The career of workplace learning began in the early 1990s. It was the result of the discontent surrounding the output of institutional learning. On one hand, institutional learning seemed to overeducate, yet, on the other hand, it did not teach and train the skills required at the workplace (Fitzgerald 1986). Learning at the workplace “may benefit from being unfettered from the constraints of formal settings” (Billett 1992, 152). In the late 1990s, the constraints of workplace learning became visible. For example, the limited development of conceptual knowledge at the workplace was observed (Billett and Rose 1997). At the beginning of the 2000s, the complementary function of workplace learning (on-the-job) and formal learning (off-the-job) was discovered: “Learning on-the-job was perceived to be more real life and focused on the ‘how’. Learning off-the-job was less pressured, broader in scope, more theoretical and concerned with ‘why’. The findings indicate that these two environments make valuable, but different contributions to apprentices’ learning and support the need for both” (Harris et al. 2001, 26). This finding supports dual apprenticeship approaches. A recent study on the effectiveness of the dual apprenticeship approach in Germany shows “that during vocational instruction, apprentices significantly improve their performance (a large effect). [. . .] The results strengthen the proposition that dual vocational learning is a powerful system for skill acquisition. [. . .] For instance, we are yet unable to say which part of the dual education – the learning at a vocational school or the working and learning at a training company – contributed most to this finding, given that ‘instruction’, for our sample, refers to the dual VET treatment as a whole” (Deutscher and Winther 2018, 27–28).

The next question concerns the precise quantitative relationship in which the two approaches ought to be placed. Based on several surveys and conclusions (Verespej 1998; Bruce et al. 1998; Marsick and Watkins 1990), as a rule of thumb, it can be summarized that about 60% of the competences needed in a workplace are acquired at the workplace through incidental learning (not intentional, not highly structured) and informal learning and training (intentional, normally not highly structured). About 40% of the required competences are therefore acquired through more or less structured nonformal and formal training.

These data fit the European Commission’s (2012) definition of company-based apprenticeships (training in companies  $\geq 60\%$ ). School-based apprenticeships (training in schools  $\geq 60\%$ ) would therefore generate a systematic mismatch, which makes training for graduates necessary, even after completion of a school-based apprenticeship. Nevertheless, other factors also affect the education-job match, especially social background (Livingstone 2010). Moreover, training for graduates would also be needed after completion of a company-based apprenticeship if the apprentice changes company (Geiben and Grollmann 2017).

Forms of informal learning/training at the workplace include self-directed learning, guided on-the-job training, study visits, participation in learning and quality circle, coaching/supervision, mentoring, and networking. The informal training of apprentices was further elaborated in a literature review (corpus: 18 research articles) by Mikkonen et al. (2017). The authors identified six major guidance practices at the workplace (experts and novices working together: experts monitoring, providing help if needed; explanations, providing information, categorization, transferring tacit knowledge; reflection, conversations, discussions, feedback; scaffolding and fading; observation and demonstrations; independent work and experimentation) offered by four providers (the entire work community, including designated trainers, fellow workers and employers and clients, peers, teachers from vocational institutes, and designated workplace trainers). The guiding principles demonstrate that mostly (limited) horizontal expansion is enhanced through informal training at the workplace. Informal training is necessary, but not sufficient. For this reason, additional structured in-company and off-site training is needed to expand both horizontal and vertical.

---

## Paradigms, Conceptions, and Misconceptions

In this section, we discuss different paradigms which often lead to misconceptions about the concept of apprenticeship: (1) the private-training-market paradigm, (2) the young-person paradigm, (3) the advanced-economy paradigm and large-company paradigm, (4) the low-skilled and blue-collar-worker paradigm, (5) the technical and men paradigm, and (6) the discrimination paradigm.

### The Private-Training-Market Paradigm

Apprenticeships can be seen as goods developed on a private training market. The points of view range from “very unattractive option” to “attractive option under certain conditions” to “very attractive option.” The perspectives can be grouped: we distinguish between a *deficit-orientated perspective* and a *resource-orientated perspective*. Arguments supporting a deficit-orientated perspective include:

- *The poaching argument:* Companies offer little or no apprenticeship “if they are located in a region with many nearby firms that could potentially poach their apprentices” (Mühlemann and Wolter 2011, 561). This increases the demand for school-based and publicly financed apprenticeship models.
- *The levy argument:* Companies are risk-averse in making investments. Investments in apprenticeships are considered relatively risk-free if offered to a firm’s own employees and if costs and expected dropout are low. A levy reduces some of the financial risk, but it does not guarantee that more employers will become engaged or that engaged employers will train more (Gambin and Hogarth 2017).

- *The subsidy argument:* Subsidies or tax reductions are offered to share costs and stimulate engagement. In countries where subsidies are offered, unintended effects may become visible. Employers “are actively incentivized to relabel training courses as apprenticeships that they previously paid themselves” (Richmond 2018, 21).
- *The precarious workers argument:* Apprenticeships may “locks-in” already disadvantaged young people to precarious pathways, and reinforces the nature of an already highly gender-segregated [...] labour market’ (Klatt et al. 2017, 473).
- *The information asymmetry argument:* Companies may capitalize on trainings because information asymmetries are in place and can pay wages below the productive added value (Acemoglu and Pischke 1998).
- *The inequality argument:* Recruitment of companies (if not targeted at low-skilled and low-paid jobs) is selective and depends on the expected characteristics – e.g., sociocultural background, gender, age, behavior, skills – of a prospective apprentice. This leads to exclusion and publicly financed substitutes (Deissinger 2015).
- *The well-run economy argument:* Company-based apprenticeships are widely dependent on a functioning economy. The collapse, e.g., of the Irish construction industry (2008–2013), led to a collapse of the apprenticeship system which was until then a well-functioning system in this sector and which was “exalted as a model of excellence when economic drivers were favourable” (Murchadha and Murphy 2016, 383).
- *The outcome argument:* Embedded within a framework of neoliberal thinking, only the criteria specified as learning outcomes (usually in terms of behavioristic skills or competencies) must be met. Rules and processes for selecting and agreeing appropriate learning and training content, syllabuses, curricula, training ordinances, supportive infrastructure, qualified apprentice supervisors, and trainers, being embedded in a community of learners, are seen as unnecessary. The key message: Abolish institutional or formal training, leave apprentices alone, and privatize skills acquisition to achieve the same (bad) learning and training conditions for all (Young and Allais 2011).
- *The flexibility argument:* Occupations are too broad to train and learn them. After defining occupations and standards for these occupations, the occupational standards are broken down into functional units – by ignoring the interdependence, the real work processes and the necessary work process knowledge – through task analysis, functional analysis, or the DACUM approach, which are then transformed into units of competence (equivalent to a qualification) which are further described by competencies (usually in terms of behavioristic skills). Each unit of competence or qualification can be trained, learned, and assessed in an isolated manner. This enables short-term training and “flexibility” for employers and learners (Mansfield and Mitchell 1996). In sum, this approach produces thousands of units that are no longer controllable, confusion on the employer and learner site, a shift from a logic of quality and content orientation to a logic of registration and bureaucracy orientation, increase of assessment expenditure

(with the rise of the assessment and private consultancy market), and, finally, low-skilled (best case) or unskilled (worst case) employees (Allais 2016).

- *The global connectivity argument:* Businesses are globalizing their supply chains, markets are international, and labor is internationally mobile, but apprenticeships are still traditionally oriented toward local and national needs. “In short, the more that nations push VET down local and national paths, the more they undercut its value by depriving it of the greatest of all economic and social advantages in today’s world: internationalism” (Shaw et al. 2016, 102).
- *The rethinking argument:* In some sectors, the poor training culture cannot be changed. Apprenticeships have to be rethought, and alternatives, such as virtual learning environments and workplace simulations, should be considered (Abdel-Wahab 2011).
- *The not my business argument:* Many employers “tend to be reluctant to invest in apprenticeship training, as they expect the broader E&T system, funded by individuals or the taxpayers, to produce appropriately-trained employees that they can hire using competitive pay strategies” (Chankseliani et al. 2017, 61–62).

Arguments supporting a resource-orientated perspective include:

- *The social partnership argument:* Nationwide, apprenticeships are more successful if they are based on social partnership agreements between key stakeholders, such as employers, trade unions, and government (Nyhan 2009).
- *The equality and trade union argument:* Apprenticeship programs, organized with trade union participation or by trade unions, are better at integrating minorities (Bilginsoy 2005) and women (Berik and Bilginsoy 2000) and have higher completion rates (Bilginsoy 2003) than programs organized without trade union participation.
- *The pre-training competencies argument:* Pre-training competencies – especially problem-solving competences – acquired in schools before starting an apprenticeship are “associated with higher productivity of apprentices, which in turn lowers the firms’ training costs” (Jansen and Pfeifer 2017, 57).
- *The profit argument:* Apprentices are less productive than skilled workers, but they are nevertheless productive. Under certain conditions and in certain occupations (trade, commercial, craft, construction occupations), this can lead to gross company profits in the short term. However, apprentices in manufacturing occupations produce net training costs during their apprenticeships, but long-term company profits thereafter (Mohrenweiser and Zwick 2009).
- *The benefit argument:* Qualitative apprenticeships can have several positive effects such as innovation and the transfer of ideas, better organizational fit, a pool of specifically skilled workers, savings from the non-recruitment and induction of workers from external sources, easy replacement of ageing workers, lower labor turnover, more committed employees and the cultivation of a culture of sincerity and loyalty, overall greater competitiveness of the organization, and an enhanced reputation for the business and organization (Asghar et al. 2016).

- *The sectoral levy argument*: Sectoral levies (e.g., building and construction) can work if the levy is bargained on the basis of collective agreement and commitment from mostly equal companies (not dominated by major players) and if the money is used as an investment to improve the cross-company training capacity (e.g., sectoral training centers) within an industrial sector (Billett and Smith 2003). If the collective money can be privatized (single companies, single stakeholders, e.g., consultants), deadweight effects occur (Kuczera 2017).
- *The nonfinancial subsidies argument*: Nonfinancial subsidies – E.g., adjustments in apprenticeship design to make apprenticeships attractive for employers and apprentices, assisting employers in providing apprenticeships with the purpose of “capacity building” (e.g., better apprentice supervisors and trainers) – “could make apprenticeships profitable for an employer” (Kuczera 2017, 11).
- *The relative wages argument*: Wages increase over the apprenticeship period relative to the growth of individual productivity, which depends on individual abilities and the share of demanding skilled work conducted (Mühlemann 2016). Some companies pay wages relative to the level of productivity, and the grades achieved in the off-the-job training in vocational schools/colleges/universities (Gessler 2017a).
- *The occupation argument*: The development of competence – “as an integrated set of capabilities acquired by professionals which enable them to effectively carry out tasks, solve problems, shape innovations” (Mulder 2017, 1098) and occupational identity (Fuller and Unwin 2013) – requires time, supportive conditions, and an orientation toward a coherent and holistic bundle of skills, occupations or occupational profiles (not parceled and fragmented occupational standards), needed at the workplace (Brown et al. 2007).
- *The youth employment argument*: An “increase in the apprenticeship coverage rate is associated with an increase in the youth employment rate” (Lodovici et al. 2013, 4).
- *The transferability of skills argument*: If apprenticeships foster the acquisition of special skills through on-the-job training and general or transferable skills through off-the-job training, apprentices can switch between employers and occupations, which can enhance individual wealth, overall advantage, and further the development of expertise within a sector (Mueller and Schweri 2015).
- *The social media argument*: The use of social media technology can enrich vocational education and training and especially improve the connectivity between in-company learning and formal learning in educational institutions, thereby also bridging private learning environments with public learning environments (Neumann and Ueberschaer 2014).

A misconception in this context means that an argument is considered absolute. While the different arguments in certain contexts are true, they are interrelated and often conflicting – e.g., engagement and intrinsic motivation/subsidization and extrinsic motivation; centralization/participation; readiness for immediate employment/readiness for higher education; high equality/high esteem; flexibility/occupation – which can lead to a moving target reform process (Jørgensen et al. 2018).

## The Young-Person Paradigm

For centuries, the concept of apprenticeship was placed within a specific progression (apprentice-journeyman-master) and focused on the relationship between an older and experienced person or group (guilds) who shared his, her, or their experience in a specific field with a younger and inexperienced person in the same field (Reyerson 1992; Epstein 1998). This basic concept, which we call the young-person paradigm, still exists, especially in countries where apprenticeships comprise part of upper secondary schooling and compulsory education (e.g., Switzerland and Germany). The Swiss scholar Gonon (2011, 33) defines apprenticeships as follows: “Apprenticeship is a mode of learning, focusing on a specific learning site as well as a form of legitimate organisational setting in order to qualify and educate young adults for work and society.” The apprenticeship system in Germany also predominantly addresses young people, but this orientation is in transformation. The mean age of all apprentices rose from 18 years in 1993 to 19.7 years in 2016, and the proportion of 24+ rose from 3.4% in 1993 to 11.9% in 2015 (BIBB 2018, 167). Under pressure from demographic change, companies have already started pilot projects to train younger and older apprentices in the same program (Nordmetall 2014). Nevertheless, a survey of Swiss-German companies showed that there are still many companies oriented toward younger people and who discriminate against older applicants (Imdorf 2012). In other countries, such as Australia, apprenticeships are available for both younger and older persons (Sparks et al. 2009), and in some countries (e.g., Canada, Finland (Finland is currently reforming the system so that apprenticeships can also be offered to young people.), and the United States), apprenticeships are predominantly for adults (Smith and Kemmis 2013; Virolainen and Stenström 2014).

The young-person paradigm also featured in an early definition by the International Labour Organization (ILO). In a 1939 definition, an apprenticeship was defined as “any system by which an employer undertakes by contract to employ a young person and to train him [or her] or have him [or her] trained systematically for a trade for a period the duration of which has been fixed in advance and in the course of which the apprentice is bound to work in the employer’s service” (ILO 1939, quoted from ILO 2012, 2). By the time of the ILO’s 1962 definition, the term “young person” had been abolished. An adequate and nondiscriminatory framing of the concept of apprenticeship would focus on the difference in expertise between a learner and a trainer, mentor, supervisor, or instructor – in line with the novice-expert paradigm (Dreyfus and Dreyfus 1986).

## The Advanced-Economy Paradigm and the Large-Company Paradigm

Some advanced economies (e.g., Austria, Denmark, Germany, and Switzerland) are known for their extensive apprenticeship system, even if the differences between the concepts in practice are large (Bauer and Gessler 2017). However, apprenticeships in

other advanced economies (e.g., the United States) play only a minor role (Lerman and Rauner 2012). Seldom recognized in the international discourse is the fact that middle-income countries (e.g., Peru) have also an established dual apprenticeship model since the 1980s (Angles and Lindemann 2019). Therefore, an advanced economy is neither a necessary precondition nor a guarantee for the establishment of an apprenticeship system, especially if the beginning, where the grounding of the medieval apprenticeship model in the craft sector is considered. Technological invention and diffusion were not a precondition but an effect of the medieval apprenticeship system.

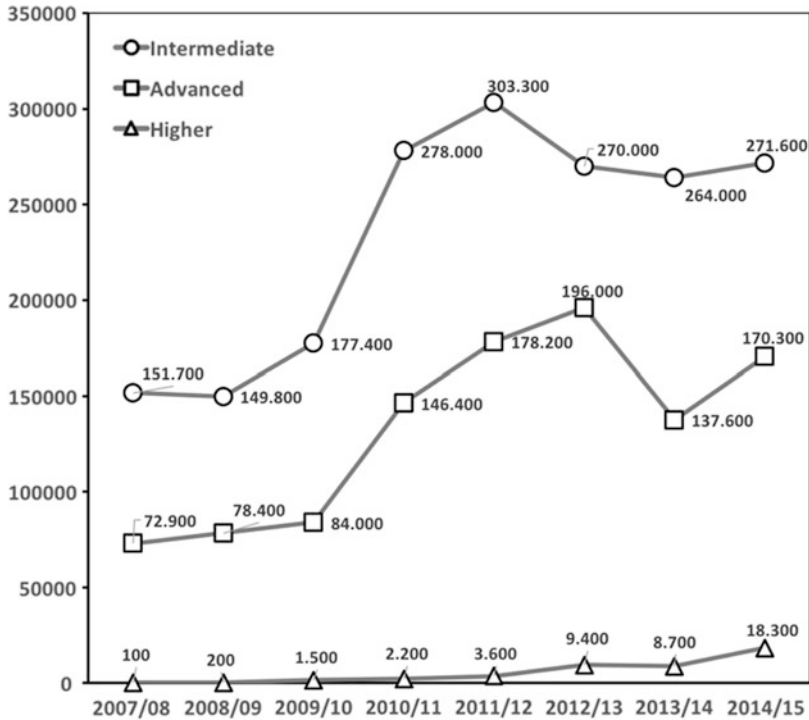

The large-company paradigm is akin to the advanced-economy paradigm. In line with the European Commission's definition, a micro company has fewer than ten employees, a small company fewer than 50 employees, and a medium-sized company fewer than 250 employees. These markers are not applicable to countries with a smaller population (e.g., Uruguay) or even in countries with larger populations (e.g., China). The concept "large company" is a cultural, societal, and economic construct. The second aspect is that larger companies might have a special human resource department, but productivity and commitment to apprenticeships are not dependent on the number of employees. Other factors (e.g., readiness to train) are more important. Therefore, a large company is neither a precondition nor a guarantee for the establishment of an apprenticeship, especially if, once again, the beginning and grounding of the medieval apprenticeship model in micro and small organizations are considered.

## **The Low-Skilled Paradigm and the Blue-Collar-Worker Paradigm**

For decades, countries with a strong apprenticeship tradition (e.g., Germany and Switzerland) and a high proportion of employed apprentices were criticized for their low proportion of tertiary graduates, and the conclusion was drawn that "reforms are necessary in a number of areas. Most importantly: tertiary graduation rates need to be lifted further to ensure a sufficient supply of highly qualified labour" (OECD 2010b, 125). In the same year, the OECD praised the strong dual apprenticeship system of Germany (OECD 2010a, 34). The recommended academic drift is now often associated with the terms "skills mismatch" (McGuinness et al. 2017) or "labor mismatch" (Mateos-Romero and Salinas-Jiménez 2018).

Nevertheless, the low-skilled paradigm is a challenge, especially in the context of a desire to rapidly expand a national apprenticeship system. An example of this challenge is the rapid growth of the apprenticeship system in the United Kingdom (see Fig. 2) (More recent data about apprenticeships by level were not available in January 2018. FE Data library – Apprenticeships: <https://www.gov.uk/government/statistical-data-sets/fe-data-library-apprenticeships#apprenticeship-participation>).

The reintroduction of the apprenticeship system in the United Kingdom (the previous program was abolished by the Thatcher government, 1979–1990) led to some unexpected effects:

**Fig. 2** The development of the apprenticeship system in the United Kingdom (Department of Education and Education and Skills Funding Agency, last updated 2017)

- Between 2009/2010 and 2011/2012, there was rapid growth in very short apprenticeships, “with some lasting just six weeks” (Pullen and Clifton 2016, 9). The government reacted and, in 2012, introduced the minimum standard of at least 12 months.
- Over two-thirds (64%) of all apprentices in 2014 were “internal recruits” (i.e., they were already employees of the company before they began their apprenticeships) and were mostly aged 25+ (BIS 2014, 22). Most apprentices over the age of 19 (80%) had already reached the qualification level they would gain in the “‘Intermediate Apprenticeship’ (European Qualification Framework [EQF]: Level 2), and many apprentices over the age of 19 (56%) who started an ‘Advanced Apprenticeship’ (EQF: Level 3) already had a full Level 3 qualification before commencing. The terms “internal recruitment” and “already reached qualification levels” may lead to the conclusion that growth in the apprenticeship system “was largely driven by employers seeking to secure government funds for workplace learning” (Pullen and Clifton 2016, 9).
- In 2014/2015, 59% of all apprentices in the United Kingdom were enrolled in EQF level 2 (so called “Intermediate Apprenticeship”), 37% in EQF level 3

(so called “Advanced Apprenticeship”) and only 4% in EQF Level 4 (so called “Higher Apprenticeship”). In comparison, Germany’s dual apprenticeship system is not offered at EQF Level 2, as 1-year apprenticeships are prohibited by the Federal Vocational Training Act/Crafts Code. 8.5% of apprentices are enrolled in EQF Level 3 for occupations requiring 2 years training, and 91.5% are enrolled in EQF Level 4 for occupations requiring 3–3.5 years training (BIBB 2018, 128).

The low-skilled paradigm is, therefore, not a characteristic of an apprenticeship system but can be an effect of an insufficient political and legal framework, in combination with low employer commitment. The blue-collar-worker paradigm is related to the low-skilled paradigm. Another abbreviated version of the apprenticeship concept is the sole focus on blue-collar workers. This orientation overlooks apprenticeships that operate in certain sectors (e.g., healthcare), certain occupations (e.g., business administration), and in cooperation with higher education institutions, such as colleges or universities. These “degree apprenticeships” (the United Kingdom), “dual higher education study” (Germany), or “licence professionnelle” (France) were, at least in Germany (Hahn 2012) and France (Calmand et al. 2014), fast-growing sectors. In Germany, for example, 39,622 companies and 64,358 student apprentices were inscribed in 1014 dual higher education programs in 2013. In 2016, these figures reached 47,458 companies with 100,739 student apprentices inscribed in 1592 dual higher education programs (Hofmann et al. 2017). Dual higher education studies are especially appropriate for countries with a weak apprenticeship tradition and a well-developed higher education system such as in the United States (Powell and Fortwengel 2014; Gessler 2017a) or Chile.

## The Technical Paradigm and the Men Paradigm

Even if the term “technical vocational education and training” is used in Asia, vocational programs are not limited to technical fields. At least four major fields can be identified: (1) engineering, manufacturing, and construction; (2) business, administration, and law; (3) health and welfare; and (4) services. On average, across OECD countries, most of the diplomas earned in upper secondary vocational programs are from “engineering, manufacturing and construction,” but the share is just 33% (OECD 2017, 56). This figure demonstrates that there is a technical bias in the system. Nevertheless, the technical field is one among many. The technical paradigm, for instance, is often related to gender.

On average, across OECD countries (OECD 2017, 54), the share of female graduates from upper secondary vocational programs in “health and welfare” is much higher (around 90%) than in “engineering, manufacturing and construction” (around 10%), while the shares in “services” and “business, management and law” are high (around 60%). This figure demonstrates that the technical bias is related to a

gender bias. Male and female attendance is not balanced in the different fields, and gender segregation and unequal pay and career opportunities are still a reality in many countries (Penn 1998; Fuller et al. 2005). The gender aspect leads to the last paradigm: the discrimination paradigm.

## The Discrimination Paradigm

Even if there is insufficient research on the correlation between discrimination and the two types of apprenticeships mentioned above, it is probable that company-based apprenticeships are more prone to discrimination than school-based apprenticeships.

The discrimination paradigm is not a misconception. In fact, if discrimination is a characteristic of the economic or societal system in which the apprenticeship system is embedded, then the apprenticeship system also includes discrimination. In some countries, this has been obvious (e.g., South Africa: McGrath 2004, 2012), while in others, it has been less so (e.g., Denmark, Switzerland, Germany, and the United Kingdom). Five groups are hit especially hard by patterns and acts of discrimination, even if the grades vary between countries and in time: ethnic groups (e.g., in South Africa: McGrath 2012); ethnic minorities (e.g., in Denmark: Colding et al. 2005); persons with mixed parentage (e.g., in Germany: Chadderton and Wischmann 2014); elderly persons (e.g., in Switzerland: Imdorf 2012); and females (e.g., in the United Kingdom: Fuller et al. 2005). Often, apprenticeship systems are characterized by multi-discriminatory patterns within the system, such as ethnic and gender segregation, and conservative governments often fail to address or change traditions of social exclusion (Penn 1998).

However, national educational systems themselves often discriminate through the lack of connections between the initial vocational and education system and the academic system. In such contexts, vocational education and training is often seen as a “second-choice option” or as a form of “lower education” in contrast to “higher education” in the academic system. It is a two-sided problem: (1) Access to university is often limited because of the incompatible curricula of the two tracks (Eichhorst et al. 2015). Solutions might be *integrated* courses: the integration of vocational courses into academic upper secondary education or the integration of academic courses into vocational upper secondary education (Polidano and Tabasso 2016). A second solution are *consecutive* courses following an apprenticeship (Harney 2018; Tønder and Aspøy 2017). (2) Access to university is also often limited because of restrictions, institutional barriers and traditions, especially regarding universities themselves. Recognition of prior learning and institutional reforms are thus needed to improve permeability (Cedefop 2012). In opposite, a qualitative apprenticeship can also be attractive. In the “additive double qualification pathway” in Germany, people with a qualification required for entry to higher education (the “Abitur”) can decide to do an apprenticeship instead of (or before) a study at the university. About 30% of the new apprentices in Germany have a university entrance qualification (Edeling and Pilz 2017).

## Apprenticeship Maturity Model

The ILO provides an overview of five forms of workplace-based learning (Table 4).

The graduation of the criteria is helpful to distinguish the different forms of workplace learning. Nevertheless, the description of apprenticeships seems more prescriptive than descriptive and analytical. Especially in company-based apprenticeship systems, e.g., in the United States, learning programs are not necessarily standard (Lerman and Rauner 2012). In school-based apprenticeship systems, e.g., in Spain, wages are not necessarily standard (Marhuenda-Fluixá et al. 2017). Moreover, in countries following a “flexible” market logic, e.g., in the United Kingdom, minimum durations are defined (since 2012) but are not necessarily applied (Fuller 2016). A differentiation is needed.

The proposed Apprenticeship Maturity Model follows a development logic: A problem arises, is then addressed, and might be solved, and a new problem arises. This process leads to a development which can be described in terms of different maturity levels. Apprenticeships on higher levels normally show a higher competence in addressing and solving problems.

The first systematization is based on the differentiation of the *economic context* and the related distinction between informal and formal apprenticeships. The apprenticeship models presented in Table 5 have already been introduced. Two forms show similarities: “developed semi-formal apprenticeships” and “time-served apprenticeships.” They are therefore grouped on the same level.

The second systematization is an inside-out perspective, with a focus on the internal configuration of the apprenticeship. Our assumption is that no standard-based apprenticeship is possible without an internally produced but externally recognized certificate, and a recognized certificate is not possible without a formal mode of assessment. Output-based apprenticeships are therefore the basic maturity level of standard-based apprenticeships. How these outputs are developed (formal in institutions or informal at the workplace) is normally not described on this level. Nevertheless, some rough orientations (e.g., learning hours) can be delivered.

Following the “black box logic,” it is feasible and practical to define the input after the output and allow the problematic process to be unobserved, open, and undefined. The next step on the maturity ladder will, therefore, be a combined output-input-based apprenticeship model. We can call it input-oriented apprenticeships (because the output orientation is a basic feature, which is included). Input standards are, e.g., defined curricula, defined infrastructure, and/or defined qualification criteria for the persons involved (trainers in company-based models and teachers in school-based models). For example, the ILO has taken up this topic with the focus on “high-quality teacher training system” (Axmann et al. 2015). The additional focus on inputs enhances the widening of the scope. Through more or less intensive cooperation, other institutions can contribute and enrich the input (e.g., schools/colleges contribute to company-based apprenticeships or companies contribute to school-based apprenticeships or the apprenticeship of another company – companies contribute to company-based apprenticeships).

**Table 4** Principles of workplace-based forms of learning

	Workplace based	Wage	On-the-job training	Legislative framework	Program of learning	Off-the-job training	Formal assessment	Duration	Recognized Certification
<b>Traineeship</b>	Yes	Maybe	Maybe	No	No	No	No	Variable	No
<b>Internship</b>	Yes	No	Maybe	No	No	No	No	Variable	No
<b>Informal apprenticeship</b>	Yes	Pocket money or in kind	Maybe	No	No	No	No	Variable	No
<b>Workplace learning</b>	Yes	Yes	Maybe	No	No	No	No	Variable	No
<b>Apprenticeship</b>	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Fixed	Yes

**Table 5** Informal and formal apprenticeships

Informal Economy		Formal Economy	
Nonexistent		Standard-based apprenticeship	Several criteria accepted and applied
Semiformal apprenticeships	Informal sector or artisan organizations recommend and sometimes stipulate certain criteria (e.g., duration, certification)	Time-served apprenticeship	Formal organizations (or the state) recommend or stipulate certain criteria (especially the duration)
Informal apprenticeship	Form of apprenticeship is individually negotiated between master and apprentice	Nonexistent	

Following the definition of the input and output, the problem arises that expectations (related to the investment on the input side) are not fulfilled on the output side. A discrepancy is observed: e.g., skills mismatch, high dropout, and a low transition rate into the labor market. These problems lead to measures of quality improvement, focusing until now on unobserved processes. Remedial measures include the definition of training plans, inspections, evaluation, enhancing peer learning, and feedback and organizational development. An example is the use of e-portfolios in Norway to bridge the gap between school and work (Nore and Lahn 2014).

Access to the internal processes of an organization (companies and/or schools) leads to another problem: influence, transparency, and power. The process-oriented apprenticeship can be stabilized through cooperation between the main stakeholders (state, employer, employee). This might lead to a tripartite model, as in Germany, or a cooperation between two stakeholders, e.g., state and professional organizations (Organisationen der Arbeitswelt), as in Switzerland.

In 2017, the ILO published a “Toolkit for Qualitative Apprenticeship.” The ILO approach is based on six key building blocks: (1) meaningful social dialogue, (2) a robust regulatory framework, (3) clear roles and responsibilities, (4) equitable funding arrangements, (5) strong labor market relevance, and (6) inclusiveness (ILO 2017). In 2018, the Council of the European Union (2018, 3) published comprehensive recommendations on a “European Framework for Quality and Effective Apprenticeship.” The framework sets out 14 criteria which can be assigned, as well as the ILO key building blocks, to the different levels. In Table 6, the proposed six levels are summarized.

On one hand, the maturity model differentiates between development levels. On the other hand, the higher level can also be initiated, even if the problems on the lower level are not completely solved. The establishment of a school-based apprenticeship starts, e.g., on Level 4, the definition of output and input, but the problem of Level 1, the involvement of the companies, is persistent and remains often unresolved.

**Table 6** Outline of the apprenticeship maturity model

Level and apprenticeship form	Characteristic	Addressed problem	Unsolved problem	Criteria (EU and ILO)
6 Collective apprenticeships	Negotiated and agreed cooperation between major stakeholders (state, employer, employees)	Cooperation on the macro level, rights and obligations	Cooperation on the meso level, school-workplace connectivity on the microlevel	Involvement of social partners (EU) Flexibly pathways and mobility (EU) Meaningful social dialogue (ILO) Regulatory framework (EU) robust regulatory framework (ILO)
5 Process-oriented apprenticeships	Additional interventions into the operation and processes of the system	Ratio between work and learning, relationship between formal, nonformal, and informal learning (on-the-job, off-the-job/ in schools), quality development	Divided responsibilities	Transparency (EU) Quality assurance and tracking of apprentices (EU) Career guidance and awareness rising (EU) Work, health, and safety regulations (EU) Clear roles and responsibilities (ILO)
4 Input-oriented apprenticeships	Additional standards for the input are defined and applied	Financing, curriculum (off-the-job training), training plan (in-company),	Unclear implementation and practice	Pedagogical support (e.g., in-company)

*(continued)*

Table 6 (continued)

Level and apprenticeship form	Characteristic	Addressed problem	Unsolved problem	Criteria (EU and ILO)
3	Output-oriented apprenticeships	qualifications of teachers and trainers, infrastructure	Lack of involvement of either schools or companies, skills mismatch	Financial and nonfinancial support for companies (EU) Equitable funding arrangements (ILO) Inclusiveness (ILO) Learning outcomes (EU)
2	Semi-formal apprenticeships / time-served apprenticeships	Recognized certification, formal assessment, some legislative framework	No formal state certificate, separated from the formal economy and education	Written agreement (EU) Pay and/or compensation (EU) Social protection (EU)
1	Informal apprenticeships	Embedded in a community of practice, on-the-job-training	Lack of protection, lack of recognized competences and mobility	Workplace component (EU) Strong labor market relevance (ILO)

## Conclusion

Informal apprenticeships create informal private training markets characterized by two fundamental conditions: master-apprentice relation and informal on-the-job training. These informal private training markets pursue a resource-oriented employment logic. This is why, from an employer perspective, arguments in favor can be applied, such as the profit argument and the benefit argument. Nevertheless, it is a barter: lower wages are paid in exchange for training services within a learning framework of socialization. The possible learning development of an apprentice is related, on the one hand, to the expertise of the master and, on the other hand, to the role model of a work-process oriented occupation. The master-apprentice relationship is closed, privatized, independent from external control, and susceptible to multi-discriminatory patterns, such as not training a person (social exclusion). These informal private training markets are also characterized by a deficit-oriented private training market logic, such as precarious workers, information asymmetry, and inequality. Time-served apprenticeships or semiformal apprenticeships partly limit the power of the master (employer), with the purpose of reducing the deficits of informal apprenticeships. Limitations could be “defined duration,” “defined daily work time,” “defined off-the-job trainings,” or “defined competences that should be developed.” The position and interest of the apprentices are strengthened by an external “advocate,” for example, the state, or an informal sector organization. Learning becomes more explicit. These semiformal training markets are also based, from the perspective of an employer, on a resource-oriented training market logic, such as profit and benefit. Nevertheless, the two-sided formula is reduction of work productivity (e.g., defined duration, defined daily work time) and expansion of learning productivity (e.g., defined off-the-job trainings, defined competences that should be developed).

The output-oriented apprenticeships interrupt this logic of learning expansion and ignore the importance of embeddedness in a community of practice. This approach ignores the process of working and the process of learning, as well as the basic principle of this private training market: working for learning. The output-oriented apprenticeships are an artificial logic developed outside of the world of apprenticeships and not grounded on principles of apprenticeships (e.g., master-apprentice relation). The output-oriented approach generates a cut in the private training market (division between process and results), with the establishment of a private certification market. This certification market is not embedded in work life and turns in a short time into a symbolic market where the trade of (competence) descriptions becomes an end in itself – the map becomes the territory, and the “private training market” turns into a “private consultant market.” The input- and process-oriented apprenticeships are approaches to win back the training perspective, where the off-the-job training logic is strengthened, school-based apprenticeships arise, and the employment logic is weakened. Learning becomes less reactive and more expansive. This development can lead to an imbalance between “work to learn” and “learn to work” until a point where the benefit argument, from the perspective of an employer, gets lost and the private market contract “working for learning” is broken. The result

is again the dead end – not to train a person (social exclusion). To come out of this dead end could be facilitated through dialogue and negotiation between the advocates of the employment logic and the advocates of the education logic, within the framework of a collective apprenticeship.

## Abstract

The fast-changing competitive landscape requires continuous skills updates and improvements at all levels, from blue collars to CEOs. A skills update is particularly relevant for executives because of their considerable influence on the performance of the organizations they work for. However, executives' learning and development has some peculiarities, such as:

---

e-mail: [marco.sampietro@sdabocconi.it](mailto:marco.sampietro@sdabocconi.it)

- While organizations design or recommend training programs for their employees, executives are often out of the loop, as they have the autonomy to decide whether they need to develop or improve a particular skill set themselves and, if this is the case, how to acquire such skills.
- Their development has an impact on many other people.
- Executives have very busy agendas; learning and development must take this important constraint into consideration.
- When attending training programs, executives are not focused on learning alone but also on developing business relationships with other participants.

In this essay, executive learning will be addressed in consideration of the aforementioned peculiarities.

## Introduction

Executive learning and development can be considered a form of continuous VET where the focus is not on delving deeper into topics related to the functional role of executives but to develop or strengthen general management and strategic skills and being aware and understanding emerging topics able to shape entire industries or sectors.

While executive education and learning is something we now take for granted, this was not the case in the past. In order to understand the origin and evolution of executive education and learning, its history will be briefly explained.

During the nineteenth century, business owners did not consider the training and education of managers as their own obligation; this meant that managers normally were not trained and that their decisions were mainly based on their experience and interpretation of how organizations worked (George 1968).

A more structured approach was adopted, thanks to “scientific management”, a school of thought led by Frederick Taylor, which rose in the first decades of the twentieth century and initiated the use of time and motion studies. It was the manager’s role to break tasks down into simple chunks and then work out the best way for a worker to carry out these chunks.

Scientific management did not change the approach to management education much; in fact, lower-level managers received little managerial education related to learning the “one best way” and then teach this to workers.

Indeed, at the time, some universities and business schools offered courses aimed at managers, which featured topics such as work methods, preparation of letters and reports, basic salesmanship, and mathematics (Bowen 1953).

During the studies carried out as part of the scientific management approach, however, researchers discovered that managers could also improve productivity by motivating employees.

Since then more attention was directed toward managerial training; this was at first focused on organization, planning, leadership and control but then developed to include the functional specialisms of finance, engineering, manufacturing, marketing and human relations (Burnham 1941).

World War II became the setting for another significant change in management training, when some US companies produced superior quantities of materials needed to support the armies. Indeed, soon after this, increased demand for consumer goods led to managers receiving further attention, such that outstanding performance led to increased public support and merited the attention of scholars and researchers. Drucker (1954) demonstrates this with his statement that the manager is the “dynamic life-giving element in every business (...) without his leadership, the resources of production never get properly utilized.” He also noted that the new focus on educating managers, as management education began to gain momentum, came at the cost of neglecting the education of executives, further observing that this situation was dominant throughout the 1900s.

It was therefore at this time that business owners and managers and executives of the highest level were considered high-status individuals who had intrinsic knowledge about investments, decisions, and management, in the main form of command and edict (Burnham 1941). It was believed that this ease of command derived from abilities that could not be taught through training or learned through education (Cordiner 1956). Results from middle-level managers seemed easier to achieve in comparison to those of senior managers, which were seen as less tangible; thus, most senior executives saw themselves as leaders rather than learners (Senge 1996), and this gave little incentive for academics and educators to create courses oriented around executives (Wren 1979). Since the work of lower and middle level managers was to acknowledge and enforce business rules, they did not need the intervention of managers of the highest level to perform their tasks, in businesses that worked in closed environments, leadership from the top loses importance (Selznik 1957).

Before the 1980s, the education that executives tended to receive was attained as managers while ascending the various hierarchical levels of business (Sashkin and Sashkin 2003). During the 1970s major change happened: increasing technological innovation, intense national and global competition, energetic crisis, new societal movements, and new governmental laws and regulations. These factors led to internal stresses and external failures and threatened the well-being and survival of a considerable amount of businesses.

In the resulting situation and alongside the demands of stockholders, the lack of managers' abilities to address certain issues led to them losing their former esteem, such that confidence in management decreased from 70% in the 1960s to under 30% in the 1980s (Yankelovich and Furth 2005). It was lower- and middle-level managers that took the blame for decreases in revenue, productivity levels, and the inability to solve new competition-related issues, but the blame can well be allocated to senior managers and executives, who were not trained to foresee change in the making or to react in an immediate and effective manner to sudden events (Timpe 1987). In this new global environment, the managerial education that had been gained earlier was no longer suitable to this new context.

One result of this was that, in an environment of constant and uncertain change, executives and executives' learning and training could in fact be an answer to some of the difficulties encountered in earlier times. It follows that executives should be educated toward seeing the business environment as a whole, understanding the interaction between its various areas, having a foresight for change, and being able to cultivate abilities to sense new trends, relationships, threats, and opportunities and lead the organization in new directions (Goleman 1998). It means that areas such as advanced functional management, which contributed to reaching the highest levels of management but are not needed for making decisions at the executive level, would be valued less.

## The Characteristics of Executives as Learners

While every executive, as a human being, has distinctive learning and development needs, there are certain characteristics that are common to many of them. First of all, executives are adult learners.

In contrast to pedagogy, the "child-leading" system which we are familiar with (e.g., lectures, memorizing, reciting, testing, etc.), there is an alternate instructional system described as andragogy (Greek: "man-leading") (Knowles 1980), which contains a number of assumptions about the way that adults learn; these assumptions will be listed together with comments and implications for executive learning and development:

- Adults need to know the reason for learning something; knowing this reveals two sorts of executives: First, those who fully understand that the current business environment requires a continuous development of their skills and, second, those who believe that their skills are already sufficient to deal with the various issues. In the first case, executives look for and welcome learning and development opportunities and are open to various stimuli. In the second case, executives have to be convinced that they still have gaps in their knowledge and skills. Different tools can be used to prompt the "wake-up call": Feedback from subordinates, peers, and bosses; direct confrontation with experts in specific fields; and discussion of difficult case studies where executives' decisions lead to disasters.
- Experience (including error) provides the basis for learning activities. Executives tend to prefer to learn approaches focused on solving and discussing real problems and welcome the opportunity to reflect on their experience. In addition, they value their own experience highly as source of learning. Given the relevance of this topic, more details will be provided in the next paragraph.
- Adults need to be responsible for their own decisions on education; adults need to be involved in the planning and evaluation of their instruction. This is particularly true for executives because the organizational power they have allows them to avoid making learning efforts that do not align with their interests and preferences.
- Adults are most interested in learning subjects that have immediate relevance to their work and/or personal lives; this topic applies to executives but is even more

relevant to professionals. While professionals often need to learn something in order to address or improve a work method, executives' needs are more strategic; therefore, the application of the knowledge is not always immediate but does have to be relevant.

- Adult learning is problem-orientated rather than content-orientated. Executives are more interested in solving and discussing issues related to theory, rather than the theory itself; theory alone does not tend to satisfy them.
- Adults respond better to internal rather than external motivators. As executives are used to a good deal of autonomy in the selection of the learning and development efforts, internal motivators are key.

In addition to the assumptions mentioned above, executives also have other distinctive characteristics, such as:

- They are busy. While it is hard to find someone who would declare themselves not busy, executives are particularly busy (e.g., Ceo.com's survey held in 2015 indicates that CEOs work, on average, 10–11 h/day). In addition, the work of executives cannot be called discrete work, as it does not consist of tasks that, once completed, mean their work is over for the day. Executives are subject to continuous flows of stimuli, issues, ideas, and tasks, and as a result their minds are always focused on what comes next (Mintzberg 1973; Mintzberg 2013); being (or feeling) busy has an impact on learning and development. In fact, executives are unable (or believe themselves unable) to dedicate much time to formal education and, when this involves learning activities, they are very sensitive to the way that time is used. For example, courses targeted at executives tend to have more extended schedules compared to courses targeted at middle managers; weekends are often used as well.
- They influence the performance of organizations and as such that of many other people. By considering the position that executives have in organizations, their decisions have an impact on the organization as a whole and directly affect its future. When it comes to executive education, training providers and executives have to keep in mind that they are not only fostering individual talent but also adding value to the organizations that executives work for (Conger and Xin 2000; Crotty and Soule 1997; Myrsiades 2001; Vicere 1996).
- They do not remain in the same role for an extensive period of time. Executives are dynamic, in they are individuals who evolve on a continuous basis and carry out several roles during their lifetime (Moulton and Fickel 1993). According to a survey conducted by ManpowerGroup in 2017, executive-level employees are concerned with upward mobility, and 50% of executive-level employees would move to another company if they lack advancement opportunity in their current company. According to ExecuNet (executive career and business network), executives' average tenure at a company has been 4.1 years in 2015 and, according to a survey conducted by the Association of Executive Search and Leadership Consultants for The Wall Street Journal in 2015, nearly 80% of US recruiters are more willing than they were a decade ago to consider executive prospects who stay less

than 3 years. As we will see, this has an impact on some variables related to learning and development, such as the relationship network.

- They are demanding. Being in a significant and time-sensitive organizational role means that executives are notoriously demanding. Executives tend to be significantly less willing than undergraduates or distance-taught graduate students, to suffer in silence when they regard teaching as less than excellent or the lecturer as insufficiently knowledgeable (Lockhart 2013). This influences who should support their learning and development in term of the status, experience, and service level that executives expect from education providers.

## Providing Executive Learning and Development

While some kinds of executive learning and development can be self-managed by reading books (various articles highlight that executives are avid readers) or critically analyzing past experience in order to improve for the future, it is nonetheless evident that executive education providers play a significant role here.

There are different types of providers, such as individual trainers, small training organizations specialized in executive education, consultancy firms providing also training services, and business schools, which are the main actors in the executive education market. The number of providers is very high; AACSB International (2010) claimed that there are 12,087 business schools; however, many of them are very small. If we look at the most relevant business schools, numbers are smaller (Table 1). Table 1 reports the estimated number of relevant business schools in different regions.

Providers of executive education, including business schools, are mainly privately held companies. The reasons lie in:

- A need of a much higher flexibility, since the offer has to be updated almost every year, something very difficult for public institutions that have very complex and long authorization processes (Aithal 2015).
- Funding, in fact, many investors consider private training organizations as interesting opportunities (Vink 2016).
- Private institutions have more flexibility in resource allocations. For example, salaries can be easily negotiated thus permitting to attract and retain best-in-class trainers (Vink 2016);

**Table 1** Estimated number of relevant business schools in different regions

Region	Approximate number of business schools
Africa	>150
Asia	450
Australia and New Zealand	100
Central and South America	>100
Europe	>250
North America	500

The size of the Executive Education in economic term is pretty difficult to quantify, however, Financial Times estimated it at \$70 Bn worldwide in 2015.

Besides content, there are several challenges facing educators in executive education. In an article describing issues that professors experienced teaching executives at Harvard Business School, Garvin points out that although the effectiveness of executive education is based to a large extent on what is taught, where, when and how it is taught, and who teaches it, are also significant (Garvin 2007), as we shall see here.

## Contents

Contents are the most dynamic element of executive learning and development, as they tend to vary in accordance with both the internal organizational dynamics and external factors; for example, the 2008 financial crisis triggered several changes that had various impacts on the content suitable for executive learning. In more recent terms, from 2010, big data, robotics, and blockchain, to name a few, posed new threats and opportunities to organizations which in turn had an impact on what executives should be aware of and be expected to know. Leadership, in the various forms it can take, is one of the most enduring elements of content targeted at executives. For example, in a survey conducted by Strategic Counsel and LinkedIn in 2017, prospect executive learners identified leaderships as the most desired content (Owens 2017), and when 500 executives were asked to rank their top three human-capital priorities, leadership development was included as both a current and a future priority. Almost two-thirds of the respondents identified leadership development as their number one concern (Gurdjian et al. 2014).

## Geographical Location

When it comes to deciding where to enroll in an executive education program, the geographical location should also be taken into consideration. It is not a matter of developed versus developing countries, but more to do with exposure to diverse business environments, which could be of particular relevance to some executives (Bradshaw 2014; Ortman 2017). It is no coincidence that while International MBAs are normally delivered in individual countries, International Executive MBAs are often held in several countries (even five) so as to expose participants to a diverse range of cultures and management practices (Symonds 2011).

## Venue

As already mentioned, executives can be rather demanding because of their role and their will to optimize the use of their time but also because they are used to levels of comfort and service that are above that of the average worker. This has an effect on executive education providers who have to provide venues with a quality level that

aligns with the high expectations of executives (Batallas 2010; Murray 2014). A dean of one of the most important business schools in the world, when asked what the factors that lead to success are, replied: “there are 3 main factors: venue, venue and venue.” Obviously this was not an entirely serious statement, but he was certainly sincere in the belief that without a beautiful venue, the ability to attract executives would have been compromised, at least to some extent. The importance of venue triggered a “venue race,” where business schools try to overtake competitors by leveraging infrastructural assets that in the past were not considered source of competitive advantage. In the past 15 years, more than 110 AACSB members out of 800 have built or have plans to build new facilities or renovated existing spaces (Ziebarth 2011). In Table 2 are some notables examples.

### Schedule of Learning Activities

While lower- to middle-level managers often choose to interrupt their career in order to increase their skill set (e.g., MBA programs, being full time, mean that participants will have to leave their current career), most executives would not start a program that requires them to leave or interrupt their career. It is for this reason that Executive MBAs are often scheduled in the format of a weekend course or short modules completed several times over the course of the year. The main reasons for these choices are:

- Their salary is already substantial, because of their role, and the cost of the opportunity to increase their skill set is considerable.
- They very often have families with children, and to lose a salary for 1 or 2 years would create difficulties for the family.
- To interrupt a lower level management or technical role in order to pursue an MBA can be considered a demonstration of commitment by recruiters; however, to leave an executive role can be seen in an entirely different way and mistaken for dissatisfaction with the current role or the inability to tolerate stress. In fact, while MBAs can be considered a revolutionary way forward for many individuals and

**Table 2** Major investments in business schools new campus or buildings

Business school	Approx. value (\$ million)
Chicago University Boot School of Business	140
Harvard Business School	100
Kellogg School of Management	220
Michigan’s Ross School of Business	145
SDA Bocconi School of Management	160
Stanford Graduate School of Business	345
Yale School of Management	243
Wharton School	140

mean an absolute change in their role after the MBA, Executive MBAs are more suitable for evolution. However, from a market perspective, evolution is the worst reason to leave a career. It is no coincidence that the salary increase after EMBA is much smaller than that which follows MBAs. Considering the data provided by the Financial Times' EMBA and Global MBA rankings for 2017, the average salary increase of the top 100 EMBA is 54%, with a maximum increase of 107%; the average increase for MBAs is 102% with a maximum increase of 180%.

- From an educational perspective, to avoid an interruption to a career in an executive role is beneficial, because it allows students to apply new concepts immediately in their workplace, and bring their daily experiences and difficulties to the classroom to be discussed with other students.

## Reflective Practice

As previously mentioned, experience is a fundamental part of adult and executive learning; some believe this should be focused on an executive's reflective abilities within the context of business organizations (Burgoyne and Reynolds 1997). Schön established the idea of reflective practice and the notion of the reflective practitioner, where the practice consists of executives who question mental models in critical terms in order to understand the world from a systemic perspective and develop personal expertise (Schön 1983); he also observed that the real problems of the world "do not present themselves to practitioners as well-formed structures" (Schön 1987) but are "intermediate zones of practice – uncertainty, uniqueness and value conflict – escape the canons of technical rationality" (Schön 1987). Indeed, this reflective practice is essential for the development of what he called "professional artistry," which included the ability to make sense of uncertain or conflicted situations of a professional nature and bases itself on the notions of knowledge-in-action, reflection-in-action, and reflection-on-action.

This knowledge-in-action is an artless and normal action that emerges from regular activities; it occurs when an individual learns how to do something and is then able to recognize, decide, act, and react in a smooth manner without having to think about it, a characteristic of "competent practitioners (who) usually know more than they can say (and) exhibit a kind of knowing-in-practice, most of which is tacit" (Schön 1983). However, people tend to be surprised because of unexpected experiences that occur in which their expectations are not satisfied and, in an attempt to allow their usual patterns to remain constant, sometimes respond to these surprises with selective attention to the circumstances that produce it, or respond to it via reflection. Schön defined this reflection in terms of two possibilities:

- Some individuals may reflect-on-action; they may think back on their actions in order to deduce how their knowledge-in-action may have made a contribution to an unforeseen outcome or reflect on this while an action is carried out. But in neither of these cases does the reflection have a direct connection to immediate action, instead defined as "thinking about thinking" (Raelin 2002).

- Some individuals may reflect-in-action as they carry out an action, without a break from their activities but rather rethinking their actions while still doing them, such that in effect “we respond to the unexpected or anomalous by restructuring some of our strategies of action, theories of phenomena or ways of framing the problem; and we invest in on-the-spot experiments to put our new understandings to the test” (Schön 1987).

Several researchers in the area of management education (Smith 2003; Gosling and Mintzberg 2003; Smith 2001; Schön 1987; Tompkins 2001) consider the reflective activity to be a very worthy course of action via which to prepare executives to face the intricate and changeable managerial environment.

## Learning Methods

There are various learning methods available; below is provided the categorization proposed by Thorsell and Bridge (2014) with comments on the peculiarity of Executive Learning and Development.

*Teaching theories.* Theories that form the basis of effective executive learning should be well-documented, regardless of the method chosen; best practices should be studied with careful attention and academic process, as business development should be founded on these theoretical practices. It tends to be difficult to make theories of interest and use, as the approach is one directional and has been viewed in academic and development practice circles as the least effective manner to prepare executives for success. Indeed, executives themselves have been known to rate this approach lowest in terms of attractiveness on a consistent basis (Thorsell and Gonin 2007; Gonin et al. 2011).

*Case studies.* Harvard Business School pioneered the case method in the 1920s to address the deficits of theory-centered teaching. It was a method that involved debating interesting successful, less successful, or unsuccessful business cases in order to extract learning in a challenging dialogue between the professor and the students. However, despite the fact that the case method appealed, and still does appeal, to students more than raw “theoretical teaching,” the challenge lies in the fact that in real life, no single case will occur again. It hones analytical skills and may well influence shifts in executives’ business mindsets but lacks immediate applicability if not properly contextualized by the instructor. Some advanced corporate universities have compensated for that deficit by using tailored cases that address relevant real-life business situations to achieve a higher level of relevance and applicability.

Using case studies with executives requires some modification compared to those used with lower management roles. Garvin (2007) states that executives need:

- More explicit connections to practical applications and company problems
- More time devoted to sharing participants’ problems and experiences
- Less time devoted to the theories that explain good decisions or solutions

- Less time devoted to problem diagnosis
- Less time devoted to discussion of action questions
- More time devoted to closures and explicit summaries
- More attention to the parallel between the case studies and the experiences of participants
- More attention to the implication of the cases rather than a focus on specific details
- More responsibility for the instructor to keep the discussion on track
- More provision by the instructor of calculations or quantitative analysis

*Simulations.* Simulations tend to favor “doers” in a competitive environment. Due to time constraints, competition between participants and lack of interaction with the instructor during the simulation, they are not very suitable to prompt deep reflection; for this reason, similarly to case studies, a debrief is fundamental. In addition, setting up simulations is time-consuming and demanding on resources; as a result, they are very limited in number, which increases the probability that the simulation does not coincide with executives’ needs. Again, the role of the instructor is fundamental here, as they have to take some time to contextualize the take-away.

*Action learning.* Confucius, the Chinese philosopher, said, “I hear and I forget. I see and I remember. I do and I understand”; this statement highlights action learning, a method that tends to be used for corporate business endeavors, which lend themselves to customization and are suitable to the real specific business environment. Action learning can often be difficult to detach from the business world and therefore can often be overlooked, or seen as inefficient from a learning view because of all the action involved; moreover, it tends to be the lack of reflection and theoretical foundation that detracts from this method of executive learning. Additional to this is the fact that individual cases might not be relevant or not coincide in view of the learning goals; thus, this method of learning is most effective as an executive learning method that cannot be effective unless it is relevant to the learner’s situation. Action learning needs corporate sponsorship too, as the involvement of the best qualified facilitators is crucial to the sharing of relevant theoretical foundation and their supervision of actions facilitates meaningful learning (Thorsell and Bridge 2014).

*Experiential learning.* Defined as “learning through reflection on doing” (Felicia 2011), this method tends to be founded on experiments, where learners interact with the intention to simulate a real-life situation and perform role plays and collaborative exercises, then acquire feedback from peers and facilitators, and then anchor the lessons learned via deliberate reflection. In this approach, the context of the learning is fundamental, to the extent that if the experience is considered separate from the learner’s real issues it will have a negative effect on learning. Compared to case studies and simulations, however, experiential learning is more intense from an emotional perspective, and for this reason, when delivered in the correct manner, participants retain it as a more vivid experience, and it brings about more immediate changes in work practices.

*Real-life real-time learning.* We noted above that experiential learning does not address the actual challenges that give the learner most grief; real-life real-time learning offers a method which centers learning around these issues, the issues most linked to the learner in the here and now. Instead of “role plays,” this method is oriented around “real plays” (Thorsell and Bridge 2014), that is, the learner’s own real-time work situation that is central to learning itself; this method entails good control of facilitation and demands a significant amount of the facilitator. In this systemic method, the total ecosystem of the executive is the base on which to learn; the process makes use of personal aspects, as well as professional ones. It tends to be the case that the challenge of real-life real-time learning is the reliance on skilled facilitators who themselves must master the unforeseeable context and share relevant theories when suitable; these facilitators, in contrast to standardized skills training where methods are established to guide the facilitators almost to the minute, do not have much structure at all other than the overall development process, as the content relies on situations which are specific to the individual. While this process can have excellent results, it does come at a considerable cost, in terms of both expense and intrusiveness into the business which the executive works for; it is understandable that this learning and development service is not used on a frequent basis.

*In-role learning.* Coaching is the most recognized instance of in-role learning, similar to real-time learning because of its learner-centric, real-life real-time-based strategies and focuses on relevant current issues. It should however be said that coaching tends to be focused on the individual executives and lacks bringing individuals in more senior roles, or even bosses, into the learning method. In terms of the views of stakeholders around the individual receiving the coaching, coaching becomes something of a black-box learning situation. In-role learning should be facilitated, as otherwise it might become difficult to motivate executives and create circumstances for learning in a hectic work environment; this can create frustration for executives at not having been able to meet in-role learning assignment, and this can lead to a decrease in the effectiveness of in-role learning methods and strategies (Thorsell and Bridge 2014).

## **Delivery Methods**

In recent years, the role of e-learning has become more and more significant, and various education providers have incorporate e-learning into their programs. Sometimes e-learning is the only delivery method used, as is the case with MOOCs (massive online open courses), while other times it is used alongside physical interaction, as is the case with blended courses. At first glance, distance learning fits with executive education, as executives are very busy and e-learning (at least asynchronous e-learning) allows for a flexible schedule. However, a closer look at real experiences shows that e-learning is not the easiest thing to integrate into executive education. In fact, according to the 2017 Training Industry Report, executives show the lowest usage of e-learning compared to other roles. An initial rationale for this is that flexibility and busy schedules very often result in continuous

postponements of the actual use of the e-learning modules; adding exams at the end of each e-learning module might increase attendance, but exams are not always feasible, either because some programs do not evaluate the performance of the participants (as for open enrollment executive education programs) or because inserting an exam is not feasible from a scheduling perspective. The St. Gallen Executive Education Report 2016 concluded: “technology-based learning formats only become effective after companies have secured top-level strategic ownership and implemented traditional learning formats”; moreover, e-learning can only ever be complementary and must not be a substitute for traditional face-to-face learning.

## Participants

Research on adult education states that adults enter into educational activities with an extensive repertoire of lived experiences, such that “for many kinds of learning, adults are themselves the richest resources for one another; hence the greater emphasis in adult education on such techniques – group discussion, simulation exercises, laboratory experiences, field experiences, problem-solving projects, and the like – that make use of the experiences of learners” (Knowles 1984). Real-life interactions between the instructor and the students are, however, an essential element of the development of reflective practice, because interactions foster the students’ abilities to review mental models and professional practices in an inquisitive and reflective manner (Lissack and Ross 1999; Meyers 1991; Schön 1983). Meyers’ studies of students’ relationships in class reveal that “confronting questions and conclusions of fellow students, often different from one’s own, adds to the disequilibrium that helps to shake students from their egocentric perceptions of the world” (Meyers 1991). Research from studies before and after the latter place importance on the development of reflective practice via social interaction and affirm that the identification and exploration of mental models, as well as the identification of alternative mental and active patterns and the development of self-knowledge, are more effective when carried out alongside others (Brookfield 1987; Raelin 2002; Rodgers 2002). Rationale for this is that “when we realise that what were perceived as unique tragedies and difficulties are, in fact, shared by many others, there is an immediate reduction of self-doubt” (Brookfield 1987); this enables individuals to take in perspectives that had not occurred to them before, such that solutions found in situations similar to their own could be possible solutions to their own problems. One executive stated that “it is not only from what we learn from the other material in class or what the professor teaches, but what we learn from each other. You are amongst a group of very talented people and you discuss things with them and this creates an environment that makes you wonder why you did not think about this before? Of you get out of the class and decide to think about how you can do that better. I think that definitely, it creates the opportunity to do more reflective thinking.” Reflections such as this led all participants to the belief that the opportunities to share the experiences acquired in tandem with the process were one of the most valuable materials acquired in the experiences that either of them has ever had.

## Instructors

Instructors might have to make changes to their teaching in order to succeed; when facing students who have worked for several different businesses, have held various roles, are knowledgeable about management methods, and therefore have great self-confidence, faculties must not restrict themselves to being knowledgeable about research in academic literature but about current methods and issues as well (Garvin 2007). Instructors must be able to discuss their knowledge in real time, reacting to the issues that students raise in class; these are students who will be content when issues studied in class can be approached in terms of their practical applications and current business issues. So lecturers must respond to the demands of the process' aims with a combination of practical experiences, theories, case studies, and anecdotal material, in order to satisfy the curiosities of curious and motivated students who are often have much more experience in a much more elevated position than their own. In fact, De Déa Roglio and Light's (2009) research on the development of the reflective executive via the studies of an Executive MBA concludes that the main duty of the faculty is to facilitate the student's discovery process; educators should "open themselves up to new possibilities as meaning is co-created and recreated in conversation with their students" (Meuser and Lapp 2004) and to be able to influence these possibilities, educators facilitate "a climate or culture of support" for learners through the creation of a safe holding environment, which the learners can then "trust to 'hold' them over time" (Kolb and Kolb 2005).

## Provider's Brand

While instructors do represent an important role, providers are important too. We have already discussed several of the reasons why executives can be demanding; here we introduce an additional factor: they have good salaries. According to the Financial Times Ranking 2017, the salary before attaining an Executive MBA is \$130,000; this means that executives (not all of them) have access to a range of high-end brands that average workers have access to on only a limited number of occasions. When it comes to executive learning and development, the status and brand of the provider (Naidoo et al. 2014) should not be considered a secondary factor in terms of getting them on board and maintaining commitment. For example, Schoenfeld and Grady(2005) found that "Prestige or global recognition of the college or university" was ranked sixth in the factors executives took into consideration to select a trainer provider, while providing the curriculum that best fitted with their need was ranked just seventh.

## Provider's Network

A final factor related to providers is the network they have, both in terms of corporate connections and in terms of alumni network (Schoenfeld and Grady 2005). We have

already mentioned that executives enroll in education programs both for learning and for access to connections which could be useful for the future of their career and that of their companies. If the provider has a good network both in qualitative and quantitative terms, executives are more willing to enroll. An interesting research (Cohen and Malloy 2010) provides an example of the power of the alumni network. The authors examined a vast data set of trading decisions of mutual fund portfolio managers from 1990 to 2006. They then compared the performance of managers' investments in "connected firms," that is, companies where at least one senior official had gone to the same college as the investor, with performance investing in "non-connected" firms, where no college ties existed between the senior ranks and the investor. Results reveal a strong pattern, in both stock holdings and returns: US mutual fund portfolio managers placed larger concentrated bets on companies to which they were connected through an education network. In addition, fund managers performed significantly better on those connected positions than they did on non-connected ones, to the tune of 7.8% a year. Finally, the size of the investments and of the returns increased with the strength of the connection. For instance, if the mutual fund manager and the CEO of the company were both MBA graduates from the same business school in the same year, the effect would be even stronger than if the manager graduated in different years.

---

## Conclusion

While there is still much discussion around various organizational issues, there is little disagreement on the recognition of the crucial nature of executives' roles in organizations. Executives can inspire other people, are important change agents, and make the most important decisions for the future of organizations. Given the fast-changing environments that almost all organizations operate within, it is no longer thinkable to have an executive who does not update and develop their own knowledge, skills, and behaviors. While executive education has been neglected in the past, it is now often considered an important component of the life of every executive and the vehicle to create a competitive advantage for organizations (Cairns 1998; Longenecker and Ariss 2002). Figures support this view; in fact, starting from 2014 (Bradshaw 2014), revenues coming from executive education started to climb, after 7 years of poor performance. In an overall positive market, short courses recorded the highest increase. The demand for short courses can be explained by considering the rise of new technologies and related managerial practices, which are posing new threats and opportunities to companies, sectors, and even entire countries. Executives need and want to understand the main characteristics of those technologies and if and how to implement them. It is not the case that almost all the most important business schools are offering courses related to, for example, big data, artificial intelligence, robotics, and digital marketing.

However, as already addressed in this chapter, executives are not only attracted by content such as brand reputation, facilities, training schedules, formats and methods,

instructors, and networks are all ingredients that determine the choice as to where to attend executive education programs.

A particular challenge in executive learning and development is demonstrating the return on investment of learning and development efforts.

At the individual level metrics already exist and for many providers are reassuring; in fact, business school rankings measure the salary increase of Executive MBA graduates. However, salary increase can be only applied to programs lasting 1 or more years since they can really reshape the curricula of participants. But what about the impact at the company level? Here data seem less positive. It is not a case that some articles represent many executive education programs as mere failures (Hassel 2016; Beer et al. 2016). It is not a problem of quality of teaching and contents, in fact, very often participants are enthusiastic about the training programs; they feel inspired, and they really want to apply in practice what has been thought to them. The problem lies in the various organizational barriers that do not permit to translate contents into daily practices: it is a change management problem. From this perspective, executive education cannot be considered in isolation but as part of a broader change management effort. Another aspect that should be taken into consideration to increase the return on investment is content and process customization. In fact, some theories and approaches apply best to some companies while fail to provide any value in others. Executive learning and development should thus take into consideration not only the needs of the executives but also the context in which they operate (Gurdjian et al. 2014) in a way to make learning and development efforts work in that particular organization.

In the future years, probably executive learning and development will have to deal with many challenges driven by technology, market, and also geopolitical changes. For example:

- Will business schools still be the main providers?
- What will be the real role and impact of distance learning?
- Will short-duration programs still be mainstream?
- Will leadership remain a hot topic?
- Will training remain the most common form of executive learning and development, or other methods will gain momentum?

Nobody knows all the answers, but for sure we will assist to interesting changes in executive learning and development.

### Abstract

In recent decades, people have faced various global economic, technological, and social changes. Consequently, there is a need for ongoing vocational and professional development in working life. Simultaneously, there has been a growing body of literature that recognizes the importance of informal learning next to formal training arrangements. This chapter provides an overview of prominent context and individual factors related to informal workplace learning. Since the overall structure of the chapter follows the tentative 3-P model of workplace learning, some central learning activities and outcomes of informal workplace learning are shortly presented. Nevertheless, informal workplace learning processes are often unplanned and unconscious, and the outcomes may be unpredictable. This chapter may serve as a base for employees, managers, and human resource development professionals for understanding informal workplace learning and workplaces as sites for learning. This chapter may also provide

## Introduction

Global technological, economic, and labor market-related changes and challenges are present in the current service-dominated economy and knowledge society (Noe et al. 2014). Due to these challenges, nations and governments aim at maintaining a skillful workforce who can adapt to the changing environment. In the same way, public and private organizations need a workforce that can respond to the changing work requirements to enhance competitive advantages. Furthermore, individual employees are expected to develop and maintain employability (Harteis and Billett 2008; Kyndt and Baert 2013; Manuti et al. 2015). For some workers, formal training or initial occupational preparation, although often including workplace experiences, is not enough; there is a need for ongoing development through work and working life (Harteis and Billett 2008). For instance, digitalization and automatization are comprehensively influencing the nature of work and expertise. The consequences of new technologies include not only a changing emphasis on the significance of required vocational skills but also the increasing automation of low-skill work tasks and the potential elimination of current work practices (Frey and Osborne 2017; Nokelainen et al. 2017). Informal learning is an important means by which employees update their knowledge and skills and adapt to changing situations, such as new technologies in organizations. However, next to realizing an organization's needs, from the employee's perspective, learning can also be directed, for example, to reaching personal career goals (Harteis and Billett 2008; Noe et al. 2013).

It is generally recognized in research that learning does not only occur through training and education. Informal learning in everyday work-related activities and environment provides an important source for achieving personal and organizational goals (Kyndt et al. 2014). Moreover, there seems to be evidence that learning most frequently happens outside formal learning contexts through informal learning activities, such as interacting with and observing others and through personal experiences and reflection (Enos et al. 2003; Eraut 2000; Skule 2004). For example, it seems that small businesses prefer informal learning, and they are less likely to provide their employees with formal training and development opportunities than large businesses (Coetzer et al. 2017). Providing formal learning has also become more challenging because of limited resources, work demands, and employees located in different places (Noe et al. 2014). Under these circumstances, it is no wonder that understanding informal workplace learning has gained increasing interest, especially since the 1990s (Eraut 2000, 2004; Kyndt and Baert 2013; Marsick and Watkins 1990).

Research related to workplace learning has been conducted in different fields, such as education, industrial and organizational psychology, and management (Noe et al. 2014), and there are multiple lines of research related to, for example, the nature of learning, identities and agency, development of expertise, and organizational learning (Tynjälä 2013). The aim of this chapter is to provide an overview of informal workplace learning, which further supports the idea of workplaces being sites for learning. The chapter begins with identifying developments and debates in the field of workplace learning and then moves on to presenting and discussing previous research in the field. The chapter takes a selective look at the previous research findings and aims at identifying prominent factors, activities, and outcomes related to informal workplace learning. The structure of the chapter follows Tynjälä's (2013) 3-P model of workplace learning, which is a modified version of Biggs' (1999) 3-P model of learning. Previous research has established that there are multiple context factors that may facilitate informal learning in the workplaces, but individual characteristics, such as demographic variables, interests, and capacities, may affect how individuals take or are granted access to these opportunities (e.g., Billett 2008; Kyndt et al. 2009; Kyndt and Baert 2013). Tynjälä (2013) emphasized that these contexts and individual factors as such do not determine learning; however, the individual's interpretation of these factors is important. Following the 3-P model of workplace learning, these factors also form the *presage* component of learning. Additionally, the model of workplace learning underlines different kinds of work activities related to learning *processes* and highlights *products*, i.e., the outcomes of the learning processes.

---

## Theories of Workplace Learning

There is no single approach to or simple definition of workplace learning (Clarke 2005; Manuti et al. 2015). Hager (2011) identified three broad approaches to theorizing workplace learning. First, early psychological theories emphasize individual behavior, cognition, and knowledge acquisition but underestimate the role of the social, cultural, and organizational factors that shape workplace learning and performance. Second, sociocultural theories either incorporate both individual and social learning or focus exclusively on social learning. Learning is seen not as a set of products but as an ongoing process of participation shaped by contextual factors. Finally, recent postmodern theories of workplace learning emphasize the emergent nature of learning as the context does not decide or predict learning (Hager 2011). Fenwick (2010) advocated a sociomaterial approach that she considered to have enormous implications for understanding work life and learning processes. For instance, notions of participation are often limited to human interactions, focusing on social relations, cultural forces, and the ways in which humans “use” tools or move through “contexts” (Fenwick 2010). In sum, theories of workplace learning have evolved and shifted the focus from individual and primarily formal learning to both informal and formal learning on the individual, group, and organizational levels (Hager 2011).

Workplace learning has often been characterized by the dichotomy between formal and informal learning (see, e.g., Malcolm et al. 2003; Cairns and Malloch 2011). Formal learning takes place in the context of organized training and learning activities and may have features such as a designated teacher or trainer and qualifications or credits (Eraut 2000; Slotte et al. 2004). Informal learning results from opportunities in everyday life and is controlled by the learner, not a trainer or instructor (Kyndt and Baert 2013). Although sometimes incidental and related to daily work activities, informal learning can also be purposeful when the learner determines a need to learn and chooses what, when, and how to learn (Marsick and Watkins 2001). Thus, informal learning refers to activities initiated by learners or employees that can also have the purpose of developing professional knowledge and skills (Lohman 2005; van Rijn et al. 2013).

There has been a continuous debate over whether workplace learning can be called informal. Almost 30 years ago, Marsick and Watkins (1990) separated formal learning from informal and incidental learning. According to their division, informal learning can be deliberately encouraged by an organization, but incidental learning occurs as a by-product of other activities. Eraut (2000, 2004) also emphasized the intentionality of learning and distinguished between three different types of informal (or non-formal) learning: implicit, reactive, and deliberative. In his classification, implicit learning is related to tacit knowledge, and reactive learning to unplanned, nearly spontaneous activities in the middle of action, such as reflecting, asking, observing, or recognizing future learning opportunities. Informal learning can also include deliberative and planned activities, such as discussions, problem-solving, and rehearsing. Billett (2002) argued that calling workplace learning informal is problematic as organizations and social communities always have formalized structures. He, therefore, considered workplace learning to be highly structured as it is always dependent on the affordances, social practices, and goals of organizations. Furthermore, there seems to be a tendency to overlook the educational worth of everyday learning activities and experiences, which are often considered to only support what is taught in educational institutions (Billett 2002).

It has been questioned whether seeing the formal and informal learning as separate is needed as they can also be considered to be complementary (Slotte et al. 2004). Slotte et al. (2004) emphasized that informal learning and tacit knowledge alone may lead to bad habits or practices. Similarly, Dale and Bell (1999) suggested that the drawbacks of informal learning are related to its unconscious nature and some of its outcomes, such as bad habits and narrow or superficial skills. Studies on professional expertise thus have emphasized different types of knowledge. For instance, the model of integrative pedagogy suggests that learning environments and situations should include and integrate practical, theoretical, self-regulative, and sociocultural knowledge (Tynjälä 2013; Slotte et al. 2004). Marsick et al. (2017) stated that new approaches to workplace learning emphasizing its complexity and dynamic nature break down the previous boundaries among formal, informal, and incidental learning. It has been concluded that in most contexts or situations, learning is characterized by attributes and elements of both formal and informal learning (Choi and Jacobs 2011; Malcolm et al. 2003; Manuti et al. 2015). As Janssens et al. (2017) summarized workplace learning involves both

formal and informal learning activities, but these have varying degrees of intentionality, consciousness, planning, and systematic support from organizations. Moreover, it seems that empirical research on workplace learning often does not differentiate between informal and formal learning (Kyndt and Baert 2013).

---

## Workplace as a Site for Learning

### Context Factors

Even though the context does not define or predict learning, Cseh et al. (1999), for example, emphasized the importance of context, which influences how the learner interprets the situation, what is learnt, and what kind of resources are available. Although previous research has identified various factors related to contextual matters of informal learning in the workplace, there is no single categorization of these factors (Coetzer et al. 2017). By using a survey instrument to identify factors promoting learning in the workplace, James and Holmes (2012) separated between factors related to task complexity and environment. Coetzer et al. (2017) carried out a literature review on small businesses and their characteristics as sites for informal learning. They underlined *job characteristics*, but further highlighted the social context and networks by separating *relational characteristics* from internal *organizational characteristics*.

Regarding job characteristics, the demands-control-support (DCS) model (e.g., Karasek 1979) proposes that based on subjective perceptions high levels of learning opportunities arise from combining demanding work activities, high levels of job control, and high levels of social support. In a similar way, the job demands-resources (JD-R) model (Bakker and Demerouti 2007) suggests that job resources, such as strong relationships and opportunities for advancement and support, affect well-being and stimulate personal growth, learning, and development. Autonomy and challenges have also been found to stimulate job crafting, which refers to employees' own initiative with altering tasks and job characteristics to better balance the demands and resources to their needs (Demerouti 2014). In their study, Harteis et al. (2015) adopted the operationalization of DCS model. Their study on perceived workplace learning support included three main job characteristics: work demands (including task significance, task variety, task complexity, information processing, and problem-solving), control provided (including autonomy regarding planning, decisions, and methods), and also social support of the work environment (feedback and interaction).

Nikolova et al. (2014) established that several studies had attempted to develop instruments measuring informal workplace learning, but they were often context-dependent and not intended to be used in various settings. Thus, they presented a multidimensional scale measuring the learning potential of the workplace (LPW), which was designed for diverse occupations and settings. They argued that workplace learning has task-based and interactional core components. Altogether, their model consisted of four factors: learning through reflection and experimentation and learning from supervisors and colleagues. To test the construct validity, they also analyzed autonomy and task variety in relation to work-based learning and found them both to

be positively and significantly associated with learning (Nikolova et al. 2014). Kyndt et al. (2009) studied learning conditions, which were created not only by the environment but also by the employees themselves. In their quantitative approach, the items related to work organization, internal and external learning networks, learning and work coaching, and information systems. From the sample of 1162 employees in 31 different organizations, they concluded that supporting opportunities for feedback (e.g., working in teams, peer feedback) and possibilities to acquire knowledge contributed most to workplace learning. Skule (2004) aimed to empirically derive a framework of learning conditions associated with learning-intensive jobs, which was intended to identify general learning conditions that were not dependent on a certain industry, type of company, or individual factors. In the first phase of the study, personal interviews were conducted in 11 private and public sector enterprises (4–8 interviews in each). In the second phase, the interviews were followed by telephone surveys from 1300 private sector and 200 public sector employees. The results revealed that universal job-related factors included a high degree of exposure to changes and demands, managerial responsibilities, extensive professional contacts, superior feedback, management support for learning, and rewarding of proficiency.

Similar factors have also been found important in single-organization case studies. Ashton (2004) analyzed wider organizational structure and culture impacting learning and based his study on in-depth interviews with 195 employees from different positions within an organization in the engineering field. The results emphasized access to knowledge and information; practicing skills; availability of the support and feedback; and rewarding learning. Ellinger's (2005) qualitative case study with 13 participants emphasized the role of leadership and management. Learning-committed leadership and management promoted coaching and mentoring and provided support, positive feedback, and recognition, whereas unsupportive behavior and micromanaging appeared to influence learning negatively. Also, work tools and resources facilitated learning, but also impeded learning by distracting or decreasing personal interaction. Concerning relationships, the role of power relationships or asymmetries affecting learning should also be acknowledged (Clarke 2005; Hökkä et al. 2017).

As a whole, learning climate and culture is needed to support learning at the organizational level. This climate and culture is built by leaders, managers, and others who influence the learning of others and create the environment that shapes, supports, and eventually rewards the desired results (Marsick and Watkins 2003). Besides a positive learning climate in general, recently, for example, fun has also been considered as a means to promote informal learning and, eventually, innovation, creativity, and performance (Tews et al. 2017).

## Individual Factors

Previous research has widely established that learning potential in the workplace depends on both *context* and *individual factors* (*personal factors* and *demographic variables*), but especially on the interrelationships between them (e.g., Billett 2008; Kyndt and Baert 2013). Lohman (2005) compared school teachers' and HRD

professionals' engagement in informal workplace learning activities. Regarding personal characteristics, she found seven personal characteristics that enhanced the motivation of both groups: initiative, self-efficacy, love of learning, interest in the profession, commitment to professional development, a nurturing personality, and an outgoing personality. Studies regarding personality traits have often used the Big Five personality factors, but, for instance, Noe et al. (2013) also highlighted the importance of exploring positive traits and states and self-concept traits, such as self-esteem and goal orientation, in learning contexts. However, van Rijn et al. (2013) pointed out that the research on employees' individual differences has focused too much on motivations, such as self-efficacy and learning motivation. They argued that to understand engagement in informal workplace learning, attention should be paid to both motivational and self-construal factors, the latter referring to how an individual can define oneself either as autonomous or as connected, for example, to a supervisor or a team. For example, in their study on employees in vocational schools, they noticed that career motivation had an overall positive effect, whereas strong individual self-construal strengthened its effect on keeping up-to-date and strong collective self-construal on knowledge sharing. Billett (e.g., 2008) emphasized the role of the work setting and its affordances, as well as the agency, i.e., intentional actions of individuals. In a recent qualitative meta-synthesis of their previous five studies, Hökkä et al. (2017) also found a reciprocal relationship between agency and emotions, and they expressed the need to further explore the connections between negative and positive emotions and learning at work. Emotions have also been explored in relation to error situations and learning in the workplace (Rausch et al. 2017; Zhao 2011).

Demographic variables, such as age, gender, ethnicity, educational level, and tenure, as well as organization type and size, have often been controlled in quantitative analyses (see, e.g., Harteis et al. 2015; Kyndt et al. 2009; van Rijn et al. 2013). Harteis et al. (2015) concluded that previous research and empirical evidence related to age and learning potential of the workplaces provided an ambiguous picture. Furthermore, in a sample of 459 employees in different occupations, companies, and workplaces, they did not find any relevant relationship between employees' ages and learning support at the workplaces. In addition, their cross-sectional sample showed no significant differences between men and women. In sum, they concluded that the opportunities that shaped learning related to occupational standing and, therefore, the level of education was a crucial factor. The research has indeed implied that learning opportunities increase with a higher level of education of employees, which may be a challenge for workers with low education levels (Kyndt et al. 2009; Skule 2004). For example, Ashton (2004) noticed that access to knowledge, support, and a system of rewards favored senior staff and managers, whereas junior staff had more limited possibilities to gain knowledge and skills.

In a systematic review of work-related learning and its antecedents, Kyndt and Baert (2013) noted that sociodemographic variables have been widely explored and measured in previous studies. They suggested that instead of including a set of variables, future studies should aim to provide more coherent models. As noted, individual factors comprise multiple variables, such as cognitive, motivational, emotional, and demographic factors. Ultimately, the interrelationships of these

factors affect learning. However, empirical research must always focus on how a particular selection from the universe of variables affects learning.

## Learning Activities

Workplace learning activities are often divided into planned activities, such as mentoring, coaching, and supervision, and unplanned learning activities that occur during job performance, such as problem-solving, observation, or participation. However, Clarke (2005) noted that such division is problematic, as all of these activities can be either planned or unplanned. One way to categorize informal workplace learning activities is to divide them into collaborative and individual learning activities (e.g., van Rijn et al. 2013). It seems that people in different occupations and career levels prefer different kinds of learning activities. Lohman (2005) found that teachers rely on interactive and social learning activities, whereas HRD professionals rely more on independent learning activities. Daley (1999) found that novice nurses prefer formal training, reading journals, and reviewing procedures, whereas experts consult peers and other professionals. In practice, participating in work activities, interacting with, observing and imitating others, and accessing support and guidance provide rich learning opportunities (Billett 2002; Eraut 2004). For instance, Coetzer (2007) suggested that observing colleagues is central to learning. Recently Froehlich et al. (2017) developed and validated a generally applicable scale to measure social approaches to work-related informal learning. In their study, social approaches referred to seeking feedback, help, and information, which are all activities that the learner or employee must proactively engage in.

Alternatively, Noe et al. (2013) proposed that informal learning includes cognition and behaviors that fall into three categories. The first category is *learning from oneself*, which includes reflecting on how to improve one's performance and experimenting with new ways of performing one's job responsibilities. The second category is *learning from others*, such as peers and supervisors, to obtain performance feedback, discuss new ideas, and learn new technologies. Finally, the third category is *learning from non-interpersonal sources*, whereby the individual acquires new knowledge and skills by searching for and reading published materials.

Studies on the nature of workplace learning have mainly described concrete learning activities instead of the learning processes underlying these activities (Tynjälä 2013). Eventually, dividing activities into clear categories is difficult. Learning takes place when, for example, external circumstances such as errors, feedback, questions, conflicts, difficult situations, and the behaviors of others trigger reflection (Rausch et al. 2017; Schley and van Woerkom 2014).

## Learning Outcomes

Research on informal learning outcomes has been scarce (Eraut 2004; Kyndt et al. 2016), and research has focused mostly on workplace environment variables

promoting or inhibiting learning (Clarke 2005; Kyndt et al. 2014). Cairns and Malloch (2011) defined workplace learning as a process of stimulating the development of competencies and creating behavioral change. The professional performance and competence consisting of various competencies integrating knowledge, skills, and attitudes are closely related to workplace learning (Mulder 2014). However, the concept of competence is not further discussed in this chapter, because conceptions of competence are varied (Mulder 2014) and the research on informal workplace learning seems to have focused on more specific learning outcomes (e.g., Janssens et al. 2017; Kyndt et al. 2014).

Eraut (2004) identified a wide range of workplace learning outcomes related to task performance, personal development, role performance, teamwork, judgement, decision making, problem-solving, awareness and understanding (of other people, contexts, values, etc.), and academic knowledge and skills. Billett et al. (2005) stated that the outcomes of participation and engagement in work practices relate not only to changing individuals but also to the remaking of cultural practices in the workplace. Workplace learning also affects organizational performance by enhancing competence, productivity, and employee enthusiasm (Park and Jacobs 2011).

Kyndt et al. (2014, 2016) further argued that informal learning outcomes are unpredictable and workplace-specific. For example, in the context of teachers' informal learning, a systematic review (Kyndt et al. 2016) identified multiple learning outcomes related to subject knowledge, pedagogical knowledge and skills, and professional attitudes and identity. Kyndt et al. (2014) also developed and validated a three-factor model for measuring informal workplace learning outcomes consisting of *generic learning outcomes*, *job-specific learning outcomes*, and *organizational-level learning outcomes*. The study suggested that Eraut's (2004) learning outcomes match generic learning outcomes for many professions. Janssens et al. (2017) further studied the relationship between learning conditions and informal learning outcomes. They found that access to information and opportunities for feedback, reflection, and coaching were associated with generic and organizational-level outcomes, whereas coaching was important for job-specific learning outcomes. It appeared that learning job-specific skills required workplace experiences, but these experiences could be enhanced with guidance.

Table 1 presents an overview of the components of workplace learning and summarizes some previously presented factors related to informal workplace learning.

---

## Conclusion

This selective review provided an overview on informal workplace learning and discussed research results and directions on related factors. This chapter may serve as a base for employees, managers, and HRD professionals to understand this type of learning. Although learning is highly person-dependent, some contextual factors seem to facilitate informal workplace learning. In providing some practical guidelines for promoting and encouraging informal learning, there are particular points to be considered:

**Table 1** Overview of the components of workplace learning and prominent factors related to informal workplace learning

Context and individual factors	Learning activities	Learning outcomes
<p><i>Job characteristics</i>                      Work demands (e.g., task significance, task variety, task complexity, exposure to changes)                      Autonomy (planning, decision, methods)  <i>Relational factors</i>                      Social support (feedback, interaction, networks, coaching)                      Power relationships  <i>Organizational factors</i>                      Learning climate and culture                      Work tools and resources (e.g., information systems)                      Leadership and management                      Rewards and recognition  <i>Personal or psychological characteristics</i>                      Personal history                      Motivation                      Self-efficacy                      Personality                      Emotion                      Agency  <i>Demographic variables</i>                      Age                      Gender                      Ethnicity                      Tenure                      Education                      Organization type and size</p>	<p><i>Learning from oneself</i>                      Reflection                      Experimentation  <i>Learning from others</i>                      Learning from colleagues                      Learning from supervisor                      Observation                      Collaboration  <i>Learning from non-interpersonal sources</i>                      Searching and scanning information (e.g., Internet, professional magazines, journals)                      Learning from errors, conflicts, etc.</p>	<p><i>Generic learning outcomes</i>  <i>Job-specific learning outcomes</i>  <i>Organizational-level learning outcomes</i></p>

- Work tasks and the opportunities they provide for learning in daily work.
- Social support and the collaborative nature of workplace learning; various communities, interaction, and networking inside and outside of the workplace can benefit learning.
- Leaders’ and managers’ engagement in supporting learning; learning climate and culture is built by leaders and managers who can also promote informal learning by providing recognition or rewards and thereby create further incentives for employees to learn.

However, paradoxically, these kinds of guidelines also weaken the informal nature of workplace learning. Informal learning should be learner-driven, so that learners or employees themselves are able to determine the learning needs, spaces, and methods. But informal workplace learning which is deliberately encouraged by

an organization inevitably becomes more organized and formal. Consequently, making a distinction between formal and informal workplace learning seems to become less appropriate, despite the informal context. All learning situations usually include both formal and informal characteristics which influence the nature and effectiveness of the learning (Malcolm et al. 2003).

The 3-P model of workplace learning originally aimed to offer an analytical tool for understanding the diversity and different emphases in the field of workplace learning, thereby helping researchers find areas of interest and plan future studies (Tynjälä 2013). There is clearly an increased interest in workplace learning, and multiple reviews have discussed work-related learning in recent years (see, e.g., Kyndt and Baert 2013; Noe et al. 2014; Manuti et al. 2015; Tynjälä 2013). This chapter may help researchers with future research designs, for example, by directing attention to the interplay between different factors and components. However, the concepts of work and workplace are also undergoing changes, which should be noted in future research (Cairns and Malloch 2011). Although the dichotomy between formal and informal learning is questioned, it is well established from a variety of studies that research focusing especially on informal learning is challenging. For instance, the systematic review by Kyndt and Baert (2013) showed that measuring work-related learning has largely focused on the participation in formally organized learning activities. When studying informal learning, respondents are more likely to refer to formal rather than informal learning (Eraut 2000). Since informal learning is often unconscious, invisible, and not recognized as learning, it is often not reported, its meaning is underestimated, or the learning is difficult to observe (Eraut 2000, 2004; Froehlich et al. 2017; Marsick et al. 2017). Consequently, the research field should also reach out to other fields to extend the understanding of the complex phenomenon of workplace learning (Billett and Choy 2013).

The review showed that empirical studies in the field have used both qualitative and quantitative approaches. Qualitative research and the case study method have offered valuable insights, but theoretical frameworks, for example, have often lacked conceptualizations (Skule 2004). Quantitative research has employed a number of different measurement instruments, but the studies have usually applied cross-sectional survey designs (see, e.g., Haemer et al. 2017; Harteis et al. 2015). Both approaches have largely relied on self-reporting methods of data collection. Although widely applied, these methodological choices might lead to common method biases (see Podsakoff et al. 2003). Kyndt et al. (2016) suggest that future research might benefit from a mixed-method approach which observes the context-specific and person-specific nature of learning. They conclude that a research design with a theoretically grounded quantitative phase with a large sample followed by a qualitative (sub)sample of the participants might be beneficial in elaborating results. There is also a need for longitudinal designs and data which would better allow the investigation of relationships between different factors and learning outcomes (Haemer et al. 2017; Kyndt et al. 2014). In addition to a focus on the individual level, group and organizational variables could also be explored as contextual factors (Haemer et al. 2017). Similarly, the mediating effects of the wider context, including

society and culture, should also be further investigated (Billett and Choy 2013). This chapter highlights the importance of understanding and paying attention to the complex contexts and the nature of workplace learning.

**Abstract**

Teams in organizations are increasingly seen as an important level and leverage for innovation and change, because they can help to let individual ideas develop into new institutional practices and support the cascading of new developments into the organization. This, in turn, can lead to the necessary innovation and change. However, why do some teams perform really well and others not? A trustworthy predicting variable of team performance is team learning. A vast amount of research has been done on this topic. However, in team learning research various differences between results were observed. The main aim of this chapter is to make an inventory of antecedents influencing team learning, and to analyze the differences between results found in quantitative and qualitative studies. Results show that many antecedents could be identified, based on both quantitative and qualitative research. And as expected there are significant differences between both strands of research. Whereas quantitative research mainly focuses on testing hypotheses of antecedents influencing team learning, qualitative research tries to unravel mechanisms on how these antecedents work and how team learning processes are influenced. Majority of the research belongs to the quantitative strand, whereas there are major questions open that can only be answered by means of qualitative research.

**Introduction**

When talking about training and learning in organizations, one refers to Human Resource Development (HRD) in which HRD consists of formal trainings (e.g., courses and trainings) and workplace learning (e.g., learning from a more experienced colleague). Workplace learning is also known as informal learning. Whereas formal trainings have clear learning objectives, often take place at a separate venue, and close with a certificate or diploma, informal learning (activities) or workplace learning (activities) takes place while employees are doing their work (Tynjälä 2008). It is seen as a by-product of their work. Although seen as a by-product, HRD researchers (and practitioners) increasingly see the added value of stimulating informal learning. When companies allow their employees to rotate their tasks or to work in teams, both their productivity and commitment may increase (Marsick and Watkins 2003) or by means of teamwork the innovativeness of the company can increase (Hülsheger et al. 2009). Although research results present informal learning as a concept (even presented as a by-product) that can contribute significantly to change and/or innovation, its appearance is not self-evident and needs careful consideration and investment from the company side. Take, for example, the

organizational structure (i.e., teams) or the role of leadership (i.e., transformational): both have significant influence on informal learning, and organizations should take that into account when designing organizational processes.

The focus in this chapter will be on team learning and its antecedents. Before these concepts can be explored, some supporting concepts need clarification. First, some concepts and their definitions will be introduced, before the core of the chapter is presented. While reading, the following should be kept in mind. The theoretical foundation for looking at more informal or workplace learning (used as equivalents in this chapter) originates from the participation and knowledge creation metaphor (Sfard 1998). Knowledge is seen as something that can be created by interacting with others and that goes beyond the more traditional approach of knowledge as something that can be acquired.

### **Spin-Off of Teams**

The focus in this chapter will be on teams in professional organizations and especially on antecedents influencing team learning within and beyond these teams. There has been a significant increase in the use of teamwork in organizations over approximately the past four decades. It is stated that due to a growing emphasis on knowledge, more dynamic environments, and increasing knowledge inflation, there is an increasing effort being put into predicting team effectiveness (Raes et al. 2015). There are multiple reasons, from different scientific fields within social sciences, which underpin the additional value of working in teams. When it comes to organizational development or organizational learning, teams are considered as the building blocks of organizations (Senge 1994) and levers for organizational development and organizational change (Crossan et al. 1999). As described in the work of Crossan et al. (1999), teams are pivotal on both the learning processes exploitation (e.g., improvement of the current system) and exploration (e.g., exploring new ways of working). Simultaneously, from a more economic point of view, teamwork leads to increased productivity and innovation (Hülshager et al. 2009). Working in teams accelerates, for example, innovation and new product development and reduces employee turnover. From an employee point of view (or Human Resource Management (HRM)), the quality of work life improves (Bosch-Sijtsema et al. 2011), because employees belong to a small unit and feel responsible and committed to make that smaller unit work. Or they are more satisfied with their job because of the experience of more autonomy. These are just some examples to illustrate the diversity of the added value of working with teams. To summarize this, both the organization and the individual employee can potentially benefit from working in teams.

### **Definition of Team**

To make sure the same is understood by the concept of “team,” a definition of this is provided. In this chapter, teams are considered as complex systems, and at the same

time part of larger complex systems (i.e., the organization), and therefore the definition by Cohen and Bailey (1997) is adopted: “A team is a collection of individuals who are interdependent in their tasks, who share responsibility for outcomes, who see themselves and who are seen by others as an intact social entity embedded in one or more larger social systems” (Cohen and Bailey 1997, p. 241). Because the focus in this chapter is on team learning and not teams as such, the discussion on the concept of team will not be further elaborated. One should realize that this conceptualization is a choice, open for debate, but attuned with the content of this chapter.

## Team Performance

Empirical research demonstrates that there is considerable variance in team performance (Hackman 1989). Whereas some teams perform really well, others have difficulties with performing anything, even when they are in the same organization (Edmondson 2002). This is an interesting observation and studied in many occasions and disciplines. A vast amount of empirical research has been done on team performance (see, e.g., Edmondson 1999) in the field of learning organizations. Many researchers have demonstrated that the relationship between team performance and its influencing factors is complex. Team learning is one of those factors that receives a lot of attention. Team learning is considered as one of the crucial antecedents for team performance and innovation (Drach-Zahavy and Somech 2001). Other influencing factors on team performance are leadership behavior and goal clarity (Savelsbergh et al. 2010), for example. Furthermore, these researchers revealed that there are no differences in assessment of what are important factors influencing team performance between team leaders (those leading within a team), supervisors (those leading outside a team), and team members themselves. So, team learning is seen as one of the influencing factors for team performance and innovation by all involved stakeholder groups (Savelsbergh et al. 2010).

## Team Learning: Process Versus Outcome

Team learning is seen as a solid predictor for team performance. But what is exactly meant by team learning? The answer is a complex one. Team learning is a relatively new subject and taken up in multiple disciplines (as teamwork is). Although attention from multiple disciplines speeds up the conceptual and empirical development of team learning, it also leads to confusion and false interpretations because of the confusion (Decuyper et al. 2010). To mention one aspect that contributes to confusion is the process versus outcome discussion. Learning can be conceptualized on the one hand as a process and on the other hand as an outcome. Same holds for team learning. Whereas Edmondson (1999) defines team learning from a process perspective with the following definition: “an ongoing *process* of reflection and action characterized by asking questions, seeking feedback, experimenting,

reflecting on results, and discussing errors or unexpected outcomes of actions” (p. 353), Wilson et al. (2007) define team learning as “a *change* in the group’s repertoire of potential *behaviour*” (p. 1043). Some scholars make a combination of both perspectives and conceptualize team learning as follows: “as a process, group learning involves the activities through which individuals acquire, share and combine knowledge through experience with one another. Evidence that group learning has occurred includes changes in knowledge, either implicit or explicit, that occur as a result of such collaboration” (Argote et al. 2001, p. 370 in Wilson et al. (2007)). Based on the findings of this chapter, it can be stated that in most cases team learning is approached as a process, and in most cases, it is described as team learning behaviors. Only a few articles choose to describe team learning as an outcome. For the separate studies reported on in this chapter, the approach will be mentioned.

