mismatch has been gaining more attention. As part of its international efforts, international organizations have been constantly engaged in discussions to maximize the effectiveness of policy interventions, human resource deployment, and utilization to resolve supply-demand disparities in the labor market and to balance the supply and demand of human resources (McGuinness et al. 2017; OECD 2005).

Since the 1990s, large-scale panel data has been developed as a response to the increasing interest in studying about skill mismatch internationally or nationally. Internationally, the system which provides strong links between education and training and labor market, such as vocational education, has been identified as a tool to address and prevent skill mismatch (The World Economic Forum 2014). These tools however need to be supplied with correct information about labor market, and hence the skill outlook and skill strategy have been discussed recently on how to predict future skill needs. Furthermore, in cases where skill mismatch has already occurred due to the lack of quality education and training system, efforts to mitigate or “treat” these skill mismatch have also been considered (ILO 2014).

Within individual countries, research institutions and governments are no longer focusing on examining the distribution of skill mismatch and their causes and consequences that affect their country. Rather, they have shifted to focus more on international comparisons of skill mismatch situation with other countries to identify the weakness in their own systems or to benchmark other systems. Research trends for skill mismatch at individual country levels vary from country to country depending on the region, especially economic development level. In regions where data on the labor market are relatively structured, such as advanced countries like the United States, Australia, and Canada, data or policy efforts have been developed for a relatively long period of time. Moreover, they have developed their own panel data from the 1970s and have been actively conducting research on skill mismatch measurement using databases on employment and the labor market. Since then OECD has been working on large panel data to collect information about skills in OECD countries. On the other hand, in developing countries or non-OECD countries, systematic research to measure skill mismatches in countries and specific regions (Marelli et al. 2014) has been actively conducted only recently by constructing panel data while comparative researches are also increasing.

The megatrend on skill mismatch topic shows a shift from just debates and literatures about policies on a macro level to the diversification in research topics to include studies about causes and consequence of skill mismatch and various other

discussions that arise through comparative analysis studies. Skill mismatch has begun to be studied as a labor market problem related to employment, whereby unemployment rate is identified to be the cause for skill mismatch and various human resource policies were discussed in relation to this (Greehalgh 1999). Since the 1990s, the research on skill mismatch have been steadily growing and diversified. The study of the causes and consequences of skill mismatches was conducted, and the drivers of skill mismatch including gender (Cedefop 2010b) and ethnicity (Cedefop 2010b) were discussed, while the effects of the skill mismatch are mainly discussed in terms of wage (Bárcena-Martín et al. 2012), job satisfaction, and turnover intentions (Béduwé and Giret 2011). There was also a study on the comparison between countries (OECD 2011a, 2015; Cedefop 2015b; Quintini 2011).

Research methods of skill mismatch have also shifted greatly from only a focus on review of literature and concepts of the skill mismatch phenomenon to include more empirical studies using a wide variety of data as mentioned in the measurement section of this chapter. Skill mismatches have begun with related research on the concept and phenomenon (Murphy 1985). Survey research was conducted to analyze the phenomenon of skill mismatch using large-scale survey data at national level (Cedefop 2015b; Mont 2015; OECD 2011a, 2015) and surveys by individual researchers (Sgobbi and Suleman 2013). Survey initially used proxy values such as education level and changed to measuring specific skills such as skill level, type, and utilization. In recent years, survey data that measures more direct skills such as literacy and numeracy have also emerged.

---

## Conclusion and Implication

Until now the understanding of skills and the researches of skill mismatches have undergone significant developments. In the past, studies of skills and skill mismatch have used indirect proxies such as level of education or qualification. However, due to the availability and developments of databases and surveys which offer direct measurement of skills such as PIAAC, skill mismatches are now entering a new stage whereby the actual skills could be collected rather than using less informative proxies. Despite such developments, there is still room for more contribution to the debate about concepts of skills, its dynamic processes, and its consequence. In this chapter, we do not propose a clear-cut definition of skills and skill mismatches. This is because all the definitions and concepts provided in past literatures have their own importance and emphasis and have been used according to different purposes and context. Rather, we suggest that skills and its mismatches could also include a more holistic perspective and can be viewed through a multidimensional lens.