## Team Learning Processes

Whereas the outcome of team learning can be more or less anything (e.g., change of behavior, new knowledge), the processes of team learning are identified and studied intensively. Decuyper et al. (2010) did a review of team learning activities (also referred to as behaviors) and came up with a set of team learning processes. These basic team learning processes are *information sharing* (team members sharing previously unshared information with other team members), *co-construction* (which refers to team members sharing previously unshared information with other team members), *constructive conflict* (team members negotiating and discussing different perspectives of team members), *storage, retrieval, team activity* (actually doing something together, i.e., experiment), *team reflexivity* (questioning the team process and possible outcomes), and *boundary crossing* (getting information from sources outside the team). Whereas sharing, co-construction, and constructive conflict are so-called basic processes, which happen when teams are interacting together, storage, retrieval, team activity, team reflexivity, and boundary crossing are called facilitative processes, which should stimulate the basic processes. Facilitative team learning processes do not necessarily take place during the team interactions. So to share information during a meeting, it is good to cross boundaries and learn from others outside the team, for example. Van Woerkom and Van Engen (2009) take these three basic processes together (knowledge sharing, co-construction, and constructive conflict) and call them *information processes*.

Similar to team performance, there is a huge variety on the extent to which teams show team learning. Edmondson (2002) investigated the extent to which teams were actually doing something different (learning as an outcome) based on team learning behaviors. Former research mainly revealed insights about team learning processes either being present or not and with this research she wanted to learn more about what teams actually do. Based on in-depth case studies of 12 teams, she unraveled three kinds of teams: first, teams that were going through an iterative process of reflection and action; second, teams that were only reflecting; and third, teams that

were doing nothing with regard to learning. All three types appeared in the same organization. So, team learning behaviors appeared in some teams (reflection and action), but not in others while those teams were situated in the same organizational context. So, differences within teams with regard to team learning behaviors do exist.

## Quantitative Versus Qualitative Research on Team Learning

Attempts to investigate team learning processes have encountered the challenge that it appears difficult to capture the emergence of team learning processes. Team learning processes are different processes and interrelated processes at the same time. These insights originate, for example, from research in which in the same teams both qualitative data (Zoethout et al. 2017) and quantitative data (Bouwman et al. 2017) were collected. Based on a self-reported questionnaire, team members reported to a high extent team learning processes. Based on video data, collected in a selection of these aforementioned teams, hardly any team learning process could be detected. This difference in observations was the motive to investigate whether there are differences and similarities in research on team learning and antecedents of team learning in either quantitative or qualitative research.

## Approach of This Chapter

As said, team learning is studied in many different disciplinary fields, and consequently, a large number of topics are related, or potentially related, to team learning. Firstly, the choice was made to limit the search to peer-reviewed articles in management research literature (using Scopus and Web of Science) that explicitly used the terms team learning and treated team learning (also) as a dependent variable and only to include empirical studies (studies that were based on quantitative or qualitative data collected in the field and not based on laboratory experiments). Secondly, a snowballing method was applied after the first list of articles came out of the search engines. The choice was explicitly made to only use articles that were based on studies in professional organizations, not being educational institutions, because the profession of teacher does have a totally different history and according to Vangrieken et al. (2013) teacher “teams” mostly do not seem to be proper “teams” when bearing the criteria of a team as defined by Cohen and Bailey (1997). Furthermore, completeness was traded for richness. Overall, it was the aim to characterize the nature of both quantitative and qualitative research strands from the last 20 years to give the reader an idea of what is known and what not on the topic of antecedents of team learning. In the remainder of this chapter, the results found in literature are presented. First the results from qualitative research are presented, followed by the results from more quantitative research. In both cases more or less similar topics will be grouped and discussed jointly.

## Antecedents of Team Learning Based on Qualitative Results

The number of qualitative papers that research antecedents of team learning is limited. As far as this study revealed, not so much research is done with the help of qualitative methods. The results found are given in the following.

### Conditional Team Learning Processes

A well-known starting point for this section is the review done by Hannes et al. (2013). They did a systematic review and included only qualitative research to integrate findings on the experiences of employees with team learning in the context of their work or vocational learning setting. Their main findings were that no matter what type of team learning (they distinguish active-reflective, feedback-feedforward, single-loop learning, or knowledge creation) is occurring on the work floor, there are three conditional team learning processes that always should be taken into account: *communication, boundary crossing, and knowledge sharing*. These as such are not antecedents, but team learning processes to facilitate the basic team learning processes (see Decuyper et al. 2010). Interesting to notice is that both teams of scholars put knowledge sharing in different categories. Whereas Decuyper et al. (2010) frame knowledge sharing as a basic team learning process, Hannes et al. (2013) frame it as a conditional learning process. A second observation by Hannes et al. (2013) is that *power differences* should be minimized or eliminated and hierarchical structures that reproduce power differences should be analyzed. Team leaders should take responsibility to influence the power relationships inside their teams and as a result positively influence the learning that takes place.

### Time

Sparrow and Heel (2006) were one of the first to include the time dimension into research on team learning. A single participant, who talked to multiple members of healthcare teams, identified four components that support team learning: (a) *knowledge sharing*, (b) *work culture and environment*, (c) *action*, and (d) *personal mastery*. Knowledge sharing is, in accordance with Decuyper et al. (2010), considered as a team learning process. The other three factors support team learning on their own level. Furthermore, Sparrow and Heel (2006) discovered, based on their single participant research, that the course of time did not influence the nature of team learning processes. Somewhat similar was concluded by Raes et al. (2017). The aim of their qualitative longitudinal study was to create a more in-depth picture of the emergence of team learning processes throughout the life span of temporary project teams. Although they framed their expectations clearly, no time-related patterns in terms of occurrence of type and topic of basic and facilitating team learning processes (Decuyper et al. 2010) were found over the meetings and across the teams. This implies that in the beginning of a (project) team

or at the end of the team, the same team learning processes occur and that the time span of a project team does not influence the team learning processes.

## Team Leader Behaviors

Boak (2016) did an in-depth study with 35 teams in the healthcare sector, in the form of action research and identified processes within the teams and factors in the teams' environment, which enable team learning. Based on his findings, the team leader plays a pivotal role. Team leaders should create commitment among their team members, facilitate time to discuss, strive for concrete objectives and steer on how to reach these objectives, monitor and review progress, combine determination and flexibility, and organize communication with others outside the team.

## Contextual Factors

Furthermore, in the same research Boak (2016) identified multiple contextual factors, and these can be summarized as follows: support of senior managers who are not part of the team, availability of information technology resources and of information about the workings of the wider system, and finally a financial and organizational stable environment.

## Rivalry

In general, research into team learning processes is done based on the assumption that all efforts in teams have to lead to some kind of smooth cooperation to be effective. Lotz (2010), however, is convinced that not only the harmony-based model contributes to learning but that competition, or in other words *rivalry*, can also contribute to learning in teams. Her reasoning is that harmony-based learning tends to reproduce the existent, while rivalry-based learning tends to trigger innovation due to an inherent conflict. With this in mind, she did interviews with members of two teams. Based on those interviews, in which she explicitly asked for rivalry, she unraveled four processes that underpinned her assumption that rivalry can support team learning. Firstly, when organizational members perform and make results and are *rewarded in a transparent way* within the teams, members want to improve to perform as good as possible and between teams they become each other's competitors. Secondly, because team members engage in and shift between various work roles, they learn how the different roles work and they want to become the *role master*. Thirdly, team members build up a *professional work identity* by gaining skills and competencies, and they want to show they have the best ideas on how to improve the existing way, and fourthly, team members strive for *social reputation* within and across teams. They want to be in favor for the next innovative project. Based on these factors not only cooperation and creation consensus but also rivalry

seems to be helping team learning to take place. Lotz (2010) ends the discussion with stating that rivalry and consensus have to be in balance.

It was expected that qualitative studies focus more on the mechanism: what antecedents contribute in what way to team learning. However, only some articles present these mechanisms (e.g., Boak 2016; Lotz 2010); others focus on identifying (contested; Lotz 2010) antecedents with describing the mechanisms. The next part is about what quantitative research brings us.

---

## Antecedents of Team Learning Based on Quantitative Results

There is a vast amount of articles dealing with antecedents of team learning studied by means of quantitative methods. The following is a summary of antecedents that were found and to prevent ending up with one extensive laundry list of antecedents, the following categories were identified: (1) factors with regard to internal team processes, (2) factors originating from team leaders and their behavior, and (3) contextual factors or in other words external factors that influence team learning. Firstly, factors influencing internal team processes are presented.

### Antecedents Originating from Internal Team Processes

The first set of antecedents deal with the internal team processes, such as diversity. And although team leader behavior could be considered as an aspect of internal team processes, it is discussed in the following section; the number of studies on team leader behavior influencing team learning is extensive, and it is considered justifiable to create a separate section.

#### Team Structure and Psychological Safety

Bunderson and Boumgarden (2010) were interested in the relationship between *team structure* and team learning orientation. With team learning orientation, they meant the shared goals that are implicitly pursued by team members within the context of a team. Bunderson and Boumgarden (2010) have the conviction that team structure does not per definition diminish team learning orientation as expected by many scholars (i.e., more rules means automatically less room for experimentation). Bunderson and Boumgarden (2010) expected that clarity of roles and tasks could also support team learning orientation and they were right. At least in situations where it concerned self-directed teams dealing with repetitive tasks. Based on a study done in Fortune 100 high-technology firms in which each of the teams was responsible for a specific task within the firm's overall production process, they came to this conclusion. In these teams it appeared that team structure affects team learning orientation through information sharing and conflict frequency, but not through psychological safety. There was also a positive direct effect of team structure on team learning orientation. Based on their findings, they also concluded that, as discovered by Edmondson (1999), *psychological safety* did have a positive influence

on team learning via the mediating variables of information sharing and conflict frequency.

A vast amount of studies have been done on the role of *psychological safety*. Sometimes as a predictor of team learning or team performance and in many instances as mediating variable, and in the majority of these studies, psychological safety is an important factor influencing team learning in a positive way. To mention one example, Leicher and Mulder (2016) studied nursing teams in elderly homes, and they found that having a safe team climate (i.e., psychological safety), assessed on the individual level, has a positive influence on team learning behaviors. As a team member, you feel that you can bring in anything without any repercussions (Edmondson 1999).

Bresman and Zellmer-Bruhn (2013) added another kind of structure. They studied to what extent organizational structure and team structure influenced team learning. To measure team learning, they make a distinction between internal and external team learning. The former captures interactions among team members inside the team boundary, and the latter captures interactions beyond the team boundary with individuals and groups in the context within which the team is embedded. Bresman and Zellmer-Bruhn (2013) found the same result as Bunderson and Boumgarden (2010) that more *team structure* (measured by specialization, hierarchy, and formalization – see Bunderson and Boumgarden (2010)) is positively related to both internal and external team learning and that in both instances psychological safety has a mediating role between structure and team learning. This is in contrast with the findings of Bunderson and Boumgarden (2010) where psychological safety did not act as a mediating variable. *Organizational structure* has a negative relationship with both internal and external team learning, and a possible explanation is that when team members experience limited task autonomy, there is less willingness to show team learning processes. However, for teams with more team structure, the relationship between more organizational structure and external learning is negative. For teams with less team structure, the relationship between organizational structure and external team learning is positive. So, organizational structure can compensate for a weak team structure in the case of external team learning.

In their research Li and Huang (2013) were particularly interested in the influence of *specialization*, *credibility*, and *coordination* on exploitative and exploratory learning. They take the stance that team learning is an outcome. Whereas credibility influenced both types of team learning positively, so more trust in a team means more exploitation and exploration, specialization only influenced exploitation positively and coordination only influenced exploration positively. A plausible explanation for the relationship between coordination and exploitation (and not exploration) is that specialization may decrease the willingness of team members to gain diverse knowledge and perspectives from outside their professional domain, thus hindering exploratory learning. And the fact that coordination only increases exploratory and not exploitative learning might imply that coordination offers opportunities for experimentation and innovation needed for exploration activities.

## Diversity and Identification

In general, it is assumed that expertise diversity leads to more team learning and that many teams should benefit from their diverse composition. However, there are researchers who are less convinced of this statement. Van Der Vegt and Bunderson (2005) investigated in teams in the oil and gas industry the extent to which *collective team identification* played a moderator role between *expertise diversity* and team learning (and performance). They expected some kind of U-shaped relationship; in the case collective team identification is high (in which collective team identification means the emotional significance that members of a given group attach to their membership in that group), both low expertise diversity and high expertise diversity have a positive influence on team learning behaviors. This is confirmed by Rosendaal (2009) in the field of large multinational companies. In the case of low team collective identification, both extremes of expertise diversity hardly influence team learning behaviors. An inverse U-shaped nonlinear relation is at stake when team collective identification is low, meaning that when members do not feel attached to a team and expertise differs a lot or hardly anything, team learning processes are not stimulated. Diversity is not in all cases a stimulus. This holds also in the case of *value diversity*. Rosendaal (2009) discovered that *value diversity* is a factor that hampers knowledge sharing. However, the positive influence of collective identification decreases the hampering relationship between value diversity and knowledge sharing.

## Stability

On the one hand, one might expect that team turnover (members leaving the team) has a positive influence on a team in general and team learning behaviors in particular. New members bring in new ideas and might spur the learning. On the other hand, one might expect a negative influence on team learning behaviors. Possible routines could be disrupted, and new routines have to be established. Also based on the existing knowledge about psychological safety (e.g., Edmondson 1999), one might expect that with many changes in a team, psychological safety drops, and this has a negative influence on team learning behaviors. Akgün and Lynn (2002) investigated the consequences when teams undergo frequent changes. Based on their results, it can be concluded that in stable environments *team stability* has a positive contribution to team learning processes. The opposite of stability is team turnover. Gerben et al. (2009) did a study on the extent to which *team turnover* influences team learning behaviors. Gerben et al. (2009) expected a U-shaped relationship between team turnover and team learning behaviors; a positive effect is expected when there is a small number of changes and a negative effect when there are a large number of changes. Based on a large-scale research, hosted by a manufacturer working with self-managing work teams, in which 47 teams were questioned in several ways at 2 points in time (there was a year in between), they concluded that team turnover negatively relates with team learning behaviors. So, based on these studies, it can be concluded that stable teams are favorable over high team turnover, when it comes to team learning processes in stable environments.

## Task Complexity

The extent to which team learning takes place also depends on task complexity. Real complex tasks require more learning, one would expect. Lantz Friedrich et al. (2016) were curious to find out how *task complexity*, in the field of lean production systems, added to team learning. Based on their large-scale research (including 54 teams and 491 individuals), they discovered that it is useful to make a distinction between main tasks, supplementary tasks, and additional tasks. Main tasks are what a team is expected to do or sets itself as goals. Supplementary tasks are subtasks necessary to complete the main tasks (e.g., having meetings to set goals), and additional tasks are extra tasks that occur on an occasional basis. For main and supplementary tasks, it holds that they do not influence team learning. Additional tasks, on the contrary, did. These tasks were seen as more complex and many times as unclear, also because they were not carried out regularly and routinely. Therefore it can be stated that complex additional tasks resulted in more team learning than routine tasks did.

## Conflict and Controversy

Although constructive conflict is known as one of the team learning processes, it is not clear to what extent conflict does help or hinder team learning? Van Woerkom and Van Engen (2009) were convinced that *conflict* would have a positive influence on team learning. They reasoned that facile and uncritical agreement within teams could have a negative influence on problem solving, whereas conflicts force individuals to think more deeply and more creatively about the problem at stake to come to an agreement eventually. Not all conflicts are the same, and therefore Van Woerkom and Van Engen (2009) distinguished between task conflicts, conflicts related to the task that has to be done, and relationship conflicts, conflicts between members of the team. They expected that task conflicts would influence team learning behavior positively and relationship conflicts would have a negative influence. The first assumption did not hold for a large sample of employees in the healthcare sector. Task conflicts did not influence team learning in a positive way. This was also shown in the research by Van Der Vegt and Bunderson (2005); conflict does not increase team learning behaviors significantly. Relationship conflicts on the contrary did influence team learning behaviors negatively and especially the particular behaviors of information acquisition, information processing, and storage and retrieval. These three team learning behaviors were less in teams with relationship conflicts. So, based on this one could conclude that conflicts are not helping team learning processes.

Chen et al. (2011) did not want to use the concept of conflict. They introduced in their studies *constructive controversy* or in other words the open-minded discussion of various views for mutual benefit and argue that constructive controversy will stimulate learning behaviors among team members. Based on a large-scale study, they concluded that constructive controversy, as experienced by team leaders, does have a positive influence on team learning (as experienced by team members).

Conflict itself is not helpful, even detrimental; constructive controversy, however, does support team learning behaviors. Possibly it is in the framing of the concepts. Whereas conflicts may have a negative connotation and people do not want to talk about conflicts, constructive controversy has something positive in it.

### Team Internal Affairs

Akgün et al. (2014) studied antecedents of team learning in IT project teams. They investigated *team internal affairs*, as teamwork, communication, trust, and commitment, and one external aspect being management support and to what extent these variables influenced team learning behaviors. They revealed that all factors mentioned influence team learning in a positive way to some extent, teamwork to a marginal extent and management support to a large extent. Yoon et al. (2010) unraveled that *team creativity* has a positive influence on the team learning process of knowledge creation.

### Leadership Style

As a second category of antecedents influencing team learning, leadership style is discussed. As said, this category could also be seen as internal team aspect, but knowing the considerable amount of research done, leadership behavior is discussed as a separate category. First, leadership styles are taken into account. There exist many different kinds of leadership styles. An often used dichotomy is between transformational and transactional leadership. Which type of leadership helps team learning behaviors the most? Kumako and Asumeng (2013) built on the work of Edmondson (1999) and discovered that a *transformational leadership style* has a mediating role between psychological safety and team learning behaviors. Team leaders with a transformational leadership style are leaders who focus on improving the performance of their team members by letting them develop to their fullest potential by granting them responsibility and involving them in decision-making, for example. Ortega et al. (2014) investigated a different kind of leadership style. They wanted to learn to what extent *change-oriented leadership* (e.g., encouraging innovative thinking, scanning the environment) influenced team learning behaviors. From their studies in 107 nursing teams (with 689 respondents), they concluded that change-oriented leadership has a positive influence on team learning behaviors. Savelsbergh et al. (2015) investigated to what extent *person-oriented leadership*, *task-oriented leadership*, and *team stability* influence team learning behaviors. In their analyses, based on 40 project teams in the construction industry, they concluded that all three factors are direct antecedents of team learning behaviors. Although, they expected that team stability would mediate between person- and task-oriented leadership, both person-oriented and task-oriented leadership styles appeared to be variables directly influencing team learning behavior. There is no decisive answer on the leadership styles; different styles appear to have positive influences.

## Team Leader Behaviors

Besides leadership styles, the more specific activities that leaders do can influence team learning. Makoto (2016), for example, investigated reflective leadership and team learning. He was aware that both leadership and reflexivity have positive influence on either team learning or team performance, and he was curious to learn more about the relationship between dimensions of *reflective leadership* and team learning. In this research team learning was seen as an outcome. Based on first a qualitative study multiple forms of reflection were identified, and second a large-scale survey was done to investigate the relationships. Based on this, it can be concluded that open reflection (as team member you feel free to speak openly) and goal-based reflection (team leaders ask for reflection about the vision, the process, the goals of the project) has a positive influence on team learning. On the contrary, problem-based reflection (reflection on things that went wrong) does not have an influence on team learning. The explanation is that problem-based reflection leads to superficial learning (error correction), and the other two lead to deeper forms of learning that really contribute to team learning outcomes.

Ashauer and Macan (2013) were not curious about reflection or looking back; they were interested in active steering and wondered what kind of team leader's instruction would support team learning. They unraveled the influence of *leaders' mastery goal instruction* and *performance goal instruction* on team learning. Mastery goal instruction means steering as a leader to master the goals of the project, and performance goal instruction means steering on the personal competencies of individual team members. Based on former research, they expected that mastery goal instruction would be less threatening than performance goal orientation. They concluded that team learning behaviors are higher in teams where there is mastery goal instruction in comparison to teams that have performance goal or no goal instruction. So steering on projects' goals enlarges the chances of team learning behaviors more than when steering on personal competencies. Psychological safety mediates the relationships between both ways of instruction; mastery and performance goal instructions facilitate team learning behavior by increasing psychological safety but to a lesser extent for performance goal instruction.

Døving and Martín-Rubio (2013) investigated additional variables and were curious to what extent *structure*, *consideration*, and *cross-training* as leadership behaviors were supportive for team learning behavior. Structure means the degree to which the leader structures and defines the leadership role and the role of subordinates concerning job-related activities. Consideration means the degree to which the leader considers employees' needs, displays concern for their well-being, creates a pleasant atmosphere for interactions, and establishes mutual interests. And cross-training means facilitation to do more than one task within the team. In their quest for answers, they used Edmondson's (2003) work on leadership. Døving and Martín-Rubio (2013) expected that the more a team leader initiates structure and uses consideration and cross-training, the more team learning behaviors will be shown by the team. Based on their research in the Spanish banking sector, including 68 teams, they concluded that all three hypotheses are confirmed in this situation. More initiation of structure, more consideration, and more cross-training (or being

able to do multiple tasks) lead to more team learning behaviors. Again it is shown that more structure in this case by the team leader leads to more team learning behavior.

In a research by Haar et al. (2017), the aspect of structuring was studied to a deeper level. These authors scrutinized the role of *structuring behavior of the team leader*, and to what extent that behavior influences the solution of constructive conflicts, being one of the team learning processes. According to Haar et al. (2015), constructive conflict makes a difference for emergency teams, because members in these teams handle differences of opinions critically but constructively by addressing them directly, act on comments given on ideas, and verify opinions and ideas by asking each other critical questions. Based on research by Haar et al. (2017), again in emergency teams, it appeared that team leaders' structuring behaviors specifically asking clarifying questions, summarizing into a command, and summarizing into a decision are powerful behaviors to make constructive conflict, as one of the team learning behaviors, work in emergency teams.

## Organizational Context

Finally, the organizational context or the external factors influence team learning. And with external is meant all the things happening outside of the team. In comparison to the vast amount of research available on team internal and leadership factors influencing team learning is the amount of research done in the field of organizational context and team learning limited. We already learned that organizational structures do not support team learning as such (Bresman and Zellmer-Bruhn 2013), but what other factors could be identified for influencing team learning? In this section some examples are presented. Based on skimming the available literature, it can be concluded that this field is clearly in its infancy. The concepts measured are not that specified as yet. Take, for example, learning culture and turbulent environment. These are both quite comprehensive concepts and consisting of more sub-variables. Nevertheless, they are worthwhile mentioning, as shown by the research of Zellmer-Bruhn and Gibson (2006). They did a large-scale research on multinational companies (MNCs) to find out whether or not *global integration* influences team learning. They measured team learning as an outcome, and they asked team leaders to respond to questions underpinning team learning. Based on a thorough examination of annual reports, they constructed a measure to say something about global integration. Based on their analysis, they concluded that team learning is negatively related with global integration. The more an MNC shows global integration, the less team learning takes place. And in the case where there is high local responsiveness, team learning increases. Furthermore, they showed that more autonomy and more norms and procedures for knowledge management increase team learning. Based on their findings, one can conclude that contextual factors do matter.

Another research by Akgün et al. (2007) investigates to what extent a *turbulent environment* influences team learning. They work with other variables representing team learning processes and add the concepts of unlearning and improvisation to the existing body of knowledge. Unlearning, although conceptually still under construction, is viewed as memory elimination in general and as changing beliefs, norms,

values, procedures, and routines in particular. Improvisation is present in those situations where routine-based solutions fail because of a turbulent environment. Based on their large-scale research and only those results that influence team learning, they conclude that a turbulent environment has a positive influence on unlearning; however, no clear relationship with improvisation could be detected. Being a team in a turbulent environment does not guarantee improvisation.

Yoon et al. (2010) studied team learning processes (i.e., knowledge creation) using the lens of learning organization. They studied the extent to which learning organization characteristics (e.g., group learning, leadership for learning) have a positive influence on team learning processes. Based on their large-scale research in Korea, they concluded that the *organizational learning characteristics* (measured by means of the DLOQ from Marsick and Watkins (2003)) have a positive influence on knowledge creation in teams. They did not distinguish which learning organization characteristics were responsible for fostering team learning behaviors.

## Impeding Factors

The debate on factors influencing team learning is dominated by supporting factors (Zellmer-Bruhn and Gibson 2006). Most scholars have investigated what factors *support* team learning. Only in a few cases inhibiting factors for team learning were discovered, such as organizational structure, value diversity, team turnover, relationship conflict, and global integration. These factors are reported in the foregoing sections. In addition to this summary, some scholars identified additional impeding factors. *Workload*, for example, is a factor that negatively influences team learning behavior. Savelsbergh et al. (2012) identified that *team quantitative role overload* (meaning a discrepancy between teams' tasks demands and time or other resources necessary to fulfill the tasks) is negatively related to team learning behaviors. All other forms of stress (i.e., team role conflict) do not impact team learning behaviors negatively.

Decuyper et al. (2010) give an overview of impeding factors in their review. To provide an even richer picture, including both supporting and impeding factors, factors that were not discussed as yet are summarized: *groupthink* (the rationalized conformity of thoughts that seeks to diminish conflict within the group or the group analogue of defensive avoidance), *diffusion of responsibility* (responsibility for the learning outcomes is divided among the team members, but no one takes responsibility for the whole), *dominant leader* (conversations in the team are dominated by the team leader and his or her opinion), *Abilene paradox* (team members do not succeed to express their true feelings and consequently pursue a course of action that all or at least most team members disagree with), *free riding* (one or more team members intentionally hide, do not participate actively in the activities, and yet take credit for the achievements of the other team members); *social loafing* (team members (unintentionally) invest less energy when performing in teams, compared to when they have to face the task on their own); and *conflict escalation* (the inverse of groupthink, too much diversity, and the escalation of conflict within a team).

## Discussion and Conclusion

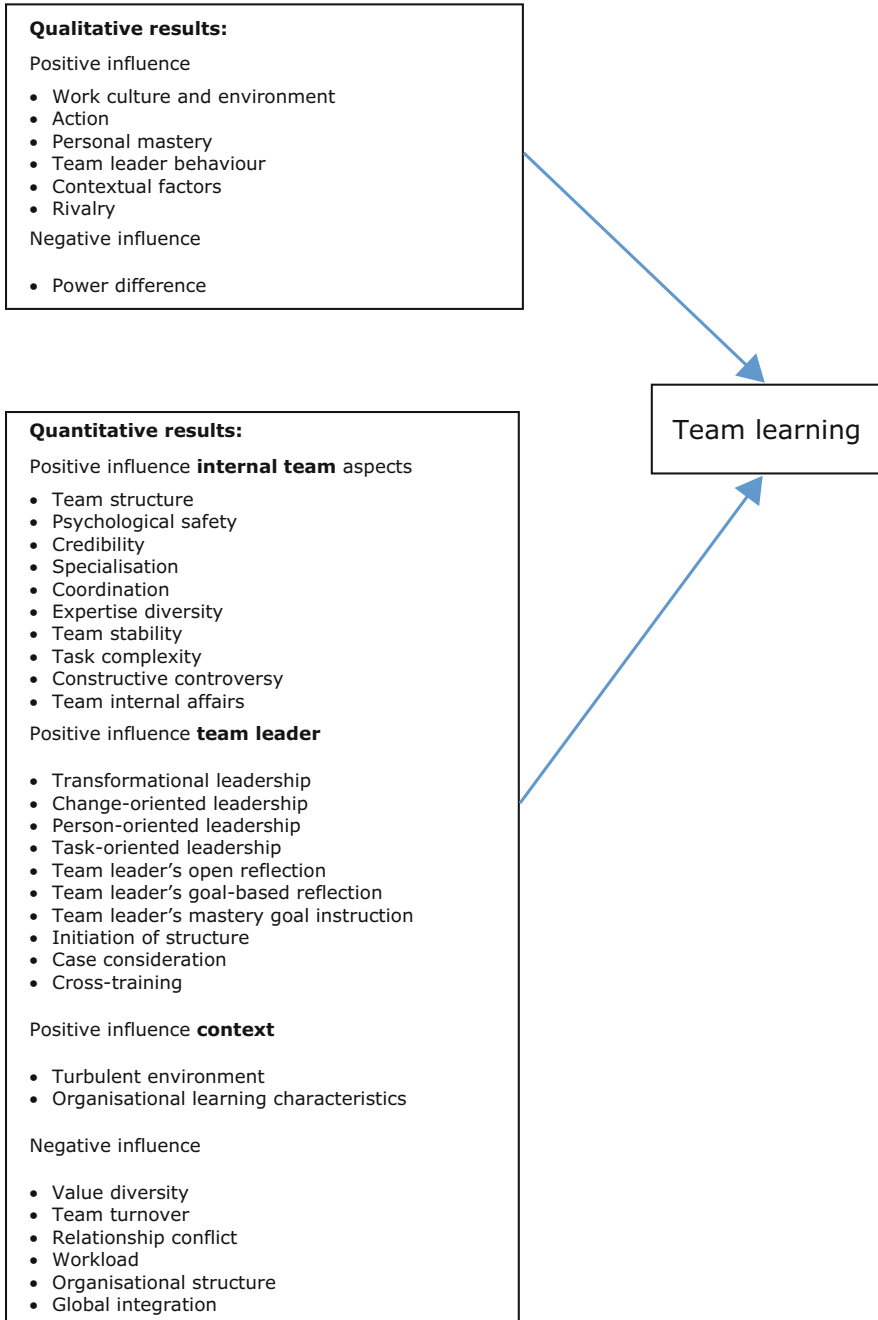

In the foregoing an inventory was made of antecedents of team learning. Although this is not the first time an overview of this field is provided, it is one of the first times this overview restricts itself to scholarly articles on team learning in professional organizations, not being schools or universities. As argued before, being a teacher team is different from being a team of professionals in another setting (Vangrieken et al. 2013). Furthermore, it was stated that it was not the aim to include all articles available. The selection was made based on clear criteria and snowballing. Enriching the list of antecedents was the main selection criteria. Figure 1 summarizes results found. This is, of course, a simplification of all information in the foregoing sections, and one should realize that some factors have both a positive and a negative influence. The most dominant influence is reported in this figure.

Furthermore, it should be realized that most studies included in this chapter originate from Western or European companies. In countries or continents with a culture that is less individualistic or more hierarchic, one might expect different results. Psychological safety is culture-bound, for example (Cauwelier et al. 2016).

There are factors of which one would expect an influence on team learning, but they had no influence at all, neither in a positive nor in a negative way. The following factors were expected to have influence, but research pointed out that they did not have any: time, task conflicts, team leader's problem-based reflection, improvisation, and stress. The longer the team is collaborating and projects develop over time, the lesser influence was detected on team learning processes. In the course of time, the type of team learning processes applied did not change (Raes et al. 2017). And where one would expect a positive influence of improvisation (room to experiment), no influence was detected in turbulent environments (Akgün et al. 2007). And obviously one would expect a negative influence of stress, but that was not the case. Stress should not be confused with workload, which did have a negative influence. As mentioned, Fig. 1 summarizes the results.

Many studies present results about antecedents of team learning. However, in almost none of these studies is the developmental character of teams taken into account. Raes et al. (2015) were among the first to study this. They used the model of Wheelan (2009). This model describes evolving group developments as observed in teams, as a result of which teams become better organized units that are capable of effectively working together. The following phases are distinguished:

1. Dependency and inclusion; team members are being really polite, but feel high levels of anxiety and uncertainty.
2. Counter dependency and fight; team members search for shared identity and definition of roles, and this process can be typified by conflict and power struggles.
3. Trust and structure; team members get to know each other and apply a more mature negotiation style, and roles and tasks become clear.
4. Work and termination; team members feel comfortable in the team and are willing to share information, and there is a good sense of where the knowledge and expertise lies within the group.

**Fig. 1** Summary of all antecedents for team learning found

In many studies, it is an assumption that when talking about teams, the third or fourth phase of team development is at stake. But it is hardly mentioned explicitly. Raes et al. (2015) discovered, based on a large-scale research, that teams in the first two phases show less team learning behaviors than teams in the phases three and four. One might assume that it is necessary to indicate in future research the phase of team development to interpret the outcomes in a meaningful way.

The same holds for the nature of the tasks teams have to carry out. Some articles included in this chapter apply the distinction between exploration (radical innovation) and exploitation (improving things). Although team learning can contribute to explorative and exploitative learning, most articles deal with the exploitative type of learning. However, the type of learning is not properly mentioned in all articles, which makes it difficult to assess the relevance of the research results which are reported in these articles. Besides, in this world in which intense problems do exist, which need to be tackled, and for which radically innovative solutions are necessary, more research should be done on the potential of exploration learning, and on how to make a real difference as a team.

## **Practical Implications**

Knowing all this, what is the yield of this chapter for practitioners? For directors, managers, supervisors, HRD professionals, and other professionals who are engaged in learning and development of staff, these lists encompass footholds to develop policies with regard to their employees. They have to consider, for example, whether or not to let employees work for a longer period of time in the same team or to develop or hire managers who are able to apply transformational leadership. However, it should be noted that working in teams itself is a (strategic) choice of organizations, which has more consequences than just implementing the lessons learned from this chapter. Organizations should make the choice for teamwork consciously and make sure that the whole organizations is well prepared to accommodate and accelerate teamwork. Think about rewarding employees on the team level (instead of or besides the individual level) or hiring new staff with teamworking qualities. If not all aspects in an organization are in place for teamwork and team learning, it might not work out the way as expected. Furthermore, organizations have to realize that in comparison with individual task distribution, a team takes more time and effort, especially on the short run, to get good and efficient results. Individuals will be more productive on the short run when tasks are clear-cut. However, when organizations' environment become more complex and dynamic, it will be more difficult for individuals to fulfill their predefined tasks, and in those situations, teams will be more effective. So, knowing all these attractive and promising results of teams and team learning, organizations should always reflect critically whether working in teams fits their own situation and pays off the investment (especially of time, but also changes in their routine setup). It is not a recipe for success in all cases, and organizations should carefully reflect on the choices to make.

---

## Conclude

What triggered the writing of this chapter was the observed difference between results based on quantitative and qualitative research. Based on the articles collected for this chapter, the difference is not as significant as expected. Both qualitative and quantitative research approaches make inventories of antecedents. In qualitative research, mechanisms underlying all antecedents of team learning behavior have been studied to a lesser degree than expected. About some antecedents there are no conclusive answers, and more in-depth qualitative research should be undertaken to fill this gap to reach stronger conclusions. Quantitative research, on the contrary, has a large basis to work from and many instruments that are ready to use, although research at the level of context or organization is still in its infancy. But as in any research field, both research approaches perfectly complement each other.

## Abstract

Practitioners and researchers would likely agree, if asked, that people are essential for organizations. But putting this agreement aside, the term “human resources management” (HRM) seems to be a melting pot of fragmented concepts and professions. For more than 20 years, organizations have tried to answer the question of whether HRM and its areas of concern can be positioned as a strategic aspect of business, or whether the focus of HRM is focused on day-to-day-operations. The profession seems to struggle with its own identity, even given noticeable differences between countries. Besides positive examples of professionalization and recognition, it seems as if human resources (HR) today is still

more an art than a science. Private training providers can support its professionalization but should also keep in mind that the types of programs that can be offered might be influenced by a specific view of HRM that can differ from other perspectives on the same issue. However, it is important to continue the discussion since organizations are facing the fourth industrial revolution and workforce requirements might change dramatically. It might be necessary to change the inward orientation of HR, focusing on the question “are we recognized as a valuable partner by senior management?” toward the external focus “what is our contribution to the organization’s success?” This chapter provides a brief overview of HRM and human resources development (HRD), which is a core aspect of HRM that incorporates vocational education and training (VET). In addition, the chapter provides recommendations for the future design of HR departments. In this context, HRD is described as a possible conveyor for private training markets and as a driver of organizational learning. Finally, an outlook onto challenges for HRM and HRD is provided.

## Human Resources Management

This section provides a brief overview of human resources management (HRM) to illustrate the history of HRM and its development. Following this, HRM is described as a support function, including how it can support an organization during various stages of development. Despite all efforts to offer such support, HRM still has a credibility issue in many organizations; this will also be discussed in this section. Finally, the professionalization of HRM is described as one possible way to counter credibility issues.

Considering the history of HRM, it is a young discipline, even if, as some authors argue, the evolution of the discipline can be traced back several millennia (Tubey et al. 2015; Rotich 2015). Savaneviciene and Stankeviciute (2013, p. 234) do not look back that far into the past; rather, they state that the concept of HRM originated between 1910 and 1920. Despite differing perspectives on HRM, the overall concept of HRM does not seem to have changed that much since 1942, when it was described by the UK Institute of Personnel Management (IPM 1988, p. 7), one of the leading professional bodies in the field. In the early twentieth century, the wellbeing of workers as individuals had been the main concern of the IPM (earlier the Central Association of Welfare Workers, between 1917 and 1919, the Welfare Workers’ Institute between 1919 and 1924, the Institute of Industrial Welfare Workers between 1924 and 1931, followed by the Institute of Labour Management between 1931 and 1946, before the IPM).

Despite little overall change, it seems as if the employees’ wellbeing is nowadays increasingly the focus of unions, while HRM deals with all other topics. It is trying to become a strategic partner but is often tied to more administrative tasks.

In addition to the various meanings and focuses of various researchers (Armstrong 2006; Johanson 2009; Collings and Wood 2009; Paaauwe and Boon 2009; Klerck 2009, as cited in Rotich 2015, p. 58), as well as the definition of the IPM, HRM activities can be placed in two general areas:

1. People as a factor in production and costs, and how to manage the people within the organization to maximize their value and meet organizational goals. Various topics, among them training and development, are mentioned, but *business value* is the main concern.
2. HRM that is influenced by the philosophy of *how to treat people* whose position in the organization is weaker than that of the employer.

The perspective and the scope of HRM varies, depending on the organization, the geographic location, and the model that is applied. Providers of private HRM training might have different offerings, based on the model that is used to train participants. Contents might also be influenced by the geographic location of the training provider.

Storey (1987) differentiates between “hard” and “soft” approaches to HRM. This differentiation may be characterized as a paternalistic approach versus the understanding that people are capable of caring for themselves. HRM, like organizations (Radel 2017), seems to be influenced by the zeitgeist, or collective beliefs of how to treat human beings and the distribution of power. Overall, there has been a shift from a short-term focus and directive power relationship (i.e., the worker is a commodity (Guest 1999, p. 6)) toward a long-term cooperative perspective with a shift in power toward the skilled employee. However, as stated by Legge, “[. . .] [I]n reality, even on the surface, most HRM is ‘hard’” (as cited in Guest 1999, p. 6). This is a fact that the department itself seems to struggle with at times, which can lead to a lack of credibility and acceptance by those departments that are “hard” themselves (e.g., production, finance, sales, marketing).

## HRM as a Supportive Department

Looking at the organizational life cycle and the stages of organizational development (Draft 2015, p. 352), it is the task of HRM to support the organization throughout all the stages:

1. Entrepreneurial stage
2. Collectivity stage
3. Formalization stage
4. Elaboration stage

Depending on the stage the organization is in, different tasks become predominant for HRM. In the first phase (**entrepreneurial** stage), employee creativity and the definition of the organization’s vision is important. At that stage, the organization

is usually quite small and basic HR functions like payroll, contracts, drafting an employee handbook, and recruiting are carried out. At some point during this stage, a crisis might emerge when the organization grows and a greater need for leadership arises. At that point, it can be important for HRM to discuss the role of leadership and support the transition from technical experts to management-oriented functions. During the collectivity stage, HRM can offer support in all matters related to providing clear directions for management and employees, by establishing core standards, by splitting teams, by assigning functions, and by developing a more sophisticated organizational structure. At some point during this stage, the need for delegation and control arises and formalization becomes increasingly important. HR usually supports the organization with the implementation of systems such as time-keeping, performance reviews, eRecruiting, and structured apprenticeship programs. Processes become increasingly standardized, and the HR department grows in number. This formalization can lead to another crisis that HR must address: “too much red tape” (Draft 2015, p. 352). The HR department might discuss whether to reduce the levels of hierarchy again or look for ways to become more flexible and avoid being paralyzed by bureaucracy. As soon as this has been solved, the organization can be described as “elaborated” and the (high) standard and efficiency are maintained. This stage comes with the risk that innovation and revitalization may be, more or less urgently, required at some point. During this phase, according to Draft (2015), the direction will be set for (a) streamlining and small-company thinking, making the organization innovative, flexible, and adaptable to change; (b) continuing to mature and maintaining the standard; or (c) declining, if it proves incapable of mastering the crisis. At this stage, HRM could offer support with the definition of the corporate strategy. Unfortunately, HRM often remains in the collectivity or formalization phase, while the rest of the organization develops.

One aspect of supporting the organization is human resources development (HRD), which will be discussed in depth below. HRD, as an organized learning experience (Nadler and Nadler 2011, p. 1), can be regarded as a key factor in facilitating the transformation of an organization into a learning organization (Tseng and McLean 2008) and might be a possible tool for decreasing some of the credibility issues that are briefly discussed next. However, the transformation into a learning organization (LO) also poses new challenges for HRM, and especially HRD, as the concept of a LO becomes increasingly relevant for a number of organizations (Tjepkema et al. 2002b, p. 1).

## Credibility Issues

Ritzer and Trice (1969) (as cited in Legge 2005, p. 49) describe the perspective of American managers on HR. They see HRM as reactive, risk-avoiding, non-influential, defending the status quo, and operating in a vacuum.

The lack of credibility and acceptance, as it is sometimes perceived (Ulrich 1998; Charan 2014; Capelli 2015; Naradran 2016), might be rooted in several aspects, when an HRM department is compared with other departments in an organization.

Using the term *other* subsumes departments besides HRM, as they are described in the value chain framework by Porter (1989), without limiting the term *other* to the departments he mentioned (e.g., purchasing, production, finance, sales, marketing).

This perception has hardly changed since 1969: “[HR] is often ineffective, incompetent, and costly; in a phrase, it is value sapping” (Ulrich 1998). It seems to come down to the fact that HRM tries to change the behavior of people within the organization, or the organization itself, acting as a change agent; this sometimes leads to or increases defensive behavior (Menzies 1960; Krantz and Gilmore 1990; Bain 1998). Finally, HRM does not – as the name might suggest – manage personnel. It often only provides the structure and frameworks for improving workforce management by others and its influence ends at the doors of its own department. Whenever it creates a concept that is not adapted by the user (management and employees), it is difficult to permeate the whole organization.

It is difficult to define HRM, its tasks, and its role so that the profession becomes accepted as such. One way of supporting this goal is to standardize requirements and certifications. These are frequently offered by private training providers, some of whom are acknowledged by national associations that can define such standards.

One of the first requirements for certification or proof of knowledge in the field of HRM is found in the records of the Chartered Institute of Personnel and Development (CIPD). Here, it is shown that a comprehensive constitution was approved in 1919 and “[. . .] it was agreed that members ‘must hold a diploma or certificate of training courses approved by the Association’” (IPM 1988, p. 5), even if an escape clause had been added to this agreement, at that time. Decades later, one of the first frameworks for HRM, if not the first, was created in 1981 and published as the Harvard model; the model was inspired, in part, by a potential market “[. . .] to develop a course at Harvard Business School” (Noon 1992, p. 175).

Since then, professionalization has become increasingly important, so that today, practitioners have an unspoken agreement as to what can be considered HRM; the term, however, still is flexible. HRD is one relevant aspect that can be considered to be an important part of HRM; it is discussed below.

## Professionalization in the Field

Despite the efforts to introduce HRM-specific frameworks and courses nearly 40 years ago, HRM is still sometimes not recognized as a profession. According to Hanlon, HR seems to be more a “commercialized profession” (as cited in Gilmore and Williams 2007, p. 409), contrary to legalized professions that are distinguished by licensure. Even the commercialization and certifications are fragmented and scattered over various associations and training providers; in addition, the entry requirements are manifold. Some associations, e.g., the Bundesverband der Personalmanager (BPM, German National Association of Personnel Management), do not even provide a framework, body of knowledge, or certification. The only criterion to become a member is that a person must be employed by a company, a corporation, an institution, a diplomatic representation, or an association as a personnel manager (BPM 2018).

Others, such as the Society for Human Resource Management (SHRM), the Association for Talent Development (ATD), and CIPD offer certifications based on a body of competence and knowledge. Overall, training of HR professionals is a popular offering: CIPD runs more than 70 short courses per year. The ATD offered more than 495 programs for HR professionals alone, between March and November 2018.

Despite the criticism of the profession so far, the Cranfield Network (CRANET) study indicates that HRM has gained a reputation in some countries. In 89% of Swedish companies, a member of the HR Department is also a member of the executive board and 81% of the companies have a written HRM strategy. France is in second place: in 88% of companies, a member of HR is a member of the executive board and 66% of the companies have a written HRM strategy. Spain is next, with 85% executive board members and 80% strategy. In Austria, only 50% of companies see the necessity of appointing an HRM executive to the board; in Germany, it is only 49% (Wehner et al. 2017, p. 15).

### **The HR Professional's Profile and the Potential for Private Training Providers**

The perceived lack of credibility and the notion of a commercialized profession raises the question of who works in HRM; however, data about the professional background of HR professionals is scarce. A bachelor's degree is the common entry requirement, but formal qualification can be substituted by experience. In addition, certifications are mentioned as an employer requirement.

In the USA, HRM is recognized as a managerial profession and is listed in the Occupational Classification System Manual (OCSM) of the US Bureau of Labor Statistics (2017) (MOG B Executive, Administrative, and Managerial Occupations: numbers B008 – “Personnel and Labor Relations Managers,” B027 “Personnel, Training, and Labor Relations Specialist,” D328 “Personnel Clerks”) or the International Standard Classification of Occupations (ISCO 08 Code 1212 “Human Resource Managers”).

The Office for National Statistics in the UK (SOC 2010, p. 33) states that “[t]here are no pre-set entry standards, although entry [for Human Resources Managers and Directors; SOC 1135] is most common with a degree or equivalent qualification.” Something similar is stated for Human Resources and Industrial Relations Officers (SOC 3562, *ibid.*, p. 133): “There are no formal academic requirements although most entrants possess a degree or equivalent qualification and/or relevant experience. Many employers expect staff to gain membership of the Chartered Institute of Personnel Development through study for professional qualifications.”

In Australia and New Zealand, “[m]ost occupations in this unit group [2231 HUMAN RESOURCE PROFESSIONALS] have a level of skill commensurate with a bachelor's degree or higher qualification. At least 5 years of relevant experience may substitute for the formal qualification.” (ANZSCO 2013).

An overview about the requirements to work in HRM, from the US perspective, are shown in Table 1 below.

However, the percentages shown above should be interpreted with caution. The recommendations of what to study or whom to hire are based on a very small

**Table 1** Required Education Level to fill the given position. Data based on The Occupational Information Network (O\*NET)

Job title (Standard Occupational Classification Code)	Education level <sup>a</sup> required % of respondents		
	PBC <sup>b</sup>	BA	MA
Human resources managers (11-3121)	9	18	68
Human resources specialists (13-1071)	0 <sup>c</sup>	46,27 <sup>c</sup>	3,1 <sup>c</sup>
Labor relations specialists (13-1075)	20	25	30
Training and development managers (11-3131)	15	19	52
Training and development specialists (13-1151)	11	17	58
Compensation and benefits managers (11-3111)	5	14	81
Compensation, benefits, and job analysis specialists (13-1141)	n.a.	n.a.	n.a.

<sup>a</sup>For educational level responses descriptions see: O\*NET (2008)

<sup>b</sup>Post-Baccalaureate certificate (PBC): Awarded for completion of an organized program of study; designed for people who have completed a Baccalaureate degree but do not meet the requirements of academic degrees carrying the title of Master

<sup>c</sup>O\*NET 22.1 Database (n.d.)

absolute number of respondents (e.g., 41 incumbent respondents for Human Resources Specialist). Besides incumbents, occupational experts were asked about the requirements. Absolute numbers of respondents were limited here as well (22 respondents for Human Resources Manager).

The inconsistent or broad entry requirements can be seen as negative, due to a lack of focus or orientation. But they can also be positive for the diversity of the profession and as a potential market for private training providers. At the same time, it is necessary to structure the development of skills, in both the HR department and in the organization as a whole.

## Human Resources Development

This section provides a brief overview of human resources development (HRD) in an organization, which constitutes a large market for training providers. Vocational education and training (VET) is described as one aspect of HRD, while HRD is considered a conveyor and broker for educational activities for the employees. The effect of a structured and well-functioning HRD, involving stakeholders, on organizational learning and toward a learning organization, will be described. After the introduction, the impact of training efforts as one aspect of HRD and its evaluation will be discussed. One of the main concerns of organizations, besides the return on investment, will be discussed afterwards: the retention of qualified staff. During the last part of this section, problems of automation will be described because they might have a significant effect on internal and external training and developmental needs.

Among the many topics and definitions that are identified in relation to HRM (e.g., Armstrong 2006; Johanson 2009; Collings and Wood 2009; Paauwe and Boon 2009; Klerck 2009, as cited in Rotich 2015, p. 58; IPM 1988, p. 4; Storey 1987;

Legge 1995, as cited in Guest 1999, p. 6; Legge 2005, p. 43), the development of the existing personnel in the organization is a relevant, ongoing, yet difficult topic for both organizations and HRD professionals (Sambrook and Stewart 2002).

It is *relevant* because it can meet employee needs by training them in a way that maintains their employability. At the same time, HRD is highly relevant for the organization, since well-trained employees are beneficial (Bagshaw 1996) and HRD might be attractive for potential candidates, especially those of Generation Y (Gessler and Radel 2015). But it is not only Generation Y that is interested in continuous development. Coates and Edwards (2011, p. 83) note that a substantial number of graduates from the USA, Canada, Europe, and the UK re-enter formal education after finishing their bachelor's degree. In the UK, it is 57% of graduates, during the first three or 4 years, while in the USA, 40% of "(...) graduates had specifically enrolled in another university-level qualification within 10 years, according to Bradburn et al. (2006)" (2010, p. 83).

HRD is an *ongoing* topic, because it takes time to learn a new skill or adapt to a new task. Organizations spend significant amounts of money for their annual HRD budget. In 2016 the total training expenditures were 70.65 billion USD (Training 2016, p. 29), with a lot of variation between the average budget for large companies (14.3 million USD), midsize companies (1.4 million USD), and small companies (376,251 USD) (Training 2016, p. 32). Even if the impact of time (Ericsson and Kintsch 1995) and deliberate practice is not as important, as one might assume (McNamara et al. 2014), HRD is time- and cost-intensive. HRD can be a day-long workshop or a degree that is achieved after several years of studying. It can take years to develop an individual, as well as to develop an entire organization toward a learning organization. However, without the ambition to change and develop, neither organizations nor individuals will master the stages or organizational development or maintain their employability. Whenever one side has no ambition, it might make sense to discuss possibilities of separation. Given this fact, all sides are ambitious to develop. Investments must be made, of either money or time (usually both). It is only when those investments are made over time that there is a chance to build capabilities, which might lead to innovation or even invention within the organization. As a last step, assuming that the investments lead to capability building and innovation, the organization might gain value or a return on the investment, as well as the employee. Whenever there is an issue at a preceding step, success is at stake. "[...] [HRD], which is defined as organized learning experiences, provided by employers within a specified period of time to improve performance and/or promote personal growth" (Nadler and Nadler 2011, p. 1) can be or can become a key factor in developing a learning organization (Tseng and McLean 2008), when employees are regarded as internal stakeholders in the HRD process.

## **Involvement of Internal Stakeholders in the HRD Process**

Besides HRM, where HRD activity can be nested (Nadler and Nadler 2011, p. 1), other stakeholders in the organization can play an important role in facilitating the

development process. Employees play an important role in learning, not only for themselves, but the “[...] ability to learn is [also] embodied in its employees” (Tjepkema et al. 2002b, p. 9). In particular, graduates or inexperienced employees as well as those in more senior positions can identify specific development needs while working on a team. Nadler and Nadler, who are considered to be very influential and somewhat polemic in the field of HRD, develop the above-mentioned activities from the perspective of adult education (Watkins 1991, p. 248):

1. Training
2. Educational activities
3. Development

Training aims to improve the current performance of employees. It can be supported by direct managers, who provide ongoing feedback about the individual performance and the fit to the current position. Direct managers and employees together can also serve as a primary source to identify gaps in performance and person-position fit, which can result in specific HRD actions that are coordinated with HRM.

Educational activities that have a long-term focus are also subject to the identification between employee and more senior manager. Both might discover the potential to develop the employee into a more senior role in the future. Based on these development possibilities, from an employee’s perspective, HRD activities can be carried out to prepare the employee for a future position. From an organizational perspective, the identification of future development needs is closely linked to the strategy of the organization, which can create a need for skills that are not yet available in the organization. The HR and HRD strategies are influenced by the corporate strategy, and senior managers can identify potential candidates for specific development.

Broadly speaking, educational activities, and therefore HRD, include vocational education and training (VET) (Mulder 2012; Garavan et al. 2000, p. 72; Holton and Trott 1996; Kuchinke 2002); at the very least, VET and HRD are similar concepts (Tomé and Goyal 2015, p. 588). As Mulder (2012) describes, boundaries between initial VET, continuing vocational education and training, which is part of lifelong learning, and HRD in an organization are becoming blurred or even fading completely.

Alagaraja et al. (2014) suggest that the link between HRD and technical vocational and educational training should be increased, even stating that there is an increasing overlap between workforce development, social development, and economic development strategies, broadening the perspective from viewing an organization toward national HRD (Alagaraja et al., p. 270).

While the permeability between VET and higher education, outside of organizations, might still be a problematic issue (Spöttl 2013), HRM in an organization might benefit from the inclusive view suggested by Mulder (2012). Unfortunately, VET systems seem to be more structured than HRD and their development in the past (e.g., Gessler and Howe 2013) is far more deeply rooted in society than HRD. Due to

this, skill and workforce development (see Warhurst et al. 2017) are becoming increasingly important.

Development, according to Nadler and Nadler, of a non-job-related activity (2011, p. 1) might be an important task for the individual that develops over the period of his or her professional life. Employees might have an interest in ensuring person-role fit as well as ensuring employability. From an organizational perspective, mentoring can be an HRD activity that is carried out between recent graduates or young professionals and senior managers. However, vocational mentoring is only one aspect and probably more related to training, as described above. The other aspect is psychosocial mentoring (personal development). Mullen (1998) investigates the combination of both aspects; her findings suggest that more senior employees should initiate the developmental relationship and are more successful in developing others when they recognize their own value for the organization. The relationship between junior and senior employees is also influenced by the time spent with each other and when the more experienced employee allows the more junior one to influence himself as well (p. 327 f.)

The last aspect, mutual development, might lead to a learning organization in the broadest sense. Providing different definitions for the term, Hee Kim and Callahan (2013) also differentiate between the learning organization and organizational learning (p. 185) and consider “[. . .] organizational learning [. . .] a prerequisite to the learning organization (Sun and Scott 2003) because it fosters the collective learning process at the individual, team, and organizational levels to evolve into a learning organization (Marsick and Watkins 2003).” Both authors state that leadership plays an important role in developing a learning organization. At the same time, leadership development becomes equally significant (Hee Kim and Callahan 2013, p. 196).

Finally, the capacity of the organization’s employees impacts the ability of HRD to build a learning organization. Questions regarding these capacities are raised by Tjepkema et al. (2002b, p. 11):

1. Are the employees capable to create or acquire new knowledge that is relevant for the organization?
2. Does successful dissemination of useful knowledge to others take place?
3. Can this new knowledge be used to improve work practices, products, or services, leading to a benefit for the organization?
4. As a fourth addition to the employees capacity, Schier (2016, p. 339) raises the question whether the employees are capable and willing to take personal responsibility for the learning process.

## **HRD as a Conveyor of Organizational Development**

While the previous chapter described various possibilities for stakeholder involvement and the impact of stakeholders on HRD activities, the next section focuses on HRD as a conveyor of organizational development, trying to design HRD activities at various levels of the organization. As such a conveyor, HRD serves as a broker for internal and

external training, as well as preparing and maintaining the basis for private training markets with various demands for programs. Compared to private training providers in the EU, organizations as employers themselves provided 33.9% of nonformal education and training in 2016 (Eurostat 2018a), while nonformal education and training institutions accounted for 17.7% in the same year (Eurostat 2018a) – the same percentage as in 2011. Compared to companies, this number seems to be small; however, when other training providers are added, the overall number of private training providers is 40% and constantly rising, since 2007 (Table 2).

Another indicator for the potential of HRD activities, continuous vocational education and training (CVET), and private training markets is the participation rate of adults who receive formal or nonformal education and training. An overview of participation in career-related adult education in the USA is shown in Table 3.

Other than in the USA as a whole, a large divide between countries in the EU existed in 2017: while adults (aged 25–64) in Switzerland (31.2%), Sweden (30.4%), Finland (27.4%), and Denmark (26.8%) received a comparably high amount of education and training within the 4 weeks preceding the survey, the numbers in Slovakia (3.4%), Bulgaria (2.3%), Croatia (2.3%), and Romania (1.1%) were significantly lower (Eurostat 2018b). Because the European Union’s target for 2020 is that at least 15% of adults (aged 25–64) should participate in lifelong learning activities (Kotzeva 2017, p. 73), the potential for training providers is huge – positively speaking. On the other hand, a lot of work lies ahead for HRD-related activities; however, in some countries, organizations still fail to offer intensive HRD activities for their employees.

**Table 2** Training providers for nonformal education and training in the EU, except employers (based on Eurostat 2018a)

Training providers for nonformal education and training in the EU, except employers	2007 (%)	2011 (%)	2016 (%)
Commercial institutions where education and training is not the main activity (e.g., equipment suppliers)	8.8	10.9	9.4
Employer’s organizations, chambers of commerce	5.0	3.2	5.6
Trade unions	1.4	1.0	1.3
Individuals (e.g., students giving private lessons)	4.3	5.6	6
Nonformal education and training institutions	16.6	17.7	17.7
<b>Total</b>	<b>36,1</b>	<b>38,4</b>	<b>40</b>

**Table 3** Participation of employed persons, 17 years and older, in career-related adult education during the previous 12 months, by selected characteristics of participants 2005. Adapted from the National Center for Education Statistics (NCES 2005, Table 507.30)

Adults participating	%
In career- or job-related courses	38.8
In apprenticeship programs	1.4
In personal-interest courses	21.8
In informal learning activities for personal interest	73.5

Based on the numbers above, the perspective for private training providers is positive; at the same time, however, the large numbers of providers and training opportunities (and needs) are also making it more difficult to decide what kind of training might be the most suitable one in a given situation. Due to this, the selection of individual courses and the design of larger programs becomes a challenge where HRD can become a mediator, a broker, and in the end, a designer of learning architectures.

Lepak and Snell (1999, p. 37) propose an HR architecture with four quadrants, to structure and plan all HRD related activities: HR and HRD must decide whether to (1) *develop (make) human resources internally*. The advantage here is that firm-specific skills can be developed, providing high value to the organization because of a high task–skill fit. Another benefit is nontransferability of specific skills, which will make a human capital loss less likely (Lepak and Snell 1999, p. 36). *Acquiring* (2) human capital and the knowledge needed is the second option, which is possible if the knowledge is available on the job market and is not too specific. Because it is valuable for the organization, Hamel and Prahalad (1994) say organizations might also consider internalizing this knowledge (as cited in Lepak and Snell 1999, p. 38). *Contracting* (3) is a way to benefit from knowledge that is available outside of the organization – while options 1 and 2 focus on internalizing employees and their knowledge. Like option 2, the knowledge can be purchased quite easily on the labor market “. . .and, therefore, can be treated essentially as a commodity” (Lepak and Snell 1999, p. 39). Creating an *alliance* (4) seems to be the most beneficial option, when the human capital that is needed “. . .is unique in some way but not directly instrumental for creating customer value” (Lepak and Snell 1999, p. 39).

Besides the aspects of the architecture above, several other questions might be taken into consideration when HRD serves as a conveyor for learning:

1. Should the learning be intentional or incidental; should the learning be formalized, or is informal learning desired (Bruce et al. 1998; Marsick and Watkins 2001; Eraut 2004)?
2. How deep will the learning impact the individual or the organization? A program for personal development (e.g., questioning values, ethics, or shared values) might be more carefully designed and followed than a technical skill training where the outcomes can be assessed immediately and the impact on the person is not as deep, as in the first example.
3. How long should the duration be to maximize the learning outcome and balance the investment of the learning and the potential outcome (see section on “[Evaluation](#)” below).
4. Is it necessary for HRD activities to be directly related to the current position and help the employee to adapt? Is the learning focused on the qualification for a possible future role/task? Or is it not job-related, supporting the “growth” of the employee?
5. Does the activity focus on the level of individuals, teams, intergroup relations, or the organization as a whole (Hayes 2018, p. 432)?
6. Within this level, does the activity focus on the area of human processes, a techno-structural area, human resources, or strategy (Hayes 2018, p. 433)?

7. Regardless of whether it is a tailor-made program or a general one, should it be rigidly structured, or leave room for flexibility?
8. Can development take place (formally or informally, structured or unstructured) on the job (Loon and Casimir 2008; Berings et al. 2005), off the job (Schellschmidt 2016, p. 351ff.), near the job (Schier 2016, p. 337ff.), along the job, or even out of the job (Conradi 1983, p. 22ff., in: Schier 2016, p. 340)? This leads to the question of whether it should be offered internally or externally.

Several of the aspects above can be connected and influence each other, which might make the design of a learning architecture a challenging task. The framework proposed by Hayes (2018, p. 433), which comes from organizational design and the area of change management, might be a useful way to structure the portfolio of HRD activities. But as mentioned above, HRM and HRD as a part of HRM can support the organization and its individuals by keeping the aspects above in mind.

While the investment in the learning capacities of employees has become increasingly important and can lead to a more vital organization that can adapt to the changing demands of the environment, the question might be raised toward HRD, whether the money is well spent or not – be it internally or externally for private training providers.

Organizations have recognized that investment in learning is vital; money, accordingly, is being provided. As mentioned above, in a survey of training magazines among 126,403 companies, employers spent about 70.6 billion USD in training their employees (Training 2016, p. 29), with an average budget of 376,251 USD (small companies between 100 and 999 employees) and 14.3 million USD (large companies with more than 10,000 employees) (Training 2016, p. 32), breaking down to an annual average of 814 USD and 42.8 h per learner in 2016 (p. 31), while the Association for Talent Development (ATD 2017) reports slightly different numbers (\$1252 and 34.1 h per employee).

To assess whether there is a return on investment of the expenses, HRD efforts might be evaluated. At least the research on the spending for Research and Development (R&D) and patents suggests that there is a positive correlation (Artz et al. 2010). For HRD, it is difficult to define a point of reference to say what has to be spent at least and “whether” more means “better,” even if Artz et al. (2010, p. 725) describe “. . .the finding of increasing returns to scale to R&D spending.”

The topic might be described as difficult for other reasons as well:

1. It is difficult to evaluate and measure the impact on business of HRD, especially if there is a lack of available data.
2. Even if time and money are being invested, they might be invested for the competition, when skilled employees leave, which makes retention a more pressing issue.
3. The irony of automation, which will be explained later in more detail, leads to the problem of employees losing their skills as tasks becoming automated and skilled employees are not needed that often or even at all. At the same time, when a specific skill is needed, for example, in case of system failure, the needed skills are usually very high. For HRD, it is a challenge to maintain employees’ skills for such an event without the possibility to practice a lot, due to a high level of automation.

## Evaluation

Given the significant amounts of the annual budget that are devoted to HRD, the wish to analyze the business impact seems reasonable. There are several approaches to and models for evaluation (see Radel 2010, pp. 110ff. for a comprehensive overview), ranging from barely structured approaches (Lawrence-Lightfoot and Hoffmann Davis 2002; Scriven 1983) up to extremely structured approaches (e.g., Beywl 2002; Kirkpatrick and Kirkpatrick 2006; Phillips and Schirmer 2005). Besides this, there are two general lines of thought:

1. Process-orientation (e.g., Stufflebeam 2003)
2. Outcome-orientation (Phillips and Schirmer 2005; Kellner 2005; Tuchscherer and Hilsberg 2007)

In HRD, the outcome is usually of the utmost interest for organizations. However, the results are seldom measured in a structured way. Most of the time, “happy sheets,” the first level of the Kirkpatrick model, are used. Results, the highest level in the model (also known as return on investment or ROI), are seldom evaluated. Especially in Germany, the number of organizations that evaluate their programs at this level is very low (10%), compared to the UK (38%), USA (26%), or Belgium (25%) (Wehner et al. 2017, p. 17). Such a low number, compared to the first level of evaluation, can be criticized, but the evaluation of the ROI itself could be criticized as well.

Niemiec et al. (1992, p. 52) state “[...] it seems dubious that any one week training event, no matter how carefully designed and implemented, can produce the skills necessary for sales personnel to actually double their effectiveness”. In addition, there is a strong survival bias in the selection of case studies that are presented (e.g., Phillips 1994; Phillips 1997), when the ROI is described. There may be some self-interest involved in presenting a positive ROI (Radel 2010, p. 120), so it might make sense to evaluate it with the goal of reflecting the program in a very structured way. The discussion about and the development in Talent Analytics (Levenson 2011) might be a positive development toward more profound evaluation of programs and could be a way to assess the impact of certain programs. This would be beneficial for training providers because they would be able to adapt their programs for HRD, buying and assessing the impact of their training investments.

## Retention and Return-on-Investment (ROI)

Retention might be positively influenced by the offer of higher compensation after training (Anis et al. 2011). However, it is unlikely that most companies adjust compensation following training initiatives, contrary to longer HRD approaches that end with an apprentice occupation (Helper et al. 2016), a formal degree (Coates and Edwards 2011), or an MBA program (Baruch and Leeming 2001), where participants might see substantial salary raises (Coates and Edwards 2011, p. 86f).

One group of employees in whom companies must invest a great deal are apprentices, who often enter the company as minors with a high school diploma or equivalent and are trained for up to 4 years (Helper et al. 2016, p. 1), depending on the country and occupation. An apprenticeship (VET) program can be seen as a very structured HRD program, as mentioned above, with a clear goal and benefit for the organization, the individual, and the profession. Like a trainee, the apprentice must spend time working in different departments of an organization to gain the knowledge necessary for the target position/role that will be filled after the program. In addition to the practical day-to-day experience, the apprentice is trained off-site, usually in a vocational school, to gain technical knowledge; this is similar to training that is offered during a trainee program or a developmental program.

The benefit for the individual is clear, even given the argument that an earlier, lower apprentice income versus a later, higher student's income provides the best financial benefit. The benefit for the profession is also reasonable, considering that a well-educated workforce is available due to HRD efforts. It is the benefit for the organization, however, that would probably influence the decision of whether to invest in HRD activities or not.

The ROI, as briefly presented above, has been discussed in several publications (Muehleemann and Wolter 2014; Asghar et al. 2016; Helper et al. 2016), each of which has come to a different conclusion. Muehleemann and Wolter (2014) conclude that “[e]mpirical evidence shows that in a well-functioning apprenticeship training system, a large share of training firms can recoup their training investments by the end of the training period” (p. 1), while Asghar et al. (2016) are more skeptical (p. 81f).

The positive findings of Muehleemann and Wolter are supported by a study in the US construction industry, where it was estimated that “[...] employers earn a return of between \$1.30 and \$3.00 for every \$1.00 invested in craft training due to improved safety, increased worker productivity, and reduction of rework, absenteeism, and turnover.” (Helper et al. 2016, p. 15). Another number that emerged from the analysis was an internal rate of return of approximately 8% at Siemens (p. 83). Their overall perception was that an apprenticeship program is positive, so it might be worthwhile to invest in the training and development of internal staff, with a clear occupation in mind. Unfortunately, this clear focus can seldom be found in regular HRD activities. It is assumed that the program must be well-functioning and that apprentices will stay with the company; however, this is not often the case, especially in small- and medium-sized companies. At least in Germany, an average of 73.15% of first-year students between 1990 and 2012 are former apprentices (BMBF, Bundesministerium für Bildung und Forschung/Federal Ministry of Education and Research n.d.).

## **Ironies of Automation**

Besides the risks mentioned above, *not* investing in HRD is not a good option. People and organizations *must* develop. While the supply of a qualified workforce

has been more or less sufficient for decades, this has increasingly become a constraint in recent years even though researchers, politicians, and international organizations are engaged in a discussion as to whether there is a skill shortage. Most agree that it will become an issue in the years to come and already exists in some sectors (health care), occupations (manufacturing, technical occupations), or regions (construction workers in the USA), while other sectors (leisure and hospitality, natural resource extraction, agriculture) show no sign of a skill gap (Stephens 2017). Especially in China, the skill gap is considered to be dramatic (Morgan 2016) and burdens Chinese employers (Hays 2018).

The challenge for HRD, however, is a concept that has been described as the *ironies of automation* (Bainbridge 1983). As information technology permeates more and more areas of work and the employee is supported – or made redundant – his skills become even more important when they are needed. Bainbridge uses the example of an operator and “[...] suggests that the increased interest in human factors among engineers reflects the irony that the more advanced a control system is, so the more crucial may be the contribution of the human operator” (p. 775). One problem is that we have to be skilled and trained to be able to solve issues that might arise in the event an automated system fails. But skill and training are lost in most areas when they are not practiced. One solution, which is practiced regularly in the airline industry, is to train operators (in this case, pilots) on a simulator.

Contrary to the notion that a skilled workforce is a necessity, thereby increasing the importance of HRD, it is also possible that fewer employees are needed due to automation. In this case, HRD and HRM must analyze the implications for the overall HR strategy and define actions for training and staffing accordingly.

---

## Challenges for HRM and HRD

Following the discussion of HRM and HRD in the previous sections, focusing on some aspects of both areas, HRM and HRD are brought together here and the manifold challenges for both areas are described. Additionally, a brief look is given of additional topics within HRM and HRD, which were not all covered in this chapter, to illustrate the complexity of the work of HRM and HRD. It will be argued that HR must take a new, streamlined, and future oriented direction to remain relevant in a changing environment.

Given the descriptions above, there are several challenges for both HRM and HRD. HR must still convince a majority of other professions in the organization of its value: “Whilst the specialist rhetoric propagated by occupational spokespersons argues for the importance of the personnel function to business performance, typically via the business partner relationship between personnel and strategic and line management, the realization of that ‘offer’ is frequently circumscribed by structural and reputational constraints that have long-standing histories (Legge 1978; Caldwell 2003; Guest and King 2004).” (Gilmore and Williams 2007, p. 399). Legge even “[...] points to an issue that has dogged personnel specialists

throughout their history. We might call it an obsession with their credibility” (2005, p. 50).

One way for HRM to gain credibility can be the projection of what skills will be needed in the future and then establishment of HRD structures to deliver qualified personnel when needed. To enable this, it is important for HRM to understand the business and the direction the business might take in the future. HR should therefore be in regular contact with senior management, which decides on the strategy of the organization. Based on these decisions, the HR and HRD strategy must be developed and adapted, including the associated activities in VET. A need assessment (Moore and Dutton 1978; Goldstein and Ford 2002; Ment 2011) might be a suitable tool to support such analysis; however, as the strategy of an organization becomes increasingly difficult to define in the long term (Teece et al. 1997, p. 15), it will become more important for HRM to create a projection and close the skill gap in a shorter period of time. It can be argued that only the subjective perception of the industry dynamics changes (Hauschild et al. 2011, p. 418 f.). But regardless of whether the increased dynamic is objective or subjective, the tools that were described can be a very valuable support for the HRM and HRD planning process. Another very valuable perspective that is discussed in the context of Big Data is talent or workforce analytics to support decision making in HRM and HRD (Della Torre et al. 2018; Schiemann et al. 2017; Minbaeva 2017). To enable this, the skills of HR and HRD professionals might also have to develop toward a more analytically skilled profile.

After the planning process, HRM must decide between *make* (HRD) or *buy* (recruit) to close the organization’s skill gap as well as its own (as in the above example). These decisions trigger different actions and have differing effects on organizational performance. Here, HRD might serve as a conveyor and broker for learning in the organization. The lack of skilled staff might be solved by automation and process optimization, so that fewer people are needed to handle the tasks. Organizations simply become more efficient at what they do. But even if this is the case, work profiles will change and employees must adapt to these changes, with support by the organization. The current structures and approaches to HRD, which are sometimes fragmented, might not be suitable to provide this support, when digitalization and redundancy of administrative tasks increase the ironies of automation, as described above. This leads to the challenge of HRD to train people such that the knowledge can be accessed when needed; however, it is not yet clear that this is the case. In addition, less qualified employees could be left behind if they are neither capable of adapting nor supported.

---

## Conclusion

The HR profession as a whole is still struggling with its professional identity and role in the organization. HRM depends on the worldview of those who create the frameworks and training in and for the field. “The present millennium is witnessing human resources (HR) at its biggest crossroad where world-renowned HR

professionals are clearly indicating the warning bell [...]” (Narendran 2016, p. 98). If HR cannot professionalize even more, build credibility, and show its value within the organizational context, there is a risk the HRM tasks will be removed from HR and distributed in the organization or outsourced.

The professionalization is mostly driven by two large associations (SHRM and CIPD) and several fragmented groups. Besides associations, the debate is dominated by “gurus” such as Dave Ulrich (1998) and Ram Charan (2014). Both provide answers as to how HRM must change and what this change should look like. But even they disagree to some extent (Charan 2014; Ulrich 2014). Whatever the best way might be, one conclusion that can be drawn is that HRM should be promoted from the top level of the organization. If senior management does not full-heartedly support HRM as an important contribution to organizational success, even if it cannot be measured at all times, HRM will struggle. HRD will struggle as well, which will affect the quality of the workforce in the long run and increase fluctuation of the best talent.

---

## Recommendations and a Further Outlook

Breaking these recommendations down to the areas of HRM, as they are defined by the IPM (1988, p. 7), nearly all tasks that are currently conducted by HR can either be internally transferred, very often to the union – which might be a concern for many companies – or outsourced. HRM can be dramatically downsized, streamlined, and focused – a proposal to which many HR managers might heavily object, either because they fear becoming redundant or because they fear the inability to carry out new tasks, as described above. On the other hand, the proposals given here should be carefully considered. Shared service centers, or the business partner framework, for example, have not been as successful as some companies had hoped.

Recruitment and selection can be supported or even completely carried out by algorithms. The same might be true for employee service. Usually, employee requests are limited to a very small number of issues. To provide employee service, chat bots can be used to cover most, if not all, standard requests.

Training and education will be defined between the direct manager and the individual employee, supported by HRD as an internal learning facilitator, not necessarily a training provider who delivers services to the organization. Learning becomes a shared responsibility (Tjepkema et al. 2002a, p. 15). Necessary skills are either acquired or a separation culture must be implemented when one side is neither capable nor willing to support the other side. Especially in smaller companies, an in-house training department may not be economically feasible; it might make more sense to purchase training. In a rapidly changing market with shifting skills and training demands, this is becoming increasingly reasonable, while the HRD professional focuses on the support of a learning organization. The proper employment, working conditions, and terms of employment of personnel are usually regulated and must be adapted to national law, where a lawyer or the compliance department can offer support. Unions are also a great partner to ensure proper employment and

discuss the implementation of amenities. They can also offer support with aspects like joint consultation between employers and employees and between their representatives, and settlement of disputes. Terms can be unified, with the risk of losing potential talent. The same is true for methods and standards of remuneration. Remuneration or compensation and benefits – the payroll – can be transferred to the finance department. One major concern with this is that remuneration is a confidential matter. Taking into consideration what other figures the finance department deals with on a daily basis, this should not be too much of a concern. The effective use of facilities can be transferred to facility management or be supported by personnel analytics to calculate the amount of office space that is needed and for a variety of other optimizations with regard to team performance, social interactions, and team behavior. Wherever an apprenticeship/VET program is in place, it can be coordinated from the HR department but carried out by the technical departments themselves. To be able to do this, a responsible person in each relevant department must be designated. The necessity of specific apprenticeship programs might be reassessed in the future. However, moving away from apprenticeship might become an issue for the future development of the workforce and a violation of the “ethos” of apprenticeship (Asghar et al. 2016, p. 81). In addition to this ethos, changing a system that is successful in many countries should be carefully considered, keeping in mind that VET can be a vital, integral part of HRD.

After transferring or outsourcing most tasks, HR will have the opportunity to focus on the support of the organization and its individuals during the stages of organizational development by coaching the management and leadership teams as promoters of HRM-related tasks. Following this proposal, unions will take on a more powerful role and the direct manager and his or her employee become the most important talent developer and HR manager in the organization.

### Abstract

Based on a claim that adult education policy developments in Europe are more strongly entangled with European rather than global governance in this policy domain, this chapter presents a critical appraisal of the Renewed European Agenda on Adult Learning (REAAL). This analysis draws on a heuristic model that concentrates attention on the strength of governance mechanisms and policy instruments as key units of analysis to examine governance in public policy

domains such as education, building primarily on the work of Del Rio and Howlett (2013) on complex policy mixes, and that of Lascoues and Le Galès (2007) on policy instrumentation. By featuring REAAL's main characteristics, and in light of its historical stages of development, this chapter elucidates how, as a policy mix, REAAL performs three substantive authoritative functions (i.e., legal, epistemic, and procedural), which ease European governance in the adult education policy domain. Moreover, through a closer examination of REAAL's mode of working, this chapter identifies the governance mechanisms (i.e., standard setting, capacity building, and financial redistribution) and policy instruments (i.e., coordinated working groups/networks, mutual- and peer-learning arrangements, data generation, benchmarks, and funding schemes) that concur to its enactment. In doing so, it highlights two distinctive qualities that differentiate European from global governance in the adult education domain: its regulatory politics and its wealth redistributive capacity. Finally, the chapter points at some of the implications for the adult education and training sector and its market segments.

**Introduction**

Adult education and training have unquestionably been made the object of global governance thanks to the work of international organizations (Milana 2017), paralleling similar work in the education policy domain more broadly conceived.

Recently, the United Nations' member states (MSs) adopted the *2030 Agenda for Sustainable Development* in September 2015 to end all forms of poverty. Grouped into 17 sustainable development goals (SDGs) for global transformation, the Agenda shall ensure that poor-, rich-, and middle-income countries promote wealth and prosperity that are sustainable for all countries worldwide. Education features high in this Agenda as one of its goals (SDG4) and through its links to most of the remaining SDGs (UNESCO et al. 2015). But in the framework for action for implementing SDG4, reference to adult education or training is spare and at times problematic, as it tends to focus on learning's outcomes (i.e., adults' skills) rather than on inputs and processes to achieve them (Milana et al. 2017). So, in October 2017, the midterm review of the VI UNESCO's International Conference on Adult Education (CONFINTEA) not only monitored progress with global agreements made in this policy domain (e.g., 2009 *Belém Framework for Action*, 2015 *UNESCO Recommendation on Adult Learning and Education*) but also debated at length what should be MSs priorities, when considering the specific contribution that adult education and training can make to global transformation.

Against this background, in Europe adult education and training policy developments are more strongly entangled with European rather than global governance. Obviously, both conceptions share an understanding that governing is not only a domain of states and governments but also depends on plural “formal and informal types of public interactions” (Pierre 2000, p. 3), “where no single actor can claim absolute dominance” (Burns et al. 2016, p. 18), hence the stress on the “interactions among structures” through “steering” or coordination (Pierre and Peters 2000). But European governance is multilevel in nature and tends toward Europeanization, an all-encompassing process of “domestic adaptation to European regional integration” (Graziano and Vink 2006, p. 7), through regulatory politics and a joint decision mode (Kohler-Koch and Rittberger 2006). As a result, since 2011 a *Renewed European Agenda for Adult Learning* (REAAL) is deliberately supporting policy coordination in the adult education domain within the European Union (EU) and its MSs. Accordingly, adult education emerges as a separate, yet complementary, policy domain to (adult) vocational education and training (VET).

This chapter presents a critical appraisal of REAAL through an examination of its development and working mode. In so doing, it teases out how adult education policy development in Europe is being governed by EU institutions, but with the contribution of a plurality of stakeholders from within and outside its MSs, and points at some of its implications.

The heuristic model guiding this critical appraisal draws on a vast literature that conceptualizes and showcases the analytical strength of governance mechanisms and policy instruments as key units of analysis to examine governance in public policy domains such as education, yet primarily on the work of Del Rio and Howlett (2013) on complex policy mixes and that of Lascoumes and Le Galès (2007) on policy instrumentation. Building on this work, REAAL is conceptualized as a policy mix or complex intergovernmental, multi-sectoral policy, which involves multiple policy goals. As such it is implemented through different governance mechanisms and instruments. The distinction between these conceptions lays in the fact that governance mechanisms are policy process aimed at reaching specific policy objective(s), which naturalizes these objectives and their effects, whereas policy instruments are the means used to reach policy outcome(s), which produce more or less stable frameworks that structure collective action. This heuristic model helps examining the different elements that concur to policy instrumentation and their relations, in the contest of European governance, and is used to analyze a set of data that consists of 60 policy documents and reports and other written information publicly available through the official websites of the EU and its institutions. Each data source was assigned an identification number, which appears in squared parenthesis when cited in this chapter. Further information has been obtained through consultation of the European Commission’s registry of committees and groups (<http://ec.europa.eu/transparency/regexpert/>).

The chapter is structured in three sections. The first section features REAAL as a policy mix that performs three authoritative functions: legal, epistemic, and procedural. It claims that these functions have put into motion a complex process to govern the adult education policy domain in Europe. The following section examines the antecedents of REAAL to appreciate its historical development and

distinguishes between a pre-foundation stage (1996–2005), a foundation stage (2006–2010), and a consolidation stage (2011–to date). Then, the third section examines the policy instruments and governance mechanisms through which REAAL governs adult education policy development in Europe. This brings to light two distinctive qualities that differentiate European from global governance in the adult education domain: its regulatory politics and its wealth redistributive capacity. Moving toward the conclusion, a further section outlines some implications for the adult education and training sector and its market segments.

---

## Featuring the Renewed European Agenda for Adult Learning

In 2011 the Council of the EU approved a *resolution on REAAL* [17]. Council Resolutions have no legal effects on EU MSs, as they are non-binding documents, but express political positions on a specific topic and set out future work within a particular policy domain that is not (or not entirely) of EU exclusive competency. Accordingly, they may have different scopes that span from inviting MSs or other EU institutions to take action in a particular area to coordinating MSs' actions by setting objectives and proposing assessments and monitoring procedures. Although not binding, this section argues that REAAL constitutes a policy mix that performs three substantive authoritative functions (i.e., legal, epistemic, and procedural), which ease European governance in the adult education policy domain.

Previous to REAAL, the Directorate-General for Education and Culture (DG-EAC) of the European Commission (EC) had put forward an agenda for adult learning in one of its 2006 communications [10], and a corresponding action plan was proposed in 2007 to the Council of the EU, the European Parliament (EP), the European Economic and Social Committee, and the Committee of the Regions (CR) [11]. This led in January 2008 to its adoption by the EP through to a resolution on adult learning [12]. More on the historical development of REAAL will be discussed in the next section. Here it shall suffice that REAAL built on these previous normative steps, yet tailed the global financial crisis that had made its effects felt in Europe too, when MSs from the Eurozone became unable to repay or refinance their government debt. It was to contrast this and related social consequences that in 2010 the EC reconsidered the union's growth strategy in *Europe 2020* [16].

Within this scenario REAAL recognizes that

to face both the short and long-term consequences of the economic crisis, there is a need for adults regularly to enhance their personal and professional skills and competences. . . [but] adult learning is currently the weakest link in developing national lifelong-learning systems. . . [and] Implementing the Action Plan [for adult learning] has also highlighted the difficulty of adequately monitoring the adult-learning sector, due to a lack of sufficient statistical data and evaluation of policy measures. ([17], p. C372/2)

Accordingly, it sets new priorities in this policy domain that are “to be seen in the context of a longer term vision for adult learning which – in the period up to 2020 –

will endeavour to raise the sector's profile" ([17], p. C372/3). This vision stresses enhancing the possibilities for adults to engage in learning activities; developing new approaches based on learning outcomes and lifelong learning guidance systems; increasing awareness among employers of adult learning's benefits for productivity; encouraging higher education institutions to embrace nontraditional students; promoting learning opportunities in support of seniors' active, autonomous, and healthy aging; enhancing the involvement of civil society, social partners, and local authorities on the basis of shared responsibility; and promoting adult learning as a means to increase solidarity between age generations and cultures.

Short-term priorities for 2012–2014 invited MSs to better liaise ministries and other stakeholders; use lifelong learning tools agreed at EU level; use Grundtvig, Leonardo da Vinci, and the Structural Fund to co-finance activities; use the open method of coordination (OMC) to promote mutual learning; and designate a national coordinator to facilitate cooperation with other MSs and the EC in implementing the agenda.

Moreover, the EC was invited to ensure complementarity and coherence between policy initiatives; establish close liaison with the national coordinators designated by the MSs; enable the sharing of information through peer-learning activities and reviews, conferences, workshop, etc.; commission studies and reinforce the capacity of existing research structures; pursue and intensify collaboration with other international organizations and particularly the Organisation for Economic Co-operation and Development (OECD) to exploit the results of the Programme for the International Assessment of Adult Competencies (PIAAC), but also the United Nations Educational, Scientific and Cultural Organization (UNESCO) and the Council of Europe; harness available EU funds to support the REAAL; and report on its implementation as part of the joint progress report of the strategic framework for European cooperation in education and training (ET2020).

Overall, REAAL performed three authoritative functions: legal, epistemic, and procedural.

Legally, although resolutions are non-binding documents like communications, according to EU Law the latter set out the EC's own thinking on a particular matter, whereas the former are legal instruments that encourage all those addressed to act in particular ways and hence enable EU institutions to establish non-binding rules for MSs. So REAAL elevated political authority on adult education from the EC (accountable to appointed impartial and independent commissioners) to the Council of the EU (accountable to national governments) (Klatt 2014). A precedent had been established in 2008, when the previous action plan on adult learning had gained legitimacy through the EP's Resolution on adult learning [12].

Epistemically, REAAL's short-term priorities and longer-term vision legitimate an "instrumental epistemology" in the adult education policy domain that, as Bagnall and Hodge (2018) argue, has come to be favored in contrast to alternative, competing ones (i.e., disciplinary, constructivist, emancipatory) in the contemporary cultural context.

Such a cultural context focuses on, or places a high value on, action: on doing, on performing and on achieving (Ball 2000). . . it focuses on outcomes – on what is done or achieved in and

through that action and on its effectiveness in doing so (Bauman 1992). In its focus on achieving desired performance outcomes of extrinsic value, it places a high value on the efficiency with which resources are used in doing so, to the exclusion of other outcomes being attained (Rizvi and Lingard 2010). It therein promotes attention to the comparative competitive advantage of different types of engagements, processes, programmes, policies or organisational arrangements in achieving the desired outcomes (Marginson 1997). . . The focus, then, is on technical, mechanistic and programmatic relationships between the desired economic outcomes and the costs of contributing human actions, engagements, policies and interventions (Bauman 1998). (Ibid., pp. 24–25)

Procedurally, REAAL sets the objectives of MSs' action (e.g., liaise ministries and other stakeholders, co-finance adult learning activities, promote mutual learning) and of EC's action (e.g., ensure complementarity and coherence between policy initiatives, establish close liaison with MSs, enable knowledge sharing, reinforce research capacity of existing structures, pursue and/or intensify collaboration with other international organizations). But it also prescribes the policy instruments through which these shall be achieved. Finally, it interlocks the short-term priorities in adult education and related policy instruments, to ET2020, a different policy mix.

In short, REAAL, through its legal, epistemic, and procedural functions, has put in motion a complex process of instrumentation in the adult education policy domain, which frames "adult learning" as the process leading to the acquisition of skills by adult citizens and, which, in turn, increases the pool of skills available in a country and, by extension, within the European region as a whole and undivided territory, in its racing for global competition.

Before understanding how REAAL naturalizes policy solutions that may produce changes in the adult education policy domain in MSs, however, it is worth appreciating its antecedents.

---

## **The Antecedents to the Renewed European Agenda for Adult Learning**

It is possible to differentiate between two periods in the prehistory of REAAL to appreciate its formation as a policy mix on its own rights. The first, spanning from the mid-1990s to the mid-2000s, is a pre-foundation stage in which the EU sets the ground for adult education to emerge as a policy domain distinct from education and training. The second period, covering just a few years from the mid-2000s to 2011, is the foundation stage in which adult education became a clearly defined policy domain.

### **The Pre-foundation Stage (1996–2005)**

A landmark for the pre-foundation stage is in the establishment of 1996 as the *European year of lifelong learning* [1]. Thanks to the activities organized across Europe to celebrate it, the conclusions of the Presidency of the European Council

held in March 2000 [2] called upon the MSs, the Council of the EU, and the EC, within their areas of competence, to move toward a European Framework defining the new basic skills to be provided through lifelong learning. Thus, in June 2000 the Presidency conclusions of the European Council [3] declared lifelong learning an essential policy area and invited the MSs, the Council of the EU, and the EC to work toward “coherent strategies and practical measures” (art. 32) to foster lifelong learning for all. No reference to the “adult learning’s sector,” as framed in REAAL, was present, with the only exclusion of making higher education more accessible to nontraditional students.

However, following up on both Councils’ mandate, in October 2000, the EC published its Staff Working Paper *A Memorandum on Lifelong Learning* [4] and launched a European-wide debate on a comprehensive strategy for implementing lifelong learning in Europe.

It is in the *Memorandum* that adult learning received its first mentioning and attention at European level, so did the need for developing indicators and benchmarks in this area. Particularly, the EC states that “[i]ntegrating learning more firmly into adult life is a very important part of putting lifelong learning into practice” [4, p. 7] and recalls that improving adult literacy rates and equitable access to basic and continuing education for adults were among the goals agreed by worldwide country representatives at the 2000 World Education Forum held in Dakar. Further, the EC mentions that MSs’ education and training systems (including “further/higher or adult/continuing”) are responsible for guaranteeing “that each and every individual acquires, updates, and sustains an agreed skills threshold” [4, p. 11]. Accordingly, among the open questions put forward to debate, a few addressed issues of concern for the “adult learning’s sector.” Finally, the EC notes that data on participation of adults in education and learning were being collected at European level through the Labour Force Survey (LFS), and data on the direct assessment of adults’ literacy and numeracy skills were also available through the International Adult Literacy Survey held between 1994 and 1998 and published by Statistics Canada and the OECD. But it argues for the need to complement systems-based with learner-centered data and suggests that “[t]o cover most of the issues... for which gaps exist... the best solution seems to be a dedicated adult learning survey” [4, p. 34]. This led to the ad hoc module on Lifelong Learning of the 2003 Labour Force Survey that initiated the European process of classification and typologization of adult learning activities, obstacles/barriers, and outcomes. Also, annexed to the Memorandum were 12 “good practices” in lifelong learning (two per each of its six key messages), compiled in collaboration with other European agencies (i.e., CEDEFOP, EURYDICE, the European Training Foundation, ETF) and a study commissioned by the EC. Three of these made direct reference to adult education and learning.

At a 1-year distance, two EP’s members, Hans Karlsson (Party of European Socialists group, PES) and Roy Perry (European People’s Party group, PPE or EPP), put forward to the EC a parliamentary question on “lifelong learning for adults” and on benchmarking in employment and education,” respectively.

On February 16, Hans Karlsson [5] enquired on what measures would the EC take to enable employees with several years of work experience to appreciate

lifelong learning at an advanced level (e.g., beyond ongoing, in-service training, for instance, through university studies).

On March 9, Roy Perry [6] asked the EC what steps had been taken to address each of the objectives agreed at the 2000 European Council and asked, where appropriate, what benchmarks had been established.

On behalf of the EC, Mrs. Diamantopoulou (the then European Commissioner for Employment, Social Affairs and Equal Opportunities) replied on April 5 to Hans Karlsson:

Lifelong learning is now seen as a horizontal objective of the Employment Strategy... The strategies should include the development of tertiary systems and further education and training for adults to improve their employability, adaptability and skills as well as their participation in the knowledge-based society... Moreover... the Commission expects to come up with some proposals at European level in its Action Plan in the autumn of this year based on the conclusions of the consultation process for the memorandum on lifelong learning. [5, pp. C 235 E/204–205]

She further clarifies, in her answer to Roy Perry on June 6, that

The Employment Guidelines for 2001... have incorporated these objectives [i.e., the objectives agreed in Lisbon] in a detailed way, setting also specific European or national targets as appropriate.

The European Social Fund is the Community's main financial for supporting the European Employment Strategy and hence, also, these four objectives. [5, p. C 340 E/78]

A number of additional complementary initiatives undertaken a European level were also mentioned by Mrs. Diamantopoulou, among which the request to the European Council and the EC to prepare a detailed work program on the follow-up of the objectives of education and training systems to be presented in the spring 2002 European Council, where “[i]ndicators and benchmarks will be key elements,” as well as the then ongoing consultation of the *Memorandum*, the results of which were to “be used by the Commission for drafting an action plan in the second half of 2001 including the development of indicators and benchmarking” [5, pp. C 340 E/78–79].

In the meantime, the *Memorandum* had been forwarded to the EP and referred by the Parliament to the Committee on Culture, Youth, Education, the Media and Sport as the one responsible and to the Committee on Employment and Social Affairs for an opinion. At a 1-year distance, the Parliament, in its 2001 Resolution on the *Memorandum*, adopted the motion to support it [7].

In fact, the Committee on Employment and Social Affairs in its opinion (adopted in July 2001) had highlighted the raising levels of investment in human resources as the most important message of the *Memorandum* and noted that “[e]xisting educational systems are dominated by basic State education for young people. An emphasis on lifelong learning would shift the centre of gravity toward adult education and further education” [7, p. 19]. Moreover, it pointed at three distinctive strategies embedded in the Lisbon Agenda: the elite strategy (i.e., develop new skills in knowledge intensive sectors), the compensation strategy (i.e., combat social

exclusion with priority to basic education for marginal groups), and the comprehensive strategy (i.e., set full employment as a priority goal). Albeit the committee recognized that MSs may combine or opt for either of such strategies, it thought important that they could be assessed and compared.

By recalling the coordination of MSs' employment policies through the European Employment Strategy and the more recent coordination process under the Education and Training 2010 (ET2010) work program, the committee affirmed that all this "should give the European Union a special role in overall educational planning and a specific responsibility for coordination on the basis of the open coordination procedure" [7, p. 20]. Hence a number of general principles were presented to the Committee on Culture, Youth, Education, the Media, and Sport, for incorporation in its motion for Parliament's resolution. All five principles listed under the motion's title *Adult Education Systems* are those proposed by the Committee on Employment and Social Affairs.

It is following the backing of the EP that in November 2001 the EC issued its Communication *Making a European Area of Lifelong Learning a Reality* [8], which then led to the *Resolution on lifelong learning* by the Council of the EU in June 2002 [9]. In this Resolution the Council reaffirms the need for convergence between the 2001 Communication and the ET2010 work program "in order to achieve a comprehensive and coherent strategy for education and training" [9, p. C163/2]. MSs are thus invited "to develop and implement comprehensive and coherent strategies. . . involving. . . in particular the social partners, civil society, local and regional authorities" [9, p. C163/2] and to mobilize resources in support of such strategy in conjunction with the European Employment Strategy.