As the detrimental effects of skill mismatches reach all levels from individual to firm and organizational, country and globally, policies or ways to alleviate these effects should be addressed more seriously. Vocational education and training, as well as workforce development, are one of the tools for the *prevention and treatment* of effects of skill mismatches. Vocational education and its curriculums, which are systematically informed about the prospects of skills needed by employers, can play

a role in delivering the required supply of skilled worker that is demanded by the labor market and thus prevent skill mismatch at initial stage of employment. On the “treatment” aspect, skill mismatches that arise due to the lack of specific skills can be alleviated by developing vocational training which facilitates the upskilling of workers or jobseekers in a targeted skill. A continuous workforce development is especially important for employees to upgrade their skill and keep up with the constantly changing demands of the labor market. However, all of these would not be possible without a proper labor market information system which constantly feeds information about current situation on skills to these vocational education and training and workforce institutions.

## Abstract

Apprenticeships are one of the oldest, yet most popular forms of training at the interface of work and learning and/or the world of education and the world of work. In the first section, we examine the characteristics of different aspects of apprenticeship such as logic, formality, work, learning and teaching. In the second section,

we discuss different paradigms which often lead to misconceptions: (1) the private-training-market paradigm, (2) the young-person paradigm, (3) the advanced-economy paradigm and large-company paradigm, (4) the low-skilled and blue-collar-worker paradigm, (5) the technical and men paradigm, and (6) the discrimination paradigm. In the third section we summarize the results in an “Apprenticeship Maturity Model” with six levels: (1) informal apprenticeships, (2) semiformal apprenticeships / time-served apprenticeships, (3) output-oriented apprenticeships, (4) input-oriented apprenticeships, (5) process-oriented apprenticeships, and (6) collective apprenticeships. The proposed Apprenticeship Maturity Model follows a development logic: A problem arises, is then addressed, and might be solved, and a new problem arises. This process leads to a development with different concepts of apprenticeship which can be described in terms of maturity levels.

## Introduction

The UNESCO “Education For All” program of the 1990s (WCEFA 1990) and the UN Millennium Development Goals (UN 2000) initiative put basic education and primary schooling for all at the center of international interest and moved vocational education and training (VET) out of the spotlight. In 2000, the OECD started the Programme for International Student Assessment (OECD 2000) to evaluate education systems by testing school-related skills and knowledge in reading, mathematics, and science among 15-year-old students. Neither the work orientation of the education systems nor the work readiness of the students were part of the assessment. The global financial crisis of 2007–2008 abruptly changed the situation because young people were hit especially hard. Transfer into employment once again became a central topic, and alongside this increasing problem, VET was rediscovered as the connecting link between education and employment systems. Examples of current international studies include “Learning for Jobs” (OECD 2010a), “Youth and Skills: Putting Education to Work” (UNESCO 2012), “Skills Beyond Schools” (OECD 2014), and “Engaging Employers in Apprenticeship Opportunities: Making It Happen Locally” (OECD/ILO 2017).

In 2016, the unemployment rate among young people aged 15–24 years stood at around 13% according to OECD statistics, more than twice as high as the average of the general population (OECD 2018). The unemployment rate among young people in countries with a dual apprenticeship system was considerably lower than that of these rates, which leads to the conclusion that VET – in line with the labor market – facilitates employment, especially among young people. “Youth unemployment certainly tends to be less often a problem (relative to adult unemployment) in countries like Germany with strong ‘dual’ apprenticeship systems” (OECD 2010a, 34). This assumption has mobilized political engagement to implement or improve

apprenticeship systems in many countries. In the meantime, the assumption has been proven in a cross-country econometric analysis: “one percentage point increase in the apprenticeship coverage rate is associated with an increase in the youth employment rate of 0.95 percentage points and a reduction in the youth unemployment rate of 0.8 percentage points” (Lodovici et al. 2013, 4).

Regardless of the political context, the first and most central characteristic of the concept of apprenticeship is that this form of learning is embedded in the authentic work context and situated in the workplace. “Situated learning” (Lave and Wenger 1991), with all its pros and cons, is therefore the first and dominant learning approach of an apprenticeship. Nevertheless, the shift from informal to more formalized apprenticeships with the creation of the “time-served apprenticeship” was the result of public authority intervention.