In extreme synthesis, in the pre-foundation stage, the adult education dimension of lifelong learning is teased out in dialogue between EU institutions, which bolsters the ties between European education and training and employment policies. This created the ground for adult and further education to be seen as an intergovernmental and multi-sectoral policy domain with multiple goals. Therefrom, the concern of EU institutions for existing statistical data gaps at the microlevel (learner-centered), and stronger knowledge exchanges and collaboration across MSs, and with other international organizations with an interest in adult and further education.

## **The Foundation Stage (2006–2010)**

It is at foundation stage, however, that a policy mix governing adult education within the EU starts to take its current shape, upon initiative of the EC.

In its 2006 Communication *Adult Learning: it is never too late to learn* [10], the EU provides the policy underpinning for implementing a dedicated action, under the Lifelong Learning Programme 2007–2013, to adult education (i.e., Grundtvig), and proposes five key messages (i.e., to remove barriers to participation, to increase the quality and efficiency of the sector, to speed up the process of validation and recognition, to ensure sufficient investment, and to monitor the sector) to advance adult learning in Europe.

Upon informal consultation with “national sounding boards” (i.e., policy-makers, social partners, and NGOs from 27 MSs, the 3 EEA countries, and Turkey) and with the support of individual experts, the social partners, and international bodies (e.g., UNESCO), the EC proposes various actions to address the five key messages in its 2007 *Action Plan on Adult learning: It is never a good time to learn* [11], addressed to the European Council, the EP, the European Economic and Social Committee (EESC), and the CR. In January 2008 the EP endorses the action plan [12] in one of its resolutions, yet noting the need for comparable statistical data to develop, review, and evaluate policies in this domain and support the European Adult Education Survey. Moreover, it calls on the MSs to make a more active use of the Structural Funds, the European Social Fund (ESF) particularly, in support of adult learning, and the EC to ensure that all MSs take necessary legal and financial steps to offer and provide access to lifelong learning for all. All of this impinges on coordination, cooperation, efficiency, and transparency between legislative measures and the institutional frameworks, networks, and partnerships of bodies or associations involved in adult learning, using local, regional, national, and European (public or private) financial resources.

In March also the EESC endorses the action plan “wholeheartedly” but subject to the comments set out in its opinion [13], which warns against any inefficient overlap with other EU objectives, projects, and programs, and calls for better attention to vulnerable groups (e.g., disabled people, migrants). Accordingly, also the Council of the EU, in its conclusions on adult learning of 22 May 2008 [14], endorses the action plan, sets common priorities in the “adult-learning sector,” and invites all MSs to implement the measures for 2008–2010 outlined in its Annex.

Measures for the EC to implement the action plan span from analysis of national reforms in education and training, national qualification, and credit transfer systems, and the impact of national reforms in terms of funding dedicated to different age groups, to support professional development in the adult learning sector, and the quality of adult learning providers, to share good practices among, to support visibility of adult learning in nation lifelong learning strategies and awareness raising among potential learners. Attention is also paid to establishing European comparable core data needed to facilitate monitoring.

Measures for MSs to implement the action plan include exchange good practices and mutual learning, develop multi-stakeholders’ projects in adult learning, remove barriers and facilitate access to learning opportunities, reach out especially to early school leavers and low-skilled adults, motivate employers and employees toward adult learning, make effective and efficient use of EU funds in support of adult learning opportunities, cooperate more closely with CEDEFOP and the UNESCO Institute for Lifelong Learning, and “make full use of the research capacities of other international institutions” [14, p. C 140/13].

The EC is tasked by the Council of the EU to support MSs in further promoting access to adult learning opportunities, stressing results-oriented learning outcomes. More importantly, however, is to ensure complementarity and coherence between measures relating to adults across three policy subdomains: adult education (i.e., action plan), higher education (i.e., Bologna process), and vocational education and

training (i.e., Copenhagen processes). To this aim, the EC is also tasked to pursue and/or intensify interinstitutional cooperation with other international organizations, and with nongovernmental organizations, and establish links with international education initiatives and agendas (e.g., Education for All, the Millennium Development Goals).

In the autumn 2008, the CR stresses that “the actions proposed in the Action Plan should also be carried out at local and regional level where appropriate. . .[and] that local and regional providers and stakeholders are involved as partners at all stages, in particular, at policy development, governance structures and delivery systems” [15, p. C 257/70].

In short, over a 3-year period (2006–2008), REAAL took full shape as a policy mix, with own mechanisms, instruments, and tools (see next section). On these precedents, the outbreak of the global financial crisis also impinged on the tuning of REAAL. Specifically, two elements of *Europe 2020* [16], though indirectly, bear higher significance for the adult education policy domain: a European benchmark on tertiary education for young adults (i.e., at least 40% of the younger generation should have a tertiary degree) and a flagship initiative linking skills to better job prospects (i.e., an agenda for new skills and jobs).

Since 2011 onward, REAAL has moved into a third stage of development that has seen the consolidation of adult education as a clearly defined policy domain, which bears strong links with other domains within the EU (e.g., covering education and training, employment, and macroeconomic policies), but with its own policy instrumentation that is examined in the next section.

---

## **The Modus Operandi of the Renewed European Agenda on Adult Learning**

A close examination of the modus operandi of REAAL points at standard setting, capacity building, and financial redistribution, as its core governance mechanisms (see Table 1), operating under the principles of the OMC.

But several policy instruments contribute to the working of these mechanisms. Those surfacing in the analysis include coordinated working groups/networks, mutual- and peer-learning arrangements, data generation, benchmarks, and funding schemes (see Table 2).

In the proceedings each instrument is explored in details, also to pinpoint at how it contributes to the working of the abovementioned mechanisms.

### **Coordinated Working Groups/Networks**

Since foundation stage to date (2018), five working groups/networks have been established in the adult education policy domain, under the coordination of the EC: four temporary Commission Expert Groups (CEGs) and one permanent Other Similar Entity (OSE) (<http://ec.europa.eu/transparency/regexpert/>). CEGs are

**Table 1** Governance mechanisms at play to implement the renewed European Agenda on Adult Learning

Governance mechanism	Description
<b>Standard-setting</b>	It involves normative actions (including benchmarking and standardization) that concur toward the establishment of a single, European model in the area of adult education and learning, to which all MSs should conform
<b>Capacity-building</b>	It promotes “good” or “best” practices that help orienting the practical implementation of policy solution in the area of adult education learning to what framed as common European problems, by EU institutions, national governments, and other stakeholders
<b>Financial redistribution</b>	It implies that EU’s wealth is shared out between MSs as a deliberate effect of joint decisions that include conditionality, and are used in support of reforms and activities in the area of adult education and learning

**Table 2** Policy instruments used to implement the renewed European Agenda on Adult Learning

Policy instrument	Description
Coordinated working groups/networks	Groups established and coordinated by the EC, whose members, appointed by MSs’ governments or the EC, represents different elite positions (i.e., governmental agencies, other stakeholders, experts), and are assembled, over a period of time, to work on important policy issues in the area of adult learning
Mutual- and peer-learning arrangements	Occasions for representatives of MSs, and EC’s staff that support this activity, to identify and learn about initiatives and practices in place in different MSs (and beyond) in the area of adult learning
Data generation	The gathering of quantitative and/or qualitative data, the method used to generate data from different sources, and the procedure through which data reaches a database or otherwise organized collection of data
Benchmarks	Accepted standards at European level, at times negotiated and agreed among Heads of states and governments, by which MSs’ performances in the area of adult education and learning can be measured, compared, and thus their level of quality judged
Funding schemes	Plans or arrangements designed by EU institutions to encourage governments, organizations, or people to attain a particular objective or to put an idea into effect by providing money to finance an activity, a program, or a project entirely or in part

consultative bodies set up by the EC or its departments when external specialist advice is needed “for sound policy-making.” OSEs have a similar function but, though administered and financed by the EC, are set up by the EU’s legislator. Both CEGs and OSEs advice the EC but their inputs are not binding. Appointed members may include individuals in their personal capacity (A); individuals representing a common interest/policy orientation (B); organizations (C); local, regional, or national MSs’ authorities (D); or other public entities (E). Unless there are overriding priorities or emergency conditions, all appointed members are selected through public calls for applications, with the exception of public authorities (i.e., D and

E). Selected features of the working groups/networks under consideration here are presented in Table 3.

All working groups/networks were tasked to assist the EC with the implementation of existing EU legislation, programs, and policies and to coordinate with MSs, through views' exchange. Only WGPAL, active at foundation stage, was tasked also to assist in the preparation of legislative proposals and policy initiatives.

At consolidation stage, however, changes in EU education governance impinged on the adult education domain. An internal restructuring of the EC moved its responsibility from DG-EAC to the Directorate-General for Employment, Social Affairs and Inclusion (DG-EMPL) since 2013, so the coordination of working groups/networks in this domain shifted accordingly.

Moreover, due to the 2009 agreement ET2020 and its tuning to *Europe 2020*, the work of these groups/networks slowly altered too, as to better fit the principles of the OMC. Made explicit in the mission statement of WGAL, such adaptation process is also evidenced in its stress on mutual learning among MSs, assistance to MSs in coping with country-specific "recommendations" by the EU institutions, and "concrete and useable outputs" as a result of the group's activity.

Operating under a looser interpretation of the OMC's principles, both TWGQA and TWGFAL had a thematic focus (quality vs. finance) and higher interest in research gaps. TWGQA explored synergies to strengthen the policy links between EU policy development on quality in vocational education and training, higher education, and adult learning through three subgroups on indicators, accreditation/governance, and staff competences [19]. In the meantime, TWGFAL explored existing good practices to produce policy recommendations to assist MSs in improving the efficiency and coherence of adult learning financing. Two subgroups focused, respectively, on funding adult learning for re-skilling and up-skilling to support innovation and growth and funding adult learning for social inclusion and active citizenship. Both working groups appointed also individuals in their personal capacity.

By contrast, WGAL, in line with its tighter governance function, did not appoint any individual in his/her personal capacity and instead increased representation of other public entities and particularly of candidate countries (now including Albania, Montenegro, Serbia, and Turkey). Further, among EU agencies, it replaced Eurydice, a network of intuitions that facilitate sharing of information on national education systems, with the European Training Foundation (ETF), an agency that supports education, training, and labor market reforms in transition and developing countries.

Yet, silenced members of all working groups/networks are consultancy firms that, having signed framework contracts with the EC, provide their services as facilitators and rapporteurs for the groups/networks' activities.

## **Mutual- and Peer-Learning Arrangements**

Mutual- and peer-learning arrangements can take many forms and may involve representatives of different elite groups. Participation may be restricted to the

<sup>b</sup>Led by European Commission's Directorate General for Employment, Social Affairs and Inclusion

<sup>c</sup>Has a "permanent" status

<sup>d</sup>No individuals representing a common interest/policy orientation (Type B, cf. p.13) were present

members of a group (e.g., one of those mentioned above) or open to nonmembers too.

At foundation stage a number of encounters, framed as “peer-learning activities,” involved members of a given group to share country-relevant knowledge on practices and experiences in a specific area or to pursue a given policy objective, like those that focused on each of the priority areas of the Adult Learning Agenda, organized by WGPAL in Dublin (January 2008), Slovakia (March 2009), London (April 2009), Prague (June 2009), and Oslo (March 2010) [25].

In addition, several regional meetings were organized by WGPAL in Germany (October 2009), Norway (October 2009), Spain (October 2009), and Slovenia (November 2009) clustering, respectively, Western European countries, Nordic and Baltic countries, Southern European countries, and Central and Eastern European countries. Such events were opened to a variety of stakeholders in adult learning “to engage in discussions, knowledge-transfer and other exchanges about topics and developments of importance to participating countries in the context of the Action Plan” [25, p. 21].

At both foundation and consolidation stages, WGPAL and WGAL also made use of workshops with country experts to discuss in-depth topics such as improving quality in adult learning, financing adult learning, adult learning in higher education, basic skills (Brussels, June 2010), effective policies for increasing the participation of adults in basic skills provision (Stuttgart, October 2014), or national and regional policies aimed at increasing the use of information and communication technologies and open educational resources in adult learning (Oslo, March 2015) [25, 33, 35].

Moreover, at consolidation stage, thematic seminars hosted by national governments provided an opportunity for collective syntheses of what learned from in-depth country or regional discussions and case studies on agreed topics, as in the case of the policy coherence seminar organized by WGAL (Brussels, 2015) [34].

Finally, mutual and peer learning also occurred at conferences sponsored by the EC either in isolation (e.g., Adult Skills Conference: Empowering People, 6–7 December 2016 [58]) or in collaboration with other international organizations (e.g., Equipping adults for the twenty-first Century: Joining Forces for Action on Skills and Competences, 9–10 December 2013, with the UNESCO Institute for Lifelong Learning [21]). Through plenary sessions and workshops, these conferences provided several opportunities for policy implementers, professionals, and, to a lower extent, academics to share information about national and regional policies and practices in the adult education domain and for EC’s staff to inform about EU’s policy development and monitor their implementation at national and regional levels.

## Data Generation

A policy instrument that equally supports European governance in the adult education domain is data generation, which comprises the collection of qualitative and/or quantitative data, more or less systematic procedures from collecting it from various sources and for organizing and/or storing it.

An approach to data generation used at consolidation stage is “literature reviews,” which implies a systematic search of the literature available in a selected area, with the scope of describing, summarizing, and possibly evaluating the facts and data it makes available and their analyses. Similar undertakings can be stand-alone activities or part of wider studies and reports. When stand-alone activities tasked by the EC to individuals or organizations, their results set the ground for further policy debate and hence frame further work in such area. An example of this is the literature review, *Improving basic skills in adulthood: Participation and Motivation*, prepared for WGAL in 2015 [31]. It offers an overview of key academic research investigating the participation of adults in activities aimed at raising their basic skills. The review comments on theoretical issues (e.g., life course, identity, and different forms of motivation) as well as empirical research evidence and highlights that “Low-income and poorly educated adults tend to be the least likely to engage in education and training, in part because of poor experiences in compulsory school, but also because employers are often reluctant to provide training for low-skilled staff” [31, p. 13]. At the same time, it recognizes that “the body of research literature in the field of adult literacy and basic skills education refers strongly to examples from the UK, the United States and Canada. Research (available in English) based on the situation in other countries is much more scarce” [31, p. 16].

But less systematic, more concise literature reviews are also done a posteriori, to build the knowledge bases that underpin data generated through other methods, for instance, in a wider study or report. In this case, the literature is cherry-picked for the benefit of the overall study or report. An exemplification is found in *An in-depth analysis of adult learning policies and their effectiveness in Europe* [30], a report published in 2015 (see later on).

But the most common approach to data generation adopted by the EC is “case study,” usually covering a country or region. Although the term is open to various definitions and interpretations, here it refers to an account that provides detailed information and report on facts, about something (e.g., a government policy, a policy implementation strategy, an initiative in the adult education policy domain), and possibly how it developed over time. Such definition comprises written accounts that derive from somewhat in-depth investigations and hence combine quantitative and qualitative data but may not necessarily involve a systematic mode of enquiry. Further, cases studies can follow quite different production procedures, and, as a result of this, data hereby collected can be organized in different ways. Their production can be tasked by the EC to selected members of working groups/networks, for instance, in preparation of mutual- and peer-learning arrangements [34], or commissioned to others (individuals or organizations), through calls for tenders or proposals. Both types of case studies, however, often tend to be reduced to written account of “best” or “good” practices identified (hence judged as such) a priori. For instance, the abovementioned report, *An in-depth analysis of adult learning policies* [30], includes ten case studies of countries that had been performing well over time (or had recently improved) in making their adult learning policies effective.

Written accounts of “best” or “good practices” are another way of generating data to govern the adult education domain. Albeit a best practice refers to “a working method or set of working methods that is officially accepted as being the best to use in a particular business or industry...” (according to the *Cambridge* dictionary), in the global education discourse, it often addresses those initiatives that limit some kind of deficit (e.g., lack of basic skills) or improve the conditions of someone (e.g., adult learner) or something (e.g., education and learning systems). In other words, best practices model desirable goal (s) that people or organizations can work toward. Similarly, a good practice is often used interchangeably, but to point more broadly at positive actions or application of general principles from which other people or organizations may learn. Accordingly, collections or libraries of good practices in the adult education domain may be produced before, during, or after mutual- and peer-learning arrangements (see above) or to generate data and capitalize from EU-funded activities and projects. Such was the case with the *ERASMUS+: Good practices in the implementation of the European Agenda for Adult Learning 2012–2016* [48], a compilation developed by NCAAL’s members while implementing the European Agenda for Adult Learning, whereby good practices refer to “a number of successful activities that had a substantial impact in their countries and that is of interest to share with anybody interested in the field of adult learning” [48, p. 1]. These “good practices” cover meetings, conferences and bilateral exchanges, awareness raising activities, preparatory work leading to reforms of adult learning policies, and concrete measures to improve adults’ basic skills in just a small cluster of Western European countries (3), Nordic and Baltic countries (2), Southern European countries (2), and Central and Eastern European countries (2), yet with the United Kingdom and Slovenia overtly represented (with three good practices per country, in contrast to one per each of the other countries). Each good practice is described through a short overview of the activity carried out, its target, the reasons for success, and its impact, within approx. 400–500 words of length.

Also, “state-of-the-art reports” can at times generate data, like the *State of the Art Report on the Implementation of the European Agenda for Adult Learning*, published in 2014 by the European Association for the Education of Adults (EAEA) on behalf of the RENEWAL consortium [57], with a preliminary analysis of the main challenges, developments, and issues regarding the implementation of the Agenda in Southern and Central Eastern Europe. Likewise other instruments for data generation mentioned thus far, the depth, breath, and soundness of data gathered through state-of-the-art reports, vary, and so does the degree to which they apply a systematic method for data gathering. However, with a few exceptions, they organize and store fact and information in fiches, catalogues, and libraries that are often available to a larger public through the EC’s websites, including the European Platform on Adult Learning in Europe (EPALE).

Last but not least, data generation also includes the design and management of, and the financial support to, quantitative studies like the Labour Force Survey and the European Adult Education Survey on adults’ participation in education and training, managed by EUROSTAT (carried out in 2007, 2011, and 2016), and PIAAC, managed by the OECD (carried out in three rounds 2008–2013, 2012–2016, and 2016–2019).

## Benchmarks

Benchmarks are accepted standards for evaluating (by comparison) countries' performance in a policy domain, which results from benchmarking, or the process of finding "good practices" (based on both quantitative and qualitative data) on which basis standards can be identified and agreed upon at EU levels. But benchmarking can be deliberate and systematic (i.e., explicit) or a by-product of data generation (i.e., implicit) (Jackson 2001). In either case, it can focus on inputs, processes, or outcomes (or any combination of these) either vertically (e.g., improving the performance within an organization from bottom line to top management) or horizontally (e.g., improving different manifestations of the same inputs, processes or outcomes, or their combinations, across organizations (Jackson 2001)). Along this line of thinking, it is possible to distinguish between explicit and implicit benchmarks (as the result of benchmarking).

Since foundation stage, even if various explicit benchmarks, agreed under ET2020 (2009) and reaffirmed in *Europe 2020* (2010), may relate to the adult education policy domain, only one is purposely targeting the adult population: by 2020, an average of at least 15% of adults should participate in lifelong learning. Hence it is such percentage to explicitly set the average European standard in this policy domain and used to assess MSs' performance, as they advance with the implementation of REAAL. But, among implicit benchmarks supported by the EU is also an average increase at European level of the percentage of adults with (literacy and numeracy) skills proficiency Level 3 or higher. Construed by Statistics Canada and the OECD (2005, p. 31) as "the level considered by experts as a suitable minimum level for coping with the increasing demands of the emerging knowledge society and information economy," Level 3 has endured in PIAAC and made an implicit horizontal benchmark for evaluating OECD's member and nonmember states' performances (Hamilton et al. 2015), as well as EU MSs, in terms of their policy outputs.

Improved networking, collaboration, and mutual and peer learning among MSs, the EU, and other international organizations can be seen as the products of benchmarking activity (cf. Jackson 2001). But by flipping the picture upside down, they are as well the fertilizers for benchmarks to be negotiated and agreed among heads of states and governments, so that MSs' performances in the adult education policy domain can be measured, compared, and judged.

## Funding Schemes

One more policy instrument assists all the others reviewed thus far, by providing the financial resources needed for the implementation of REAAL: funding schemes. These are plans or arrangements designed by the EU institutions to encourage governments, organizations, and people to attain particular objectives as they provide the money to finance an activity, a program, or a project entirely or in part. Three such schemes support REAAL in various ways: the ESF, the Europe Programme for Employment and Social Innovation (EaSI), and Erasmus+.

Specifically, set up in 1957 the ESF is the main funding scheme to support achievement of the *Europe 2020*'s priorities, including in the fields of education and lifelong learning. Each MS agrees with the EC "Operational Programmes" covering an entire MS and/or one of its regions, which set the priorities for ESF's spending over a 7-year period (currently covering 2014–2020). ESF funding is always co-financed by public or private funding, which varies between 50% and 85% of the total project costs, depending on the relative wealth of MS or region. MS's participation to PIAAC, for instance, was supported through the ESF.

EaSI is a funding scheme that supports employment and social protection for combating social exclusion and poverty and improving working conditions. Over the period 2014–2020, it has earmarked a total of 1.000.000 euros of EU budget in support of *Europe 2020*'s priorities that, managed by the EC, co-finance projects led by public entities in MSs and candidate countries, Iceland and Norway, are responsible for national or regional up-skilling policies and actions. In 2017, for instance, a call for proposals was dedicated to *Awareness-raising activities on Upskilling Pathways: New Opportunities for Adults* [56].

Finally, Erasmus+ is an additional funding scheme that also supports the *Europe 2020*'s priorities, but only in the fields of education, training, youth, and sport. It is open to both organizations and people, depending on the country in which they are based (including also selected non-EU countries). A co-financing by public or private organizations is foreseen, but its amount varies depending on the line of financing. Its management can be centralized (when funds are managed by the EC's Education, Audiovisual and Cultural Executive Agency, EACEA) or decentralized (when funds are managed by national agencies located in each country eligible under Erasmus plus). Activities by NCAAL's members to implement REAAL in their countries have been partially financed through the Erasmus+, under the Key 3 Action: Support for policy reforms.

Summing up, the connections between the policy instruments reviewed thus far (Table 2) and the governance mechanisms (Table 1) through which REAAL governs adult education policy development in Europe are presented in Table 4.

One of the mechanisms through which REAAL is enacted is standard setting, a process that involves normative actions toward the establishment of a single, European model in the area of adult education and learning. Implicit and explicit European benchmarks (or accepted standards), however, result from complex negotiations and consensus building among heads of states and governments. Negotiations and consensus building are facilitated by data generation activities and mutual- and peer-learning arrangements, as well as by working groups/networks dedicated to adult education and learning coordinated by the EC, and the availability of EU financial resources that are redistributed (via funding schemes) to public entities, organizations, and people within and outside MSs.

But, standard setting through negotiation and consensus building requires a parallel mechanism to promote "good" or "best" practices that can help orient the practical implementation of policy solution in the area of adult education and learning: capacity building. This is a process that involves EU institutions, national governments, and other stakeholders in mutual and peer learning thanks to (though

**Table 4** Connections between policy instruments and governance mechanisms in the implementation of the renewed European Agenda on Adult Learning

Policy instruments		Governance mechanisms		
		Standard-setting	Capacity-building	Financial redistribution

	Data generation	X		
	Benchmarks	X		
	Funding schemes	X	X	X

not exclusively) the management of, and participation in, coordinated working groups/networks. However, portions of the EU budget support capacity building by making funding available through plans and arrangements to attain particular policy reforms and their local implementation.

The fact that EU's wealth can be shared out between MSs (via funding schemes), as a deliberate effect of joint decisions that include conditionality, constitutes a strategic opportunity for REAAL's to perform its legal, epistemic, and procedural functions, and for a plurality of stakeholders from within and outside EU MSs to support European reforms and activities in the area of adult education and learning. By the same token, there are also serious constrains in Europe for supporting reforms and activities in adult education and learning that move always from, or even contrast conformity to, expected MSs' performances which cannot be measured, compared, and judged toward agreed (explicit as well as implicit) standards.

## Some Implications for the Adult Education and Training Sector

At this point it is worth interrogating the implications of the REAAL and its deliberate support to policy coordination within the EU and its MSs, for the structuration and/or regulation of the adult learning and training sector, as this has repercussions for several of its market segments.

In fact, from a market perspective, the adult education and training sector is seen as a system in which different types of providers can supply education and training, for which adults, or their employers, are willing to pay. Clearly, this concept derives from microeconomic theories where a "market" refers to the exchange of good or services that happens through the direct or mediated contact between buyers and sellers. Paralleling this understanding of the adult education and training market addresses the interplay between supply and demand for education and training activities. Yet different logics may substantiate policy (and EU policy) interventions on such market. One, building on behavioral economics, assumes that modeling human behavior can trigger adults' demand for education and training, bringing about a "natural" market adjustment. A different logic, however, maintains that institutional formations as much

as social structures are important determinants for the structuration of adult education and training markets. Such logic appreciates an adult education and training sector in which different market segments coexists (cf. Hefler & Markowitsch 2013). Accordingly, there is no adult education and training market (singular) but rather a plurality of adult education and training markets that may be affected by EU education policy, including in the adult education domain.

Now, the REAAL's basic assumption (as mentioned at p. 4) is that adult learning represents the "weakest" link for lifelong learning systems to flourish in MSs. But this may be seen as an almost natural consequence of the fact that those education and training activities that stimulate adults to learn, contrary to other type of educational provisions (e.g., primary education), can take a plurality of forms. For instance, Hefler and Markowitsch (2013) distinguish at least eight market segments in the adult education and training sector: (1) General Education (Schools for Adults/Evening Schools); (2) Vocational Education for Adults; (3) Active Labour Market Policies; (4) Corporate Training; (5) Management Training, Human Resource Development, and Organization Development; (6) Professional Education (offered by professional bodies); (7) (Liberal) Adult Education; and (8) Higher Education for adult students, including postgraduate programs. In each market segment, the supply-demand interplay is dependent on a number of factors on which policy can intervene (e.g., existing regulations, available resources, a provider's relative positioning in relation to its competitors).

Yet, when REAAL refers to "adult learning" is de facto addressing the adult education and training sector as a whole. But, as such, within MSs, public power authority on adult learning is more often than not fragmented between ministries and across governmental levels (from central to local). Hence governance of the adult education and training sector involves collaboration across public and private sectors and civil society. Consequent to this, MSs statistical evidence on the number of providers and participation rates is difficult to gather, so is detailed information on the type, characteristics, and quality of the provision and on its financing. Cross-country comparisons turn even more challenging, when one takes into consideration the different categorizations found in the academic and policy-oriented literature of educational provisions and the various classifications used in survey questionnaires (Boeren et al. 2017). So, for instance, the Adult Education Survey, a recurrent household survey of adults aged 25–64, run by the statistical office of the European Union (EUROSTAT) every 5 years (2007, 2011, 2016), covers participation in formal and nonformal education and training (<http://ec.europa.eu/eurostat/web/microdata/adult-education-survey>). Formal education and training "consists mostly of initial education" (as classified in ISCED 2011), which includes vocational education, special needs education, and some parts of adult education that are part of the formal education system. Nonformal education and training cover courses, workshops or seminars, guided on-the-the-job (planned periods of education, instruction, or training directly at the workplace, organized by the employer with the aid of an instructor), and lessons. However, such categorizations capture information on the demand rather than on the supply side, at the same time as they classify types of provision that is supplied, or privileged, by certain market segments, not others.

Finally, a key question is whether European governance, with its distinctive qualities (i.e., regulatory politics and wealth redistributive capacity), is promoting

an elite strategy, a compensation strategy, or a comprehensive strategy (cf. p. 8) in the adult education domain. Answering this question requires in-depth analysis of the development of the adult education and training sector and its market segments within and across MSs. However, it is reasonable to assume that different market segments may be differently responsive to either strategy. At best, within a MS, different market segments may privilege and specialize to differential strategic objectives, and thus the development of new skills in knowledge intensive sectors may progress hand in hand with full employment and social inclusion of the adult population. At worst, however, differential responses may produce further fragmentation in the adult education and training sector, which in turn may lead to higher competition within and between market segments, for instance, for accessing financial resources and/or attracting adults-as-customers.

---

## Conclusion

Departing from the claim that adult education and training policy developments in Europe are more strongly entangled with European rather than global governance in this policy domain, this chapter presented a critical appraisal of REAAL. By featuring its main characteristics, and in light of its historical stages of development, it elucidated how, as a policy mix, REAAL performs three substantive authoritative functions (i.e., legal, epistemic, and procedural), which ease European governance in the adult education policy domain. Moreover, through a closer examination of REAAL's mode of working, this chapter identified the governance mechanisms (i.e., standard setting, capacity building, and financial redistribution) and policy instruments (i.e., coordinated working groups/networks, mutual- and peer-learning arrangements, data generation, benchmarks, and funding schemes) that concur to its enactment. In doing so it also highlighted two distinctive qualities that differentiate European from global governance in the adult education domain: its regulatory politics and its wealth redistributive capacity.

Further, this chapter argued that adult education emerged as a separate, yet complementary, policy domain to (adult) vocational education and training (VET) under EU policy coordination. On the one hand, this is appreciative of the distinctive characteristics that learning provision embeds, depending on its primary orientation toward different spheres of adults' further development (personal, social, and professional). This is in turn reflected in the differentiated market segments that compose the adult learning and training sector. On the other hand, within each market segments, the supply-demand interplay is dependent on a number of factors that fluctuate, also due to policy intervention. Hence, the fluctuating effects that differentiation as well as coordination in European policy promotes in adult learning and training markets (plural), at European, national, and local levels, are an aspect that merits further research attention.

training to talent development. As a comprehensive and continuous process, talent development is strategically aligned with organizational goals and develops people in an organization to meet current and future organizational needs. Because the role of talent development professional is different from the role of trainers, talent development leaders are requested to have different competencies. This chapter presents specific competencies required for talent development leaders.

---

**Keywords**

Corporate training · Talent development · Talent development professional, and competency

Say the word “training,” and it evokes a mental image of practical instruction offered in workplace settings to help workers become more productive in performing their jobs. But training has not remained static. Like much else in the modern world, it has been changing to meet increasing demands. The corporate private training market consists of individuals working for nongovernmental employers as so-called corporate trainers, now commonly called *talent development professionals* or *learning and performance professionals*. Corporate training is sponsored by employers for three key reasons: (1) to help workers qualify to meet minimum employer expectations at the time they are hired, (2) to help workers maintain updated knowledge and skills as technology and other changes render their pre-employment training obsolete, and (3) to help workers qualify for more challenging work duties at higher levels of responsibility on the organization chart. Corporate training helps individuals transition from educational institutions or external labor markets to unique corporate cultures that may place special demands on practitioners in any occupation.

This chapter examines changing views of training and why those views have changed. The first part of the chapter explores trends that have shaped the changing business landscape. The second part of the chapter examines the shift from training to talent development, defining terms and explaining the reasons for the change. The third part of the chapter focuses on the competencies of trainers and talent development practitioners.

---

## Trends Shaping the Business Landscape

Nobody can dispute that the modern world is typified by rapid change. While futurists may debate which trends will have the most impact on the future, few can dispute that several trends will have great impact:

- Changing workforce demographics
- Globalization
- Technology
- Lean environment
- Knowledge-based work

But what do these terms mean? How might they affect the future? How can they affect the role played by learning in organizational settings?

## Changing Workforce Demographics

The world’s population is getting older, and that means workers are getting older. That is what we mean by *changing workforce demographics*.

Workforce demographics are changing for two reasons. First, women worldwide are having fewer children (Lawler 2014). Why they are having fewer children is unknown. But they are. Second, people are living longer due to improved medical treatment. When fewer people live longer, the world’s population grows older. That includes its workforce.

Consider the statistics (Lee and Mather 2008):

- By year 2020, about one-fourth of the US workforce will consist of workers ages 55 and older.
- It is possible that there will be a shortage of workers in the USA because there will be too many older people and too few younger people available.
- An aging global workforce will require employers to explore ways to recruit, select, onboard, train, develop, and retain older workers despite differing perceptions about older workers across global cultures.

There are, of course, many other implications of a globally-aging population and workforce. Those include concerns about workplace health and safety, the welfare of elderly people, the economic implications of large numbers of elderly people, and the efforts needed to deal with the disabilities created by age.

## Globalization

*Globalization* refers to the worldwide integration of economic considerations. It involves the gradual convergence of people, cultures, and work (Beck 2015). It is driven by the ease of cross-cultural transportation, the broad availability of technology, and the spread of methods by which to make low-wage workers more productive.

Globalization creates job opportunities in low-wage nations but reduces (or changes) job opportunities in high-wage nations (Spence 2011). It can lead manufacturers to move from high-wage countries to low-wage countries. It can prompt examination of governmental policies that attract and retain employers – such as the role of taxation, environmental and safety regulations, and unionizing efforts.

## Technology

*Technology*, derived from a Greek word that means know-how (Wikipedia 2018), refers to applications of science. Many associate technology with change itself and a

primary driver of change. Technology can make some people more productive and can change how people do their jobs and how people work together on their jobs to achieve results.

Consider:

- Business leaders often point to technological change as the biggest challenge facing their organizations.
- Technology change is often associated with the major drivers in business disruptions, the source of unemployment or structural shifts of employment in the economy, and a leading cause of global warming and environmental pollution.
- Changes in technology can shift entire industries from a traditional business model to something entirely new (e.g., consider how taxi services worldwide were changed by the technology that led to Uber or how hotel services worldwide were changed by the technology that led to Airbnb).
- More technological change has occurred since the beginning of the twentieth century than in all of human history before it.

Technological change requires workers to train for new skills and change the skills they possess to remain employed. Technological change is also associated with the information explosion because it is through technology that new knowledge is communicated. New knowledge, created by that information explosion, risks making worker knowledge and skills obsolete. The half-life of knowledge varies by discipline, but it is now possible that half of everything college students learn while in a 4-year degree program may be obsolete by the time they graduate. That is particularly worrisome for technical fields such as engineering, information technology, and sciences such as biology, chemistry, or physics.

Workers who can innovate – that is, apply creativity to discover new commercial applications of knowledge – are the most valuable of all. The reason: it is through people that businesses discover new products or services, find new ways to make or sell those products or services, and explore new markets where those products and services can be sold.

## **Lean Environment**

Lean was first invented by Toyota in the 1990s. Its goal was simply to reduce or eliminate waste, particularly in the manufacturing process (Hines et al. 2004). Lean encourages systematic study of every aspect of the production process to increase integration and thereby reduce waste.

Interest in lean has prompted more attention to the human side of the enterprise and to increase the focus on ways to encourage learning that go beyond mere formal settings such as online or onsite training. Indeed, if people can learn from the work they do and from the people they work with, much waste can be reduced, and time can be used with more impact.

---

## Knowledge-Based Work

*Human capital* refers to the collective value of the knowledge, skills, and attitudes of people in an organization, community, industry, or nation. Human capital is thus associated with the value of *knowledge-based work*, which is work that relies on specialized knowledge (Drucker 1999). What people have learned to do has economic value (Becker 1962). What people have learned from experience has economic value. Moreover, how people have learned to innovate has economic value.

Many organizations today do not have good ways to value knowledge-based work or place an economic value on what people know how to do. As a consequence, no method exists to value human knowledge on balance sheets or income statements or to price worker engagement (or lack of it). Nor are organization leaders encouraged to find and groom their successor or capture tacit knowledge gained from experience.

## Summary

The movement from training to a talent development viewpoint is affected by each trend listed above. As the world’s workforce ages, employers will need to find ways to unleash the talents of older people rather than rely on the traditional view that new hires are nearly always young people drawn from schools. Talent development is about recognizing the critical importance of human creativity in creating innovation and helping employers achieve competitive advantage. Globalization will mean that workers, and employers, must be more cognizant of cultural intelligence and more capable of addressing national as well as corporate cultural differences. Technology changes the knowledge and skills that workers need to perform their jobs effectively, and technology change also places special value on the ability of workers to demonstrate special gifts (talents) in using that technology to achieve results. Workers must achieve more outputs with fewer inputs to help themselves, and their employers, gain and preserve competitive advantage. The ability to discover and apply special knowledge will increasingly be a source of competitive advantage, and that fact alone intensifies the importance of talent.

---

## Transforming Training into Talent Development

Shifting business trends have transformed the nature of work and have led to a concurrent shift in the conceptualization of our role from corporate trainers to talent development leaders. Reflecting this conceptual reframing, in 2014, the American Society for Training and Development (ASTD), the world’s largest association for professionals in the workplace learning field, changed its name to the Association for Talent Development (ATD) to better indicate its purpose. However, people may still have questions about talent development that center on its nature, the difference

between it and training, and its structure within organizations. In this section, we cover these fundamental questions.

## What Is Talent Development?

Before we discuss talent development, we should first clarify how we define talent. This is a critical step because any confusion about the meaning of talent will hinder a full understanding of the talent development concept.

Practitioners have different opinions about how to define talent. According to Gallardo-Gallardo et al. (2013), talent refers to personal characteristics such as innate ability (objective approach) or people themselves (subjective approach). In our field, talent means people (Bingham 2014). Within this subjective approach are some professionals who define talent as people who have exceptional abilities and skills. From this perspective, talent refers to a group of employees who are top performers. Because of their exemplary performance, these people are referred as *high potentials*, *A-players*, or *superstars* in their organizations. Experts who support this exclusive approach argue that talent development should be focused on these high performers because they are future leaders and have the most impact on productivity which can be gained by improving the efforts of this group.

Others define talent in a more inclusive way, seeing talent as consisting of everyone in a given organization. According to this approach, each employee has his or her own strengths and potential to add value to the organization. Therefore, the entire workforce constitutes talent. Especially in today's knowledge information society, every employee is a valuable resource for his or her organization because the employee's knowledge contributes to the creation of economic value. Both the future competitiveness and growth of an organization hinge on its employees.

In the past, many organizations adopted the exclusive approach because it was considered a cost-efficient way to increase organizational performance. However, the exclusive approach has been criticized by many experts because it leads to ethical issues (e.g., inequality) and disengagement among employees (e.g., Harris and Foster 2010).

In this chapter, we take the inclusive approach, using *talent* to mean everyone in an organization. This is because we firmly believe in every employee's potential and strengths. Furthermore, organizational success stems from every individual's contribution, not only from the contributions of a few high performers. With this in mind, we define *talent development* as a comprehensive and continuous process that develops talents in an organization using a talent management system. Talent management is an integrative system that includes the selection, development, and retention of employees to meet an organization's end goals. Talent development is a significant component of overall talent management and cannot exist apart from a talent management system because they share organizational goals.

Other experts have defined talent development in the following ways:

- Talent development is the “planning, selection and implementation of development strategies for the entire talent pool to ensure that the organisation has both the current and future supply of talent to meet strategic objectives and that development activities are aligned with organizational talent management processes” (Garavan et al. 2012, p. 6).
- Talent development is “a process that delivers capabilities that the organization needs, identifies future capabilities, delivers team capabilities, creates innovation, inspires, seeks out people’s ideas, [and] actively communicates” (Caplan 2013, p. 17).
- Talent development is “building the knowledge, skills, and abilities of others and helping them develop and achieve their potential so that the organizations they work for can succeed and grow” (Bingham 2014, para 15).
- Talent development is “efforts to groom high performers or high professionals for the future and/or to tap them to transfer the specialized knowledge of high performers” (Rothwell 2015, p. xix).
- Talent development is “a comprehensive system that consists of a set of values, activities, and processes with the aim of improving all willing and capable individuals for the mutual benefit of individuals, host organizations, and society as a whole” (Mehdiabadi and Li 2016, p. 287).

Although experts have not reached a consensus on the proper definition of talent development, key points can be identified in the aforementioned definitions.

1. Talent development is a comprehensive and continuous process.
2. Talent development is strategically aligned with organizational goals.
3. Talent development develops employees to meet current and future organizational needs.

Relatedly, talent development leaders are professionals who continuously connect organizational strategies with employee development to promote organizations’ sustainable development.

## **How Is Talent Development Different from Training?**

In the previous section, we pointed out three distinct aspects of talent development based on various experts’ definitions. Yet how do these aspects make talent development different from training?

First of all, talent development is a comprehensive and continuous development process, whereas training is a short-term planned intervention for employees who need to improve their knowledge, skills, and attitudes. Rather than providing a one-shot solution, talent development focuses on developing employees throughout their careers in their organizations. Talent development is not a set of training programs but rather a systemic approach that integrates development practices,

business strategies, and other systems (e.g., selection, performance appraisal, career development, and succession planning).

Second, talent development is strategically aligned with organizational strategies and goals. Training helps individuals meet their job requirements and improve their knowledge, skills, and attitudes in their current jobs, but talent development is connected to the overall organizational outcomes. Talent development is designed and implemented based on organization's value, business goals, strategies, and needs. The results of talent development are not limited to the individual level but instead affect organizational performance. Talent development seeks to implement organizational strategies, build corporate culture, and align individuals with organizational values to achieve business goals and improve performance.

Third, talent development develops employees to meet current and future organizational needs. Unlike training, which focuses on short-term needs, talent development is directed toward current performance improvement and future business needs. In today's rapidly changing business environment, organizations must consistently and successfully adapt to changes to ensure their sustainable development. Talent development captures these long-term dynamics and is reflected in the developmental system. For employees to be agile in approaching future needs, talent development must engage and empower the employees to ensure that they can lead their organizations through various changes. Finally, by developing individuals, talent development creates a sound talent pipeline for meeting future needs.

## How Does an Organization Build a Talent Development Structure?

To build a talent development structure, an organization must first and foremost articulate its current and future talent needs. Doing so may include determining the number of talents that will be needed at a certain time in the future, as well as the specific competencies and characteristics of the talents that are needed. Without this clear picture, an organization's talent development structure becomes ad hoc. Future and current needs can be identified through a formal talent review process and a review of the existing competency models in an organization (Caplan 2013; Garavan et al. 2012). During the formal talent review process, talent development leaders assess the existing talent pool and identify gaps between the status quo and future needs. Reviewing competency models also provides important information, but talent development leaders should not rely solely on this information because the models have been created based on the past successes. Since every organization addresses different business challenges and experiences a different kind of talent shortage, an organization should build a unique talent development structure based on its particular needs.

Gandz (2006) proposed the concept of *talent development architecture*. Talent development architecture is supported by three pillars: pathways, programs, and processes. Once organizations have clarified their talent needs, the organizations can then create developmental pathways for their employees by providing

various work experiences and challenging projects. Employees can develop their abilities and careers by following the pathways that are suggested to them by their organizations. Organizations also provide developmental programs such as training, coaching/mentoring, and informal learning opportunities. Finally, processes refer to organizations’ integrated HR systems (e.g., selection, succession planning, performance management, reward, and career development). When an HR system is seamlessly integrated with a given organization’s developmental pathways and programs, the flow of talent within the organization is readily accessible.

Rothwell et al. (2015) proposed a puzzle model that shows how an organization can build its unique talent development structure using 39 functional pieces. The 39 functional pieces were identified based on the ATD Competency Study and input from the ATD Forum. Many workplace learning practitioners are familiar with these 39 functional pieces because they handle these issues in everyday practice. Talent development is not something else but things that they are already doing. By rearranging, removing, and add pieces to their existing systems, workplace learning professionals can create their unique talent development systems that fit their organizational needs and strategies. By surveying 307 talent development leaders, Rothwell et al. (2015) found 15 core components of talent development among the 39 functional pieces: change management, coaching, compliance, evaluation of learning impact, employee engagement, executive development, instructional design, leadership development, learning technologies, management of learning programs, needs assessment, onboarding, performance improvement, performance management, and training delivery. These are the most common components of talent development across organizations, but as in the former case, components can be added and removed as necessary.

The concept of talent development architecture (Gandz 2006) and the puzzle model (Rothwell et al. 2015) serve as good guidelines for talent development leaders who would like to build sound talent development structures for their organizations. A one-size-fits-all approach is unsuitable for meeting the diverse needs of an organization in a rapidly changing business environment. Using these models, talent development leaders can create their own structures that best support their organizational strategies and foster employee engagement.

---

## **New Competencies of the Talent Development Leader**

This section focuses on the transformed competencies of talent development leaders based on the changing trends and the changed role from trainers to talent development leaders. To fulfill the changed role, talent development leaders are requested to have different competencies from trainers. In the following sections, we will review the competencies of talent development leaders based on *ASTD Competency Study: The Training and Development Profession Redefined* which was published by ASTD (now ATD) in 2013 because this study is perhaps the most critical study in understanding the competencies needed by talent development leaders.

## Defining the Term Competency and Competency Model

Before we review the competencies of talent development leaders, we will briefly explain what competency means and why the competencies have changed. The term *competence* came into trend following White's seminal work, *Motivation Reconsidered: The Concept of Competence*, which was published in *Psychological Review* in 1959. White explains that because people are intrinsically motivated to achieve competence, having competency models enables organizations to tap into our own desire to achieve proficiency. Spencer and Spencer (1993) defined competency as "an underlying characteristic of an individual that is causally related to criterion-referenced effective and/or superior performance in a job or situation" (pp. 391–395). This definition was found to be burdensome, and even the authors had to continue to elaborate on the meanings of the words included within the definition such as underlying characteristic, causally, and criterion-referenced.

For this chapter, the definition given to the term *competency* is any skill, task, ability, or knowledge needed for an employee to succeed in his or her job (Mulder 2017). To achieve competence in a particular job, a person should be able to perform various tasks or skills at a specific target proficiency level. Corporations often build competency models to depict different competencies needed for certain jobs within the organization. A competency model encompasses all the competencies, tasks, skills, behavioral examples, and proficiency requirements for a particular job. It focuses on factors the organization has marked "critical" to achieving the corporate strategy.

## Reasons Competencies for Talent Development Leaders Changed over the Past Two Decades

Taking a closer look at the landscape within organizations and in the training and development field shows transformational changes over the past two decades. As we mentioned above, most notable across the globe, critical challenges occurred such as the recession and economic uncertainty; digital, mobile, and social technology; demographic shifts; and globalization. These challenges also caused the role of the organization trainer to shift and expand into the talent development leader role. The main function of the trainer was to educate employees on specific job-related topics. In this role, the trainer was not linking the training topics to the employee's personal growth or organizational growth. Trainers were not as focused to how the content was transmitted or retained by the employees.

As organizations began to connect training to the employee's personal development and the strategic growth of the organization, the role of trainer began to focus on development of employee talent and how that talent can lead to positive organizational growth. As this new role began to expand, the title of talent development leader emerged.

As a result, talent development leaders had to learn new concepts such as integrated talent management, employee engagement, and crowdsourced, collaborative, mobile, and continuous learning. These new concepts disrupted conventional

notions of the training and development function’s job and changed the competencies required for success. Talent development leaders can no longer ignore external factors that can reshape the way organizations train and develop their employees. If organizations want to maintain their competitive advantage, they must heed the warnings of these external factors and understand how to reconstruct the ways in which talent development leaders develop employees.

Talent development leaders must understand and demonstrate their competence in adopting a global mind-set, emerging and ever-changing learning technologies, emotional intelligence, industry knowledge, collaboration, and innovation. The ways in which talent development leaders can share the value of demonstrating new and emerging competencies can be shown in the following ways:

- Staying abreast of new and emerging learning technologies
- Moving from the role of trainer to a facilitator of learning and content curator
- Fostering and supporting a culture of connectivity and collaboration
- Developing an environment of knowledge generation
- Building a stronger understanding of knowledge transmission
- Developing learning activities as a process that engages learners in a variety of ways and not as one-time events
- The ability to give learners a *voice* and a *choice* in how they are developed and select learning activities that meet their individual needs
- Using metrics to demonstrate the value and impact of learning
- Being a strategic business partner at the C-Suite level to promote support for training and development efforts

Several of the more deliberate ways for talent development leaders to give credence and validity to their efforts is being engaged at all levels of the organization. For example, the competency of giving a *voice* and a *choice* can be demonstrated by leveraging the learning styles and preferences of new generations entering the workplace and also those generations leaving the workplace. The term *voice* is shown in the way in which the talent development leader incorporates feedback from the employees on how they want to be developed. The term *choice* is reflected in how the talent development leader builds a repertoire of different training activities to select from or what some people call the “cafeteria-style” learning options.

Another way for talent development leaders to enhance their effort is being viewed as an integrated talent manager. This allows the talent development leader to engage in all the processes and systems that create organizational capability and understanding the role and contributions of the learning function. Talent development leaders can also demonstrate the value and impact of learning by using metrics that are meaningful to business and using data analysis to measure the effectiveness and efficiency of learning and development. Knowing how and when to share these business analytics can help talent development leaders’ gain support from C-Suite, executives, and board of directors.

By mastering these competencies, talent development leaders are viewed more successfully as a strategic business partner who aligns their activities with the

organization's business strategies and goals and demonstrates their return on investment, especially during challenging times.

### **Specific Competencies Required for Talent Development Leaders**

Talent development leaders must master many different competencies. According to the *2013 ASTD Competency Study: The Training and Development Profession Redefined*, competencies can be sorted into the following categories: business skills, global mind-set, industry knowledge, interpersonal skills, personal skills, and technology literacy (pp. 79–91).

Talent development leaders need to illustrate their competency in business skills by showing the ability to uncover the needs and opportunities of the business, client, and learners by comparing data from different sources to conclude and using effective courses of action in developing solutions. Several key actions listed in the business skills category include the ability to diagnose learning and development issues, generating multiple alternatives to meet learning needs, understanding business operations, and creating a value proposition between business needs and specific learning solutions.

The category of global mind-set leverages talent development leaders' abilities to work effectively with individuals from different generations who have diverse styles, cultures, abilities, and motivations. Several key actions included in this category are conveying respect for all perspectives, adapting one's own behavior to accommodate others, being a champion of diversity, and soliciting contributions from a diverse group of individuals.

The industry knowledge category encompasses a perspective of how well the talent development leader actively scans and assesses information on current and emerging trends in the learning and development industry. A key element included within this category pertains to how well the talent development leader maintains their own professional knowledge while keeping a keen eye on industry changes and trends.

The interpersonal skills category is comprised of ideas on how well the talent development leader interacts with others in a way that gives them confidence and builds trust. The interpersonal skills category has subsets that include building trust, communicating effectively, influencing stakeholders, networking with partners, and understanding emotional intelligence. Key attributes of this category include operating with integrity, leading by example, treating people fairly, nurturing relationships, and ensuring compliance with legal, ethical, and regulatory requirements.

The next category, personal skills, includes how well the talent development leader deals with adaptability and change. Talent development leaders must be able to handle constant change. As a change agent for the organization, the talent development leader must remain open to different people, thoughts, and approaches and to have the ability to adjust effectively to work within many work structures and processes. Key attributes of this category include approaching change with a positive attitude, modeling self-mastery in learning, and maximizing learning opportunities.

The last category, technology literacy, is perhaps the most prevalent change to the talent development leader job within the past two decades. This category includes ideas

on how well the talent development leader demonstrates an awareness and ease of use with the existing, new and emerging technologies. The talent development leader must have the ability to demonstrate a practical application of technology trends to leverage these technologies to accomplish learning activities and achieve business goals.

## Benefits of Using New Competencies

When talent development leaders master these new competencies, they will inherit benefits for themselves, the workforce, and the overall organization. Talent development leaders gain individual competence through modeling the behaviors needed to gain momentum and support in the overall buy-in of all learning and talent development efforts. Through this process, talent development leaders become life-long learners and use their knowledge to build a benchmarking tool to ensure that the organization’s talent resources are used and managed effectively.

The workforce benefits by having a talent development leader who can help employees with career exploration and development opportunities. Talent development leaders understand how to assess competencies needed within each job type within the organization. Talent development leaders coach employees in a manner that builds trust, analyzes needs, and provides the most successful learning and development solutions, which in turn builds employee engagement and success.

Other leaders and executives of the organization view talent development leaders who master these competencies as strategic partners. This will allow the talent development leader to engage leaders in the overall employee development process using a holistic approach including all processes, policies, and programs used for learning and development purposes. One of the most important aspects of the holistic approach is to be able to fully engage all leaders by educating them on the focus of organization development from the talent development perspective. This includes leaders understanding career planning, employee development processes, and how leaders should provide coaching and feedback to gain buy-in and engagement from all employees.

## Preparing Talent Development Leaders for Future Challenges

Keeping up with these changing competencies is but only one of the challenges talent development leaders will face in the future. Several other challenges that will test the talent development leader’s knowledge and capabilities will be their understanding of defining the word *talent*, *business agility*, *global strategy*, and clarify and defining *employee engagement*.

As we mentioned above, the term *talent* has many meanings, and the definitions of talent are different across people. Therefore, it is critical that the talent development leader spend time clarifying with other leaders a clear definition of how the organization is defining the word *talent*. While many organizations view talent development for just the “high performers” within the organization, demographic changes such as a four-generational workforce have changed the words talent

development to be inclusive of all employees in the workforce. Talent development leaders assist in building learning and development solutions to transfer knowledge through all generations, cultures, and geographic boundaries.

In his book, *Obliquity: Why Our Goals Are Best Achieved Indirectly*, John Kay discusses the idea that if the environment is uncertain, imperfectly understood, and constantly changing, the product of a process of adaptation and evolution may be better adapted to that environment than the product of conscious design. He gets readers to ponder the question that if environments are constantly changing, how can we cultivate agile practices? (Kay 2011).

The term *agility* speaks to how well the talent development leader can shift their day-to-day practices and attitudes to find learning solutions to build a more flexible and adaptable workforce. Agile talent development leaders will need to be highly adaptable on a regular basis. Several aspects of agility can be shown by how the talent development leader realigns their day-to-day actions, easily recalculates priorities, can be seen as a catalyst for change, and mostly important can affect overall business results in a positive manner.

Global strategy speaks to how the talent development leader can be involved with the organization's strategic and global talent development efforts. Specifically, the talent development leader will need to assure that these efforts are aligned with future global needs to ensure that the organization is prepared for filling future talent gaps. Talent development leaders must work with C-Suite and executives to educate on how global talent development impacts the overall organization's culture. C-Suite level refers to those employees who are normally at a senior level within the organization such as Chief Executive Officer, Chief Learning Officer, Chief Financial Officers, Chief Human Resource Officer, and Chief Talent Development Officer.

Lastly, talent development leaders will need to continue to build techniques for engaging workers. Talent development leaders can achieve this goal by continuing to assist the employees by giving them the *voice* and *choice* in how they are developed. Talent development leaders will need to work with C-Suite levels and above to assure the correct budgets will be allocated to provide the many different types of learning activities such as those found in mobile and social media learning solutions.

---

## Conclusion

In this chapter, explanation was given to several aspects of changes within corporate training environments. These aspects included trends shaping the business landscape, transforming training into what is now commonly known as talent development, and how the position of trainer has now grown into a highly-skilled functional position of talent development professional or learning and performance professional. These changes were made to meet the business needs of the ever-changing and fast-paced corporate environments. Another prevalent change within the corporate environment is the expansion of multi-generational workforces. In order for talent development professionals to be successful in working in today's multi-generational workforces, they must master specific competencies. These

competencies include having a global mind-set, in-depth industry knowledge, adaptability to change, interpersonal skills, and technology literacy.

As organizations continue to grow and connect training to not only the employee's personal development but to overall organization performance and outcomes, talent development professionals and learning and performance professionals will be required to grow their expertise so that they are viewed as valued partners. Organization leaders will rely on the expertise of the talent development professionals and learning and performance professionals to help develop talent within the organization and to show how talent development can lead to positive organization growth.

## Abstract

The Humboldt model of higher education describes the two main missions of universities, i.e., teaching and research; however, this has increasingly been complemented with the third mission of connecting with business and communities through knowledge transfer, valorization, engagement, and training. One important dimension of this third mission is the provision of training programs which bring numerous benefits to universities and their constituent communities.

829

Yet, closer inspection of this training reveals a complex array of provision, and it is argued that the term “knowledge transfer” provides a more accurate picture from a learning perspective.

In recent decades, the United Kingdom has maintained a *laissez-faire* approach allowing industry to respond to the market; however, recently there has been a significant change with a new interventionist industrial strategy. The *Industrial Strategy* document described the University of Sheffield’s Advanced Manufacturing Research Centre (AMRC) as a role model for innovation and economic growth. The AMRC Training Centre will be discussed to provide a practical context with regard to degree apprenticeships and other training which is delivered to employees of approximately 300 companies, including Boeing, McLaren, and Rolls-Royce, which have established manufacturing facilities at the AMRC.

**Introduction**

Just as castles provided the source of strength for medieval towns, and factories provided prosperity in the industrial age, universities are the source of strength in the knowledge-based economy of the twenty-first century. (Lord Dearing 2002)

The Humboldt perspective of universities describes two main missions of teaching and research; increasingly, however, this has been complemented by a third mission – that of engaging with local, national, and international communities and businesses (Schimank and Winnes 2000). The third mission is also known as third stream, triple helix, knowledge triangle, knowledge transfer, and valorization and in the United States as outreach and engagement. This repurposing of the roles of universities has emerged for a number of reasons:

- Governments encouraging university – industry relationships in a triple helix (Etzkowitz and Leydesdorff 2000).
- Limitations on state funding for universities (Universities UK 2016c).
- Demands by society for less isolationism and greater involvement from the “ivory towers” of universities (Reid 2013).
- Businesses wishing to benefit from the research conducted in universities (Abramovsky et al. 2007).
- Open innovation strategies by businesses which no longer exclusively conduct in-house R&D seeking out research and innovation from other sources including universities (Chesbrough 2006).

Historically, higher education institutions (HEI) have provided a range of vocational education programs which can be defined “as being designed to offer

a pathway to a specific career or profession – by deploying specific, technical skills used in that career” (UUK 2016a, p. 11). Using this definition, Universities UK examined the Higher Education Statistics Agency (HESA) student records as well as the Skills Funding Agency’s Individualised Learner Record to categorize nine vocational study areas: architecture, building, and planning; computer science and ICT; education and training; engineering; medicine-related subjects; law and legal studies; medicine and dentistry; social work and care; and veterinary, agriculture, and environment. Based on the definition above, 42% of universities and 54% of further education (FE) colleges provided education which can be considered vocational.

In addition to this student-focused vocational education, higher education institutions and further education colleges also provide external training and continuing professional development. The title of this chapter, “Public Education Institutions as Providers of Private Training Programs,” at first glance, would appear to be a relatively distinct area, but the closer one investigates it, the more diverse it becomes. Inspection of this training reveals a complex array of provision from short bite-sized training to long extensive programs, in house/on campus, certificated/non-certificated, bespoke/off-the-peg, face-to-face/distance, online learning, government-supported programs/individual–company sponsored, etc.

To add further complexity, definitions of training are blurred and porous, overlapping with vocational education, learning, development, and knowledge transfer (Wilson 2012a). For example, the Manpower Services Commission (1985, p. 62) defined training as:

a planned process to modify attitude, knowledge or skill behaviour through learning experience to achieve effective performance in an activity or range of activities. Its purpose, in the work situation, is to develop the abilities of the individual and to satisfy the current and future needs of the organisation.

This definition of training is also relatively limited in its scope to provide a window on university–business links, and there are also other complications in defining “private training programs.” Do these mean only direct face-to-face training should be considered? What about when training is part of a wider provision of knowledge transfer, e.g., training in the use of technology, on-the-job training, etc.? The range and variety of learning can be summarized in the 70:20:10 model of learning and development in which 70% of a person’s total learning results from challenging assignments, 20% from interactions with workplace colleagues, and 10% from structured training programs (Eichinger and Lombardo 1996). Training is too narrow a term to be fully practicable in discussing the wide range of learning opportunities which occur in the current environment. By contrast, knowledge transfer is more widely applicable and appropriate as the following definition illustrates:

Within a modern, knowledge driven economy, knowledge transfer is about transferring good ideas, research results and skills between universities, other research organisations, business and the wider community to enable innovative new products and services to be developed. (Office for Science and Technology 2002, p. 63)

It is with the above considerations in mind that this chapter will study university third mission initiatives and explore some governmental training delivery interventions by universities. Next it will describe the historical development of apprenticeships leading to the new degree apprenticeships. It will then describe the United Kingdom's industrial strategy and how the University of Sheffield's Advanced Manufacturing Research Centre is contributing toward innovation and economic growth. And finally, it will describe the Apprenticeship Standard for Postgraduate Engineers.

---

## The Third Mission: University–Business Collaboration

The third mission is becoming increasingly important for universities, and the representative association for UK universities described how “Universities engage in a wide range of knowledge exchange activities, such as long-term collaborative research programmes, consultancy, and bespoke training” (Universities UK 2015, p. 12).

A Higher Education-Business and Community Interaction survey of 161 UK higher education institutions identified that 108 provided continuous work-based learning and 150 universities delivered bespoke courses on campus or business premises (HESA 2015). Employers were involved in content development and curriculum review in many of the programs, and 113 out of 161 ranked this involvement as 4 or 5 out of 5. Moreover, businesses which collaborated with universities were six times more likely to report the introduction of product innovations (Howells et al. 2012). In addition, 28% of employers were directly involved with degree program advisory boards and course design (Universities UK 2015).

The *Lambert Review of Business–University Collaboration* (Lambert 2003) noted that the continuing professional development market was valued at £23bn, and the Council for Industry and Higher Education estimated that universities only accounted for £250 m. These figures indicated substantial financial opportunities for universities which adopted an entrepreneurial approach. Perhaps more importantly, a list of potential benefits between businesses and universities included:

- Applied research in advanced technologies.
- Bespoke collaborative degree programs.
- Collaborative research.
- Education of graduates.
- Enterprise education for graduates.
- Helping government agencies encourage major employers to invest in the United Kingdom.
- Higher-level apprenticeships.
- In-company upskilling of employees.
- Industry-sector foundation degrees.
- “Science” park developments
- Spin-out companies.
- Support for entrepreneurs (Wilson 2012b, p. ii).

## Competition and Collaboration Among Universities

It has been argued that competition among universities has encouraged diversity, effectiveness, and efficiency at the same time as ensuring excellence (Wilson 2012b). Moreover, no single university offers business collaboration across all dimensions with the result that diversity provides strength. One downside of this competition is that there is the potential for universities to chase business customers in pursuit of financial returns even when they do not have a strong offering. It is not unusual for universities to talk up their excellence, but this needs to be underpinned with substance.

An alternative approach for university leaders might be to emphasize the complementary strengths different universities offer. Universities should be honest about what they can provide by mutually recognizing the abilities of other universities and, where relevant, recommending other universities. Without this perspective, competition might become a weakness (Wilson 2012b).

One strategy to overcome the limitations of competition is the concept of collaborative advantage (Kanter 1994). This collaborative advantage involves universities working in consortia and alliances to provide a broader portfolio to the business community, for example, Universities West Midlands (2018) which represents 12 universities provides a website portal which encourages interest in working with these universities and: “It fosters collaborative solutions and strong partnerships in support of economic, social and cultural wellbeing and public benefit.” (universitieswm.co.uk 2018).

---

## Failure of University–Business Collaboration

Although there are many benefits of university–business collaboration, it may not always be successful for a range of reasons which are summarized below:

1. Business needs do not fit with a university’s strategy and mission.
2. A university’s capacity may not be available within the timescale required by the business.
3. A capability mismatch where a university does not have the skills or facilities needed.
4. The bidding cycle for external funding may not match the timescales required by the business.
5. Universities should provide services at full economic cost, and this may sometimes be more than businesses are willing to pay.
6. The investment by the university does not provide a sustainable payback period.
7. There is a mismatch between expectations and objectives.
8. Ownership of intellectual property can prejudice collaboration.
9. There may be different views about indemnities and liabilities between partners (Wilson 2012b).

A helpful piece of guidance to avoid some of the challenges described above is to give a clear and prompt response to collaboration enquiries and requests. No response or unnecessary delays can cause frustration and adversely impact on reputation and other collaborations with the business. One helpful strategy used by some universities is to say “No, because. . .” and quickly refer the business to other universities or providers (Wilson 2012b).

A consultancy approach is sometimes more effective for universities than only offering a menu of training programs. In an interview, a stakeholder organization representative stated: “There needs to be much more understanding [of employer needs from universities] first. Rather than ‘are you interested in buying training off us?’ [. . .] It’s about understanding what the employer’s pain is [. . .] and what model will fix that pain” (Universities UK 2016b, p. 16).

In spite of these potential shortcomings, there has been an increasing appetite by higher education institutions to build links with businesses and communities. These connections also have been encouraged by government initiatives some of which are described below.

---

## **Examples of University–Business Training and Knowledge Transfer**

One of the most important factors supporting labor productivity is human capital which the OECD (2001, p. 18) described as: “The knowledge, skills, competencies and attributes embodied in individuals that facilitate the creation of personal, social and economic well-being.” Universities are in a prime position to support the development of human capital, and the collaboration between universities and businesses has been ongoing for many years. For example, the establishment of many civic universities in the United Kingdom was linked to the provision of medicine and engineering, and the former polytechnics also provided a range of offerings to business and industry. In an investigation of labor market training interventions and the links between education institutions and business/industry from 1839 to 2010, hundreds of initiatives were identified (Wilson 2011), a few of which will be briefly described below.

One initiative was Professional, Industrial, and Commercial Updating (Pickup) which was launched in 1982 (Department of Education and Science 1985). Its aim was to provide pump-priming finance to encourage colleges, polytechnics, and universities to increase their involvement with industry and commerce and deliver self-financing vocational courses for companies and people in employment (HM Inspectors 1990a, b). Associated with the Pickup program were Local Collaborative Projects which ran between 1984 and 1988. These were a combined initiative supported by the Manpower Services Commission and Education Department whereby employers and education providers in both HE and FE developed links to increase the amount of education and training updating (HM Inspectors 1990a, b).

Another initiative encouraged by government was the “Higher Education Reach-out to Business and the Community Fund (HEROBC)” which subsequently became

the Higher Education Innovation Fund (HEIF) (Goddard and Puukka 2008). This began in 2001 to provide a range of training and third mission activity and continues today.

Yet a further initiative was the Teaching Company Scheme which encouraged companies to partner with universities to benefit from the transfer of knowledge provided by graduates who were known as teaching company associates. In 2003, this scheme was replaced with Knowledge Transfer Partnerships which involved both universities and further education colleges. A KTP associate worked with a company on a business development project (Wilson 2011).

---

## A Brief History of UK Apprenticeships

During the Middle Ages in Western Europe, merchants, landowners, and skilled tradesmen grouped together and formed guilds focusing on specific occupations; e.g., the Cutlers' Company (cutlery and metal working) was established in 1624 and, among other responsibilities, oversaw the binding of apprentices to employers. The guilds were the first organizations which systematically managed the relationship between employers and employees.

In the United Kingdom, the state first became involved with training with the introduction of the Statute of Artificers 1406 (a person who made artifacts). The statute legislated that, "every man or woman of what state or condition that he be, shall be free to set their son or daughter to take learning at any school that pleaseth them within the realm" (De Montmorency 1902, pp. 28–29). A subsequent Statute of Artificers 1563 declared that young people were "to be enstructed or taught in any of the Artes Occupacions Craftes or Misteries which they or any of them [the masters] doo use or exercise" (De Montmorency 1902, p. 71).

In the nineteenth century, apprenticeships expanded to new industries including electrical activities, engineering, and shipbuilding with approximately a quarter of a million apprentices during the 1960s. By the 1990s the number had declined to 50,000 due to economic difficulties, a decline in manufacturing, and young people attending school for longer. Also, many apprenticeships (normally 5-year length) were not matching the requirements of the labor market, and the learning was not always of an appropriate quality. This resulted in government intervention with the introduction of modern apprenticeships which raised numbers to 180,000 by 2010.

Although the numbers of apprenticeships increased during this period, there was a concern about their quality and suitability (Fuller and Unwin 2003). Some of these apprenticeships were of short duration, and their relatively low level resulted in a reduction in demand from some employers and potential apprentices (Winch and Clarke 2003; Toner 2008). A review of vocational education by Wolf (2011) observed that the UK's system of technical education was weaker than most other developed nations. Subsequently, another report by Wolf (2015, p. 1) described it as a dysfunctional and "broken training system" in which modern apprenticeships did not resemble traditional apprenticeships and had contributed to a decline in training

by employers. Moreover, government provided funding for training which many employers would have delivered anyway.

This recognition of a dysfunctional training system led to the Richard Review of Apprenticeships (2012, p. 15) which described an important observation: “Elsewhere, in Europe and beyond, apprenticeships are held in very high regard. This is a very different world from England where all the prestige is tied to a university education and all alternatives are considered second class.”

In 2016, the average level of UK productivity was calculated as 15.1% lower than the combined productivity of the other G7 nations. For the individual nations, UK productivity was above Japan (by 12.0%) and above Canada (by 3.4%); however, it was lower than Italy (9.0%), the United States (21.8%), France (22.3%), and Germany (25.6%) (Office for National Statistics 2018). A report by HM Treasury (2015) suggested a number of strategies to resolve this productivity problem including increasing the quality and quantity of apprenticeship training because of the correlation between higher skills and productivity levels, degree apprenticeships, and introducing a training levy. Higher-level skills and education are linked to higher productivity, and the Department for Business, Innovation, and Skills (BIS: 2013, p. 3) calculated that a 1% increase in the workforce possessing a university degree increased long-run productivity by 0.2–0.5%. It appeared that linking universities and apprenticeships somehow might provide a partial solution to the problem of skills and productivity.

---

## Degree Apprenticeships

### An International Perspective

This chapter focuses on the context and development of degree apprenticeships in the United Kingdom, but it should also be acknowledged that previously other countries have developed hybrid forms of learning which combine vocational education and training (VET) with higher education. This provision often varies depending on national circumstances, and a detailed consideration of these is beyond the scope of this chapter; however, it is important to draw attention to some examples to illustrate the scale of these developments and the potential opportunities for learning from these wider experiences.

The separation of VET and HE in Austria, Germany, and Switzerland was described by Baethge (2006) as an “educational schism,” but increasingly there has been blurring of the distinctions between the two (Graf 2016). This has occurred for a number of reasons including socioeconomic factors, demands for higher skills, and the Bologna and Copenhagen agreements encouraging movement between VET and HE (Powell and Solga 2010).

One example is the German “Stuttgarter Modell” which began in 1972 as a cooperative initiative between companies such as Daimler, Bosch, and SEL and the State Minister for Education and Culture of Baden-Württemberg. It was subsequently called “Berufsakademie Baden-Württemberg” and is now called “Duale

Hochschule Baden-Württemberg” or “Baden-Württemberg Cooperative State University” (DHBW). This cooperative (work-integrated) education combines theory and practice through university education and on-the-job training in companies (Duale Hochschule Baden-Württemberg 2018). A similar model can also be found in South America where the Duale Hochschule Latinoamericano (2018) combines academic and work-based learning in Colombia, Mexico, Peru, and Ecuador.

The sources of funding for students’ education and training vary depending on the country, which can be the employer, state, company, student, or combinations. Below, we will discuss the UK situation in which the company/organization is predominantly responsible for funding through the apprenticeship levy.

## UK Degree Apprenticeships

In November 2014, the UK government announced the development of a new form of vocational education, i.e., degree apprenticeships (DA), which began delivery in autumn 2015 (BIS 2014). Degree apprenticeships, which were first launched in the digital sector, combine academic learning and on-the-job practical training. They contribute to filling skills gaps in the economy and respond more closely to the needs of employers. Universities UK (2016b, p. 7) stated that:

Degree apprenticeships combine university study and workplace learning to enable apprentices to gain a full bachelor’s or master’s degree. An apprentice has full-time employment status rather than student status, and receives at least an apprentice’s minimum wage.

Employer groups known as “trailblazers” develop the apprentice standards which describe what an apprentice will do and the skills they will possess. The degrees are linked to professional standards identified by professional bodies or associations which make them relevant and credible to employers and apprentices. The Institute for Apprenticeships (2018) was created in April 2017 and is responsible for supporting and overseeing the development of apprenticeships.

Historically universities have been somewhat reluctant to become involved with lower-level vocational education and training (Richard 2012); however, a number of benefits for universities were identified (UUK 2016b):

- Degree apprenticeships play an important role in government policy.
- They provide a new income stream.
- DAs attract nontraditional students and widen participation.
- Encourage universities to diversify their full-time on-campus offering, e.g., blended learning, distance, online, and weekend.
- Degree apprentices will possess good skills and be attractive to employers.
- Links with employers can be developed.

In general, the degree apprenticeships are targeted at 18–19-year-olds providing an alternative route into higher education; however, they are also open to mature

students. Furthermore, they support people from disadvantaged backgrounds for whom the cost of studying for a conventional degree is costly with fees in England being up to £9250/year. The duration of study for a DA is 1–5 years, and degree apprentices are not eligible for student loans.

Two thirds of the training costs and course fees of the degree apprenticeship are funded by government with a maximum cap, and the employer pays the other third. The employers also pay the apprentice a wage. This route toward a degree is advantageous to apprentices because not only do they receive a wage during their study, but they also do not have to pay university course fees (UUK 2016c).

The degree apprenticeship applies to undergraduate degree level 4 (certificate of higher education, CertHE), level 5 (diploma of higher education, DipHE), level 6 (degree, e.g., BA), and level 7 (master's degree, e.g., MSc) (see Fig. 1).

In September 2015, the first places on degree apprenticeships were introduced in automotive engineering, banking relationship management, construction, and digital (UUK 2016b). It was estimated that at least 60 universities and higher education institutions were intending to provide degree apprenticeships in 2017–2018 (UUK 2017) raising the number to 7600 apprentices. The majority of apprentices are locally or regionally based indicating the relevance of providing training which is accessible and responsive to employers (UUK 2017).

In May 2017, an Apprenticeship Levy of 0.5% was introduced for employers which had salary costs of £3m+. Employers who contribute to the levy can then recoup apprenticeship training costs from the fund. For organizations whose salary costs are less than £3m, the government will pay up to 90% with the employer paying the additional 10%.

Assessment of the DA provision is provided by both HEFCE and Ofsted (Office for Standards in Education, Children's Services and Skills). Traditionally, universities have been assessed by HEFCE (Higher Education Funding Council for England), and the requirement for universities to respond to the demands by

Apprenticeship Name	Qualifications and Credit Framework (QCF) Level						Equivalent Education Level
	2	3	4	5	6	7	
Degree Apprenticeship							Bachelors or Masters Degree
Higher Apprenticeship							Foundation Degree and above
Advanced Apprenticeship							2 Advanced-level passes
Intermediate Apprenticeship							5 GCSE passes , grades A*-C

**Fig. 1** Levels of apprenticeship. (Adapted from Universities UK 2017)

a different body (Ofsted) which is responsible for schools and further education colleges, etc. has sometimes been onerous (Universities UK 2017). So, how do these degree apprenticeships relate to the third mission and national industrial strategy? The next section will provide the context.

---

## UK Government Industrial Strategy

For many years, the UK government adopted a laissez-faire approach to the economy which involved limited intervention based on a belief that markets were best left to manage themselves (Mill 1848). However, in 2016, a new Department for Business, Energy, and Industrial Strategy was established which recognized the role of government in supporting industries, thereby enhancing the economy. Reflecting this new role, the government published *Industrial Strategy: Building a Britain fit for the future* (HMG 2017) which, among other things, acknowledged the nation's world-renowned universities and the need to translate their research into products and services which would support future growth and industries.

Five foundations of productivity were described in the Industrial Strategy: ideas, people, infrastructure, business environment, and places. In addition, four grand challenges were identified: placing the United Kingdom at the head of the artificial intelligence and data economy; becoming a world leader in mobility for people, goods, and services; taking advantage of the movement toward clean energy; and using innovation to support the requirements of an aging society. Among the key policies were the establishment of a world-class technical education system; increased investment in science, technology, engineering, and math (STEM) skills; and establishing a National Retraining Scheme to support people in changing jobs for digital and construction (HMG 2017). To achieve all this, the Strategy stated:

“Business, academia, civil society and the government must engage together, bringing their expertise and entrepreneurial spirit, to drive us all towards success” (HMG 2017, p. 35).

The *Industrial Strategy* document described a number of examples of best practice including the University of Sheffield's Advanced Manufacturing Research Centre which will be discussed below.

---

## Sheffield City Region Science Innovation Audit

The United Kingdom's levels of productivity have stagnated since the great financial crisis of 2008 and have underperformed many other nations; furthermore, many regions of the United Kingdom including the Sheffield City Region have significantly lower levels of productivity than the Southeast of England (ONS 2018). This productivity deficit has been attributed to three main factors: structural readjustment arising from a movement away from manufacturing to activities with lower productivity, a skills shortage and relatively high levels of educational underachievement, and lower levels of R&D and limited innovation and entrepreneurship (BEIS 2016).

To address these challenges, the UK government stated, in 2015, its intention to conduct Science and Innovation Audits (SIA) to identify regional strengths, limitations, and the potential opportunities for raising economic growth. The Sheffield City Region Local Enterprise Partnership and Lancashire LEP formed a consortium to investigate their strengths in high-value engineering and especially the potential to capitalize on Industry 4.0, i.e., the smart factory which integrates artificial intelligence, manufacturing, and the Internet of Things. Advanced Manufacturing Innovation Districts at both ends of the corridor linking the two regions of Sheffield and Lancashire are being developed which create innovative ecosystems.

The SIA identified four main areas of strength: firstly, a strong higher education research base with growing income streams; secondly, public sector R&D facilities, e.g., the National Nuclear Laboratory at Sellafield and large teaching hospitals – Sheffield City Region are involved with the National Health System (NHS) Test Bed programs; thirdly, translational research centers which connect academia with regional and global companies, e.g., AMRC Group with Boeing, McLaren, Rolls-Royce, and Siemens; and, fourthly, private sector collaboration, e.g., Siemens funding research at the University of Sheffield. Building on these strengths, growth opportunities were identified particularly in the area of Industry 4.0 and the “Internet of things” which integrate digital technology and manufacturing to increase productivity and add value. Specific areas of market growth were identified in aerospace, nuclear energy, rail, and healthcare technology.

Drawing upon the opportunities identified, the Audit stated that:

The vision presented here is of a *Northern Advanced Manufacturing Innovation Corridor*, bringing existing, emerging and new science and innovation assets and programmes into collaboration with industry to drive productivity growth in advanced manufacturing and key linked sectors across the region to world-class levels. (BEIS 2016, p. 8)

To achieve this vision, the Audit conducted a gap analysis between the projected vision and the underlying skills and innovation base. It noted that general private sector R&D spend was low; the region’s translational research institutions needed to be expanded to support industry; and academic research needed to be connected more strongly with local industry. There was a particular concern around intermediate technical skills and attracting and retaining graduates (BEIS 2016).

To bridge these gaps, the SIA report recommended a number of steps: investment in science and innovation infrastructure, Northern innovation support, a Northern Powerhouse Productivity Academy in Lancashire, support for internationalization, and support for talent attraction, development, and retention. In addition, a pan-Northern skills program will be developed to support the needs of advanced manufacturing and complementary sectors particularly for the skills required to support Industry 4.0. This approach is designed to encourage young people and thereby provide a talent pipeline to replace an aging workforce and retain skills in the North.

The Science Innovation Audit observed that if the region led the United Kingdom in implementing Industry 4.0, this would increase economic growth and

productivity across the United Kingdom. In doing so it would contribute to the vision of a Northern Powerhouse: “. . . joining up the North’s great towns, cities and counties, pooling their strengths, and tackling major barriers to productivity to unleash the full economic potential of the North” (HM Treasury 2016). The area is being developed as the UK’s Advanced Manufacturing Innovation District (AMID) and is designed to encourage innovation, inward investment, networking, production, research, and technology transfer.

---

## **University of Sheffield’s Advanced Manufacturing Research Centre**

The University of Sheffield’s Advanced Manufacturing Research Centre with Boeing was founded in 2001 and has expanded to include two High Value Manufacturing Catapult centers (AMRC, Nuclear AMRC), Medical AMRC, and the AMRC Training Centre. These are located in two centers located on the Sheffield–Rotherham border, and they represent nearly £300m investment, have a turnover of £38m, and employ more than 600 staff. It is situated in the Sheffield City Region Enterprise Zone, and its mission is to assist manufacturers of all sizes to increase competitiveness through the use of advanced techniques, technologies, and processes (AMRC 2018). As a result, it has attracted a range of companies to locate there including a £110m Rolls-Royce Advanced Blade Casting Facility, a £50m manufacturing facility for McLaren supercars, and Boeing’s first manufacturing plant outside North America. As a result of its success, it has become a model for collaborative research between universities, academics, and industry which is being copied in Oman, South Korea, and the United States (BEIS 2016; AMRC 2018).

Researchers are organized into core groups including castings, composites, design and prototyping, integrated manufacturing, machining, Medical AMRC, metrology, National Metals Technology Centre, and structural testing. Researchers work on individual research projects for companies as well as collaborative research on generic research to support all members. The research supports a range of industrial sectors including aerospace, automotive and transport, energy, food and drink, healthcare, infrastructure, and marine.

Companies can access the AMRC research and facilities through different levels of membership: Tier 1 costs £200,000 in cash or kind, and Tier 2 costs £30,000 in cash or kind. More than 100 companies have become members, and the AMRC has a board containing industrial partners who have the opportunity to guide research direction.

---

## **The AMRC Training Centre**

The AMRC was established to provide a sustainable manufacturing ecosystem which includes skilled and knowledgeable employees to support operations. For this reason, the AMRC Training Centre was established to provide a range of

training options including apprenticeship, MBA, and doctorate levels. In addition, it delivers bespoke training courses and a series of open continuing professional development (CPD) courses. The training facilities are constructed as a real manufacturing environment reflecting the apprentices' workplaces.

---

## AMRC/University of Sheffield Degree Apprenticeships

Earlier in this chapter, we discussed the historical progression of apprenticeships from the medieval guilds to the recent development of degree apprenticeships in the United Kingdom. In particular, it was noted that, formerly, apprenticeships did not have the same status and respect which is found in other countries. To remedy this shortcoming, degree apprenticeships were developed by universities in liaison with employer groups known as "trailblazers" which identify and specify the apprentice standards that describe what an apprentice will do and the skills they will possess. Linking the degrees to professional standards identified by professional bodies makes them relevant and credible to employers and apprentices (University of Sheffield 2017).

All apprentices are employed full time over a period from 1 to 6 years and work at least 30 h/week. Training can be day-release or in blocks involving practical on-the-job training. University study is a key component of the degree apprenticeship program. For example, the level 7 Apprenticeship Standard for Postgraduate Engineer involves an industry-led specification for core knowledge and skills and core behaviors which are detailed below:

---

### Knowledge

The theoretical knowledge to solve problems in existing and emerging technologies, applying and developing analytical techniques

Understanding of business and commercial needs/constraints

Knowledge and understanding of own competencies capabilities and limitations and ability to work within these and highlight when work goes outside of these

Understanding of financial responsibilities and authorization processes

Understanding of technical sign-off responsibilities, who within their organization need to be involved in the sign-off of product/processes

---

### Skills

Safe working practices, an understanding of technical governance, and quality management

Compliance with legislation and codes but be able to seek improvements

Practical competence to deliver innovative products and services

Technical responsibility for complex engineering systems

Accountability for project(s)/program(s), finance, and personnel management

Management of trade-offs between technical and socioeconomic factors

In addition to the core knowledge and skills, postgraduate engineers need to possess core behaviors in the following areas:

- A. Knowledge and understanding
- B. Design and development of processes, systems, services, and products
- C. Responsibility, management, or leadership
- D. Communication and interpersonal skills
- E. Professional commitment

---

## Conclusion

This chapter has described how the Humboldt model of a university which focused on teaching and research has been complemented with the third mission of connecting with businesses and communities through knowledge transfer, valorization, engagement, and training. This delivery of private training programs by HEIs involves a wide and complex range of provision which is difficult to consider in detail. Moreover, definitions of training are not only narrow; they do not represent the broader considerations which are contained within the term “knowledge transfer.”

For the above reasons, the UK’s Industrial Strategy document was explored together with a Science Innovation Audit of Sheffield City Region. Regional strengths were identified in four main areas: a strong higher education research base, public sector R&D facilities, translational research centers, and private sector collaboration. In particular, the University of Sheffield’s Advanced Manufacturing Research Centre was presented as a model for economic regeneration for other regions and which is also being replicated in Oman, South Korea, and the United States.

A vision of a Northern Powerhouse across the north of England and a “Northern Advanced Manufacturing Innovation Corridor” connecting centers of manufacturing excellence were described together with the gaps which needed to be overcome before the vision could be achieved. One of these gaps was the need for a more skilled workforce which would lead to higher productivity. To address this, the government introduced a strategy to increase the reputation and number of apprentices which included the development of degree apprenticeships. The core knowledge, skills, and behaviors of these DAs are identified by industry representatives, and then the DAs are delivered by universities with apprentices also learning in the workplace.

The University of Sheffield, along with many other civic universities, grew out of the University Extension movement during the late nineteenth and early twentieth centuries, and it was established by funding from local businesses and communities. This close association between the university businesses and communities has continued ever since, and the impact of the University’s AMRC is having a substantial impact not only on the local Sheffield City Region but nationally and internationally. The powerful triangular synergy of the third mission which exists between teaching, research, and community should provide a sustainable platform for future economic growth and prosperity.

## Abstract

Learning in the workplace is crucial for vocational education and training. Every organization should support its employees to learn and to develop their competencies throughout their working life. Most jobs and workplaces have great potential to motivate individuals and let them become engaged in non-formal or informal learning activities. This potential is, however, not always fully used. Not all companies are prepared to offer everybody suitable training and learning opportunities, and some individuals lack the motivation to engage in learning. We

propose a conceptual model that explains the workers' and learners' motivation-engagement-learning process, discuss individuals' motivation and engagement as essential prerequisites of learning in organizations, and highlight individual and situational resources that foster motivation and engagement. We conclude that situational resources such as an organization's learning culture as well as the job design and the social situation at work might be even more important in motivating workers to engage in learning than individual learning needs and characteristics.

## Introduction

In times of economic and societal change, continuous learning in and through work plays an increasingly important role. Learning is essential for individuals to keep up with work's changing demands, remain employable, and develop their professional careers (Billett and Choy 2013; OECD 2017). It is important for organizations to stay successful in a competitive economic market (Høyrup 2010). Formal education and training – although an important prerequisite for learning in the workplace – cannot prepare individuals sufficiently for a dynamic work world, where tasks and work processes change rapidly (Kyndt et al. 2018). The motivation for and engagement in informal and non-formal learning therefore is essential for individuals and employers.

In this book chapter, we discuss learners' motivation and engagement in organizations and describe key factors that promote motivation and engagement in learning situations at work. Drawing from research on motivation, engagement, and learning in the workplace, we first outline the characteristics of non-formal and informal learning and explain how motivation and engagement in learning evolve. Second, we show how employers can design tasks and work environments that motivate their staffs to learn and engage in lifelong learning. Third, we highlight the learners' resources and characteristics that foster or hinder motivation, engagement, and learning in the workplace.

Our reflections are based on a conceptual model, which illustrates the motivation-engagement-learning process and its relation to situational and individual factors (Fig. 1). We presume that learning is an individual and social process and that motivation and engagement are prerequisites for successful learning. Motivational factors play a key role as an individual will only invest in learning and become engaged if he or she is motivated. Furthermore, we posit that an employee's motivation to learn always depends on situational and individual resources (Järvelä and Volet 2004). Situational resources include, for example, the organizational learning climate, job design, the team structures, and co-workers' support. Individual resources include, for example, an employee's self-esteem, optimism, self-efficacy,

**Fig. 1** Motivation, engagement, and learning: A conceptual model

resilience, hope (Saks and Gruman 2011; Xanthopoulou et al. 2009), positive core self-evaluations (Bono and Judge 2003), and the personal need for professional and individual development (Shalley et al. 2009).

## Learning at Work

*Learning* as part of work refers to lasting changes in an individual's behavior, cognitions, and emotions. It is an individual process that unfolds in the interaction between the task and social environment (Illeris 2011). Learning at work can occur spontaneously or can be initiated as a planned activity. Two forms of learning situations at work are distinguished: informal learning and non-formal learning. Both are important to advance organizational and individual competences.

### Informal Learning Situation

*Informal learning* is embedded in daily activities and work processes (Engeström 2001, 2011). It resembles a problem-solving process (Lohman 2000): The learner has to frame the context, react to triggers of the potential learning situation, examine problem-solving and learning strategies, produce alternative solutions, assess intended and unintended consequences, and evaluate what has been learned (Watkins and Marsick 1992). In informal learning situations, work activities can be used explicitly with the purpose to learn, for example, when an employee explains to a colleague how a job must be done or when someone explores various ways to best accomplish a task. Informal learning in the workplace is, however, often incidental (Kyndt et al. 2018). It emerges in situations that are unplanned and unforeseeable and that can interfere with productive work and organizational regulations (Cerasoli et al. 2018; Flynn et al. 2006). Some situations make informal learning more likely. Often, informal learning is triggered by disturbances that

hinder the action or lead to a distortion of the cognitive equilibration. Other situations that favor informal learning are handover situations, site walks, or catch-ups or cases in which something was going wrong and errors occurred (Rausch et al. 2017; Reich et al. 2017).

To make informal learning happen, not only the individual but also the co-workers need to understand and agree that the situation is a learning situation. Let's illustrate this with an example of a missed opportunity for learning: An experienced plumber needs to install a shower set together with an apprentice. It is a new product the plumber has never installed before, and he needs to read the assembly instructions. While he reads the instructions silently, the apprentice stands beside him and does nothing. They have no interaction; they do not talk. Neither the plumber nor the apprentice makes use of the unforeseen learning situation. The plumber is self-focused, staying in the mode of "let's get it done" instead of shifting into a learning mode: "Let's learn together how to do it." Why does the plumber not involve his apprentice in solving the problem? Why doesn't the apprentice intervene? He doesn't seem to be motivated to learn or become engaged in this learning situation. But is this explanation sufficient? And if so, what reasons might hinder his motivation and engagement?

## Non-formal Learning Situations

Non-formal learning situations are structured programs that are planned in advance, such as training courses or introductory programs for novice learners. The programs' education and training goals are set by the employers and reflect the organization's need to professionalize its employees (Janssens et al. 2017; Manuti et al. 2015; Wofford et al. 2013). Learning is organized and guided by a tutor, teacher, or trainer as described in the concept of cognitive apprenticeships (Collins et al. 1991). When preparing non-formal learning situations, a trainer must reflect on how to attract the learners' attention, inform them about the objectives, present the learning content, give feedback and advice, and evaluate the performance and knowledge transfer (Gagné and Medsker 1995). Important principles include the conceptualization of the whole task before executing the parts ("global before local"), the sequencing of tasks in terms of increasing complexity and difficulty, and an increasing task diversity in a variety of situations (Collins 2006). To support the learning process, the trainer/tutor serves as a model (she/he performs the task, while the learners observe), stimulates reflection (learners verbalize what they do and learn), and gives advice and support. Often, the transfer of competencies acquired in non-formal training programs is limited (Blume et al. 2010; Holton et al. 2000). Let's illustrate this support again with an example. New electrical installations need to be approved by external inspectors. The fewer errors an inspector finds, the better for the company. To reduce the number of complaints and save time, the company organizes a training course to teach its employees how they can test the electrical installations before the external inspection. During the training, the employees follow the trainer's instructions and use the test device. However, when going back to work

on the construction site, they do not apply what they have learned. The trainer attributes this poor transfer to the employees' missing motivation and engagement. But other explanations might also be possible, such as poor quality of instruction or employees' unwillingness to take on the additional responsibility.

---

## Motivation

*Motivation* refers to the question of why individuals act in a situation. It directs a learner's behavior toward particular learning goals and can lead to increased effort and engagement (Kanfer et al. 2017). Often, organizations attempt to motivate individuals with external rewards, sanctions, or imposed targets (Kuvaas et al. 2017). This attempt to motivate individuals externally often fails, and research shows that individuals are best motivated through internal motives. Intrinsic motivation develops if an individual's personal values are met or if he or she identifies with the work and significant others and can express him- or herself at work (Katz and Kahn 1978; Ryan and Deci 2000). Individuals that perceive themselves as competent and responsible at work are more likely to be intrinsically motivated (Dysvik and Kuvaas 2014). This perception is important because learning is an individual, constructive process in a social setting and relies on internal motivation (Illeris 2004).

The needs for autonomy, competence, and relatedness are universal (Deci and Ryan 2000). They vary to a lesser extent between individuals than more specific needs like the achievement motivation or the need for power (McClelland 1965). The latter motives are shaped by an individual's biography, his or her learning experiences, the subjective interpretation of these experiences, and the situation in the workplace. Ideally, learning experiences lead to the development of an interest in a specific topic through strengthening self-regulatory processes (Lent and Brown 2013).

A key process to motivate workers to learn is the definition of goals (Kanfer et al. 2017). Goals steer an individuals' attention and channel the investment of energy toward goal achievement (Locke and Latham 2002; Lunenburg 2011). As goals need to be internalized by an individual, the definition of goals is a crucial phase in the motivational process. Therefore, individual perceptions of the behavioral control, subjective norms, and attitudes determine which goals are set and adopted (Ajzen 2012). The behavioral control describes an individual's perception of his or her freedom and capabilities to act according to the organization's expectation. The pros and cons of pursuing a certain goal may lead to a redefinition of the goal. Goals can unfold their full power and induce learning only if an individual internalizes a goal and makes an externally set goal an "own goal." A person that accepts a goal unwillingly will be little motivated to achieve the goal and learn. Once goals are set, engagement processes describe how people strive to reach their goals. Successful goal striving and achievement depends on self-regulatory mechanisms, self-monitoring, self-evaluation, and the allocation of resources (Kanfer and Ackerman 1989). In sum, the development of intrinsic motivation relies on individual and workplace resources, which develop in the interaction of an individual's motives, values, characteristics, and situational characteristics (Kanfer et al. 2017).

---

## Engagement

Whereas motivation answers the question *why* specific behaviors are chosen, engagement refers to the active involvement in a task or activity and the question of “energy in action” (Grohmann et al. 2014). Motivation and engagement are related but distinct. A learner may be motivated but not actively engaged in a learning-oriented task. The motivation to learn is necessary but not sufficient for engagement in learning (Appleton et al. 2006).

Engagement at work refers to “a positive, fulfilling, work-related state of mind that is characterized by vigor, dedication, and absorption” (Schaufeli et al. 2002, p. 74). Vigorous workers feel energetic and are willing to put effort into their work. Dedicated employees are highly involved in their work and experience a sense of significance, enthusiasm, and challenge. Absorbed individuals are highly concentrated and engrossed in work, so time passes quickly (Bakker and Demerouti 2008). In learning-related contexts, definitions of engagement stress behavioral components, such as active participation in work or training activities (Billett 2004). Engaged learners participate in learning activities with their head, heart, and hands. They put mental effort into learning and monitoring their comprehension and want to go beyond the requirements (cognitive component). They show interest, enjoyment, and curiosity in the learning objective rather than feeling bored or anxious (emotional component). They are focused and persistent, sustain their goal-directed activities, and demonstrate a high physical learning effort rather than being passive recipients or trying to avoid the situation (behavioral component) (Kanfer et al. 2017; Schaufeli et al. 2002).

Like motivation, engagement in learning activities emerges in the interaction of situational (social, organizational, and task features) and individual factors (Billett 2001). Engagement and its cognitive, emotional, and behavioral components therefore vary in intensity, duration, and stability. It might change from one day to another or between persons, tasks, and situations (Fuller and Unwin 2004; Sonnentag 2017). In general, positive learning and work outcomes are achieved if engagement is high but balanced, so it does not overly deplete individual resources (Bakker et al. 2004).