---

## **Invention of the Time-Served Apprenticeship**

Formal apprenticeships have a long history, and their major purposes were, at least at the beginning of the ninth century, intended neither to train young people nor to develop skilled workers. The early medieval “time-served apprenticeship” is probably the earliest formal apprenticeship within a legislative framework, in contrast to the already existing purely private “informal apprenticeship.” The time-served apprenticeship was not invented by the medieval guilds but by the medieval cities. Young men were, on one hand, highly mobile and free to travel between cities and, on the other hand, were important as future draftees who would protect the cities against aggressors. To restrict the young men’s mobility and accumulate human capital, medieval cities established “laws lengthening an apprenticeship’s year of service with a master substantially beyond that which free contracting would produce” (Hickson and Thompson 1991, 140). Apprentices committed themselves to the town and, in return, earned the right to open a shop and become a master after a certain period of time. On the contrary, apprentices who fled their masters lost their rights. Even if the mandatory duration differed between industries and cities, all apprenticeship rules obligated young men to serve until they were at least 25 years old. If a familial attachment to a city was assured, masters were allowed to pass their privileges onto their sons. Applicants were rarely rejected on account of their learning abilities, but in case of unsuitability for future military combat, applicants were rejected (Hickson and Thompson 1991). The intention of the time-served apprenticeship was, therefore, to tie young people to the cities. The Statute of Artificers (1563), an act of Parliament in England, stipulated very similar the lengths for apprentices to serve: 7 years and until age of 21 (for married apprentices) and 24 (for not married apprentices) years at least. The intention was to exert control over artisan production and societal life. “Apprenticeship was used to enforce an extensive conception of social order, control and loyalty” (Snell 1996, 305).

On the basis of the first formalized apprenticeships, many different forms of apprenticeships were developed, depending on the local manorial structures and shifts in power. Key actors included the supranational, national, provincial, rural and

urban clerical, temporal, and commercial authorities, which sometimes acted in opposition to each other and were occasionally joined in more or less fragile alliances.

Time-served apprenticeships were very stable in some countries. In Ireland, for example, they survived until 1990. In 1991, the standard-based apprenticeship system was implemented with a National Craft Certificate as a compulsory requirement (O'Connor and Harvey 2001).

---

## **Invention of Standard-Based Apprenticeships**

Guilds, which represented the private craftsmen and trading sector, rose to power with political influence in many medieval cities between the ninth and thirteenth centuries (Mocarelli 2008). They played a major role in the further development of specific requirements for “standard-based apprenticeships” through the control and regulation of apprenticeships (e.g., entry restrictions and trade examinations). The rise of standard-based apprenticeships was less a cause than an effect of the functions fulfilled by the guilds. Guild functions included the creation of wealth (De Moor 2008), the implementation of minimum product qualities and maximum nominal prices (Hickson and Thompson 1991), the enabling of technological invention and diffusion (Epstein 1998), the market exploitation abroad (Soly 2008), the defense of cities in case of attack (Haupt 2002), and the creation of social peace by means of their own jurisdiction (Caracausi 2017). In a record from 1261, for example, a master in London was forbidden by the guilds’ court from enticing the apprentice of another (Seybolt 1917). The intention of the guilds’ standard-based apprenticeship was not only to train and educate young people but to provide cultural socialization. These collectives and their apprenticeship systems offered a strongly interconnected professional and social-cultural character.

One explanation for the decline of the guilds’ power – which began in the sixteenth century – can be seen in changing consumer preferences; if consumers are not willing to pay for quality products and services, a system oriented toward the creation of quality would be in trouble (De Munck 2008). Another explanation is that the guilds “disappeared not through adaptive failure but because national states abolished them by decree” (Epstein 1998, 684). Especially in northern cities and provinces (e.g., Flanders), the guilds were in opposition and often even in open rebellion against the cities and authorities (Haupt 2002). In some countries (e.g., Germany), this tradition was nevertheless restored by monarchic authority in the nineteenth century to strengthen the merchant, craft, and (young) industry sector and was led in combination with a corporatist philosophy to the foundation of a robust and widespread apprenticeship system based on quality and nationwide legal standards (Gessler 2017b). In other countries (e.g., the United Kingdom), this tradition was not restored by democratic authority, which led, in combination with a liberal philosophy, to a fragmented apprenticeship system based on a *laissez-faire* approach (Fuller and Unwin 1998).

Guilds and other forms of corporate collectives were not only present in medieval Western Europe but also in China (Moll-Murata 2008), Japan (Nagata 2008), and India (Roy 2008). However, there is still little research about their impact on apprenticeships.

In the next section, we will extract the underlying characteristics of the concept.

---

## Characteristics of Logics, Formality, Work, Learning, and Training

### Logics: Employment and Education

Angelo Varetto, Head of Standards, Qualifications, and Apprenticeships at Skills for Health (the United Kingdom), defines apprenticeships as follows: “An apprenticeship is a job that includes training” (Varetto 2017, 26). On one hand, this definition seems to be self-evident in an age where lifelong learning and training are basic demands for every job or occupation (Volles 2016). On the other hand, many countries (e.g., the United States and the United Kingdom) face a major challenge under this definition, since employers are often unwilling to train their employees (Cappelli 2015; Green et al. 2016). If employers offer an apprenticeship, the tasks of “training and learning” become part of the job description, even if there are still many ways in which to enable learning on-the-job and to offer training on-, near-, and off-the-job.

The slogan “Apprenticeship is a job” is grounded in an employment logic. Beyond this employment logic, Iannelli and Raffe (2007) describe a second logic or second reference: the education logic. These two logics were used to distinguish between company-based (In the European Commission’s report, the term “work-based apprenticeship” is used. Work-based learning is also possible in schools. The difference between the two schemes has blurred; therefore, we prefer the term “company-based apprenticeships.”) and school-based apprenticeships (European Commission 2012). The basic differences between these apprenticeship schemes (or ideal types) are summarized in Table 1.

The analysis of the apprenticeship systems in Europe identified a few countries with primarily school-based apprenticeship systems and others with primarily company-based apprenticeship systems. In most of the countries, “company-based apprenticeships coexist with other vocational training schemes which are mainly school-based” (European Commission 2012, 30).

A major difference between the two approaches has to do with who has the lead. In company-based apprenticeships, the interested person has to apply for an apprenticeship directly with the company (Fig. 1). The company then selects the apprentice and formalizes the contract. The apprentice is part of the community of practice at the company and has a status equal to that of an employee. It is for this reason that wages are often paid. The involvement and commitment of the company are high, but selection is intensive, and social inclusion is normally low. The dual systems of Germany and Switzerland are company-based apprenticeships.

**Table 1** Basic differences between company-based and school-based apprenticeship schemes (European Commission 2012, 120)

Mainly company-based	Mainly school-based
Training in enterprises $\geq 60\%$	Training at school $\geq 60\%$
Companies offer places Students actively search for places	Training centers and students search for companies
Work contract: Enterprise-apprentice Apprentice = employee	Training agreement: School-enterprise Apprentice = student
High share of financing by enterprises	Public sector is the main source of funding
Apprentice receives remuneration	Apprentice may receive compensation
Companies define training plan	Schools establish training plan

**Fig. 1** Typical governance structure

In school-based apprenticeships, (public) schools (or colleges) are selected by interested persons. The level of social inclusion is mostly high, but the involvement and commitment of the companies are mostly low. Nevertheless, the temporary stay at the company has to be formalized (e.g., trainee contract). The apprentice is not a full and permanent member of the community of practice, and wages are not normally paid. An apprentice is more a student than an employee.

The distinction between employment/education or company-based/school-based raises the question of which of the two forms should be promoted and implemented. The dominant contemporary trend is toward the company-based model (OECD/ILO 2017) because of the expected negative effects of school-based learning (skills mismatch, difficult transition into the labor market) and, on the contrary, the positive effects of company-based learning (skills match and better transition into employment). Learning without work potential is only one side of the coin, the other being work with/without limited learning potential. This aspect requires further elaboration.

**Characteristics of Formality: Informal, Semiformal, and Formal**

Formality seems to be a prerequisite of a nationwide VET approach. The informal apprenticeship model is nevertheless a common approach in countries with a dominant informal economy and with mainly micro and small enterprises, as in many countries in Africa, Asia, and South America. Informal and formal

apprenticeships can also exist side by side (Smith and Kemmis 2013). Steedman (2015) defines two principal attributes of an informal apprenticeship: (1) on-the-job learning and (2) master-apprentice relation. Wages are sometimes paid in cash or in natural goods. In this section, we focus on informal apprenticeships, while formal apprenticeships will be examined later.