---

## Situational Resources

Situational resources play a crucial role in motivating apprentices, organizational newcomers, and more experienced employees to learn and become engaged in learning activities in the workplace (Billett and Choy 2013). Situational resources refer to physical, mental, social, or organizational aspects of work that serve to achieve work goals, help meet and reduce job demands, and stimulate learning and personal growth (Bakker and Demerouti 2007). Research has shown that high levels of situational resources are positively related to learning (De Witte et al. 2007), work engagement (Schaufeli et al. 2009), and job satisfaction (Keller and Semmer 2013). The availability of resources affects motivational and engagement processes, and in turn, being motivated and engaged helps workers create additional resources in the long run (Xanthopoulou et al. 2009).

A challenging, empowering, and supportive work situation that responds to an individual's need for autonomy, competence, and relatedness is an important precondition for motivation and engagement at work (Deci and Ryan 2000; Messmann and Mulder 2015). Most important for learning are the cooperation with and learning from other members of the community, motivating tasks, and a learning-conducive organizational culture (Billett 2004; Hackman 1980; Nikolova et al. 2016). Organizational and work-related factors can hinder or foster learning at work (Kyndt et al. 2018). All these factors can be shaped by an organization, setting the stage for the motivation and engagement to learn to occur (Tynjälä 2008).

In the following sections, we will discuss organizations' strategies and means to foster their staffs' motivation and engagement in learning activities, focusing on the learning culture, job design, and social relations and exchange processes with colleagues, trainers, and supervisors.

## The Learning Culture

The organizational learning culture is the backdrop against which individuals' motivation and engagement emerge and which makes learning possible and effective. An organization that acknowledges learning as a guiding principle of its activities will more likely facilitate and support the learning of all its employees. An organizational culture dedicated to learning defines learning-oriented goals for all employees and for the organization as a whole. It defines how goals can be achieved and allocates adequate resources to support workers to engage actively in learning. It transfers the power from the organization to the employees and allows them to create, shape, and change their realities (Senge 1990). Organizations with a learning-conducive culture enable the direct transfer of knowledge across organizational boundaries (Remedios and Boreham 2004) and foster lifelong learning through high job complexity learning from mistakes, dialogue, inquiry (Kyndt et al. 2016, 2018), team learning, and empowerment (Egan et al. 2004; Gil and Mataveli 2017; Joo and Lim 2009; Marsick and Watkins 2003).

To establish and maintain a learning-oriented organizational culture, leaders and supervisors need to determine how and to what extent the current organizational culture provides or limits opportunities to engage in learning. This evaluation includes reflecting on, for example, the organization's overall learning goals, the employees' learning needs, the expectation of workers' continuous competence development, the knowledge transfer between learning locations, and the job design (Noe et al. 2014; Sonnentag 2017).

The first crucial phase regarding motivation and engagement is the time of onboarding and organizational socialization, when newcomers learn about and adapt to norms, values, and rules of a professional domain and of the organization. It is also the time when organizational learning and engagement expectations at work are communicated (Bauer and Erdogan 2011; Saks and Gruman 2012). Positive experiences in the first weeks and months in a new job and organization are essential for workers' social integration and commitment to the organization (Nägele and

Neuenschwander 2014). Therefore, employers should reflect on the adequate way to structure and accompany the first phase after organizational entry. They have to think about, for example, whether they want to follow a more institutional or a more individual socialization approach and how they can build on new employees' prior knowledge and work experiences (Jones 1986; Van Maanen and Schein 1979). A clear and unambiguous communication helps an individual orient herself or himself in the organization with respect to learning and the expected level of engagement.

## The Job Design

The job design concerns how work is structured, organized, experienced, and enacted (Grant et al. 2010). Well-designed jobs have the potential to motivate people and allow them to become engaged in learning (Wielenga-Meijer et al. 2010). If core job dimensions such as skill variety, task identity, task significance, autonomy, and feedback regarding the task are well-designed, people feel responsible for the outcomes of their work. Having a sense of responsibility makes work meaningful, satisfying, and motivating (Hackman and Oldham 1975; Oldham and Hackman 2010). Well-designed jobs can motivate employees to learn if they have the opportunity to engage in complete tasks, including elements of planning, preparing, completing, and evaluating the task (Dehnbostel and Schröder 2017; Frese and Zapf 1994). Tasks must be complex in the sense that they demand employees to process information and they must offer employees a chance to apply various strategies to accomplish them successfully (Hirschmann and Mulder 2018). Additionally, a job design that fosters motivation and engagements implies variation at the level of the job itself, including temporary job changes, cross-trainings involving employees in extra-role activities, and job enrichment through additional responsibilities and functions (Cunningham and Hillier 2013).

In sum, well-designed jobs allow workers to select their own goals (Kanfer et al. 2017; Locke and Latham 2002), self-regulate their learning, and shape their own learning pathways (Bandura 1986). It offers ample opportunities for learning, competence development, and recognition from significant others, and it enables workers to form a vocational identity and design a meaningful career (Stalder and Nägele 2015).

## The Colleagues, Trainers, and Supervisors

Most learning is embedded in and influenced by the organization's social structures, the work team's composition, and opportunities to network and interact with more experienced colleagues, tutors, supervisors, and mentors (Eraut 2011; Kyndt et al. 2018). To motivate workers to engage in learning activities, colleagues, trainers, and supervisors can use a vast range of behaviors and activities, for example, "providing feedback, role-playing, observing, listening, asking questions (the 'what do you

think and why' investigative questions), talking things through (explaining and seeking understanding), walking through things step by step ('you drive,' I'll take the passenger seat), seeking others for knowledge or additional insights as needed, sharing materials and resources, using examples, removing obstacles, broadening perspectives, being a role model, and focusing on the big picture" (Ellinger and Cseh 2007, pp. 443–444).

Supervisors and teams facilitate engagement and learning by making it possible to explore ideas and processes, discuss differences, and resolve these differences with the aim to co-construct a new and shared understanding of the situation (Lehmann-Willenbrock 2017). The co-construction and development of a shared understanding of the task depend on complex interpersonal relations and require dialogue and exchange (Filliettaz et al. 2015). Leadership, relationships, and relationship dynamics become a central element of learning at work (Cunningham and Hillier 2013). The availability and willingness of trainers, co-workers, and supervisors to share information and provide precise, constructive, and helpful feedback and to offer adequate guidance and support is therefore essential to stimulate motivation, engagement, and learning (Billett 2000; Kyndt et al. 2016).

---

## Individual Resources

Individual resources such as the learner's cognitive abilities, educational level, personality, attitudes toward learning, and proactivity play an essential role in the motivation-engagement process at work. Of importance is how people evaluate their own effectiveness, capability, and worthiness (Bono and Judge 2003). This self-evaluation co-determines whether and how strongly individuals are motivated to engage in learning activities. It affects self-regulation strategies, which are grounded in an individual's belief he or she can have an impact on the environment and the ability to control it through its own activities (Xanthopoulou et al. 2009). Self-evaluations rely on personality traits. A positive self-evaluation is more likely if an individual is extroverted (assertive and active), open to experiences and others' ideas, agreeability, and achievement striving (a facet of being conscientious) (Major et al. 2006). Neurotic and anxious individuals evaluate themselves less positively, which hinders their motivation and engagement (Major et al. 2006; Webster and Martocchio 1993). It has often been argued that personality traits are rather fixed. This "fact" is, however, increasingly challenged, and it has been shown that an individual's personality can change over time through experiences and interventions like an apprenticeship training (Roberts et al. 2017; Schallberger et al. 1984; Semmer and Schallberger 1996). This challenge is in line with research on identity development, which includes changes in personality (Collin 2009; Field 2011).

Personality factors are often overruled by, for example, goal-setting processes, and goal orientation seems to be a more proximal predictor of motivation than personality traits (Preenen et al. 2012; Steinmayr et al. 2011; Zweig and Webster 2004). Once goals are set, they lead to higher performance through self-affirmatory processes (Schwinger and Otterpohl 2017). Individual factors such as personality,

attitudes toward learning, proactivity, self-efficacy (Kyndt et al. 2016, 2018), and self-awareness about the situation and the available support can foster motivation and engagement and lead to an increased chance that learning opportunities are recognized and used (Marsick and Watkins 2001). But the same individual factors are determined by workplace factors. Employers should be aware of this and take it into account when designing the workplace.

Consequently, self-evaluations depend on situational, workplace-related factors and learning experiences. Learning experiences have an effect on an individual's self-efficacy and self-esteem (Lent et al. 2002), his or her optimism and hope (Saks and Gruman 2011; Xanthopoulou et al. 2009), and core self-evaluations (Bono and Judge 2003). Learning experiences form interests and nourish the need for development (Shalley et al. 2009).

---

## Conclusion

Motivation and engagement are essential for learning because learning is an active process in a demanding environment, which is structured by the tasks, immediate social environment, and organization (Illeris 2011). In this setting, individuals need to be offered non-formal and informal learning situations that allow them to learn new skills, behaviors, and attitudes to develop professional and personal competencies. Individuals are forced to shape their work situations, make use of learning opportunities, and create their own learning paths. Therefore, individual resources, such as a positive self-evaluation or a proactive behavior, are helpful, along with the ability to reflect on one's motivation and engagement to learn. But it would be too simple to attribute motivation and engagement uniquely and primarily to the individual. Individuals have a basic need for autonomy, competence, and relatedness (Deci and Ryan 2000), which form a solid fundament for lifelong learning and development. But too often the fulfillment of basic needs is hindered by organizational factors, and the lack of situational resources hampers employees' motivation and engagement in learning. Intrinsic motivation and engagement in learning will develop best if an organization emphasizes learning as a core organizational goal, learners are supported and guided, and they have the opportunity for self-determination and self-reflection.

Organizational strategies help build an environment that helps individuals become motivated and engaged. These organizational strategies and measures include a positive and open learning culture, thoughtful socialization process, job design that allows for learning at work, and supportive social environment. Such measures and strategies are essential not only for individual learning processes but also for a productive and innovative organization.

We argue that organizational resources might have an even stronger effect on learners' motivation and engagement than individual resources and that an individual's personality and self-evaluation are significantly shaped by the environment. Therefore, in the first example given at the beginning of the chapter, it is neither the plumber's nor the apprentice's sole fault that they missed the opportunity to make

use of the incidental learning situation. The missed learning opportunity might also be due to organizational factors, such as an organization that does not stress and communicate that learning at work is important for everybody in every situation. Also, the second example, in which almost no transfer of learning from the training to the workplace occurred, needs to be analyzed in the context of the organizational learning culture. Surely, non-formal and informal learning rely on individuals' motivation and engagement. Learning at work can be motivating in itself if individuals work on real tasks. But this is not enough. The interplay of people, tasks, technology, and the organizational learning culture motivates individuals to learn and helps them become and stay engaged in learning. To help an individual want to keep his or her knowledge and skills up to date experiment, ask for feedback, and self-reflect on actions and learning activities, this interplay of organizational and individual psychological factors must be respected.

### Abstract

The aim of this chapter is to provide a critical overview of relevant aspects related to Technical and Vocational Education and Training (TVET) in small- and medium-sized enterprises (SMEs). In the first section, the authors conceptualize the key terms associated with TVET in SMEs. The second section provides an insight into TVET prevalence, participation rates, and investment in the SME sector of various countries. The third section of the chapter addresses issues and challenges that are critical to TVET in SMEs, such as formal versus informal training, generalist versus specialist training, and supporting finance sources in industrially developed and developing economies, as well as countries in transition. The chapter concludes by exploring the future of TVET in an SME context, as impacted by recent trends in globalization, technological developments, robotization, social media, and the increasing personalization of learning.

**Introduction**

The origins of the term “Technical and Vocational Education and Training” (TVET), in its various evolutionary forms, can be traced back two and a half centuries, as a reaction to the elitism inherent in the traditional, church-dominated, English education system (Simon 1960) and to the emergence of the first industrial nation (Matlay 1991). A great deal has been written about the English education system, its origins, development, and structure (see, e.g., Evans 1975). It is beyond the scope of this chapter to provide a comprehensive overview and critique of the evolution of the English system of education. Nevertheless, its impact upon the shaping and the progress of national and international education should not be understated (Evetts 1973). Briefly, several distinct stages of educational development (cf. Silver (2007)) can be identified: (i) Anglo-Saxon beginnings (cc. 600–1066); (ii) early medieval, as a function of the church (1066–1300); medieval, within and outside the church (1300–1780); industrial England (1780–1945); and, educational growth and expansion (1945–present). The inherent elitism of, and class influence on, the early English liberal education and its structure as well as the eventual reaction against it has influenced considerably the long-term development of alternative, as well as complementary, educational movements (O’Day 1982; Sharpe 1997). Importantly, however, it was the beginning of the Industrial Revolution and the rapid growth of the uneducated and largely unskilled working class (see Lawson and Silver 1973) that precipitated the emergence of vocationalism, as a productive and skill generating alternative to religious and liberal education (Matlay 1992; Wrigley 1993).

As countries across Europe and, later on, elsewhere began embracing industrialization, the economic imperative highlighted a growing need for “modern,” skill- and knowledge-forming, practice-oriented, and vocational education. Throughout the nineteenth century, modern public schools in England, Germany, France, and Italy offered postprimary vocational education in competition with traditional liberal education, aimed largely to fulfill the growing demand for both educated labor and the needs of middle-class children, aspiring to gain access to managerial positions in industry and commerce (Craig 1981). In addition, traditional European elites also perceived vocationally-oriented education as the route to modern, high-status professional positions (Kaebler 1981). Given the growing demand for vocational studies and related certification, it is not surprising that this sector of the educational system grew at a relatively rapid rate. Unfortunately, however, as it is the case in other sectors of a nation’s socioeconomic and cultural infrastructure, expansion led invariably to fragmentation and unequal private/public support as well as conceptual and contextual confusion.

In terms of TVET for smaller businesses (as opposed to large businesses and corporations), its emergence, development, and focus on the actual or perceived needs of small- and medium-sized enterprise (SME) owner/managers and their workforce are relatively recent. Historically, TVET in, and for, SMEs only reached the agendas of policy makers and educational leaders during an economically challenging, post-World War II, period. Due to the “oil shocks” and consequent cycles of recessionary “boom and bust” economic conditions, large-scale industrial restructuring acted to diminish the overall importance of large corporations and, at the same time, accentuated the emergent importance and growing contribution of the SME sector to the industrial health and economic success of nations. In the United Kingdom (UK), for example, the Bolton Report (1971) highlighted serious concerns in relation to the survival of small businesses in this country (Matlay 1993). It provides a guideline SME definition based on the number of employees (including owner/managers), for three size ranges within this bracket: (i) micro businesses, with up to 9 employees; (ii) small businesses, employing between 10 and 49 individuals; and (iii) medium-sized enterprises, with a payroll of between 50 and 249 employees. The other two, complementary definitions, based on turnover levels and value of assets, could not be used to any significant effect due to the lack of reliable and transparent data (Matlay 1996). A similar definition has been recommended by the European Commission in 1996 and in 2003, although it has since been adjusted a number of times (see EC 2003). Unfortunately, however, SME definitions in North America, Australasia, China, and India differ significantly and are considerably larger in number of employees, turnover levels, and value of assets, as reflected in published accounts (Matlay 2002).

The Bolton Committee (1971) also made, for the first time, reference to a demand for Vocational Education and Training (VET), in order to satisfy the specific requirements of small business owner/managers and their workforce (Matlay 1996). The Wilson Committee (1979) confirmed the upward trend in the number of SMEs in the UK and called for more and better financial education for owner/managers. There followed a long period of numerical expansion of the SME sector, which continues until the present day, emphasizing the growing need for relevant TVET supply to satisfy the varied needs of a large population of owner/managers and their workforce (Hussain and Matlay 2018).

The rest of the chapter is structured as follows: in the next section, the authors conceptualize the key terminology associated with TVET in general and small- and medium-sized enterprises (SMEs) in particular; in the following section, they provide an insight into TVET prevalence, participation rates, and investment in the SME sectors of various countries; this is followed by a critical evaluation of issues and challenges that are vitally important to TVET provision in SMEs, such as formal versus informal training, generalist versus specialist training, and supporting finance sources in industrially developed and developing economies, as well as countries in transition; the chapter concludes with an exploration of the future of TVET in an SME context, as impacted by recent trends in globalization, technological developments, robotization, social media, and the increasing personalization of learning.

## Key Terms Associated with TVET in SMEs

There are a small number of definitional, conceptual, and contextual terms that are considered crucial to the theory and practice of TVET in SMEs. Perhaps the most important of these is the definition of the term SME. The Organisation for Economic Co-operation and Development (OECD) variously estimates that SMEs represent 99.8% of all economically active units in the world, inclusive of industrially developed and developing countries as well as nations in transition (OECD-UNIDO 2004; OECD 2010). In his overview of statistical data relevant to TVET, Matlay (2017) claims that “official” figures represent only a conservative estimate of the world SME population, which is based on value-added tax (VAT) with a compulsory relatively high threshold. Therefore, a significant proportion of self-employed entrepreneurs and micro businesses are not included in the official statistics. In addition, none of the businesses operating in the informal sector of an economy are taken into count. Thus, it can be safely assumed that official statistics under represent the smaller businesses, to the advantage of medium-sized firms and large organizations. This size of businesses employs over 63% of a nation’s workforce and contributes to about 55% of their total annual Gross National Product (GDP).

Given their importance to local, regional, and national economic development, one would expect a measure of standardization in the SME definition and relevant official statistics. Unfortunately, however, this is not always the case. Generally speaking, the term “SMEs” has emerged, in recent years, to represent a convenient “umbrella” concept which incorporates, under such a vague description, a plethora of “smaller firms” operating in a diversity of settings and contexts. Their overall socioeconomic, cultural, and business impact is manipulated by the media and economic observers, in contrast to “larger businesses,” ensuing in an almost useless comparison. Nevertheless, statistical manipulation acts in favor of “larger businesses” in terms of resource allocation and politically beneficial representation. Importantly, however, apart from media purposes and related official rhetoric, it does not appear to satisfy any of the main stakeholders that profess to have a vested interest in smaller businesses (Matlay 2011). Many attempts have been made to construct a formal, universally accepted, standard definition of what represents SMEs. Definitional difficulties are important not only for academics and researchers but also to governments and their representatives, as well as support agencies, economic observers, and employer organizations. The International Labour Organization (ILO) has collected over 50 definitions that purported to relate to the SME concept as used by relevant stake holders (ILO 2006, 2015), to which they added a definition specifically for training purposes (ILO 2013). Most stakeholders, however, bypass conceptual difficulties by purposefully adopting their own “working definition,” one that better suits their stated aims and objectives (Matlay 2000). This widely used strategy further complicates an already acrimonious and long disputed conceptual argument among stakeholders, without adding anything of substance to the generalization of research results or the clarity of related outcomes (Matlay 2002).

There are a number of direct and indirect links between TVET and the performance of SMEs. Searching for an acceptable, complete, and all-encompassing definition of TVET in SMEs has proved a time-consuming and ultimately futile exercise, mostly because of conceptual and contextual difficulties, as well as the heterogeneity of this economic sector. The authors of this chapter would prefer the widest and most encompassing definition and therefore have settled on defining TVET in SMEs as postprimary education and training that acts to increase an individual's productive work (both economic and social) in SMEs and which motivates him or her to undertake continuous, lifelong learning and personal development. This convergent definition (as opposed to its negative opposite, the divergent approach) encompasses action, responsibility, and benefits across the widest spectrum of stakeholders, from the individual learner to the society as a whole (see, Matlay 1976–2017). Despite the entrenched dichotomy between SME conceptual universality and standardization, there are a number of key terms that can be associated with TVET in SMEs. Although some aspects of these conceptual terms overlap in practice, it is worth differentiating among them for the benefit of clarity and thoroughness of the overview. A brief overview of these terms, in the context of SMEs, is outlined below (for a more detailed overview, please see Matlay 2000):

- *Vocational Education (VE)* ~ appears to represent one of the earliest attempts to distinguish between liberal and vocational, postprimary education, on offer in secondary, tertiary, and specialized institutions.
  - *Continuing Vocational Education (CVE)* ~ involving a planned route of increasing the vocational education of employees, throughout their career.
  - *Continuing Personal Development (CPD)* ~ (not to be confused with continuing professional development) generally applied to family members involved in small businesses and/or manager in managerial small firms.
- *Vocational Training (VT)* ~ is usually applied to on-site provision, such as apprenticeships, both traditional and new, and shorter training schemes.
- *Vocational Education and Training (VET)* ~ involves a combination of the above two offerings, traditionally including a combination of on-site and off-site and formal and informal provision, containing both theory and practice.
- *Training* ~ is a widely used, general label, incorporating specific efforts, schemes, courses, and related expenditure and used to increase skills, productivity, motivation, and competencies in SMEs.
- *The Learning Small Business* ~ is a contextual concept designating smaller firms that encourage learning and related culture, among both managers and employees.
  - *Lifelong Learning* ~ is aimed to increase attitudes, motivation, and a willingness to learn throughout an individual's life, regardless of age and position.
  - *Lifelong Training* ~ is aimed to increase attitudes, motivation, and a willingness to train throughout an employee's working life, regardless of function or position.
- *Human Resource Management (HRM)* ~ generally considered an organizational function and position, specifically designated to recruit and manage a firm's employees, inclusive of employee termination or early/old age retirement.

- *Human Resource Development (HRD)* ~ represents an organizational function and position, specifically designated for the development of talented, promising, or average employees.
  - *Management Learning* ~ is aimed to increase attitudes, motivation, and willingness to learn in the context of managerial functions and/or positions.
  - *Management Training* ~ is aimed to increase attitudes, motivation and, a willingness to train in the context of operational or sales/marketing function or position.

In the last two decades or so, there has been an important new addition to TVET in SMEs, one that has been variously described as a “game changer” and a “quantum leap” in the development of this overused umbrella label, namely, the emergence and rapid growth of Enterprise and Entrepreneurship Education (E&EE). Following on from the tremendous growth in, and recognition of, entrepreneurship as the panacea to declining economic activity and prevailing recessionary condition, E&EE aims to increase both the number and the quality of entrepreneurs entering an economy and engaging in new venture creation (Matlay 2005). Typically, E&EE provision is mostly offered by Higher Education Institutes (HEIs), although recently, secondary schools and private providers are also offering education and training for new and established entrepreneurs (Matlay 2006). There are two distinct components of E&EE, both of which are relevant to TVET provision in SMEs:

- *Enterprise Education and Training* focuses specifically upon educating and training individuals to develop their potential and capabilities and enhance their entrepreneurial abilities and skills.
- *Entrepreneurship Education and Training* focuses more widely upon educating individuals in the processes and practicalities of new venture creation, its management, and development.

It should be noted, however, that as a convenient and expedient shortcut, most academics, researchers, and commentators, as well as government officials and representatives, tend to use the term entrepreneurship education to incorporate or cover all aspects of TVET relating to E&ET. Individually and cumulatively, these key terms cover the main aspects of TVET in an SME context. In the next section of this chapter, the authors provide an insight into TVET prevalence, participation rates, and related investment in the SME sector of various countries.

---

## **TVET Prevalence, Participation Rates, and Related Investment**

The extant literature suggests that, overall, SMEs invest less in formal training and development compared to larger organizations (Nolan 2017). Unlike the latter, “SMEs are unlikely to have a dedicated HRD, or even HR, specialist (. . .) Furthermore, few SMEs have a specific HRD budget” (Short and Grey 2017, p. 3). Nolan and Garavan (2016) state that SMEs prefer informal approaches to HRD: “The

evidence suggests a strong belief on the part of SME owner-managers and employees that informal, on-the-job, experiential workplace methods are the most critical to job competence development due to their context-specific nature” (p. 92). Nolan (2017) mentions as a reason for SMEs’ lack of willingness to invest time and money in formal training and development including e-learning: the high opportunity cost of utilizing formal methods. Offering evidence from Australian SMEs, Barrett (2015) concluded that they “did engage workers in formal training when necessary but it was put in the context of the idiosyncratic approach of the owner-manager and the day-to-day needs of the firm” (p. . . .). Despite the generally lower investment in training among SMEs, however, Bishop (2015) showed how “corporatist” systems (e.g., those in Germanic and Scandinavian countries) are often more supportive to skills development in small companies than the “liberal, free market” systems found elsewhere (e.g., USA, UK, and Canada).

Nevertheless, the relatively low investment in formal training and development interventions by SMEs is echoed in a large-scale study among 48,000 firms across 99 developing countries, relying heavily on the manufacturing sector (78%). Almeida and Aterido (2015) analyzed the relationship between company size and investment in job training by employers and found a large and positive correlation. Specifically, small (11–50 permanent employees), medium (50–250), and large firms (over 250) invested 13, 30, and 40 percentage points more in formal training than did micro firms (under 10 employees). On average, 39% of companies provided their employees with job training. Countries in South Asia, the Middle East, and Africa invested the least, whereas at least 70% of companies in Slovakia, Chile, and Thailand offered their workforce training. Compared to firms that offered training, those that did not were smaller, more closed, younger, operating in less capital-intensive sectors, having lower labor productivity, paying lower wages, with a less skilled workforce and lower investments in technology.

According to the Organisation for Economic Cooperation and Development (OECD 2015), micro firms and SMEs “invest a larger proportion of their value added in organisational and managerial capabilities than large firms” (p. . . .). For 22 developed countries all over the world investigated in 2011–2012, it is estimated that 6–7% of value added was invested in training, on-the-job training accounted for 2.4% by itself. For micro firms the percentage was even higher than for SMEs. Over 50% of all investment in organizational capabilities among SMEs is spent on managers, compared to 45% in large firms, which is surprising in view of what Georgiadis and Pitelis (2016) found among SMEs in the UK accommodation and food service sector. According to their data, “employees’ training had a stronger positive impact on firms’ labour productivity and profitability than that of managers” (p. . . .). Mostly in line with Bishop’s analysis mentioned above, SMEs invested in organizational capital and on-the-job training most in Sweden, Denmark, and France (OECD 2015).

In the 22 developed countries considered, in 2011–2012 on average 61% of employees participated in formal and/or on-the-job training at least once (OECD 2015). There were however substantial differences in the proportion of employees trained (34% in Italy versus 77% in Finland) as well as in how much was invested.

Data showed that in Denmark, Korea, and Australia, the highest percentages of investment respective to total value added were found: for formal (1.8%), on-the-job (2.8%), and both types of training together (6.3%), respectively. In line with larger companies, SMEs in the service sectors invest a higher share of value added in training (6.3% on average) than do those in manufacturing (4.2% on average) (OECD 2015).

A number of country-specific studies on the prevalence of TVET in SMEs have been conducted in countries that were not included in the abovementioned OECD data. Damoah et al. (2016) investigated 85 SMEs in Accra, Ghana, and found that the internal resource capacity of a company has considerable impact on participation in formal training programs. Especially larger SMEs with younger owner/managers were therefore prone to investing more in TVET. A study among 533 SMEs in China (Bai et al. 2016) looked at the motives, intentions and actions of their CEOs in offering their employees training. The CEOs were focused more on the benefits of training for the firm than on those for their employees. External constraints contributed significantly to the lack of training provision, making SMEs in China reluctant to provide formal employee training at all. A Vietnamese longitudinal study (Duy et al. 2015) calculated the impact of SMEs investing in off-the-job training on their performance. The results showed that training had a positive impact on firms' return-on-assets (ROA) in the short term. However, there was no impact of training investment on firm revenue and profit either in the short term or after 1–2 years, which might explain why SMEs are reluctant to offer formal training and see a better trade-off with informal learning approaches. A comparative study conducted among family-managed SMEs and large business units in India (Bhattacharyya 2016), for instance, applauded the former's best practices in talent development by way of mentoring, cross-skilling, and fostering employee engagement. And Jeong et al. (2018) explored informal learning in South Korean knowledge-intensive SMEs, taking into account its embeddedness in a culturally sensitive context. The latter encompasses "a family-like atmosphere, one employee – multiple tasks, passive investment in employees, and the absence of systems" (p. . . .). The authors conclude that employee learning in South Korean SMEs hinged entirely on informal learning, focused on immediate application as well as trial and error and was strongly relationship/client needs-based, which is likely to be the case for SMEs in other countries around the world just as much.

---

## Issues and Challenges Critical to TVET in SMEs

There are a number of important issues and challenges that affect the provision, as well as the outcomes of TVET in an SME context. Interestingly, the majority of these reflect ongoing conceptual and contextual difficulties, most of which are yet to be resolved to the satisfaction of the any of the main stakeholders who profess interest, and involvement, in TVET in SMEs. The authors provide below a brief generalized overview of the main difficulties and challenges associated with educating and training entrepreneurs, owner/managers, and individuals employed in their firms:

- *Definitional diversity* ~ this chapter links together three main yet interrelated topics: TVET, entrepreneurship, and SMEs. Within each of these important topics, there exists a diversity of definitional difficulties, disagreements, and variations.
- *Conceptual diversity* ~ inherent in all three topics and drives a divergent set of stakeholder' interests, approaches, and agendas. It has created a paradox, which ultimately acts as a strong barrier to the supply and demand for TVET.
- *Contextual diversity* ~ intrinsic to the SME sector and symptomatic of the heterogeneity of business sizes, variety of economic activities, diversity of locations, and the assortment of product and service outputs.

Although for the purpose of this chapter, these issues are simplified and forcibly dichotomized, in practice they overlap considerably and, in the process, complicate as well as amplify an already deeply entrenched, highly dogmatic, and long-standing TVET debate. Importantly, however, in order to resolve, or at least mitigate, some of the many issues affecting the provision, efficiency, and impact of TVET in SMEs, there needs to be a clarity and transparency in relation to the meaning of the terminology and typology in existence, so far.

Definitional diversity invariably results in confusion among TVET providers (i.e., supply side), their SME-based target market (i.e., demand side) and government agencies and their representatives (i.e., funding and control side). Matlay (1993, 1996, 1998, 2002) has repeatedly highlighted the existence of a “Paradox of Training” in the SME sector of the UK economy. This misalignment between training providers' preferences and owner/managers' positive and very positive attitudes to TVET accounted for over 90% being in favor but fewer than 10% of them providing any training for their workforce. The paradox holds true to the whole SME sector and across the full range of definitional, conceptual, and contextual diversity. Similarly, the marginally higher TVET uptake reported by some of the larger of these small businesses and all medium-sized enterprises can be attributed almost exclusively to compulsory and regulated provision, such as Health and Safety training.

Similarly, conceptual diversity seems to grow and get worse each year, caused largely by government and funder inspired “newest/latest terminology/trend,” combined with suppliers “rebranding” and/or “repackaging” old and, in some cases, even obsolete courses in order to comply with an artificially created “training demand.” In turn, academics and researchers, driven by their universities' obsession with “third sector funding,” tend to comply and reinforce conceptual trends, such as, among many others, “knowledge management” (KM) and “talent management” (TM). Both KM and TM incorporate major TVET elements and represent important aspects of strategic SME recruitment, training, and HRM/HRD. In terms of financing TVET, due to the growing diversity of new trends, it has become increasingly difficult to locate, evaluate, and establish the efficiency and/or impact of a wide range of shorter term training initiatives. This also impacts upon SME owner/managers' ability to match their specific TVET needs to the available sources of training and related funding subsidies.

In turn, contextual diversity, which relates mostly to the inherent heterogeneity of the SME sector of an economy, also acts as a major barrier to TVET uptake and successful implementation. First, the sector is dominated by the self-employed owner and micro business owner/manager: estimates variously place their numbers between 77% and 86% of the total SME population. Second, the variety of products manufactured, as well as of services on offer in SMEs, range considerably across the sector, mirroring the magnitude of niche markets its services locally, nationally, regionally, and globally. Third, the variety of locations (e.g., inner city, outer city, urban, and rural) can influence significantly the quantity, quality, and type of TVET needs and availability, as well as the buying power of owner/managers. Contextual diversity also affects proximity of, and access to, TVET. This is particularly acute in the case of old fashioned, rural owner/managers and those who lag behind in terms of the adoption or implementation of Information and Communication Technologies (ICTs). There appears to exist a resistance to acquiring and using the latest technologies across the internal functions and operational delimitations of both urban and rural SMEs.

Linked to the above computing and ICT challenges, several recent trends might affect TVET in SMEs in the near future. On the one hand, globalization and robotization (Frey and Osborne 2013) impact jobs in SMEs perhaps more so than those in large companies, which puts a premium on the importance of SMEs engaging in formal and (especially) informal learning. It is a strength of SMEs that they are, almost by nature, more agile than major corporations and other large organizations although, as hinted at above, much depends on the willingness and ability of the owner/manager to engage in renewal. On the other hand, technological developments including the widespread use of social media are enabling the increased personalization of learning (Redecker and Punie 2013). Work-related learning, even together with other people, is now possible almost at all times, in all places and increasingly customized to every individual. The informal nature of such personalized learning makes it likely an attractive proposition for SMEs, offering as it does a viable alternative for expensive, formal off-site training programs.

---

## Concluding Remarks

In this chapter, the authors provide a critical overview of relevant aspects related to TVET in SMEs. It emerges that the rapid growth and expansion of TVET offered to SMEs has had a mixed impact upon the SME sector: both the theory and the practice have moved on from an initial attempt to conscribe large firm training and development support to relevant and successful smaller business solutions. Although some of the old-fashioned views still persist amongst the older generation, in recent years new and specific directions have emerged and developed, customized largely to the explicit needs of owner/managers and their workforce. Fortuitously, most TVET professionals proved perceptive to guidance and continue to improve and further develop TVET initiatives, programs, and

courses, designated specifically for servicing a large and heterogeneous sector of a nation's economy. Data presented in this chapter highlights national and regional similarities, as well as differences, in the uptake of TVET provision, which adds further credence and importance to a prevailing paradox of training in SMEs. In addition, SMEs are less likely to invest in formal training and development, as compared to their larger counterparts. Generally speaking, smaller businesses tend not to plan their training and TVET investment, lack periodic HRD plans and budgets, and mostly added to a short-term view of fulfilling their training needs, obligations, and challenges. Thus, SME owner/managers tend to view TVET and related expenditure as a cost to be met, as and when absolutely necessary. Only a minority of them view TVET as an investment, to be planned ahead and undertaken periodically, on a regular basis.

In terms of the TVET theory and practice, the authors have identified three main categories of barriers and challenges associated with educating and training owner/managers and those individuals who are employed in their businesses, full time as well as part time: definitional, conceptual, and contextual diversities. Individually and cumulatively, these barriers and challenges tend to handicap some of the efforts and initiatives of the main stakeholders who profess an interest in TVET in SMEs. It should be noted, however, that longitudinally, the narrowing of the gap between TVET supply and demand, as highlighted by the long-term diminishing of the training paradox, seems to indicate that stakeholders' efforts to align training on offer to specific SME needs have met with increasing success. Further research is needed on this topic, to involve all those stakeholders who are engaged with TVET in SMEs, in order to make it even more relevant and attractive to SME owner/managers and their employees.

## Abstract

The Europe 2020 Strategy arose from the serious economic and social crisis experienced on the European continent in recent years. One of its objectives is to reduce the number of people at risk of poverty and social exclusion by 20 million before 2020. For this reason, adult education programs being developed in EU countries are an important contribution to the achievement of this objective. This chapter first addresses the legislative measures adopted in Europe regarding the training of adults and integrating the long-term unemployed and people at risk of social exclusion into the labor market. Next, the actions developed by companies and private entities in Ireland, Portugal, and Spain are analyzed with the aim of socially and occupationally integrating these people, given the high rates of poverty and risk of social exclusion in each of these countries. Ireland's Back to Education Initiative (BTEI) is addressed, as well as Portugal's EFA courses and Spain's training in alternation with the employment and insertion companies approach. In conclusion, it is analyzed what factors companies must consider in

## Introduction

Europe has experienced a significant economic and social crisis in recent years. For this reason, European institutions have sought to respond by establishing a series of objectives to be achieved by all European Union (EU) countries before 2020: the Europe 2020 Strategy (Comisión Europea 2010). One objective is reducing the school drop-out rate to below 10%; therefore, the training of adults in European countries contributes significantly to the achievement of these objectives.

At present, many European adults have a low level of both academic and occupational competence, so it would be necessary to start with the development of these skills, as well as second-chance measures that would serve to incorporate these people into working life, especially among groups that are at risk of social exclusion. In 2015 more than a quarter of the EU population between 25 and 64 years of age had left the education system after obtaining an education equal to the lowest grade of secondary education.

Another objective of the Europe 2020 Strategy (Comisión Europea 2010) is reducing the number of people who are at risk of poverty and social exclusion by at least 20 million. Based on the idea that there is a close relationship between educational achievement and social progress, training these groups is crucial to achieving this objective. The chances of living in poverty or experiencing social exclusion among people who only have a basic education are almost three times larger than people with university-level studies (Consejo de la Unión Europea 2016), and unemployment rates are higher among those with a lower level of education (Sapelli 2005).

Therefore, it would be necessary to promote the training of young people and adults who are at risk of social exclusion. This would contribute to the economic development of countries with high levels of poverty and exclusion, given the investment in human capital is crucial to promoting economic prosperity, full employment, and social cohesion (Villalobos and Pedroza 2009). In fact, the EU's objective is to promote a competitive economy based on knowledge and innovation that makes the most of resources and human capital in all EU countries (Comisión Europea 2010). Hence, public institutions and private companies and entities can play a decisive role in this endeavor.

Accordingly, throughout this chapter, the response offered by entities and companies in the field of adult education will be addressed to those who are at risk of social exclusion in three European countries: Portugal, Ireland, and Spain. These countries have been selected because they have suffered a serious economic and

social crisis in recent years and experienced high levels of poverty. In 2016, poverty and the risk of social exclusion rates have been quite high in these three territories: Ireland (24.2%), Portugal (25.1%), and Spain (27.9%) (Eurostat 2016). The impoverishment of the population has been much more pronounced in these countries than the official statistics show because as poverty increased, a large part of the population has become significantly impoverished.

Likewise, people who are at risk of social exclusion in these countries are characterized by suffering long periods of unemployment and having a low level of education (European Commission 2017). For this reason, the measures established in the field of vocational training will be analyzed, especially for people who are unemployed and living in poverty in Ireland, Portugal, and Spain, as well as actions taken by private entities and companies in these countries to achieve socio-labor integration.

---

### **Lessons Learned from Comparing Training Processes of Socio-labor Insertion for People Who Are at Risk of Social Exclusion**

Developed as a result of the Fifth International Conference on Adult Education (UNESCO 1997), the Hamburg Declaration on Adult Learning, which was signed by 130 countries, 478 NGOs, and 237 foundations, affirmed that adult education consists of a set of learning processes, whether formal or informal, from which adults develop skills, enrich their knowledge, and improve their technical or professional qualifications or reorient themselves to meet their own needs and those of society. It was a new vision of education that considers learning a lifelong process. Therefore, learning throughout life demands complementarity in processes and continuity over time. In this sense, continuing vocational education and training (CVET), as part of adult learning aimed at professional development, is essential for any country's economic competitiveness, productivity, and growth. Hence, the European Center for the Development of Vocational Training (CEDEFOP) defines CVET as "education or training after initial education or entry into working life, aimed at helping individuals to improve or update their knowledge and/or skills; acquire new skills for a career move or retraining; continue their personal or professional development" (CEDEFOP and Tissot 2014, p. 51). Therefore, CVET stands out among all forms of adult learning not only for its orientation to professional development but also for satisfying the labor market's needs. Hence, all the European Union's related statements and documents have recognized their importance, especially in the Council Resolution on a renewed European Agenda for Adult Learning (Council of the European Union 2011). Thus, CVET is key to achieving the EU's social and economic objectives, especially those involving the participation of adults in lifelong learning, improving the employability of individuals, and increasing employment in the EU (CEDEFOP 2015). Accordingly, in a 2009 resolution on the active inclusion of people excluded from the labor market, the European Parliament established that EU countries must expand and improve investment in human capital through

inclusive education and training policies. In addition, the Council of the EU indicated in a recommendation on Upskilling Pathways (Consejo de la Unión Europea 2016) that all EU states should promote that adults with a low level of knowledge and skills, such as those who have left the educational system before completing the second cycle of secondary education, acquire the relevant knowledge and skills needed to integrate into the labor market and, thus, be able to progress to level 3 or 4 qualifications of the European Qualifications Framework. For these reasons, CVET plays an essential role in the integration of people at risk of poverty and social exclusion in different European countries.

The challenge of integration relates to andragogy since this discipline has been a determining factor in the development of adult learning. Andragogy is a theory and practice that has focused on the person (i.e., on the adults who learn), thus providing a different methodological alternative in this field of knowledge. It is defined as a set of basic principles of adult learning that apply to all adult learning situations and is based on the following six principles, including the learner's need to know, self-concept, prior experience, readiness to learn, orientation to learning, and motivation to learn (Knowles et al. 2012). These principles are very important when working with all types of adults, especially with people at risk of social exclusion.

The first principle implies that the facilitator must help the student be cognizant of the need to know since the adult needs to comprehend why learning is important, the reason for learning, and how to carry it out (Knowles 1980).

According to the andragogic model, an adult has a self-concept and a sense of being a self-directed and autonomous person, which is the second principle. This vision is based on the idea that an adult has a self-concept of being responsible for his or her life and decisions, and hence, needs to be considered someone who is qualified for self-direction. Self-directed learning is based on personal autonomy, or taking control of the goals of one's learning and assuming ownership of it (Ghost Bear 2012). Therefore, when adults begin participating in educational and training activities, they balk at situations in which they feel other people are attempting to impose their will. Therefore, the facilitating teacher's task, according to Knowles, is to identify, guide, and respect the adult student's decisions concerning their level of autonomy while learning (Sánchez 2015).

The third principle states that adults who participate in any educational activity come to it with a large volume and quality of experience. This implies that a group of adult students is diverse and heterogeneous in relation to their needs, motivation, interests, and learning styles; therefore, it is necessary to individualize teaching methods. These adult students' experience and prior knowledge can be a valuable resource for some types of learning. Hence, according to Knowles, using methodologies and learning techniques that emphasize experimentation so that adult students can use their experience to advance their learning is important. Hence, if adults' experience is ignored or devalued in a learning process, these adults will perceive it as a rejection not only of their experience but also of themselves as individuals (Knowles 1990).

According to the fourth principle, which is related to the student's willingness to learn, adults are prepared to learn the things they need to know to be able to cope

with real-life situations. This relates to the overcoming of tasks from one developmental stage to the next (Sánchez 2015).

Concerning to the fifth principle, adult learning orientation must be centered on life, a task, or a problem. Therefore, the motivation for learning in adults is greater when they perceive that they need help to perform tasks or achieve the goals, or they have parents who face problems with their lives. In this way, learning is more effective. According to Knowles (1980), the lack of recognition of this characteristic in adult learning has been the main cause of dropping out of school for a long time.

Finally, the sixth principle states that motivation is a fundamental element of learning. Although many adults respond to external motivations, such as improving one's work performance ratings or the perceived opportunity for a higher salary, other motivations are of an internal nature, such as self-esteem and personal satisfaction (Knowles et al. 2012).

However, to help design educational programs aimed at adults with social integration difficulties, a North American foundation (Roberts and Price 2013) launched the Shifting Gears project a few years ago. It was developed in six Midwestern states in the United States to help working-age adults with low educational levels and few professional qualifications progress professionally. The project involved 4,000 adults and was based on systemic change through collaboration among leaders at adult basic education agencies, community and technical colleges, and workforce development programs. The project required participating states to replace existing educational and employment services with a more cohesive approach that considered the needs and real circumstances of low-skilled adults.

Another significant example related to the design of educational programs for young adults at risk of social exclusion is the Young Adult Literacy Program created in 2008 by a New York institution (Hossain and Terwelp 2015). This program is aimed at young adults between 16 and 24 years of age who left school prematurely and did not have a job, thus constituting a group at risk of poverty and social exclusion. The program is characterized by the fact that these adults receive academic instruction in literacy and mathematics, personalized social support, transportation aid, preparation activities for employment accompanied by small economic benefits, and training in personal and work skills. All these components are based on a holistic approach, since the program's staff coordinate and work jointly in each of these areas. They also offer the learners relationships based on trust as well as physical, emotional, and psychological security (Hossain and Terwelp 2015).

In Africa, the UNESCO's Institute for Lifelong Learning (Bolly and Jonas 2015) conducted research that aimed to measure the learning outcomes of adults with low educational levels in various literacy programs in different African countries. To this end, the participants' communicative and mathematical competencies and skills for measuring time and space were evaluated. Knowledge regarding health and wellbeing, care of the environment, citizenship, and employment were also evaluated. These areas were selected by the research because of their importance in the design of adult literacy programs.

Furthermore, in connection to the use of innovative methodologies in the design of adult literacy programs, various learning experiences have been developed based on the

use of personal mobile devices that are intended to provide functional support to adults with low literacy levels. For example, a mobile application (Munteanu et al. 2014) was developed in Canada and designed to be used both in the classroom and in daily life. Its purpose is to help adults improve their literacy level and increase independence. After conducting various studies, it has been demonstrated that using these devices increases users' motivation and interest in learning and raises their level of confidence in educational activity participation, as well as facing the challenges of daily life.

Finally, bearing in mind that one of the priority groups in the field of adult education in Europe is people at risk of poverty and social exclusion, the profile of these individuals is then tackled. The risk of social exclusion is a situation in which any person can be immersed at some point in their life, negatively affecting the individual's development, whether on a personal, social, or economic level. To measure the population at risk of poverty and social exclusion, the AROPE (At Risk of Poverty and/or Exclusion) indicator is used in Europe, which refers to the percentage of the population that is at risk of poverty, social exclusion, or both (Llano 2017). The AROPE population includes people living in households in which there is at least one of the following three circumstances: they are at risk of poverty, suffer severe material deprivation, and/or there is a low intensity of employment (MSSSI 2014).

There are different approaches to describing the situation of people who are at risk of exclusion due to its multidimensional characteristics. However, some of the common risk factors are as follows:

(a) Economic

These people live in a situation characterized by economic instability and a shortage of resources. They usually have low incomes and fewer opportunities to access economic benefits. This economic situation means that they do not have housing, and if they do have housing, it lacks the minimum conditions of habitability. Also, they usually live without medical insurance.

(b) Personal

They are unable to participate in decisions that affect their own lives, which is an indicator of their low level of personal development. They are unmotivated individuals with unhealthy lifestyles, so they tend to require more frequent or intensive health services.

(c) Social

People who are in this situation are habitually characterized by the deterioration of their social, family, and community ties. At the family level, they usually have a weak family network (Jiménez 2008). Furthermore, they do not have access to recreational spaces and social relations, being unable to participate in social life under conditions of equality. This last situation is especially serious among immigrants.

(d) Labor

These individuals are characterized by employment instability; their occupations are habitually precarious, and they can experience long periods of unemployment. For this reason, they generally have little work experience and a low educational level, as well as few if any professional qualifications. Some are illiterate. They also tend to be in age groups that are not preferred in the labor market.

For all these reasons, the training programs offered in Portugal, Ireland, and Spain for people who are at risk of social exclusion is discussed below. Thus, the measures established in the field of professional training in each of these countries are analyzed, as well as the action taken by private entities and companies. The ultimate purpose of these measures is to socially and professionally train and integrate this group of individuals.

---

## Inclusion and Training Markets in Ireland

Most of Ireland's professional training programs take place in the public sector; however, private providers also play an important role in this sector. To gain a broad understanding of how vocational training works in Ireland, it is necessary to first address how the education system is structured. Ireland's educational system is divided into four stages: primary, secondary, further education and training (i.e., further education and training [FET] and postsecondary education), and higher education. Vocational education and training (VET) is taught at the FET level, although there is also something in higher education.

Digging deeper into the structure of the Irish educational system, there is a 3-year program in lower secondary education that leads to obtaining the title of junior cycle program of achievement. Subsequently, an optional 1-year program is established called the transition year, which is part of upper secondary education. Students can then access the leaving certificate program, which lasts 2 years and culminates in the leaving certificate examination. There is also a leaving certificate vocational program (LCVP) that is similar to the leaving certificate program. It is characterized by providing technical content as well as some additional professional training modules. It is a 2-year program that was introduced in 1989 (Heraty et al. 2000). The certificate issued at the end of these studies includes additional information learned in the professional modules. The legal authority on vocational training is the 16 education and training boards (ETBs) distributed throughout the country, as established by the Education and Training Boards Act of 2013 (Irish Statute Book 2013). ETBs maintain and manage second-level schools, further education colleges, multi-faith community national schools, and a variety of adult centers that offer professional training programs (CEDEFOP 2014).

A new further education authority, called SOLAS (AnseSebibis Oideachais Leanúnaigh agus Scileanna/Continuing Education and Skills Service), was created in 2013. Its mission is to coordinate the 16 regional ETBs in addition to hiring professional training providers in the private and community field through competitive tenders. The active inclusion of people at risk of exclusion is one of the four strategic objectives that underpin the Further Education and Training Strategy 2014–2019 (DES 2016) and aims to support the participation of people of all ages and abilities in further education and training (FET). It is taught in vocational schools, adult education centers, and private centers and covers all postsecondary educational activities except higher education, including adult literacy, vocational

education and training, second-chance programs for dropouts and the unemployed, and adult and community education.

Likewise, in recent years, Ireland has linked the training provided in FET with the needs of the labor market. In fact, in this country, a solid mechanism has been developed to identify competencies demanded by the labor market. The task is supervised by a group of experts composed of government representatives, representatives of workers and companies, and professional training providers (CEDEFOP 2014).

ETBs also operate a series of professional training programs. One of them is the Youthreach educational program that currently serves 3,313 students who left school prematurely. Its objective is to socially reintegrate young people between the ages of 15 and 20 and provide them with professional skills so that they can access the labor market. The program's length is 2 years full time and characterized by offering a policy of continuous admission. Classes are taught for 35 h per week over a 45-week period. Once the training is completed, the young person can access a post-leaving certification course (PLC), request an apprenticeship, or find employment. In this program, the needs of young people are identified, and an individual learning plan is negotiated according to the center's capacities. Two very important aspects of the program are the possibility that young people have of opting for different thematic areas, as well as the friendly teachers and its comprehensive nature.

The program is organized in two phases. The first phase, called the foundation phase, allows young people to overcome learning difficulties, develop their self-esteem, and acquire the necessary skills to continue learning, especially in reading, writing, and arithmetic (Dolan and McGrath 2006). The second phase is the progression phase; it promotes the development of professional competencies through a series of training options and work experiences that lead to various forms of certification. The program offers training in different professional fields, such as hairdressing, crafts, carpentry, catering, photography, sports, and computer science. It also has a work experience program.

ETBs also offer community education that meets the educational needs of local groups, currently covering some 53,415 people. Community education unites people and communities, thus contributing to social cohesion (Further Education Development Unit 2012a). It also enables intergenerational learning, increasing self-confidence and self-esteem, especially among those whose prior formal education was a negative experience. This program improves the possibilities for broader learning, as well as acquiring qualifications and accessing the labor market.

In addition to providing training in Skills for Work (SFW) to some 3,000 workers with low levels of professional qualification, sometimes even in the workplace, ETBs also offer adult literacy programs throughout the country, including English as a second language. These literacy programs currently serve about 57,000 people.

The Vocational Training Opportunities Scheme offered by ETBs is a second-chance program for unemployed people that includes courses of up to 2 years. Its implementation has been very successful. Students who participate in this training

modality can take courses in the junior or leaving certificate programs or modules that are certified by Quality and Qualifications Ireland (QQI) at the foundation level, level 1, level 2, or level 3. The courses are taught 30 h a week, aimed at unemployed people over 21 years of age (Kis 2010) and designed to improve these individuals' employability, as well as prepare them for new opportunities that lead to gainful employment.

Another training program is the Back to Education Initiative (BTEI), which is part time with 32,066 students currently enrolled and in which private entities and providers also participate. It is a brilliant initiative in the field of training people at risk of social exclusion. This project offers a wide range of part-time accredited courses for young people and adults with an educational level below upper secondary education. The purpose is to facilitate access and progression to other educational levels or certain employment routes.

The Back to Education Initiative (BTEI) allows the entities and companies involved to increase individuals' participation through flexible options that adapt to students' individual circumstances, which enables them to combine work, family, and job responsibilities (Further Education Development Unit 2012a). These courses can be accessed through literacy and community education programs. The BTEI allows entities and companies to expand the provision of courses that lead to certification in levels 3 and 4 of the National Framework of Qualifications (NFQ). These courses allow participating individuals to access education and training full time. Information and communication technology (ICT) training is also offered. BTEI is designed for adults and young people who dropped out of school and have a low literacy level (Further Education Development Unit 2012b). The program also works with the unemployed, especially with the long-term unemployed, the elderly, women who have social participation difficulties, men suffering from rural isolation, and single parents who have minors under their care. The latter have difficulty participating in full-time training programs. Other important recipients are the homeless, ex-prisoners, people with disabilities, and immigrants who need support in language learning and literacy.

It is important to emphasize that within these groups, priority is always given to people with the most educational disadvantages, offering access to those who come from the literacy and community education programs. Moreover, no more than 30% of the available places can be directed to people who have already obtained certification in upper secondary-level education (i.e., a leaving certificate or equivalent).

The programs must not exceed more than 17 h per week or 400 h per year and may be taught in the mornings or afternoons, at night, or on weekends. They can also be organized as intensive courses and even summer courses. The courses can be organized into modules to allow the accumulation of credits, thus facilitating the students' progression in their studies. The content of these courses must be relevant to the students' personal, social, and cultural needs, as well as the labor market's needs.

This type of training develops key competencies related to communication, mathematics, information and communication technologies, interpersonal and social competencies, and specific vocational skills. All courses must be related to the

subjects of the junior or leaving certificate or to degrees accredited by the Further Education and Training Awards Council (FETAC). Since 2001, the FETAC is the only national body in charge of the accreditation of the Further Education and Training (Conroy and O’Leary 2007). Students in these programs are offered educational guidance since they are at the center of the learning process. Private providers of these courses are required to have a flexible approach to the evaluation and validation of learning, as well as the accumulation and transferability of credits.

---

## **Inclusion and Training Markets in Portugal**

The education system in Portugal is divided into three stages: basic, secondary, and higher education. The Ministry of Education is responsible for education from the preschool level to upper secondary education, while the Ministry of Labor is responsible for continuous professional training and the measures of activation of the labor market. The National System of Qualifications (SNQ) reorganized vocational training into a single system within the competences of education and employment authorities (CEDEFOP 2017). Law 85/2009 established compulsory basic and secondary education up to the age of 18 years. Basic education lasts 9 years and is divided into three consecutive cycles, and professional training occurs in education and training courses and vocational courses.

Secondary education is oriented to both pursuing higher education and entering the world of work. The structure of this secondary level is based on 3 years of schooling and comprises a variety of courses. Thus, there are scientific-humanistic courses, specialized artistic teaching courses, and courses with own plans that usually have a scientific-technological component (Ministério da Educação e Ciência 2012). There are also courses of recurrent education at the secondary level that constitute a second-chance teaching modality aimed at those who could not complete their studies, as well as those who seek a cultural and professional promotion. It constitutes a modality of adult education similar to the studies that take place during daytime teaching and lead, therefore, to obtaining an equivalent certification.

At this level of secondary education, professional courses are also taught, which are essentially aimed at students who intend to join the world of work. Their duration is between 3,200 and 3,440 h (Ministério da Educação e Ciência 2013) and are subdivided into three areas: (a) the sociocultural field, comprising 1,000 h, in which Portuguese, a foreign language, the area of integration, information and communication technologies, and physical education are taught; (b) the science field, comprising 500 h, which contains two to three disciplines depending on the professional qualifications to be acquired; and (c) the technical field, comprising 1,000 h, which includes three to four disciplines, and an additional 600–840 h of training in a work context.

It should also be mentioned that secondary education also includes vocational courses for students over 16 years of age who are at risk dropping out; they are offered technical courses that allow them to obtain a specific professional skill

(Ministério da Educação e Ciência 2012). In these secondary-level vocational courses, companies, entities, and social institutions of the school area that are involved in providing students with training programs in a business context collaborate, thus contributing to the vocational component. These courses are 2 years in duration with a class size between 20 and 24 students and structured in three parts (Ministério da Educação e Ciência 2015): a 600-h general part contains disciplines such as Portuguese and English; a 300-h part integrates other disciplines, such as applied mathematics; and a third part involves vocational disciplines with 700 h of Short Training Units Duration and, finally, a 1,400-h formative stage. Both the vocational part and the formative stage are developed within a framework of flexibility; the formative stage is based on a model of alternation between real training in the context of a company and practical training. The professionals that comprise the pedagogical team are the coordinator, the group tutor, the teaching staff of the different disciplines, and the school psychologist who coaches the entire teaching process, always in coordination with the family. These secondary-level vocational courses in secondary education confer the fourth level of qualification of the National Qualifications Framework of Portugal.

At the postsecondary education level, vocational training programs combine general education, scientific education, and technological training in a work environment. These are called Technological Specialization Courses (CET) and generally last between 1 year and a year and a half, and 30–46% of the time is spent in work-based learning (CEDEFOP 2017).

An important tool created in Portugal in the field of adult education and aimed at promoting the reduction of skills deficits and improving levels of employability and social and professional inclusion are education and adult training (EFA) courses. These courses are aimed at people over 18 years of age who do not have adequate educational and professional qualifications to enter the labor market and, most importantly, those who have not completed basic or secondary education (Taveira 2010). Specifically, the recipients of these courses are groups of people at risk of social exclusion. The courses may correspond to the level of basic education as well as to the level of secondary education. EFA courses at the secondary level, which are usually taught on a day or full-time basis, can only be attended by adults of 23 years of age or older (Ministérios do Trabalho e da Solidariedade Social e da Educação e Ciência 2008).

Many of the entities promoting EFA courses are companies, business associations, unions, education centers, and associations of local, regional, or national scope, although some are public entities. All participating entities must be integrated into the network of training entities within the framework of the National Qualifications System.

The offer of EFA courses has been gradually expanded to include a growing number of entities and promoter companies, as well as adults in training. A new initiative called New Opportunities has been created that aims to further increase the number of EFA courses at the basic and secondary levels. The goal is the generalization of secondary education as a minimum level of qualification for the entire population.

The EFA training model is based on the perspective of lifelong learning. Thus, adults who participate in flexible training itineraries must carry out a Recognition, Validation, and Certification of Competencies (RVCC) process that they have previously acquired formally, not formally or informally (Silva 2015). A modular training model is used in these courses, which has been structured from the training references that are included in the National Catalog of Qualifications. They address various areas of key competencies such as citizenship and employability, language and communication, mathematics for life, information and communication technologies, and technological training. The language and communication area also includes competencies related to a foreign language. Technological training compulsorily integrates practical training in the context of work (Ministérios da Economia e do Emprego e da Educação e Ciencia 2008). This period of practical training must be guided by an individualized plan that has been agreed upon by the training entity, student in training, and company where the internship is carried out. These courses also include a “learning with autonomy” module at the basic level or a “reflective portfolio of learning” at the secondary level (Taveira 2010).

The groups can include 15–30 students and can provide a double certification (i.e., school and professional). The duration of the training, rules, and weekly workload are usually adjusted to the students’ living conditions. However, the number of training hours cannot exceed 7 h per day or 35 h per week, and if it takes place after work, it cannot exceed 4 h per day. The technical-pedagogical team responsible for the EFA courses is made up of a group of trainers responsible for each of the key competency areas, tutors of practical training in the work context, and a personal and social mediator. This mediator participates in the selection of students as well as the diagnosis, monitoring, and personal, social, and pedagogical orientation of the students. In turn, the trainers participate in the diagnosis of the students, create a training plan, develop the training in the corresponding area, and produce the necessary pedagogical materials (Ministérios do Trabalho e da Solidariedade Social e da Educação e Ciencia 2008). The evaluation method in these courses is based on the continuous and systematic observation of the training process, using multiple techniques and instruments for collecting information. At the end of an EFA course, a certificate of qualification is issued that may correspond to some of the cycles of basic education, some secondary education, or professional certification.

---

## **Inclusion and Training Markets in Spain**

Vocational training in Spain is made up of two subsystems: the Subsystem of Initial or Regulated Professional Training, which depends on the Ministry of Education, Culture, and Sports and Autonomous Communities; and the Vocational Training Subsystem for Employment, linked to the Ministry of Employment and Social Security and the Autonomous Communities. To analyze the Initial or Regulated Professional Training Subsystem, it is necessary to begin with the structure of the Spanish educational system. It is regulated by both the Organic Law of Education

(LOE) and the Organic Law for the Improvement of Educational Quality (LOMCE). Mandatory schooling ranges from 6 to 16 years. Primary education consists of six academic courses, while compulsory secondary education comprises four courses. In the fourth course, students can choose between an academic education followed by a baccalaureate or applied teaching to continue studies in vocational training. Once the graduate in compulsory secondary education degree has been obtained, those who wish to pursue professional studies can access the middle-grade vocational training cycles. These trainings have a modular structure, and they earn the title of technician in the corresponding training field when these trainings are completed (Ministerio de Educación y Ciencia 2007).

There are also some training programs that have the character of postsecondary education: the vocational training cycles of a higher degree. They are accessed with the bachelor's degree or the title of middle degree technician. Once these studies are completed, the title of superior technician is obtained in the corresponding training field.

The Middle-Grade Vocational Training Cycles are designed to offer a specialized and qualified workforce that allows them to occupy jobs in the sectors of industry or services. The Higher Degree Training Cycles are designed to train future highly specialized technicians or middle managers of companies in any economic sector. All training cycles are grouped into 26 professional families and have a duration of 2,000 h, equivalent to two academic years. These cycles include various professional modules associated with competency units of the National Catalog of Professional Qualifications, as well as training modules and career guidance, business and entrepreneurial initiative, and training in work centers. Likewise, the Organic Law for the Improvement of Educational Quality (LOMCE) (Jefatura del Estado 2013) created Basic Vocational Training Cycles. These are aimed at students who have failed during secondary education, constituting an important way to prevent drop-outs, thus facilitating students' engagement in the education system and preventing future social exclusion.

The professional profile of these degrees includes units of competence of a complete professional qualification level 1, belonging to the National Catalog of Professional Qualifications. The training leading to basic professional titles enables learners to carry out the functions of a basic level of prevention. These teachings also have a modular structure, including professional modules that guarantee the acquisition of the skills of lifelong learning (Communication and Social Sciences and Applied Sciences), professional modules that guarantee necessary training in professional skills for professional life and labor insertion, and a training in the work center (FCT) professional module that takes place in the company (Ministerio de Educación, Cultura y Deporte 2014). The total duration of these basic training cycles is 2,000 h, equivalent to two full-time academic courses.

Next, the second subsystem that exists in Spain will be addressed. In Spain, within the subsystem of Vocational Training for Employment (Jefatura del Estado 2015), there is a very useful instrument called offer training that consists of training plans aimed at both employed and unemployed workers. Training plans aimed at unemployed workers are designed to improve their employability. The actions

developed within the plan consider current job opportunities in the market and the detected qualification needs. It includes actions that enable learners to earn certificates of professionalism included in the National Catalog of Professional Qualifications (CNCP). Currently, they focus on people who are in a special unemployment situation, specifically, young people without qualifications, victims of gender violence, the long-term unemployed, people over 45 years of age, and other individuals at risk of social exclusion. The goal is to obtain a certificate of professionalism, as it is an accreditation instrument highly valued in the workplace that can be taught by private training providers.

The National Repertoire of Professional Certificates orders the 620 existing certificates in 26 professional families according to the levels of qualification established by the regulations, which is 1, 2, and 3. In the field of Vocational Training for Employment, the certificate of professionalism is responsible for accrediting the competence units that make up the qualification with which they are associated. They are valid throughout the country, and although they are of an official nature since they are issued by the State Public Employment Service (SEPE) and the competent administrations of the autonomous communities, they do not regulate the exercise of a profession (Ministerio de Empleo y Seguridad Social 2013).

Next, different instructive modalities pertaining to alternation training are discussed. Developed by entities, consortiums, or associations, their purpose is the immediate employment of participants. This type of vocational training for employment is most directly related to real employment; therefore, it is configured as training support for hiring. Its purpose is to impart professional skills, allowing users to combine periods of training in an educational center with others in the workplace. There are several modalities: workshop schools, craft houses, employment workshops, and training programs in alternation with employment (PFAE). All these are projects where training and employment are combined. Workshop schools and craft houses are aimed at unemployed persons under 25 years of age, and the employment workshops are for persons older than 25 years of age. PFAEs generally cover the entire age range. During the project, users receive occupational training mainly aimed at obtaining certificates of professionalism that are then accredited, and, at the same time, a work contract is made for training. In workshop schools and craft houses, students receive a scholarship during the first 6 months, and the contract is made in the 7th month.

Therefore, employment workshops constitute a mixed employment and training program that aims to improve the employability of the unemployed aged 25 and older with the aim of facilitating gainful employment (Ministerio de Trabajo y Asuntos Sociales 2001). They are also developed by entities, consortiums, or associations. In employment workshops, work and services of social interest are performed, which allow the participating students to carry out an effective job while receiving occupational training for a profession, thereby increasing the user's chances of gainful employment.

Employment workshops are integrated into comprehensive employment plans that respond to the demands of the labor market, thus activating regional development, generating wealth, and, consequently, creating jobs. These workshops have

a maximum duration of 1 year, with the students being hired by the promoters through a training contract. They receive salaries equivalent to the minimum interprofessional salary established annually. Students receive occupational vocational training, as well as basic training and information and communication technologies training. Upon completion of the employment workshop program, students earn a certificate that can be validated in whole or in part by a certificate of professionalism.

All these modalities are aimed at improving the qualifications and employment possibilities of groups of unemployed people with low levels of qualification, young people who have left the education system, and people with special difficulties of social insertion. Training is centered in the fields of agriculture, construction, stonework, and gardening, among others. Although they are financed by different autonomous communities, they are promoted by local and private entities that intend to respond to a specific local need, such as the restoration of a monument. Other examples include private entities which produce fruits and vegetables for the social services of a given municipality. At the end of the employment workshop, the promoter entity is responsible for providing technical assistance to the participating workers, both for the search for employment as an employee and for the establishment of their own business. All this is done through its own guidance and counseling unit but always in collaboration with the Public Employment Service. Access to the labor market among students of the employment workshops is 45–50%, while, among students of craft houses and workshop schools, the percentage increases to 60–65%.

Another very useful instrument is addressed in the training of people at risk of social exclusion: insertion companies. These companies play an important role in the processes of labor insertion of people in situations of social vulnerability. Currently, they focus on four disadvantaged groups: immigrants, women, people over age 50, and young people under age 30 (Castelló et al. 2014). It is an innovative model with development in different sectors of the social economy, focusing on productivity as well as people. These companies are an important instrument for the implementation of active employment policies since they are autonomous companies that carry out market activities in different sectors, creating employment and offering training and insertion itineraries for people who have difficulty accessing the labor market and are at risk for social exclusion (Martínez et al. 2012).

Therefore, these companies can hire people in situations of social exclusion or unemployment and registered in the Public Employment Services who have special difficulty integrating into the labor market (Arrillaga et al. 2012). Most of these companies are involved in the service sector, such as laundries, courier services, gardening, textiles, cleaning, and recycling. The intervention model used by these companies is based on the accompaniment of people, seeing people's positive aspects rather than just their shortcomings and trust them. They also combine the processes of social incorporation and labor insertion (Castelló et al. 2014).

For insertion into the labor market, an insertion itinerary or shared work plan is used, which includes both personal goals and the insertion actions to be developed. An important part is the training actions that the user must carry out and must be

designed so that they comply with the criteria established in certificates of professionalism. To develop the itinerary, an evaluation of the employability of the person in the labor market is conducted. For this purpose, personal, professional, and psychosocial variables are considered, evaluating the person's training, work experience, attitudes toward employment, and other factors. More than 50% of these people finish the process in an insertion company and obtain a job in the ordinary labor market (Arrillaga et al. 2012). It is a highly positive result given that, before being part of the insertion company, they were people at risk of social exclusion and had low education and employability levels.

The following table compares the main important training actions developed by different institutions and entities in Ireland, Portugal, and Spain for people who are at risk of social exclusion (Table 1).

Below is a comparative analysis of the training measures implemented in Ireland, Portugal, and Spain according to the different target groups. Therefore, in relation to young people who left school prematurely, it can be observed that the different training programs developed in the three countries, namely, the Irish Youthreach program, secondary-level vocational courses in Portugal, and basic vocational training in Spain, have a similar duration of 2 years. However, the number of hours is different since the Irish program is approximately 1,575 h, while the duration is 2,000 h in Spain and 3,000 h in Portugal. Nevertheless, Ireland's Youthreach program has the advantage of offering a policy of continuous admission, while the Portuguese and Spanish models only enroll students at the beginning of the school year.

When examining the contents taught, the three programs concur on working on basic subjects such as language and mathematics that are decisive for school success. However, the Irish model also focuses on students overcoming their learning difficulties, developing self-esteem, and engaging in activities that take place in the school, which are all essential elements for the continuity of these students' education. The Youthreach faculty also strives to be friendly and understanding with the students. As stated by Marchena et al. (2015), establishing rapport between students and teachers has a positive impact on decreasing school dropouts. However, if practical training in companies is the focus, the Spanish and Portuguese programs stand out for enabling students to complete a period of internships with companies, which significantly increases these students' motivation to complete their professional studies.

Regarding the pedagogical follow-up of students who participate in these programs, Portugal establishes in its regulations that the school psychologist is a member of the pedagogical team taking charge of the whole process of teaching the students. The Irish model is characterized by developing an individual learning plan that adapts to the characteristics of the students. However, the Spanish model lacks such individual learning plans, which can negatively influence the level of academic success achieved.

Another point that is presented hereafter is a comparative analysis of the different countries mentioned in terms of unemployed adults with low levels of professional qualifications and literacy who, therefore, are at risk of social exclusion. For this

**Table 1** Comparison of training programs for adults at risk of social exclusion by country

Country	Program	Target groups	Main features
Ireland	Youthreach	Students who left school prematurely	Develop professional skills needed to access the labor market. Two phases: (1) overcome learning difficulties and develop self-esteem and (2) develop professional competencies Time period: 35 h × 45 weeks
	Community education	Educational needs of local groups	Continuity in studies Professional qualifications for access to the labor market Social cohesion
	Skills for work	Low levels of professional qualification	Increased professional qualifications
	Vocational training opportunities scheme	Unemployed people over 21 years old	Second-chance program Up to 2 years of courses at 30 h per week
	Back to Education Initiative (BTEI)	Low literacy levels and at risk of social exclusion	Part-time courses: maximum of 17 h per week Adapted to the students' individual circumstances Modular structure with an educational orientation Competencies: communication, mathematics, interpersonal and social, and ICT and professional
Portugal	Courses of recurrent education at secondary level	Uncompleted studies or searching professional promotion	Second-chance teaching modality
	Vocational courses	Students over 16 years at risk of early school leaving	Technical education Collaboration of companies, entities, and social institutions of the school area Duration: 2 years Number of students: 20–24
	EFA courses	People over 18 years of age, without adequate educational and professional qualifications	Courses corresponding to the level of basic or secondary education Network of training entities Modular training model Adjusted to the students' individual needs Competencies: citizenship and employability, language and communication, mathematics

*(continued)*

Source: prepared by the authors

purpose, the Irish training program called the Back to Education Initiative (BTEI), Portugal's EFA courses, and Spain's employment workshops and insertion companies will be analyzed.

All these training programs coincide in having a modular structure that allows the accumulation of credits, thus facilitating students' progression in their studies. Likewise, they agree on their flexibility and adaptation to the students' specific circumstances; thus, the Irish BTEI program is characterized by offering flexible options, while the EFA courses in Portugal have flexible training itineraries, and the Spanish insertion companies offer their users personalized itineraries of training and employment. However, the BTEI program offers educational guidance to its users, while the EFA courses require participants to carry out a process of recognizing previously acquired competencies. There are also differences in the workloads. While the BTEI is structured to require a maximum of 17 h per week and no more than 400 h per year, Portugal's EFA courses cannot exceed 7 h per day or 35 h per week, and Spain's employment workshops, being a mixed employment and training program, have a maximum duration of 1 year.

In relation to the contents, all these programs include competencies related to vocational areas as well as key competencies related to information, communication technology, and other related skills, but it is necessary to emphasize that Ireland's BTEI program also places special emphasis on interpersonal and social competencies. Similarly, Spain's insertion companies focus on vocational training as well as social inclusion. For this reason, these intervention models are based on the accompaniment of the people, which is an essential element when working with people who are at risk of social exclusion. In this same sense, it is noted that in Portugal's EFA courses, there is a personal and social mediator in charge of the personal and social follow-up of the students.

Finally, in relation to the precarious economic situation these people suffer, it is necessary to underline the role played by the Spanish employment workshops as opposed to the other two countries' training programs. These workshops are distinguished by the training contracts that they make with their users since, through these contract, they pay the minimum interprofessional salary to individuals who have suffered long-term unemployment. Furthermore, once the employment workshops are completed, the participating entities provide the users with the necessary technical assistance to search for employment as an employee, as well as establish their own business.

---

## **Requirements and Guidance Notes for Training Programs**

Next, factors that should be taken into account by training companies in the work they carry out with people at risk of social exclusion for the training to be successful and lead to these people being able to integrate effectively into society and the field

of work will be analyzed. An important element of working with people at risk of social exclusion who have a low level of education and have experienced long periods of unemployment is getting them to participate in training activities and continue participating in them over time. It is necessary that private training providers generate a positive disposition toward the students' learning. This is achieved by highlighting the benefits of learning and that students perceive it as something important. By doing so, the student's need to know, which is one of the principles proposed by andragogy, is fulfilled (Knowles et al. 2012). If they are aware of the educational opportunities available their willingness to learn will be increased. However, teachers in these programs must also create a pleasant atmosphere in class, establishing rapport with students. Accordingly, positive results have been obtained when the training staff develops relationships with users based on trust, as well as physical, emotional, and psychological security (Hossain and Terwelp 2015). In this regard, it is necessary to highlight the role of intermediary organizations as charities and private associations to select and incorporate adults from disadvantaged backgrounds into the courses, as they tend to be more effective in this area.

Another element to be considered by the training providers is that these students need educational guidance that addresses their personal and work circumstances. They often also require support from social services. Therefore, the most effective intervention model in these cases is the accompaniment of the people that implies the need to dedicate time to talk and meet with the students to analyze each student's situation. An example is the work done by the social mediator in Portugal's EFA courses and Spain's insertion companies (Castelló et al. 2014).

It is also necessary to design activities that are adapted to the students' characteristics, especially in the beginning of the course since a negative experience could dissuade these students from participating in further learning. The training provider must design personalized study programs in a way that adapts to the students' personal and social circumstances (Roberts and Price 2013), which is done in Ireland with the BTEI (Further Education Development Unit 2012a), that are characterized by their temporal flexibility. Furthermore, if the courses are modular, students are more likely to progress. It should not be forgotten that for the design of this type of personalized study program, it is necessary to recognize previous formal and informal learning that the individual has acquired throughout his or her life. These adults' prior knowledge and experience can be a valuable resource to help advance their learning (Knowles 1990). In this regard, a process of recognizing, validating, and certifying competences is carried out in Portugal's EFA Courses (Silva 2015).

Another important factor in the design of training programs is including literacy, mathematics for life, and information and communication technologies in addition to professional training since these three areas of learning are decisive in the success of training and facilitating students' progression to other types of studies in the future. An example of this approach is Portugal's EFA courses (Ministérios da Economia e do Emprego e da Educação e Ciência 2008). However, some training programs for adults at risk of exclusion also include topics related to health and well-being, care of the environment, or citizenship in addition to the areas mentioned above (Bolly and Jonas 2015). Moreover, adult learning must be oriented toward a task or problem

because the motivation for learning is greater when adult learners perceive that what they learn will help them perform tasks or solve problems related to real-life situations (Knowles 1980).

On the other hand, a determining factor in the design of training programs for adults is the use of innovative methodologies based on the use of mobile devices, as it increases the motivation and interest of users for learning and increases their level of confidence (Munteanu et al. 2014).

Training providers must prioritize courses that provide qualifications that are accredited externally, such as the delivery of certificates of professionalism in Spain (Ministerio de Empleo y Seguridad Social 2013) by private entities, since it will improve students' employability, allowing them broader access to job opportunities and higher salaries. This also benefits the economy in general and allows students to continue studies at higher levels. It is also important that employers participate in the design of these programs; in this way, learning will be relevant to the students' lives, especially people at risk of social exclusion who have had long periods of unemployment. An example of this approach is the introduction of work-based learning (WBL) by training providers (Ministérios da Economia e do Emprego e da Educação e Ciencia 2008), which generates greater motivation among students and serves to improve their professional competencies. Therefore, training providers should work in a closely coordinated manner with employers.

Furthermore, training programs that include financing or a salary via a training contract for students, such as in Spain's employment workshops (Ministerio de Trabajo y Asuntos Sociales 2001), increase participation, especially among adults who are unemployed with scarce economic resources and usually have inadequate professional skills. It can even be necessary to provide transportation assistance for some students given the fragile economic situation in which some find themselves (Hossain and Terwelp 2015). Hence, there is a need for public institutions to provide funds, promote, and support this type of initiative by private training providers. Finally, training providers should not forget that a relevant factor is the quality of the training received by students. Therefore, it is crucial that the teaching staff is not only sufficiently qualified but also open to the possibility of further professional training.

---

## Conclusions

Training companies that work with people at risk of social exclusion must consider a series of factors that ensure the success of the training and allow the targeted population to integrate into the labor market. Furthermore, private training providers must highlight learning benefits and generate a positive disposition toward learning in the users, as well as establish a conducive climate in the classroom and healthy relationships with the students based on trust. Another element to consider is the accompaniment of the people that must be done to help orient students throughout the learning process and address their personal circumstances. Designing personalized study programs that adapt to students' personal and social circumstances, offering temporary flexibility, providing a modular structure, and acknowledging

the learning acquired by the individual along his life or her path are also important. Training programs aimed at people at risk of exclusion should include training in a certain professional field, literacy, mathematics applied to daily life, and not only ICT but also content related to health and education, welfare, care of the environment, and citizenship. It must not be forgotten that motivation is a determining factor of success in learning, which is increased if innovative methodologies are used, if learning is oriented to performing tasks or solving problems related to life situations, and if training is carried out in the workplace. The need to support these users with economic benefits is often crucial since they often are unemployed people with multiple needs and scarce financial resources. Finally, training providers should not neglect the quality of the training provided, which requires sufficiently qualified teaching staff.

## Abstract

This chapter reviews a text wrote in 2004, which has analyzed VET (Vocational education and training) in Brazil as a “nonsystem” composed by two segments – one “formal-visible” and the other “nonformal-invisible” – both supported by a historical alliance between public funding and private management (Leite EM, Moradillo M, Chieco NW, International handbook of education for the changing world of work; bridging academic and vocational learning. UNESCO/Unevoc – International Center for Technical and Vocational Education and Training, Bonn, 2009). This version keeps this analytical vision, but updates

the VET market figures and highlights new VET demands driven by the social-economic agenda in the 2000s. In order to illustrate the referred public-private alliance, the chapter also presents consolidated VET cases involving different financing and management schemes. To conclude, the text outlines short- and medium-term perspectives for the VET market in a context of political-economic uncertainty, challenged by increasing demands for educated and skilled workers in a huge and diversified country.

## **Introduction: VET in the National Agenda**

### **A Defying and Diversified Country**

Brazil is one of the biggest world countries in terms of territory (8.5 million km<sup>2</sup>), population (207 million people, 85% in urban areas) and economy (GDP around US\$2 trillion), with a complex political-administrative organization. According to the Federal Constitution approved in 1988, the country is a presidential federal republic, comprising one Federal District, 26 States, and almost 5.6 thousand municipalities (cities), including about 40 centers with more than 500 thousand inhabitants (IBGE 2017b, c). The States and municipalities are relatively autonomous, but their actual autonomy also depends on their economic and political power.

The country is not an exception in the instable Latin American (LA) trajectory, particularly in the last decade. The Brazilian economy boomed in 2007–2010, decelerated in 2011–2013 and almost collapsed in 2014–2016. In 2 years, the GDP declined 8.2%; the unemployment rate climbed from 6.2% in 2013 last quarter to 13.7% in 2017 first quarter; 100 thousand firms closed the doors, extinguishing 3.5 million formal jobs. At the same time, the country had to face troubled majority elections (2014) and the new president's impeachment (2016), followed by an unpopular government threatened by lawsuits, as a result of an unprecedented mobilization against corruption, reaching top entrepreneurs and politicians (BBC 2017; IBGE 2017b, c; MTE 2017b; Transparency International 2017).

As other former colonies, Brazil has initially developed VET as a second-class education, targeting those who must work or did not succeed in formal studies. This vision started to change by the 1940s, when the skilled labor became a bottleneck for the urban-industrial development. Therefore, VET has gradually evolved as an entrepreneurs' strategy and a way to social mobility, strongly supported by public funding.

The 1980s have brought more complex VET demands, driven by the urgent economic modernization, the fast technological innovation, and the delicate democratic reconstruction, after 21 years of military dictatorship (1964–1985). In this context, VET has become a crucial and even mandatory component in the social-economic agenda,

involving a myriad of public and private agencies, under multiple and barely integrated governances (at federal, state, and local levels).

These escalating demands, compounded by the chronic political-economic instability, have been challenging the VET market for decades. In this context, the public-private alliance has been decisive for its resilience and performance.

## VET Demands Driven by Social Policies

Poverty is a structural and large-scale problem in Brazil, like in most of LA countries and other emerging economies. About 25% of the population (52 million) survive with less than US\$5 per day and almost two-thirds of the workforce receives less than US\$600 (two minimum wages) per month (IBGE 2017b, c).

Since the 1990s, the country is implementing vouchers programs targeting these populations. In 2004, these programs were merged in the “Bolsa Família,” coordinated by the Social Development Ministry. This program grants money transfers (R\$180 monthly = around US\$55) to poor families, which must enroll their children in health services and basic education, including training courses for people aged over 14. In 2013–2017, about 13.8 million families have received this benefit monthly (IPEA 2014; MDS 2017).

Their young and adult members have been increasingly enrolled in VET courses and microcredit programs, in order to build “exit doors” for the voucher program (IPEA 2014). Most of this demand has been supplied by national VET programs (see section “The National and Sectoral VET Plans”), often including literacy and adult education courses, whose scale is still modest in relation to the 80 million poor-educated Brazilian adults: 11.8 million of illiterate people aged 15 and over and other 66.3 million aged over 25 who have concluded only the primary school (IBGE 2017c).

## VET Demands Driven by Economic Modernization

As other emerging countries, Brazil is opening and modernizing most of economic activities since the 1980s, implying strategies and practices to cope with multiple challenges, such as:

- Technological innovation in terms of equipment, materials, processes, systems, etc.
- International and domestic agreements and regulations about labor safety, civil rights, environment preservation, and other quality issues implied in national and international certifications (“excellence/green/safety seals”).
- National/local regulations imposing “job permits” for a wide range of operational jobs, also involving training courses for broad categories such as bodyguards and escorts; professional drivers (bus, truck, taxi, motorcycle); janitors and gatekeepers; food-street vendors; caretakers; traditional fisherman.

- New business models (startups, franchising), which usually involve continuous manpower training. The startups are still incipient, but franchising is a consolidated sector in the country, encompassing 3 thousand brands (95% national), 134.2 thousand sales points, and about 1.9 million direct jobs (ABF 2017).
- High labor turnover (above 50% annually, cf. DIEESE 2017, p. 36), entailing continuous training for new jobs and activities.

Actually, these requirements have led most firms and individual entrepreneurs to develop a “VET culture,” regularly investing in formal education (from literacy to post-graduation courses), on-the-job training, and other nonformal technical events, such as workshops, seminars, conferences, visiting, and internships. These practices are largely spread in the formal sector, but often reach the informal economy by means of productive chains, public regulations and consumers’ preferences (IPEA 2006; Leite 2015b).

### Training Demands from Informal Economy

The Brazilian formal economy encompasses 8.2 million firms and 46.1 million employees (MTE 2017b), but the informal labor market is bigger: 59.8 million people, including 33 million workers not covered by social protection, 12.9 million unemployed people and 13.9 underemployed people, equivalent to 57% of the total labor force aged 14 and over (IBGE 2017b). This is a heterogeneous universe, composed by unregistered employees, freelancers, self-employers, small entrepreneurs, and often formal employees performing a second job, in order to complement the low wages.

So, the Brazilian informal economy is not limited to odd jobs or black market. Actually, it involves activities integrated to modern productive chains, such as information technology, ecology, agribusiness, culture, tourism, sports, and popular art. In this context, informal entrepreneurs and workers are continuously compelled to update processes, techniques and skills, also looking for “quality seals” and “job permits” increasingly required for many activities, even the traditional ones, such as food-street vendors, caregivers, and artisans.

The Brazilian development policies cannot ignore this huge “gray zone” where formal and informal activities are merged in production chains, driving significant VET demands. The following federal programs (APL, B+P, and MEI Law) illustrate this trend.

- The APL (Arranjo Produtivo Local) and the “B+P” (Brasil mais Produtivo) have been implemented since the 2000s under the Ministry of Industry and Commerce coordination, aiming at develop clusters of small producers, both formal and informal. Presently, there are about 680 active APLs, in 2.2 thousand cities, involving 291 thousand firms and 3.3 million direct and indirect jobs, both formal and informal, covering around 60 industrial and agribusiness branches (MDIC 2018).
- The “MEI Law” (Lei do Micro Empreendedor Individual) incentives self-employees to get a register as “individual entrepreneurs,” in order to access the public pension

and health services. In 2008–2017, almost eight million people have got this registration (SIMEI 2018), becoming potential candidates to training courses, in order to improve their self-management skills and/or get “job licenses” for regulated activities (mostly in food, beauty, cleaning, and maintenance services).

## Labor Policies Involving Mandatory VET

In 1990 (Federal Law 7988) was created the FAT (Fundo de Amparo ao Trabalhador), as a public funding for labor and development policies. Since then, most of this policies have been including VET as a mandatory component, mainly the unemployment insurance, the placement services and the lay-off programs (MTE 2017c, d – see also section “[The National and Sectoral VET Plans](#)”).

- The unemployment insurance benefits formal employees, for 3–5 months after dismissal. Since 2012, their beneficiaries must be enrolled in VET courses, while looking for a new job. In 2015, it was paid to 7.9 million people mostly registered at SINE’s (Sistema Nacional de Emprego) agencies.
- The SINE’s agencies (1.5 thousand across the country) are mainly in charge of public placement services. They may also promote training courses or refer the candidates to public VET programs (see section “[The National and Sectoral VET Plans](#)”), in order to adjust the applicants’ profile to the job’s requisites. As a matter of fact, most of them need to be trained, since only 20–25% is used to succeed in the first job interview, mainly for lack of basic skills (MTE 2017c, 2017d).
- To mitigate the recession effects, a lay-off program has been implemented since 2014 (Federal Law 13189), imposing education and training for the workers at risk of dismissal. In 2015, the program benefited 41 thousand workers; and 22 thousand in 2016, mostly in industrial sector – modest figures that seem to reflect mainly the high degree of uncertainty for most economic sectors.

---

## VET in the Brazilian Education System

### The Brazilian Education System

In 1996, an Education Law (LDB – Lei de Diretrizes e Bases da Educação – Federal Law 9334) recognized the VET alternatives as part of the education system, upgrading the VET status and defining its constitutional funding sources.

The LDB has established two levels for formal education in Brazil – basic and higher (see following illustration).

- The basic level is ruled by State and Municipal Secretaries of Education. It targets children from 4–17 years old, including 14 grades of mandatory education – preschool (2 grades), primary (9), and secondary (9), together with adult education (EJA – Educação de Jovens e Adultos).

- The higher level refers to the post-secondary education, including bachelor and post-graduation courses, under the Ministry of Education (MEC) federal governance.

These two levels include three VET branches: at basic level, the nonformal and technical courses; at higher level, the technological courses.

- The nonformal VET encompasses apprenticeship courses (see section “[The New Apprenticeship Scheme](#)”) and initial/continuous training, mostly heterogeneous and flexible in terms of contents and objectives, duration, suppliers, and clients (people aged over 14). As nondegree programs, these courses are not regulated by the education authorities, do not provide recognized certificates and are not benefited by constitutional funds for education, representing a large but less visible share of the VET market (see section “[The Brazilian VET Nonsystem](#)”).
- The technical courses are long-term programs (around 1000 h, 2–3 years), which graduate medium level technicians. They are mostly post-secondary, but also offered in parallel or integrated to secondary school. Their curricula, duration, and certification are regulated mainly by the state education authorities, but there are important nets under federal administration.
- The technological courses are also long-term post-secondary programs, but equivalent to higher education (similar to the American colleges). Thus, they are ruled by the Ministry of Education, although mostly under private management (see sections “[The Brazilian VET Nonsystem](#)” and “[The Private Higher Education](#)”).

**LDB-1996: the Brazilian education system and the VET alternatives**

Levels	Courses/grades		
<b>HIGHER</b>	Post-graduate > Doctor – PhD (3–5 years), Master (2–4 years), Specialization, MBA (1–2 years)		
	Bachelor (4–6 years)	<b>Technological Education (1–3 years)</b>	
<i>Preparatory courses (optional) and/or ENEM*</i>			
<b>BASIC</b>	Secondary > 3 grades (people aged 15–17)	<b>Technical Education (1–3 years)</b>	<b>Adult education (EJA)**</b>
	Primary > 9 grades (people aged 6–14)		<b>Non-formal VET:</b> initial/continuous training/apprenticeship courses (see section <a href="#">The New Apprenticeship Scheme</a> )
	Preschool > 2 grades (people aged 4–5)		

**VET according to LDB/96**

\* ENEM (Exame Nacional do Ensino Médio) is a national test implemented in 1998 by the Ministry of Education. The test initially aimed to evaluate the secondary education, but since 2009 it has become a selection process for public universities, also adopted by many private institutions. In 2016, ENEM had 8.6 million inscriptions and 6.1 million effective participants.

\*\* EJA (Educação de Jovens e Adultos) includes literacy, primary, and secondary courses/examinations for low educated adults and young dropouts aged 15 and over (similar to the GED – Graduate Equivalency Diploma in United States of America).

Besides the LDB’s definitions, two other alternatives should be seen as VET in Brazilian context, due to its importance in terms of employability: adult education (EJA) and the higher education.

- The EJA courses offer the primary and/or secondary certificates for the young dropouts and poor-educated elders – a basic requirement for get a job, especially in the formal market: about 70% of the formal employees have completed at least this level, contrasting with only 42% of the workforce as a whole (MTE 2017b).
- The higher level, by its turn, is mostly attended by students-workers. For most of Brazilian students, working is a condition to access the higher education, which works as a passport for better jobs and higher wages, not to mention the social recognition.

## The Brazilian VET “Nonsystem”

For analytical purposes, the Brazilian VET market may be characterized as a “nonsystem” with two segments: one “formal-visible” and other “nonformal-invisible,” with several distinctive features in relation to traditional VET systems (Castro 2002; Leite et al. 2009; Leite 2017).

The “nonsystem” notion refers to a myriad of suppliers under multiple and barely integrated governances, either public or private, dispersed among federal, state, and municipal authorities (see “[Introduction: VET in the National Agenda](#)”). These suppliers are mainly vocational training institutions (VTIs), such as technical schools, colleges, universities, nondegree proprietary schools, public clerks, and military academies. Besides that, there is a significant contribution from entities focused on other business, such as labor unions, suppliers of equipment and products, franchisers, lay and religious NGOs (nongovernmental organizations), professional associations (engineering, chemicals, metallurgy, metrology, welding, accounting), and independent consultants (usually registered as “individual firms” for tax purposes).

This “nonsystem” would reach 41.2 million enrollments in 2014–2015 (Table 1) – an offer 30% higher than the figures estimated for 1999–2000 (Leite et al. 2009, p.1274). This increase reflects the significant expansion of VET demands, driven by social policies and by the “economic bubble” in the years 2007–2010. The VET’s figures must have shrunk during the recession (2014–16), but they seem to be recovering, pushed by a few positive economic indicators and the continuous demands from vulnerable groups (see sections “[Introduction: VET in the National Agenda](#)” and “[The National and Sectoral VET Plans](#)”).

The “*formal-visible*” side is estimated in one third of the VET market, encompassing the courses that provide technical, technological, bachelor and post-graduation certificates, according to the LDB definitions. Their suppliers are education institutions recognized by the Ministry and the Secretaries of Education (except for the Apprenticeship courses – see section “[The New Apprenticeship Scheme](#)”), regularly covered by the annual education census (see note in Table 1).

Most of these formal branches had a significant expansion in the 2000s, stimulated by generous public incentives, in a context of economic euphoria. The apprenticeship courses and the higher education have actually boomed, and should be pointed out as consolidated cases of the public-private alliance in the VET market (see sections “[The New Apprenticeship Scheme](#)” and “[The Private Higher Education](#)”). The medium level technical courses have also boomed (from 565 thousand enrollments in 2004 to 1.9 million in 2015), but remain mostly under public administration.

**Table 1** Brazilian VET “nonsystem” profile – 2014–2015

Branches	Enrollment (million)	Privately managed (%)	Main suppliers
<b>“Formal/visible” (2015)</b>			
Adult education (EJA)	3.4	7	Universities and colleges
Technical courses (secondary level)	1.9	45	Basic education schools
Technological and higher level courses	8.4	73	Technical schools
Apprenticeship courses	0.4	80	S System (see section “The S System”)
<b>Subtotal</b>	<b>14.1</b>	<b>54</b>	Corporate foundations/colleges
<b>“Nonformal/invisible” (2014 - estimates)</b>			
Basic and continuous VET courses for the public at large	11.5	100	S System Nondegree proprietary schools Labor unions (until 2017) <sup>a</sup> NGOs (lay and religious)
VET for formal employed people	9.8	100	S System Corporate foundations/ universities Equipment/material suppliers Franchisers Professional associations Independent consultants
Basic/continuous VET for informal workers and vulnerable groups	5.1	100	S System Labor unions NGOs
VET for public clerks (civil/military)	0.7	0	Government schools Public universities and colleges Military schools and academies
<b>Subtotal</b>	<b>27.1</b>	<b>97</b>	
<b>Total</b>	<b>41.2</b>	<b>82<sup>b</sup></b>	

Sources: Formal alternatives – INEP 2017a, 2017b; MTE 2017a; Todos pela Educação 2017. Nonformal alternatives (references for estimates): ABED 2017; Castro 2002; GIFE 2017; IPEA 2009; Leite et al. 2009; Leite 2015a, 2017

Note about the sources: the Ministry of Education is responsible by the Education Census (INEP 2017a) that reaches institutions recognized by education authorities (basic schools, colleges, and universities), i.e., the VET formal side. Other official statistics (demographic, social, and economic) are conducted by a federal foundation (IBGE – Instituto Brasileiro de Geografia e Estatística),

linked to the Ministry of Planning, but there is not a systematic survey about nonformal VET (maybe for reasons of costs and complexity). In order to estimate this segment, one must join references from specific surveys and studies

<sup>a</sup>In 2017, the labor unions lost their main funding source – the union’s tax, abolished by the new Labor Law (Federal Law 13467). Created in 1943, the union tax has stimulated the union’s multiplication in Brazil: almost 17,000 in 2017, 69% for employees and 31% for employers (IBGE 2017a). Most of them are not expected to survive without the tax union

<sup>b</sup>Estimate = 33.9 million enrollment = (14.1 million × 54%) + (27.1 million × 97%)

Only the EJA has practically stagnated in the last decade. The 3.4 million enrollments in 2016 are negligible in relation to the potential demand in the country (almost 80 million of poor-educated adults – see “[Introduction: VET in the National Agenda](#)”). The potential EJA clients seem to be discouraged by difficulties to attend the courses, which are mostly face-to-face. There are good practices in terms of distance learning for EJA since the 80s, but its expansion is limited by adults’ difficulties in dealing with self-learning and new technologies.