Even in cases of informal apprenticeships, a higher degree of formalization is possible through local informal artisan associations, often called informal sector organizations (ISO). These informal organizations sometimes set standards, offering off-the-job training, assessments, and even certificates. In a way, their role is comparable with the influence of the medieval western guilds in the early stages. However, in an informal apprenticeship, contracts between the master and the apprentice are not normally legally binding (although there might be a strong interpersonal commitment), national training standards are not necessary (not existing or not followed), certificates are not recognized, governmental funding is not available, and the informal apprenticeship approach is not part of the national VET policy. The improvement (or upgrade) of the informal apprenticeship approach is directed toward these deficits: including informal apprenticeship in the VET policy (e.g., Niger), setting standards for contracts and training (e.g., Zimbabwe), national recognition of certificates (e.g., Benin), and off-the-job training for informal apprentices (e.g., Egypt). At least six actions might improve an informal apprenticeship system (ILO 2011):

- Capitalizing on the existing system: Strengthening the role of ISOs (if existing)
- Strengthening the apprenticeship contract: Defining the minimum terms (e.g., daily work time, duration of a trial time and the apprenticeship, requirements for completion, liability, how to solve conflicts)
- Bringing new skills into informal apprenticeships: Compensating learning deficits at the workplace through short courses and/or rotation between workplaces at different companies
- Enhancing the quality and reputation of informal apprenticeship: Improving the quality of learning, assessment, and certification (e.g., standards, logbooks, checklist of competence, valid assessments, creditability, and trustworthiness)
- Improving equal access to informal apprenticeships: Improving equal access (e.g., pre-apprenticeship training, involvement of ISOs, information)
- Including informal apprenticeships in the national training system (e.g., recognition of prior learning, defined pathways for former apprentices into the formal VET system)

Two informal apprenticeships should therefore be distinguished: (1) informal apprenticeships and (2) semiformal apprenticeships. The basic logic of all forms is the employment logic. The learning potential of an apprenticeship is, on one side, related to the degree of formalization (duration, certification, curricula) and, on the other side, to the degree of the learning potential of the work and its work environment.

## Characteristics of Work: Defensive and Expansive

An influential and often-criticized study focusing on the influence of the work environment on the performance of workers have been the Hawthorne experiments of the 1920s and 1930s (Gillespie 1991). Embedded in this wider tradition, Hackman and Oldham published the Job Diagnostic Survey, intended “to diagnose existing jobs to determine if (and how) they might be redesigned to improve employee motivation and productivity” (Hackman and Oldham 1975, 159). From the perspective of the work psychology, motivation is a key issue. From the VET perspective, learning is the key issue (including motivation). Even if the goals are not identical, the key dimensions overlap. The original five dimensions of Hackman and Oldham (skill variety, task identity, task significance, autonomy, and feedback) can nevertheless be used to identify the learning potential of work. These criteria are necessary for such an identification, but not sufficient. For our purposes, the dimensions were further developed (Table 2). The perceived individual observation of these dimensions, combined with the individual ability and motivation to shape the perceived potential in relation to the extended peer support, can increase or reduce the learning potential of a workplace.

The criteria in Table 2 are sorted from more work-related (e.g., completeness and complexity of work) to more work-environment-oriented (e.g., development and mistake orientation). The criteria are nevertheless interrelated. Based on these criteria, work/work environment with learning potential (expansive) and work/work environment without learning potential (defensive) should be distinguished. Work and its environment do not automatically enhance learning and promote the development of self-, social, and professional competence. However, some work and work environments, e.g., project work, contain permanent challenges and unsolved problems and promote and require permanent learning on-, near-, and off-the-job (Gessler and Stübe 2008).