The “*nonformal*” side represents two thirds of the “nonsystem” supply, including initial/continuous training courses, seminars, workshops, consultancies, and all sort of events focused on the employability and business development. Promoted by countless entities, almost all (97%) under private administration, these events are mostly “*invisible*” for the education polices and for official surveys (see Table 1).

A significant part of the “nonformal” VET is concentrated in a regular supply, covering areas such as foreign languages, computers, electrician, electronics, mechanics, crafts, foods, beauty, health and personal care. Besides that, specific programs may be designed to match new labor market regulations and standards, as well as specific groups targeted by public policies (see sections “[Introduction: VET in the National Agenda](#)” and “[The National and Sectoral VET Plans](#)”). Their certificates are not recognized for educational upgrading, yet valid for getting “quality seals” or “job permits” required or valued in formal and informal economy (see “[Introduction: VET in the National Agenda](#)”).

Formal and nonformal VET are offered mostly face-to-face. Alternatives for distance learning have existed in the country for about 100 years, mainly for the nonformal courses. Currently, they are expanding fast, propelled by new technologies (personal computers, mobiles, tablets), increasingly available at home, work, and public spaces. These new media are opening new possibilities for the VET market, thanks to lower costs and greater flexibility for students and teachers, together with more attractiveness for the youngsters (ABED 2017; IBGE 2017b).

---

## Public Funding and Private Management: Brazilian VET

The Brazilian VET “nonsystem” development has been supported by a historical alliance between public funding and private management. This sort of alliance is not unusual in Brazilian public policies and is often criticized for lack of transparency, poor accountability, modest results, and clients’ dissatisfaction.

The public-private alliance for the VET development is not above this sort of criticism. Nevertheless, it shows more consistent results, in terms of capacity building (infrastructure, human resources, and methodologies), high-quality services and clients' approval, not to mention the strengthening of a "training culture" in the productive sector.

This mutually beneficial partnership has been decisive for the VET market consolidation despite the chronic political-economic instability of the country. A continuous flow of funds has sustained a medium and large term perspective for the VET suppliers. The private management – encompassing planning, supervising, and execution activities – has been more flexible and sensitive to large-scale and diverse VET demands in the country.

Historically, VET in Brazil has been financed by two main public sources: the constitutional funds for formal education, which benefit EJA, technical, technological, and higher level courses; and pay-roll levies and other compulsory contributions from enterprises, which have been created by federal laws, in order to finance social and labor policies, directly benefiting the VET market.

Besides these main sources, the subsidies for higher education had a considerable expansion in the last decade (see section "[The Private Higher Education](#)"). The tax rebating schemes are less important. The main tax rebate scheme for VET in Brazil existed from 1975 to 1990; since then, several exemption mechanisms have been dismantled, for budgetary reasons. Nevertheless, there are a few alternatives that may include VET programs in cultural-social projects subsidized by tax incentives. In addition, the personal income tax rules allow small deductions related to formal VET expenses (fees, books, materials, and equipment), excluding nonformal training (more difficult to be monitored by the Federal Revenue).

In order to explain the public-private alliance peculiarities in Brazil, this section highlights consolidated and large-scale VET cases, covering different programs and funding schemes, namely: the S System and the new Apprenticeship Law, both financed by payroll levies; the national VET plans supported by compulsory social contributions; and the higher education expansion promoted by public subsidies.

## **The S System**

First, the "S System" is not a system. This expression is a popular label that has become practically "official" to designate a set of nine institutions that provide VET, social and cultural services for specific economic sectors in Brazil. Created from the early 1940s to the later 1990s, these institutions are named as "Services" (S), most of them organized in pairs, encompassing the "Apprenticeship Services" – focused on VET, and the "Social Services" – for culture and educative activities, often including nonformal training. The only exception is a consultancy Service (Sebrae) that provides technical assistance and training for small business (Table 2).

For legal purposes, the Services are independent organizations, classified as nonprofitable private entities, structured in national and state (called "regional") departments, managed by executive directories and national/regional boards. These

**Table 2** Profile of the Brazilian “S System”

Creation	Institutions	Services	2016 – VET enrollments (million)	Levies contributors <sup>a</sup>
1942	<b>Senai</b> (Serviço Nacional de Aprendizagem Industrial)	VET	2.6	<b>Industry</b> (manufacturing, construction, mining, rail transportation, utilities services)
	<b>Sesi</b> (Serviço Social da Indústria)	Social-cultural-educative <sup>b</sup>	1.1	
1946	<b>Senac</b> (Serviço Nacional de Aprendizagem Comercial)	VET	1.2	<b>Commerce</b> (gross and retail, personal and commercial services)
	<b>Sesc</b> (Serviço Social do Comércio)	Social-cultural <sup>b</sup>	0.1	
1972	<b>Sebrae</b> (Serviço Nacional de Apoio às micro e Pequenas Empresas)	Technical consultancy <sup>b</sup>	1.0	<b>Small business</b> (less than 100 employees – all sectors)
1992	<b>Senar</b> (Serviço Nacional de Aprendizagem Rural)	VET + social-cultural <sup>b</sup>	0.1	<b>Rural and agribusiness</b>
1993	<b>Senat</b> (Serviço Nacional de Aprendizagem do Transporte)	VET	0.6	<b>Ground transportation</b> (except by rail)
	<b>Sest</b> (Serviço Social do Transportes)	Social-cultural <sup>b</sup>	0.8	
1998	<b>Sescoop</b> (Serviço Nacional de Aprendizagem do Cooperativismo)	VET + social-cultural <sup>b</sup>	–	<b>Urban cooperatives</b>

Sources: SEBRAE 2017; SENAC 2017; SENAR 2017; SENAT 2017; SESC 2017; SESCOOP 2017; SESI 2017; SEST 2017

<sup>a</sup>Targeted by each service and charged by the respective payroll or sales levy. There are important economic sectors not covered by the services, such as banking, harbors, navigation, and airlines. Some of them count on compulsory contributions for VET, but are mostly under public administration (see Table 3).

<sup>b</sup>These services provides mainly social-cultural events (literature, arts, sports, health care), and often nonformal training (literacy courses and adult education). In São Paulo, the most important Brazilian State in economic terms, the bigger private system of basic education is managed by Sesi

boards include representatives of entrepreneurs, government and workers – but not in a tripartite basis (except for Senar). Although privately managed, their public funding implies annual reporting to the state or federal audit authorities.

The Services are mainly financed by the levies charged over the companies’ payroll or sales. The payroll levies were instituted in 1942 (Law Decree 4048) to finance the industrial apprenticeship courses, together with the first Apprenticeship

Service (Senai) and its social partner (Sesi). From then on, other similar Services have been organized, targeting other economic sectors (Table 2).

These levies are monthly collected by the public pension system (INSS – Instituto Nacional da Seguridade Social) and transferred to the Services by the tax revenue authorities (SRF – Secretaria da Receita Federal). In 2016, the SRF transferred levies near to R\$38 billion (almost US\$12 billion): 42% for the “S System” and 58% to other funds, mostly under public administration (Table 3). The Social Services (Sesi, Sesc, and Sest) have received the bigger share, since they count on levies 50% higher than their Apprenticeship partners (Table 3).

The levies represent around 80–90% of the Services annual budget, complemented by two additional sources: fees paid by the students and companies for training and technical assistance; and temporary contracts for national and sectoral VET plans (see section “[The National and Sectoral VET Plans](#)”). By law, only the Apprenticeship courses (see section “[The New Apprenticeship Scheme](#)”) should not be charged, but the services supply many other free programs, mainly for the unemployed people and other vulnerable groups.

**Table 3** The Brazilian “S System”: levies received in 2016

Institutions	Payroll levies charged monthly <sup>a</sup>	Levies received in 2016	
		R\$ million	%
<b>Apprenticeship services</b>			<b>29</b>
Senai <sup>b</sup>	1%	1,520	10
Senac	1%	2,571	16
Senat	1%	467	3
<b>Apprenticeship and social services</b>			<b>7</b>
Senar	0.2 to 2.5%	744	5
Sescoop	2.5%	319	2
<b>Social services</b>			<b>45</b>
Sesi	1.5%	2,176	14
Sesc	1.5%	4,643	29
Sest	1.5%	298	2
<b>Consultancy-training services</b>			
Sebrae	0.3 to 0.6%	3,157	20
<b>Total levies transferred to the “S System”</b>		<b>15,895</b>	<b>100</b>
<b>Total levies transferred in 2016<sup>c</sup></b>		<b>37,835</b>	

Source: SRF 2017

<sup>a</sup>Exceptions: Senar levy is charged over sales of rural/agribusiness companies, also counting on funds from National Agrarian Reform Institute (INCRA). The autonomous drivers linked to Sest/Senat are charged over their gross income

<sup>b</sup>Companies with more than 500 employees pay an additional levy (0.5%) that is managed by the National Department

<sup>c</sup>Including mainly the “wage salary” that finances an education fund (FNDE – see section “[The Private Higher Education](#)”), together with specific levies for the harbor, navy and aviation sectors (Navy and Aeronautics funds), which finances a traditional net of military schools and academies

The services keep a net of 2.8 thousand schools, training center, and mobile units (trucks, wagons, boats) across the country, which supply a wide range of courses, either face-to-face and distance learning: EJA, continuous education, secondary technical, higher (technological), and postgraduation (7.5 million enrollments in 2016). Historically, the System has been the only supplier for Apprenticeship courses, remaining as its main provider since 2010 (see section “[The New Apprenticeship Scheme](#)”). Furthermore, they provide technological services (lab tests, product research, and development), and business consultancy for its associates.

Historically, the Brazilian “S System” has been a model for several organizations in other LA countries, some of them still actives. But the Brazilian scheme is the most ancient, bigger and resilient in the region, not to mention that is the only that joins public funding with private management.

The Services, especially the more ancient (Senai-Sesi and Senac-Sesc) have built an image of efficiency and quality, even better in comparison to other public VET alternatives in the country. Senai is among the few Brazilian VTIs that keep a monitoring system, including the students’ follow-up (revealing an average employment rate around 70–80% for technical and technological graduates). Most of their direct clients (students, parents, workers and employers) declare themselves satisfied with their schools, courses, and teachers. Their methodologies, systems and didactic materials have been adapted or adopted by numerous VTIs in the country, and largely transferred to foreign organizations, by means of international cooperation agreements (Leite [2015b](#), [2017](#)).

Besides the general criticism involving any public-private alliance in Brazil, the S System is used to face two threatens: become a government organization or survive without the payroll levies, as a private business. Actually, these are delicate issues that affect other institutions also financed by compulsory contributions (such as the entrepreneurs’ federations/confederations in charge of the Services, not to mention the military schools).

## **The New Apprenticeship Scheme**

The Brazilian Apprenticeship course was born in 1943, together with the first Labor Law (CLT *Consolidação das Leis do Trabalho* – Decree-Law 5452). Inspired in the German dual model, it was conceived as a hybrid mechanism, combining a job contract with school-based training. The CLT has fixed compulsory “quotas” for the young apprentices (aged 14–18 years), who should be hired by the firms as formal employees, and enrolled at Senai and other similar Services created since them. By this time, the Apprenticeship courses were mostly long-term (2–3 thousand hours), including different internships’ schemes in the enterprises.

This model did well until the 1960s, survived the 1970s and almost collapsed by the 1980s, affected by the enterprises’ modernization, new agreements for youngsters’ protection, and families’ aspirations in terms of education and jobs for their children. Facing a decreasing demand, the main Apprenticeship’s suppliers – Senai and Senac – had to reduce the course’s offering.

After several studies and propositions, the Ministry of Labor (MTE) approved the “New Apprenticeship Law” in 2000 (Federal Law 10097), in order to promote decent work and reinforce youth policies. Among several innovations, the new Law has reduced the labor costs for the apprentices’ hiring, also extending their top age limit (from 18 to 24 years old). The courses and contracts have been limited to 24 months, and any institution was authorized to enter this market, formerly reserved to the S System (Leite 2015a), which kept their respective levies. Inspecting and fining mechanisms were reinforced by the MTE.

As a result, the Apprenticeship contracts rise from 57.2 thousand in 2005 to 402 thousand in 2015 (MTE 2017a). Despite the market opening, the S System remained as the main supplier (76% of enrollments/contracts, mostly at Senai and Senac), thanks to their infrastructure, know-how and public image. Anyway, new suppliers have emerged (24% of enrollments), including private and public enterprises, foundations, and NGOs – in several cases adopting or adapting the Services methodologies (Leite 2015a).

The MTE has initially considered a potential for 1.2 million of Apprenticeship contracts yearly. But the program reached at best about 400 thousand contracts in 2014–2015, decreasing to 310 thousand in 2017 (MTE 2017a). Indeed, the scheme has been affected by the decreasing of formal employment (that is not expected to recover in the short term). Likewise, it depends on the potential apprentices’ aspirations, which are clearly more interested in the technical and higher education certificates. Even so, the MTE evaluates the program positively, considering that it has opened decent job opportunities for the young people, also stimulating the apprentices to look for more education and training (Leite 2015a).

## The National and Sectoral VET Plans

In addition to the payroll levies (see section “[The S System](#)”), Brazilian laws set “social contributions” over profits and sales, charging public and private enterprises. These contributions finance a public fund (FAT – see “[Introduction: VET in the National Agenda](#)”), managed by a tripartite deliberative board (CODEFAT – Conselho Deliberativo do FAT) and administrated by the MTE.

Since the 1990s, FAT has been supporting public labor policies, encompassing economic development, job creation, placement services, unemployment insurance, micro credit for formal and informal sector, and VET programs pertinent to all these activities.

In 2015, FAT’s total budget reached R\$ 65.7 billion (about US\$21 billion), increasing to R\$72.8 billion in 2016, in spite of the economic recession (MTE 2017c). This budget covers two main expenses: loans (R\$16.5 billion in 2016) granted by the BNDES (Banco Nacional de Desenvolvimento Econômico e Social) – the main national development agency; and social benefits, such as the unemployment insurance (R\$38.4 billion) and the annual bonus for formal workers that received less than two minimum wages (R\$17.9 billion). Specific funds for VET have decreased in the last decade, due to the recession and public budget

adjustments, but training has become a crucial element in most of FAT’s expenditures, also reinforced by means of national and sectoral plans.

National VET plans have existed in Brazil since the 1970s. After FAT’s creation, these plans have been integrated to public policies, under federal, state and local governances (Table 4).

Despite their different titles and acronyms, the national VET plans share several common features, such as:

- The focus: Vulnerable groups benefited by social policies, such as poor and/or unemployed people, informal workers, ethnical minorities, immigrants and refugees.
- The contents: Short-term training, aiming at immediate productive insertion, but often including basic skills (writing, reading, calculating) and social attitudes valuable for living and working (the current Pronatec has expanded these contents, adding adult education and long-term technical courses).
- Their main suppliers: The S System and other private VTI, operating with a large degree of autonomy in order to enlarge the sectoral and territorial coverage.
- The results: At best, 30–40% of the students get a job after the courses, mostly informal. Nevertheless, 80–90% of the clients evaluate the programs positively, pointing out benefits in terms of self-esteem, information about labor market and incentives to continue studies and training (IPEA 2014).

**Table 4** Brazil – National VET Plans financed by FAT (1995–2018)

---

**1995–2002 > Planfor** (Plano Nacional de Qualificação Profissional)

Coordination: Ministry of Labor

Priority public: Vulnerable groups, mainly the beneficiaries of social, labor and development programs (see “[Introduction: VET in the National Agenda](#)”)

Contents: Short term training courses (40–100 h)

Enrollments: 27.2 million (1996–2001), covering 75% of the Brazilian cities

Main VET suppliers: S System (70% of enrollments), universities and colleges, technical secondary schools, labor unions, NGOs

---

**2003–18 > PNQ** (Plano Nacional de Qualificação or “Qualifica Brasil” since 2018)

Coordination: Ministry of Labor

Priority public: The same as Planfor

Contents: Short term training courses (100–140 h)

Enrollments: 1.3 million (2003–2012)

Main VET suppliers: The same as Planfor

---

**2011–18 > Pronatec** (Programa Nacional de Acesso ao Ensino Técnico e Emprego)

Coordination: Ministry of Education

Priority public: The same as Planfor, with a special focus on the Bolsa Família beneficiaries (see “[Introduction: VET in the National Agenda](#)”)

Contents: FIC (initial and continuous training) = 160 h and TEC (technical courses, at secondary level) = 800 h, including alternatives of distance education and EJA (since 2016)

Enrollments: 9.4 million (2011–2015), aiming more three million (2016–18), covering 75% of the Brazilian cities

Main VET suppliers: The same as Planfor (the S system and other private VTIs have supplied 65% of TEC and 87% of FIC enrollments)

---

Sources: Leite et al. 2009; Leite 2003, 2015a, 2017

Sectoral VET plans are more focused on training and recognition for specific activities in formal economy. In fact, since the 1990s, many technical and operational jobs have been regulated in Brazil, aiming at upgrade the worker's educational profile, according to new domestic and international standards. These requisites have implied massive VET and recognition programs, such as Profae/Profaps – for the health sector, and Prominp – for the oil and gas chain (Table 5). Both programs count on positive evaluations and have been active for long periods, although affected by the economic-political turbulence since 2014 (see “[Introduction: VET in the National Agenda](#)”). Nevertheless, these programs are expected to continue in the short and medium term, considering the huge demand for skilled labor in their sectors.

## The Private Higher Education

A higher education diploma is used to be a sign of social prestige in Brazilian culture. Currently, it is also a passport for better jobs and wages, as well as a basic requirement for public clerks careers: in 2015–2016, more than two million formal jobs have disappeared, but high educated workers have a positive balance

**Table 5** Brazil –Sectoral VET Plans financed by FAT (2000–2018)

---

<b>2000–10 &gt; Profae</b> (Projeto de Profissionalização dos Trabalhadores da Área de Enfermagem)
Focus: Secondary education, training and recognition for low educated nurses, according to new health services' directives
Coordination: Ministry of Health
Additional funding/technical assistance: IDB - International Development Bank and PAHO – Pan American Health Organization
Enrollments: 250,000 (2000–2002)
Main VET suppliers – Around 300 entities specialized in health sector: Senac, universities and colleges, technical secondary schools, professional associations, public foundations, NGOs
<hr/>
<b>2010–18 &gt; Profaps</b> (Plano de Certificação de Técnicos Para a área de saúde)
Focus: Certification of secondary health technicians (a degree over assistant nurses), a highly demanded by public health services (in continuity to Profae)
Coordination: Ministry of Health
Goal: 700,000 certificates 2010–2018 (results not available)
Main VET suppliers: The same as Profae, but able to emit secondary technical certificates
<hr/>
<b>2006–18 &gt; Prominp/PNQP</b> (Programa de Mobilização da Indústria Nacional do Petróleo e Gás natural – Plano Nacional de Qualificação Profissional)
Focus: Training and recognition of skilled workers from operational to higher level, for gas and oil chain
Coordination: Ministry of Industry and Commerce and Petrobrás (Petróleo Brasileiro S.A.) – the biggest Brazilian oil company
Additional funding: Petrobrás
Enrollments: 99,000 in 180 courses (2006–2015), mainly focused on skilled operational workers (welders, mechanics, electricians, metallurgists, heavy equipment operators).
Main VET suppliers – Around 80 entities: Senai, universities and colleges, technical schools, professional associations (metrology, welding, metallurgy, mechanics, electricity, and electronics)

---

Sources: Leite 2003, 2015b, 2017

of 142 thousand new employees (MTE 2017b). By the end of 2017, the higher education workers were less unemployed (6%) than the average labor force (13%), receiving about US\$1550 monthly – more than five times the minimum wage (IBGE 2017c).

However, as usual in most countries, colleges and universities are difficult to access, due to high competition for the public schools and high costs in the private ones.

Since the 2000s, the Brazilian education agenda has favored the higher education expansion and diversification, by means of subsidized credit, affirmative actions (quotas for minorities), and market opening for international corporations (such as Kroton and Laureate groups). Besides that, the Ministry of Education (MEC) has implemented a national evaluation process, which classifies the courses and institutions according to their students’ performance in a national test. It is not mandatory, but the institutions, mainly the private ones, stimulate their students to participate, in order to get “excellence seals” valuable for marketing and financing purposes (Leite 2017).

In 2004–2016, the number of higher level courses has increased 76%, practically doubling the enrollments (Table 6). The technological branch has boomed in terms of courses (+278%) and enrollments (+495%), for practical reasons: the courses are shorter and less expensive than bachelors; they focus on expanding areas, such as business, computers, logistics, health, environment, and ecology; their diplomas are so prestigious as any bachelor degree (except for top careers in medicine and law).

The higher education’s boom has taken place mainly in the private institutions, fueled by two public incentives: FIES (Programa de Financiamento Estudantil) – a subsidized loan program, and ProUni (Universidade para Todos) – a scholarship program.

Both programs target low-income candidates approved at the national post-secondary examination (ENEM), prioritizing undergraduates from public schools. The loans and scholarships are financed by an education fund (FNDE – Fundo Nacional para o Desenvolvimento da Educação), created in 1968 (Federal Law 5537), to finance basic and higher education policies under MEC’s coordination. The Fund’s budget reached R\$30 billion (about US\$9 billion) in 2016, including almost R\$20 billion from the education salary – a 2.5% payroll levy created in 1975, complemented by other sources, such as lottery taxes (MEC 2018a, b, c; SRF 2016).

**Table 6** Brazil 2004–2016 – Higher education courses and enrollments

Year	Courses (thousand)		Enrollments (thousand)		Enrollments in private entities (thousand)	
	Total	Technological <sup>a</sup>	Total	Technological <sup>a</sup>	Total	Technological <sup>a</sup>
2004	19.6	1.8	4,223.3	158.9	3,009	113.3
2016	34.4	6.8	8,048.7	946.2	6,058.6	789.2
<b>2016/ 2004</b>	<b>76%</b>	<b>278%</b>	<b>91%</b>	<b>495%</b>	<b>101%</b>	<b>598%</b>

Sources: INEP 2014, 2017b

<sup>a</sup>The technological courses generally last 2 years, focusing specific areas/jobs, such as business, computers, logistics (similar to the American college)

The higher education institutions themselves perform as intermediates between MEC and the candidates to these incentives, which that have benefited 40% of their students in 2016 (MEC 2018a, b, c).

- FIES was created in 2001 (Federal Law 10260), boomed in 2010–2014 (from 76,200 to 731,000 contracts), and decreased in 2015 (252,000 contracts). Since then, the program has been reviewed, announcing 310,000 loans for 2018. The loans may be paid until 14 years after the graduation, with zero or low interest rates.
- PROUNI was created in 2005 (Federal Law 11096), granting tax exemptions for private institutions that offer full or partial scholarships (complemented by FIES) to their students. Until 2015, Prouni has benefited almost 1.9 million students, mostly with full scholarships. Although decelerating since 2016, the Program promises 243 thousand scholarships for the 2018's first semester, mostly partial.

Although decelerating since the last recession, both Programs have revealed the potential for the higher education market in Brazil, where only 14% of people aged 25 and over have concluded this level (IBGE 2017b). Interested in this potential, the bigger education corporations are creating their own credit mechanisms, exploring partnerships with private financial institutions (Pravaler 2018).

---

## Conclusions: Challenging Perspectives

For analytical purposes, one may say that the Brazilian VET market has been consolidated as a “nonsystem,” encompassing a mix of formal and nonformal alternatives, mostly “invisible” for the education policies and official statistics.

Presently, this “nonsystem” encompasses traditional VTIs (schools, universities, academies) and a myriad of public and private entities not exclusively focused on education and training (NGOs, unions, suppliers, councils, associations, and consultants). They provide a wide range of events that should be seen as VET in Brazil, as far as required or valuable for employability: literacy courses, adult education, on-the-job training, apprenticeship courses, technical and higher education, workshops, seminars, internships, and consultancies.

A mutually beneficial alliance between public financing (from payroll levies and other compulsory contributions) and private managing (involving planning, supervision, and execution) has been decisive for the Brazilian VET “nonsystem” consolidation since the 1940s. This sort of alliance is not uncommon in Brazilian public policies and is usually criticized for lack of transparency, poor accountability, and frustrating results.

Although not immune to this sort of criticism, the alliance that supports the VET “nonsystem” presents more consistent achievements, in terms of capacity building (infrastructure, human resources, and methodologies), quality services, and a positive perception from most of its clients, even better in comparison to most public services in Brazil.

These results reflect, by one side, a considerable and continuous flow of funds that have sustained a medium and large term perspective for the VET development. On the other side, the private management practices – more flexible and focused on the market needs – have been able to meet large-scale and diversified VET demands.

The country has several consolidated VET cases based on this alliance: the so-called “S System,” composed by nine independent institutions that have been delivering VET services since the 1940s; the new Apprenticeship scheme implemented since the 2000s, focused on decent work opportunities for young people; the national/sectoral VET plans targeting vulnerable people or strategic sectors since the 1990s; the higher education expansion based on subsidies for private institutions, in the last decade. Despite of their results and resilience, these cases also reveal that the Brazilian VET “nonsystem” has much to do in terms of transparency and accountability.

Prospects are difficult in Brazil, given the chronic political-economic uncertainty. Anyway, one may expect that the public-private alliance concerning VET and other policies must be in the short- and medium-term national agenda.

The forecasts for the Brazilian economy are cautious (WB 2018). The inflation seems to be under control, the interests’ rates have declined and the investment may grow, providing that the government succeeds in structural reforms and public debt control. Incentives, subsidies, and other nonreturning spends are expected to decrease, also requiring better focus and more transparency. The employment rate may rise, but slowly and mainly in the informal sector, thus affecting compulsory contributions and levies charged on sales and formal labor.

The payroll levies can also be impacted by the new labor law which was approved in 2017. This law is supposed to increase the labor market’s flexibility, and promote direct agreements between employers and workers. From an optimistic view, the new rules may reduce the red tape and labor costs, stimulating the formal employee’ expansion; from a pessimistic look, wages, and other labor conditions could deteriorate, increasing turnover and labor informality.

In any scenario, the Brazilian VET “nonsystem” must be prepared for continuous demands of skills and competences, driven by multiple and combined forces, namely: a more flexible and dynamic labor market; companies and citizens’ pressures for better services and urban infrastructure (education, health, transportation, housing, energy, clean water, and sewerage systems); international agreements and domestic regulations concerning environment, civil rights, and decent labor; social policies concerning poverty and inequality; education goals defined by the National Education Plan (PNE) 2014–2024.

Actually, the PNE defines multiple challenges for the education system, which may directly impact most of VET alternatives: universalize basic education, including secondary level; eliminate adult illiteracy; expand adult, technical, and higher education. There are also ambitious goals in terms of efficiency and quality, implying new technologies and skilled human resources in the educational sector, mainly teachers and managers (Observatório do PNE 2017).

A new national curriculum for the secondary school is supposed to be implemented until 2024 (Law 13415/17), including basic vocational contents, which could imply specific demands for the VET market. Its main goal is to make the secondary level more attractive to the students, reducing dropout rates and enlarging their professional development perspectives.

In a context of scarce funding sources, all these demands shall require the VET market to be more efficient and focused. New technologies, including distance education, are expected to expand, favored by their flexibility, lower costs, and attractiveness for younger students and workers. Transparency laws and citizens' pressures may result in better accountability, including systematic monitoring and evaluation of all VET branches, including the less visible ones.

technology for learning, including in SMEs. It suggests that the major issue has been an approach to the development of technologies for learning founded on technological determinism and this fails to consider the nature of learning in the workplace. It suggests the use of technology for learning in the workplace requires the development of new pedagogic approaches. Such approaches are illustrated with examples drawn from recent large-scale European research and development projects.

## **E-Learning: A Cost-Effective and Flexible Solution for Learning for the New Skills Required of the “Knowledge Economy”?**

This chapter explores the development and practice of e-learning in the workplace. E-learning is understood here as “the study and ethical practice of facilitating learning and improving performance by creating, using, and managing appropriate technological processes and resources” (Januszewski and Molenda 2010). In recent years, the term “technology-enhanced learning” (TEL) has tended to be more prevalent. In this chapter, both terms are used interchangeably. Similarly, the term “in the workplace” requires some clarification. While once largely limited to the offices and factories of companies and organizations, the use of information and communication technology has led to the development of the distributed workplace and increasingly allows employees to work from home. It is therefore becoming appropriate to define the workplace as any setting in which an employee is performing work duties, even if this location is his or her home (Sloep 2011).

The narrative promoting the use of e-learning in the workplace varies a little but in general is based around changing technologies, new knowledge and skills, and lifelong learning. Later in this chapter, I will explore some of the more problematic issues in such a narrative but first will exercise the main arguments.

Educators today, it is said, are tasked with developing lifelong learners who can survive and thrive in a global knowledge economy – learners who have the capability to effectively and creatively apply skills and competencies to new situations in an ever-changing, complex world (The World Bank 2003; Kuit and Fell 2010).

In part, this is due to the rapid pace of change in the world of work meaning that both the nature and content of jobs are changing fast. For example, it is claimed that the effect of Artificial Intelligence (AI) and robotics in the workplace means that many jobs, if they are not completely replaced by robots, will be very different (Hart 2018). With the rapid growth in the availability of information and data, there is a concern that knowledge and skills now have a short shelf-life. At the same time, individuals are living longer, so the traditional “job for life” model has disappeared. In fact, a MIT Sloan Management report (2017), entitled “The corporate implications of longer life,” suggests that the flexible nature of the modern workforce will likely see a 15-year-old today navigating a portfolio of 17 jobs in 5 different industries.

These changes are leading to new demands for skills and knowledge. A study of pay rates in the USA found increasing demand for cognitive as well as non-cognitive skills and that digital intensive industries especially reward workers having relatively higher levels of self-organization and advanced numeracy skills (Grundke et al. 2018). They also found that “bundles of skills are particularly important: workers endowed with a high level of numeracy skills receive an additional wage premium, if they also show high levels of self-organisation or managing and communication skills.”

But changing skills demands are not limited to digital industries: research has shown growing demand for new and higher levels of skills in traditional manual occupations in the construction sector (Attwell et al. 2013).

With this background, e-learning is proposed as a cost-effective and flexible solution for not only replacing traditional face to face training but to scaling up access to learning for the new skills required of the “knowledge economy.” E-learning can provide flexible learning options for employees and allow them to up-skill more rapidly (Guiney 2015). E-learning in the workplace can decrease the costs of up-skilling a workforce through reducing travel and employee time away from work. E-learning is particularly useful for a geographically dispersed workforce because it can deliver a consistent training experience (ibid.).

It is also argued that e-learning is increasingly valued by employees. A survey of approximately 4000 professionals globally by LinkedIn (2018) “with the goal of providing a holistic view of modern workplace learning” found that 58% of employees prefer opportunities to learn at their own pace and 49% prefer to learn at the point of need. This experience can only be achieved by online learning solutions, says LinkedIn.

Guiney (2015) says: “From an employee perspective, e-learning can provide flexible learning options and also allow them to more rapidly up-skill. Simulations and virtual reality environments are being used to provide more relevant, authentic workplace learning. E-learning can offer more customised training. E-learning also allows employees to revisit challenging aspects of the course more readily. Some firms are starting to introduce systems, technologies, and processes that embed training and learning within employees’ daily work flows.”

## The E-Learning Industry

The increasing use of e-learning in the workplace is reflected in the growth in the market for e-learning technologies. The size of the e-learning market was estimated to be over USD 165 billion in 2015 and is likely to grow by 5% between 2016 and 2023, exceeding USD 240 billion (Docebo 2015), although these figures include colleges and schools as well as workplace learning. The corporate sector has been viewed as a potential fast growth area. According to a market study released by Technavio (2018), the size of the global corporate e-learning market is predicted to reach an approximate amount of USD 31 billion in revenue by the end of 2020. Technavio’s analysts say changing business needs and technology improvements

have encouraged the adoption of e-learning solutions at the expense of traditional teaching methods.

In 2018, stock market listed educational technology provider, Blackboard, had a market cap of USD 1.3 billion. In 2015, LinkedIn announced the USD 1.5 billion acquisition of online education company Lynda.com (Recode 2015). Lynda.com provides video courses to paying subscribers hoping to learn online, with tutorials on a wide range of business subjects from Web design to 3-D animation. Other e-learning companies such as Coursera and Codecademy have attracted substantial investment.

## The Limited Impact of E-Learning in Companies

Yet, despite the claims of “e-learning evangelists,” the exhortations of economic organizations, and the hype of the e-learning industry, there remains serious doubt over the effectiveness, impact, and take-up of technology for learning, especially in the workplace. As Dirk Van Damme (2014) asks: “Why have ICT and the internet – which has profoundly changed production and distribution in so many sectors and improved productivity – not had the same impact on education so far.”

UK’s Chartered Institute of Personnel and Development (CIPD) ran an annual Learning and Development survey report from 1998 to 2015 which examined current practices and trends within learning and development. The 2013 survey showed that only 15% of the organizations which replied to their questionnaire considered e-learning to be one of the most effective learning methods available to them. However, this belief in e-learning effectiveness had grown from 7% in their 2009 survey (CIPD 2013).

The CIPD’s 2013 survey showed that face-to-face training was considered much more effective than virtual training, with 48% favoring in-house development programs and 39% preferring coaching by line managers (CIPD 2013). The survey also showed that 91% of organizations taking part believed that e-learning was most effective when combined with other learning methods, with 72% stating that TEL should not be regarded as a substitute for face-to-face training.

A study by Mwangi (2014) investigating the adoption and use of e-learning at the workplace revealed that 55% of the respondents to a large-scale questionnaire were of the view that workplace e-learning applications fail to meet the needs of learners, hence not motivating employees to learn, while 45% disagreed. Regarding people interaction, 76% of the respondents said that they felt that e-learning cuts the social and cultural interaction of people, while 81% did not agree that e-learning should be replaced by human instructors.

Regarding factors mostly influencing the adoption of e-learning in workplaces, the findings showed that 53% of the employees interviewed attributed the lack of interactivity as the single-most important factor to overcome learner resistance to workplace e-learning.

It appears that there is little change since these reports were undertaken. In the seventh Annual Survey of Workplace Learning (involving over 5000 companies),

Jane Hart (2018) has found little value attached to e-learning. Daily work experiences (i.e., doing the day job) and knowledge sharing within teams were most valued, with manager feedback and guidance not far below. The most valued ways of learning also include Web search, Web resources, and professional networks and communities.

In June 2018, David Hopkins, tweeting from the LTFS conference, said “How do you deliver training/learning . . . online or F2F? More hands in audience for the latter, is that indicative of tech used for learning, in online/digital environments?”

## E-Learning in Small and Medium Enterprises

That there has been only a limited take-up in the use of technology for learning in companies, particularly in small and medium enterprises (SMEs), is an issue of concern to policy makers and planners (Attwell 2007).

Large organizations are more likely to adopt e-learning than SMEs because they have better infrastructure and systems and can more readily achieve economies of scale and return on investment (Guiney 2015). Guiney suggests SMEs can form collaborative networks to share knowledge, resources, and expertise to overcome the cost and relevance barriers they face when implementing e-learning.

Admiraal and Lockhorst’s (2009) survey of over 400 small and medium enterprise (SME) owner-managers across 7 European countries and subsequent interviews with owner-managers and employees from more than a quarter of these also showed a predominantly negative attitude toward technology and learning.

A critical review of the way in which information technologies are used for workplace learning (Kraiger 2008) concluded that most solutions are targeted toward a learning model based on the ideas of direct instruction based on a traditional business training model with modules, lectures, and seminars transferred from face-to-face interactions to onscreen interactions, but retaining the standard tutor/student relationship and the reliance on formal and to some extent standardized course material and curricula.

However, research suggests that in SMEs much learning takes place in the workplace and, through work processes, is multiepisodic, is often informal, is problem based, and takes place on a just-in-time basis (Hart 2011). Rather than a reliance on formal or designated trainers, much training and learning involves the passing on of skills and knowledge from skilled workers (Attwell and Baumgartl 2008). In other words, learning is highly individualized and heavily integrated with contextual work practices. While this form of delivery (learning from individual experience) is highly effective for the individual and has been shown to be intrinsically motivating by both the need to solve problems and by personal interest (Attwell 2007; Hague and Logan 2009), it does not scale very well: if individual experiences are not further taken up in systematic organizational learning practices, learning remains costly, fragmented, and unsystematic.

In this introduction to the chapter, I have looked at some of the discourses surrounding the use of technology for learning in the workplace. In the next section,

I will examine issues in research in this area. The third section will return to the issue of the take-up of technology for learning, including in SMEs. I will go on to suggest that the major issue has been an approach to the development of technologies for learning has been founded on technological determinism and this fails to take into account the nature of learning in the workplace. The use of technology for learning in the workplace requires the development of new pedagogic approaches. I will illustrate such approaches with examples drawn from recent large-scale European research and development projects.

---

## Researching E-Learning in the Workplace

Technology-enhanced workplace learning is an under-researched field and according to Peter Sloep (2011) “a comprehensive understanding of its potentials and pitfalls requires significant research efforts.” He goes on to say: “The lack of sound research findings follows both from the speed with which new technologies become available, thus leaving researchers always in pursuit of the latest and the newest, but it also follows from the relative novelty of the field.”

Indeed, in a special issue of the *British Journal of Educational Technology* (BJET) devoted to technology-enhanced learning in the workplace, Short and Greener (2014) reported that a content analysis of the journal, looking at editorials, refereed articles, and colloquia in 31 issues of the publication between January 2000 and November 2005, found of 374 items, only 3% were from “colleges, industry and the ‘learning and skills sector’” (Latchem 2006). Yet despite this it took a further 8 years for a special edition to be published!

Most research in e-learning is focused on the use of technology for learning in school and higher education institutions and in distance education. What research there is on employing technologies for workplace learning has often concentrated on larger enterprises where higher setup costs (like the need to model learning and working domains) as well as costs of operation and maintenance are more easily and earlier outweighed by the corresponding benefits. This contrasts with the situation in SMEs. Also, by addressing highly computer-based workplaces, past learning technology research has started out by picking the low-hanging fruits. In many SMEs, however, and particularly in those from more traditional sectors, much of the work and learning is happening in physical contexts.

Research has tended to focus also on the use of particular technologies for learning or on case studies in particular companies or industries.

There are good reasons to explain this dearth of broader research in e-learning in the workplace. Firstly, it is a very broad field. Evidence would suggest a very varied pattern of take-up in different sectors and occupations (Attwell 2007) and also within sectors. Even within sectors seen as slow to adopt the use of e-learning, there will be examples of innovative and effective use. More problematic would seem to be the generalization and mainstreaming of examples of effective practice.

Secondly, the practice of e-learning in the workplace requires a multidisciplinary and boundary-crossing approach from a research perspective. Prime among these

perhaps is the boundary between formal and informal learning. There are also boundaries between initial and continuing VET, between practice and knowledge, and between developers and learning professionals.

As Kunzmann and Schmidt (2006) have pointed out, in a perspective focusing on the individual, technology-enhanced workplace learning has emerged as an approach bundling classical e-learning with knowledge management techniques for holistic workplace learning support covering both formal and informal learning and focused on learning activities integrated into work processes, merging e-learning, knowledge management, and performance support.

Complex also is the relation between changing practices in training and human resource development, to a large extent driven by changing technologies, and the emergence of new technologies with the potential to support workplace learning. Any study of vocational and workplace learning has also to account for the duality of learning about technology and learning through technology.

Attempts have been made to explain the developing use of e-learning in the workplace through time-based phases. Peter Sloep (2011) identifies four different phases of “Perspectives on learning in the workplace” (based on Kluijtmans 2010): the human relations movement until 1970, professionalizing organizational training and learning from 1970 to 1990, human resource development from 1990 to 2000, and lifetime employability from 2000 onward. He looks at how technologies supported each of these “movement.” In a short history of workplace learning, Jane Hart (2018) says the work of the learning and development departments has evolved and moved through a number of five identifiable stages: classroom training, e-learning, blended learning, social learning, and modern workplace learning.

Other analyses have been based on the potential affordances of different technologies for learning (see, e.g., Istance and Theisens 2013). At a simple level, such analyses have looked at the differences between applications which support synchronous and asynchronous communication. Others have attempted to divide between those technologies designed for education and learning and those designed for communication and knowledge exchange and applications which support both formal and informal learning. An issue in developing such taxonomic tables is that while e-learning has been associated with the use of learning management systems, the use of social software is being widely used for learning purposes. Taxonomies tend to become rapidly outdated, in part due to technological change and in part due to changing ideas about e-learning. Technologies such as augmented reality and learning analytics based on data analyses and machine learning are impacting on e-learning in enterprises. There is increasing interest in personalized learning as a way to promote e-learning in SMEs.

There may be differences between the use of technology in initial vocational education and training (IVET), continuing vocational education and training (CVET), and school-based vocational education and training, although it is difficult to generalize. Obviously, there will be differences when organizations have a primary purpose in providing education and training and thus a greater awareness of the role of technology in supporting learning. But differences may be also due to the need to

provide greater scaffolding and support to apprentices and students in IVET and, for example, an expectation of greater learner autonomy in CVET.

It has been suggested that there is a need to reexamine the use of technology for learning not from a technical perspective but from a social and pedagogic viewpoint (Van Damme 2014). Twenty-first-century learning, he says, requires a focus on more innovative skills development and pedagogies. Yet the term “twenty-first-century learning” lacks real content. A more analytical approach is to look at the different boundaries which shape the teaching and learning process in companies. This includes the relationship of technology, learning, and innovation. Researchers from both human resource development and from innovation theory have failed to make the critical link between situated learning and social innovation (Deitmer and Attwell 2000). By treating innovation as a technologically determined process and by treating learning as a largely technical and individual matter, learning is rarely seen as integral to the process of innovation, and new forms of knowledge production become abstracted from social forms of interaction and practice within the workplace and broader community. As Guile and Young (2001) have cogently argued: “the problem with individualist conceptualisations of learning is that they neglect the extent to which learning is first and foremost a human activity and therefore, about social relationships and people participating in different types of community.”

In the next section, I look at barriers and issues in the development of the use of e-learning at the workplace, before examining in more detail the nature of workplace learning.

---

## **Barriers and Issues in the Development of the Use of E-Learning at the Workplace**

There has been considerable analysis as to why the take-up of e-learning in the workplace has been slower than expected. Here we will provide only a brief overview, before looking in more depth at the nature of workplace learning and new pedagogic approaches to e-learning in the workplace. In some ways, it may not be an issue about e-learning as such, but about workplace learning overall. With the expansion of workplace learning as a result of the growing impact of technology, the main approach was in classroom-based settings away from the actual workplace (Sloep 2011), but even at the end of the twentieth century, there was growing concern about the effectiveness of classroom-based training because of the absence of convincing evidence for its actual contribution to employee’s on-the-job performance (Baldwin and Ford 1988; Latham and Crandall 1991). The introduction of technology has tended to follow existing learning and teaching approaches, regardless of the particular technology implemented – learning management systems, video, mobile devices, social networking tools, wikis, weblogs, simulations/virtual reality, CD-ROMs, and DVDs – reflected in terms like the electronic classroom and the online meeting room. While there are a wide range of initiatives and examples of e-learning in the workplace, ranging from the

founding of organizational virtual universities to building virtual reality training suites for simulation activity, many of these examples, as elsewhere in online learning, simply transpose conventional practices to a new online space (Littlejohn and Pegler 2014).

Information and communication technologies for learning have been dominated by virtual learning environments which assume a formal and structured curriculum, with educational attainment recognized as a proxy for learning (Attwell 2016). While in some occupations and subjects, such as computer programming or language learning, learning activities may be predominantly cognitive, practice-based occupations, including in healthcare and construction, do not render so easily to this approach. At best technologies have been used for augmenting the teaching and learning process and providing enhanced access to resources.

Attwell (2007) found a variety of reasons for the lack of take-up of technology for learning in small and medium enterprises. One has been the lack of infrastructure and another a lack of awareness of the potential of such technologies, particularly by SME managers. Trainers may not be confident with new technologies, and there may be a lack of digital learning materials for occupational learning. In reality, most technologies are used in existing educational settings.

Guiney (2014) says the main barriers to implementing e-learning in the workplace are:

- High up-front costs that include new and/or upgraded systems, training the trainers, and developing interactive and/or personalized content
- Employee resistance to e-learning
- Organizations not having an appropriate learning culture in place
- Lack of management support
- Adopting technologies and systems that are difficult to use and access, are unreliable, and/or lack technical support
- Employees and trainers lacking the skills and capabilities to teach and learn in e-learning environments
- Irrelevance to real-time work tasks and not integrated with business processes

Where e-learning is implemented, Guiney says, “it is most often as part of a blended approach where it supplements traditional delivery. Blended learning can contribute to significant gains in learner achievement. E-learning is most commonly used by firms to meet their compliance requirements, for business inductions, and information and communication technology (ICT) training.”

There may also be a tension between individual and organizational learning. While research and development for e-learning has been focused on students in formal learning environments, companies are both concerned in the value proposition, learning, and knowledge of the organization, while at the same time the organizational learning environment is conditioned by the external environment (Serrat 2017). In this environment the “organizational context, inter- and intra-organizational relationships, and organizational knowledge interact” (ibid.). Wang (2011) considers that current technology-enhanced learning programs fail to systematically align the

learning with the organization's goals and the individual's needs, which could hamper both organizational and personal growth.

Most of the learning processes are formal, and the potential of informal learning and user-generated content is not being exploited (Werkle et al. 2013). The paradigm change of content toward the expert as author is not yet turned into practice in companies.

It should also be noted that learners in the workplace are a very heterogeneous target group with big age differences, different educational backgrounds and previous knowledge, job roles, learning requirements, learning preferences, and learning goals (Scheffel et al. 2013). Further, the learners in workplace environments have primarily to fulfil their job role, and learning is mostly to support them in doing so (ibid.). With the pressure of high workloads in many working environments, it is difficult for workers to find the time to participate in online learning, even with the support of management (Schmidt and Kunzmann 2016). Learners at the workplace need to be supported systematically, not only with new e-learning solutions but also with their development goals, their working and learning conditions in general, and their work-life balance (Scheffel et al. 2013).

---

## Technology and the Nature of Work-Based Learning

Much of the literature on e-learning at work seems to ascribe e-learning at work to the provision of direct alternatives to traditional training packages, in other words to attempt to move training onto an online platform (Wang 2011). All too often, Wang says, the resulting focus on technology rather than learner's needs results in low-quality, badly designed training that does not achieve its goals. By seeking to mimic the face-to-face learning experience online, we create problems of accessibility, of pedagogy, and of learner engagement.

Critics of e-learning development have pointed to a technocentric approach which they say has dominated the design, development, and introduction of technology for learning (see, e.g., Papert 1990; Brennen 2014). Brennen says "learning' is focused on learning about the tool/technology or the effects of the tool/technology itself, rather than learning with or through the technology." Technology-enhanced learning initiatives tend to be based upon a traditional business training model transferred from face-to-face interactions to onscreen interactions but retaining the standard trainer/learner relationship and a reliance on formal and, to some extent, standardized course material and curricula.

The attempts to replicate face-to-face training and learning experience online have led to a focus on explicit and formal learning. However much of the learning in the workplace is implicit and tacit and occurs in informal contexts. According to Cross (2003), nearly 80% of what people learn at work comes from flexible and self-regulated informal learning activities. The term informal learning is somewhat problematic but can be defined as describing learning without formally organized content and learning that occurs outside of formally organized settings (Sefton-Green 2004).

People learn through observing other behavior, attitudes, and the outcomes of these behaviors. “Most human behaviour is learned observationally through modelling from observing others, one forms an idea of how new behaviours are performed, and on later occasions this coded information serves as a guide for action” (Bandura 1977). Facilitation is seen as playing a key role in structuring learning and identity transformation activities and supporting networking in personal networks, teams, and organizational networks, as well as cross-organizational dialogue (EmployID or brown).

Furthermore, much of the learning in the workplace is related to practice and vocational and occupational competence, rather than the cognitive knowledge associated with the “knowledge economy.” Research around social practice has largely remained the preserve of social science with different approaches based on structuralism, phenomenology, and intersubjectivism among others.

In his paper on theories of social practice, Reckwitz (2002) draws attention to the idea of a “practice” (Praktik) as a routinized type of behavior which consists of several elements, interconnected to one another: forms of bodily activities, forms of mental activities, “things” and their use, a background knowledge in the form of understanding, know-how, states of emotion, and motivational knowledge. A practice represents a pattern which can be filled out by a multitude of single and often unique actions reproducing the practice and the single individual – as a bodily and mental agent – and then acts as the “carrier” (Träger) of a practice and, in fact, of many different practices which need not be coordinated with one another. “Thus, she or he is not only a carrier of patterns of bodily behaviour, but also of certain routinized ways of understanding, knowing how and desiring” (ibid.).

In this understanding knowledge is more complex than “knowing that.” It embraces ways of understanding, knowing how, and ways of wanting and of feeling that are linked to each other within a practice.

In seeking to support e-learning in the workplace, a vital prerequisite is understanding the nature of the social practices within the workplace, both through observable patterns of individual practice and through developing an overall pattern language. This includes the use of objects. Objects are necessary components of many practices – just as indispensable as bodily and mental activities (Reckwitz 2002). Carrying out a practice very often means using particular things in a certain way. Electronic media itself is an object which can mold social practices and enable and limit certain bodily and mental activities, certain knowledge, and understanding as elements of practices (Kittler 1985; Gumbrecht 1988). One approach to choosing ways to develop particular objects is to focus on what Onstenk (1997) defines as core problems: the problems and dilemmas that are central to the practice of an occupation that have significance both for individual and organizational performance.

If understanding the nature of social practices and patterns is a necessary step to developing e-learning applications, it is not in itself sufficient. Further understanding is needed of how learning, particularly informal learning, takes place in the workplace and how knowledge is shared and developed.

Michael Eraut (2000) points out that “much uncoded cultural knowledge is acquired informally through participation in social activities; and much is often so

‘taken for granted’ that people are unaware of its influence on their behaviour. This phenomenon is much broader in scope than the implicit learning normally associated with the concept of socialisation. In addition to the cultural practices and discourses of different professions and their specialities, one has to consider the cultural knowledge that permeates the beliefs and behaviours of their co-workers, their clients and the general public.”

Eraut (2000) attempts to codify different elements of practice:

1. Assessing clients and/or situations (sometimes briefly, sometimes involving a long process of investigation) and continuing to monitor them
2. Deciding what, if any, action to take, both immediately and over a longer period (either individually or as a leader or member of a team)
3. Pursuing an agreed course of action, modifying, consulting, and reassessing as and when necessary
4. Metacognitive monitoring of oneself, people needing attention, and the general progress of the case, problem, project, or situation

He also draws attention to the importance of what he calls mediating objects and points out that while some artifacts are used mainly during learning processes, most artifacts used for working are also used for learning. Such artifacts play an important role in structuring work and sharing information and in mediating group learning about clients or projects in progress.

Among the informal learning processes that Eraut lists are participation in group processes, consultations, problem-solving, trying things out, and working with clients. Working alongside others is important in allowing “people to observe and listen to others at work and to participate in activities; and hence to learn some new practices and new perspectives, to become aware of different kinds of knowledge and expertise, and to gain some sense of other people’s tacit knowledge.”

Tackling challenging tasks and roles requires on-the-job learning and, if well-supported and successful, leads to increased motivation and confidence.

According to de Laat and Schreurs (2013), informal learning in the workplace is often described as observing how others do things, asking questions, trial and error, sharing stories with others, and casual conversation (Marsick and Watkins 1990). Boud and Hager (2012) argue that learning is a normal part of working and professional development should be placed in a social context where professionals work and learn together, changing and innovating both their professional practice and their professional identity.

Laat and Schreurs (2013) argues that we need to find a new balance between formal and informal learning and provide opportunities for what Fuller and Unwin (2003) call expansive – as opposed to restrictive – learning through developing an organizational culture that values and supports learning and, by so doing, opens doors to various opportunities for professional development. Informal professional development through engagement in social learning spaces can enable participation, construction, and “becoming” (Laat and Schreurs 2013).

E-learning can support informal learning in the workplace in two critical ways. Firstly, it can codify tacit or informal information and knowledge and make this available to the organization and its external stakeholders. This also improves organizational knowledge management. Secondly, e-learning makes it easier for employees to form networks with others in the organization and/or externally to share information and knowledge to assist with their daily work or up-skilling.

Tynjälä et al. (2014) say technology can support workplace learning by serving as mediating tools – “tools that help a student either 1) make connections between theory and practice or 2) to reflect on their experiences.”

The transfer of technology skills and the potential for success in design of online technology skills transfer programs is highly dependent upon the social factor. Spitler (2005) found that social interaction has a significant role in technology learning in the workplace with respect to how employees learn to use and become proficient in utilization of technology in their work setting.

The possibilities for learning in the workplace depend strongly on three factors: job characteristics, information environment, and social working environment, respectively (ibid.).

The content and complexity of a job determine to a large extent the learning opportunities within a work setting, including the different types of tasks included in a job, sufficient autonomy for employees to perform their job tasks, and opportunities to be regularly engaged in dealing with unknown problems. Social interaction requires opportunities to build and maintain contacts with significant others, including participation in communities of practice. Access to information including manuals and factsheets is important, but so too is access to information about the expertise of other staff in an organization. The social working environment determines possibilities to learn from more experienced colleagues or colleagues with particular expertise. It also can enable learning and the development of knowledge from participation in projects and the opportunities for experimentation.

The key to designing successful e-learning in the workplace lays not so much in the particular technology used, but in providing opportunities for learning which understand and build on the nature of practice in the workplace and provide opportunities for the social development and exchange of knowledge and practices. This in turn requires a move away from the tendency to replicate traditional course and work-based training, rather designing, developing, and implementing technologies that support new approaches to pedagogy in the social practice of work and in work practices and the development and sharing of both explicit and implicit knowledge.

---

## **Pedagogical Approaches to Work-Based Learning**

Although space prohibits a comprehensive discussion of new and emergent pedagogic approaches which can support e-learning in the workplace, I look here at the pedagogic approaches of four recent projects funded by the European Research Framework programs addressing learning in the workplace: Learning Layers,

EmployID, Mature, and ROLE. Significant is that all are multinational, all seek to link research and practice, and all are large-scale projects. The projects are based in different sectors with different sized companies. All eschewed more traditional approaches to the use of technology for learning such as learning management systems and virtual learning environments. Most importantly, each of the projects addressed different boundaries through developing different pedagogical approaches to learning. These include informal learning, knowledge development and maturing, identity transformation, support for reflection, facilitation and social learning, the appropriation of technology for learning, and the relation between personal and organizational learning as well as the training and personal development of teachers and trainers.

## The EmployID Project

The EmployID project addressed the fundamental transformations in the world of work through working with European Public Employment Services (PES). Technological developments such as digitization and automation are leading companies to reshape their value creation processes and guide their employees to new job roles, creating an uncertain outlook. But employees (including managers) rarely embrace and shape change but are more driven by it.

The ability to utilize modern technologies and methods is just the surface. Overcoming resistance to change, stressful conflicts, and lack of openness are major roadblocks, resulting in the need to look at a deeper level of learning. Employees need to rethink their job roles, the relationship to others, and what good work means to them. Also, leaders need to take new approaches to match the new responsibilities.

This indicates the importance of the professional identity of individuals and occupational groups. Employees are often not given spaces to engage in conversations and transform their identity, consider emotional aspects of their work, acquire skills for moving from a problem focus to a solution focus, and help each other in their learning process (Fig. 1).

Thinking about identity development at work (Brown and Bimrose 2015, 2018) led to the idea that learning at work can be effectively supported if it is understood that such learning can be represented as a process of identity development, a process of development in four interrelated domains (relational development, cognitive development, practical development, and emotional development), and taking place within particular structures and contexts which are rich in learning and development opportunities (Brown and Bimrose 2018). Such an approach could also be linked to the processes of career construction, deconstruction, reconstruction, and co-construction through language and interpersonal processes (Savickas 2013). This theory regards everyday experiences as representing building blocks from which narratives about careers are constructed. Career constructionist practice addresses explicit reflection and career processes with career conversations being facilitated by skilled practitioners.

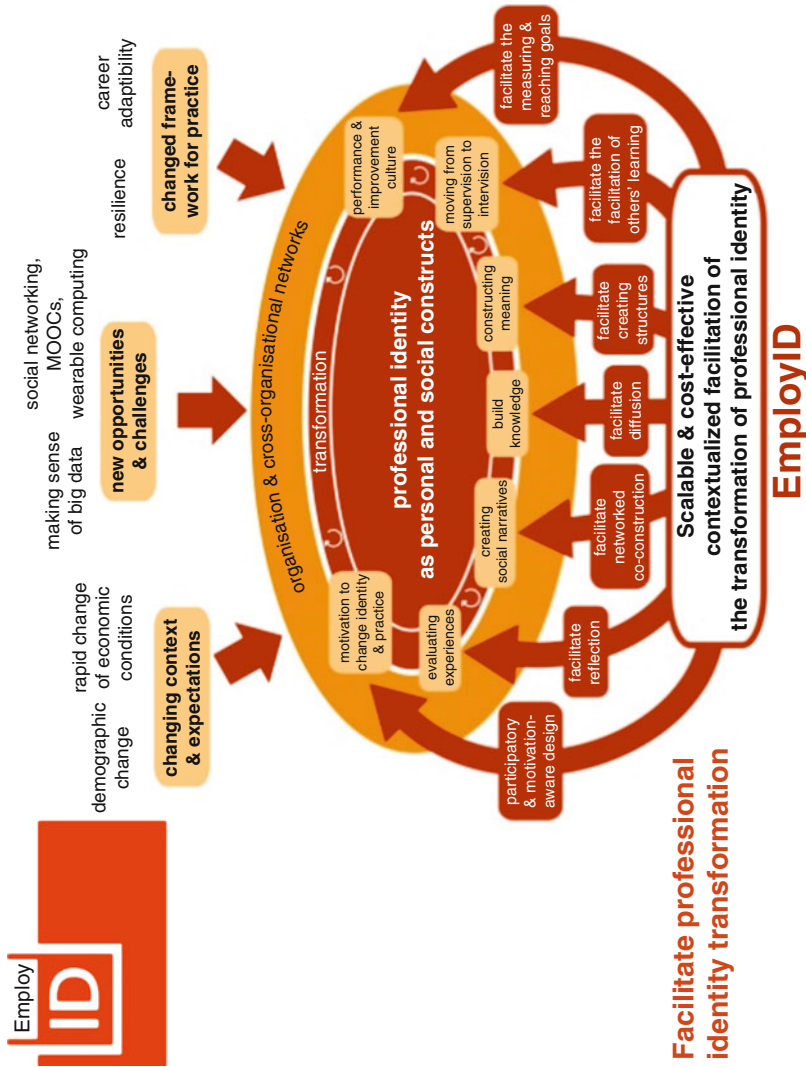

Fig. 1 Professional identity transformation

Therefore, while career practitioners support their clients' career conversations, conversations about their own careers and identities could be driven by similar processes that are facilitated in different ways. For the EmployID project, one key question was: Can ICT tools create spaces to drive processes of learning, facilitation, and reflection in support of identity development and career construction?

ICT has for some time been able to provide spaces for peer interaction (e.g., discussion forums, massive open online courses (MOOCs)), but a continuing problem has been that the potential of these spaces has often not been realized by turning these into places where much active collaboration actually occurs. In such settings "space" describes structural arrangements that might constrain and enable certain forms of interaction, while "place" denotes the ways in which settings acquire recognizable and persistent social meaning in the course of interaction. Space was seen as the opportunity, while place represented the social practices underpinning the (understood) reality. As Dourish (2006) has argued, both elements should be seen as critical aspects that interact. What is clear, however, is that if ICT tools are to become places for learning and reflection in support of identity development and career construction, then facilitation should play a major role.

Among other initiatives, the EmployID project, through processes of co-design with staff from public employment services, has developed social learning programs and communities of practice.

ICT applications were developed to support practitioners with online reflection, coaching, and the use of labor market information (LMI) in their practice. These included blended learning programs and an international MOOC, facilitating the use of, for example, peer coaching, reflection, and innovative uses of LMI as a means to generate practitioner commitment.

The blended learning program evaluations (EmployID 2017) highlighted evidence of individual development, such as increased digital capabilities, a deeper understanding of coaching processes and how to use LMI in practice, and transformed attitudes to learning that amounted to a changed culture supportive of resourceful learners. Learners had actively engaged in experience exchange and collaborative discussion during the programs. This collaborative approach carried over to their subsequent work activities, as demonstrated by a statistically significant rise of collaborative reflection activities (EmployID 2017).

The collaborative learning activities around the changing world of work also significantly changed the learners' experience of collaborative learning, helping to solve problems, reflect about their own learning, and understand their role in the organization and how to reach organizational and individual goals.

In order to support counsellors in their professional identity transformation, and to support their need for an improved means of communication, the EmployID project developed a community of practice approach. This involved the development of a reflective community platform offering various features to users in order to focus on learning while contributing. The platform has now been adopted by public

employment services in three countries, with a fourth platform for managers from across European PES being planned.

The evaluation highlighted the importance of ownership of community spaces and the time taken for such community spaces to “emerge.” It also pointed to the importance of active moderation in stimulated exchange and learning.

## **The Learning Layers Project**

The Learning Layers project aimed to scale up informal learning in SME clusters through the use of technologies to create meaningful learning opportunities and thereby improve sustained competitiveness of individuals, SMEs, and the clusters as a whole.

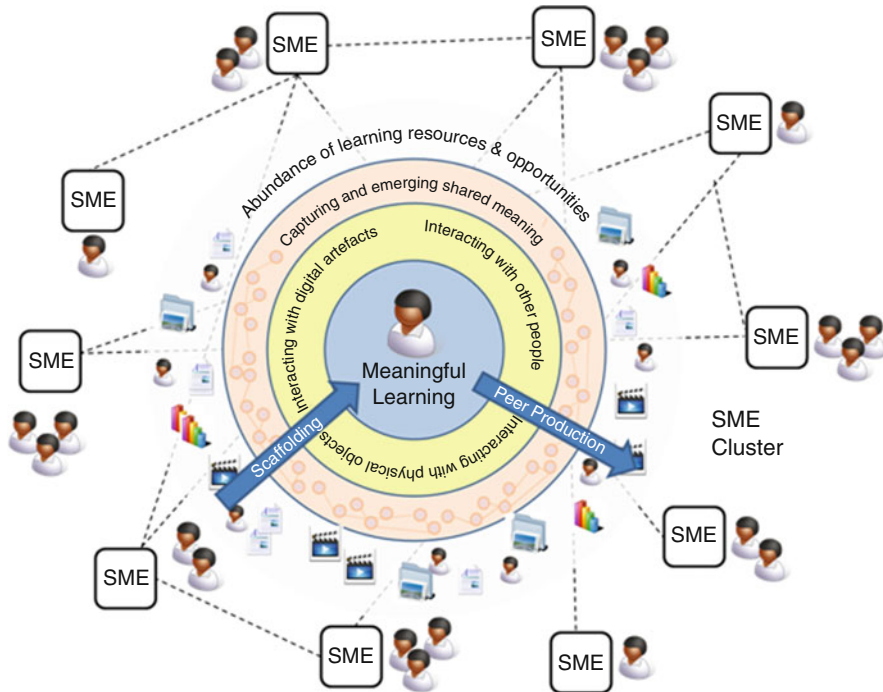

This entailed investigating informal learning practices, especially those of SMEs in more traditional sectors, and on those practices taking place in physical workplaces and across organizational boundaries and the development of a set of learning technologies that unlock peer production in networked SME settings and scaffold individuals for meaningful learning. Driven by the main types of informal learning interactions – people, digital, and physical artifacts – the project focused on three types of technologies to support informal learning:

- Technologies to scaffold interpersonal help seeking in a networked enterprise context
- Technologies to create, remix, and share dynamic, up-to-date, and high-quality learning content in a cost-effective way within and across organizational boundaries
- Technologies that capture and mediate meaningful informal learning in work processes and practices in physical contexts using physical artifacts

In informal and workplace learning, a dynamic interplay takes place between learning in different contexts. Individuals learn in a self-directed manner. At the same time, they participate in collaborative informal learning environments as they are members of groups and communities, organizations, and cross-organizational networks (Fig. 2).

The Learning Layers project worked with two sectors which were seen as having relatively low levels of use of e-learning for workplace learning: the healthcare and construction sectors. For working with apprentices in the construction sector, the project developed a flexible, mobile platform, Learning Toolbox, for contextual on-the-job learning, bridging formal and informal learning contexts.

Teachers and trainers can create their own learning materials using different media and share these with others through a tile store. Users are able to interact with each other and to develop a portfolio of their work, including photographs and video using mobile devices. For apprentices, the mobile app links learning in the training center, in the vocational school, and in the workplace.

**Fig. 2** Scaling informal learning

## The ROLE Project

The Responsive Open Learning Environments (ROLE) project developed and piloted technology centered around the concept of self-regulated learning that creates responsible and thinking learners able to plan their learning process, search for the resources independently, and learn and then reflect on their learning process and progress. The main objective was to support teachers in developing open Personal Learning Environments (PLEs) for their students.

The ROLE project developed a Personal Learning Management System which is an open, social-based LMS combining the functionalities of an LMS and a Personal Learning Environment and allowing users to construct their virtual learning environment according to their learning history, goals, and preferences.

One pilot was for employees of Festo, a German engineering company, where it was piloted through their Virtual Academy (Scheffel et al. 2013). Festo wished to improve their existing learning systems to support:

- Openness and adaptivity
- Communication with other learners
- Facilitation of collaboration and peer-assisted learning
- Collaborative and individual work
- The sharing of best practice

One aim for the work was to understand how widely a corporate learning environment can be opened up, especially given system restrictions and concerns over data security. It was recognized that the job role of the learner has to be in the focus of all learning processes involving and understanding of learning processes that take place during daily work and after work.

Self-regulated learning was seen as comprising an essential aspect of the PLE, as it enables learners to become “metacognitively, motivationally, and behaviourally active participants in their own learning process” (Zimmerman 1989).

The ROLE developed the Psycho-Pedagogical Integration Model (PPIM) (Fruhmann et al. 2010). This model identifies four main steps:

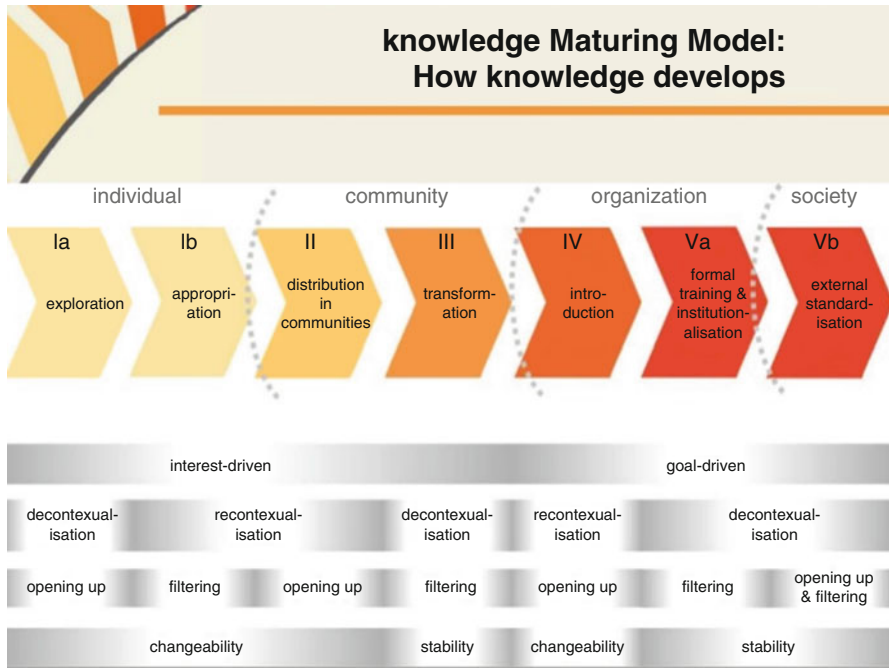

1. Plan: Including the definition of the learning strategy, learning goals, actions to be taken to achieve these goals, as well as preferences in the sense of tools and types of content that will be used.
2. Search: At this step the learner searches for learning resources and tools within the learning environment and outside of it. Here, the user may get recommendations from tutors and peers but also use recommendation systems to find appropriate resources.
3. Learn: Learning includes studying of the selected tools and materials, attaining skills, training and testing, as well as assessment by tutors and self-assessment.
4. Reflect: This phase implies gathering feedback from different sources and self-evaluation, as well as reflection on the learning process and achievements in order to evaluate the usefulness of the learning strategy and particular actions and their correction if needed (Scheffel et al. 2014).

Different widgets were developed to support each stage of the learning process. The LearningTube widget became an essential part of the Virtual Academy, allowing access to videos but more importantly allowing Festo employees to themselves contribute video content. The key to the success of the video tutorials was seen as didactic simplification through visual representation. Wherever one previously had to describe a subject in words, written or verbally, or complex product drawings had to be created, it is simple to visualize information using moving, narrated images.

## **The MatureIP Project**

The MatureIP project explored the idea of knowledge maturing, based on the assumption that learning is an inherently social and collaborative activity in which individual learning processes are interdependent and dynamically interlinked with each other: the output of one learning process is input to the next. Seen from a distance, it is possible to observe a knowledge flow across different interlinked, individual learning processes. Knowledge becomes less contextualized, more explicitly linked, and easier to communicate; in short, it matures.

Knowledge maturing is defined as the goal-oriented development of collective knowledge or better as goal-oriented learning on a collective level where goal-oriented describes knowledge maturing as a process with a direction. The goal can

**Fig. 3** Knowledge maturing model

be an individual goal (e.g., to deepen understanding in an area out of curiosity), a team goal (e.g., to grasp known errors with respect to a product that the team works on), or an organizational goal (e.g., refine an organization’s core competency). Goals typically change over time and get aligned in social processes, resulting in a direction as a (mostly a posteriori) interpretation (Fig. 3).

The collective level can refer to different levels of granularity, e.g., a team, an organization, or a community. Knowledge maturing is not the result of an individual’s activity, but of an interconnected series of activities of interacting individuals, frequently also within different collectives.

Knowledge is understood as both cognitive structures bound to individuals’ minds (becoming manifest in their behavior) and as an abstraction of the knowledge of individuals in a collective.

Tools for supporting knowledge maturing support individuals in their activities that contribute to knowledge maturing. The variety of workplace activities often makes it difficult to judge where support is most needed. Knowledge Maturing Activities represent a proven selection and categorization of activities that can form the basis for diagnosing which elements of work practices are not well supported and which are more critical than others.

On a more detailed level, the characteristics of Knowledge Maturing Activities change in various phases requiring different forms of IT support. In general, present ICT and e-learning applications lack support for individuals to reflect on and refine

work practices and processes, to find people with particular knowledge or expertise, and to assess, verify, and rate information. These correspond to different strands of workplace knowledge: knowledge how to do something (process), knowledge about others (people), and knowledge in artifacts (content).

The MatureIP project has developed tools for supporting these social processes of learning and knowledge development and sharing.

---

## **Conclusions: Developing E-Learning for the Workplace**

First, I would want to acknowledge the limitations of this study. E-learning in the workplace is a very broad area, albeit one which is under-researched. Even though the e-learning industry is a global concern, the examples given from Europe exclude developments from other parts of the world. More seriously, the general nature of this chapter precludes examination of practices in different economic sectors and different occupations, which may differ greatly. I have also not looked in any detail at the differences between initial vocational education and training (IVET), continuing VET (CVET), and school-based VET.

Central to my argument is that despite the promise of e-learning to extend and deepen workplace learning, it has yet to deliver on such promise, particularly within small and medium enterprises. The e-learning industry has adopted a technocentric approach to the design and development of e-learning applications and the use of technology to largely replicate existing face-to-face training practices. Technology-driven transformations are changing the world of work and the content and practice within occupations. This leads not only to the need for retraining of workers but to the need for lifelong learning which in turn requires new approaches to vocational education and training and human resource development.

Thus, there is a need to reexamine the use of technology for learning not from a technical perspective but from a social and pedagogic viewpoint (Van Damme 2014) in order to support learning in the workplace.

Design for e-learning in the workplace has to consider both the nature of work practices and the workplace environment. This includes the development of skills and competences, the use of tools and objects, and knowledge development and maturing.

E-learning applications in the workplace also have to take account of both individual and organizational learning processes. Learning and the application of knowledge within the workplace are inherently social activities. E-learning applications need to recognize and build on such social processes and in particular to support the facilitation of learning.

Technology can be used to embed learning in workplace practices, developing and supporting social processes for skills development and knowledge sharing. The emergence of new technologies such as augmented reality, mobile learning, and machine learning can enhance such a development. Brown and Bimrose (2018) have pointed to the need for structures and contexts rich in learning and development

opportunities that can support relational development, cognitive development, practical development, and emotional development.

As is shown in the examples from international projects in the last section, there are new and innovative approaches to pedagogy, capable of building on new and emergent technologies. However, there are doubts as to how sustainable and scalable these projects are. As research projects, their focus is not the development of e-learning applications as such, but the development and dissemination of new knowledge. Yet, if new pedagogies and approaches to teaching and learning are not embodied in e-learning applications resulting from innovations, there is a reliance on the e-learning industry to build on the lessons of such research. Despite the rapid growth of the industry, it must be doubted whether it has the capacity, expertise, and motivation for such innovation.

One approach to overcoming these barriers is to relocate e-learning development within the broader scope of innovation and regional development. At the same time, if e-learning is to be integrated with workplace practice, it will require support for not only recognized trainers but for all those who facilitate learning in the workplace. It will also require recognition that time spent learning is an integral part of improving working practice and encourage the development of personal learning networks.

I have also drawn attention to the issues faced in researching e-learning in the workplace. There is an urgent need for broader understandings of the context and process of learning and links to the work process. There is also a need for research in design processes on how to develop applications to support learning and knowledge development in the workplace.

Such research requires the emergence of a research and development community, capable of working across disciplinary boundaries.

## Abstract

Fresh perspectives on vocational learning require new vantage points – vantage points from which we can view enduring questions and challenges from a different direction or in a changing light. Fresh perspectives can reveal hidden aspects or address long-standing issues in ways that question currently dominant assumptions. They make the case for developing educated attributes throughout the life course; for establishing polyvalent or permeable institutional pathways for vocational learning and achievement, in sustainable ways; for developing knowledgeable and creative practitioners; and for recognizing, opening up, and connecting learning-conducive working spaces. The perspectives on vocational learning explored in this chapter are exemplified in contributions to the 2018 Handbook of Vocational Education and Training: Developments in the Changing World of Work (McGrath et al. 2018); and all have been supported to some degree by research inquiries involving new empirical encounters. The discussion does not make claims for comprehensive coverage but rather aims to stimulate extended dialogue connecting fresh ideas and new evidence from diverse cultures, new policy directions, and changing practice environments.

Vocational learning is being reshaped and revolutionized by three main forces. First, the emergence of new technologies permits new ways of learning and contributes to the reshaping of work as digitization and automation gather pace. New learning technologies are influencing the ways in which people participate in existing formal learning programs and through individual accessing of online resources. Second, new workplace occupations and technologies have emerged with new knowledge and skill requirements. These undermine old boundaries between vocational and academic learning and between advanced and non-advanced programs. They stress stronger affective and cognitive skills than has previously been the case for much vocational provision, with profound implications for the demands placed upon vocational learners and workers. Third, the rise of new disciplinary perspectives, from spatial analyses of cultural geographers to the evidence of neuroscientists, is generating major new insights for all forms of learning.

To develop fresh perspectives, it is often necessary to leave the heavily trodden pathways and find new vantage points. New vantage points are found in some unexpected places: in neglected issues, in gaps in the research and practice literature, and in ways of looking at the matter offered by authors who have their roots in substantially different political-economic scenarios that are underrepresented in the English language literature. In considering vocational learning, it is important to counter tendencies to “learnerism,” which limit rather than expand our field of view in approaching questions of learning. Learnerism is the term that has been applied to the increasing tendency for learning to be separated from questions of content and context, to be equated with an individual process undertaken by doers of learning, that is held to be unquestionably worthwhile and good: “learning in itself” (Holmes 2004). The contemporary “turn to learning” in the educational sciences does not adopt a single definition of learning, but rather acknowledges the range of the meanings that learning holds and conveys, according to the framework adopted: institutional frameworks of education and training, the codes and tenets of disciplines such as cognitive psychology and the sociology of education, the concepts of work organization and political-economy frame vocational learning, and the questions we consider worthy of investigation. When we strive, through research and inquiry, to learn more about vocational learning, the process itself, after Wittgenstein (1953: 308), commits each inquirer to a particular way of looking at and understanding the matter.

The “turn to learning” can be viewed according to the changing relationships between the social organization of learning and the learning individual. The interplay between these perspectives can be understood in terms of the interplay between the social worlds and lifeworlds (Evans 2012), illuminated by an historically informed understanding of how processes of social “shaping” take place over time. The implications for vocational learning and vocational pedagogy of an appreciation of social shaping are revisited, updated, and reframed for contemporary times by

Heidegger and Petersen (2018). Challenges to economic and technological determinism have, since the 1980s, emphasized the scope for shaping not just the uses of new technologies but also their development and implementation. While the effects of technological advances are frequently presented as inevitable consequences, Heidegger and Petersen show how analyses based on the unfolding of technology miss the significance of cultural factors. Analyses of the shaping of work and technology have shown how the “social sites of shaping technology” (Rauner et al. 1988) range from the workplace through the individual lifeworld up to the sites for scientific knowledge production, political interest groups, and the state. Mutual learning is important for social shaping of work, working organization, and also technology, for reasonable compromises to be achieved. The argument is that vocational education and training (VET) should open up spaces for such procedures and processes. The development of educated attributes is essential to this argument. For Heidegger and Petersen (2018), this entails personality development and the continuing development of participatory capabilities in adult life; for DeJaeghere (2018), it entails the development of critical capabilities necessary for sustainable livelihoods and well-being.

---

## Vocational Learning Through the Life Course

Fresh perspectives move beyond preoccupations with initial VET and young people’s transitions to keep in view the system-world, the lifeworld, and the multiple forms of learning that reflexively shape occupational and personal development biographies. These forms extend from pre-VET to post-initial VET to continuing professional development, workplace learning, and vocational learning in later adult life.

Most research on learning in and for VET has concentrated on young people and initial VET, but increasingly, in aging societies where the duration of working life is extending, older workers are coming into view. Little is known about their vocational learning and what motivates them to continue learning in and through work. Migliore (2018) focuses her attention on vocational learning in later life, in considering older workers and ways in which motivation to learn is conceptualized in different disciplinary perspectives and schools of thought. She develops the idea that motivation to learn emerges in the relationship between work and the engagement that the older workers develop with their work. Aging is understood as coevolution between experiences and self which occurs through involvement and participation in activities, including the activities of an extended working life. This approach has salience throughout the life course and for the development of more critical perspectives on lifelong learning. For Kersh and Huegler (2018), links between lifelong learning and VET are significant for rethinking how young adults can be supported in realizing better opportunities. They explore how different discourses of LLL and adult education can influence strategies and approaches for young people positioned as vulnerable in the contexts of labor market and societal changes, as governments strive to prevent groups from becoming socially and economically detached in

market economies by maximizing involvement in the labor force throughout the life course. Kersh and Huegler emphasize that engaging vulnerable young adults in VET alone is insufficient to facilitate their social inclusion. Approaches to vocational learning that embrace a holistic lifelong learning perspective and address the pertinence of factors such as race, gender, and disability in life course development have a greater potential to impact on longer-term economic and social participation.

Contributions to debates about what vocational learning means in the contexts of societal shifts and changing labor market dynamics are instructive in revealing emergent priorities in societies that are working strategically to reshape their systems. For example, Dobrydina et al. (2018) take up the theme of the importance of educated attributes in the context of informatization of society in Russia, emphasizing the ability to act independently in a highly automated information society. Li and Yuan (2018) also focus on the intersections of the ideas of lifelong learning with VET which are central to China's stated strategic intentions to make education more diversified, flexible, and open. This modernization process involves promotion of coordinated development and the achievement of cohesion through communication and correspondences between "all kinds of educations at all levels." For China, creating an "overpass" for talent cultivation is a key aim in development of vocational learning within an enhanced VET system, sharing with Western counterparts a policy objective of increasing the attractiveness of vocational education and training but finding different means for influencing public perceptions of the status of VET and a positive societal image of its participants and their capabilities (Nokelainen et al. 2018).

The development of educated attributes through vocational learning increasingly embraces the concept of creativity development. Barabasch (2018) connects the innovation processes that are essential for companies' survival under conditions of global competition with the need for greater emphasis on creativity development in the workforce. Exploring what it means to support creativity development through vocational education and the workplace, Barabasch proposes adjustments that can be made to pedagogical practices to incorporate creativity support and assessment, showing how, for example, art as a stimulator in creativity development can be integrated into vocational learning processes. Significantly, these types of approaches to creativity development within the field of VET are shown to require deep domain-specific knowledge.

Fresh perspectives entail a recognition that the vocational learning that takes place through the vocational classroom, the workplace, or practice setting is driven not only by specific skills or competence requirements but also by workers striving to become knowledgeable about what they do, through activities, performing roles, and engaging in social practices. These processes are central to the longer-term development of professional identities. They take place partly within VET programs and continue after program completion, as the graduates take up positions that enable or require further workplace-based learning.

All transitions in working life involve substantial new vocational learning. In some cases, the transition is itself structured by the employer or profession, for example, firm-based "training contracts" offer periods of recognized practice-based

training; preceptorships structure the post-qualification stages of development for some public service professionals; and in commercial firms, various forms of internship or graduate training schemes often fulfill this function. How vocational learning is experienced in these transitions derives in large part from the process of negotiation of fields of practice, as different forms of knowledge developed within and beyond the initial vocational program are put to work in new and changing contexts. Vocational learning continues post-qualification as new entrants become more deeply involved in workplace practices and experience working in teams and across boundaries within the social relations of the workplace. These ideas have themselves developed in the context of research which has yielded fresh ways of thinking about the ways in which different forms of knowledge are put to work, offering new insights into how both VET students and newly qualified workers can be supported in their development as knowledgeable practitioners (Evans 2015, 2017).

---

## Developing Knowledgeable and Creative Practitioners

Fresh perspectives that include *how* people become knowledgeable and develop creative capabilities require new conceptualizations of the relationship between vocational knowledge and practice. Hordern (2018) argues that greater attention needs to be paid to the differentiation between specialized and nonspecialized aspects of vocational knowledge. Hordern explores how vocational practice can be understood in terms of the specialization of underpinning knowledge and the extent to which that knowledge is made explicit in workplace curricula. A contrasting but complementary approach to knowledge recontextualization in students' vocational learning by Gustavsson and Persson-Thunqvist (2018) focuses attention on the enabling conditions for putting knowledge to work, contributing deeper insights into the school-related and workplace-related conditions that enable students' vocational learning during workplace-based learning within vocational education. The discussion of the nature of full participation in occupational practices and the potential for learning from all aspects of workplace activity connects in new ways to the shaping principle. Arguments for opening up of the spaces of vocational learning to enable participants to realize the possibilities of full participation are further supported by Zepke (2018) in a new analysis of how peer-facilitated learning and active citizenship processes are shown to support TVET learners' success. Furthermore, the concept of "capabilities" is increasingly adopted and critically developed by researchers and developers to highlight the potential for VET to promote participatory practices and future-oriented perspectives in an array of contexts, a tendency illustrated by DeJaeghere 2018 in her postcolonial exposition of the significance of critical capabilities in entrepreneurship education in South Africa.

These perspectives raise fundamental further questions about the role of vocational teachers, and their vocational learning. Loo (2018) offers a theoretical framework for understanding the micro-workings of vocational practitioners, a wider perspective of knowledge, and the use of examples of vocational areas to illustrate the practitioners' activities. For vocational teachers, their pedagogic training should

include an understanding of the relevant recontextualization processes and an appreciation of what constitutes “knowledgeable practice” and “practice architectures” both in their vocational field and in the teaching dimension of their occupational profile. They also need to keep in view changing demands on occupational know-how in continuously developing their roles.

One example of contemporary significance is offered by Teräs (2018), who identifies the importance for teachers of developing their transcultural competences in working with students with different linguistic and cultural backgrounds. Broad’s (2018) analysis also takes further our understanding of how vocational teachers develop as knowledgeable practitioners. The pedagogical approaches used by vocational teachers to capture new techniques, technology, and knowledge are developed through shared practice in workplaces. This is an example of the socially situated knowledge that, according to Heidegger and Petersen (2018), all workers should appreciate is theirs to use in shaping how things are done. Broad (2018) argues that this is both a challenging and a problematic endeavor as teachers are situated in contexts removed from where vocational knowledge is developed. In addition, the nature of vocational knowledge itself requires continuous recontextualization of new techniques and innovations from workplaces to teaching environments. Vocational teachers overcome these challenges by utilizing professional development activities to capture new techniques, technologies, and knowledge. How they self-determine and self-regulate the activities they engage with (Panadero et al. 2018) resonates again with the experiences of their students and with the independence of thought combined with mutual learning advocated by the shaping approaches introduced earlier.

Changing conceptions of vocational learning thus challenge the ways in which the development of vocational teachers is approached. They also pose significant challenges to systems as well as practices.

---

## **Rethinking Vocational Learning Priorities in Contexts of Systemic Change**

Vocational learning is embedded in national systems, and most is known, at an international level, about the German system of initial VET. The English language research literature tends to be dominated by discussions of various manifestations of the dual system together with variants and alternatives in countries such as the Netherlands, Denmark, Sweden, Switzerland, and the UK. Examples both from within and beyond Europe often focus on the demands that the dual system makes on infrastructure (Maurer 2018) and, crucially, the preparation and training of suitably qualified teachers. The latter challenge is exemplified by Wiemann’s (2018) account of the demand for methodologically and technically well-qualified trainers to improve in-company training in Mexico. At the same time, German perspectives on the structures that are needed to support vocational learning are opening up in new ways, particularly at advanced levels.

Authors who are able to discuss, from direct experience, the ways in which vocational learning is being reformulated in systems that are undergoing

transformations or whose operation is based on paradigmatic differences can offer fresh insights. Characterizing the dynamics of developments in Eastern Europe has been described by Védier (2018) as a particular challenge for comparativists, as analyses move away from the convergence/divergence continuum toward recognition of the hybrid nature of reforms in post-communist scenarios. Laczik and Farkas (2018) writing about developments in Hungary show how attempts to replicate aspects of the German dual system are playing out under resurgent centralizing tendencies in this post-communist society, creating challenges for young people faced with new pathways for vocational learning and realization of their goals. The German model has strongly influenced Hungarian policies, but in a way that has to be understood in terms of the historical tendencies of an early return to a more democratic and liberal system in the post-communist transition period, reliant upon broad-based education, later overtaken by a privileging of the position and demands of economic players in VET. Employers are key players in VET and these players are assigned considerable responsibilities. It is yet to be seen whether they can fulfill expectations and make VET a more viable and hence popular option for young people.

Innovation and digitization pose the challenging question of how education and training professionals can keep abreast of the skills and areas of expertise that are required to develop new kinds of professionals; indeed the whole question of how these new professions should be constituted and regulated is open for debate. The information society, in the Russian context, is fueling demands for a refocusing of the whole system of education and vocational training, led by the adoption of an approach centered on new standards and qualifications (Dobrydina et al. 2018). Vocational learning in this setting is regenerated in the creation of VET working plans and work programs based on new technologies of education. The informatization of the society can be viewed as one of the shaping influences in Russia as it interacts with the education system in its role to equip students with the key competencies of future specialists. This condition is recognized as “informatization of education,” with modern information and communication technologies seen as both a goal and a facilitator of vocational learning in VET, opening up new learning opportunities and contributing to the development of future-oriented capabilities. Information communication and technology (ICT) is also a critical component in technical and vocational education and training (TVET) in India, potentially enabling improvements in inclusivity and quality, as well as standardized skill development according to Balakrishnan et al. (2018). The extent to which skill development in India takes place beyond formal contexts, in non-formal, open, and distance learning settings, places ICT at the heart of reforms to TVET delivery practices.

The expansion of higher vocational education is becoming a global phenomenon, as a concomitant of efforts to increase the attractiveness of VET and to raise its status in the eyes of users and the wider public. These developments have to be understood in context. The interaction between higher education and vocational education, with the aim of promoting higher vocational learning, is a theme for major economies across both Europe and Asia, from Germany to China. In Germany, vocational education and training already has a relatively high status. Tertiary expansion in

Germany is challenging the system with questions of how “permeable” pathways to work can become. As Schröder and Dehnbostel (2018) argue, shifts in workplace learning as well as additional demographic, labor market, and higher education policy developments have led to the adoption of two nationally recognized pathways toward permeability between vocational and tertiary education. One solution for the enhancement of vocational learning is to acknowledge and award competence-based vocational education based on educational standards. This approach connects with developments in countries engaged in more fundamental restructuring of their systems, such as the Russian Federation, as new professions demand new standards and VET content. For China, Li and Yuan (2018) also highlight the priority of expansion of vocational learning at the higher, tertiary level and the search for permeability in the operation of their systems, emphasizing the distinctive characteristics of the Chinese mode while exploring what can be learned from the international scene.

The implementation of new vocational programs, particularly at the post-secondary level, is dominated by considerations of the organizational arrangements for work-based elements. Technical issues that accompany credit and quality assurance frameworks are intertwined with continuing debates about the scope, nature, and assessment of learning outcomes (Coates 2018). Higher vocational programs that incorporate substantial elements of work-based learning bring disciplinary, work-based, and practice-based knowledge together in ways that present curriculum and pedagogic challenges for lecturers and workplace mentors. As Loo (2018) and Hordern (2018) both reflect in different ways, discipline-based knowledge has a different logic from practice-based and work-based knowledge. The former develops through codified rules that can be used to select and combine theories and concepts into modules. In contrast, practice-based learning involves a good deal of procedural knowledge, some highly codified according to rules and systems (e.g., legal) others less codified, and work-based learning involves getting to grips with forms of work process knowledge. In the case of discipline-based knowledge, learners have been expected to “apply” it to practice. In the case of work-based knowledge, learners are often assessed in accordance with competence-based criteria (that are themselves heavily contested) as program designers struggle to articulate the relationship between discipline-based, practice-based, and work-based knowledge. Participants in vocational learning often take a considerable time on graduation to think and feel their ways into using their knowledge at work.

---

## Opening Up the Social Spaces for Vocational Learning

The turn to learning, in addressing these problems, does not equate to preeminence of the individualism of “learnerism.” The turn to learning has been accompanied by greater recognition of the role that spatial analysis can play in understanding the scope and dimensions of education (Brooks et al. 2012). There is a variety of ways in which spaces for decision-making about VET and for new forms of vocational learning can be opened up. Firstly, the learning space can be perceived as a physical space where learning is taking place such as a classroom or any other form of

teaching space. Secondly, the learning space can refer to a space where learning occurs as participants learn from each other's activities and experiences and from the work process itself. Workplace spaces have strong significance for vocational learning, at the points where the two human processes of learning and working intersect, with a blurring of the boundaries between the two. Thirdly, the expansion of digital technologies has resulted in the development and growth of virtual learning spaces that ultimately change the boundaries of learning spaces making them more flexible and mobile. Finally, the learning space can be perceived as a combination or overlap of a range of components, such as physical space, learning contexts and environments, formal/informal learning, and virtual learning. All of these spaces are subject to the political, regulatory, and cultural frameworks that are key elements of the social shaping processes that have to be kept in view. More generally, contemporary economic, political, and educational developments are associated with a blurring of the boundaries between the spaces in which learning, work, and leisure occur.

It is possible to identify four types of learning space that are highly relevant to vocational learning. The learner's immediate setting, such as a course or classroom or workplace, can be interpreted as a microsystem, building upon Bronfenbrenner's ecological models (2005). Other concurrent contexts in a person's life such as parallel courses, family, and arenas in which learners interact with other peers and professionals who crucially affect the learners' personal worlds (Hodgson and Spours 2009) are considered to be part of the mesosystem. The exosystem refers to the formal and informal social structures that influence the learner's immediate environment, for example, institutional policies and procedures, the regulatory environment, and work cultures. Finally, the macrosystem relates to the overarching institutional, economic, and political structures and also cultural values, such as those privileging or affording higher status to abstract knowledge over practical knowledge, which influence actions in the person's immediate microsystem and mesosystem.

In line with shaping principles, Heidegger and Petersen (2018) argue that contestation occurs in each of these systems and creates spaces for thinking about which things can be done differently. At all levels of the workforce, people interested in shaping their work practices, environments, and life experiences need to understand the ways in which their knowledge is socially shared so that they can make use of it in shaping processes. This is a challenge for vocational learning that applies equally for vocational teachers.

The analysis by Broad (2018) represents the voice of vocational teachers, showing how some activities are perceived by teachers to be valuable and why some hold little value, according to the relational value of the activities engaged with and how relevant they are to the day-to-day practices of the individual teacher. The hidden nature of the pedagogy that teachers use is also illuminated, showing how teacher agency, relational networks, and hidden pedagogical practices are important determinants of space for vocational learning. Furthermore, Teräs's exploration (2018) of intercultural spaces in the cultural diversities of VET demonstrates the significance of a relational approach that recognizes leaving one cultural environment and moving into another as a cultural learning process. This learning process involves

transition and transformation both on the individual and collective levels. For both teachers and learners, intercultural experiences have to extend into the building of authentic relationships with people of different backgrounds. Intercultural learning processes take time and require supportive spaces for learning in which individuals and communities can enact new knowledge, skills, and competences.

The collective and social dimensions of work-related and vocational learning have important resonances for social shaping, opening up new perspectives on motivations to learn. Enlarging the view of motivational factors to include activities and their strategies leads to consideration of vocational learning as a collective and social issue and an issue that is actively connected to needs for new business models. Migliore (2018), for example, argues that older workers' conceptions of working and learning depend on the development of the professional activities in which they are and were involved, and she considers whether and how the activities succeed in getting older workers engaged. In this analysis, working activities offer workers the meanings and senses either to feel engaged or resistant to getting involved.

Four themes of significance in vocational learning have recurred in this consideration of fresh perspectives: fostering of educated attributes, throughout the life course; establishing polyvalent or permeable institutional pathways for vocational learning and achievement, in sustainable ways; developing knowledgeable practitioners; and recognizing, opening up, and connecting learning-conducive working spaces. The fresh insights into enduring themes in vocational learning have all been elaborated or supported to some degree by new empirical encounters in a diverse array of contexts. Most of these empirical encounters rely partially or wholly on qualitative data that are subject to interpretations in relation to the salient bodies of knowledge introduced by the authors. The methodological perspectives offered by Guenther and Falk (2018) provide an important stimulus to research in recognizing the often understated strengths of qualitative research in building, iteratively and incrementally, some "normative truths" about vocational learning while at the same time continuously recontextualizing and revising provisional principles in the shifts and turns of diverse cultures, new policy directions, and changing practice environments.

Fresh perspectives continuously offer views that challenge some of the dominant conceptions and assumptions of mainstream discourse on vocational learning. Other perspectives coexist and have renewed power to explain and persuade. The challenge for educators is to know where they stand in the debates introduced by the authors and how to engage in dialogic approaches while keeping the integrity of the frameworks within they are operating.

following the rules, the issue is to “shape” them by participating in decisions about how things could, should, and will be done. Historically, the shaping principle originated in the context of endeavors toward humanization of work during the 1970s, mainly in countries with a strong tradition of workers’ participation. A new idea for “Bildung” arose within VET, related to organization and content of work and later also toward social shaping of technology, that is shaping – by the skilled workers – not only the application or use but also the implementation and even the development of technology. The issue of shaping workers’ own occupational biography subsequently came into the focus, where supporting people in decisions regarding their occupational biography is the task of processes of vocational orientation. This applies both for young people in the context of VET and for adults. The chapter adopts a perspective of international comparison, in this case a European perspective. The dependency of possibilities and opportunities for shaping in “systems of gainful employment/occupation” is described, with reference to five systems, moreover orientations of VET, and the factors promoting and hindering shaping. Accordingly, weak VET structures and strong educational orientations of VET promote shaping the own occupational biography. Weak formal rights of participation hinder shaping working conditions and work, whereas the neo-corporatist system promotes it particularly well.

**Introduction**

The title “Shaping the own occupational biography and working conditions” already refers implicitly to a principle that is in fact immanent to “vocational education and training” (VET) because this concept itself is related to two terms that can be seen to be in dialectical opposition to each other: education and training. In an exigent definition, education aims not only at subject knowledge but through and beyond that at fostering the development of personality in a comprehensive sense. This is expressed in a pronounced way through the German concept “Bildung.” On the other hand, training is often understood as preparation for rather simple jobs where one has to follow the rule without much understanding. In fact, however, these two factors are not only in (partial) opposition, but they also presuppose each other. For education and, for that matter, Bildung are, in the long run, not really meaningful without “competences to act” which are at least to a considerable part gained through vocational training. Similarly, training, even for simple jobs, must always contain knowledge and, beyond that, more or less also abilities founded in successful personality development which are, again partly, gained through vocational education. In this way a dialectical opposition can be stated (Heidegger 2005).

Although the concept of VET comprises always both aspects, education and training, this combination can differ in various countries or VET cultures. This is explained and elucidated by the theory of the “system of gainful employment/occupation” which, as described below, implies the subsystems employment, work organization, VET, and social welfare regime (Petersen 2013, 2016).

The interlocking of training and education can be strengthened by intensifying the aspect of education within the training itself through fostering the self-reliance at the workplace by stimulating independent thinking (Heidegger 1991). That is, the center the focus is no longer only on following the rules but rather to “shape” them partly independently, that is to participate in decisions about how things could, should, and will be done. This is called the “shaping principle” in VET. It is in contrast to the “adaptation approach” to VET where one tries to enable people to adapt as well as possible to predetermined demands. Shaping can be directed, as said in the heading, toward the own occupational biography and the working conditions and work. The English expression “shaping” was created for use in this context (typical: MacKenzie and Wajcman 1985) in parallel to the German term “Gestaltung” that gained particular influence because of the tradition of social partnership in Germany. A similar meaning has the term “participatory design” which, however, is used more for shaping of technology and less for shaping of social items.

---

## Foundations of the Shaping Approach: Historical Roots

For the field relevant for VET, the concept “shaping” appeared explicitly and saliently in connection to efforts toward humanization of work, starting in the 1970s. This endeavor was (and still is) particularly prominent in countries with a strong tradition of workers’ participation leading partly to co-management or formal codetermination, examples being the Nordic countries, the Netherlands, Switzerland, Austria, and Germany. But in parallel to activities within the framework of the social partnership, critical elucidation (“Aufklärung”) of the workers was foregrounded in the labor movement, particularly in the context of union-provided further education for workers, where materials were used which had been informed by the influential book *Sociological imagination and exemplary learning* (translation by the authors, Negt 1968, 1997, 2016). That work, however, in its title already prefigures important aspects of orienting oneself toward shaping. Imagination is important for conceiving alternatives to the prevalent circumstances in company and society. For that “sociological” (critical) understandings of societal influences are necessary which are frequently overlooked in the concrete reality of work and which manifest themselves often in questions of power. Finally exemplary learning should help to go beyond abstract analyses and to contrive change that can be really attained. In Germany, the “Works (Council) Constitution Act” (official translation) from 1972 obligated the management to “shape” the working conditions according to trusted ergonomic findings which lead to corresponding research (Pöhler 1979) and to the action program “Research for Humanization of Work Life” (translation by the authors, Oehlke 2001, p. 81), sponsored by the State.

This research should combine the conventional top-down approach with participatory research which particularly asked for the necessary shaping qualifications of workers in order to support – partly collective – (co-)shaping (“Mitgestaltung,” Fricke et al. 1982). In their expert opinion “Work and Technology as a Task of Political Shaping” (translation by the authors, Fricke et al. 1985), the political dimension was accentuated, and it was emphasized that content and organization of work are connected to technology – particularly in the industry for tangible goods but more and more also in activity fields of businessmen/women and even nowadays in the supply of personal services.

During the 1980s, the shaping approach became important for the field of vocational pedagogy and was introduced in the area of VET research notably by Rauner (1986, 1988) – see also Heidegger (1978) who proposed for education in science and technology an orientation toward “Kompetenzen zu verändernder Praxis” (competences for activities for change).

The new “Idea for Bildung” was to mean an orientation toward “inspiring capability/competence for shaping work and technology.” Shaping orientation as an interdisciplinary approach for research became important also in fields like planning/design of VET, vocational didactics and “Shaping the own occupational biography” (Hendrich 2002, p. 92 ff.; Kaufhold 2009).

These activities were in the first instance related to organization and content of work and particularly VET for shaping these items. But they were also already oriented toward social shaping of technology – or shaping of technology compatible with social demands.

In this context, the statement of Rosenbrock (1984) “Developing Technology – Shaping is Possible” (translation by the authors) became important. On the basis of case studies, he provided evidence that already in the past there were situations of branching of the technological development where it would have been possible to exert influence toward social shaping of technology and with that to humanization of work life (Kuby 1980; Noble 1979).

Appropriately later the R&D program “Innovative Shaping of Work – Future of Work” (Oehlke 2001, translation by the authors), funded by the State, has been implemented.

Regarding technology, until the 1980s, the dominant view was that the effects of technological change must be seen as a consequence of economic and technological determinism. Now however more attention was paid to the possibilities of shaping not only the application or use but also the implementation and even the development of technology (Rauner 1986; Fischer 2001, p. 46 ff).

In particular the influence of cultural factors was discovered (Gerds 1988). Research about shaping of work and technology – notably by the skilled workers – was expanded beyond the direct reference to the workplace. Rauner (1986, p. 137 ff.) developed a matrix of “Fields of Shaping Technology” where “sectors of technology and their applications” are intersected with “social sites of shaping technology” (translation by the authors). The latter range from the workplace through the individual lifeworld up to sciences, political interest groups, and the State.

At every site, the individual person adopts a special perspective where these perspectives can be inconsistent with one another for the single individual as well as for social groups. In this way, it becomes necessary to instigate comprehensive procedures of mutual understanding – such as those analyzed by Habermas (1981) in the book *The Theory of Communicative Action* (usual translation) – for social shaping of work, working organization, and also technology that can lead to a reasonable compromise. The argument is that VET should open up spaces for such procedures and processes.

A decisive role played also the debate about ecology and preserving the environment whose influence had strongly risen. A functionally informed dialogue of ordinary laypersons about technological development was demanded (Senghaas-Knobloch 2001, p. 75). Debates on the “Ethics of technology” (Zimmerli 1998) gained particular significance (Grundwald 2013) and have special salience today for developments such as climate change and digitalization, which demand nowadays determined shaping activities, on all levels, workplace, company, and society.

The approach toward shaping of work and technology – or of its participatory design – was (and is) connected to international discussions and intentions prominently represented by Mackenzie and Wajcman (1985), Cooley (1987), and Rauner et al. (1988). Especially the international comparisons of “industrial cultures” showed different conditions for shaping (Ruth 1995).

---

## Shaping the Own Occupational Biography

This is, on the one hand, based on interests and competences; on the other hand it must be seen in relation to labor market opportunities.

The influence on the occupational biography refers to the path which is taken after middle school, at the instant when it is no longer mainly controlled by parents and school teachers within the specific societal conditions. The question has to be answered which occupation/vocation one would aim at and the level on which one would like to pursue these plans. On this it is dependent which branch of the school system one would and should – if possible – continue the studies or if one would enter an apprenticeship or go directly to work in gainful employment. To support people in these decisions is the task of processes of vocational orientation, which is implemented, dependent on the VET and school culture, in various institutional settings, in general or vocational school, employment agency or labor office, or other institutions.

But nowadays the idea of lifelong learning has gained strength which means that in principle vocational orientation has become important for the whole life course. That is, later, after having entered the adult workforce, the issue is still to choose between different options, like going to a different workstation or to strive for promotion and to relate that to individual interests in private life, that is to define the respective form of work-life balance for oneself. Other possibilities to be considered are going back to formal VET (see the respective issue of the journal IJRVET 2017) or to supplement it through studies in higher education, maybe even

in a new field, taking for that possibly a sabbatical or staying (maybe part time) at home for possibly a longer period, for work and life in the family.

This decision-making process is influenced by many factors based on personal experiences in work environments, family life, and leisure time. Certainly there is often guidance by labor market agencies and other institutions in place and also usually informal counseling by friends and relatives. To prepare young people for these decisions in VET, innovative pedagogical and didactic models are still to be developed. Here in particular approaches from the area of social pedagogy are relevant.

Up until now, the decision-making process is frequently still rather accidental; it lacks more in-depth information. On the one hand, this refers to information on future job opportunities where the role of relevant guidance institutions should be strengthened. On the other hand, the individual should be supported in appreciating his or her experiences, skills, and motivations more clearly. For this, a more systematic manner of recognizing these factors could and should be employed particularly (but not solely) for adults that is called “validation of non-formal and informal learning” (“ValNIL”) and which has become one out of four priorities of the VET policies of the European Union. Besides that, ValNIL can support not only a more distinct identification of aspirations but also of the self-efficacy beliefs which may hinder somebody to aspire to further steps in one’s career.

In this way the labor agencies, which often are responsible for that, become additionally relevant for vocational orientation although their activities are rather disparate in the different European countries. The provision of “ValNIL” shows different forms in various European countries which have been investigated by Petersen (2016, p. 101 et seq.). In any case to promote shaping, the own occupational biography means to explicitly support people in recognizing the various possibilities and opportunities and to relate them to their experiences, abilities, aspirations, and dreams.

However shaping one’s own occupational biography is not self-sufficient but dependent on exterior conditions and caught in a crossfire of influences. The very important dependency on school success itself contingent upon societal factors like income or sociocultural traditions of the family that cannot be influenced directly by the individual was already mentioned. Furthermore, the opportunities for gainful employment depend heavily on the national and regional conditions of the economy. Here differences in the amount of unemployment are of utmost importance, but also qualitative factors like the distribution of the various sectors of the economy are obviously also significant for the chances to enter a vocation/occupation one aspires at. Factors promoting shaping like cultural acceptance for change of company and change of branch of trade, soft VET structures, VET taking into account educational potentials, are also highly important.

---

## **Shaping Working Conditions and Work**

Historically, shaping working conditions and work was the origin of developing the shaping approach, being in contrast to adaptation to the demands of a given task within the scope of a given job. These demands can be rather challenging, and

therefore the competences necessary for adaptation can be sometimes quite exigent. The difference to the shaping competences – although only gradual – consists in an explicit emphasis on autonomous thinking, planning, and evaluating. And the content of “VET for shaping” puts the possibility and necessity of designing something new in the foreground. It presents explicitly different solutions for a problem that often has to be discovered as such for a start and for which then decisions have to be made which one might be the best fitting – or to detect possible new solutions. This means that before or at least in parallel to the shaping activities – through thinking and doing – a critical evaluation of the situation (see Negt 1968 above) which the shaping is aimed at is necessary. This critique is in turn dependent on shaping ideas if it should not stay in pure negativity.

During the 1980s of the last century, the idea of shaping was developed notably by German and British scientists who sought close connections to workers in industry, particularly to the shop stewards or “Vertrauensleute” and their representatives in the shop stewards committee or “Betriebsrat” who had already commenced shaping activities. These workers’ representatives stayed the decisive people for any shaping activities also later. Influential were the scientists Mike Cooley (1987) and Engeström (1987) with his emphasis on reformulation and renewal of knowledge and competences. Furthermore in the German metal workers’ trade union in the course of computerization, a fear arose that the qualification requirements would be diminished through transfer of planning activities to the work preparation department for writing the adequate program which the skilled workers had only to see to let the machine tool execute it, resulting in a deskilling and downgrading of jobs. This leads to a movement for “human centred CIM systems” (Rauner et al. 1988). These ideas are very relevant nowadays in view of the next wave of computerization or digitalization like in Germany the tripartite (employers, unions, State) initiative “industry 4.0” (Plattform Industrie 4.0 2015) and the concomitant initiative “Berufsbildung (VET) 4.0” (BMBF, BIBB 2018).

Shaping can be stimulated by societal, (work) group, and individual interests. Criteria for a “felicitous” solution are often thought to be:

- Useful for the relevant group: colleagues, employees, but also personal groups like family
- Useful for society
- Under artistic aspects: creative power

In the context of the UNESCO Global Action Program “Education for Sustainable Development” for the German branch, a “concept of competence for shaping” (Programm Transfer 21 2008, 2018), useful or even necessary for shaping also at the workplace, was developed, encompassing competences like to be able to:

- Build new cosmopolitan and interdisciplinary perspectives
- Be forward-looking
- Recognize and ponder risks and dangers
- Autonomously as well as collectively plan, decide, and take action
- Consider conflicts of aims

- Reflect about one's own guiding principles and those of others
- Use ideas about (social) justice for deciding about activities  
(Abbreviated and translated by the authors)

Shaping working conditions and work may well often start with the simplest although still very important issues: physical working conditions like coldness or heat in the factory, also sound office furniture, things that are often dealt with by work councils or shop stewards.

Then the work organization is at issue, including shaping the diversity at the workplace. Traditionally, planning the work organization is the task of the work preparation department or of the supervisor in the respective department. Of course, already since about 30 years, a discussion about participative operations or production scheduling is under way and certainly some change has happened, trying to implement worker participation, also via involvement of workers' representatives. The degree of implementation varies from branch of trade or industry sector to another and – particularly important for the theme of this chapter – from country to country or production culture to another (Ruth 1995).

The task of initial VET (IVET) and continuing or further VET (CVET) is then to encourage young and older people – to develop the competences useful for participating in these endeavors of planning and redesigning the work organization regarding the own workplace. This represents the shaping approach with respect to work organization. It appears that VET courses that contain “alternance” (Lattard 1999) between workplace and vocational school or college should be particularly appropriate for putting the shaping approach into effect because a close connection to practice is favorable.

Shaping (the own) work can also aim at the content of the work, that is, the concrete tasks and the work processes. This in turn encompasses different forms of concrete work as well as taking part in shaping the production technology, particularly participating in redesigning of human-machine interfaces like shop-floor programming of digitally programmed machine tools. Obviously it is difficult to implement worker participation in this field because it means real power sharing between management and workforce. But also the actual abilities of the workers are sometimes not sufficient. Participating in shaping presupposes shaping competences that represent a task for VET.

The main area where these shaping processes are relevant is the development of production technology, presenting new knowledge and skill requirements that should not be taken for granted but should be seen as a challenge for shaping. Shaping the work could or even should also encompass the results, the products. Here too shaping can happen primarily via the influence of the trade unions and the workers' councils. Therefore the neo-corporatist (cf. Lehmbruch 1982) system of gainful employment/occupation again is particularly well suited for supporting these shaping processes because it is characterized through cooperation of representatives of employers and employees.

## Shaping as a Pedagogical Principle in VET

Shaping is predominantly based on the interests of people in improving their living conditions, particularly at the workplace which is of special interest for VET, but also in all aspects of life: personal and family life and life in the (also wider) community.

However, often these interests are not clearly formulated. Rather people have to become aware of these interests more and more, a process in which they should be supported and encouraged – for the sphere of work the appropriate place is VET, IVET, and also CVET including ValNIL.

CVET which is important for shaping at the workplace can be carried through by interested people either in parallel to gainful employment or while taking a sabbatical leave, sometimes supported by the employer, sometimes by the labour agency, but often self-supported – where differences exist internationally. An important aim in the course of shaping activities is that the employers should provide adequate time for further studies.

The required competences for shaping can be attained through formal learning (VET), “nonformal” learning (often CVET), and – particularly important – through informal learning that can eventually lead to “ValNIL,” first of all in its first two modes, that is emotional esteem and social appreciation (Petersen 2016, pp. 136–148).

The term “nonformal learning,” especially according to Björnåvold (2000), designates self-controlled learning processes within the framework of formal learning structures, that is learning in the process of working, specifically during VET courses realizing alternance, carried through nowadays – although often not as a rule – in many European countries.

Informal learning for shaping happens mostly accidentally – by chance – and incidentally – according to the opportunities given at a time. In this context, one should realize that there exist three perspectives on learning, in addition to the one related to instruction theory, that are particularly significant for learning for shaping:

- Perspective of (pragmatic) learning by doing (“knowing-in-action”) (Schön 1983; Nielsen and Tanggaard-Pedersen 2011, p. 569)
- Perspective of learning as a social process (especially according to Lave and Wenger 1991)
- The constructivist perspective (from Piaget (1976) onward until today)

Informal learning relates predominantly to forms of knowledge which are different from universal, logically structured knowledge which is the basis of formal learning. Rather learning from experience is at stake which is founded in actions and which cannot, to a great part, be described exactly (cf. Dreyfus and Dreyfus 1987; Neuweg 1999; Schön 1983). This “knowing-in-action” is related to “bodily knowing” (Nielsen and Tanggaard-Pedersen 2011, p. 568) and “tacit knowledge” and “tacit knowing” (loc. cit. p. 568, cf. Polanyi 1966; Eraut 2000). For learning in

an apprenticeship or in other forms of alternance, it is considered to be highly relevant.

It is typical for informal learning for shaping to take place in working groups, analyzed by Lave and Wenger (loc. cit.) as “communities of practice” with the main aspects – in addition to the important “doing” – of learning, meaning, and identity, which are supposed to be present everywhere in working life as well as, although in different form, in family life and also often in leisure activities. To take part in such a community means, however, more than just working together, at the workplace mostly under the supervision of a superior. The conceptions “situated learning” and “legitimate peripheral participation” should be deemed central elements of the idea of learning as a social process (Lave and Wenger 1991), notably for shaping. It means, put in a slightly simplified version, that working and, particularly by that, learning for shaping is situated in the specific circumstances and not of a general nature.

It denotes that one moves in the community from the periphery to the center, so that one gets more influence (competence meaning responsibility) on how to fulfill the tasks and communicate about it and about the tasks themselves and to participate in shaping the co-operation and the tasks and also to motivate others to join in.

All learning is according to Piaget (1976) a combination of assimilation and accommodation. In this process not only plays the influence of the outer world a decisive part but even more so the *construction* of new cognitive schemes. This constructing activity of learning is usually not adequately taken into account and may lead to a higher appreciation of informal learning, as proposed by Björnåvold (2000, p. 24).

---

## **“System of Gainful Employment/Occupation” as an Analytical Instrument**

### **General Approach**

The starting point of the international comparison of the preconditions for carrying through shaping activities is the observation that in the European Union the VET systems are disparate (Fischer et al. 2004) and that nearly no processes of harmonization are to be observed. In contrast to the developments in Higher Education, the “Copenhagen Declaration” on VET (Eqavet 2018) formulates only a closer cooperation between the countries as the aim of European VET policies (cf. Refernet Germany 2015), although via the European Qualifications Framework (EQF) and the approach toward the European Credit System for Vocational Education and Training (ECVET) there exist at least impulses toward the comparability of learning outcomes and their certification.

For the systematic European comparison, the so-called regulative principles are defined, which are related to the societal field/system of gainful employment/occupation and represent the thesis that the working and living situation in a respective country is determined by fundamental principles (Petersen 2016,

p. 181). They have developed in history and frame the structures in the different subsystems or “societal fields” (Bourdieu 1987). One should note that some authors (Heikkinen 2004, p. 35) doubt whether such comparisons are possible and meaningful. The reason is that these comparisons are thought to hold an oversimplification of the situation in a concrete country and don’t respect the history of events in an adequate manner.

In addition, one should recall the opposition of “system” and “life world” (Habermas 1981). The societal regulative principles for the employment/occupational system incorporate the life world only marginally. The relative independent interactions of cultural preconditions with the determinants of a system are represented in explicit fashion merely to some extent which means that characteristics of a society to be described in terms of social psychology are not the focus.

The theoretical model developed for the transnational comparison is based on an analysis of phenomena called “Erwerbstätigkeitssysteme” (“systems of gainful employment/occupation”), constructs – rather basically – adjusted from the “employment models” by Bosch and Lehndorff (2007). This model that was developed from the problem area of “ValNIL” (Petersen 2016) was generalized for the international comparison of VET at large and will be transferred now to the analysis of preconditions for shaping activities.

The regulative principles themselves are subjected to processes of continuing transformation which are to be analyzed through the dialectical relation of, on the one hand, (economic) “(neo)liberalism” versus “European social model” and, on the other hand, structural “modernism” (in the social-historical meaning) versus “post-modern” flexibility and openness to varying developments. They are called regulative principles related mainly to gainful employment/occupation and have grown out of a respective historical tradition. As an extension (and alteration) of the work of Greinert (1995), they are called “tradition,” “market,” “bureaucracy” (according to Greinert), and, newly worked out by Petersen (2013), “neo-corporatism” (cf. Lehmbruch 1982) and “social welfare.” It is obvious that nowadays these regulative principles are operative within the economic system of capitalism (Hall and Soskice 2001).

They define the “working” of the national systems – or fields according to Bourdieu (1992) – of gainful employment/occupation, sometimes also called “occupational systems.” In extension (and alteration) of the work of Bosch and Lehndorff (2007) and Lehndorff (2009), these systems are supposed to be composed of four subsystems which are defined to be the systems of work, employment, VET, and social welfare. Each of these subsystems is influenced by a predominant regulative principle that leads to a matrix of four times five, that is 20 elements which can be used to analyze real countries.

As representatives of the five differently regulated systems of gainful employment/occupation, five countries have been scrutinized: Portugal, traditional system of gainful employment; the UK, market-oriented system; France, bureaucratic system; Germany, neo-corporatist system; and Sweden, social welfare system (Petersen 2016, pp. 287–303). This approach means having an overall occupational system with one regulative principle and subsystems with sometimes diverging regulative

principles that allows to design a flexible analytical instrument, as stated by Arnold et al. (2015, p. 131) with respect to Petersen (2013).

### **Five Kinds of VET Systems as Subsystems of Five Types of Systems of Gainful Employment/Occupation**

For the five types of systems of gainful employment/occupation, five kinds of VET systems can be detected/defined as different subsystems in which possible shaping activities would be embedded. For concrete countries, “combination models” can be described where at least two regulative principles are effective, like in alternance systems the training company (most often regulated by market principles) and the vocational school or college, run often by State agencies, that is then regulated by the regulative principle of “bureaucracy.” Apprenticeship systems are historically based on the situation in the middle ages and include therefore also the principle of tradition. In all countries with an alternance VET branch, there exist also school branches and often VET courses in Higher Education institutions, resulting in mixed systems. It becomes apparent that the analysis, in spite of its clear structure, does not lead to a “terrible oversimplification” but presents many variations, especially for the international comparison.

The question of how much it is promising to undertake shaping activities is to a great degree contingent on the respective system, not only the VET system (sometimes as a part of the general education system, sometimes more separate) but the systems of work, employment, and social welfare too. For the analysis, one has to take into account the work hierarchy (work system) that is common in the respective country and also the labor market (employment system) as well as the conditions for social welfare (welfare system) for possibilities of financial support in case of leave of absence or even a sabbatical for taking a course for acquiring additional shaping competences.

---

### **The Dependency of Possibilities and Opportunities for Shaping on the System of Gainful Employment/Occupation**

The theory of systems of gainful employment/occupation will now be used for a *systematic* distinction of the possibilities and opportunities for shaping within these systems. The main new perspective relative to the state of the art is represented by a *systematic* answer to the question which are the supportive and hindering functions of the different systems, specifically the VET systems.

It has furthermore to be taken into account that there are individual dispositions and characteristics that are relevant for the ways in which individual learners cope with their opportunities to shape their working conditions.

## Dependency on Types of “Biographical Occupation Orientation”

For that, reference is made to the distinction of three types of “biographical occupation orientations” determined by Gericke (2017):

Type I: strategic use of qualification offers which leads to a holistic perception of occupation

Type II: defining and accepting limits of one’s one scope of duties and expertise, which results in a limited perception of the own occupation

Type III: passionate professional practice

It appears to be obvious that Type I and Type III support shaping, whereas Type II rather hinders it because the identification with the professional practice is rather weak. This could apply also for shaping the own occupational biography as the interest in the own career path might be fairly low. It is reasonable to assume that the three biographical occupation orientations should exist in all five systems. However, because of the existence of market forces for VET (like in the UK) on the one hand and the neo-corporatist embedment of VET (like in Germany) on the other, one would expect that Type I is stronger in a neo-corporatist system, whereas Type II should be more prevalent in a market-driven system. In a traditional system (like in Portugal), Type II might be relatively strong because the self-reliance in the occupation (profession/vocation) is not so much supported by the still not always quite systematic VET provisions. In bureaucratic systems (like in France), Type I may be rather strong as the VET provision supports identification with the profession although the “real work life” is underrepresented in the dominant school provision of VET. This may hinder the development of specific shaping competences (“pragmatic learning,” cf. above) and also the motivation for shaping as the identification with the real, concrete performance in the job might be fragile. In the system of social welfare (like in Sweden), again Type I may be prevalent for reasons similar to these in the bureaucratic system, but shaping the own occupational biography is in principle better supported through provisions of the welfare state.

## Tables Sketching the Influence of the Systems of Gainful Employment/Occupation on Shaping

### Shaping the Own Occupational Biography: Promoting Factors

*Simplified thesis:* The more rigid the VET structure, the less shaping of own occupational biography is facilitated for the short term. But in the long run, the neo-corporatist system of gainful employment/occupation may also support shaping. See Table 1.

Shaping the own occupational biography is supported informally in cases where there are weak VET-structures, and it is a task of and a demand for the individual to

**Table 1** Shaping the own occupational biography – promoting factors

System of gainful employment/ occupation	Traditional	Market oriented	Bureaucratic	Neo-corporatist	Social welfare
Promoting factors	Strong	Strong	Strong	Weak (short term), rather strong in the long run	Strong
	Weak VET structures demand...	Weak, multiple VET-structures demand...	Educationally dominated VET system promotes...	Strong VET structures are in the short term a limiting factor for ...	School-based VET system stressing educational aspects promotes ...

...shaping the own occupational biography

learn and work toward an own occupational perspective. Moreover systems of gainful employment/occupation which provide school-based VET systems also promote the aspect of shaping of the own occupational biography through stressing educational aspects such as personal interests, work-life-family balance and personal occupational aims.

Furthermore, the influence of the social welfare system, its structure, and intensity of benefits that support occupational learning, orientation, and change is an important factor that promotes the shaping of own occupational biography.

In contrast, formally strong VET structures may in fact initially limit the shaping of the own occupational biography. The frame given through the specific concepts of “Berufe” (vocations) and “Beruflichkeit” (vocationalism) in Germany – as an example – paves the way for promotion without stimulating own planning. But the emphasis on fully acknowledged nationwide certificates (“Berufsabschluss”) effectuates a rather clear system of formal CVET for vocational promotion (“Aufstiegsfortbildung”).

**Shaping Working Conditions and Work: Promoting Factors**

*Simplified thesis:* The more holistic the VET structure, the merrier shaping of working conditions is supported. See Table 2.

Focusing on the vocational learners influence on work and working conditions during their occupational career, the assumption is that holistic VET structures support the shaping of work and working conditions stronger than either market-driven or school-based VET structures. This is facilitated by the fact that holistic VET structures in general combine and parallelize practice and theory, vocational knowledge, general subjects, and personal development and involve different institutions in IVET at the same time.

**Table 2** Shaping working conditions and work – promoting factors

System of gainful employment/ occupation	Traditional	Market oriented	Bureaucratic	Neo-corporatist	Social welfare
Promoting factors	Uncertain	Rather weak	Established	(Very) strong	Strong
	Small enterprises => strong personal relations may support. . .	Weak formal rights for employees' participation/ representation hinder. . .	Defined employees' representation, educational aspects in school based VET support. . .	Often strong employees' participation, also for apprentices, supports. . .	Strong educational aspects in school based VET; clearly defined rights for employees' representation support. . .
	BUT often strong hierarchy, weak workers' participation may hinder. . .	BUT experience in real company work processes may support. . .	BUT little introduction of young people into real company work processes may hinder. . .	BUT traditional hierarchical structures in small enterprises may hinder. . .	BUT little introduction of young people into real company work processes may hinder. . .

. . .shaping working conditions and work

In a traditional system of gainful employment/occupation, there are no formal opportunities for shaping work or working conditions as the rights of employees are still rather often uncertain and sometimes not clearly acknowledged on a legal basis. The ways in how far an individual worker or learner can influence his work or working conditions are connected to the social recognition of the employee at the specific workplace and to personal characteristics and the position of the individual worker.

In market-driven systems of gainful employment/occupation, VET structures are generally vague, occupational profiles are variable, and therefore the trade unions do not show a deliberate branch-specific differentiation which would enable them to claim opportunities for shaping work or working conditions in a specific branch. In general, employee representation in the company codetermination is weak.

A bureaucratic system of gainful employment/occupation – including a school-based VET system and clearly defined employees' rights within the work and employment system – shows established structures for employee's shaping of work and working conditions. Employees' representation and participation are clearly defined according to the company's size, and employee's rights with regard to access and financing of CVET are legally defined. Furthermore a school-based VET system supports the idea of shaping through emphasizing employees' rights in the curricula. But in fact the commitment of the unions for shaping is reduced by the relative weakness of neo-corporatist thinking.

A neo-corporatist system of gainful employment/occupation represents specifically strong promoting factors for shaping working conditions and work which gives reason to describe it in more detail.

In a neo-corporatist system of gainful employment/occupation and particularly a VET system which is characterized through codetermination of employers' organizations and trade unions under an only weak supervision of the State (Petersen 2016, p. 192, 274 et seqq.), the latter "corporations" have various opportunities for shaping work conditions and work. The organizational structures in each company and the general relative strength of the trade unions promote negotiations about the organization of work processes and division of work. The codetermination within each company – apart from the very small ones – is legally institutionalized. Employees elect their representatives who are supported and trained for their codetermination tasks by the trade unions. Their representative tasks are part of their job profile. The inclusion of the works' council on several structural levels of a company – with union representatives in bigger companies on the supervisory board – promotes the shaping of work and working conditions in various ways. Additionally the share of the trade unions within the VET system has to be highlighted. It is – together with the employers' organizations – traditionally their responsibility to identify the need for a new VET profile including updated training rules ("Ausbildungsordnungen") and to discuss the content especially of the practical part of it. The specific dual structure of the VET system in Germany includes young apprentices in the real work process on an early stage, while they are also part-time pupils in the "Berufsschule" which provides theoretical background with regard to the vocation through different "Lernfelder" that are taken not from subject structures but from exemplary work situations. In addition, their study comprises also topics of general education.

In social welfare-oriented systems of gainful employment/occupation, shaping of working conditions and work is promoted through the strong educational focus in the school-based VET system. In this the clearly defined rights for employee participation and representation within the companies are an important subject in the curricula. Employees' participation and representation are guaranteed by specific committees on company level. Employee representatives have to be included in company boards if the company has more than 25 employees. Furthermore the developed system of welfare contains specific programs for supporting CVET advantageous for shaping. But due to their lack of practical experience with real work processes, young people are in principle not well prepared for a pragmatic influence on their working conditions and their work. As the school-based VET system only offers placements within the phase of IVET, the individual trainee always remains within his trainee status which generally promotes a less strong and responsible relation to the work tasks and working conditions in comparison to an apprenticeship.

---

## Conclusions

The shaping principle which has been developed about 40 years ago in the context of humanization of work and which constituted a new educational principle for VET is gaining new relevance because of the digitalization of work which may influence all kinds of work, in the factory, in the office, in the repair shop, and in the studio, but also care work in the hospital and even in the retirement home. The consequences of that, particularly in view of the uncertainties of the pace of its development, are still not clear. Rather – according to the shaping principle – the way how the digitalization is used should be shaped, not only by the employers and top engineers but also by the workers directly involved. Following the tradition of the waves of automation during the 1960s/1970s and of computerization during the 1990s/2000s, the new wave of digitalization presents a stimulus to intensify shaping activities not only in society and economy at large but also at the workplace. Opportunities for that are dependent on the economic sector which should be systematically investigated in future work, and they are specifically contingent on the preconditions of the various countries which have been analyzed by means of the analytical instrument “system of gainful employment/occupation” including “regulative principles.”

These possibilities and opportunities for shaping are rather different in these countries or systems. It appears that for shaping the own occupational biography in the short term, not so stringent VET systems are favorable because they leave much open, similarly school systems because they have a strong inclination toward general education. In contrast neo-corporatist systems prescribe rather much in the beginning of the career but they build a good foundation for advancement through CVET. For shaping working conditions and work, weak formal rights of participation are less favorable, whereas the neo-corporatist system with its inbuilt strong regulations of participation promotes it particularly well.

The results of these deliberations are, however, still tentative. On the one hand, it appears that the critique of a systematic comparative analysis is in the first instance partly justifiable because it turns out that a lot of different interdependent factors are influencing the respective situation. One should, however, take into account that to abstain from it would one leave without guidance for looking at the concrete countries which is obviously inappropriate. On the other hand, the empirical basis is still rather small which should be an incentive to carry through a fairly extensive research project, in the framework of the EU or the OECD.

## Abstract

The purpose of this chapter is to contribute knowledge about school-related and workplace-related conditions that enable students' vocational learning during workplace-based learning within vocational education. The research underpinning the chapter draws on evidence from a research project on students' vocational learning in the industrial vocational education program at six different Swedish upper secondary schools. The theoretical concept of recontextualization contributes to uncovering the dynamic conditions that enable students' vocational learning as they bring knowledge from the school context to the workplace context and back in vocational education programs. The argument is that both

school- and workplace-related conditions must support putting knowledge to work in the workplace context. The ways in which different types of knowledge are put to use form the basis for examining how school-related and work-related conditions can support students in their vocational learning. The students' ways of making sense of workplace-based learning as an extension of their educational program and of putting knowledge to work in the workplace are connected with their identity formation processes. Students use different learning strategies to bridge school-based and workplace-based knowledge that support changes in the workplace. The implications of this study are discussed in terms of potential changes in practices for vocational learning in the context of vocational education.

## Introduction

This chapter contributes to contemporary research on vocational learning and the long-standing challenges of integrating school-based and workplace-based learning in vocational education. Vocational education and young adults' school-to-work transition constitute a well-established research field. However, knowledge gaps remain, and many questions are still unanswered within the field. There is emerging research regarding the nature of vocational learning for students who alternate between school-based and workplace-based learning and thus move between different learning contexts, in developing relevant vocational learning within vocational education programs (Endedijk and Bronkhorst 2014). This overriding international trend is widely reflected in the development of vocational education and the requirements from both educational institutions and the work life to better integrate theoretical and work-specific knowledge into vocational education (Littke and Thang 2015).

In Swedish upper secondary school vocational education, there has been a renewed interest in workplace-based learning and apprenticeship in an attempt to counteract the dual problem of high youth unemployment and shortages of skilled labor and to strengthen young people's direct access to the labor market (Persson Thunqvist 2015). Similar discussions and policy trends have been highlighted in several other countries as well, for instance, Finland (Virolainen and Persson Thunqvist 2017), the UK (Fuller and Unwin 2009), and Canada (Lehmann et al. 2014). In addition to preparing students for specific qualifications and occupations, vocational education must also promote lifelong learning and ensure further career development in the case of structural transformation (e.g., geographical redistribution of work, the closing of industries). Demands to bridge the gaps between education and work have also been fueled by globalization, digitalization, and new work organizations (Lauder et al. 2006).

Learning in formal educational institutions and workplace settings is often viewed as different processes with separate structures (Billett 2011), and school- and workplace-based forms of learning have different rationales that may affect students' vocational learning and create different conditions for their learning (Schaap et al. 2012). A vocational education program that alternates between school-based and workplace-based learning implies a holistic view of vocational education that integrates theoretical knowledge with work-based knowledge and goes beyond a theory–practice dichotomy (Evans et al. 2010). However, as such integration does not come easily in practice, it remains significant to deepen the understanding of conditions that enable or constrain students' learning within vocational education programs in which students go back and forth between school-based and workplace-based learning. Understanding of how such vocational education programs can be developed both for and by the students and of the conditions that enable (or constrain) vocational learning in the workplace context must be advanced (Guile and Evans 2010).

The purpose of this chapter is to contribute knowledge about school-related and workplace-related conditions that enable students' vocational learning during workplace-based learning (in the workplace context) within vocational education. The chapter draws on evidence from a research project on vocational learning based on interviews with 44 students (33 boys and 11 girls) enrolled in the industrial vocational education program at six different Swedish upper secondary schools. The research evidence is used to illustrate school-related and workplace-related conditions that enabled the students' vocational learning in vocational education. The contribution of this chapter lies in its input into the ongoing discussion of the challenges of relating different forms of knowledge and learning in vocational education, including the long-standing, seemingly intractable problems of interconnecting theory and practice in vocational education.

The chapter has four sections. The following section provides a brief contextual description of the current state of the vocational education system in Sweden, particularly vocational education in upper secondary school. The subsequent section introduces the theoretical framework, which is inspired by Evans et al.'s (2010) theoretical model that is used to analyze students' vocational learning in vocational education programs in which students alternate between school and work. This model offers an alternative way of analyzing students' vocational learning in which the underpinning assumption is that all knowledge has a context that includes traditions, norms, and practices and that knowledge learned in the school context can be recontextualized, that is, put to use in the workplace context. Our argument is that learning conditions must also support putting knowledge to work in the workplace context. In the following section, school- and work-related conditions for vocational learning are discussed, and some examples from research are provided. The ways in which different knowledge is put to use form a basis for examining how school-related and work-related conditions can support students in their vocational learning. Finally, some conclusions are presented.

## The Current State of Vocational Education in Sweden

A brief description of the current state of vocational education in Sweden is provided to establish the context of the Swedish vocational education system. Since the early 1970s, initial vocational education has been an integral part of a state-governed upper secondary school system that targets almost all 16- to 19-year-olds. At present (since 2011), there are 18 national programs, 12 of which are vocationally oriented. All vocational education programs last for 3 years and comprise a mix of school-based education and workplace-based learning. Upper secondary schools are responsible for providing apprenticeship as a complementary track along with school-based vocational programs. Goals and syllabi for these two pathways are formally the same, but students in apprenticeship education spend at least half of their time at one or more workplaces. All programs lead to a vocational exam administered by the school (Swedish Agency of Education 2017).

In addition, all vocational education programs formally provide basic eligibility for higher education. All students in upper secondary school are required to pass mandatory core courses (e.g., mathematics, Swedish, English) at a level that is sufficient for entry into higher education. This also makes it possible for vocational students to shift between programs if they find that they have made the wrong educational choice. The vocational education programs typically start with a broad introductory year. During the second and third years, the educational system provides more specialized vocational courses and workplace-based training within vocational fields such as industry work, construction work, auto mechanics, health care, and business and administration (Persson Thunqvist 2015).

In comparative research on different vocational education systems in industrialized countries, Sweden is often discussed within the framework of a “Nordic egalitarian model of education” (Dobbins and Busemeyer 2014). The model is characterized by publicly funded comprehensive school systems guided by the principles of equity, democratic participation, and welfare (Antikainen 2006). Historical comparisons (Michelsen and Stenstrom 2018) of the postwar Nordic vocational education systems reveal how the strong political force of the Social Democratic Party has struggled to reduce the distance between general education and vocational education and to promote equal access for further studies for all young people, irrespective of their social backgrounds. However, the national policy strategies for improving the quality of vocational education in relation to general education differ among the Nordic countries. For example, the school-based systems in Sweden and Finland are generally distinguished by attempts to integrate vocational education and general education, while those in Denmark have been characterized by attempts to modernize the apprenticeship system and thus protect the specific nature of vocational training (Persson Thunqvist and Jørgensen 2015). In the Nordic context, the Swedish vocational education system is the most clear-cut example of the Nordic model of education in terms of the role and function of vocational education. Hence, it represents a kind of natural experiment regarding the challenge of integrating general and vocational education to provide access to both skilled employment and further studies (Jørgensen et al. 2017).

However, in practice, such integration has remained a challenge for policy-makers and educational scholars in the past decades. Since 1994, all vocational education programs have been organized to provide better general education and basic eligibility for higher education. A trade-off, however, was that the direct links between upper secondary school vocational education and work life weakened, and transitions from school to work become complicated in several vocational fields (Olofsson and Persson Thunqvist 2014). In the new millennium, vocational education has been subject to renewed reforms to manage this challenge. By bringing educators and representatives of the work life together, political efforts have aimed to develop frameworks for cooperation between schools and workplaces at the central and local levels (Persson Thunqvist 2015). The initiators of the most recent school reform, in 2011, emphasized the importance of conducting workplace-based learning at a learning site that is equivalent to school (SOU 2008). At the same time, according to the educational goals, general education, vocational education, and workplace-based learning should be integrated to form a whole (Swedish Agency of Education 2013). A main challenge for school organizations and social partners is to jointly implement the intended curriculum in practice. In addition, the student perspective regarding this challenge is important to consider. However, vocational students' workplace-based learning within Swedish upper secondary school is largely under-researched (Ferm et al. 2017).

---

## Vocational Learning: Alternating Between School and Work

The theoretical framework presented in this section is inspired by a theoretical model developed by Evans et al. (2010) to analyze students' vocational learning in vocational education programs in which students alternate between the school and work contexts. The model is based on the theoretical assumptions of situated learning (Lave and Wenger 1991; Fuller and Unwin 2009). From a situated learning perspective, learning is social and is defined as a process of participation in and between communities of practice where interaction in activities, mutual engagement, and a joint repertoire (e.g., methods and routines) are important elements for developing vocational knowledge and future vocational identities (Wenger 1998). The concepts of community of practice and legitimate peripheral participation have been developed to describe apprentice learning and identity formation in analyses of the social and pedagogical processes involved when a "newcomer" becomes an "old-timer" in the practice of a shared activity (Lave and Wenger 1991). Although Lave and Wenger's seminal work does not particularly focus on the role of the school-based part of vocational education in the newcomer's learning process, the situated learning approach to vocational learning has been applied and further developed in research regarding how conditions for modern forms of apprenticeship are shaped by student participation, formal educational contexts, and the institutional arrangement of workplace-based learning (Fuller and Unwin 2003). The concept of expansive and restrictive learning environments has been developed to identify conditions that enable and constrain different types of workplace learning, adaptive and

expansive learning (Ellström 2006; Fuller and Unwin 2004), and different approaches to apprenticeship (Fuller and Unwin 2003). An expansive approach to apprenticeship is associated with expansive learning (Engeström 2001); that is, learning that is closely related to the transformation of vocational education and the conditions for students' vocational learning may depend on the degree to which school- and workplace-based knowledge is integrated into vocational education. In contrast, the restrictive approach is associated with the adaptive learning of vocational knowledge.

The model of Evans et al. (2010) offers an alternative way to analyze the interplay between school-based and workplace-based learning and how different forms of knowledge are recontextualized by students as they use knowledge and move between learning contexts at school and in the workplace. All vocational knowledge that a student learns is thus dependent on the context, i.e., whether learning occurs at school or in the workplace. Context is often understood as settings or places, but Evans et al. (2010, pp. 246) extend the use of the term to include the “schools of thought,” traditions and norms of practice, and life experience in which different kinds of knowledge are generated. This dynamic account of context is comparable with theoretical developments in other disciplinary fields, such as dialogic and interaction research regarding communication, cognition, and discourse (Goodwin 2000; Linell 1998), in which the notion of “recontextualization” is fundamental. While recontextualization was originally a text-based notion (e.g., implicated in the work of Bakhtin 1981) referring to the dynamic transformation of something from one discourse to another (Linell 1998, pp. 154–155), in this chapter, the notion will be assigned broader applicability in vocational education.

In the context of Swedish vocational education, the notion of recontextualization has been used in studies demonstrating the hybrid nature of project-based vocational programs organized in close collaboration with head teachers, vocational teachers, students, and professionals (Linell and Persson Thunqvist 2003; Persson Thunqvist and Axelsson 2011). In such complex learning environments, where different knowledge traditions are simultaneously at play, it can be relevant to discuss contextual configurations (Goffman 1974; Goodwin 2000) and elements from different contexts (e.g., school and work life) that are updated and reappropriated on a moment-to-moment basis in teaching and learning. In Goffman's terms, recontextualization usually amounts to reframing. When knowledge or traditions of knowledge are relocated from one context to another, they are subject to change, requiring new ways of seeing things and responding to them (Goffman 1974). Under these circumstances, knowledge is also sometimes subject to textual changes (e.g., changes in the educational curriculum), such as simplification, condensation, elaboration, and refocusing (Bernstein 1990). Bernstein (1990, pp. 59–61) used the term recontextualization in the discussion of the reproduction of educational discourse.

In this chapter, a slightly modified version of the model by Evans et al. (2010) is applied as an analytical framework (Fig. 1). Vocational students are required to progressively use and relocate knowledge from the school to the workplace context and back to learn their vocations. The application of school-based and work-based knowledge provides students with resources for dealing with problems in the workplace (Guile 2012).

**Fig. 1** Theoretical model for analyzing vocational learning in vocational education programs in which students alternate between school-based and workplace-based learning. (Adapted from Evans et al. 2010, pp. 247)

The model illustrates that disciplinary and work-based knowledge shapes the vocational programs' curricula and thus influences the courses and knowledge that students require to enter a specific vocation. Vocational education programs are struggling with the pedagogical challenge of meeting the requirements of both school and work life when designing programs that integrate disciplinary and work-based knowledge (Evans and Guile 2012) and that provide students with a meaningful, whole vocational learning (Littke and Thång 2015). In the school context, students encounter contextualized "real-life" cases that are used to prepare them for their new vocation. Vocational teachers have a key role in vocational students' learning; they give students access to relevant vocational experiences and function as intermediaries between school and work life (Persson Thunqvist and Axelsson 2012) by contributing to the school's formal goals and informal expectations (Billett 2011).

A conventional assumption in previous research is that the workplace as a learning environment is highly important for students' vocational learning. However, merely being present in a workplace is not adequate to allow students to apply the knowledge gained in the school context to the workplace context. When students enter the workplace, vocational learning is not restricted to training in specific skills; it also entails knowledge about activities, roles, and social practices and to vocational identity formation (Evans and Guile 2012). Opportunities to participate in workplace activities and interactions depend on both the learning environment provided to the students (i.e., good or poor conditions for vocational learning) and how the school-based and workplace-based parts of a vocational program are organized (Fuller and Unwin 2003).

Another central aspect of the model illustrates the importance of recognizing what the students themselves do to integrate knowledge gained from school and their workplace-based learning to meet their own learning needs. The school and workplace contexts shape and guide the students' learning of a vocation, but they emphasize different requirements for the vocation and what students need to learn

to meet those requirements. In a sense, students are boundary crossers because they alternate between school and workplaces (Akkerman and Bakker 2012). Students develop and use different strategies to integrate the knowledge they gain from the different contexts, and some strategies, such as asking questions and identifying role models from whom they learn the new vocation, are prompted by the individual student's prior experiences and personal characteristics (Ferm et al. 2017). As Evans et al. (2011) argue, the learner's recontextualization occurs through self-chosen strategies that entail understanding the demands of the chosen vocation and, above all, the learner's motivation to join it. For students, the challenge is to form a personal strategy that makes use of both school-based and workplace-based knowledge to gain the knowledge, skills, and insights they need to learn, develop a vocational identity, and meet the demands of their chosen vocation.

---

## Conditions for Vocational Learning

This section presents an empirical study of students' vocational learning based on qualitative interviews with 44 students (33 boys and 11 girls) enrolled in a vocational (industrial) education program at six different Swedish upper secondary schools. Due to the large amount of data and the space limitations of the chapter, the findings are portrayed relatively briefly, focusing on key features of the school- and workplace-related conditions that enabled the students' vocational learning and the ways the students themselves shaped their learning conditions to put their knowledge to use in their workplaces.

### School-Related Conditions for Vocational Learning in the Workplace

Several school-related conditions served as a bridge for preparing the students' entrance to the workplace and could later support their learning in workplace settings. For the students, it was important to receive as much preparation as possible at school before beginning their workplace-based learning. Student readiness is an important condition related to their ability to make informed decisions about a chosen vocation and engage effectively in vocational education toward a career for which they are suited (Billett 2011).

In school workshops, the students encountered content and work methods involving contextualized "real-life" cases that prepared them for the vocation as an industrial worker. The important condition in these authentic situations was that the students were permitted to make mistakes and had opportunities to reattempt tasks. Like the students in Berner's inquiry (2010), the students in this study perceived the school environment as a safe and inclusive place to learn from mistakes. In contrast to classroom teaching, school workshop training was characterized by intense interaction between the students and experienced vocational teachers, tools, and machines. Gradually, the students were given more challenging tasks with the support of the vocational teachers. This support from vocational teachers was a

crucial condition for the students' learning. The teachers were key people who provided the students with access to vocational experiences and served as intermediaries between school and work life (Persson Thunqvist and Axelsson 2012). The students recognized the vocational teachers as role models who helped the students with instructions for handling different specific tasks, such as welding and sheet metalworking or CNC (computer numerical control) machining and turning. The vocational teachers often translated the informal requirements of the vocation to the students. The vocational teachers' knowledge was recontextualized in their teaching and training; that is, it was visible in the teachers' pedagogical assumptions regarding the vocational qualifications the students had to acquire informally and the formal curriculum goals that they should achieve (cf "pedagogic recontextualization"; Evans et al. 2011).

Knowledge gained in the school context was, as the students said, a "springboard" for continuing to learn the vocation in the workplace. It seemed crucial for the students to have a minimum base of "correct" vocational knowledge to feel capable of handling certain work tasks and to face emerging problems when they entered the workplace. In some schools, the students had the opportunity to learn specific work tasks that required licensed skills, such as welding and forklift driving, and occupational safety certification. Obtaining a certification demonstrating that they had the necessary skills was a significant condition for gaining knowledge that could immediately be put to work in the workplace.

Additionally, local school regulations and the curricula for the vocational educational program created mutually interacting conditions that, in turn, framed the students' vocational learning in terms of establishing the learning goals and learning activities that they should achieve in the school. As noted by Billett (2011), even though students have similar curriculum pathways for learning in vocational program, their learning is regulated by the local school context. Some students described practical barriers in the organization between subject-based courses and workplace-based learning, which affected their access to learning opportunities both at school and in the workplace. The subject-based courses simply did not fit schematically into the workplace-based learning placement period. For instance, students who aspired to apply for university studies had difficulty qualifying because preparatory courses, such as mathematics and English, conflicted with the students' workplace-based learning. Vocational students who meet the requirements for both theoretical and vocational subjects receive a so-called double diploma, which is necessary to continue to higher education in the Swedish school system.

The students complained that the content of the preparatory courses had no or a limited connection to the industrial work. For example, the courses lacked industry-theoretical knowledge, such as tool names in English (as many companies had English-speaking co-workers and customers). These insufficiencies indicate that vocational education should prepare students in broader competencies, particularly as workplaces are becoming more diversified and production systems and work methods in the industrial sector more specialized (Olofsson and Persson Thunqvist 2018).

Conditions related to the organization of the school- and workplace-based parts of a vocational program can also be partly attributed to generic learning differences

between school and work contexts in that the former follows the logics of education and the latter the logics of work (Akkerman and Bruining 2016). To overcome organizational differences and meet the students' learning needs, the vocational teacher at the school usually followed up in planned meetings with the workplace supervisor and the student, in which time was set aside for reflection and discussion of the students' work experiences and personal development. In these three-part meetings, the focus was not only on the students' vocational learning but also on building strong collaborative relationships with the company. These meetings were a necessary condition that functioned as an organizational bridge between the school and the company. Therefore, the students understood the school would get a bad reputation if they misbehaved during their workplace-based learning.

### **Workplace-Related Conditions for Vocational Learning**

The workplace environment was highly important for the students' vocational learning because it allowed them to gain specific industrial "know-how" during workplace-based learning. Opportunities to participate in workplace activities and to interact with supervisors and experienced co-workers depended on whether the workplace learning environment provided good or poor conditions for learning and developing vocational skills (Fuller and Unwin 2003) in the companies. Each student had a formal supervisor. Previous research has shown that a formal supervisor in the workplace is crucial for students' learning; furthermore, in the Swedish context, students are required to have formal supervision during workplace-based learning. Nevertheless, the support that the supervisors provided varied. Some supervisors offered substantive learning support, while others did not provide the support that the students expected to receive in the workplace. In case of unsupportive supervisors, co-workers were committed to providing the students with access to different forms of guided learning, such as coaching, peer support, answering questions, and providing practice opportunities as part of everyday work (Billett 2000). Experienced and skilled co-workers with good teaching abilities were particularly appreciated as they could create valuable learning opportunities by demonstrating and explaining how and why production routines and work tasks were organized in a certain way. Opportunities to participate actively in different work activities and interactions with experienced co-workers were paramount for allowing the students to learn the skills necessary for their chosen vocation and to develop a vocational identity (Evans et al. 2010). The students stated that the co-workers provided a trustworthy progression of the knowledge, skills, and insights they needed to learn to meet the demands of the vocation and to proceed from simple to more demanding task as their capacities increased. However, the co-workers did not expect the student to be fully trained.

Some students had the freedom to choose what task they wanted to do and with whom, which gave them highly appreciated insight into the vocation's various duties and the production process at the company. In contrast, other students had more limited opportunities due to a restricted learning environment in the welding box;

they performed a single welding task of putting together two pieces. However, a necessary condition was that the students were permitted to participate regardless of the nature of the task. A few companies had difficulties due to reduced production and staff cutbacks, which in turn were reflected in the students' poor learning opportunities (Fuller and Unwin 2004). As seen, the workplaces could not provide a uniform practice, and there were very diverse conditions related to access to work activities for learning the vocation.

The workplaces' experience with having apprentices also proved to be an important social condition for how the students' learning progressed and gradually gained acceptance as members of work communities in the workplace. In this regard, the size of the company was a significant condition. Large workplaces could offer the students more specialized tasks, while some small workplaces could offer more diverse tasks (cf Billett 2011).

The geographical locality also mattered. In Swedish towns where large or middle-sized industrial companies are established internationally, the companies usually also play a significant role in securing employment for community members and contribute to economic development in the localities. It is also in the interest of the company to maintain a good local reputation to recruit and attract committed vocational students from upper secondary schools. This implies that it is not only specific workplace settings that attract students but also the prestige and career opportunities associated with certain companies. In addition, companies that had established a long-standing cooperation with the schools seemed to facilitate a wider range of work activities for students to experience. Such beneficial conditions also appeared to provide what Wenger (1998) has called "breaks in routines," that is, chances for students to discuss and reflect upon their experiences with work and production routines. In cases of smooth collaboration between the company and school, work-related conditions for learning and school-organized pedagogical methods could reinforce each other to promote such reflexive learning practices and potentially widen the students' learning horizons.

### **Individual-Related Conditions for Vocational Learning in the Workplace**

In addition to school- and work-related conditions for vocational learning, individual students shaped their learning conditions as they moved from the school to the workplace. What the students themselves did to bridge school-based and workplace-based knowledge was important for creating learning conditions that could satisfy their own learning needs in the workplace. A prerequisite individual condition, however, was that the students were inclined to work in the industrial sector and had the right attitude toward a vocation as an industrial worker. The students understood the employers valued their suitability and fitness for the vocation (cf Billett 2011), and social skills were often regarded as more important than industrial and technical skills (Nielsen and Tanggaard Pedersen 2011). The ways in which different types of knowledge were put to use by the students formed a basis

for examining how school- and work-related conditions can support their learning trajectories and transitions from school to workplaces. A significant question is whether vocational students can find ways to integrate the different forms of knowledge, perspectives, and cultural traditions they may encounter in different contexts (Tuomi-Gröhn and Engeström 2003). In particular, it is very difficult for students when collaborative relationships and organizational ties between school and workplaces are weak as it may lead to discontinuities in students' vocational learning across different learning contexts (Persson Thunqvist 2015).

At the same time, whether school-based and workplace-based knowledge will be integrated depends on the students' chosen learning strategies and capacities (Ferm et al. 2017). To be accepted as a member of the work community and, presumably, achieve status despite being an apprentice required not only displaying interest but also actively positioning oneself as a resource for co-workers. The students worked as hard as their workmates and tried to catch up with the work tempo and to be alert when they were asked to perform particular tasks. Therefore, learning strategies that the students used frequently to gain deeper vocational knowledge were asking question and searching for role models that could serve as informal supervisors (Ferm et al. 2017). The students' active engagement created more learning opportunities, and the more they were accepted, the more they were trusted to perform more advanced tasks. The students' personal agency was also reflected in the way they spoke about their own individual responsibility. They accepted a great amount of individual responsibility in gaining access to work tasks, supervision, instructions, and explanations from co-workers.

Consequently, the students' active learning strategies were clearly oriented toward the workplace context and their future employment. However, work and employment were not the only sources of these students' attitudes, aspirations, and commitment to learning new things in the workplace. First, the students' learning strategies cannot be viewed in isolation from their participation in upper secondary schools. As previously mentioned, the workplace-related conditions provided opportunities for the students to apply the specific vocational skills and knowledge they learned in school-organized workshops. However, as Swedish upper secondary school vocational education is also distinguished by a relatively strong academic orientation (e.g., in subjects such as mathematics, Swedish, and social science), the students were educated to consider themselves active learners. The universal comprehensive school system generally privileges the value of democratic participation. Students' school-based situated learning has been characterized in terms of negotiated participation (Persson Thunqvist and Axelsson 2012), which refers to the ways in which students (or groups of students of similar ages) recurrently negotiate with their teachers to determine how their learning should be organized. Similar forms of negotiated participation are not expected in workplaces, where students are on their own and must adapt to new circumstances that are quite different from school. However, the students in the present study brought along their school experiences and searched for role models among their co-workers. The workplaces that received students from upper secondary schools on a regular basis seemed to transform the everyday workplace into pedagogical environment (Unwin et al. 2007). Such a

change in the everyday work environment may imply the development of workers' skills in articulating and explaining tacit knowledge regarding production work and being able to answer the students' questions.

Second, the students' social background also constitutes a relevant condition; that is, it contributes to their disposition for learning and the development of a vocational identity in workplaces (Evans et al. 2006; Evans and Kersh 2004). Additionally, several students had parents and relatives who were working in the industrial sector. In these cases, the students were familiar with the informal constituents of industrial culture in local workplaces, which is marked by a certain manner of talking and making jokes (Ferm et al. 2017). This probably eased the students' relocation of knowledge from school to the workplace and partly explains why the vocational students were keen to fit in and show their social and communication skills in "handling the jargon" in work groups. However, while such skills may enable access to workplace communities, other cultural elements, such as gender, may function as a barrier in the male-dominated industrial sector (Gustavsson and Fogelberg Ericsson 2010). Additionally, female vocational students in the industrial program have experienced such barriers (Ferm et al. 2017), but their experiences have not yet been analyzed.

## **Changing Conditions for Vocational Learning: From the Perspective of Recontextualization**

This chapter provides insight into the school- and workplace-related conditions that enable students' vocational learning in the workplace. These conditions for vocational learning can be understood in terms of tension between the school and workplace contexts and in connection to the different logics and rationalities associated with school-based versus workplace-based knowledge (Schaap et al. 2012). Vocational students are expected to progressively use knowledge from and in different contexts (e.g., school and workplace contexts) and to relocate knowledge in relation to different purposes. The students' vocational learning was not restricted to training in specific skills; it also entailed knowledge about activities, roles, and social practices and vocational identity formation (cf. Evans and Guile 2012). Workplace-based pedagogics, such as different forms of guided learning (coaching, questioning) as part of everyday work, created conditions that supported the students' vocational learning (Billett 2000) as they engaged in progressively more demanding tasks. Despite differences between school- and workplace-based learning, both forms of learning and the conditions in the different contexts were geared toward a clearly defined vocational labor market in the industrial sector. To some extent, these different learning conditions reinforced each other. Such similarities can provide an explanation of why knowledge gained in the school context functioned as a "springboard" for continued learning in the workplace.

Nevertheless, the focus in previous educational research has mainly been on the school as a learning environment and how students are formed there. Pedagogical challenges in vocational education include how to develop and consolidate

knowledge in everyday work activities. This challenge raises questions regarding how workplace-based learning works and how educational institutions reach their goals and emphasizes that students' workplace-based learning should be visible. This mirrors a shift in the transfer concept, which was historically considered a one-way transfer of knowledge from school to work (Akkerman and Bakker 2012), and in the perspective regarding vocational knowledge and the knowledge needed in the ever-changing work life (Raelin 2008).

The theoretical concept of recontextualization directs our attention to how changes occur when different traditions of knowledge intersect (Evans et al. 2010). These intersections may create a basis for innovations that ultimately transgress existing opportunities for vocational learning. From this perspective, the implications of this study may also be discussed in terms of potential changes in practices for vocational learning in the context of vocational education.

First, the dynamic nature of vocational learning can be attributed to personal agency and linked to students' roles as *brokers* as they move between different contexts of learning. The ways in which students recontextualize – bring about and bring along knowledge from one context to another and back again (Evans et al. 2010) – may form the basis for hybrid learning practices (Linell and Persson Thunqvist 2003). In this respect, the students' learning activities are both shaped by everyday work and influenced by neighboring practices of (at least) two different kinds, which in turn challenge the conditions for vocational learning: first, through educational practices, e.g., workshops in school, which are similar in some sense, so students can relocate knowledge from school to the workplace context when putting knowledge to use, and, second, through biographical practices that are near at hand because of students' individual experiences (e.g., personal interests in technology in everyday life) or because of students' *common* experiences with vocational education for developing self-knowledge, which may promote a greater understanding of industrial work. In this sense, the students' social background also may facilitate their participation as newcomers at workplaces as they are already somewhat familiar with informal elements of the industrial culture because their parents or relatives work in the industrial sector.

Second, the presence of students in workplaces may also influence and transform practices in everyday work. Students' engagement and motivation to learn and their position as upper secondary school students impose certain expectations regarding learning and pedagogy and challenge conditions in the workplace. In interacting with students, co-workers are expected to act responsible and to function as informal supervisors. The informal culture in industrial work may therefore change in the presence of students who consistently ask questions as part of their vocational learning. Making workplace-based learning a regular feature of everyday work in companies may contribute to continuous opportunities for learning among the students' co-workers. As indicated in the analysis, the schools' preparedness to take the obligations associated with vocational students' learning differed for various reasons among companies. Some companies had made it a habit to provide workplace-based learning for vocational students. As co-workers occasionally took on the role of informal supervisors in their interactions with

students, they had to articulate tacit vocational knowledge and explain and sometimes justify work routines and procedures. In addition, co-workers introduced students to new technologies and taught them how to operate machines that are not used in school workshops. According to the students, most of the companies that participated in the study expressed mainly positive experiences with workplace learning not only in terms of securing skill provisions but also because the daily interactions between “old-timers” and students stimulated the learning environment of the workplace.

Third, and finally, conditions for vocational learning in upper secondary school vocational education programs are circumscribed by the ways in which disciplinary and work-based knowledge are being defined and recontextualized in the programs' curricula (Evans et al. 2010). The meaning of work-based knowledge, which derives its purpose from the context of employment (Evans and Guile 2012, pp. 114–115), changes when this concept is reformulated in the school curriculum within the framework of workplace-based learning in the school context. As discussed in the introduction section, the educational authorities in Sweden primarily set standards for workplace-based learning, and a strong focus is placed on the organizational arrangements and quality assurance framework for such learning. This framework is different from the nature and logics of workplace learning in everyday work. However, there are commonalities and overlaps between the concepts of workplace-based learning and workplace learning in some substantive areas (Evans et al. 2011).

The curriculum for vocational educational programs, including workplace-based learning, is partly the result of negotiations and compromises between the educational authorities and labor market organizations involved in the field of vocational education (Virolainen and Persson Thunqvist 2017). Therefore, the curriculum is also connected to the context of employment; it is based on the knowledge, skills, and methods common to an occupational group. In that sense, the national curriculum determines what a qualified worker needs to know to be considered employable in a certain field, and it is not company specific. In the Nordic context, such national regulations are historically associated with “the skilled worker concept,” in which national certificates in vocational education play an important role in distinguishing unskilled work from skilled work. However, since the labor market partners only have an advisory role in the Swedish vocational education system, the state and educational authorities take a strong stance on the formulation of the curriculum and in defining how vocational learning in workplaces should be organized and linked to school-based vocational learning and general education.

---

## Conclusions

The research underpinning the present chapter has responded to challenges to improve workplace-based learning in vocational education and to relate different forms of knowledge and learning by bridging the gaps between the school context and the workplace context. At the national policy level, as demonstrated,

workplace-based learning is being recontextualized to fit a pedagogical context tailored to meet the institutional goals of vocational education. When implemented in practice within local schools and industries, it is particularly interesting to note how changed conditions for students' vocational learning emerge within the field of tension between the "education-based" version and the "employment-based" version of workplace-based learning.

The concept of recontextualization (Evans and Guile 2012) has contributed to uncovering the dynamic conditions that enable students' vocational learning as they bring knowledge from the school context to the workplace context and back. The school-related conditions prepare the students for entrance into the workplaces, while workplace-related conditions provide students with the opportunity to obtain specific industrial knowledge and to engage in interactions in the workplace. The students' ways of making sense of workplace-based learning as an extension of their educational program (curriculum) and of putting knowledge to work in the workplaces were intrinsically connected with their identity formation processes, that is, becoming skilled workers. Furthermore, the students themselves used learning strategies to bridge school-based and workplace-based knowledge, thus supporting changes in the workplace cultures. In their interactions with the students, industrial workers had to learn and develop pedagogical strategies and new identities as supervisors, instructors, and role models. The conditions for a successful connection between school-based and workplace-based learning were identified in cases where collaboration between schools and industrial companies was well-established. These examples also demonstrate the emergence of hybrid practices where industrial production sites function as supportive environments for working and learning.

## Abstract

In the European debate, the issue of older workers' vocational learning is framed as one of updating skills, contrasting ageism, providing access to learning, and supporting mobility, with limited attention to the issue of motivation or motives to learn when retirement is approaching. The chapter illustrates the view on older workers' motives for workplace learning in different disciplines, from psychology of work to organizational studies, to educational gerontology, and to educational sciences. Placing side by side the different disciplinary approaches highlights all the aspects of that issue and indicates that the dimension of the development of activities in which older workers are involved is neglected. The last part of the chapter focuses on a case of contextualized analysis in

industrial activities. It presents an attempt to hold a non-dualistic approach by connecting the older workers' development to the development of the industrial enterprises in which they work. The aim is to show the importance of taking into account the activities in order to analyze the older workers' motivation to learn. Motivation is conceptualized through the cultural-historical activity theory (CHAT). This choice stems from the idea that individuals and contexts cannot be separated and that motivation to learn emerges in the relationship between work and the engagement that the older workers develop with it. Enlarging the view to include activities and their strategies leads to consideration of older workers' vocational learning as a collective and social issue, and not as solely an individual one. This perspective brings about policy implications and needs for new business models for industrial production.

## Introduction

The issue examined in this chapter is the older workers' workplace learning in all its forms such as learning on the job and continuing vocational learning, with a focus on motives for learning in later professional life. Faced with an aging workforce and an increasingly competitive global economy, the European Union promotes the older workers' (and all workers') learning to favor updated skills and innovation (European-Parliament and European-Council 2006). This institutional discourse, as other types of European discourses (Hoskins 2008), emerges through contributions from academic discourses developed in different scholarships and perspectives. However, the issue of motivation and motives for vocational learning is neglected in that institutional discourse, and learning is seen as an individual endeavor, overlooking the role of the activities in which workers are actually involved, their embedded culture, and the institutional contexts (Migliore 2013, pp. 30–35). This chapter illustrates the view on older workers' motives for workplace learning in different disciplines and – by comparing them – aims to indicate what aspects of the issue remain underinvestigated and which theoretical perspective could be adopted to make further progress in analyzing it. As an example of the theoretical perspective proposed, the chapter reports about a research on the older workers' learning in shop floors in industrial enterprises in the last section.

---

## Vocational Learning, Training, and Workplace Learning

Although the chapter takes an interdisciplinary view, its main approach is from an educational perspective and from a social practice theory of learning. As it is explained in more detail later, learning is seen as an aspect of any activity. Moreover

the concept of workplace learning is preferred to that of vocational learning. Workplace learning represents the learning in, through, and for the workplace (Evans et al. 2006). The concept of workplace learning fits better than the vocational learning concept in this chapter for it gives a clearer visibility of the workplace, the space in which, through which, and for which vocational learning develops. As working and learning are viewed as interrelated, studies on motivation and motives to learn and to work are reviewed. The assumption is that when motivation to work is high, motivation for workplace learning is high too.

---

## **Older Workers' Motives for Workplace Learning in Different Disciplines**

The following disciplinary domains have attended to the relationship between being older workers, working, and learning: psychology of work, educational gerontology, organizational studies, and educational science. Since the focus of this chapter is on motives to learning, studies which deal with this motivational aspect will be presented above all.

### **In the Psychology of Work**

In the psychology of work, scholars refer to the construct of motivation rather than motives. Motivation to training at work is seen as an individual characteristic (i.e., Bertolino et al. 2011, p. 252) and often defined according to the expectancy theory, developed to provide managerial indications to improve workers' performance (Vroom and Deci 1983; Truxillo and Weathers 2005). Motivation is seen as related to desiderated individual outcomes. The learning outcomes considered are limited to the prospective career (Maurer et al. 2003). However on the basis of the socio-emotional theory, there is invitation to look at other types of learning outcomes, and some studies highlight that older workers are in a different position compared to young workers with reference to time (Kanfer and Ackerman 2004; Bertolino et al. 2011): youth might perceive time as unlimited, while older people assess time as time left. This differential future time prospective brings about an exchange in evaluating what goals are relevant: from more career-focused ones to more social-affective ones, including personal satisfaction, identity, and self-concept protection (Kanfer and Ackerman 2004), building and maintaining relationships with colleagues (Beier 2008). This focus on specific preferences, values, and orientations of older workers represents the latest trend in analyzing older workers' motivation to work and learn (Kooij et al. 2011; Kanfer et al. 2013). Yet work and workplaces are conceptualized as framed by characteristics such as support from superiors and colleagues, job demands, and age bias, and these features are interpreted as sources of job attractiveness for older workers to choose to continue working longer (Kanfer et al. 2013, p. 8). What is learning is much less discussed. One can infer that learning is seen in the

cognitive-oriented literature as a training and vocational development, needing cognitive resources, motivation, individual goals, and some job characteristics.

Regarding cognitive resources, they are framed adopting a perspective developed more than 70 years ago which distinguishes between fluid and crystallized intellectual abilities (Kanfer and Ackerman 2004, p. 443). The notion of fluid intellectual abilities refers to working memory, abstract reasoning, attention, and processing of novel information and has its peak in the twenties. The crystallized intellectual abilities point out to the knowledge accumulated through education and experience and are associated with the extent of vocabulary and verbal comprehension. These crystallized are held to increase over life. According to Kanfer and Ackerman, older workers consider the effort needed to compensate the decline of the first type of cognitive decline when they evaluate job demands and performance. Their study is on work motivation. However they mention motivation for training several times: their view emerges as heavily conditioned by the model of cognitive abilities' decline, both the decline in fluid intellectual ability and crystallized intellectual ability:

Our analysis of work motivation in the context of aging suggests that the motivation for training will decline with age, as declines in cognitive ability slow learning and the time frame for development of Gc-type expertise (in which performance may be sustained with less effort) decreases. As such, we expect that motivation for the development of new expertise, whether to prevent skill obsolescence or to develop expertise in a second or third career, should be higher early in midlife, before the individual approaches retirement. (Kanfer and Ackerman 2004, p. 455)

These authors make a translation between work motivation and learning motivation based on the same theoretical assumption: in the face of cognitive decline, the relationship between effort and performance is the determinant in motivating older workers to work and learn. Goals, preferences, self-concept, and some job characteristics act as moderators in this relationship and in the relationships between effort and utility and between performance and utility. This idea of framing the analysis of the relationship between age and employee training by adopting the model of a relation moderated by a number of non-cognitive factors belongs distinctively to organizational psychology too (Van Vianen et al. 2011).

Other studies from the psychology of work on the issue of older workers' workplace learning place more emphasis on previous learning experiences and job characteristics (Warr and Birdi 1998) and leave aside the focus on cognitive decline. Peter Warr's work on age and personal development through learning activities is framed in the job characteristics theory (Oldham and Hackman 1980) and the relationship between job characteristics and well-being. In this type of study, as in that of Maurer et al. (2003, 2008), age emerges as a not significant factor in explaining development and learning activities. Other individual factors surface such as previous learning experiences and educational attainment in explaining learning participation. As in the case of the cognitive approach, learning is not explored with the theoretical conceptual tools of the educational sciences. Learning is conceptualized more in line with the human capital theory and less in line with the social theories of learning, which should fit better with workplace learning, as argued

later. Yet works of this type are relevant to the issue of older workers' motives for workplace learning as they draw the attention to the job characteristics in giving support to learning activities. However, work organization and production strategies receive a limited view.

Recent neurological and neuropsychological studies have developed a more interrelated approach to the relationship between individuals and context. The cognitive reserve theory shows how life span cognitive activities related to educational attainment and consequent patterns of cognitive activity in the socioeconomic conditions appear to bolster the brain's ability to compensate the damages produced by pathologies and aging (e.g., Stern 2007). This shift in the cognitivist approach toward analysis of how experiences shape the brain and mind is a step forward to recognize the variability of the situations and how different life contexts can shape cognitive and individual development.

### **In the Organizational Studies**

One of the first works on older workers and learning from an organizational and managerial perspective has been produced by Tikkanen (1998; Tikkanen et al. 2002), even if we can trace an interest for the issue back in the 1960s (Belbin 1965). The study of Tikkanen and colleagues was conducted in 27 SMEs in industrial, service, and office work sectors in England, Finland, and Norway, presumably at the end of the 1990s. It focused on job competence and learning at work from an organizational learning view, that is, considering the working environment as pivotal for learning. One of its main findings has been that the age dimension did not emerge as crucial and that differences in older workers' job competence and learning mainly depend on the type of sectors and job in which one is involved and the managerial attitude toward workplace learning.

The mainstream in organizational studies on older workers keeps maintaining its focus to redesign work in ways that support older workers' motivation to work (Armstrong-Stassen 2008; Sanders et al. 2011) and learning. Most recent works are developed with the aim of explaining how to retain older workers in the workplaces, postpone retirement, or support return to work after retirement. This trend – in the landscape of increasing life expectancy – is related to the concern for the sustainability of the pension schemes. These studies have the job characteristics theory as their theoretical starting point, already mentioned above, which indicates five main job features to foster internal work motivation and two individual differences, recognizing that not everybody reacts in the same way to the same working conditions. The five elements are skill variety, task identity, task significance, autonomy, and job-based feedback. The two individual features are growth need strength and job-related knowledge and skill (Oldham and Hackman 1980). What is interesting to note here is the recent emphasis on the features of the physical and social work environment, so that it is now more adequate to refer to work characteristics rather than job characteristics (Humphrey et al. 2007, p. 1333; Sanders et al. 2011, p. 134). This is an important point because it widens the view from the

jobholder to her/his working context. For example, Sanders et al. have found that social support in the workplace from managers and colleagues, interactions with customers, and complex tasks favor the older workers' work motivation (Sanders et al. 2011).

We now leave the presentation of works from the psychological and organizational perspectives to move to a field which is devoted to aging and finds its own disciplinary definition in this.

## **In the Educational Gerontology**

Although a large part of the educational gerontology literature has been theoretically underdeveloped for a long time, more recently, studies in this field have been elaborated according to critical perspectives and the life course approach (Glendenning 2000; Withnall 2006). These theoretical frameworks have given rise to questions about what age, aging, and the position of old age in the postmodern society are and the role of education in supporting old people, especially in the post-work phase of life. Even if there is not an explicit reference to the issue of motivation or motives for learning in later life, the aspects of aging highlighted by the studies in this research field are interesting for the sake of the focus here.

From a critical perspective and with reference to works of Lash and Urry (1987), Bauman (1997), Leonard (1984), and Taylor (1989), Phillipson depicts the postmodern society and its characteristic of instability, and lack of resources to support people in constructing their identity. According to the critical perspective, the task of critical educational gerontology is to highlight the role of education in supporting older people in their struggle to find a place in the postmodern society and to build their identity.

The gerontology field is traditionally defined by the concept of older age and is based on the premise that older age has a specificity compared to the younger one. The focus is on biological and psychological factors, and the emphasis is on impairment of health, cognition, and loss of perspectives. Yet since the end of the 1990s, the adoption of a life course approach has widened interests in the gerontology field to the social factors and the long-ranging effects of early experiences. In the gerontological literature, the issue of whether age can still be seen as the relevant common denominator among older people arises, when it can be seen that variability within this group is even greater than in other age groups (Settersten 2006). The adoption of the life course approach reveals that older people do not share the same economic and social circumstances in which they have grown up and lived. This raises the question of whether it is possible to generalize the findings to future cohorts of older people (Settersten 2006; Withnall 2006). However, the life course perspective is used to investigate how social and individual experiences can influence learning in later life and how older people make sense of their own learning attitude.

In critical educational gerontology, aging is seen as a socially constructed event in which the state and the economy play major roles (Glendenning and Battersby 1990). The preoccupation is about marginalization of older adults and raising their

consciousness of power and control in the construction of the aging process (Withnall and Percy 1994). From this point of view, education can play a role of empowerment and emancipation.

The humanistic perspective has been developed in Britain by Percy and in the United States by Moody. Percy points out the difficulties in generalizing about older adults as a disadvantaged group and questions the supposed superior position of educators in trying to transform the others' view. Educators could be facilitators of the older people's learning, taking into account that older people have a lifetime experience to pass to the younger generations (Withnall and Percy 1994). Moody offers a more complex picture of the accumulated experience of older people, noting that this can be either a resource or a stumbling block. This depends on the meanings people give to their past:

Our attitude toward our own past deeply affects the quality of life, whether we hold on to it too dearly or disown it too readily. (Moody 1990, p. 25)

On the basis of the poet T.S. Eliot's meditation on the meaning of time and aging, and on the call for attention to the value of the process of life review made by gerontologist and psychiatrist Robert Butler, Moody stresses that past experience needs to be questioned and reviewed to find meanings for what otherwise is only a sequence of events. He relates the life review to the conceptualization of development and learning in old age. According to Moody, each age has its own developmental task. The one for the old age is the process of life review:

It is this sense of discovery that gives the process of life review its true significance and its relationship to continuing education throughout the life cycle. If we accept this process of life review as being the major developmental task of old age, it must become the starting point for any theory of education that we might evolve. We will need to pay the closest attention to how older people use their life experience in the learning process in order to build the strengths of experience in old age. (Moody 1990, pp. 28–29)

Education can support older people in this process through integrating their life experience into the classroom. Pointing to the work of Paul Freire, Moody argues that an educational method based on a dialog and partnership between educators and older learners is needed.

---

## Considerations on the Contributions So Far Illustrated

Framing the discourse on older workers' motivation to learn with cognitive and intellectual capabilities' decline, even when balanced with other increasing trends (e.g., fluid and crystallized intellectual abilities), emphasizes aging processes to the detriment of other social and cultural processes. The social and cultural processes which differentiate workers at any age create more heterogeneity in the old age than in the younger one (Kolland and Wanka 2013). When psychological and sociological approaches interact, paradoxes emerge such as the one that job performance

does not depend on age, but on experience. This seems in contrast to the idea that learning performance could decrease with age. There is the suspicion that the experimental psychometric tests in laboratory cannot take into account the workplace context and its potential of engagement and motivational effect (Schaie and Schooler 1998, p. 8). It is possible to find reference to the job characteristics but sometimes with simplistic taxonomies and thinking of workers as career-focused individuals or needing support (i.e., personnel management policies, working conditions, employer's support in favor of older workers' participation in learning activities). This implies a view of learning as an individual endeavor which has to be triggered by favored conditions. These studies tend to consider all types of workplaces to be similar (with the exception of Tikkanen and colleagues) and fail to thematize the link between learning and production strategies (Tikkanen and colleagues included). According to the view held in those studies, older workers become engaged in learning if they have support from the companies, and if training systems are more adapted to their specificity.

When job characteristics are used, the reference to the sector and the production strategy pursued are not included, with the effect of looking at workplaces as nonhistorical and nonpolitical places, neutral with respect to the industrial policies choices. Workplaces are seen through organizational dimensions and not the object of the activity as shaped by global competition and types of capitalism (Hall and Soskice 2001). In other words, what production strategy corresponds to workplaces in which jobholders, including older workers, have interactions with customers and carry out complex tasks? These latter two elements are listed by Sanders and colleagues, as favoring work motivation in older workers. These authors seem to suggest that any enterprise can implement those two work aspects. Yet, these features are more linked to certain production strategies than others, as it will appear later. This point is important for it allows to appreciate that the issue of older workers' motives to work and learn is also an issue to be considered in industrial and economic development policies.

The invitation from the educational humanist gerontology to consider the review and interpretation of the past experiences as the characteristic of growing old stresses the relevance of older workers' subjectivities. The contribution of the humanist approach is to consider older workers' subjectivities in the process of growing old. This means to investigate how older workers develop personal senses for their lifetime experiences in order to interpret their engagement with the present. While one can acknowledge the relevance of the theme of the personal sense of growing old and the role of the past in it, there emerges a fracture between the above discourse on workplace characteristics, with its potential of being linked to wider economic trends, and this latter discourse on personal and subjective side of development. Is it possible to connect these two apparent separated discourses? In some way, the neurosciences mentioned above invite an exploration of the interactions – or “intractions” in the philosophy of quantum theory, as argued by Karen Barad (2007) – between individuals and contexts.

Before dealing with this issue, contributions from social theories of learning are presented.

So far poor definitions of learning have been used, seen mainly as structured activity of teaching and learning and as investment and return from investment (e.g., Warr and Fay 2001, p. 352). So it is interesting to consider contributions from studies on older workers' motivation to learn framed in the educational perspective.

---

## Perspective from the Social Theories of Learning

Educational sciences are more equipped to analyze the learning aspect of the relationship of concern here. Yet few works deal with older workers' motives for workplace learning, in particular from a participative and situated conception of learning.

Fuller and Unwin, whose work attends to the whole workforce, have briefly touched the issue of older workers' workplace learning (Fuller and Unwin 2005). They frame their study from the situated approach developed by Lave and Wenger (1991) whose work is considered to be a milestone in the literature on learning at work from a social practice perspective. Lave and Wenger point out the relevance of situated learning in the transition of newcomers to become expert workers in communities of practices. This transition occurs through legitimate peripheral participation, where appropriation of skill and knowledge takes place. Fuller and Unwin have extended and developed the situated approach to analyze workplace learning in western standard economic activities of production of goods and delivery of services. These authors propose to analyze the variety of settings through the expansive-restrictive continuum of approaches to apprenticeship programs. Expansive approaches are identified on the basis of Wenger's ideas on "work of imagination," which entails processes that open up "opportunities for learning through moving beyond a tightly bounded approach to participation . . ." (ibid., p. 412).

The attributes of the expansive approaches refer to multiple communities, sharing memories, access to qualifications, time off-the-job, individual support, favorable conditions for developing extended identity, and production of documents and tools. An expansive learning environment "entails the creation of environments that allow for substantial horizontal, cross-boundary activity, dialogue, and problem-solving" (2006, p. 43).

These authors are interested in the learning opportunities created by the job design and work organization, but at the same time, they pose the issue of the individual agency through which workers elect the extent to which they engage in those opportunities (Fuller and Unwin 2005, p. 26). They follow Billett in framing the relationship between structure and agency, but also Hodkinson & Hodkinson with Bourdieu's concepts of learning disposition and habitus (Hodkinson and Hodkinson 2003). It can be argued that these two theoretical approaches, from Billett and Hodkinson & Hodkinson, are opposed one to the other: Billett conceptualizes structure and agency as two logically separate entities, although interrelated, while the use of concepts such as the Bourdieu's habitus implies the inseparability of individuals and contexts:

It is [habitus] a means of expressing the integration of social structures and person (body and mind), as indivisible. (Hodkinson and Hodkinson 2003, p. 4)

From this idea of expansive and restrictive learning environments, Fuller and Unwin have analyzed the relationship of older workers toward learning using case studies of two firms in the United Kingdom, with contrasting approaches to workforce organizations. Company A designs and manufactures bathroom showers, thermostats, and valves, and its strategies are quality and competitiveness. Company B manufactures steel rods and bars for the construction industry and, at the time of the research, was struggling under price competition from “cheap imports.” The authors have found older workers to be generally interested in learning, especially when this aims at helping them to do their jobs better or easily and independently from the type of work organization and approaches to workforce development. However some differences emerge when the authors consider the negative attitudes toward organizational changes leading to more opportunities for learning at work (for instance, through broader definition of tasks and job rotation) in Company B. They interpret the different perceptions of the new ways of working among older workers as being related to individual dispositions and prior status (Fuller and Unwin 2005, p. 34), which in turn seem linked to features of the established organizational approach to employees development, based on specialism and seniority (*ibidem*, p. 35). Referring to the Pillay et al. study, they want also to indicate a subtler factor playing in the issue of older workers’ workplace learning: the relevance of the older workers’ conceptions of work and learning at work. They quote Pillay et al.: “They argue that recent research in epistemology and conceptions of learning indicate that ‘if workers do not consider learning as part of their conception of work then the approaches they adopt in their work practice may not include learning’” (Fuller and Unwin 2005, p. 36). These authors found that older workers hold work and learning conceptions that are not aligned with what they call “new capitalism,” that is, ways of producing based on innovative practices, creativity, organizational learning, and lifelong learning. In the light of Fuller’s and Unwin’s work, work and learning conceptions can be influenced by the organizational culture. Therefore, older workers can also benefit from a workforce development approach and work organization which support and manage new learning opportunities and conceptions of work and learning more adapt to the changing economy.

Billett warns that older workers might receive little support in the workplaces, as happens for most women and disabled workers (Billett 2006, pp. 161–162). So, he considers that it could be risky to wait for employers’ interventions and research should support the empowerment of older workers. Hence, he concludes that older workers’ “agency and capacity to be agentic (...) will become the key determinant of older workers’ capacity to maintain competence throughout working life” (*ibidem*, p. 162).

Thus Billett’s stance leads to an emphasis on individuals and their agency, while in the Fuller’s and Unwin’s approach the attention is on the workplace environment and its organizational features and practices.

These are examples of how in the educational sciences the issue of older workers’ workplace learning is framed with different approaches to the relationship between

individuals and contexts, agency, and structure. Yet, the sort of swinging between emphasis on agency or structure seems to call forth the possibility of developing a perspective able to find out how to deal with individual development and context development at the same time. In what follows, the working activity is proposed as the unit of analysis able to connect these two developments, so that they became a single development (Cole and Wertsch 1997).

---

### **CHAT: A New Perspective to Investigate the Older Workers' Learning**

People need to find motives to engage in workplace learning, independently from age. In the psychological studies discussed above, motivation refers to internal motivation, that is, individual desires. In the educational studies just discussed, the authors adopt the concepts of disposition. In a CHAT (cultural-historical activity theory)-influenced perspective, the corresponding concept to explain what prompts to learn is "motive." To explain what "motive" is in that perspective requires leaving the issue of older workers' workplace learning issue for a while, to go back to the focus of this chapter equipped with a new language and view. CHAT is based on Marx's philosophy of the ontology of consciousness as developed in *The German Ideology*, with its view of the primacy of human activity in shaping individual consciousness. The Russian psychologists adopted Marx's thinking to develop a cultural and historical approach to psychology, and to search for resolutions to the principal theoretical problems encountered by behaviorism, Gestalt psychology, and psychoanalysis (Leontiev 1978, p. 2; Bakhurst 1991, p. 62). The project was started by Vygotsky, who gave great insights into the origin of individual development in little more than a decade, in the 1920s, before dying prematurely. He developed what he called cultural-historical psychology. Leontiev, one of his well-known followers, elaborated the related theory of activity. The works of these authors and other co-workers penetrated Western academic thinking slowly, due to the restrictions imposed by the Soviet regime on their diffusion. Yet from the 1970s, their ideas started to spread in America and Europe, giving rise to the development of a wide range of studies, all having their roots in the Russian school of thought founded by Vygotsky and his followers. One way of labeling this mainstream is cultural-historical activity theory (CHAT).

To understand the CHAT approach, one should keep in mind its fundamental principle: individuals' characteristics develop in the participation of collective and material activities; individuals do not hold inborn features which determine who they are. Individuals internalize language, symbolic tools, use of artifacts, the social meanings, and motives which they encounter in activities. What is internalized becomes subjectivized by the individual unique constellation of experiences and encounters in life. The externalization follows the internalization, in shaping the actions and operations carried out in activity. The continuous movements between internalizations and externalization, with the moment of the subjectivation (Stetsenko 2005), create the internal (in the subject) and external (in the world)

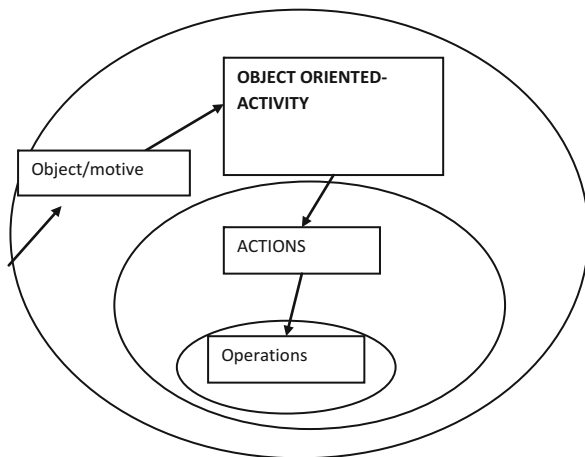

development of the activities. Hence individuals and the world can be a continuum in which it is impossible to identify what is only individual or what is only social: for instance, where the person ends and her/his inseparable mobile phone begins, if one considers that the mobile telephone stores people's and collective data so important to the contemporary way of living? In sum, a CHAT-influenced perspective suggests focusing on activities as unit of analysis.

It should be clear by now that the concept of activity plays a central role in CHAT. Activities are i) collective because they are carried out together (even when persons act alone, e.g., the others are present in their minds and imagination to comply with some duties) and ii) material through the use of cultural tools (symbols, artifacts) developed throughout the history of the earth and its species, especially the human species.

Motives arouse collective and material activities. Motives develop in the collective human enterprise to respond to culturally and historically shaped needs. Motives emerge when the culturally and historically shaped needs find the object able to relieve and fulfill the needs. For example, a collective and material activity can be producing shoes. That activity has been prompted by the need of walking more comfortably on the various surfaces on the earth, maybe when human beings began to walk long distances, in search for a better life (which can be viewed as a historical and cultural need). When that need found the "object" able to relieve it, that "object" became the "motive" of the activity. The concept of "object" refers to the ensemble of actions and operations carried out to produce – in the example – the shoes. So, the object is not the shoes. The object is what prompts the activity, is its true motive, and it generates actions and operations. For a detailed presentation, see Migliore (2013, 2015) (Fig. 1).

It is important here to focus on the motives of collective and material activities to say that, in Leontiev's view, people internalize personal senses of activities' motives from participating in activities. People organize all the personal senses of motives in

**Fig. 1** Levels and elements of activity. (Source: from Migliore (2013), p. 57 (modified))

a hierarchy, according to their life circumstances. The theory of personality outlined by Leontiev sees personality and the self as a hierarchy of motives.

To clarify, a person who learned to appreciate (verb which reveals a personal sense attached to) the motive of caring for other people might put this motive higher in his hierarchy for he also learned to love children and has now a loving family. The same person could have learned from his mother that it is important to attend to the management of the family financial and patrimonial resources, and more in general, that accounting is necessary. However, for some other social circumstances, he feels that accounting is not exciting. Therefore, his hierarchy of personal senses of motive (first "caring for others" and second "accounting") is likely to guide his job choices toward enterprises which are prompted by the motive of caring for others.

On the base of this perspective, the close connection between self and activity should be clear: the same motives prompt both. Leontiev judges this insight – the same structure of activity and consciousness – "to be one of the more important discoveries of contemporary psychological science" (quoted in Migliore 2013, p. 52).

---

## Older Workers' Motives to Workplace Learning from CHAT

Going back to the issue of older workers' motives to workplace learning, this CHAT-influenced approach underlines the importance of considering the object/motive of the activity in which older workers work and their personal relation to that motive. Getting back to the above example, the older workers for whom the motive of caring for others is high in their hierarchy of motives, working in an enterprise guided by that object/motive, and carrying out actions and operations coherently related to that object/motive, should feel engaged in their workplace and be oriented to learn what they think it is necessary to carry out his job with satisfaction.

Findings from a research based on two case studies in northwest Italy (presented fully in Migliore 2013) give an example of how this theoretical perspective can support the interpretation of the relationship that older workers have with workplace learning. In coherence with the framework, the research design chose to analyze two industrial activities, characterized by contrasting features in their production strategies. The production strategy is about how to organize the labor process and the work organization to comply with the object of the activity, given the institutional and market conditions; the technological, financial, and human resources available; and the economic, social, and political cultural beliefs. Thus the production strategy is the outcome of complex interrelated factors. In the research mentioned above, one enterprise (E1) was impelled by the production strategy of mass production (its object/motive) to produce parts of machines (not further specified to cover the anonymity) for multinational companies. Around 600 workers used to work in E1. The other enterprise (E2) was prompted by the production strategy of "flexible specialization" (its object/motive) to produce parts necessary to the field service of a complex machinery. Two hundred workers were employed in E2.

Older workers (nine) in the shop floors and managers (six) were interviewed between 2007 and 2008 in E1 and E2. In the E1 the older workers (all female) were working at the assembly line, carrying out brief operations, which did not allow them to have a clear image of what was the object/motive of the enterprise. Yet, they were asking for learning more about their work, and this request appeared as a way to ask for attention and development. Their narrative of their day-by-day lives, with their responsibilities at home and their dreams, shows the connections between activities at home and at work: the housework was giving to them elements to judge (negatively) the work organization in the E1. They were feeling engaged in their work in the E1 shop floor but with frustration for the inefficiencies they believe there were in that enterprise.

In the E2 the older workers (all men) were working as turners, welders, cutting machine operators, and they knew about the production strategy of their company. They thought they had learned and developed professionally over their working lives significantly, and they did not show much interest in learning more. Their main concern was now the potential waste of all their professional knowledge developed and accumulated in their working life. These men were much more oriented to the coming retirement than the female workers in E1 and worrying about the loss of their knowledgeable workers' status.

The differences in the personal ways of attending to their jobs, tasks, and vocational learning among the older workers in case studies E1 and E2 were sharp and were clearly related to the challenges that the two examined production strategies were facing in the global competition, especially in the case of E1, as they emerged in the tasks the older workers had to perform.

The older workers in company E2 had the clear perspective of retirement and with this a feeling of personal achievement and fulfillment, because they had been engaged with an object of activity which had required the development of skills and provided personal senses. So, after some decades of work, they had achieved a feeling of satisfaction and were ready to retire, even if they would have preferred to carry on in making sense of their working life by passing on their knowledge to their younger colleagues. Most of the older workers in E1 were in a diverse life position. They still had expectations, as they had not been able to achieve what they would have liked to achieve. For this sense of frustration, mixed with expectation and hope, these older workers were willing to learn what they thought would eventually supported their professional development and the development of the activity.

This example illustrates, with reference to the particular industrial activities discussed here, how the older workers' conceptions of working and learning depended on the development of the professional activities in which they are and were involved, and how activities succeeded in getting older workers engaged. Working activities offer the meanings and senses to feel engaged or resistant to get involved, and not only conditions and opportunities for learning. This means that the relationship between workplace and learning is less direct than some other studies have suggested, so that even when the first has features not favorable to workplace learning, as in E1, workers can get involved and engaged in learning as well, despite the negative conditions of work. In this view, the subjective aspects – defined as social

in their origins – become central in explaining the choices of the older workers with respect to workplace learning and not moderators as seen in the psychology of work.