Other learning barriers have to be considered within a VET perspective. The learning potential within the workplace is limited to the expertise of the master craftsmen/supervisor, the expertise within a company, the expertise within a region, and the expertise within a country. Apprenticeships mainly reproduce pre-existing knowledge, competences, and expertise. These barriers can be overcome through rotation within a company (internal job rotation), cooperation between companies (external job rotation, e.g., training in a network), reorganization of processes and division of labor within a company (internal job enrichment) or across companies (external job enrichment, e.g., development of new occupational profiles and curricula such as mechatronics or systems engineering), organization of in-company training (internal training enrichment), cooperation with an external training provider (external training enrichment), and knowledge exchange between regions and countries either company-based (internal knowledge exchange and creation, e.g., journeyman, joint ventures) or industry-based (external knowledge exchange and creation, e.g., international cooperation).

**Table 2** Expansive and defensive work and work environments

Job Diagnostic Survey	VET perspective	Relation between work and Learning	
		Expansive learning potential	Defensive learning potential
Task identity	Completeness of action	A low division of work with wide-ranging tasks/problems and related single activities, including problem definition, goal setting, planning, execution, and evaluation (evaluation: Feedback through work)	A high division of work with a focus on isolated activities (e.g., just planning, just execution of narrow activities, external evaluation instead of self-evaluation)
Skill variety	Complexity	Diversity and variety of work, high degrees of vagueness and problems	Monotony of work with equal skills requirements and repetitive activities
–	Time structure	The work organization includes and allows time for self-reflection	Time pressure at work prevents self-reflection
Task significance	Goal orientation and significance	The goal, importance, function, and context of a task or problem is clear	The purpose of the task is unclear
Autonomy	Autonomy and responsibility	High degrees of freedom and decision-making in the work require and create responsibility	Decisions are given by routines, rules, guidelines, specifications, rules; reduced responsibility
Feedback	Social embeddedness, support, and feedback	Suggestions, support, and feedback from colleagues, the team, supervisor, and customer; communality	Limited feedback about the individual, social, and professional performance; individuality
–	Development orientation	Tasks are demanding and within the zone of proximal development	Excessive and overstrained demands, or demands are too low
–	Mistake orientation	Mistakes are used to improve performance	Mistakes are penalized

### Characteristics of Learning: Implicit and Explicit

Polanyi starts from the fact that “we can know more than we can tell” (Polanyi 1966/1983, 4). The way in which cognition is dependent on personal conditions cannot be fully formalized, as one is unable to independently express one’s own dependence (Polanyi 1966/1983, 25). Due to this personal restriction to experience, implicit knowledge cannot be completely expressed. The development of competences at work requires taking implicit knowledge into account, and this aspect has been taken up by the apprenticeship model. It is typical of the learning situation in apprenticeships that there first be cooperation between the apprentice and master craftsman (or experienced worker) while working with real tools on real work pieces within an authentic work environment on behalf of a client. Learning matter is highly

orientated toward real application. The degree of task difficulty, while being guided by the expert, gradually increases over time. The learning is situated (Lave and Wenger 1991) and a social-cultural activity (Guile and Young 1998).

Following the systematization provided by Nonaka and Takeuchi (1995), this counter-practice enhances the transfer and development of implicit knowledge through *socialization*. Professional competences as well as values and social and personal competences are developed through this form of learning from a role model (Bandura 1977). By means of practice, the tacit knowledge is experienced, internalized, and routinized. The strengths of this learning mode are the development of implicit “know that” (declarative implicit knowledge), implicit “know-how” (procedural implicit knowledge), implicit “know when” (conditional implicit knowledge), and, to some extent, implicit “know why” (conceptual implicit knowledge). Crooks and Alibali (2014, 348–349) distinguish six forms of conceptual knowledge: (1) connecting knowledge (“understanding of relationships and connections within a domain”), (2) general principal knowledge (“understanding of principles that govern a domain”), (3) knowledge of principles underlying procedures (“understanding the basis for procedures or knowing why a procedure works”) (4) category knowledge (understanding the “categories that can be used to organize knowledge within a domain”), (5) symbol knowledge (“awareness of what symbol means”), and (6) domain structure knowledge (understanding of the underlying structures of a domain). Some of these can also be learnt through socialization (e.g., symbol knowledge). Others require explanation (e.g., domain structure knowledge). Self-development is limited to the availability of external role models and does not incorporate systematic improvements. “Implicit learning” (Eraut 2004) is mostly defensive, unconscious, and limited to the reproduction of given practices in the workplace.