---

## Discussion and Conclusions

Placing side by side different disciplinary approaches to the issue of older workers' motives toward workplace learning casts doubt on studies which focus on age by considering individual factors as context-independent. As some authors mentioned in this chapter pointed out, age is not a significant factor in interpreting the relation between being an older worker and workplace learning. Aging is a co-evolution between experiences and self which occurs through involvement and participation in activities (Migliore 2013, pp. 81–82).

Older workers may be shop floor industrial workers, as in the example above. They may be managers in enterprises of different kinds or they may be non-permanent workers engaged in freelance and contract-based work or self-employed. The availability of freelance work and contract-based specialist positions on a nonpermanent basis in the job market is often an important structural aspect guiding the work journey of the older worker (Bound et al. 2018). The different senses of self and purpose as workers and as people with particular interests and motives are reflected in the variety of ways people engage in work activities and experience learning and development.

Workplaces are generally attached to enterprises, whether micro, medium, or large in their scale of operation, that differ in their production strategies as well as their organizational culture. How work activities are integrated into production processes has been shown to be the most important occupational affordance for the learning, motives, and development of workers of all kinds, including freelance and contract-based workers (Bound et al. 2018). It is important also to recall the gender issue which surfaces and needs further investigation. In the empirical work framed with CHAT outlined above, some differences between the female and male older workers emerged as related to their activities outside their workplaces, mentioned by the older workers to explain their relation to their workplaces: the female older workers referred to housework and the male older workers talked about their hobbies. These few examples recall that the female and male activities outside the workplaces can be very different. It would be interesting to look at how far industrial activities designed mainly by men (Acher 1990; Probert 1999), who take to a much lesser degree responsibility for domestic works and caregivers than women, influence the range of possibilities for female workers.

Workforce development policies are defined implicitly by production strategies and not solely by HR departments. Scholars, practitioners, employers, stakeholders, officers, members of governments, and parliaments should consider industrial policies as a means to favor the development of workers and older workers in the aging societies, to support the kinds of production strategies that allow people to develop and flourish. Conceptualizing development as collective and material can support new ways of designing industrial and learning policies.

Even if the literature put more emphasis on the vocational learning apparently needed by older workers, one should not neglect the workplace learning and the professional knowledge developed through the older workers' working life. Recognizing older workers as knowledgeable practitioners (Evans 2015) calls for attention in two directions: to support i) the making sense of getting old of workers who have become knowledgeable in their work and ii) the transmission of the knowledge to the younger generations. Echoing Moody, this could help older workers to use their lifetime experience to further develop in order to build the strengths of the experience of becoming old, enriching the whole society.

## Abstract

Under the conditions of global competition, innovations are essential for companies' survival. Creative workers who can contribute to innovations are increasingly demanded, and schools as well as training institutions need to respond to this shift in competence requirements by adjusting their pedagogical practices, including assessments, curricula, and learning environments. This chapter provides an overview about creativity research where it applies to VET. It first presents an overview of some of the main pillars of creativity research and explains the concept of creativity vice versa entrepreneurship. This is followed by providing insights into practices of creativity support and assessment that can be applied in the school context and followed by elaborations on what it means to support creativity development at the workplace. Art can be used as a stimulator

## Introduction

In our innovation-driven societies, flexibility of the workforce has become a panacea for the economy. It entails the expectation that workers are constantly updating their skills and competencies according to labor market needs. International competition forces enterprises to find new approaches toward increasing the productive potential of their workers. One approach toward the systematic development of enterprises within the context of global competition is to rely increasingly on the creativity of all company's staff members. Therefore, training of workers becomes a continuous need and has an increasingly important role to play. Particularly relevant within vocational education and training (VET) is the acquisition of skills that support workers in seeking new solutions to workplace challenges, which means to think and act creatively. This new requirement is also reinforced by the development and introduction of new technologies, which will replace workers in some fields and will require new jobs in others. Accordingly, VET is particularly challenged to support the development of creative thinking skills and action competence, abilities that can be expected to support individuals in managing their careers successfully and advancing professionally through their creative contributions at the workplace.

The European Commission had declared the year 2009 to the “year of creativity and innovation.” For this purpose, a number of artists and scholars, among them Edward de Bono, the choreographer Anne Teresa de Keersmaeker, architect Rem Koolhaas, designer Philippe Starck, and the star cook Feran Adrià. They were the official European ambassadors who claimed that “Europe needs to boost its capacity for creativity and innovation for both social and economic reasons” (European Manifest 2009). The report provides recommendations in respect to education and training, supporting lifelong learning, reforming schools and universities, and investments in research and knowledge production. A European report (Cachia et al. 2010) states that creativity, in the educational context, should be conceptualized as a skill that schools need to foster and inhibit in students. Teachers reacted positively to the importance of creativity and innovation in education, although conventional ways of teaching related to teacher-centered methods, frontal teaching, and chalk and talk seem to prevail largely in schools within the European community. The report highlights five major areas for improvement, which are to enable more creative learning and innovative teaching by adapting curricula, pedagogies, and assessment as well as teacher training and include more ICT and digital media. Further, educational culture and leadership are addressed which need to facilitate this change.

The report draws on interviews with teachers and addresses the necessity to move toward a more creativity-supportive practice. However, teachers need to be supported with further training because they currently lack the skills and confidence for changing their teaching practice. Additionally, factors such as tight timetables, overloaded curricula, lack of support in the classroom, too many pupils per teacher, and a school culture that does not support new methods were highlighted. To what extent this is also the case for vocational schools has not been addressed and needs to be inquired.

In VET, students are confronted with workplace realities and contribute as employees to the company's income. Although they are learners who need to build up skills and competences, they are also a source of ideas that enterprises can build on when further developing their existing products or even working on radical innovations. Viewing the apprenticeship as an opportunity for all, apprentices, co-workers, VET teachers, and trainers and employers, requires a change in organizational learning cultures and to some extent work and learning practices. In this chapter the term student and apprentice is used interchangeably, while the first applies more to the school context and the second to the workplace learning part as well as overall to the legal status a student is based in.

This chapter provides an overview about creativity research where it applies to VET. It first presents an overview of some of the main pillars of creativity research and explains the concept of creativity vice versa entrepreneurship. This is followed by providing insights into practices of creativity support and assessment that can be applied in the school context and followed by elaborations on what it means to support creativity development at the workplace. Art can be used as a stimulator in creativity development and is increasingly integrated into learning processes – a topic that will be briefly addressed before the chapter ends with an advocacy for more creativity development within the field of VET.

## **Creativity Development in VET**

### **The Pillars of Creativity Research**

Research on creativity started in the United States in the 1950s with Richard Guilford (1950), a psychologist who developed a comprehensive factor analysis model for the assessment of personality. His psychometric studies on intelligence and creativity showed that there is no causal relationship between intelligence and creativity. Creative individuals tend to create larger amounts of possible solutions, findings that lead to the development of the concept of “divergent thinking.”

Convergent and divergent thinking is needed for the creative process (Cromptley 2006). Convergent thinking is oriented toward deriving the single best (or correct) answer to a clearly defined question. Divergent thinking involves producing multiple or alternative answers from available information. It requires making unexpected combinations, recognizing links among remote associates, transforming information into unexpected forms, and the like. Guilford (1950) argued that psychologists and teachers traditionally place too much focus on convergent thinking (problem-solving

skills, logic, coherent answers, etc.) at the expense of divergent thinking (unusual, lateral thinking that involves seeking out new possibilities).

Guilford's achievement includes the development of a comprehensive factor model of the human mind and personality, which consists of 120 creativity factors. For Americans his research was at the time of utmost importance in the context of international competition and cold war. Not only was it important for the development of new competency assessments, for example, among pilots, it also was expected to help find the best talents, an urgent desire following the "Sputnik-Schock," which stands for Russia sending its first satellite into orbit. The result was a massive investment in the United States into creativity research (Krause 1996).

In the aftermath of the massive initiation of creativity research, many different disciplines started to be concerned with it, such as psychology, philosophy, cultural science, economy, sociology, neurobiology, and education. Howard Gardener, with his theory of multiple intelligences, pathed the way for the recognition of additional abilities that are beyond rational thought and rational logic. Especially the intelligences associated with the arts and sports (musical, visual-spatial, and bodily kineshetic) are highly relevant when it comes to acting creatively. Today, especially within the field of economics, the importance of creativity development has become highly prominent, which must have consequences for the ways in which not only students within higher education institutions are trained but also apprentices within VET.

While there are many research centers focusing on students and knowledge workers to develop their creative potential (Stanford D-School, Stanford Department of Management Science and Engineering, International Center for Studies in Creativity at Buffalo State University or Hasso Plattner Institute), within the field of vocational education and training, the relevance of the topic seems not to be recognized much at this stage. This book chapter follows the advocacy of Gerald Hüther (2011, 2012) and Rothauer (2016) in arguing that VET schools need to go far beyond teaching knowledge and essential life and learning skills and open up for new ways of teaching that support the creativity of students as an essential competence.

## What Is Creativity?

Creativity is the competence to create innovations (Witt 2010), and more specifically Amabile (1996, p. 33) coins it as "A product or response is creative to the extent that appropriate observers independently agree it is creative. Appropriate observers are those familiar with the domain in which the product was created or the response articulated. Thus creativity can be regarded as the quality of products or responses judged to be creative by appropriate observers, and it can also be regarded as the process by which something is produced."

Amabile (1987) developed a simple model for creativity which comprises three features: domain-relevant knowledge, technical skills, and intrinsic task motivation. To produce work that is original, she argues, individuals must also possess creativity-relevant skills, such as suspending judgment, self-discipline, perseverance, and nonconformity. Motivation is generally divided into extrinsic and intrinsic motivation,

whereas the latter is more conducive to the generation of new ideas. Although an eagerness to work diligently appears to be an essential component of high levels of creativity (Golann 1963) and although a number of introspective accounts describe creativity as marked by deep involvement in the activity at hand, these accounts also stress the importance of intellectual playfulness and freedom from external constraints (e.g., Einstein 1949).

Acting creative means to find valuable starting points for renewal bring ideas for their solution and realize them properly and with efficiency. At the core of creativity is creative thinking which resolves out of a new combination of what is already known. Creative thinking skills, however, are manifold and can comprise constructs, such as visionary thinking, diagnostic thinking, strategic thinking, thinking with ideas, judgmental thinking, contextual thinking, or tactic thinking. Also, analogical, associative, lateral, and combinatorial thinking skills have been referred to. Developing all of these thinking styles is a comprehensive task for teachers and requires a thorough revisit of curricula in order to understand to what extent these thinking styles are embedded in the training of competences in VET.

Rothauer (2016, p. 40) summarized the request for the variety of skills needed to be creative: “Considering our holistic abilities we not only need to connect analytical thinking with associative, experimental thinking, but also intuition and emotion with rationality. We need to trust sudden insights and unusual lines of thought and follow up on them, instead of only go through something systematically and analytically. Experiments of thought and the openness for untested terrain contribute in our times of constant change and less predictability to shaping the future than the attempt to continue with well-known and proven approaches.”

The creational process or “Schöpfungsprozess” involves the experimentation with ideas, their consideration, discarding, selection, rearrangement, revision, and perfecting, which has been coined as the method of “design thinking” (Plattner et al. 2009). Holm-Hadulla (2005) had summarized the process of creative thinking as it is embedded in the design thinking approach with preparation, incubation, illumination, realization, and verification. Wording differs when describing the method, and a last order should be mentioned here. Design thinking according to Rustler (2016) comprises to understand, observe, synthesize, develop ideas, prototype, and test (Rustler 2016). Especially the development of prototypes has been considered largely relevant in educational settings. Working with ones’ hands, materializing ideas, shaping and reshaping them, as well as sharing them with a group have become a common practice within the schools who prescribed themselves to the method.

Next to understanding of what creativity and the creative process mean, it is also relevant to have a common idea of how to identify creativity. According to Barron (1955) and Guilford (1950, 1957), creativity consists of two core elements. These are on the one hand newness, novelty, or originality and on the other hand appropriateness, usefulness, or meaningfulness. Judging creativity by means of standardized testing seems to be adventures if not impossible according to the large scope of these dimensions. Especially research findings on the ways in which our memories work are pertinent for understanding creative work. Among the two types of memory, declarative and non-declarative, the latter is particularly relevant when studying

creative minds. Declarative memory is closest to everyday meaning of memory; it is the capacity to recall everyday facts and events into consciousness. Declarative memory is representational and provides us with the means to model the world and to compare and contrast remembered material. Vice versa, non-declarative memory is expressed through performance rather than recollection. While this can be declared as right or wrong, non-declarative memories appear as changes in behavior and cannot be judged in terms of accuracy (Howard-Jones 2010). For the context of VET, where the majority of assessments of work performance is done qualitatively by experts, it is highly relevant to have common criteria for the assessment of behavioral changes and performance.

The terms creativity and innovation are often used interchangeably. In the following, the concept of “innovation” will be introduced and somewhat distinguished from creativity. Innovation has been defined as “the intentional introduction and application within a job, work-team, or organization that are designed to benefit that job, work-team, or organization” (West and Rickards 1999). West and Farr (1991, p. 16) understand innovation as “the intentional introduction and application within a role, group, or organization of ideas, processes, products or procedures, new to the relevant unit of adoption, designed to significantly benefit role performance, the group, the organization or the wider society. The elements need not be entirely novel or unfamiliar to members of the group, but it must involve some discernible change or challenge to the status quo.” The term “innovation” is used in many different contexts. There is the discrimination according to how new the innovation is as mentioned above: basis innovations, simple imitations, or creative imitations. In the literature appear many different types of innovation, such as incremental, semi-radical, radical, social or environmental innovation, etc. (Rustler 2016).

Research on creativity has outlined a large number of abilities and skills that contribute to being creative. Although intelligence is relevant, only in combination with phantasy, it might lead to innovations. Very important in the context of the abilities of our minds, memories, nerves, or emotions are that creativity requires knowledge. “Without knowledge phantasy cannot evolve and ideas cannot be developed, except by chance” (Witt 2010, p. 24). In order for creativity to lead to innovations, further requirements are courage, a mood for experimentation, seeking new information, appreciation of the new and of change, the ability and willingness to fool around, curiosity and openness, self-confidence, endurance, and persistence. All of these are requirements that shape personalities in particular ways – a task that VET teachers and trainers need to pursue. How to approach supporting creativity in apprentices within VET schools is part of the content in the next section. It will provide some ideas derived from the literature, and it is meant to inspire for “fooling around” with pedagogical methods and tools.

## **Preconditions for Supporting Creativity Development in VET Institutions**

The sociologist Ulrich Bröckling (2007, p. 154) summarized the challenges that all individuals face in the race for more creativity in the following way. Foremost,

creativity is something that everyone owns or disposes over – an anthropological possession. It is further something that one needs to have – a binding norm. Above and beyond, it is something that one never has enough of – an “interminable Telos” – and last, it is something that can be increased by applying various methods and exercises. It is a learnable competence. Creativity development in students starts with VET teachers becoming and acting creative. What this entails has been studied by Tanggaard (2014) who claims that creative learning pathways require to:

1. Fool around and play with things and materials at hand.
2. Dig deep into traditions as sources of inspiration
3. Learn from, manage, and survive resistance.

For teachers in VET, the topic is new, and there are many constraints that they need to overcome in order to make room for new approaches to teaching and learning. Challenges are manifold. It starts with teachers being mostly occupied with managing the required content within the given classroom time and the feeling that there is not enough room for maneuver left to support more individualized learning within experimentation. The incentive to teach students to be more creative is often missing, because many companies, which train apprentices, still do not see the value of more creative workers and therefore creative competence is not purposefully required (e.g., not listed in job advertisements). Reports of apprentices about their workplace experience indicate that throughout their training they experienced that workers are mostly concerned with managing a given task and little with seeking better ways for developing products or managing their days. Innovations or innovative ideas at the workplace even cause unrest, insecurity, and inconvenience and are therefore often not wanted or welcomed. There is the conviction that apprentices first need to learn their trade and acquire the foundational knowledge and competences for working in a chosen profession. Qualified workers often do not expect from apprentices to take part in a critical assessment of work processes and product development. Lastly, competence assessments and quality standards can be constraining when room for exploration and experimentation is needed. Both require openness for mistakes and fuzziness. When it comes to designing classroom instruction in innovative ways, teachers might face multiple issues, such as a troubled relationship to technology, a self-image as being not creative, different personal interests and aspirations about how to work, and also issues of identity (linked to their course of study, academic orientation, occupational choice, image of the profession, or area of specialization entered) (also see Perret and Perret-Clermont 2011, p. 169).

Where VET is organized in a dual nature, part time in school and part time at the workplace, the students' appreciation for work and using their growing professional skills can be met (Nielsen and Kvale 2003; Tanggaard 2006). Workshop formats where practical skills are thought can to some extent be of similar nature. By using technology, such as videotaping or video annotation, learning between the workplace and school can be bridged. Focusing on the products and services developed and enabling a critical discussion, for example, on the aesthetics of it are effective tools also for creativity development.

Focusing on the scope of action for teachers, some of the constraints above can be overcome by appropriate teacher training as well as by consulting the literature for pedagogical tools. For the different forms of training, a “framing” specific to the learning activity is needed in relation to the nature of the tasks involved (exercise, individual or collective project, development work), the type of educational support that is established, the implicit “teaching contract” that structures exchange, the individual or collective form of work, the time frame (work to be completed in a few hours or over a course of several weeks, with or without a fixed deadline), and finally the forms of educational assessment made of the completed work (Perret and Perret-Clermont 2011, p. 169).

Focusing on classroom instruction that stimulates creative thinking, Feldhusen and Treffinger (1980, p. 32) proposed ten recommendations for establishing a creative climate, which is essential for student engagement:

1. Support and reinforce unusual ideas and responses of students.
2. Use failure as positive to help students realize errors and meet acceptable standards in a supportive atmosphere.
3. Adapt to students’ interests and ideas in the classroom whenever possible.
4. Allow time for students to think about and develop their creative ideas. Not all creativity occurs immediately and spontaneously.
5. Create a climate of mutual respect and acceptance between students and between students and teachers, so that students can share, develop, and learn together and from one another as well as independently.
6. Be aware of the many facets of creativity besides arts and crafts: verbal responses and written responses both in prose and poetic style and fiction and nonfiction form. Creativity enters all curricular areas and disciplines.
7. Encourage divergent learning activities. Be a resource provider and director.
8. Listen and laugh with students. A warm, supportive atmosphere provides freedom and security in exploratory thinking.
9. Allow students to have choices and be a part of the decision-making process. Let them have a part in the control of their education and learning experiences.
10. Let everyone get involved, and demonstrate the value of involvement by supporting student ideas and solutions to problems and projects (as cited in Fasko 2000–2001, pp. 319–320).

The creation of a creativity-supportive atmosphere is the foremost condition for students to discover and work with their creative ideas. The next step for teachers is to enable students by providing a number of tools as well as knowledge and experiences.

Fasko (2000–2001, p. 321) proposes for these purposes the following actions for an inquiry-discovery learning experience:

1. Provide an initial experience to raise the interest of students in inquiring about a problem, concept, situation, or idea.
2. Provide the students with manipulative situations and materials to begin avenues of exploration.

3. Supply information sources for students' questions.
4. Provide materials and equipment that will spark and encourage student experimentation and production.
5. Provide time for students to manipulate, discuss, experiment, fail, and succeed.
6. Provide guidance, reassurance, and reinforcement for students' ideas and hypotheses.
7. Reward and encourage acceptable solution strategies.

Additional strategies are suggested in the literature:

8. Use randomness, such as when students are required to incorporate material and stimuli into their work (Ernst 1948).
9. Replicate a typical innovation process, which comprise the following elements (Witt 1996, p. 7):
  - Establish a framework for potential change.
  - Browse through information to find a starting point for an innovation.
  - Collect ideas for change and renewal.
  - Assess the ideas and select feasible ideas.
  - Concretize ideas and develop measures for their implementation.
  - Test the new product or process.
  - Introduce the new product or process.
  - Test it and improve it.

The next step after creating framework conditions and a climate as well as applying various tools and approaches is to focus on specific measures that support the generation of effective novelty (Savransky 2000):

1. Improvement (improvement or perfection of both quality and quantity of what already exists)
2. Diagnostics (search for and elimination of shortcomings in what already exists)
3. Trimming (reduction of costs associated with existing solutions)
4. Analogy (new use of known processes and systems, e.g., bionics)
5. Synthesis (generation of new mixtures of existing elements)
6. Genesis (generation of fundamentally new solutions)

In addition to:

7. Brainstorming (Osborn 1957) and brainwriting (Rohrbach 1969)
8. Divergent thinking (mental provocation and introduction of stimulus word) (Bono 1996, p. 138; Guilford 1950)
9. Inversion method
10. Morphological methods by newly constructing of elements of a complexity by mindmapping, functional analysis, and comparisons with nature (Zwicky 1971)

One of the essential preconditions for creativity is coined as “cognitive style,” which means understanding complexities and being the ability to break set during

problem-solving. The following features were identified by Amabile (1996, pp. 88–89) as relevant in this respect:

1. Taking a different perspective on the use of objects
2. Abandoning an old set of problem-solving strategies and moving into a new direction
3. Understanding complexities
4. Avoiding foreclosure of alternatives
5. Suspending judgment
6. Using wide categories in order to find relationships between diverse bits of information
7. Remembering accurately
8. Breaking out of performance scripts
9. Perceiving differently

Interpreting, conceptualizing, and applying these techniques require from teachers exercising with students and learning what and how it works best under specific didactical considerations. Ideally, the application of these approaches builds on the primary goal of teaching knowledge and skills as well as building competences as they are listed in the framework curricula of a training program. The last points to consider for teachers are assessment criteria and assessment procedures. The assessment of creativity largely remains a subjective statement; finding objective criteria to judge creativity seems to be difficult, if not impossible. This might be a reason for neglecting the development of creativity within VET curricula, because learning it cannot be easily assessed or measured.

Nevertheless, Amabile (1979) undertook the endeavor to identify criteria for what she termed the Consensual Assessment Technique with the following 16 dimensions to judge creativity:

1. Expression of meaning
2. Degree of representationalism
3. Silliness
4. Detail
5. Degree of symmetry
6. Planning evident
7. Novelty of idea
8. Balance
9. Novelty of use of material
10. Variation of shapes
11. Effort evident
12. Complexity
13. Neatness
14. Overall organization

15. Creativity

16. Technical goodness

These criteria may guide teachers in their assessment of students' creative work. The assessment should ideally be done by the students themselves in order to shape their critical judgment skills. Since assessment is essential for student learning, it should be given substantial time and attention. At the same time, the feedback needs to be given by starting with positive reinforcement first and then judgment by content variables defined at the beginning and be sensitive when it comes to the overall implementation. Similar criteria apply to creative work at the workplace, which will be addressed in the next section.

### **Framework Conditions for Unleashing the Creative Potential of Apprentices in Enterprises**

Enterprises are increasingly realizing that workers need to take over ownership and that new approaches are necessary to profit from employees' full potential. More than before, it is important that employees can act autonomously and problem oriented (Griffin et al. 2007). Creativity in this way becomes an aspect of work performance, while at the same time, it means an active form of well-being (Warr 1994). This corresponds well with Hackman and Oldham (1976) Job Characteristic Model which comprises those aspects that are relevant for workers to be satisfied at work: skill variety, task identity, task significance, autonomy, and feedback from the job.

Accordingly authoritative hierarchical management structures need to be replaced by participatory approaches with less reporting, more recognition, and trustful and fear-free cooperation among workers and apprentices. This new approach not only sets free productive potential among managers, who are traditionally largely concerned with administrative or reporting tasks, it also requires new forms of work organization, a new communication culture, as well as a shared learning culture. The establishment of a creative climate is as important in organizations as it is in schools. This involves that apprentices perceive new tasks as a challenge, to have the freedom to play with ideas, and that new ideas are supported. It requires an atmosphere of trust and openness and a dynamic use of time and space. An atmosphere of liveliness, playfulness, and humor needs to be created for which leaders are largely responsible. Supporting creativity also requires discussions, a readiness to take risks, and discharging conflicts (Rustler 2016).

Social factors can have a powerful impact on creativity (Amabile 1996), and the question of what are the social conditions most conducive to creativity becomes highly relevant for organizational cultures in learning and work settings. Amabile (1996, p. 120) defined the following social environmental influences on creativity, distinguishing between those with a positive or negative effect on workers' creativity:

	Positive	Negative
General	Autonomy/sense of control	Threatening critical evaluation connoting incompetence
	Sufficient resources	Expectation of critical evaluation
	Optimal challenge	Surveillance
	Recognition/reward that confirms competence	Contracted-for reward connoting
	Reward that enables intrinsically interesting work	Restricted choice/constraint control
	Task matched to interest	Arbitrary/unrealistic deadlines
	Sufficient task structure to support competent performance	Competition with co-workers
Organizational	Recognition that failure in work can provide valuable information	Lack of communication
	Mechanisms for considering new ideas	Lack of cooperation
	High-level encouragement toward innovation	Emphasis on the status quo
	Immediate supervisor encouragement	Emphasis on extrinsic motivators
	Co-worker skill diversity	Win-lose competition within the organization
	Co-workers' openness to new ideas	Rigid procedures
	Rigid status structures	Apathy toward project from others in organization
	Co-workers challenge ideas constructively	
	Emphasis on intrinsic motivators	
	Competition with outside organizations	
	Constructive work-focused feedback	
	Clear strategic direction, with procedural autonomy	
	Cooperation	
Collaboration		

Next to work climate, the learning culture within a work setting can impact creativity development. Particularly important for working creatively is a solid information base. Information exchange at the workplace, especially between apprentices and more experienced workers, through working in teams or through rotation models where apprentices can get to know different parts of the enterprise and being able to observe processes would support the development of a wider view and the possibility to gather knowledge. In addition to these sources of information, various media and digital devices can be used. However, finding reliable and valuable information requires good searching skills as well as critical judgment skills.

A change in the work organization is a logical result of the required climate changes described above. This could mean that a formerly vertical organization needs to be turned into a largely horizontal work organization, with project work being the norm. Decision-making would be more than before a concern of middle management, such as project managers. Individual responsibility and initiative among workers are

strengthened, and ideally cooperation takes on the form of equal partnership. While individual creativity, which involves activities that individuals perform on their own, will still be required in certain jobs and work environments, more emphasis is put onto organizational creativity mechanism, or the practices and formal procedures adopted by organizations to promote creative behavior (also see Bharadwaj and Menon 2000). Tanggaard and Stadil (2014) frame the conditions for creativity work with low distance of power, quick interchange of knowledge, learning across sectors, and the conceptualization of new products and designs on “the edge of the box.”

Some of the conditions above are already becoming a reality in enterprises, while others are still mainly theoretical considerations. The gradual workplace culture change and a turn toward valuing, unleashing, and using workers’ creativity start to arrive in the minds of VET teachers and trainers and lead to changes within the organization of apprenticeships. One trend would be to delegate more responsibility to the apprentice, especially during times of the master journeymen’s absence. Such situations force the young employee to find ones’ own solution that one believes is better than those that already exist. The new trend to become early on a member of a team and over time of many different teams (which can mostly be practices within larger enterprises and organizations), some of them can be called “innovation teams,” provides apprentices with the experience of developing a shared understanding of what a company stands for, what its goals are in terms of vision and mission, and how it wants to achieve them. Values, attitudes, and shared beliefs are highly relevant, and learning about them as well as integrating them in ones’ mind-set is part of the socialization process at the workplace.

After addressing the cultural and organizational needs within schools and workplaces to facilitate creativity development among VET students, the necessary framework conditions are clarified. However, there is an aspect missing that mostly comes to mind first when talking about creativity. It is the arts as well as arts-based methods in teaching and learning that heavily rely on creativity and also inspire new one. The following paragraph will provide some elaborations on the role of art and its integration into VET.

## **The Role of Art in Teaching, Learning, and Working**

Joseph Beuys declared once “everyone is an artist” (1972, Manifest at Documenta 5 in Kassel). While the sentence holds true, it might often be used ironically to comment on ones’ humble attempts to work creatively. However, the statement is becoming a philosophy for modern workplaces to the extent that not just the creativity of workers within the so-called creative professions needs to be developed but that every ones’ creativity can be drawn on to develop innovations. Creativity is needed to produce art and art inspires new creativity. This has implications for the ways in which individuals and teams work, on the shape of their work environment and on the usage of art as a tool to unleash creativity.

While most people think of art primarily in the form of paintings, music and performance, or sculptures, it can be much more. When during the era of Pop Art art

has been declared as a good, Marcel Duchamp's readymades declared goods for art, and concept artists declared a concept as art, the idea of designing almost everything as art evolved, and finally art became much more than a physical product or creation. It can be a process, a concept, a rhetoric design, a service, or a network. Art can be anything, be it immaterial, digital, or virtual (Rothauer 2016).

Along with the creation of art came the notion of design. Design is the creation of a plan or convention for the construction of an object, system, or measurable human interaction. The idea of designing something does not only relate to shaping a product with a particular aesthetic approach; it is also the response to develop something better because the existing product or practice seems to be insufficient. Thinking about a solution for this insufficiency is foundational to design and later on to design thinking. Today many different approaches to design have been developed because of the large variety of perceived defects in society, e.g., sustainable design, information design, inclusive design, service design, or social design (see Rothauer 2016).

Design thinking can build a bridge between art, design, and finding solutions for particular problems through the development of new ideas. It is mainly an innovation method applied in education and gradually now at workplaces, e.g., at Swisscom. However, most enterprises that apply the methods of design thinking have not taken a holistic design thinking approach, which would also require a change of their work environment, a requirement which was claimed to have a major impact on creative thinking and creative work. Although working with art is not a requirement within the design thinking theory, the development of the collection of information and inspiration, e.g., by looking at art objects, as well as the development of new designs that can be artful brings the two close together. Next to it, art-based methods to shape work and learning are increasingly applied in education and some workplaces.

Rothauer (2016), for example, cites a project undertaken at the company Unilever which struggled to remain competitive in the market and undertook a training program with hundreds of their employees who learned with artists to unleash their creative potential. A representative from human resources resumed: "(...) I think that by exposing people to the visual arts, to the theatre and to poetry, the skill levels in design, video and therefore advertising and personal communication, both written and verbal, have gone up. People are being more challenged" (Hill, zit. by Darso 2004, p. 110). Other examples refer to introducing theater-based methods in the training of nurses, policemen, or personnel in various social occupations.

The "Arts-in-Business Movement" which had been created with this large-scale activity at Unilever could be taken as a model for exploring the possibilities of integrating arts into vocational education and training. Darso (2015) realizes that the movement did not take off within industry yet, although the time seemed to be ripe for it. However, she is convinced that education is foundational to changing the ways in which businesses operate. Students need to experience artfulness themselves first in order to understand how the process works. This would enable them to contribute to innovation at the workplace by understanding artistic creativity as the basis, as a mind-set (Darso 2015).

Based on the realization of what comprises art, Seelig (2012, p. 79) states that “learning about art is much more than learning how to paint a picture, make a photograph, or create a sculpture; it is about how to observe the world with great attention to detail, to internalize those observations, and then to give expression to them in the chosen medium.” It is the challenge for VET to provide environments and opportunities to teach students these observation skills. These skills are essential in the development of an aesthetic mind and critical for developing an individual opinion about something as well as an individual style.

---

## Conclusion

There is a large body of literature about the concept of creativity, how it evolved within the arts and crafts metier, and how it is needed for innovation. Authors have provided several lists of advice as to what kinds of climate, including attitudes, values, and beliefs, are necessary for stimulating creativity, which methods can be applied within teaching as well as at the workplace, and how creativity can be assessed. While the literature is largely concerned with primary education and the workplace, general education is covered to some extent, and a very few sources do specifically refer to the field of VET. A wide consensus exists about the need to do more to support creativity within education as the following statement by various authors illustrates: “The relationship between education and creativity would seem to be a natural one, almost obvious in its degree of ‘fit’. But to a great extent, this appears not to be the case” (Makel 2009; Plucker et al. 2004).

For VET creativity development and its potential for innovation need to be understood as an essential element within our attitude and our pedagogical approaches toward learning. Part of this paradigm is that teachers and VET students need to develop the self-confidence and trust in their abilities. For VET teachers, the challenge is to unleash their own creative potential as a precondition for understanding how to support students in developing theirs. Thinking about creativity and acting creatively require a change of mind that goes beyond schooling. To think innovatively and act creatively should be a general approach to work and life. Acting creatively selectively in certain moments is less promising than turning this approach into a life philosophy.

While most scholars agree that creativity development is important and that it needs to be better integrated in curricula, there is some disagreement about the role of knowledge in all of that. Some futurists believe that knowledge acquisition will increasingly be less important, because we might soon have a chip in our brain and easily draw on all the existing knowledge. However, this only holds true, if one knows which questions to ask and how to make sense of the existing knowledge. Witt’s (2010, p. 24) statement about the role of knowledge, which says that “without knowledge phantasy cannot evolve and ideas cannot be developed, except by chance,” should support one of the traditional roles that educationalists have and also pioneer their thinking about how to transmit, reflect, and discuss knowledge in the future. It is evident that “domain-relevant skills,” such as factual knowledge,

technical skills, and special talents in the domain in question, as well as “creativity-relevant skills,” such as cognitive style, application of heuristics for the exploration of new cognitive pathways, and working styles, need to go hand in hand.

## Abstract

This chapter focuses on the working and learning of teachers' professional/occupational practices. These practices occur in the teachers' specific areas of professional sectors such as the airline industry, equine sector, and fashion and textiles. The deliverers teach on work-related programs in the vocational/technical and vocational education and training (TVET)/preuniversity academic level.

In studying the working and learning of the teachers' professional practices, this chapter uses a conceptual framework that relies on a dual professional concept (Handal 1999) at the initial stage, and this contribution centers on occupational practices and not the pedagogic activities of the teachers. Acquisition of knowledge theoretical frameworks relates to those by Clarke and Winch (2004), Eraut (2004), and Winch (2014). Turning to the application of knowledge, the relevant conceptual frameworks include those by Barnett (2006), Evans et al. (2010), Kahneman (2012), Kemmis and Green (2013), and Evans (2016).

The empirical evidence is based on data from a larger project (Loo 2018). The research methodologies include quantitative and qualitative research methods.

e-mail: [sai.loo@ucl.ac.uk](mailto:sai.loo@ucl.ac.uk)

These are questionnaire survey, one-to-one semi-structured interviews and documentary evidence.

Using empirical data, examples of how types of know-how acquired by participants in gas servicing, health and social work, fashion and textiles, and equine industries are discussed. The participants' perspectives of their use of know-how are also delineated using the above theoretical frameworks to provide deep insights into how they perform their roles in the respective work areas. The conclusion section offers contributions and implications of this study.

## Introduction

This chapter contributes to the “Vocational learning” section, and specifically, it focuses on the vocational learning and working of teachers in their occupational settings. These teachers in the post-compulsory or further education (FE) sector, in addition to delivering work-related or vocational programs, also have experiences of working in their relevant occupations. Using empirical data from a large project (Loo 2018), the data on teachers of vocational or technical and vocational education and training (TVET) is used in this chapter. TVET is used for two reasons. The first is that it is an internationally recognized term (United Nations Educational, Scientific and Cultural Organization 2012) that features programs that are related to work such as health and social care, travel and tourism (e.g., airline studies), and gas fitting. The second reason is to avoid the “English contexts” where past research has been hampered by issues such as the academic-vocational division and sociocultural dimensions (Loo and Jameson 2017).

The FE sector in England has a diverse range of teaching settings. The teaching settings include adult and community learning providers; armed and uniformed services; commercial organizations; FE colleges; independent training providers; industry, prisons, and offender learning institutions; public sector organizations, specialist colleges; and voluntary and community sector organizations (Education and Training Foundation 2014). The learners are 16 plus, adult, and lifelong learners, and a significant percentage of them have diverse learning abilities. One of the characteristics of this sector is it offers further learning opportunities for students from the compulsory education sector. The other characteristic is over 75% of the provisions which are work-related. The popular areas include visual and performing arts and media; health, social care, and public services; foundation programs; business administration; management and professional (at higher education academic level); and hospitality, sports, leisure, and travel (Frontier Economics Limited 2014, Table 15).

This chapter investigates how and what the TVET teachers need to carry out their occupational practices in their respective areas. Using the empirical data of the larger project (Loo 2018), the TVET occupational areas include the airline industry, equine

sector, fashion and textiles, gas services, and health and social care. To study this, the chapter is structured into five sections, following the introduction. The next section delineates the relevant theoretical frameworks, and the third section offers details of the relevant project. The fourth section includes a discussion of the findings, and the final section provides a summary, contributions, and implications of this study.

---

## Conceptual Frameworks of Working and Learning

This section on the theoretical frameworks investigates the relevance of knowledge concerning learning and work. The relevant knowledge is then discussed concerning its application in work settings. This section uses recontextualization processes to offer insights into how knowledge may be understood regarding its relevance to work and its utility concerning work practices. Recontextualization may be viewed as the selection, relocation, and refocus of knowledge (Bernstein 1996), which is modified and made relevant to a specific occupation.

Post-Bernsteinian researchers such as Barnett (2006), Evans et al. (2010), and Loo (2012, 2014) offer additional forms of this process. Barnett (2006) acknowledges the relevance of the disciplinary knowledge in work conditions. His reclassificatory recontextualization process relates to the utility of disciplinary knowledge such as physics as a “toolbox of applicable knowledge” with strategies to satisfy the demands of occupational practice (Barnett 2006, p. 147). He offers another process which he calls “pedagogic recontextualization” for teaching purposes. However, he is short on the details of the two recontextualization processes. Evans et al. (2010, p. 254) develop the recontextualization concept further to include the “subject-based and work-based aspects of a curriculum and learning programme” where different forms of know-how are selected and relocated in “different sites of learning in colleges and workplaces.” They include skills and capabilities in addition to disciplinary knowledge and suggested four recontextualization processes. These are content recontextualization, pedagogic recontextualization, workplace recontextualization, and learner recontextualization. With content recontextualization process, codified forms of knowledge of disciplinary, procedural, and work process are selected for use in curriculum and teaching. Pedagogic recontextualization relates to the selected know-how and its application in teaching, learning, and assessment. Workplace recontextualization offers insights into how knowledge may be applied in workplace contexts. Learner recontextualization concerns the learner’s acquisition and application of knowledge. Evans et al. offer nuanced insights of the acquisition and application of know-how in pedagogic and work contexts. However, from a temporal dimension, it is not clear how the two codified knowledge of disciplinary and work-related are acquired. Also, there are insufficient details of the possible interactions between explicit and tacit know-how. Evans (2016) clarifies this point in her descriptions of “knowledgeable practice” where it infers forms of learning such as informal and peer learning. It assumes varieties of know-how such as explicit (e.g., disciplinary knowledge) and tacit (e.g., interpretation of work activity), skills (e.g., suturing skills in nursing), and abilities (e.g.,

problem-solving). Loo (2012) explicitly suggests that tacit knowledge, such as those from work settings, may be recontextualized along with explicit forms. He later offers a new form of recontextualization – ongoing recontextualization – involving disciplinary know-how between subject areas and between disciplinary/theoretical knowledge and everyday or tacit experiences (Loo 2014, p. 352). He develops further “Bernstein’s fine division of his horizontal pedagogic discourses and tacit ‘vocational elements’ of horizontal knowledge structures of the vertical pedagogic discourses, and Barnett’s reclassificatory recontextualization” (Loo 2018, p. 40). In short, Loo advocates that explicit and tacit forms of knowledge may interact and are changed as a result.

A worker, who may eventually become a teacher of TVET programs, needs to acquire the relevant disciplinary know-how that is related to that occupation. This acquisition may be exemplified by a person learning to become a gas fitter. He/she needs to know about physics relating to gas expansion, etc. However, the knowledge of how a particular type of gas such as carbon monoxide behaves is not sufficient. This know-how needs to be relevant to gas fitting. It is through the process of content recontextualization where the disciplinary knowledge of physics is selected and relocated to meet the needs of gas fitting.

Bernstein offers three modes of the organization of the vertical knowledge. Bernstein viewed this knowledge as explicit and codified and might be organized into singulars, regions, and generic. For him, singulars are disciplinary knowledge such as “physics, chemistry, history, economics and psychology” (Bernstein 1996, p. 65). Regions are constructed by recontextualizing singulars into larger units, which operate in fields such as engineering and architecture (Bernstein 1996). Generic mode relies less on academic or applied academic disciplines, and vocational know-how may be classified in this mode as part of a “skill task, practice or even area of work” (Bernstein 1996, pp. 66–67). This radical “generic” mode offers insights into learning of TVET programs such as airline studies, equine studies, fashion and textiles, and gas fitting. These occupations are included in the list of occupational areas in Table 1.

Once the disciplinary knowledge is made relevant via the content recontextualization process, it becomes occupational knowledge. According to Eraut (2004) and Winch (2014), this type of knowledge also includes knowledge of procedures, skills (e.g., interpersonal and intrapersonal that are tacit), techniques, transversal abilities, project management abilities, personal capabilities, and occupational awareness. In short, occupational know-how is more than recontextualized disciplinary knowledge from the singular mode. It consists of a worker’s past knowledge (of theoretical and procedural knowledge and experiences), understanding (of work and specific project contexts), skills (technical and nontechnical), dispositions, and the perceptions of the work settings the workers operates. This know-how may be explicit or tacit (Collins 2010; Nonaka and Takeuchi 1995).

The occupational knowledge along with work knowledge (which is viewed as knowledge that is related to the work environment/organization in which the worker is situated) are then recontextualized via the occupational recontextualization process to become applied occupational knowledge. This work knowledge may include

**Table 1** Details of participants

Participant	Teaching institutions	Full-time/ part-time	Disciplinary areas	Occupational/life experiences
Gender	Level of academic qualifications	Years of teaching experience		
Age				
P1 Female 40s	FE college Level 4	Full-time 7 years	Travel and tourism	Worked in the airline industry as part of a cabin crew for 8 years
P2 Male 50s	FE college Level 4	Full-time 15 years	Gas services	Worked in the gas service industry as an engineer and as trainer and assessor
P3 Female 50s	FE college Level 5	Full-time 8 years	Health and social care	Worked as health and social care worker and nursery nurse in the early years and childcare areas
P4 Female 60s	FE college Level 5	Full-time 13 years (6 years in HEIs) currently 0.6	Art and design fashion and textiles	Worked in banking and retail (craft and museums) Currently working as a fashion designer
P5 Male 40s	FE college Level 4	Full-time 3.5 years (4 years p-t)	Equine studies	Worked and performed in the equine industry and related governing bodies
P6 Female 40s	FE college Level	Full-time 5 years	Equine studies	Worked in the equine industry
P7 Male 40s	Adult and community Level 5	Part-time	Art – Painting and printmaking	Worked as a printmaker and architect

processes, protocols, and mentoring systems, which are specific to that work environment (Evans et al. 2010). This is after the second recontextualization process that this modified know-how may be applied in work activities.

In addition to the recontextualization processes, there are concepts that provide additional insights into how a worker may apply the modified know-how to work practices. These concepts include “knowledgeable practice” (Evans 2016). It is developed through formal and informal learning in the work environments and beyond. “Practice architecture” (Kemmis and Green 2013) is viewed as the “sayings,” “relatings,” and “doings” in work organizations, institutions, and settings, and “systems 1 and 2” (Kahneman 2012) where the former is intuitively based on past occupational experiences. The latter system is based on rational and cognitive interactions.

“Knowledgeable practice” is developed through learning at the workplace, observations of others, and includes support structures such as mentorship (Evans 2016). This concept offers a way of understanding the occupational practice. It supports the sociocultural impact on a worker’s learning including collaborative working with people in the work settings. One may also suggest that this approach infers informal and peer learning and assumes a wide perspective of knowledge to include explicit

and tacit forms along with occupational experiences, skill sets, abilities, and dispositions. These perspectives of practices offer insights into how a TVET worker may acquire and apply forms of knowledge in the work environments.

“Practice architecture” is used as a concept to understanding teachers’ pedagogic activities in work-related provisions. Kemmis and Green (2013) advocated that these teachers with occupational experiences can provide insights into the micro-workings which use past work-related experiences. Practice architecture uses “sayings, doings, and relatings” to help understand the practices. They argue that “these practice architectures are constructed shapes practice in its cultural-discursive, social-political and material-economic dimensions, giving substance and form to what is and can be actually said and done by, with and for whom” (Kemmis and Grootenboer 2008, p. 57). Like knowledgeable practice above, practice architecture acknowledges the sociocultural dimensions. The former concept perhaps offers a more micro-delineations of working in an occupational setting focusing on the deliberations – verbal, actions, and cognitions – concerning work practices. However, neither of the concepts provides understandings of decision-making.

Kahneman (2012) offers “systems 1 and 2” to understanding how a worker decides a course of action. For him, system 1 is responsive to a specific need for decision-making such as responding to an already drunk airline passenger’s request for more alcohol in the airline industry. Little effort is involved and is based on skills or heuristics from past occupational experiences. System 2 is slower in its reaction to a particular situation and is based on conscious and rational approach. It needs continuous professional training, and with this, there are implications for financial and human resourcing. The two systems are connected. Kahneman’s concepts provide a way of understanding decision-making processes, which have varying speeds of reaction and potentialities of judgment errors. These approaches have traction on how TVET workers decide on their courses of action.

It is through these frameworks that know-how is acquired and applied in work settings by a worker. This conceptual framework is not necessarily linear or -one-directional but is dynamic and process-driven (Chaiklin and Lave 1996; Cole 1996).

It involves contexts of sociological forces around temporal dimensions such as work conditions, forms of teaching institutions, academic level of the taught provision, types of learners, and nature of the occupation. Movements may occur between these contexts and can affect the acquisition and utility of occupational know-how via the recontextualization processes in specific learning and work conditions.

These concepts will be referred to in the discussion section below using analyzed data. Before this, the next section offers salient methodological details.

---

## Project Details

The empirical data that is used in this chapter relates to a larger project (Loo 2018) where the main research questions center on the nature of occupational pedagogy and the manner in which the related know-how is acquired and employed in the pedagogic activities of work-related programs. The project used the term

“occupational pedagogy” to denote teaching and learning practices across the three academic levels of TVET, first-degree/higher vocational and professional education. It draws on 21 purposive teachers/participants, 7 from each of the 3 levels. In this chapter, seven of these participants (P1–7) (Table 1) teach on the TVET programs of airline studies, art (painting and printmaking, equine studies, fashion and textiles, gas services, and health and social care). The research methods used included a questionnaire survey and semi-structured interviews. The survey elicited details such as gender, age, pedagogic, occupational and life experiences, and academic and professional qualifications. The qualitative data from the interviews offered thick descriptions of their professional practices. Both the data capture involved pilot studies in fine-tuning the survey, interview questions, and procedures. Documentary evidence such as program specifications was also gathered, and these three data sources were analyzed and triangulated using generated codes, identified phrases, patterns, and themes as part of the thematic analysis (Robson 2002). The principal and only investigator used narrative analysis (Robson 2002) where the relevant teachers’ descriptions were employed in the discussion and findings section to illustrate and provide further insights. It is not the intention to include details of all seven of the participants but merely to focus on those participants, whose occupational experiences are pertinent to the aims of this chapter.

---

## Findings and Discussion

This penultimate section uses the relevant analyzed data to discuss the participants’ perceptions of the sources and types of know-how and how these relate to their occupational practices. The structure follows the same format as in the literature review section of critiquing the sources and types and applications of the related know-how.

### Acquisition

P2 (Table 1), a male lecturer in his 50s at an FE college, has been teaching gas services provisions for 15 years. He worked in the gas service industry as an engineer. From a disciplinary knowledge, he views the “basic knowledge of physics, mathematics, and chemistry” as relevant to this industry. In particular, the theoretical knowledge of combustion equation and gas flows is as particularly relevant to his sector. However, the theoretical knowledge is not as in-depth as those required at “Advanced” levels, and the emphasis is on the “hands-on” dimension concerning his occupation practice. In the health and social care sector, P3, a female lecturer with 8 years full-time teaching experiences, indicated that “basic knowledge of biology, anatomy, and psychology” is required. Additionally, her “practitioner’s experiences and life experiences of secure family life” are also relevant to her occupational work. For an equine industry, P5 with the industrial or occupational experiences suggested that “physics, anatomy, psychology, numeracy, and occupational knowledge” are all

necessary for working in this sector. In addition to disciplinary know-how, there is also occupation-specific “knowledge of show jumping, dressage, and theory of horses getting into a horsebox.” Other industry-specific know-how includes numeracy such as 2.5 kilos of oats and barley are consumed daily by a horse, and a horse has 36–45 heartbeats per minute. However, he admits that “the equine sector regarding the types and sources of knowledge are at the coal face” and much more research is still needed.

The above delineations offer a range of sources and types of knowledge. P2, P3, and P5 refer to theoretical knowledge from the disciplines (Becher 1994; Smeby 1996), which Bernstein (1996) refers to as “vertical discourse.” The source of this knowledge is from the disciplines. Some of the participants use “basic knowledge” to describe the knowledge of disciplines. They imply that these forms of theoretical knowledge are used as starting blocks for their occupations. The participants also mentioned that other types of know-how are relevant in their occupational practices. The term, “occupational relevance,” offers an entry point into how they relate theoretical knowledge to their work. P2 uses “hands-on” in a similar fashion.

The suggested conceptual framework uses content recontextualization as a process by which knowledge from other sources such as the disciplines of physics, chemistry, biology, and mathematics are re-applied for their occupational relevance. So, in P2’s example, certain aspects of physics about gas fitting/services are chosen as of occupational relevance. This theoretical knowledge is recontextualized, that is, selected, relocated, and refocused (Bernstein 1996) to make the knowledge relevant to gas fitting. Here, theoretical knowledge of combustion and gas flows from physics is selected from the curriculum. This is relocated and refocused to make it relevant and applicable to gas services so that a worker in this industry can understand the theoretical principles as well as understanding the relevance to the gas fitting of a boiler in a household environment. This process is called content recontextualization where parts of the specifications are selected and made relevant to the occupation. A civil engineer who is involved in sewage works may use the same disciplinary know-how, but for the particular occupational practice that is specific to that project. One may argue that this content recontextualization process is different for different occupations and occupational practices.

From a curriculum formation or development perspective, the level of theoretical knowledge necessary for occupational practices may not be at the same level of those merely acquiring the knowledge of that discipline. So a person studying “A” physics may have a higher level of the subject compared to a student of gas services. However, one may argue that for the gas fitter learner, he/she requires further cognitive processing to understand the selected theoretical know-how and then relate it to the industrial requirements, which may require further cognitive processing. The cognitive processing uses learner recontextualization (Evans et al. 2010).

This application of theoretical knowledge is supported by Clarke and Winch (2004, p. 519) which they see as “applicable theory and practice appropriately informed by theory.” Eraut (2004), in a similar vein, views disciplinary knowledge as the springboard to work practices, and Winch’s (2014) professional knowledge typology also subscribes to “systematic knowledge” as theoretical know-how that is

applied to occupational contexts. All three theorists advocate the relevance of theoretical know-how to work contexts. What might be missing was the acknowledgment that the theoretical knowledge needs to be made relevant via a process of content recontextualization where parts of a specification are chosen and relocated to specific occupational needs.

In addition to the theoretical knowledge, the participants also refer to other sources of know-how. P3 refers to her “practitioner’s experiences and life experiences of secure family life,” and P5 mentions his occupation-specific know-how of show jumping, dressage, horse’s food consumption, etc. These are sources of know-how, which relate to Eraut’s (2004) methodological knowledge, practical skills and techniques, and general knowledge. Winch’s (2014) professional knowledge typology also has overlaps with Eraut’s and the participants’ knowledge sources especially with his technique, skill, transversal abilities (such as planning and coordinating a dressage event), and project management abilities (such as fitting a boiler in a house). These know-how, skills, abilities, and capacities are pertinent to the participants’ specific work practices. They are front-loaded base on the seven participants’ experiences. However, this does not mean that in theory, occupational know-how may not be acquired while in occupational settings (Hager 2004) rather than a front-loaded scenario, as exemplified by the seven participants.

In addition to the sources of know-how, there are types too such as explicit and tacit. Explicit types may include the disciplinary know-how such as physics and biology. These can be acquired in a formal program such as the Level 3 National Vocational Qualification (NVQ) in gas servicing, a Level 3 Business and Technology Education Council (BTEC) program in fashion and design and travel and tourism. Knowledge sources from the Internet may also be codified. Tacit sources may be from individuals or through collaborations (Nonaka and Takeuchi 1995; Collins 2010). They may include a participant’s occupational experiences, colleagues’ experiences, and occupational skills (e.g., the necessary pressure to turn a valve in gas fitting and steer a horse for dressage). How the occupational know-how is utilized is discussed in the next section.

## Applications

This section offers the perspectives of two participants – P2 and P5 – who are practitioners in the gas services and equine industries, respectively. They provide insights of their use of know-how concerning their occupational practices and their relevance to the concepts of “knowledgeable practice” (Evans 2016), “practice architecture” (Kemmis and Green 2013), and “systems 1 and 2” (Kahneman 2012).

P2 recounted the incident as a gas service engineer (for 6 years) with a national gas provider in the private sector:

On a cold winter’s day being asked to go to a house in the street next to my house as there was a smell of gas. There was no gas leak inside the house on inspection, and so the leak must be from the outside. I radioed to Bolton (where the office was) and left it and further

asked the outside distribution lads to check it out. On my return from my other duties, I passed the inspected house, and the front door was blown off along with the windows. Since that incident, the house had not been lived in. (Loo 2018, p. 58)

P5 worked in the equine industry for over 20 years as the owner of riding schools and designer of showjumping courses and took part in competitive showjumping. Before entering the horse industry, he trained as an accountant. He acknowledged the need for the equine industry to undertake further research. These include the intricate synergy between the horse and rider using the Pegasus system of cameras and global positioning system (GPS) to track the anatomical movements of the horse and rider. They also include the enhancement of safety features in the sector as advocated in France and the impact of racecourses on both the horse and the rider.

From the perspective of the occupational recontextualization, P2 used his occupational knowledge (via the content recontextualization) of physics and chemistry knowledge of gas flows, gas expansions, and combustion that is occupationally relevant to gas servicing to inspect the house internally. On satisfying himself that the gas leak was not from the house, he concluded that the leak was from the outside. This decision was illustrative of Kahneman's system 2 where P2's past professional experiences, cognitive processes, and the specific contexts of the setting were used in arriving at a professional judgment to discount the house as a potential source of the gas leak. Practice architecture of "sayings, doings, and relatings" (Kemmis and Green 2013) may also be featured here. P2 conveyed ("sayings") his professional evaluation to the head office before moving to another case. He adhered to this procedural aspect of the company's system ("doings"). His message should have been conveyed to the external distribution department of the company in the follow-up process ("relatings"). P2 as a professional practitioner carried out the company's procedures. This aspect of the specific occupational practice also has resonance with another part of the content recontextualization, which is work knowledge. In addition to applying his recontextualized disciplinary knowledge, i.e., occupational knowledge, P2 also used his knowledge of the organizational system of health and safety procedures and established lines of communications to carry out his professional responsibilities.

In a slightly tangential perspective, Evans's (2016) knowledgeable practice concept provides insights into P2's learning of his occupational experiences by focusing on the development of his learning by observing and being mentored by his peers and learning about specific aspects of his work through different occupational experiences. The combination of his disciplinary/theoretical knowledge along with his learning experiences while at work provided him with a unique data of knowledge, experiences, skills, and abilities (Eraut 2004; Winch 2014) to refer to and apply to the specific professional setting such as the one, which was recounted above.

Turning to P5, he offers a different perspective to that of P2's. P5 ran his riding schools and designed showjumping courses. Different knowledge, abilities, and skill sets are needed. He needs to have a vision for setting up a riding school such as its location, potential catchment area, and clients and the rationale for this undertaking.

His earlier training in accountancy would have been useful in ascertaining the financial viability of such an undertaking through his use of cash flow and budgeting know-how. Leadership, planning, project management abilities, focus, self-motivation, and risk-taking are skills, abilities, and capacities (Eraut 2004; Winch 2014) that are needed to start his riding schools. Also, P5 needs to establish a system for his school such as health and safety procedures, especially if young people are involved, and procedural, administrative, and financial systems. An example of this is the purchase and payment of food for the horses. A horse consumes, on average, two and a half kilos of oats and barley feeds per day. This information will be helpful in the ordering of feed for the horses, and the choice of supplier and its payment require a system in place. These systems constitute work knowledge and together with the necessary occupational know-how will enable P5 to relocate and modify via occupational recontextualization process to facilitate him in his occupational activities.

He uses his occupational know-how of competitive horse eventing experiences, knowledge of showjumping courses, and the equine industry to enable him to design a showjumping circuit. This know-how may include his experiences as a competitive rider of approaching jumps, the use of support teams in getting horse and rider ready for such an event, the required feed leading up to this, and the exercises for both horses and riders to acquaint with a specific course. All these experiences will enable P5 to design a circuit for an appropriate level. It will involve details of the type of ground, distances leading up to and after the hurdles, the dimensions and structures of the hurdles, and much more. From the perspective of occupational recontextualization, he draws on not only his past professional experiences but also his sense of a vision for a circuit, which fits the requirements of a specific event or funder, and his leadership abilities to sell his idea. From the implementation aspects, he needs project management abilities, collaborative capacities, patience, and the ability to follow it through to completion. The know-how, like the ones stated earlier, is both codified and tacit (Polanyi 1966; Nonaka and Takeuchi 1995; Collins 2010). Examples of codified forms are the occupational knowledge derived from the disciplines such as biology and mathematics. The tacit ones include occupational experiences, knowledge of showjumping courses, and collaborative working with related stakeholders. These tacit varieties may broadly be classified as individual and collaboration-related as investigated by Nonaka and Takeuchi (1995) and Collins (2010).

P5's occupational activities may be connected to the three concepts of "knowledgeable practice" (Evans 2016), "practice architecture" (Kemmis and Green 2013), and "systems 1 and 2" (Kahneman 2012). Examples of the first concept include the setting up and implementation of a mentoring system in P5's riding schools and observations of the impact of riders and horses at a showjumping event. Examples of the second concept are how health and safety features are conveyed to his staff and users in the riding school and the implementation of these guidelines concerning the wider industry and its related organizations such as the British Horse Society and the World Equestrian Authority. Finally, with the third concept, his professional experiences in approaching equestrian jumps in a competition may be

viewed from system 1 or 2 perspectives, the former has a quick response and the latter a considered response based on reflected evaluations of similar situations.

The above discussions focusing on the occupational activities of P2 and P5 provide contrasting insights into the types, sources, and applications of occupational and applied occupational know-how.

Regarding sources and types of know-how, P2 and P5 use disciplinary or “basic” knowledge of physics, mathematics, and chemistry for gas fitting and physics, anatomy, psychology, and numeracy for the equine industry, respectively. However, these basic knowledge needs to be “made relevant” to the specific occupations. Similarly, the level of disciplinary know-how is not the same as its academic equivalent program. Thus for P2, the level of physics necessary for gas fitting is not as high as the equivalent advanced level course. However, it does not mean that the training is of lesser quality, as the disciplinary knowledge needs to be recontextualized via the content recontextualization process to give the know-how the “occupational relevance” for eventual application. Additionally, the participants’ occupational and life experiences along with occupational know-how such as knowledge of showjumping and dressage are needed, especially in the equine sector where the lack of research meant that, according to P5, “the types and sources of knowledge are at the coal face.” Also, there are the explicit and tacit forms of know-how. The disciplinary ones represent the explicit variety. The tacit variety (Polanyi 1966; Nonaka and Takeuchi 1995; Collins 2010) includes occupational experiences, experiences from colleagues, and skill sets, e.g., the necessary pressure to turn a valve in gas fitting and steering a horse in a dressage event. It also includes collaborative working with the related stakeholders. The two studies also offer insights into the explicit and tacit forms of know-how as well as a wider delineation of knowledge (such as abilities, capacities, experiences, skill sets, and theoretical knowledge) as espoused by Eraut (2004) and Winch (2014).

P2 and P5 recounted their real-life experiences of a gas leak in a house nearby to P2’s and the managing of riding schools, designing of and competing in showjumping events, and accountancy training, respectively. P2 used his disciplinary and occupational know-how to inspect the gas leak (via the content and occupational recontextualization processes). He decided to discount an internal gas leak (Kahneman 2012) and contacted the head office to look into an external leak before going onto another job (Kemmis and Green 2013). P5 has managerial experiences (Eraut 2004; Winch 2014) where he implemented health and safety procedures in his riding schools with specific adherence to the equine industry guidelines (Kemmis and Green 2013) and organized mentoring systems to train staff (Evans 2016). These “knowledgeable practices,” “practice architectures,” and “systems 1 and 2 decision-making” processes added another layer of understanding of knowledge applications.

However, these complex interactions of know-how occur constantly and are continually modified as a result of specific occupational settings. These ongoing recontextualization processes as propounded by Loo (2018) involve the following. They are forms of disciplinary knowledge, “theoretical” and “everyday” knowledge (Bernstein 1996), explicit and tacit varieties of know-how (Nonaka and Takeuchi 1995), and between abilities, capacities, experiences, and skill sets (Eraut 2004;

Winch 2014). Examples of these were discussed earlier. This ongoing process, according to Loo, changes the characteristics of the know-how from the users' perspectives (such as P2 and P5). For the users, they can become conscious and unconscious varieties of know-how, where the disciplinary knowledge (explicit and conscious, e.g., knowledge of physics) combined with occupational experiences and practices (tacit to a degree) may become unconscious and instinctive in decision-making. Similarly, a solving of an occupational problem may offer opportunities for aspects of the know-how to become explicit, e.g., the formalization of industry procedures. Through this, constant recontextualization of knowledge by a practitioner over time becomes specific to him/her.

---

## Conclusion

This chapter studied the working and learning of teachers' professional/occupational practices. The conceptual framework used Bernstein's recontextualization as a platform for delineating these micro-practices. The framework draws on post-Bernsteinian researchers to illuminate these complex practices and at the same time expanding and developing the definition of knowledge to include theoretical know-how, experiences, abilities, capacities, and skill sets. The framework offered two types of recontextualization processes: content recontextualization and occupational recontextualization. In so doing, the contributions of this chapter include a theoretical framework to understanding the micro-workings of a vocational practitioner, a wider perspective of knowledge, and the use of real-life examples of vocational areas to illustrate the practitioners' activities.

These contributions have implications for the education of vocational teachers, the areas for qualified teachers' continuous professional development (CPD), and the support structures to mentoring and professionalizing vocational/occupational teacher educators and lecturers.

For FE teachers, the training in the sector in England is at present underdeveloped and inconsistent (Loo 2014). An issue concerning the training of lecturers surrounds disciplinary teaching, where generic teacher training is more the norm. The findings from this chapter highlight the need for vocational teachers to understand uncontested and ill-defined terms like teacher knowledge, vocational education and training, and vocational pedagogy (Loo 2018). Included in a teacher education program should be opportunities to study the evidence-informed findings on topics, such as teacher know-how, choice of pedagogic strategies, and understanding of teacher knowledge applications. Where possible, there should be offers of action research opportunities (perhaps as part of a separate module) to pursue a trainee's interest. Perhaps more significantly, the trainee teachers should understand how to integrate disciplinary and pedagogic know-how. Loo (2013) used multimodality (Kress 2010) and reflective peer review (Pollard et al. 2008) to offer a "360°" training experience using digital recordings of teaching sessions. Multimodality is used to analyze the different modes (e.g., visual imagery, sound, and text) of the digital recordings (Kress 2010). Reflective peer review is applied to offer a

supportive and constructive dimension to evaluate the recorded teaching sessions in a collaborative context within a sociocultural environment (Loo 2013, p. 501). Through these, trainee teachers have the opportunities to analyze, discuss, and inform each other about the subtleties of teaching; the mutability of disciplinary, pedagogic, occupational, and real-life know-how (both explicit and tacit forms); and the symbiotic relationships between teaching and occupational practices (Loo 2014).

Regarding CPD, one needs to be aware of the possible tensions in CPD provisions. One tension is for teaching institutions to offer generic or specific offers. Generic ones could include administrative aspects relating to teachers' requirements such as adherence to particular institutional systems and teaching styles such as the use of smart boards and technological tools, e.g., Socrative software. Specific CPD offers relate to the teachers' occupational areas such as equine studies and gas fitting industry. These CPD provisions might include teaching strategies that are relevant to the delivery of these occupational areas. These teachers would also need to keep in touch with their occupational practices. These could include spending time at the occupational organizations (industrial placements), attending trade and professional conferences and related events, and subscribing to related publications. Linking to this generic and specific tension is the delivery of these provisions either internally or externally. The constraints such as expertise, resource (financial and nonfinancial), and temporal would need to be taken into account. The third tension revolves around pedagogic and occupational considerations. As these vocational lecturers require the two areas of professional updating, consideration should be given to offer a balanced approach. As the deliverers work in a teaching organization, the vocational needs might not be fully appreciated by the management, which could be a cause of conflict. One possible solution is to appoint industry experts on the CPD panel to oversee staff development. This panel of external experts drawing from education, industry, and lay members might ensure that the needs of the staff are met. So far, the foci have been on teaching staff. However, there will be those who are in positions of responsibility where managerial and leadership abilities are needed. So, the final tension for CPD requirements relates to managerial and leadership provisions. Questions concerning the actual subject areas and delivery by external or internal experts need resolving.

Finally, teacher educators also require similar CPD and supporting structures to enable them to update their relevant occupational expertise. One has to bear in mind the specific nature of these educators. They are very likely to be former teachers in the sector with varied disciplinary expertise. Their roles are to provide a training program to a diverse group of FE teachers where over 70% of its provisions are vocational. It appears that they have three dimensions to their roles: as vocational practitioners, lecturers of vocational programs, and teacher trainers. Currently, there are no accredited pathways to becoming teacher educators. One possible route is to undertake action research in their disciplinary or pedagogic field via a doctoral program. Their exposure to the investigations of education and occupational theories regarding teacher training would hone their powers of research methodologies, judgment, and critical analysis. As there are gaps in teacher education in the FE

sector, there is much to be gained by this approach. However, there might be other approaches such as a program with specific modules for these educators in areas like teaching knowledge, curriculum development, and generic and subject-specific teaching approaches.

**Abstract**

Research on vocational education and training has a long history in China, and it developed based upon the rapid development of vocational education and training system after the reform and opening-up of People's Republic of China. Under the relative support policies, research on vocational education and training has formed a comprehensive organization system, project system, and results publication system. Tracking the published papers and books about vocational education since 2000 shows that research on vocational education and training is focusing on nine fields: Development strategy and path of higher vocational education; relations between vocational education and socio-economic development; theories and discipline construction of vocational education; reform and development of rural vocational education; curriculum and teaching reform of vocational education; strengthening school-enterprise cooperation; constructing modern vocational education system; reflection and comment on vocational education policies; ideas and strategies of vocational education in international society, especially in developed countries. On the whole, research on vocational education and training in China manifests distinct policy guidance in research themes, together with the conscientious pursuit of scholars to strengthen discipline construction. Inquiries take literature research as the principal method while tending towards multiple and mixed research methods. Construction of the Chinese mode by referring to international experience is an important field.

**Introduction**

Chinese vocational education started more than 150 years ago and has gone through the tenacious and tough contending period in old China, the overall arranging and planned developing construction period in new China, and the modernized development period with reform, opening-up and rising prosperity. During the vocational education development process, research has always provided an important knowledge base. This chapter reviews the background, system, and changing priorities in the field of research on vocational education in China, with particular reference to the organizational and curriculum features that impact on vocational learning.

**Background of Research on Vocational Education and Training in China**

Based on the interpretation of the *Vocational Education Law of the People's Republic of China*, vocational education is also called vocational and technical education and refers to an education type of necessary vocational knowledge, skills, and

professional ethics offered to the students to make them able to engage in certain occupations. Vocational education includes vocational education in school and vocational training. Vocational education in school is a kind of degree education and can be divided into secondary and higher vocational education. Secondary vocational education plays a fundamental role in the modern vocational education system and carries out fundamental knowledge, technique, and skills education for the graduates of lower secondary schools implemented by various kinds of secondary vocational schools. Higher vocational education refers to degree education and continuing education at junior college and undergraduate stages delivered by higher vocational colleges, and postgraduate education at professional degree level delivered by various institutions of higher education. Vocational training includes pre-employment training, occupation-transfer training, apprenticeship training, on-the-job training, job-transfer training, and other occupational training and can be divided into elementary, middle, and higher vocational training according to actual situations. Vocational training can be implemented by corresponding vocational training institutions and vocational schools, respectively.

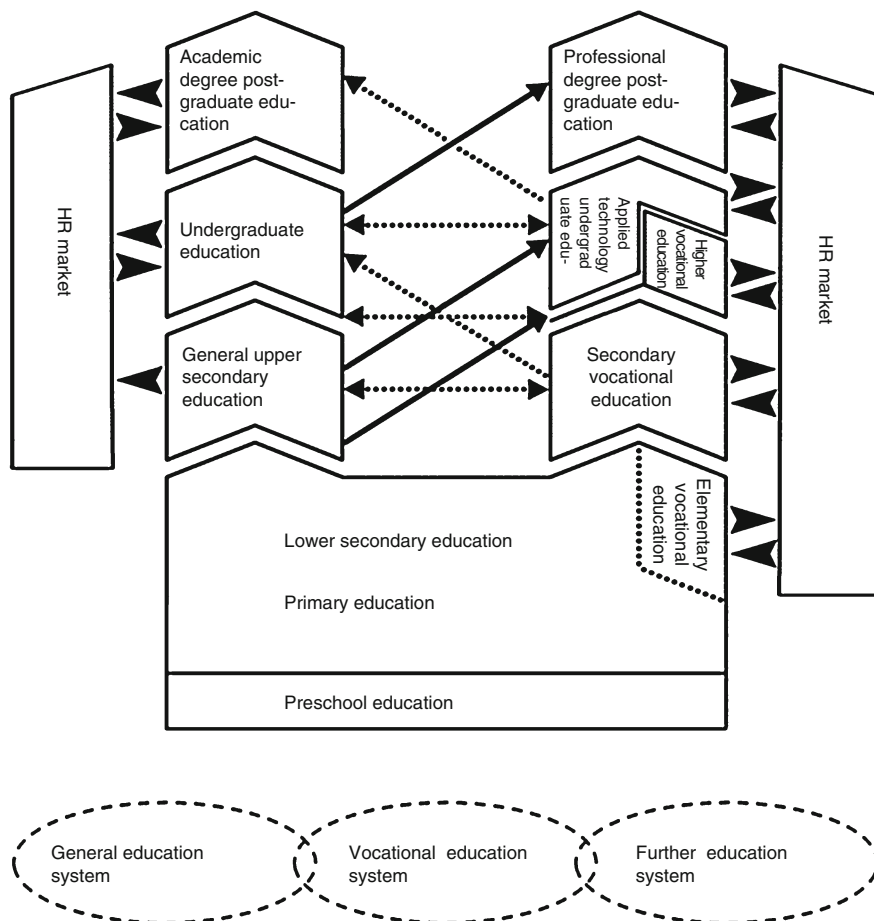

After the implementation of the reform and opening-up in 1978, the State has accelerated and promoted the development of modern vocational education and has achieved a historical breakthrough. The most important mark is that China has established the largest scale of vocational education in the world. In 2015, China had more than 10,000 secondary vocational schools with over 18 million students and more than 1,200 higher vocational colleges with over 10 million students.

Based on the requirements of national policy, the development objective of Chinese vocational education is, by 2020, to form the modern vocational education system with Chinese characteristics and world standards, which shall adapt to development demands, deeply integrate the enterprise and education, link secondary and higher vocational schools, exchange the ideas of vocational education and general education, and embody the lifelong education concept. See Fig. 1 for the basic framework of the system.

---

## Research System of Vocational Education and Training in China

Since the implementation of the reform and opening-up policy, China has paid high attention to the vocational education research work. From March 23 to April 14, 1979, the Ministry of Education and Chinese Academy of Social Sciences jointly convened the First National Working Conference on Education Sciences Planning. The Conference deliberated and adopted the *Education Sciences Development Planning Outline 1978–1985 (Draft)*, which placed the development of vocational and technical education research in an important position. In 1987, 10 discipline planning groups, including the vocational and technical education, were established under the *Leading Group of National Education Science Planning*, which marked the official incorporation of vocational education research into the national education research planning system. The *Vocational Education Law*, issued for enforcement in

**Fig. 1** Schematic diagram of basic framework of Chinese education system

1996, clearly indicated that “the country encourages and organizes the scientific research on vocational education.”

In 2002, the State Council issued the *Decision on Energetically Promoting the Reform and Development of Vocational Education*, which proposed that China should strengthen the theoretical research and policy research on vocational education and perfect the scientific research and teaching research organizations. In 2015, the Ministry of Education issued the *Innovative Development Action Plan for Higher Vocational Education (2015–2018)*, which proposed that China should strengthen macro decision-making research and research into hot topics and difficult problems on higher vocational education reform and development.

The implementation of policies and regulations promoted the prosperity and development of research undertakings of vocational education and enhanced the development of vocational education research organization. At present, China has

basically formed four research groups of vocational education, including the governmental vocational education research institutes, the vocational education research departments in higher education institutes, the vocational education research departments in vocational schools, and the vocational education societies and associations system in China, which has formed the vocational education research system covering the national, local, and school levels from department to industry and from the central government to the local governments. According to incomplete statistics, there are more than 200 vocational education research (teaching and research) institutes throughout the country (Xue Peng 2015).

---

## **Focus Fields of Research on Vocational Education and Training in China**

Since entering the new century, under the guidance of national policy, the research on vocational education in China has demonstrated substantial development. On the one hand, the quantity of academic papers on vocational education published on journals increased rapidly; when retrieving on China Knowledge Resource Integrated Database (CNKI, <http://www.cnki.net/>) with the key word of “vocational education,” the number of papers retrieved since 1980 is 33,814, while the number since 2000 is 33,605. On the other hand, the publishing of academic monographs on vocational education also presents a rapid increasing trend; according to an incomplete statistics, there are hundreds of monographs on vocational education published since the new century. From the perspective of themes, the research on vocational education in China mainly focuses on the following fields.

## **Development Strategy and Path of Higher Vocational Education**

Since the new century, with the development of higher vocational colleges, higher vocational education has become the emphasis of vocational education research in China. Zhang Yaoxue clearly proposed that “higher vocational education is a kind of education” to deal with the problem of relatively ambiguous orientation of higher vocational education (Zhang Yaoxue 2002). Wei Jin used the regression analysis method and established a mathematical model through deep enterprise investigation and overall sampling and concluded that: compared with the graduates of general higher education institutes, the graduates of higher vocational colleges who obtain employment in targeted majors enjoy higher job satisfaction, bring in higher labor productivity, and realize higher economic benefits (Wei Jin 2004). Wang Minglun systematically researched higher vocational education in the aspects of background, orientation, concept, scale, institution, quality, system, evaluation, target, curriculum, and trend and tried to build a theoretical system for higher vocational education development (Wang Minglun 2004). Feng Zengjun proposed that higher vocational education must adhere to the development of technical education and, on this basis, promote the combination of skills and humanity and move to a new higher

vocational education development road from pure technique to combined technique and R&D and to the integration of technique, R&D and academic application (Feng Zengjun 2006). Ma Shuchao comprehensively and systematically analyzed the historical development, practical conditions, and strategic thinking of the higher vocational education in China and illuminated that the development of higher vocational education is an inevitable historical choice of the social and economic development in contemporary China (Ma Shuchao 2009). Liu Hongyi put forward the paths of higher vocational education development: adapting to the needs of regional economic and social development, reasonably adjusting scale and speed, establishing a system suitable for the regional industrial structure, and developing a characteristic regional development road (Liu Hongyi 2012). Ding Jinchang proposed that the talent cultivation ideas of higher vocational colleges mainly include the following steps: clearly define the cultivation objective; form a school-running pattern of combination of production, teaching and research; build a curriculum system with a mainline of professional technology application ability; establish the educating system organically integrating “three kind of learning spaces (school, community and enterprise)”; construct supporting conditions suitable for the cultivation of technical talents (Ding Jinchang 2015).

## **Relations Between Vocational Education and Socio-economic Development**

Exploring, in depth, the relations between vocational education and socio-economic development and strengthening the service capability of vocational education are the important focus of research on vocational education in China. Yu Zuguang examined vocational education’s function in helping the disadvantaged and concluded that China still needed to make long-term efforts to establish a lifelong vocational and technical education and training system, no matter from the perspective of popularization or improvement. Such efforts included the update of educational concept, the adjustment of educational development goals, and the rational combination of the educational, economic, and employment policies (Yu Zuguang 2007).

In 2008, the *Sociology of Vocational Education* was published. This book tried to establish an interdisciplinary systematic framework between vocational pedagogy and sociology. According to this book, the sociology of vocational education mainly studied the interaction between vocational education and the society, its theoretical bases included the theories of vocational education, sociology, and economics, and its practice basis lay in the continuous development of the course of vocational education and the continuous appearance of issues in vocational education (Wang Qinglian and Zhang Shezi 2008). Cao Hongjian and Zhou Nan made a special study on the role of vocational education in social stratification. The study presented that under the external functions of the education system, the educational management system, and the traditional cultural ideas of the society, vocational education worked on the development of the students through multiple processes. The processes included education and teaching (including the selection and transmission of

knowledge, and the achievement expectancy on the students shown by the teachers) and the influence of school educational culture (including the identity culture of peer groups of the students and the positioning of objective hierarchy of the school), thus shaping the output of educational achievements of vocational education (Cao Hongjian and Zhou Nan 2012). Zhang Yuan associated vocational education with the strategy of reinvigorating China through human resource development and pointed out that the gap between the vocational education system and the strategy of reinvigorating China through human resource development exists in many aspects at present and China must steadily build a corresponding security mechanism in combination with the process of industrialization in the future to solve the problems in the development of modern vocational education system (Zhang Yuan 2012). Chen Peng and Pang Xueguang et al. specifically discussed the development of vocational education under the background of *Made in China 2025*. Their study suggests that as the Chinese economy has entered a state of new normal and under the background of transformation and upgrading of the industrial structure, vocational education must improve its concept, quality, and the development of its professionals.

With the rapid development of vocational education, the economic benefits of vocational education have become an important research focus. Hu Yongyuan divided human capital into three kinds of general human capital, skills human capital, and innovative human capital and calculated that the contribution rate of skills human capital in China to economic development is 1.96% (Hu Yongyuan 2004). Some researchers measured the relationship between vocational education and total factor productivity (TFP) using the GMM method of spatial correction system and found that all levels of vocational education public input, nonpublic input, and TFP have spatial auto-correlation, and TFP exists spatial spillover effects. When increased 1% of public investment for higher vocational education, the TFP can significantly increase 0.082% (Lv Lianju and Kan Daxue 2016). Recently, some researchers have paid attention to the microbenefits of vocational education, such as the changing of income, occupational enhancement, employment stability, and self-entrepreneurship after accepting vocational education. For example, by the method of tracking investigation, the *Chinese Higher Vocational Education Quality Report* put forward that higher vocational graduates' average month wage has increased continuously since 2011; after 3 years of graduation, higher students' average month income can increase 83.8% comparing with after half a year of graduation (MyCOS Institute 2016).

## Theories and Discipline Construction of Vocational Education

An in-depth exploration on the essential attribute, position, and role of vocational education and its relationship with human and society through literature analysis has indicated that the essence of vocational education is to cultivate application-oriented talents and skilled talents, and its essential attribute is occupation-oriented nature of technical skills (Ouyang He 2004). Jiang Dayuan presented that vocational

education, as a type of education, had the type characteristics different from those of general education that reflected the basic attributes of vocational education. These type characteristics at least include: the talent concept based on multiple intelligence, the education concept based on competency, the competency concept based on overall development, the specialty concept based on professional attribute, the curriculum concept based on working process, the teaching concept based on action orientation, the construction concept based on learning environment, the evaluation concept based on whole consideration, the foundation concept based on life development, the hierarchy theory based on technical application, and the concept of education system based on flexible management (Jiang Dayuan 2007a).

Xu Guoqing proposed that the principle of VTE existed along with other sub-disciplines of vocational education and was a subdiscipline with its own research contents and style. This should be the reasonable position of the principle of VTE in the discipline system of vocational education (Xu Guoqing 2006). Zhou Mingxing put forward that the development direction of the disciplinary study of vocational and technical education was to highlight the innovativeness, the systematic approach, and the theoretical properties (Zhou Mingxing 2009). The *Historical Logic and Philosophical Foundation of Vocational Education* addressed the question “what is vocational education” linearly from the perspective of historical development in combination with multidisciplinary knowledge. The dynamic mechanism of vocational education came from the basic human nature, and society and its formation can be attributed to various factors such as “vocational interest” and “market requirement” (Xu Pingli 2010).

## Reform and Development of Rural Vocational Education

Issues concerning agriculture, countryside, and farmers have always been major concerns for the government of China. It has become a key field to improve the vocational ability of rural population through rural vocational education and then enhance the economic development level of rural areas. In China, the concept of rural vocational education indicates the kind of vocational education serving for agriculture, countryside, and farmers, which includes the vocational education running in countryside, the agricultural vocational education, and the vocational education and skills training that aims for training talents for the construction of countryside. Agricultural vocational education indicates the vocational education serving industries that relates to agriculture, forestry, animal husbandry, fishing, water conservancy, grain, and agricultural socialization service. Therefore, rural vocational education is a more broad concept than agricultural vocational education.

Li Shuishan checked out the situation of rural education in the respective regions by questionnaire and analyzed the main sticking points in the development of rural vocational education, the basic problems in the combination of preliminary education in rural areas with vocational education, and the basic situation of curriculum and teaching material design in rural vocational education (Li Shuishan 2003). Xu Changfa explored the scientific development, classification and regionalization,

comparative advantages, overall planning, adaptation to local conditions, and harmonious development of rural vocational education under the new situation (Xu Changfa 2006). Tang Shengling and Cao Ye established a discipline system for rural vocational education, and first proposed and performed the studies on “rural vocational education in three types of economical areas” and “government in rural vocational education” (Tang Shengling and Cao Ye 2006).

On the basis of building an evaluation system of farmer vocational education, Chen Huayu and Jiang Nan comprehensively analyzed the overall condition and regional variance of farmer vocational development in China from three dimensions of educational objects, educational conditions, and educational effects (Chen Huayu and Jiang Nan 2008). Through a positive analysis on the rate of return to education and to length of service of the income of migrants, Ren Yuan stated the effects of human capital on the income of migrants and tried to establish an academic education and vocational training system more suitable for the requirements of migrants (Ren Yuan 2010). Ma Jianfu proposed that it was difficult to truly solve the problems of relative poverty and development poverty in rural areas in China merely through economic growth, and the key lied in education and the core was to provide suitable vocational education and training for the farmers and their children (Ma Jianfu 2012).

Wu Zhihui made a special exploration into the strategic transitions of rural vocational education. First, vocational education should be oriented towards the construction of the ecological agriculture system with modern characteristics and new rural construction in various regions and towards the transfer of surplus rural labor and the technical talents in urgent need by the country. Second, build a unified labor employment training system for both urban and rural areas, and a vocational education administrative system and a labor force employment system under urban and rural integration (Wu Zhihui 2012). Ma Jianfu studied the relationship between vocational education and the cultivation of new vocational farmers, the competence model and cultivation concept of new vocational farmers, and other basic problems (Ma Jianfu 2015).

## **Curriculum and Teaching Reform of Vocational Education**

Since the new century, the development of vocational education in China has been shifting its focus from size development to connotation construction, paying attention to questions of the meaning and qualities of vocational education and how vocational learning is best supported. Against this background, improving the quality of talent cultivation in vocational education through curriculum and teaching reform has become an area of focus for the researchers. Zhao Zhiqun introduced three theories of action-oriented teaching, social learning, and organizational learning to explain the rules of modern vocational learning (Zhao Zhiqun 2003). Yang Jin comprehensively clarified that the teaching reform and curriculum construction of secondary vocational education must be student-oriented, to operationalize the teaching process, promote the socialization of quality evaluation, and improve the quality and profit of vocational education (Yang Jin 2004). Jiang Dayuan believed

that the most important characteristic of specialized teaching of vocational education was the consistency between the teaching process and the action in related fields, so the specialized teaching of vocational education should be oriented towards typical vocational activities corresponding to this specialty, and vocational education should be built with specialized teaching theory different from the teaching theory of general education (Jiang Dayuan 2004). Chen Yongfang proposed to construct specialized teaching theory of vocational education and that the research and teaching object under the specialized teaching theory should be not just the specialized disciplinary knowledge, but more important, the complicated interrelation among vocational education, labor (work), and skill in the area of expertise (Chen Yongfang 2007). Centering on the disciplinary theory and vocational theory, general theory and specialized theory as well as basic theory and pragmatic theory, Xu Guoqing tried to establish the curriculum theory of vocational education with the paradigm function on the level of concept and principle (Xu Guoqing 2008). He also made an integrated study on three key fields in the reform and development of vocational education in China – curriculum, teaching, and teacher – and sought a systematical understanding of these three fields from the perspective of their interaction (Xu Guoqing 2016).

It is worth noting that under the influence of competency-oriented education thought in the world, competency-oriented curriculum and teaching reform has become an important trends since 1990s. There are many articles to explore the theories, practical model, implementation strategies of competency-based vocational education. For example, Huang Riqiang put forward that competency-based vocational education is the development trends of modern vocational education (Huang Riqiang and Zhou Qi 1999). However, with the rapid changing of economic and social background, different voices against competency-based have appeared. Many researchers advocated to cultivate more broad qualities in vocational education rather than postcompetency, so as to enhance the lifelong development of learners. The most representative points are “quality-oriented,” “personality-oriented,” “capabilities-based education,” and so on.

## **Strengthening School-Enterprise Cooperation**

As the breakthrough point of realizing the reform of talent training mode of vocational education, school-enterprise cooperation is of special concern for Chinese researchers of vocational education. Chen Xiao proposed that the most remarkable feature of higher vocational education was school-enterprise cooperation and China should take a talent cultivation path combining the industry, the school, and the research (Chen Xiao 2002). Hu Yanhua explained the essence of the cooperation between school and enterprise from the perspective of economics and proposed that the talent cultivation path under the school-enterprise cooperation and the combination of production and learning was an obvious characteristic of higher vocational education (Hu Yanhua 2004). Under the framework of resource dependence theory, Huo Lijuan analyzed the foundation for school-enterprise cooperation, the resource

interdependence of both parties in the cooperation and the structure of dependence, and the effects on both parties, describing different periods of establishing and maintaining the school-enterprise cooperation in higher vocational colleges in China (Huo Lijuan 2010).

It is worth noting that, in recent years, modern apprenticeship has become an important research focus since many scholars take modern apprenticeship as the most effective way to realize working-learning combination. The total literature about modern apprenticeship exceeds 2000 in CNKI by the end of 2017. In summary, the research studies on modern apprenticeship can be divided into the following aspects: the first is about research about the essential attributes, connotation, and running mechanism of modern apprenticeship, for example, Zhao Zhiqun put forward that modern apprenticeship is a kind of cooperated vocational education system participated by vocational schools and enterprises (Zhao Zhiqun 2009). The second is about practical exploration on modern apprenticeship. In 2014, the Ministry of Education put forward to “carry out the pilot of modern apprenticeship system” and many vocational colleges in China have introduced modern apprenticeship into talent training process. For example, taking the practice of a vocational school as an example, Zhao Pengfei put forward that the effective implementation of modern apprenticeship should strengthen policy environment construction as well as connotation environment construction (Zhao Pengfei 2013). The third is about research studies on modern apprenticeship in western countries. For example, Guan Jing’ doctoral dissertation takes “western apprenticeship” as the subject (Guan Jing 2010).

## **Construction of the Modern Vocational Education System**

According to policy deployment of the state, it is a fundamental objective of vocational education development to construct the modern vocational education system, which is also the target of the research and study in Chinese vocational education. Li Yixian made a comprehensive interpretation of the concept of lifelong education system and put forward that for lifelong education as a system, during the implementation process, emphasis should be put on the principle of comprehensive organization based on various forms, but also on transcending these forms (Li Yixian 2004). Wu Xiaoyi deemed that lifelong learning is an educational idea which is formed on the basis of the concept of lifelong education and which emphasizes the dominant role of the learners and advocates to provide individualized services for lifelong learning of citizens. Its promotion and implementation will surely require making full use of educational functions of various social resources, as well as realizing communication and cohesion between school education and social training (Wu Xiaoyi 2007).

Centering on the policy hotspot of the construction of the modern vocational education system, Jiang Dayuan pointed out, through research, this construction should grasp the following three basic problems: the connotation of skill (education) and technical (education), the similarities and differences of secondary

vocational education and higher vocational education, and the equivalence between vocational education and general education. He suggested constructing a national qualifications framework and thus realizing real equivalence of various kinds of education at the same level (Jiang Dayuan 2011).

Developing vocational education at undergraduate level is a key link for perfecting the vocational education system, and has become a key focus in the academic field since the new century. Yang Jintu put forward that the pursuit for diversity of undergraduate education types and structural rationalization of education types is a common trend for reform and development of higher education in the latter half of the twentieth century in the world. Establishing the appropriate status of higher vocational and technical education in China is an objective requirement of China in the process of modernization (Yang Jintu 2003). Shi Qiheng and Wang Aiping proposed that application-oriented undergraduate education is a new education type formed along with the development of science and technology and during the transition of higher education from elite education to mass education. It is a higher education relative to theory-oriented undergraduate education and practical technology-based education, targeted at cultivating comprehensive and coordinated development of knowledge, capacity and quality toward senior application-oriented talents in first line of production, construction, management, and service. Basic characteristics of application-oriented undergraduate education are mainly manifested by: positioning the “nature” in industry, positioning the “orientation” in application, positioning the “pattern” in compound, and positioning the “point” in practice (Shi Qiheng and Wang Aiping 2008). Han Xuejun put forward the conception of construction of a vocational higher education system of Chinese characteristics, in which he made a preliminary sketch of the logic framework and practical method of the cultivation modes of application-oriented innovative talents (Han Xuejun 2010). Moreover, GuYong’an deemed that the destination of the objective of the transformation development of newly built undergraduate colleges shall be application-oriented brand universities. The application-oriented brand universities have two distinguishing characteristics: one is the application-oriented university and the other is the brand university. To construct application-oriented universities is an inevitable choice of the newly built undergraduate colleges under the background of massification of higher education, and the core of it is to emphasize participating in social progress through cultivating application-oriented talents and providing research studies on the applied technology (GuYong’an 2012).

## **Reflection and Comment on Vocational Education Policies in China**

Records, reflections and comments on development policy and the course of vocational education in China have always been focus of attention of research on vocational education. Zhang Li put forward that vocational education shall run through secondary education, higher education, and even the whole life of a person, and the core is employment, livelihood education, and career education (Zhang Li 2005). Other perspectives insist on taking employment as the orientation, with the

fundamental requirement for vocational education to serve employment and serve economic and social development (Ma Zhenhua and Zhang Yu 2005). Since 2005, the “Book Series of Researches on Modern Vocational Education” have been published by Shanghai Educational Publishing Press successively. The book series centered on practical problems of vocational education and expanded the theoretical logic around practical problems of vocational education in China, so as to promote disciplinary development of vocational education. In 2007, the “Book Series of Report on Development of Vocational and Technical Education in China” was published. This book series consist of total 11 books which displayed the development course of vocational education in China in recent years from various perspectives (Yu Zhijing 2007). In 2015, the “Book Series of Report on Development of Modern Vocational Education in China” was published; it recorded the development course of vocational education in China between 2007 and 2014 and emphasized the basic characteristics of development of vocational education in China during this period, so as to explore the thought development that the course of vocational education has entailed (Yu Zhijing 2015).

### **Ideas and Strategies of Vocational Education in International Society Especially in Developed Countries**

Strategies and good practices of vocational education in international society, especially in developed countries, have always been the focus of attention of vocational education in China. Jiang Dayuan made research studies on in-depth philosophical thought and rational thinking of vocational education in Germany (Jiang Dayuan 2007b). Kuang Ying discussed the development and transformation of higher vocational education from the perspective of comparative education, focused on expounding hotspot issues of higher vocational education in China, tried to seek solutions from the dimension of international comparison, and tried to consider advantages and disadvantages and applicability of different schemes (Kuang Ying 2006). Wu Xueping made systematic research on historical development, existing system, characteristics and reform and development trend of vocational and technical education in total 17 countries: Denmark, Finland, Norway, Sweden, Germany, France, UK, Netherlands, South Africa, Australia, New Zealand, USA, Canada, India, Japan, South Korea, and China, and made review and prospect of overall development of world vocational and technical education on the basis of national research studies (Wu Xueping 2005). Zhai Haihun made research studies on generation, development, and transformation of secondary vocational education in UK since the late nineteenth century and put forward the learned experience and lessons as well as suggestions for further reform and development of secondary vocational education in China (Zhai Haihun 2005). Li Jiyan, starting from inner link between macroeconomic, regional economic, and industrial structure, and the vocational education, and in combination of the latest development trend of vocational education in internationally developed countries in recent years, made a carding of its historical evolution and trend, so as to provide reference for construction of vocational education in China (Li Jiyan 2014).

## Conclusions

Through literature review, some important characteristics of research on vocational education and training can be observed in China.

### Distinct Policy Guidance in Research Themes

It can be seen from the development course of vocational education in China, that government leadership is the main development method of vocational education in China, while policy promotion is the main content of government leadership. Since the reform and opening-up, every time when critical periods of economic and social development occur, the government of China always made strategic deployments and issue major policy measures to promote the vocational education to match with economic and social development. As put forward by the researchers, development of vocational education in China is not a blind one but a conscious one. Constant development continuation, actuation by new situations, and promotion by national policy have jointly constituted the basic development logic of vocational education in China in an overlapping way (Yu Zhijing 2016). To adapt to such characteristic, the research themes and fields of vocational education in China are also equipped with distinct policy orientations, which are manifested by the strong sensibility of Chinese vocational education scholars toward policy hotspots of vocational education. The key point of policy development is always the focused research theme of vocational education, while serving the policy development is a conscious mission of Chinese vocational education researchers. For example, since the new century, development of higher vocational education, construction of modern vocational education system, and development of rural vocational education are all key points of reform and development of vocational education in China, and the achievements of vocational education in China in these fields are also the most abundant.

### It Is a Conscientious Pursuit of Chinese Vocational Education Scholars to Strengthen Discipline Construction

Research on basic principles of vocational education has always been key content to which Chinese scholars pay attention, with the main objective to construct an independent vocational education discipline. Early in the Period of the Republic of China when vocational education in China was in the budding stage, Chinese scholars have published a series of works on basic theories of vocational education, and the representative works extended from Zhu Jingkuan's *Theory of Vocational Education* (1916) to a series of monographs on basic theories of vocational education and on vocational and technical pedagogy (Liu Chungsheng 2006). Since the new century, on the basis of research studies on basic theories of vocational education, relevant scholars have also formed a series of research achievements in basic theories in history, sociology, economics, teaching theory,

and other fields of vocational education, which gradually made vocational pedagogy a more mature discipline.

### **Research Method Takes Literature Research as the Principal but the Trend of Multiple and Mixed Methods Is Obvious**

Over the years, academic research on vocational education in China mainly used literature research methods. However, in recent years, with the development of scientific technology, qualitative research and empirical research have increasingly become important research methods of vocational education, and a series of influential research achievements have been realized in this aspect. For example, Li Hongwei applied interview methods in qualitative research, conducted a case study by selecting one student from a vocational school, and examined the education mode, education highlights, and focus of strengthening attraction of vocational education in vocational school (Li Hongwei 2010). Shen Youlu, through investigating 22 secondary vocational schools, 25 higher vocational colleges, and in total 135 schools in all learning states in 9 provinces nationwide, analyzed the students, family backgrounds, and reasons for choosing vocational schools (Shen Youlu 2016). Chen Zhao, starting from adult questionnaire data of follow-up survey of Chinese family dynamics and making use of nationwide microsurvey data, discovered that the return of vocational education especially higher vocational education is related with the receiving place of vocational education (Chen Zhao 2015). Chen Yan et al., through referring to and applying theory and assessment system of modern international competitiveness, measured the level of competitiveness of vocational education of various countries from the structure, quality, benefit, scale, change, and investment and obtained the rank of international competitiveness of vocational education of various countries or regions in the world (Chen Yan et al. 2009).