Further learning requires the externalization of implicit knowledge (from both sides) in order to enhance *dialogue*. The development of explicit and conscious “know that,” “know-how,” “know when,” and “know why” needs, in addition, first, a *reflection* in and on the practice and, second, a *workplace recontextualization* to develop knowledgeable practice and action-taking (Evans 2016). In the event of difficulties, the master craftsman, an expert in his field, can now support the learner with advice and explanations (Brown and Cole 2000). Through dialogue, the learning potential expands. Learning is mainly situated, but it is also cognitive (Anderson et al. 2000). It is also partly defensive, reactive, and limited to the reproduction of given practices within a community of practice. Eraut (2004) calls this modus “reactive learning.”

Another step would be, first, the *validation* of the insights (verification or falsification) relating to, and compared with, explicit knowledge, the state of the technique in a landscape of practice (Wenger-Trayner et al. 2015), in combination with, second, the *workplace recontextualization* of the validated knowledge. With this step, the apprentice, as well as the role model (e.g., the master craftsman), crosses the boarder of a local community of practice. Learning is mainly cognitive but also situated. It is less defensive or analytical but limited to the reproduction of given practices within a landscape of practice. Eraut (2004) calls this modus

“deliberative learning.” We have to differentiate horizontally the levels of embedding and apprenticeship: the workplace, the community of practice, and the landscape of practice.

Vertically, again through reflection (self and with others) and based on the validated or unvalidated *explicit* knowledge, *meta-knowledge* (meta-declarative, meta-procedural, meta-conditional, and meta-conceptual knowledge) can be developed through metacognitive learning. Meta-knowledge includes knowledge and regulation of cognition. Meta-knowledge enhances strategic thinking and self-regulated learning and is a prerequisite for expansive learning and innovations (Kuhn 2000; Hacker et al. 2009). “In expansive learning, learners learn something that is not yet there” (Engeström and Sannino 2010, 2). Metacognitive learning requires *learner recontextualization*, which is critical to the development of professional and occupational identity (Evans 2016). This learning mode is subsumed under deliberative learning in the typology of informal learning proposed by Eraut (2004). We suggest a distinction between implicit and explicit (reactive, deliberative, expansive) learning and reactive and deliberative learning, on one hand, and expansive learning on the other. Also reactive learning can, to some extent, be expansive, while deliberative learning is not necessarily expansive. Meta-knowledge can be referenced to the workplace, the community of practice, or the landscape of practice and is, therefore, also reliant on workplace recontextualization to become productive.

It is obvious that the quality of learning within apprenticeships rises in relation to horizontal and vertical expansion. A third dimension has to be considered: horizontal and vertical expansion, and internalization and routinization require time. Dreyfus and Dreyfus (1986) distinguish between different skills levels: (1) novice, (2) advance beginner, (3) competence, (4) proficiency, and (5) expertise (Dreyfus 2004). Empirical results for different domains showed that at least 10 years of relevant experience – supported by training – was necessary to reach the status of an expert (Ericsson 2014a). Nevertheless, “10 years of experience in a domain does not guarantee that expert performance is attained” (Ericsson 2014b, 10). The progress of skills acquisition does not seem to be linear. The length of time required to reach a higher level extends from level to level (Ericsson 2014b, 11). These results lead to the following exemplaric relation between the duration of skills acquisition and the skill level attained (Table 3).

The duration of an apprenticeship (including training) should therefore be as a rule of thumb between 3 and 4 years so that the apprentice can at least attain the level competent after the completion of his/her apprenticeship. Becoming an expert require more than just time or the acquisition of skills. The character of expertise

**Table 3** Duration and skills level

Ericsson (2014b)											
Years	1st	2nd	3rd	4th	5th	6th	7th	8th	9th	10th	>10th
Forms	Novice	Advanced beginner		Competent			Proficiency			Expert	

Dreyfus and Dreyfus (1986), Dreyfus (2004)

is described with different terms and concepts, such as “knowledgeability” (Wenger-Trayner et al. 2015), “vocational Bildung” (Tyson 2016), “competence 3.0” (Mulder 2017), “wisdom” (Hawse and Wood 2017), or “mindfulness” (Hyland 2017).

## Characteristics of Training: On-the-Job and Off-the-Job