### **Construction of Chinese Mode by Referring to International Experience Is a Key Aspect of Vocational Education Research in China**

Since vocational education started relatively late in China, in late 1970s and early 1980s of the twentieth century, with the opening-up of China, learning and borrowing vocational education experiences of developed countries have become important references for vocational education development in China. From then on, Chinese vocational education scholars began to introduce successful experiences of vocational education as well as masterpieces on vocational education in foreign countries. The book *Secondary Vocational and Technical Education* published in 1979 made selective introduction of the development of secondary vocational and technical education in foreign countries. Hereafter, some translated books introducing the development of vocational education in foreign countries have been published in China successively, including the compilation on *Productive Labor Education and*

*Vocational Education* published in 1984, of vocational education and vocational guidance approaches in the Soviet Union, Japan, France, East Germany, Thailand, and New Zealand, in the 1970s. Since the late twentieth century, Chinese scholars have begun to make deeper comparative analyses of vocational education in more developed countries, trying to introduce advanced foreign vocational education practices in China, and they have realized many valuable research achievements during this process.

## Abstract

This chapter will consider the role of vocational education and training in contributing to strategies to enhance the life chances and social inclusion of young adults. Recent changes in economic and social development and the impact of globalization have contributed to the changes in perception of both vocational learning and skills required by contemporary workplaces. Vocational and work-based learning has been recognized as a core component of national and international strategies for lifelong learning (LLL) (Evans 2012; NIACE 1999; Aspin et al. (eds) (2012) The second international handbook of lifelong learning. Springer, Dordrecht), which aim to bring about higher participation and inclusion of young people, especially those who are considered to be vulnerable or disadvantaged. Engaging vulnerable young people through different forms of lifelong learning has been strongly related to addressing the specific needs and requirements that would facilitate their participation in social, economic, and civic/political life in their relevant contexts. The

chapter will consider the links between LLL and VET, particularly discussing the extent to which the different discourses of LLL and adult education influence strategies and approaches for vulnerable young people and the implications of VET. The chapter will further consider some policy and practice developments in the UK context, in both historical and contemporary perspectives. Subsequently, some approaches will be considered to illustrate the debate and developments, particularly drawing on research findings from selected research projects. The chapter will conclude with discussing the potential of VET for promoting active citizenship specifically in providing the learners with both economic and social skills in a lifelong learning perspective.

## Introduction

Engaging young people through different forms of lifelong learning (LLL) has been strongly related to addressing the specific needs and requirements to facilitate their participation in social, economic, and civic/political life in their relevant contexts. The vocational education and training (VET) system, as a means to integrate young people into society and especially into the labor market, has been an important element of LLL and inclusion approaches (e.g., Evans and Niemeyer 2004; Holford et al. 2008). Recent changes in economic and social development and the impact of globalization have contributed to the changes in perception of both vocational learning and the skills required by contemporary workplaces. Vocational and work-based learning has been recognized as a core component of national and international strategies for LLL (Evans 2009; Aspin et al. 2012; Malloch et al. 2011), which aim to bring about higher participation and inclusion of young people, including those who are considered to be vulnerable or disadvantaged. The significance of the growing problem of social exclusion and disengagement of adults has been underpinned strongly by the current global challenges (such as youth unemployment, lack of involvement in employment or education, low levels of basic skills of the population, the refugee crisis). A recent EU report shows that around 25% of adults (aged 25–64 years) in the EU have not completed any formal education beyond the level of lower secondary education. In addition, of these, 6.5% of adults in the EU left the education system with no more than primary education (European Commission 2015). Over the last decade, one of the main concerns of governments in Europe has been to raise the skill and education level of the adult population as a way of increasing competitiveness in the global economy. Addressing these complex problems specifically through engaging and reengaging the adult population in LLL and skills development has become an important target of national governments across Europe and globally.

This chapter will consider the role of VET in contributing to strategies to enhance the life chances and social inclusion of young adults, specifically focusing on the UK

(Although this chapter makes some general observations that relate to the UK, the discussion will focus largely on England.) context. The chapter will start with a discussion of recent policy developments of VET in England and will provide some theoretical considerations on the role of LLL and its discourses for VET in the UK context. The chapter will consider the notion of disadvantage in relation to young adults and will further discuss the links between LLL, VET, and inclusion, particularly discussing the extent to which the different discourses of LLL and adult education influence strategies and approaches for vulnerable young people and the implications of VET. Subsequently, some approaches will be considered to illustrate the debate and developments, drawing particularly on findings on research dealing with issues of VET, LLL, and disadvantaged young adults. The chapter will conclude with some recommendations for policy and practice and directions for future research.

---

## Theoretical Considerations and Policy Developments

The role of VET in promoting LLL and engaging young people, including those suffering from different types of disadvantage, has long been recognized in both policy and research (Saar et al. 2013; Jarvis 2012; Schuller 2009; European Commission 2015). The VET system as a means to integrate young people into society and especially into the labor market has become one of most integral configurations of LLL, fostering social inclusion through aiming to equip (vulnerable) young people with a range of skills, including vocational, basic, and personal skills. Both national and international research have stressed the potential of vocational education in combating elements of social exclusion, specifically through contributing to young adults' transition to employment, skills development, and reducing early school leaving. An investigation of young people's pathways undertaken by Cedefop demonstrates that VET attracts learners at risk of dropping out or those who have already dropped out because they prefer VET-specific pedagogies as a way of learning (Cedefop 2016). Other commentators have made similar observations in relation to potential positive impact of VET on the life chances of young adults including both professional and personal development (Evans 2009; Malloch et al. 2011).

In this respect, the role of VET in equipping individuals with skills to succeed in the labor market has been emphasized in both research literature and policy papers (e.g., Evans et al. 2006). It has been observed that the number of job roles requiring intermediate and higher skills and education is rising in the UK, and it is expected that it will become even more important to possess specialist skills in the coming years, in order to participate in a more advanced labor market (UK NARIC 2016). Vocational qualifications provide practical skills that are directly related to employment in one or more occupations and can also prepare learners to progress to academic education, and therefore, vocational learning plays a critical role in both building a skilled and productive workforce and equipping learners with employment-related skills.

In the UK context, it has been observed (e.g., Stasz et al. 2004) that government policy for VET has been directed toward two broad purposes. The first is related to economic objectives, focusing on the development of economic capabilities and employability skills of the population. This policy discourse emphasizes that higher skills levels will lead to national economic prosperity, increased benefits for companies, as well as higher earnings and better life chances for the individual. Policy developments related to this discourse in the LLL and VET fields in the UK have been strongly underpinned by neoliberalism, emphasizing global competitiveness, the market economy, and its skill demands, and this was reflected in policy documents such as the *Leitch Review of Skills* (HM Treasury 2006). The corresponding market-related or economics-associated discourse of LLL, “the more we learn, the more we earn” (Evans 2009), has affected the development of adult education both in Europe and globally over the last two decades. For both VET and LLL, economic and market-related integration have therefore been important objectives; and the development of young people’s employability skills has been considered a key factor for their successful integration into European societies. The second purpose of VET is social, emphasizing that vocational education is not simply about occupationally relevant skills and qualifications but also about developing the motivation, confidence, and transferrable skills of individuals. A substantial body of literature identifies a range of nonvocational outcomes associated with VET provision, which include increased positive learning attitudes among young people and adults, promoting social inclusion, as well as facilitating progression to further learning (e.g., Evans 2009; Guile 2011; Cedefop 2016). The success of this agenda for young people may vary across contexts and depends largely on a number of external and internal factors such as teachers’ competences and support for students, students’ attitudes, individual biographies, financial and social setup, etc.

In the UK context, the problem of social exclusion and the need for developing policies and strategies for social integration have been increasingly recognized among policy-makers and practitioners over the past two decades; specifically the term “social exclusion” has mainly been used in policy agendas since the 1997 New Labour government. These two broad purposes, both economic and social, have been evident in relevant policies and strategies implemented by the government. In the latter part of the last century, some influential policy papers contributed to developing both the social and the economic agenda of VET. *A Basis for Choice*, published by the Further Education Unit (FEU) in 1979, became an important policy document in setting the agenda for vocational education, which emphasized the significance of helping young adults to make informed and meaningful choices in relation to their education and employment and opportunities. As noted by Pring (1995), the agenda emphasized the provision of guidance to enable young people to make a more informed choice about their routes into society, adult life, and employment, as one of the dimensions of VET. The policy also underpinned the importance of developing young adults’ transferable skills to ensure that their options are kept open (FEU 1979, 1982). Furthermore, a review of courses conducted on behalf of the FEU (Pratley 1980) identified that young adults are likely to need help in areas that relate not only to general education but also to job finding, employment skills,

and personal skills development. Through the Manpower Services Commission (later succeeded by the Training Agency), some important programs were initiated in the 1970s to tackle youth unemployment (e.g., the Job Creation Programme and the Work Experience Programme, later succeeded by the Youth Opportunities Programme). An “employment program” – work experience, training, and work preparation courses for unemployed school leavers – was another example of addressing unemployment and the disengaged. However, as Evans (1991) notes, the program did not succeed in solving the problems of unemployment and social exclusion. An additional concern was the widespread abuse of the programs by employers, who often saw them as a source of cheap labor. The Youth Training Scheme (YTS) was set up to replace these schemes in 1983. As Lucas (2007) observes, this was intended to be a modernized apprenticeship for everybody, committed to providing places for all unemployed 16- and 17-year-old school leavers in order to enhance their employability chances. The 4-year Technical and Vocational Education Initiative (TVEI) and the 1-year Certificate in Prevocational Education (CPVE) were introduced in 1983 and 1986, respectively. The TVEI was introduced to offer full-time students aged 14–18 years a 4-year course combining general with technical and vocational education in schools. The primary aim of this initiative was to make the school-based curriculum more relevant to the world of work. The CPVE included common core options for developing skills in selected occupational areas, as well as job seeking and enterprise skills. However, as Evans (1991, pp. 55–56) notes, the initiatives introduced in the 1980s presented “a confusing array of possible pathways to young people as well as to teachers, counsellors and parents who seek to guide them and the companies who might offer them employment.” During the 1980s Further Education (FE) colleges played an important role in providing “new vocational” or “prevocational” programs by offering a range of courses which emphasized preparation for work in general, not for specific jobs (Lucas 2007). In 1990 Youth Training replaced the YTS and became a significant program for unemployed 16- and 17-year-olds until April 1998, when it was replaced by Work-Based Training for Young People. Youth Training was delivered by training providers under contract to the local Training and Enterprise Councils. Work-Based Training for Young People retained most of the main characteristics of Youth Training. Taking the CPVE initiative further, General National Vocational Qualifications (GNVQs) were introduced in 1992 at three levels (foundation, intermediate, and advanced). They were aimed at young people who wanted to keep their career options open rather than embarking on specific NVQs. The introduction of GNVQs (phased out in 2007) and more recently the vocational General Certificates of Secondary Education (GCSEs) in applied subjects have meant that aspects of a 14- to 16-year-old’s program of studies may be vocationally related, providing what Pring (1995) defined as “the prevocational context.” With the variety of vocational training courses that could be offered in different contexts (e.g., college or workplace), there are certain common features of this type of learning, such as the incorporation of vocational relevance, providing opportunities for sampling or “tasting” a range of jobs to allow informed choices as well as taking into account the individual needs and circumstances of young people.

More specific policy developments to address the social exclusion of adults became evident in the UK political agenda at the end of the 1990s. The Social Exclusion Unit (SEU) was set up in 1997, in order “to help improve government action to reduce social exclusion by producing ‘joined-up solutions to joined-up problems’” (SEU 2004, p. 2). One of the SEU’s most influential reports, the *Bridging the Gap* report (SEU 1999), as well as its subsequent Policy Action Team report on young people (SEU 2000), raised the issue of social exclusion as one of the most significant social challenges, affecting adults and young people. The need to develop various programs and schemes that aim to engage young people, specifically those who are disadvantaged or disengaged, has also been strongly articulated in the SEU’s reports.

Subsequent policy developments to address the issues of social exclusion raised by the SEU have been focused strongly on the economic dimension of LLL, with a focus on labor market skills and employability. Under New Labour (New Labour is a term that refers to various British Labour Party governments, during the period from the mid-1990s until 2010, under the leadership of Tony Blair and Gordon Brown.) policies, social exclusion was to be countered by economic inclusion, focusing primarily on providing education, training, and employment opportunities (Coffield et al. 2008). Schemes for young adults were usually geared toward employability and training, to help with job search, interview, and personal skills and, ultimately, move them into employment.

During recent years a number of reforms and initiatives have been launched with the purpose of improving VET for young people and adults and to make it more responsive to the needs of employers and the labor market. The provision of VET, primarily post-16, includes FE colleges, apprenticeships, and systems of work-based learning. Many recent reforms have aimed to enhance the status of VET and make it an equal alternative to higher education. University degrees have become increasingly expensive since the introduction of fees in 1998 and at the time of writing cost up to £92,500 per annum. A wide range of vocational opportunities is available for learners at the end of compulsory education, including qualifications within the National Qualifications Framework (NQF)/Qualifications and Credit Framework (QCF), other qualifications outside the NQF/QCF (e.g., RSA or City & Guilds, vendor certifications offered by Microsoft and others), short training courses (not necessarily leading to a qualification), as well as publicly funded work-based training, e.g., apprenticeships or traineeships. The issue of concern, however, is the potential for confusion over a wide range of different qualifications, resembling a junglelike landscape of post-compulsory training in the UK (Unwin 1999). A further, and very damaging, feature of the fragmented and turbulent vocational scene is that employers have little confidence in – or indeed knowledge of – the awards designed to prepare young people for entry to their businesses. There is a range of education and training providers within the UK VET sector, including secondary schools, sixth form schools, sixth form colleges, private training companies and academies, FE colleges, and higher education institutions. FE colleges make up the largest group of VET providers, providing education for both young people and adults.

Formal VET opportunities for disadvantaged groups are mostly offered by the same providers that also cater for other students; however, additional funding might be available. Funding for young people in England between the ages of 14 and 17 to succeed in education and training is available through the Youth Engagement Fund. It was created as a set of measures to address the attainment gap between children and young people from different social and economic backgrounds and to reduce the number of young people classified as “not in employment, education or training” (NEET) (HM Government 2014, p. 3). The purpose is to support disadvantaged 14- to 17-year-olds and to enhance their motivation to participate in education or training, thus improving their life chances and success for their future professional and personal development. Another example are Lifelong Learning Partnerships (LLPs), which consist of a variety of education providers ranging from voluntary sector providers to further and higher education institutions as well as employers and trade unions. LLPs often reach out to disadvantaged communities and assist disadvantaged learners to engage with education and training again (UK NARIC 2016).

Recent years have seen widespread interest among different stakeholders in VET. Both current and previous governments have issued major reports, each having quite different approaches to the problems raised by Britain’s poor record in this field (Winch 2012). Improving the VET system through making it accessible and understandable to young people has been and remains an important objective of a number of national strategies. There are concerns that the system is too complex and lacks clear routes for progression to higher-level skills or a sustainable career, with too many young people obtaining qualifications which are of little or no value to the labor market and many employers reporting hard-to-fill vacancies due to a lack of skills (DfE 2017). Recent decades have witnessed a series of reviews that have raised the debate about the need to make the VET system more responsive to the needs of both individuals and employers. The main objective of the *Leitch Review* of 2006 (HM Treasury 2006) was to raise the skills levels of the British workforce to facilitate the country’s economic competitiveness. Some of the main targets identified by the *Leitch Review* included recommendations to increase adult basic skills across all levels and strengthen employer voice and engagement as well as to increase people’s aspirations and awareness of the value of skills (HM Treasury 2006). Subsequently, the then Liberal Democrat-Conservative Coalition government recognized the need to carry on reforms in the VET sector. The independent *Wolf Review* (Wolf 2011), commissioned by then Education Secretary Michael Gove, has further underpinned the significance of VET reforms. Following the *Wolf Review*, the “Building Engagement, Building Futures” strategy was launched in 2011, which focused on raising attainment in school and beyond to ensure that young people have the skills they need to compete in a global economy; helping local partners to provide effective and coordinated services that support all young people, including the most vulnerable, aiming to achieve full participation for 16- to 17-year-olds by 2015; and encouraging and incentivizing employers to inspire and recruit young people by offering more high-quality apprenticeships and work experience places and ensuring that work pays and giving young people the personalized support they need to find the work, through universal credit (HM Government 2011, p. 5). The

program has had an explicit focus on VET, specifically, making a clear commitment to improve vocational education and specifically emphasizing the role of apprenticeships and incentivizing small businesses to take on young people and make it easier for employers to offer opportunities for apprentices. The strategy makes a clear link between vocational education and economic prosperity, suggesting that VET can yield considerable returns for young people and the economy (Cedefop 2016). Correspondingly, most recent strategies aiming to tackle youth unemployment and to provide more choices for disadvantaged young people have focused on improving apprenticeship provision, making it more accessible for different types of young adults. Traineeships provide an example of opportunities for those who are not ready to start apprenticeships due to a lack of appropriate skills or experience. This may apply to different types of disadvantaged/vulnerable young adults, including those who newly arrived in the country (immigrants or refugees), dropouts from the mainstream education system, as well as young people lacking basic skills. The trainee scheme endeavors to give young people the skills they need to progress into an apprenticeship, further education, and training or employment, specifically through developing their literacy and numeracy skills as well as providing them with opportunities to engage in work preparation and training. As noted elsewhere, the Coalition vision was one in which young people would be empowered consumers of training opportunities and where informed choice in a market of opportunities would improve standards (Swift and Fisher 2012). This was underpinned by the tradition of neoliberalism that has been centered around features such as the promotion of free competition, deregulation, privatization, internationalization, consumer choice, and the use of market proxies in the public sector (Souto-Otero 2013). Individuals with low skills levels are more likely to be unemployed or in insecure, underpaid employment (Swift and Fisher 2012). As a result, various schemes in the area of VET have often been explicitly aimed at, and seem to have a greater impact on, those individuals who are not succeeding at school or at work or whose skills do not meet the needs of the economy and therefore hamper their ability to enter employment.

The conclusion is that major government vocational education policies and reforms have been driven primarily by economic purposes and less by the need to address the problem of social exclusion. Another concern is that of the status of VET within society, as it has been perceived as a “second choice” option, while “academic” education, especially as represented by the General Certificate of Education at Advanced Level (GCE A Level), “has been widely regarded as the prestigious option to which the best should aspire” (Swift and Fisher 2012, p. 208). As the discussion above indicates, a number of reforms and initiatives have been launched with the purpose of improving VET for young people and adults and to make it more responsive to the needs of both employers and individuals. However, as Evans and Niemeyer (2004) warn, getting vulnerable young people into employment does not immediately solve the challenge of social exclusion and disengagement, and even successful entry into the labor market can bring another set of limitations and instabilities. While recognizing the significance of the economic agenda, i.e., equipping adults with employability skills and moving them into employment, a substantial body of research (Holford et al. 2011; Evans 1995; Evans 2009; Evans and

Niemeyer (2004) supports the idea of developing and promoting the LLL perspective that would enable vulnerable young adults not only to develop their economic and employability skills but would also encourage their social inclusion, personal development, and participation in their communities and wider society. Beck (2015) also notes that in investigating the issue of learning providers who work with young people with experiences of being NEET, the problems of the quality of provision, which open few opportunities for participants, need to be taken into account. In addition, she makes a point that the low expectations of providers can result in additional barriers for young people as they may be discouraged from following their ambitions with potential implications for the development of their own sense of agency. Correspondingly, White and Laczik (2016) make a similar argument and support the view that successful programs for disadvantaged young adults need to incorporate specific features that contribute to making the programs successful. They identify some characteristics of successful programs that need to be taken into account, such as offering young people tailored provision to reengage them in education and training, offering them a choice in vocational areas and other skills development programs, and supporting them in making an informed choice. The significance of tutors' attitudes and taking into account learners' backgrounds has also been cited in relation to programs provided for vulnerable learners (e.g., refugees) (Chadderton and Edmonds 2015), as well as developing meaningful VET pedagogies that contribute to individual success, motivation, and improved life chances of young adults.

Providing opportunities to engage vulnerable young adults in VET alone is, therefore, not sufficient, and the successful strategies to facilitate social inclusion through VET require taking into account the LLL perspective, to make the process of VET-related learning meaningful and have an impact on individual life courses. As Evans (2009) argues, LLL is more than simply about equipping learners with labor market-related skills and competences. The expansion of human capabilities rather than merely economic development should be the central aim of this process, which extends beyond the economic dimension, and emphasizes the importance of social and political participation as well as the responsibilities of participation, developing capabilities, and the rights to participate (Evans 2009). Facilitating inclusion through LLL in VET settings may involve a range of dimensions, such as learning contexts, skills development and recognition, and promoting opportunities for active citizenship.

---

## **Facilitating Inclusion Through Lifelong Learning: Implications for VET-Related Training**

As the concept of LLL has taken prominence both nationally and globally, as one of the most influential concepts affecting educational initiatives in a range of contexts, the UK VET developments have been increasingly drawing on the LLL agenda, specifically in the way of rethinking the objectives of VET. The LLL vision of VET is that not only should vocational programs equip young adults with occupationally related skills but they should also be aiming to facilitate their transferrable skills,

improve life chances, and facilitate social inclusion. Engaging young adults to be lifelong learners through VET and facilitating the inclusion of those who are considered to be disadvantaged and at risk of social exclusion have become significant elements of VET-related and work-based learning provision. In the research literature, facilitating LLL and inclusion through VET and workplace learning has been identified as related to a range of dimensions, including the significance of learning contexts and spaces, skills and competence development, and encouraging young adults to become active citizens.

### **Learning Spaces and VET: Promoting Inclusion Through Inclusive Learning Contexts**

The notion of contexts and spaces and their role in facilitating learning and inclusion has received recognition in the research literature in the past two decades. The ways that learning spaces facilitate individual engagement and perceptions of knowledge and learning at work have been reconceptualized in response to the changing requirements of contemporary economies and, more specifically, workplaces (Kolb and Kolb 2005; Malloch et al. 2011; Evans and Kersh 2014). The complex interdependencies between types of learning spaces and learner engagement have been underpinned by research exploring school to work transitions, work-related learning, and VET as well as issues of social integration and inclusion. This research has been characterized by perceiving and conceptualizing VET and work-related spaces not simply as settings for the development and deployment of occupationally related skills but as contexts that may play an important role in contributing to personal development, improved life chances, and reducing social exclusion (e.g., Malloch et al. 2011; Evans and Kersh 2014; Evans 2009; Kersh 2015). VET-related contexts have been considered and recognized as multifaceted spaces that may promote opportunities for enhancing motivation, positive attitudes, and skills development. Fuller and Unwin (2004) have conceptualized expansive and restrictive learning environments that may exist and coexist in work-/VET-related contexts, where the former provides affordances for engagement and personal development (i.e., vision goes beyond immediate job requirements – to progression for personal development and career) and the latter restricts opportunities for wider professional and personal development (i.e., the focus is on the minimum skills required to fulfil current job tasks). The expansive/restrictive framework provides a foundation for considering potential affordances of the learning spaces in VET-related settings and the role that spaces in contexts may play in facilitating engagement and inclusion. The study by Evans and Kersh (2004) of unemployed adults has demonstrated how expansive learning environments might contribute to the development of confidence and positive learning outcomes of disadvantaged adults in work-related settings. Furthermore, Evans and Niemeyer (2004) have identified a link between engagement and situated learning contexts; specifically, their research has found that those suffering from social exclusion could be better motivated and reintegrated through

VET-related programs that provide opportunities for situated learning. The situated learning context has been perceived as a space where the individual biography of each person is highly significant for their engagement in the learning environment and communities and where workplace learning that does not take place in closed communities may have the goal of enabling people to move through and to move on. Arguing that within work-based learning contexts, situated learning potentially plays a part in countering the social and economic exclusion of young people, the researchers further identify some important dimensions of situated learning, such as pedagogical, motivational, social, and economic as well as the dimension of diversity that contributes to the flexibility of opportunities required in a modern education system (p. 29).

### **Promoting Inclusion Through Skills Recognition and Development**

Learning spaces that provide affordances for inclusion and engagement of vulnerable young adults (expansive learning spaces) have been linked to the development and recognition of a range of skills and competences, not restricted to immediate work-related skills. Engaging and reengaging adults through the development and recognition of their personal skills in vocational and work-related contexts has been receiving attention in research on work-related contexts and settings in the last two decades (Evans et al. 2006; Eraut 2000). Evans's research (Evans et al. 2006) has suggested the significance of past experiences and prior skills acquisition from a range of experiences, such as work experience, formal education, and various life experiences (e.g., running of households, bringing up children, travel, etc.). Further research has demonstrated the ways in which adult learners that have come from disadvantaged backgrounds draw on their past experiences in their new settings and contexts, including work-related contexts. The research underpins the notion of tacit skills recognition, specifically in a range of workplace contexts. Such skills have strong tacit dimensions that may become explicit or visible to the holder when deployed or recognized in a relevant context or environment. The benefits of capturing such skills for the purpose of recognition and accreditation in VET settings have been found to be the most relevant measure of progress for a number of learners experiencing different kinds of disadvantages. Improved motivation, increased confidence, self-assurance, and self-esteem are good examples associated with tacit skills recognition (Evans et al. 2004).

Lacking basic skills such as literacy, numeracy, and information technology has been identified as one of the crucial factors that may prevent employees from engaging in learning and competence development within their workplaces (Evans and Waite 2009; Wolf and Evans 2011). The issue of the significance of employing "basic skills" in the workplace has been identified as related both to employees' biographical life experiences and their workplace learning as well as career and life chances.

## Facilitating Active Citizenship

The promotion of active participatory citizenship of young people, both directly and indirectly, is an area where many adult education and VET programs overlap. Research undertaken as part of the EduMAP project (Kersh and Toivainen 2017) supported the view that the development of social, political, and economic skills can take place through different types of adult education and LLL (e.g., vocational education, basic skills classes, second-chance education) in both formal and informal settings (see also Saar et al. 2013; Jarvis 2012). While some programs are specifically focused on citizenship (e.g., programs for migrants), often “citizenship” is not used explicitly and/or may be embedded. Adult education programs and initiatives across all countries are seen as related to social, political, or economic dimensions of active citizenship. In particular, the:

- (a) Social dimension focuses on the development of social competences and social capital.
- (b) Political dimension encourages civic and political participation, running for boards and neighborhood activities.
- (c) Economic dimension relates to employment (e.g., developing employability skills) and access to social benefits.

The potential of VET for promoting active citizenship lies in providing the learners with both economic and social skills in a LLL perspective and facilitating their career aspirations and life chances, as well as progression and transition to employment. At the same time, the concept of citizenship has been described as linking the different domains of employment, education, and “life in general” in its various personal and social configurations (Further Education Funding Council 2000, p. 4). In this context, distinctions can be drawn between learning *about*, *for*, and *through* citizenship (Kersh and Toivainen 2017).

The more “traditional” dimension of learning about citizenship may be incorporated into and embedded within VET-specific curricula themselves, for example, where issues such as equal opportunities in diverse societies, employment-related rights and responsibilities, or consumer rights are concerned. Hopkins (2014) considers the issue of embedded versus “stand-alone” approaches to citizenship education in VET in England and finds that the latter is more difficult to realize in the specific context of further education in the UK, as the predominant site of VET. He attributes this to various factors, including the relatively “downgraded” status (financially and image-wise) of vocational education and the institutions delivering it compared to their more academic counterparts (i.e., higher education). At the same time, he describes processes by which VET has seen a narrowing of curricula based on specific work-related competences, influenced by market-driven concerns. In contrast, both historically and in international comparison, there are examples of VET aspiring to providing more holistic forms of education, where citizenship studies form an integrated part of the school- or college-based learning accompanying vocational craftsmanship training (e.g., in Germany). Examples of an embedded

approach to including learning for and about citizenship in VET programs provided by Hopkins (2014) include exploring issues of sustainability of wood sources within carpentry courses or considering training practices in hairdressing through a lens of cultural and ethnic diversity. In this way, the real-life contexts of VET can facilitate citizenship education uniquely and far removed from the seemingly “dry” and theoretical domains of political philosophy.

However, real-life contexts can also have their own challenges, and some would argue that they may be particularly prone to political instrumentalization. In recent years, a specific form of “citizenship education” has been introduced for a majority of VET providers (further education colleges and many independent training providers) in England and Wales through the Counter-Terrorism and Security Act 2015, requiring both the promotion of the so-called British values and various measures under the anti-extremism and anti-terrorism agenda of the “Prevent duty.” These measures have been controversial, not least because of concerns that a focus on “British” values might in fact be used to promote assimilationist agendas, revealing tensions between central government concerns based on normative concepts of “citizenship” and the diversity encountered at the local level of educational and community contexts (McGhee and Zhang 2017). These challenges are by no means unique to VET, but they demonstrate that the contexts and ways in which young people learn *about* and *for* citizenship can be complex and sometimes contested.

As mentioned above, holistic models of citizenship education also emphasize the dimension of learning *through* the practice of citizenship (EduMAP 2017), which provides a focus on how VET pedagogies and (organizational) processes promote citizenship practice. At the same time, considering citizenship as a practice, and the specific contributions made by VET as part of that, also reveals some fundamental social, economic, and political challenges. In the UK as in many other postindustrial countries, social-integrational discourses (Levitas 2005) which consider participation in the labor market as a key remedy against social exclusion are being increasingly challenged in the wake of increased digitalization as well as the exhaustion of market growth and natural resources. If paid employment itself is becoming a scarcer resource in the future, this undermines not only neoliberal discourses of LLL and economic models of the integrated citizen as “taxpayer” but also threatens some of the fundamental tenets of VET itself. In this context, Avis et al. (2017) raise concerns about risks that some young people in VET programs, particularly black and ethnic minority learners, may be subject to “warehousing,” a process by which attendance of some education and training programs not only does little to facilitate young people’s entry into the labor market but effectively contributes to their removal from it (and, as a result, from unemployment statistics). Whether such a damning verdict of specific VET programs is justified or not, this emphasizes the pertinence of exploring factors such as race, gender, and disability as part of LLL research, in order to critically analyze the ways in which VET can and does promote inclusion and active participatory citizenship. A current example in the UK context of trying to raise the particularly low labor market participation rate of adults with learning disabilities are programs of supported internship for young people aged 16–24 (Department for Education 2013). While initial evaluations suggest that the programs have been effective in terms of more young people involved in the schemes moving on to

paid employment than the national average, the long-term sustainability of their employment is not yet known. Overall, both the significant potentials of LLL and VET in contributing to inclusion and promoting active participatory citizenship and the challenges described above point toward a somewhat reciprocal relationship: as much as the practical focus of VET can give citizenship education a real-life context, a holistic concept of active citizenship (as outlined above) can support VET policy and practice in facing the fallacies of neoliberalism. What both concepts (VET and citizenship) also have in common is that in the current era of change, they need to be continuously explored and critically reexamined as part of research and practice.

---

## Conclusion

Engagement and reengagement through equipping young adults with employability skills has been considered to be one of the most significant elements for combating social exclusion across European countries. This is also underpinned by the market or economically associated discourse of LLL affecting the development of adult education both in Europe and globally. The role of VET as a means to facilitate social integration and contribute to LLL of young people has been and remains a significant area of research. Over the last decade, the global recognition of LLL and learning throughout the lifespan has brought attention to the significance of the changing nature of the relationships between education, life, work, and learning in the knowledge-driven economy (Aspin et al. 2012). One of the most influential discourses of recent decades emphasizes the economic justification of LLL, where the value of LLL is in acquiring job-related skills and competences, i.e., skills that would enable individuals to succeed in the job market. The second perspective provides a different view of LLL, where education is seen as intrinsically valuable, as something that is good in and of itself (Aspin et al. 2012, p. 1). The developments of VET have been strongly influenced by the former, specifically in relation to improving the chances of young people through their integration into the labor market and by fostering lifelong learning.

The relationship between education, life, and learning has been defined by the knowledge-driven economy where the relationship between education and “real life” is that “the more we learn, the more we earn” (Evans 2009), and this has contributed to a strong focus on equipping young people with job-related skills. This chapter has debated the potentials of vocational education and training in promoting the inclusion and active participation of young people while also pointing toward some of increasing challenges facing the VET and LLL fields in the postindustrial era.

## Abstract

The Hungarian vocational education and training (VET) system is becoming once again highly centralized and state controlled. This chapter discusses the tendencies of centralization and decentralization of VET in three periods: 1945–1989, 1990–2010, and 2010–present. The first section concentrates on events that have influenced and impacted on the development of education within the monolithic state. It is shown through examples how the Hungarian education system slowly moved away from a highly centralized system. The

next section demonstrates the immediate reaction to the collapse of the one-party system which resulted in a highly decentralized VET system. During 1990–2010 the VET system became stabilized, and measures were introduced to reach a balance. Nevertheless, this period is still primarily characterized by decentralization of VET. The post-2010 period is discussed in most detail in the third section of the chapter. Due to the fact that the nationalist conservative government elected in 2010 is still in power, once again the VET system experiences considerable centralization and state control.

While early on there was a genuine urge from educationalists to return to a more democratic and liberal system, other economic, political, and societal forces have been playing an influential role in how the VET system has been developing. The chapter offers some insight into the role of economic players in VET and the ways in which their roles have changed over time. The current government considers employers as key players in VET, and these players are assigned considerable responsibilities. It is yet to see whether they can fulfil expectations and make VET a more viable and hence popular option for young people.

## Introduction

This chapter presents past and present developments, trends, and characteristics of the Hungarian initial vocational education and training (VET) for the 14–19 age group. The chapter will be divided into three parts. The first part will offer a brief and more general introduction to education in Hungary during the pre-1989 era. It will argue that deviations from the highly controlled Soviet type of education had already started in the 1950s and spread and accumulated over time. The 1985 Education Act is the most important milestone pre-1989 which reintroduced some liberal and democratic traditions in Hungarian education. The second and third parts of the chapter will focus on initial vocational education and training developments between 1989 and the present. The second part will cover the tendencies of accelerated decentralization at a systemic level and gives examples of localized national solutions between 1989 and 2010. It will be argued and demonstrated by those examples that after the initial rapid decentralization process right after 1989, measures and standards were introduced responding to economic and societal changes. The third part receives the most emphasis within the chapter as it elaborates in more detail on some of the most recent (post-2010) and current major changes in VET in Hungary. These include, for example, the introduction of the dual VET model, the increased role and responsibilities of the Hungarian Chamber of Commerce and Industry, and most importantly the tendency of a rapid centralization across the VET system post-2010.

## Education in Hungary Pre-1989

The education system in Hungary after WW2 was very similar to other Eastern bloc countries where they mirrored the Soviet model. The whole system was highly centralized, controlled, and planned by the single party: the Hungarian Communist Party. Education was interwoven with politics and was used to propagate Marxist ideology. The schools were “the tools to raise obedient citizens” (Pukánszky-Németh 2001, p. V–470). Education was also used to serve the centrally managed and planned economy. It was this ideology that drove education, economy, and society. While the broad characteristics of the system were shared among other Eastern bloc countries, Hungary demonstrated country-specific deviances. During the time between 1945 and 1989, there seems to be a mismatch between what the single-party system forced to achieve and what the economic and societal changes required. Consequently, there have been reform attempts made in education that emerged as a response to real economic and societal changes. Kelemen (2003) discusses four main periods framed around four significant events: (1) 1945–1948, unfinished or expropriated reform; (2) 1961, pseudo-reform in the name of consolidation; (3) 1972, reform or anti-reform; and (4) 1985, outbreak attempt of reform values. The earlier reform attempts aimed at promoting liberal educations, while the latter periods weakened the centralized education system over time (Laczik 2015). However, while these reform initiatives aimed high, they were often curtailed. Nevertheless, they led to some important developments. These include the introduction of free compulsory 8 years of basic education for the masses in 1945, the compulsory school attendance was raised to age 16 in 1961, and during the 1960s there were well-developed vocational post-basic education provisions available to young people. Basic (1963) and secondary school curriculum (1965) were developed, within which the modern scientific content was balanced with age differentiations and some allowances were made to meet learners’ individual interests (Hungarian on-line library 1996–2000). Kozma (2012) considers the late 1960s as one of the “most intense reform times.” Although, in 1968, the announced economic reforms were curtailed, they were followed by irreversible changes, in particular in the renegotiation of power between the state and the society. The 1970s have seen an increase in critical social and educational research, which were hoped would lead to the development of educational programs based on research and needs’ analysis. However, yet again the 1972 resolution of the Hungarian Socialist Working Party halted the democratic and liberal ideas and reinstated the power of the state where political decisions overrode professional ones.

The 1985 Education Act is considered by many educationalists in Hungary as the most important landmark before the political change in 1989 and therefore started a “radical decentralization process” (Halász 2000). Many of the political characteristics were present at the time, but there were fewer of the political elite, including educational policy makers who actually believed in the communist ideology (Halász 2009). The 1985 Education Act reflects the necessary compromises and presents an interesting mix of socialist upbringing and rhetoric combined with new content and style. The Act provided more independence to educational institutions and

pedagogues. It determined the rights and responsibilities of all those involved in education, for example, learners, parents, teachers, and the local community. Some of the reforms, however, could not be put into practice, or they were restricted due to a lack of resources and supporting economic environment or the party state's conflicting interests. Pre-1989, there has been a clear struggle to align the aim of the state, education, economy, labor market, and society. Nevertheless, changes that were successfully introduced show a slow but linear return to liberal and democratic traditions in education (Laczik 2015).

---

## **Accelerated Decentralization in Vocational Education and Training Between 1989 and 2010**

Post-1989 education and training developed a radically different political, economic, and societal environment in comparison to the previous 50 years. They demanded real reforms in education, which were coupled with rapid decentralization of education and the promotion of local national needs. The stimuli behind the developments were a mixture of reactive responses to the Soviet type of system with its ideology and values and active solutions to the new situations to achieve a more decentralized, personalized, and democratic liberal education.

The fundamentally new political situation in 1990 demanded immediate changes in education, and simultaneously medium- and long-term reform plans were outlined. Due to the shortage of time, the newly elected incoming government was unable to develop a fundamentally new education law and therefore modified the 1985 Education Act in 1990. The modification focused on the most important aspects, such as the removal of all references to the communist ideology. The 1990 Act concentrated around secondary and higher education, introducing free school choice, and regulated the establishment and maintenance of educational institutions.

The new political, economic, and societal situation created huge challenges for the Hungarian VET system. The change was immense. Through the emerging market economy, the structure of the economy has changed, and the structure of ownership has shifted. The large state enterprises collapsed, which used to serve as training places for vocational schools. Therefore, vocational schools had to set up their own workshops to provide practical training for the young people. Instead, small- and medium-sized enterprises mushroomed. Whole industrial sectors have also disappeared, such as mining, and many new jobs were created, particularly in the tertiary sector. Consequently, job security has disappeared, and Hungary experienced mass unemployment that was unknown before 1989. Farkas (2013) claims that between 1989 and 1992, 1,174,000 jobs ceased to exist. As a result of the introduction of free school choice, learners and parents were able to decide on their own careers and progression routes. These were previously led by the planned economy, i.e., the state. While post-basic vocational provision was well-developed, pre-1989 it "created" the socialist working class. Post-1990, there was more emphasis placed on general education, and the compulsory school age was raised to age

16 (raised to 18 in 1998 and again reduced to 16 in 2012). This also impacted on the VET as young people's decisions shifted to post-compulsory, post-16. In Hungary there were three main secondary school types: 3-year vocational schools, vocational secondary schools, and the academic *Gimnasiums* (similar to Grammar schools). The popularity of these types of schools has changed considerably. Between 1980 and 2012, the proportion of young people attending vocational schools halved (25%), while in 2011, 41% of young people chose vocational secondary schools which could lead to studying in higher education or to pursuing postsecondary vocational programs (Ministry of Human Resources, Hungary 2012).

The new 1993 Act aims "to develop a flexible and differentiated system of VET that adjusts to the societal changes and to the national economic and labor market demands." However, it did not regulate the operations of VET establishments but instead the operations of the VET functions. According to Halász (2011), there were three particularly significant elements of this: (1) the state saved the VET educational establishments from collapsing together with the business sphere, (2) adult education has become a new significant target group for VET, and (3) enterprises have become influential partners through paying a unique, new tax-like contribution and so directly financing VET and through sitting on a tripartite decision-making board (Laczik 2015). In order to set standards, in 1993 the Government published the National Vocational Qualifications Register (NVQR), which was one of the most significant developments in the modernization process. It contains the state-recognized vocational qualifications and imposes the same requirements to all VET provision. The NVQR was redeveloped in 2004–2006. The new system was modular and competence-based which seeks to enable permeability between qualifications and also facilitates a quicker reaction to changes in the labor market by adjusting the content. The aims of the renewed NVQR were (1) to reduce the number of qualifications in the register, (2) to shorten the length of training through developing a modular system that recognizes prior qualifications, (3) to develop a competence-based qualifications system with appropriate assessment, (4) to strengthen the links between education and training and the economy, and (5) to promote lifelong learning by adjusting the NVQR and VET outcome requirements to labor market demands (Laczik 2015).

Parallel with the development of NVQR, the related Vocational and Examinations Requirements (VER) were developed for each qualification. Employers were invited to contribute to the VER to ensure that it contains only the relevant elements, activities, and knowledge to each particular occupation. Competence profiles were defined through the analysis of each occupation by teams of, for example, employers, VET teachers, and the chambers of commerce. VER is inclusive and identifies the professional knowledge and skills, transferable skills, and personal competencies. NVQR has been in VET schools since 2008 and continues to be regularly updated.

The 2010 election yet again brought a different power relation as the Fidesz, the Hungarian Civic Union, won the general election with 56% of the votes and has an outright majority in the National Assembly. Since then, the vocational system has yet again been undergoing new major changes. However, Halász (2011) argues that the

demand toward VET (and other education sectors) has remained the same: to contribute to economic competitiveness, to improve employability, and to integrate socially disadvantaged groups (p. 33).

---

## **Structural and Content Transformation of the Vocational Training System in Hungary After 2010**

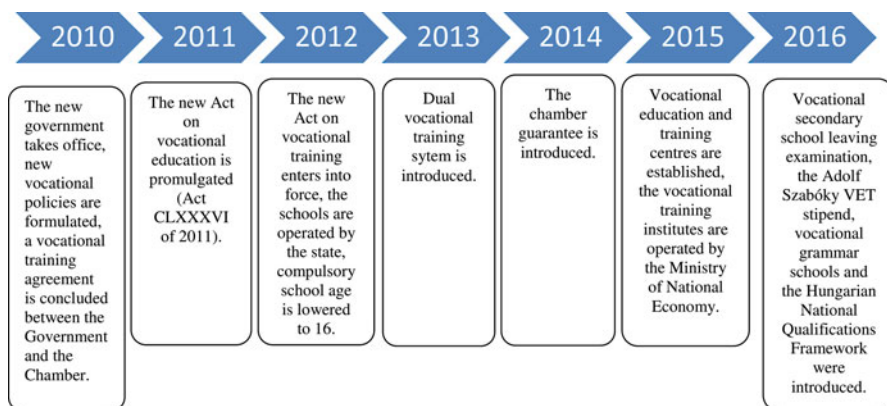

It was the priority of the incoming government in 2010 (and has been in power ever since), to fundamentally change the VET system and to reintroduce dual vocational training wholesale in Hungary. The aim was to improve VET provision to meet the needs of the labor market. The reasoning behind this was twofold: the lack of well-trained workforce was one of the major obstacles for large foreign companies coming to Hungary, and a well-trained workforce was necessary for the development of small- and medium-sized domestic businesses. A significant milestone during the transformation process was the adoption of Act CLXXXVII of 2011 on VET, which came into force on 1 January 2012. As a result, the decentralized vocational system that functioned earlier was gradually replaced by a highly centralized VET governance, funding mechanism, and institutional system. The content of VET became more strictly regulated, and a dual vocational training system was reintroduced. The model of dual vocational training and the belief that it was capable of resolving every problem in vocational training projected a new horizon for the transformation of the vocational training system. VET was of the utmost importance for the Hungarian economy, and it was also believed to help tackle social problems. VET has been continuously subject to changes during the past 7 years and continues to do so at present. The Act on VET was modified 18 times between January 2012 and December 2016. These measures were deemed necessary to better satisfy the needs of businesses, to increase the popularity of vocational training, and to boost the number of stakeholders involved in vocational training, thus providing impetus for economic development.

In this section VET policy developments after 2010 and the process and results of the VET reform will be analyzed through major milestones (see Fig. 1) paying special attention to the features of dual training.

### **Major Transformation of the Governance of the VET System**

As a result of the 2011 Act on public education and vocational training, the maintenance, management, and financing system of VET changed radically. Earlier the maintenance of school-based vocational training was the responsibility of the local municipalities, for which the state allocated per capita funding. Following the 2011 Act, in 2013 the maintenance of public education and school-based vocational training was transferred to the responsibility of the state. The maintenance responsibilities have been performed by the state-owned “KleBELSBERG” Institution Maintenance Centre. Parallel with this, per capita funding has been terminated, and input

**Fig. 1** Major milestones in the reform of vocational training between 2010 and 2016

financing has been introduced. This meant that the salaries of VET teachers and various other employees, the overhead costs, and other expenses such as material that is incurred by individual institutions are planned and funded by the state through the Institution Maintenance Centre. With the enforcement of this measure, the individual institutions cannot develop their own budgets, and they cannot make individual financial decisions. In 2015 the Act on VET was modified, and as a result, on 1 July 2015, the maintenance of the state-owned vocational institutions was transferred from the Institution Maintenance Centre to the Ministry of National Economy, who is also responsible for vocational training and adult education (Polónyi 2016). Effectively the maintenance responsibilities remained with the state.

Parallel with the above changes, the operation and structure of the vocational institutions also changed: the Government created large regional VET centers by merging individual vocational institutions. On 1 July 2015, 44 regional VET centers were established in Hungary, 5 in Budapest, and 39 in other parts of the county (1, 2, or 3 per county). Now 370 member institutions belong to the 44 regional vocational training centers. However, in addition to the vocational training centers maintained by the Ministry of National Economy, there is a significant volume of vocational training offered by other organizations (e.g., churches and private foundations).

The transformation of the maintenance and structure of institutions also entailed the transformation of funding. The vocational training concept adopted by the Hungarian Government in 2011 (Government Resolution 1198 of 2011) contained that the vocational qualifications and rates of enrolment into school-based vocational training must be centrally determined. Therefore the final decision about these issues is made by the Government and is based on the recommendations issued by the regionally functioning training and development committees. The aim of this measure was that the state would allocate funds only for those vocational school maintainers (including churches and private foundations), whose schools trained students to acquire vocational qualifications that most probably were in demand in the labor market. This is particularly interesting as between 2006 and 2010, local

professional consultative bodies were set up within the regional integrated vocational training centers with identical aims, that is, to identify local skills needs and influence the career choice of young people and VET school's provisions according to labor market needs (Farkas 2013). Although the work of these institutions ceased in 2011, the regional integrated vocational training centers have resurfaced again in 2015 under the name of vocational training centers.

## **A Core Element of the Reform: The Introduction of Dual Vocational Training**

In 2016, the names of vocational schools and vocational secondary schools have been changed to raise the profile of vocational training. There are currently two types of VET schools in Hungary, both of which are part of the public education system. The previously called vocational schools became vocational secondary schools (3 years and awarded an ISCED 353 level state-recognized vocational qualification), and the vocational secondary schools became vocational grammar schools (4 years and awarded an ISCED 344 level vocational secondary school leaving certificate). They admit pupils typically upon completion of the 8 years of basic school.

Vocational secondary schools have followed the dual VET model since September 2013. Three-year vocational secondary school training prepares learners for state-recognized vocational qualifications listed in the National Vocational Qualifications Register (NVQR). Theory classes are classroom-based, while practical training takes place mainly at enterprises (see also Chamber Guarantee). Training can be school-based or enterprise-based (dual training). In school-based training, the practical training component of initial VET program is organized in school workshops. This can be supplemented by short-term training organized at an enterprise on the bases of cooperation agreement between the VET schools and enterprises. The dual apprenticeship training is based on apprenticeship training contracts when practical training is provided by enterprises. Both are integrated parts of initial VET at upper secondary VET level and lead to the same vocational qualifications listed in NVQR.

In dual VET, the state and various economic players share the responsibilities and costs relating to vocational training while recognizing mutual interests. This means that theoretical training is performed in VET schools maintained by the state or by other maintainers (e.g., churches and foundations), while practical training is provided by enterprises (or other organizations, e.g., state budgetary institutions, such as hospitals and social institutions). The Chamber plays a role of primary importance as a mediator, process manager, and coordinator between the VET schools and enterprises (Fig. 2).

An important feature of the dual VET system is that the students learn in real work environments. Therefore in essence they receive their training in corporate-industrial environments as a supplement to school training. The dual VET system in Hungary is based on the model of the dual system in Germany. However, the Hungarian local social, economic policy and education policy features were also taken into

**Fig. 2** The Hungarian dual VET model. (Source: Hungarian Chamber of Commerce and Industry 2015:18)

consideration. One of the major differences between the two systems is that while in Germany the trainees are dominantly regarded as employees, in Hungary they are primarily in student status. In the German system, a student as a first step establishes formal employment with an enterprise, which then organizes practical training for this individual. Following that, this individual enrolls in a vocational school, where theoretical training is provided. A student in Hungary attends a vocational secondary school as a first step; later on this individual can conclude an apprenticeship training contract with an enterprise. This means that students start in vocational secondary schools, but they will not necessarily continue with an apprenticeship. Those students, who cannot conclude apprenticeship training contracts, can participate in school-based VET where practical training is organized for them in the school workshops or based on bilateral agreements concluded between schools and companies.

Although the vocational secondary school programs provide state-recognized qualifications, they are not sufficient for directly entering higher education. In 2016 the Government made an attempt to mitigate this “dead-end” character of dual VET and introduced a measure which provides students with full-time vocational qualifications an opportunity to prepare for a secondary school leaving examination through an additional 2-year academic program. This opens up opportunities for students to choose from, such as applying for jobs or going onto further vocational training that requires a secondary school leaving certificate. It also makes students eligible to continue their studies at higher educational institutions.

Dual training is based on the system of apprenticeship training contracts, which is drawn up between the students and the enterprises. These contracts are countersigned and recorded by the local branches of the Hungarian Chamber of Commerce and Industry. Although apprenticeship training contracts can be concluded as early as in grade 9 at the age of 14/15, the practical training can only be provided in the school’s training workshops. However, during the second semester in grade 9, students sit for a level examination to establish whether they are in

possession of the competences necessary for work in a controlled environment and therefore whether they can be sent to an enterprise to participate in industrial “production.”

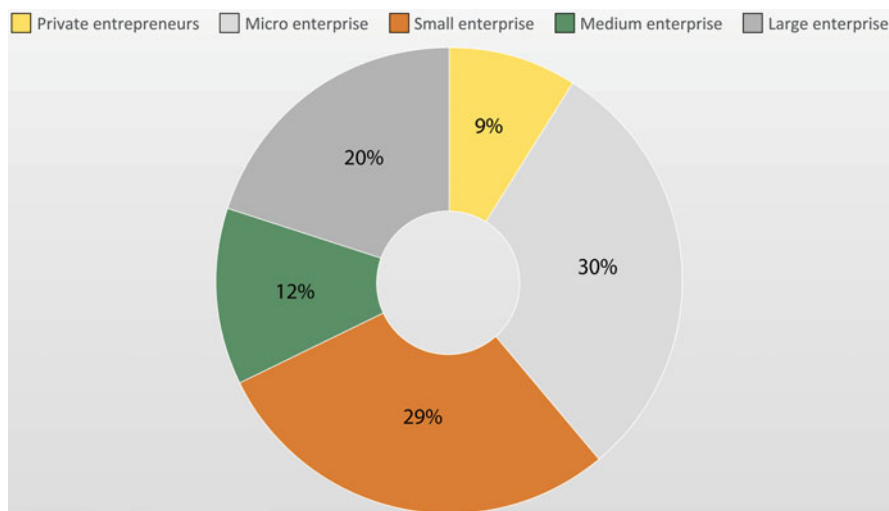

Only those enterprises can enter into an apprenticeship training contract, which are listed in the relevant register of the Hungarian Chamber of Commerce and Industry or of the Hungarian Chamber of Agriculture. In the case of new enterprises planning to offer apprenticeship training, the Chamber conducts a so-called introductory inspection, to ensure that these companies/enterprises have the personal and material conditions necessary for the efficient implementation of good quality practical training as set forth in relevant laws (Cedefop-Refernet 2014). As practical training under the apprenticeship training contracts qualifies as employment, the Labour Code is applicable. Consequently, apprentices are entitled to the same rights as any other employees, e.g., work wear, protective clothing, discounted meals, travel cost reimbursement, sick leave, sickness benefit, maternity leave, etc. (Article (7) § 26 of Act CLXXXVII of 2011). The apprentices receive monthly remuneration (similar to wages) during the training period.

In 2015, the Government set a goal to increase the number of apprentices participating in secondary dual VET to 70,000 by 2018. In order to achieve this, the Chamber Guarantee was introduced on 1 July 2015. The Chamber guarantees that it will find companies that are willing to sign apprenticeship training contracts and will provide facilities and conditions for practical training for the students. If the Chamber fails to find such companies, they issue a certificate on the basis of which vocational secondary schools can provide practical training for their students within the schools' workshops.

The dual training model relies on the increasing number of enterprises offering vocational training. At present only a small number of enterprises participate in vocational training. Currently only between 7000 and 8000 enterprises (2% of all the enterprises) provide practical training for students. The Government wishes to increase this number to 20,000 by 2018 (Hungarian Chamber of Commerce and Industry 2015). In Hungary, microenterprises (39%) and small enterprises (29%) present the highest ratio that provides practical training under apprenticeship training contracts (Fig. 3).

The Government has introduced per capita payment as an incentive for enterprises to participate in vocational training. The businesses employing apprentices on apprenticeship training contracts can write off or reclaim the basic per capita payment from their taxes in the form of vocational training contribution. This means that companies pay levy but then can reclaim per capita funding. Those companies that do not pay levy can also claim per capita funding. The amount can differ depending on the material and cost requirements of the training, the number of vocational teachers and mentors involved, the ratio of theoretical and practical training, and the extent to which training is offered for in-demand occupations.

In dual training the Government encourages participation in initial VET for in-demand occupations by centrally regulating the number of students enrolling in training institutions and offering student stipend in these qualifications. The Government

**Fig. 3** Distribution of apprenticeship training contracts according to enterprise type. (Source: Hungarian Chamber of Commerce and Industry 2015:23)

has introduced a cap on student numbers for not in-demand occupations and also centrally determines the orientations and ratios of enrolment in dual VET. The vocation-structural decision, that is based on labor market forecasts, categorizes the types of vocational qualifications – in respect of budgetary support – as supported, supported with limitations, and not-supported qualifications. Supported qualifications are supported without limitations (these are mainly related to in-demand occupations). Any VET school maintainers can launch vocational training courses in any number of classes with unlimited headcounts of apprentices in any county or in the capital of Hungary, and they are also entitled to budgetary support. The maintainers cannot claim budgetary support after vocational training classes they launch in the not-supported category (e.g., urban development, special technician, fishermen, fish breeder, industrial rubber process worker, orthopedic, mechanic, paper industry technician, and canning technician). In the category supported with limitations (e.g., CAD-CAM IT expert, confectioner, retail assistant, health masseur/masseuse, trader, gardener, cosmetician, waiter/waitress, and catering outlet manager), the total enrolment headcount per county and in the capital city is determined, as is the distribution of headcount among the maintainers of vocational training schools. The aim of this measure is for the state to provide budgetary support for only those vocational qualifications which most probably lead to jobs.

This regulation concerns each and every school maintainer, so it is binding for state, church, and private maintainers alike. However, students can engage with studies leading to vocational qualifications that are classified as non-supported, but in such cases they have to cover the cost of their own studies.

The other incentive for learning for the qualifications for in-demand occupations (e.g., carpenter, joiner, tinsmith, floorer, electronic technician, building and

**Table 1** Number of students studying at upper secondary level. (Source: Ministry of Human Capacities 2017)

Academic Year	Number of students in full-time vocational secondary school programmes (ISCED 353)	Number of students in full-time vocational grammar school programmes (ISCED 354/344)	Number of students in full-time general secondary programmes (ISCED 344)
2010/2011	129,421	240,364	198,700
2011/2012	129,440	233,122	195,169
2012/2013	117,543	224,214	189,526
2013/2014	105,122	203,515	185,440
2014/2015	92,436	188,762	182,228
2015/2016	80,493	182,529	180,966
2016/2017	78,200	167,600	181,800

construction fitter, CNC operator, intern nurse, welder, meat process worker, industrial mechanic, mason, central heating and gas network system mechanic, agricultural mechanic, dressmaker, baker, toolmaker, social caretaker and nurse, and electrician) is the VET stipend that the Government provides for students studying in vocational secondary schools to acquire their first vocational qualification. The aim of this measure is to urge students to choose occupations that are especially important for the national economy and to provide an incentive for them to achieve better learning outcomes (the rate of stipends depends on the students' individual scholarly records) in preparation for these occupations.

In spite of the priorities set by the Government and the measures introduced, the number of students attending vocational secondary schools and vocational grammar schools decreased significantly after 2013. The number of students attending full-time vocational secondary school programs fell below 80,000 by 2015 (Table 1). The reasons for the decrease can be explained by demographical data but more importantly by the fact that the vocational training period was curbed from 4 years to 3 years. Hence, in general, the interest in vocational training has been diminishing. An increasing number of young people wish to acquire higher educational degrees, and, instead of attending vocational secondary schools, they enrol in vocational grammar schools or general secondary grammar schools that provide secondary school leaving certificates.

Another reason why the number of students is decreasing in VET is the fact that the employment rate in the group of individuals with secondary school leaving certificates is significantly higher than in the group of those who have only vocational qualifications. This situation is similar for new career entrants. The dual training is shorter and contains more practical training elements. However, it does not provide enough time for the development of key competences such as literacy and numeracy. Consequently, the ratio of youths in vocational training with low literacy and numeracy is all time high; therefore they are likely to be excluded from the labor market.

## Features of Training at Vocational Grammar Schools

Apart from the vocational secondary schools that provide dual training, there are vocational grammar schools that provide secondary school leaving certificates. Therefore, they offer students the higher education pathway. Training at vocational grammar schools is similar to school-based training. The students participate in practical training blocks with enterprises during the summer as laid out in cooperation agreements between the schools and the enterprises. Only 9% of the students participate in training under apprenticeship training contracts in vocational grammar schools.

From 2013 to 2014, vocational grammar school programs have provided students general education (70%), as well as vocational training (30%) during the first 4 academic years. Following the conclusion of their studies in the four grades of secondary grammar schools, the students sit for a vocational secondary school leaving examination (ISCED 344 level). This is different from the secondary grammar school leaving examination, as instead of taking an examination in a mandatory fifth academic subject, students are tested in mandatory vocational subjects relating to their specializations. In the system of secondary school leaving examinations in Hungary, the students are tested in five different subjects: Hungarian literature and grammar, history, mathematics, a foreign language, and an optional subject. Although after the completion of the vocational secondary school leaving examination, the students are not granted state-recognized vocational qualifications that are listed in the NVQR, they acquire certificates that entitle them to perform various individual types of jobs in certain areas of the labor market. Students who have the vocational secondary school leaving examination have two options. They either continue their studies in postsecondary vocational grades in vocational grammar schools to acquire ISCED 454 level vocational qualifications listed in the NVQR or enter higher education. The first group of students graduated under the new regulation from vocational grammar schools in 2017, so there is not enough evidence available for the assessment of this type of training.

## Content Regulation of VET

Parallel with the centralization of the management and financing of vocational training, the content of VET has become highly centralized. In dual VET, only courses leading to vocational qualifications listed in the NVQR may be launched. The NVQR contains vocational qualifications recognized by the state. The NVQR was first published in 1993 and was later modified several times (see earlier section). The latest significant modification of the NVQR took place in 2012 (Government Decree 150 of 2012 on the National Qualifications Register and the procedure of the modification of the National Qualifications Register).

Although features such as the modular structure of vocational qualifications and competence-based character were retained in the modified version in 2012, the role of the former was reduced. The number of qualification outcomes in each

qualification was decreased by approximately 50%, and steps were taken to lower the average number of modules. There were nine modules in earlier versions of NVQR, which were lowered to six. Today the number of vocational qualifications listed in the NVQR is 769. The new NVQR was introduced to the VET system in autumn 2013 as a phasing-out system.

New vocational and examination requirements were developed for each vocational qualification listed in the NVQR. The revised documents were completed by spring 2013, and the work was coordinated by the Hungarian Chamber of Commerce and Industry. The vocational and examination requirements were issued in an order by the Minister responsible for vocational training, so it is compulsory to apply them at each vocational training institution. The function of vocational and examination requirements is to provide a uniform set of requirements regarding vocational qualifications recognized by the state. The vocational and examination requirements contain the conditions necessary for the launch of the training courses. These include the ratio between theory and practice, the jobs that are most likely to be performed with certain vocational qualifications, the training modules, and the requirements of the complex vocational examination, also the list of tools and equipment necessary for the efficient implementation of training courses.

Following the new vocational and examination requirements, new curriculum frameworks for vocational qualifications were developed. In the Hungarian education system, the framework curricula for general subjects ensure the enforcement of the National Core Curriculum in every type of school and pedagogical-educational phase. They contain the goals of education, the system of subjects, the topics, the content, and the requirements of individual subjects. Furthermore, they include the compulsory and recommended time frames available for the fulfilment of the requirements. Similarly to the education of general subjects, which is performed according to compulsory framework curricula, vocational training must also be performed according to the so-called vocational training framework curricula regulated by law. The compulsory vocational framework curricula are introduced in 2013 as a new element to determine the work in training institutions up to 90%, thus ensuring uniform quality for vocational training (including dual VET).

One of the most radical measures taken in the transformation of the content of vocational training was that in the new 3-year dual vocational training system, the ratio of practical training increased significantly reaching 66% compared to the situation earlier, while the number of lessons in vocational subjects and especially in general subjects decreased significantly (34%).

In dual vocational education, the focus is on the development of competences relating to vocational occupations to the detriment of the development of general competences. This cannot be effective; most career entrants find jobs in other areas than their special vocational ones, and those who remain in their vocational areas may also change vocational occupations several times during the expected five decades in their active working careers.

In the new VET model, the system of examinations has also changed significantly. The most important change compared to the previous system is that the new, complex vocational examinations have been simplified and shortened. This is

the consequence of a measure that the modular examinations conducted earlier (the content of which was regulated per module) have been replaced by complex vocational examinations. Only students who satisfy all the requirements set in the vocational and examination requirements before examination committees are entitled to acquire vocational qualifications. The independent examination committees consist of four examiners: the head of the examination committee is nominated by the Minister responsible for vocational training, one member is delegated by the Hungarian Chamber of Commerce and Industry, one member is a representative of sector bodies, while the fourth member is a VET school representative. The examinations are holistic, the students are tested relating to the whole content of the training, and there are no modular examinations in school-based vocational training.

---

## Conclusion

In this chapter we have discussed three periods of the Hungarian vocational education, all of which demonstrated within their periods a linear progression in relations to centralization and decentralization. If centralization and decentralization of education and VET are seen as a spectrum, the 1950s being highly centralized would be at one end of this spectrum, while the 1990s would be at the other end. However, the worrying tendency of rapid centralization post-2010 and the frequent changes of VET legislations remain real.

Throughout the chapter the interconnections between the state, education, economy, labor market, and society were also outlined. In this chapter it was also claimed that VET does not operate in a vacuum, and changes in economy and society should and will impact on the VET system. Understandably, the three different eras demonstrated different contexts and experienced different challenges, the solution to which materialized in different VET developments and modernization processes.

The 1945–1989 period shows generally a highly centralized and state-controlled education with the strong infusion of socialist ideology. This era early on produced a selection of post-basic school vocational school types. This, of course, was of paramount importance and supported the development of the socialist work(wo)men. However, the changing demand of the economy and society led to attempts to introduce fragmented but more democratic and more liberal elements in education that responded to these changes. While these attempts were mostly unsuccessful, they left their traces and legacy behind. The changes that were introduced and sustained over time have accumulated. Consequently, they damaged the power of the state and people's beliefs in the socialist ideology. It is claimed that the 1985 Education Act was one of the most important milestones during this period. This is underpinned by the fact that the new 1990 Education Act, the first one after the collapse of the one-party system, continued using the 1985 Education Act as its basis and mainly only removed all references to the Soviet ideology.

During 1990, there was an immediate move away from state control, and the sense of freedom led to many significant changes in education. Over time during the 1989–2010 period, some of these quickly introduced changes were reverted.

Nevertheless, while the decentralization process peaked in the 1990s, the system gradually stabilized over time. The 1989–2010 period was also characterized by the struggle of VET to move away from the Soviet-type system and to respond to the economic and societal changes. In general, it aimed to move to a democratic and liberal vocational education that responds to local national needs, as well as individual needs. The change of the VET system affected, for example, school types, VET provision, and employer engagement. The frequent shifts of compulsory school age, in particular from 14 years to 16 years and then in 1998 from 16 years to 18 years, suggest a move toward a preference of general education and a later start of vocational specialization.

Following the change of government in 2010, a new strong centralization tendency can be detected. During this latest period, the state took the maintenance, management, and financing of VET in its hands. VET is crucial for the economy, and the Government also believed that it would tackle social problems. Dual training was introduced in Hungary as the main and preferred VET provision. The key players of the Hungarian economy, mainly the Hungarian Chamber of Commerce and Industry, were invited to contribute to the development process. In principle the strategic goal of engaging with employers was to ensure that the dual vocational training was strongly supported by enterprises. Hence, they would provide the basic pillar of dual training by offering work experience. Work experience ensures that students acquire experience in real work settings; hence they are better prepared for employment. While dual training is highly acclaimed, in particular in Germany and Switzerland, the question is what sustainable outcomes its introduction will yield in the long term. This question is also relevant in the short term considering that it was a top-down administrative measure enforced by direct educational policy interventions. The VET reform launched in 2010 is in progress even today, and the total transformation of the vocational system is expected to conclude only in 2018. As a result, it may only be possible to objectively assess the impact and outcomes of the reform of the vocational training system 5–10 years from now.

## Abstract

Vocational teachers and students encounter cultural diversity daily in their work and studies. They therefore need new competence, transcultural competence. The aim of this chapter is to examine cultural diversity, transcultural competence, and transcultural learning process to give VET teachers and students tools to encounter cultural diversity. First an outline of different circumstances and environments for cultural encounters is given. Then different approaches to cultural diversity are depicted and elements of learning reflected on. Lastly, a transcultural learning process is presented. The empirical examples of this chapter come from two studies. The first one focuses on the development of preparatory vocational training for immigrants (Teräs 2007) and the second on the development of regular VET concerning students with diverse cultural and lingual backgrounds (Teräs 2013; Teräs et al. 2014).

## Introduction

Learning and teaching are fundamental cultural processes as Nasir et al. (2014) have argued. Vocational education practitioners usually encounter people with diverse cultural, ethnic, and linguistic backgrounds in three ways. First, they work with newly arrived migrants, also called the first generation, who are studying in various types of preparatory or introductory training and vocational programs. Second, they face the children of migrants born in the country, called the second generation, who are studying in different regular vocational programs (for more about different generations of migrants, see Rumbaut (2007)). The third possibility is to create or be part of international projects and exchange programs through which both vocational teachers and students are able to learn and study their profession and gain expertise in diverse cultural environments. Thus, cultural encounters both in one's homeland and abroad have increased tremendously during the last decades. UNESCO has been one of the international organizations promoting cultural encounters in the world.

UNESCO's (2002) Universal Declaration on Cultural Diversity states that cultural diversity is the common heritage of humanity. The declaration nurtures respect for the diversity of cultures, tolerance, dialogue, cooperation, as well as mutual trust and understanding. Diversity, however, also has other dimensions such as age, gender, disability, or sexual orientation (cf. Bennett and Bennett 2004). This chapter focuses on cultural diversity, in other words approaches when encountering with people with diverse cultural, linguistic, and ethnic backgrounds.

There is a repertoire of different approaches to the situation that people with different cultural and linguistic backgrounds encounter. They can be roughly divided into three main categories: culture-oriented, language-oriented, and society-oriented approaches. Culture-oriented approaches, which focus on familiarization with cultures and cultural practices, are divided into two additional categories: general cultural interaction and awareness-raising approaches, as well as specific cultural approaches such as learning business ways in a certain cultural environment. Language-oriented approaches focus on learning the target language, and in the case of VET, it can be also the target language of a vocation. For example, in Sweden, the government has introduced the so-called fast track for educated immigrants who move to Sweden, and the program includes both general and professional language courses (Government 2016). Society-oriented approaches are typically various kinds of integration trainings aimed at introducing societal practices and structures to new comers, for example, how to apply for a job in the new country or knowledge about how does education system function. Common to all approaches is the need for people to become aware of the attitudes and prejudices toward different groups of language and cultural practices of the group. Furthermore, approaches emphasize developing respect for others and their capabilities and practices, as well as learning to act appropriately in various intercultural situations (cf. Landis et al. 2004; Deardorff 2009). These issues are needed to take into account when a person moves to another country.

Leaving one cultural environment and moving into another is always a big change, which can be described as a cultural learning process involving transition

and transformation both on the individual and collective level. In other words, the person who moves learns as well as the community, which receives movers. Mere intercultural experience, however, is not enough; one needs to build authentic relationships with people of different backgrounds. One has to be ready to observe, listen, and ask people to share their ideas and conceptions in the new environment, which in return requires respect and trust from both parties, as the author (Deardorff 2009, p. xiii) reminds us. This cultural learning process, which is here called the transcultural learning process, takes time, and individuals and communities need new knowledge, skills, and competences.

The competence for cultural encounters has been described several ways in the literature: as multicultural competency (cf. Mayorka et al. 2012), cross-cultural competence (cf. Seeberg and Minick 2012), intercultural competence (cf. Deardorff 2009; Dervin et al. 2012), transcultural competence (cf. Mayer and Boness 2011), or simply global competence (cf. Popov et al. 2017) or cultural competence (cf. Kirmayer 2012). Each concept has a slightly different emphasis and historical background, and they have been used within different disciplines and contexts. Accordingly, behind the concept, there are diverse paradigms like culturalism, multiculturalism, interculturalism, and transculturalism, all aimed at describing situations and taking a political stance or improving encounters with diverse people. In a similar vein, there are different educational approaches among paradigms such as multicultural education (cf. Banks 2002), intercultural education (cf. Räsänen and San 2005), transcultural education (Aldridge et al. 2014), and so on. In recent educational discussions, global education has gained more space. Differences, as has been already mentioned, are in emphasis, a historical development of the concept and approach as well as contexts in which they have been used. For example, intercultural competence has been studied within communication (Gudykunst and Mody 2002) and education (cf. Teräs and Lasonen 2013). Multicultural competence has a strong foothold in education (Banks 2002), as does transcultural competence within nursing (Leininger 2002). Trompenaars and Woolliams (2009) have even argued for hypercultural competence, which involves previously mentioned competences, such as cross-cultural and intercultural competence, as layers of hypercultural competence. This multi-conceptuality and the multiple approaches reflect the complexity of the phenomenon of learning to encounter and act with groups and people who have different linguistic and cultural backgrounds. Teräs and Lasonen (2013) have written about the so-called complex concepts, which Engeström and his colleagues (2005, pp. 48–49) describe as products and tools of collective activities that evolve historically, and they need to be studied as embedded in complex human activity systems, not merely as logical propositions or textual products. Complex concepts are best learned when they are challenged, reconstructed, and implemented in practice. However, when choosing to use a certain concept, one needs to be aware of its historical involvement and how it has previously been used within different disciplines, contexts, and practices.

Some similarities among diverse approaches are that they refer to the awareness, attitudes, knowledge, sensitivity, responsiveness, and skills needed when meeting new cultural environments and people with diverse backgrounds. Moreover, they

take as a starting point the concept of culture. The concept of culture is here understood as plural, dynamic, varied, overarching, changing, and historical; it acquires its meaning and content when used. This is in contrast to a display of culture as one entity, a national, static, and ahistorical “package” that can be taught and learned in a specific situation when a person moves from one environment or country to another.

---

## Transcultural Competence and Transcultural Education

The author takes as the starting point the field of vocational education and training transculturalism and transcultural learning process. Lewis (2002), in the area of cultural studies, highlights how transculturalism is interested in dissonance, tensions, and instability as well as stability and historically shaped and conducted meaning making through language. This is despite the fact that transculturalism does not underline semiotic power over the material conditions of life and vice versa. Transculturalism also emphasizes the transitory nature of culture and its power to transform (Lewis 2002). This is an important aspect when thinking transcultural competence and the learning process; it is a lifelong learning process, and one needs to be open to new ideas and practices in order to develop and transform them.

According to the *Oxford Dictionary*, “trans-” means “across,” “beyond,” or “through” like being or going to the other side or transcending and transforming a state or place. Thus, transcultural means that one crosses cultural boundaries and goes beyond cultures to transform and to create something new. In order to do this, one needs transcultural competence.

Thus, transcultural competence needs to be a part of the vocational educators’ professional skills. Mayer and Boness (2011) describe transcultural competence as having eight aspects: openness to appreciate cultural differences, emotion management, information processing, tolerance to ambiguity, cultural understanding, communication, conflict management, as well as self-management. The author agrees with their reasoning but would add that transcultural competence also involves actions. Aldridge et al. (2014) wrote that culture is also a verb, not only a noun, and they propose “culturing” to illuminate that people actively produce and create cultures, not just consume them. In a similar vein, transcultural competence includes producing discourses, practices, artefacts, and policies that transcend cultural boundaries. A teacher does not need to know every detail of the students’ cultural backgrounds, although it may help her/him to understand some of the students’ practices. Instead, the teacher needs to be aware of and discuss with the students the various cultural practices that may affect teaching and studying practices in a new cultural environment. Teachers and students can create together new, common ways and practices to enhance learning and understanding (see Teräs 2007). In other words, they went beyond and across cultural practices of teaching and studying to be able to transform them.

Aldridge and his colleagues (2014) suggest a model of transcultural education, highlighting the meaning of “trans” with five possibilities: transferential,

transactional, transformational, transmutational, and transcendent. Transferential refers to code switching when interacting with a person whose communication style differs from a dominant style. Transactional emphasizes knowledge construction within and among diverse individuals and groups participating in the teaching-learning process. Transformational highlights the process of teaching students to transform their own cultures by working to correct injustices while at the same time changing the world at large. Transmutational goes even further and highlights the deeper change. Lastly, Aldridge and his colleagues propose transcendent culturing (they use the verb not noun in relation to transcultural education), stating that it is the goal of transcultural education, and refer to overcoming cultural barriers in interaction.

The argument here is that in transcultural learning, one crosses cultural boundaries, which are permeable, and goes beyond and through cultural discourses and practices in order to transcend and transform them. Thus, transcultural learning is intertwined with learning a profession in a new environment. Learning and developing professional skills are based on learning the cultural practices required in the profession in certain time and context. Cultural practices are locally and historically developed ways and means of doing things, and their relationship with the environment and the community's cultural practices are also valued in a specific environment and in a specific vocation (cf. Nasir et al. 2014). For example, how respect is shown to teachers varies. In some environments, respect is shown by addressing the teacher by her/his title and last name, while in other environments respect is shown by engagement and dialogue with the teacher.

---

## Elements of Learning

All learning consists of different elements. Accordingly, learning models and theories require considering the following: who are the participants and why are they learning, what are the contents of learning, how is it learned and with what equipment, and where does the learning take place, in which environment. Next will be briefly reflected on these elements and given examples in relation to VET and cultural diversity.

The student and her/his learning skills focus heavily on the student's cognitive skills, such as identifying a learning style or strategy, surface or deep orientation, motivation, or target orientation (cf. Illeris 2015, pp. 215–224). Based on these, students are taught a variety of studying techniques such as making notes, memorizing content, reading textbooks, and listening to lectures. All these learning skills can differ from the cultural practices of the students' previous learning environments, and thus it is important to discuss, make visible, and transform these into skills needed in the new environment. For example, in the culture laboratory, the students said that group-work practices were new to them (Teräs 2007). Working in groups and teams is an important skill in vocational education and training to prepare the students for their future working life. Not only students need new competences but also teachers need them.

Transcultural competence of a vocational teacher is a key aspect when working with students with different linguistic and cultural backgrounds. Teacher's attitudes toward different students are reflected on in her/his work, as is awareness of how teachers and students move beyond and transform cultural practices. One important trait is how the teacher can support students in transitional skills when they are moving across different cultural boundaries (Phelan et al. 1998). When crossing cultural boundaries, the students face new learning environments.

Diverse vocational learning environments form a central facet of vocational education and training. Learning environments include school, class, work, and home and virtual and other environments where learning takes place. Some students may be accustomed to school and the classroom being the only places to study. In this case, for example, study visits or homework are not considered as part of their learning process. It is crucial for the vocational teacher to clarify how to study in different environments: what is to be learned there and why it is imperative for everyone to participate in. A team consisting of different professionals and people with diverse backgrounds is also an important part of learning at work, as it helps the students to acknowledge transcultural competence. In vocational education, it is also central to be able to study at workplaces, as in apprenticeships and workplace learning periods (cf. Malloch et al. 2011). During workplace periods, students use different working and learning tools.

Vocational learning tools, as a variety of intertwined methods and equipment used in studying and teaching, can be new to students. The term covers both symbolic and material tools, which often go hand in hand (Vygotsky 1978). For example, teaching materials often guide their use. The textbook guides you to read the subject matter that is important to know in the new environment; an assignment guides on writing practices and teamwork for social interaction. While students use the tools, they are given a picture of what is important in this cultural environment and how knowledge is used in it. It is essential for students and teachers to explore how different tools are used in order to make visible what tools the students are used to in their previous education. This allows them to compare different ways and to think about what is common practice in current education. This can be called the transcultural "learning to learn" skill. It may be that the students are accustomed to teacher-oriented and teacher-centered teaching rather than student-centered. Regarding teaching methods, different technology-mediated methods are typically novel ways of studying. Teachers' expectations and different assessment practices are also important to clarify. Self-assessment or peer feedback may be a new practice for many students that require skills and training.

Different kinds of teaching methods are in use in different occupations. Before starting a new course, it is important for the teachers to explain and clarify their expectations and methods concerning, for example, the following: how do they expect students to participate in teaching; what kinds of questions will they ask; is it a question of information or whether he or she looks for different perspectives, students' opinions, or experiences? Furthermore, why are different questions important for learning, and how to work in a group?

The importance of the study group for learning a profession may also be new for some students. Understanding group dynamics and organizing work in a group require familiarity if the student is well accustomed to individual and competitive learning habits. It is also essential to clarify what a student can learn from other members of the group and how other's contribution can enrich his or her learning vocational competences.

Vocational content knowledge gives a direction and a goal for learning. In different occupations, different types of knowledge and skills are needed. Depending on the area of the vocation, typically transdisciplinary knowledge is necessary to become a competent worker. For example, in the area of health care, learning knowledge based on different sciences and disciplines such as nursing, medicine, and psychology is essential for functioning as a nurse.

In sum, the elements of learning affect transcultural learning process.

---

## Transcultural Learning Process

A model for transcultural learning illuminates the elements, layers, and dimensions of the process when encountering and learning with people with diverse cultural backgrounds. Elements of a transcultural learning process are the same as in all learning that involves participants, content, tools, and environment described above.

Layers of the transcultural learning refer to individual, collective, societal, and global aspects of the process. These elements and layers are present in all learning. People are at the same time individuals, members of cultural groups, members of a society, and members of the world at large. Transcultural learning can penetrate all these layers. In vocational education and training, the layers of transcultural learning can get different manifestations. For example, a student studying economics can do her/his internship in a multinational company and have colleagues in different parts of the world. As an individual the student is thus part of the study community in one place as well as part of the global work community, following both national and international laws of accounting.

Dimensions of transcultural learning reflect four counter-pairs: transition, stoppage; transformation, stagnation; trust, mistrust; and fast time, slow time. Learning can occur as an oscillation between two ends of the dimensions. Next will be examples of the dimensions.

Moving to a new environment may be voluntary, as in a case where a person starts to study in a new school or work in an international company, or involuntary as in the case of refugees and asylum seekers. Either way, moving is a transition, which can give impetus to transcultural learning process. Transition can be regarded as movement between different places like school and work or a development between different phases, such as from childhood to adolescence (cf. Teräs et al. 2015). In this case, transition occurs very concretely when a person moves from one country to another.

Young people with a migration background experience many transitions in their life such as moving from one country to another, moving around inside one country,

and moving from one school to another or from school to work. The next example shows how a student reflected on his experiences: “I really don’t have a plan yet, if I’m staying here [Finland]. I will see how it goes on, if there, in my own country, is a war or not. This a peaceful country, it’s good to be here. But if the war ends, then of course, everyone has his own home country” (Teräs et al. 2015, p. 48).

Dimensions of transition can, however, also be abstract such as learning a new language or remembering new words needed for a specific occupation. In other words, concrete and abstract are intertwined in transcultural learning process. Dimension of transition has a stoppage at the other end. Sometimes learning in the new environment can be difficult, demanding, and overwhelming, and the person becomes trapped and stopped in her/his transcultural learning process. However, stoppage is sometimes needed for learning.

“... Everything was quite different than in our school” (Teräs 2007, p. 1) wrote one of the students in her diary. To face the difference requires transformation, that is, transformation in relation to one’s identity and in relation to a social and physical environment. Transformation can be perceived as a deep individual, social, societal, and global process of change. For example, highly educated professionals typically have difficulties finding jobs that match their competence and often are recommended to have training in their new environments (Lasonen and Teräs 2015). Transformation is necessary for different layers. In other words, not only individuals are transformed but also communities and societies. For example, companies need to develop different kinds of recruiting policies to face a diversity of clients or determine the kinds of services that are needed to reach different cultural groups. Dimension of transformation has stagnation at the other end. Stagnation can occur if there is no activity, growth, or development on either the individual or collective level. It may be that there is too much that is new and too many changes, and a person feels that she/he needs to wait to be able to learn it all. In the case of an organization, which is going through many changes, stagnation can occur.

Transition and transformation need two other dimensions, namely, trust and time. Trust in the respect that refers to a person being able to learn and understand; one needs to trust that the knowledge and skills one is learning are beneficial in the vocation of the new environment. Therefore trust-building is essential in transcultural learning process. One needs to trust teachers and the new environment, and vice versa. Without trust, learning is not meaningful to the person. Trust-building is a reciprocal process, and mistrust might direct learning toward unintended directions. For example, when one young person with a migration background discussed his future plans, he expressed both mistrust and trust: mistrust from a collective perspective and trust from his individual perspective. “(...) They [other immigrants] have said to me once that for us [foreigners] it’s no use to study, because we are foreigners. We are not going to get any good jobs. Our future is in a pizzeria or something like that. But I want more and I want to get a good certification so that I would get a good job, not like the pizzeria” (Teräs 2010, p. 7). An employer working with migrant families had noticed that a trustful relationship was beneficial for the whole family: “(...) Parents try to hide as long as possible if they have issues, they are inside family issues and no one [the authorities] is supposed to touch those

issues. They try of hide possible problems as long as possible. But then I have noticed that if a good, trustful and open relationship is formed to parents, then they open up and they want to use services and they are content and grateful. (. . .)” (Teräs 2010, p. 8).

Time dimension is interesting; on the one hand, learning a vocation takes time, even though there are individual differences. Some people learn faster than others do. However, especially when learning in a new cultural environment and with a new language, it is time-consuming. Time has been approached from different angles, such as how people experience time and haste in work (cf. Niemelä 2006) or how different occupations have different timeframes (Kaiser 2009) and how social processes seem to accelerate (Rosa 2013). In relation to transcultural learning process, for example, the government of Sweden (2016) introduced the “fast track” program for newly arrived migrants so that they would find a job quicker than before, especially if they have an education from their previous countries. Dimensions of time oscillate between slow and fast in the transcultural learning process. Furthermore, a person needs to learn many things at the same time, such as a new language and subject content, as well as how to study. One of the students expressed it like this: “Then we think that learning in workplaces is important because workplace learning, because there we can improve our Finnish language skills and then we get to know about professions and then we can talk to Finnish people” (Teräs 2007, p. 120).

In sum, a transcultural learning process is a cyclic, oscillational process involving elements such as participants, contents, tools, and environments as well as layers of individuals, collectives, societies, and the global community, in addition to dimensions of transition, stoppage; transformation, stagnation; trust, mistrust; and fast time, slow time. These elements, layers, and dimensions are here called ingredients of transcultural learning.

---

## Discussion

The aim of this chapter was to examine the cultural diversity that students and teachers of vocational education and training encounter in their work. In addition, the aim was to reflect on transcultural competence and the transcultural learning process.

Teachers and students of vocational education and training can encounter cultural diversity in several ways. They can be part of an international project, they can be engaged in various exchange and mobility efforts, or they meet people and their children who have moved to new cultural environments. Accordingly, there are several ways to approach cultural diversity in vocational schools. Banks (2002) has studied and proposed multicultural education, highlighting equity and prejudice reduction in education. Räsänen and San (2005) discuss intercultural education as a way to act with cultural diversity. Aldridge and his colleagues (2014) bring transcultural education into discussion. Each approach is followed by competence needed in practical situations – multicultural competence, intercultural competence,

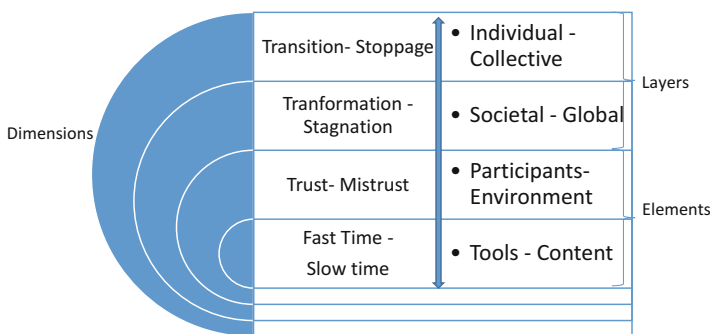

or transcultural competence – to name some. The focus, in this chapter, has been on transcultural competence and transcultural learning process.

The elements of transcultural learning process follow a regular learning process involving participants, teachers, and students, content knowledge, as well as tools and diverse learning environments. Layers of transcultural learning involve individuals, groups such as communities and organizations, different societies, and the global community at large. These layers are present in all learning, even though the focus of learning can be on individual layer or community layer, for example.

Furthermore, four dialectical dimensions are present in transcultural learning process: transition, stoppage; transformation, stagnation; trust, mistrust; and fast time, slow time. A question rises if these dimensions are a quality of all learning too. In addition, what does make learning transcultural? Before pondering this question, the Figs. 1 and 2 depict relations of the ingredients of transcultural learning.

In Fig. 1, the model of transcultural learning reflects the complexity of the phenomenon, which is learning when diverse people and cultures encounter each other. It also describes how elements, layers, and dimensions are dynamic and intertwined in the transcultural learning process. The arrow at the center of Fig. 1 illustrates that the ingredients are in constant interaction with each other. Fig. 2 spotlights the dimensions. In the figure, a star outlines relations of different dimensions.

All dimensions are in relation with each other, but at the same time, some dimensions can have stronger emphasis in the learning process. For example, when starting to study a new vocation, mistrust can dominate the learning process.

**Fig. 1** Ingredients of transcultural learning

**Fig. 2** The dimensions of transcultural learning

A person, especially if one has already vocational qualifications from her/his previous country, may feel that she/he already have competences and that she/he does not need any further training. When proceeding in the training, transformation dimension can oversee the learning process, which then requires more time from the person. Therefore, interplay on the one hand between dimensions and, on the other hand, oscillation between the ends of dimensions is a dynamic and self-renewing learning process.

Now back to the previous questions on what makes transcultural learning special and if elements and layers depicted are present in all learning. This question can be perceived from three angles. First, dimensions of transcultural learning can be present in all learning, depending on the elements and layers of learning, in other words who are the participants, what kinds of contents are in focus and what kinds of tools are used, and so on. Also layers of learning are central: is the focus on individual or global layer? The comprehensive whole is important. Second, it is important to understand what the context of learning is. For example, are the participants of the learning process migrant workers or refugees, why are they learning, what are the aim and objective of learning, and what kinds of previous learning experiences do they have? Third, if all learning is perceived as similar, it becomes vague and the conceptual and analytical power can be easily lost. Learning and transcultural learning are complex concepts and that they get their meaning when used in actual empirical situations. Thus, more empirical research in the area is needed.

Promoting transcultural learning and facilitating it require transcultural competence from vocational teachers. Mayer and Boness (2011) describe transcultural competence with eight aspects such as being open and appreciating cultural differences, being tolerant to and understanding cultural diversity, as well as being able to communicate with different people and managing conflicts. Furthermore, transcultural competence also involves actions; one needs to be able to act in different situations. In other words, the teachers need to be aware of the transcultural learning process and to facilitate the students to navigate through cultural diversity.

Cultural diversity and practices are part of the vocational and professional activity. In order to meet the challenges that vocational teachers and students face in their work, they need to increase their transcultural competence. It is therefore crucial that vocational education institutions identify and make visible the different roles, practices, and tools that teachers and students use in their studying and teaching practices. Transcultural learning arises from the respect of different people and cultures, the desire to understand one's own and others' cultural heritage, the ability to work in diverse situations, and the ambition to create a new kind of study and teaching culture.

## Abstract

This chapter examines conceptualizations of the relationship between vocational knowledge and practice and explores implications for workplace learning suggested by contrasting approaches. A distinction is drawn between theories that foreground practice as a site of vocational learning through participation and those which have tended to highlight the acquisition of systematic knowledge as the basis for expertise in occupations. It is suggested that these divergent approaches assume different conceptualizations of practice itself and involve distinctive treatments of issues of vocational knowledge and identity. It is argued that greater attention needs to be paid to the differentiation between specialized and nonspecialized aspects of vocational knowledge, and this provides a basis for differentiating forms of vocational practice in terms of the specialization of underpinning knowledge and through the extent to which that knowledge is acknowledged, recognized, and foregrounded in workplace curricula. This then provides a means for evaluating the potential for learning profitably from aspects of workplace activity and for considering what constitutes full participation in an occupational practice.

**Introduction**

Debates around the importance of vocational knowledge in vocational education are often framed around unresolved questions concerning the relationship between theory and practice in vocations. On the one hand it can be argued that the systematic knowledge produced by academic research and represented by academic disciplines is the most reliable and durable form of knowledge (Young 2006; Wheelahan 2010) and therefore must be represented in all forms of education including that which takes place for vocations and in workplaces. Such arguments for the prominence of systematic knowledge also draw on theories of expertise (Winch 2010) that suggest that propositional, inferential, and procedural knowledge are interdependent elements in the constitution of expert practice. This argument is also supported by research into the knowledge requirements of certain occupations, for example, that which examines the needs of occupations in sectors such as engineering, construction, or health, where forms of “applied theoretical knowledge” (Clark and Winch 2004) are seen as indispensable for vocational activity.

On the other hand, it can be argued that forms of systematic disciplinary knowledge are remote from the actuality of vocational practice and largely irrelevant to much of what occurs in workplaces, and therefore vocational education needs to focus to a greater extent on forms of situated know-how attained in the context of practice (i.e., Markauskaite and Goodyear 2014). Studies have shown the considerable potential for learning in workplaces, particularly where certain “environmental” conditions exist (Fuller and Unwin 2004). Furthermore, research examining the relationship between work practices and learning (i.e., Orr 1996; Lave and Wenger 1991; Fuller et al. 2007) demonstrates the potential of occupational practice to generate forms of situated knowledge that are adapted and refined in processes of exchange among bodies of practitioners deeply immersed in their work. The works of Lave and Wenger (1991) and Brown and Duguid (1991) suggest that it is the dynamics of practices that generate requirements for forms of knowledge and knowing which are therefore learnt by practitioners as they participate in the practice. As practice requirements change, thus knowledge requirements change – and therefore change is often seen as stemming as much from the practice itself as from advances in systematic knowledge produced externally to the practice.

This chapter examines the relationship between vocational knowledge and practice and explores the implications for how we think about workplace learning. First some arguments for the centrality of vocational practice for workplace learning are addressed, and some objections are raised to approaches that suggest that all valuable learning can be achieved through practice immersion. These objections relate to how practice is conceptualized in such approaches, the difficulties with sustaining quality

in practice, and the lack of connection to systematic knowledge production which may thus quickly render practice knowledge ephemeral. It is suggested instead that greater attention needs to be paid to the differentiated nature of vocational knowledge, drawing on the arguments of Bernstein, Young, Muller, and Winch, and in particular the relationship between the systematic or “specialized” and the non-systematic or “nonspecialized” forms of knowledge.

This also suggests, following Winch (2010), that greater attention needs to be paid to the relationship between the propositional, inferential, and procedural forms of knowledge, in addition to acquaintance knowledge, when identifying the knowledge base and the curriculum for an occupation, and the development of workplace expertise. Moreover, scrutiny of the differentiated nature of vocational knowledge indicates that greater attention needs to be paid to the sources of this knowledge and the processes of selection, appropriation, and transformation (Bernstein 2000) that they undergo as they move from their original source into a vocational curriculum, whether classroom- or workplace-based. It is suggested that a more acute differentiation of vocational knowledge provides a basis for differentiating forms of vocational practice, as practices can be differentiated in terms of the extent to which they are “purposive” (Rouse 2001, 2007; Hager 2011), the extent by which they are underpinned by a form of specialized knowledge, and by whether they provide the affordances and environmental conditions (Billett 2004; Fuller and Unwin 2004; Winch 2010) that enable the acknowledgment and recognition of those (and other) forms of knowledge in practice. It is argued that this approach has considerable implications for how we evaluate the potential for learning profitably from aspects of vocational activity.

---

## Foregrounding Practice to Understand Vocational Learning

There is a considerable amount of academic literature on learning in occupations that suggest that how we understand practice is central to how we understand vocational learning/workplace learning. The works of Lave and Wenger (1991) on Communities of Practice, Brown and Duguid (1991) on networks of practice, and Argyris and Schön (1996) on learning in organizations served to orientate much research on vocational learning toward the analysis of work practices as sites of learning. It has been argued that practitioners develop the most important aspects of their expertise in workplace contexts and that fluent practice does not rely much on declarative knowledge, including in quite complex specialized expert practices (Dreyfus and Dreyfus 2005). It can be argued that knowledge and learning should be seen as “culturally and socially situated” (Markauskaite and Goodyear 2014, 80) and that expertise should increasingly be understood as co-constructed through collaboration with others (Guile 2010), distributed socio-materially among and within practice contexts (Fenwick 2014), and “relational,” involving boundary-crossing and “understandings of the work problem as an object of joint activity” (Edwards 2010, 13).

These arguments suggest that vocational knowledge and learning are best understood through analysis of work practice and that valuable knowledge and

opportunities to learn are in essence constituted through the character of the practice. This line of thought has led to many researchers on workplace learning to conduct detailed practice fieldwork in different occupations in attempts to profile the nature of knowledge and learning in that occupation and to garner insights that have resonance across occupations. For example, the work of Billett (2004) draws on fieldwork on hairdressers and coal mining and Eraut (2004) on studies of teachers, nurses, and midwives among others. While many of these theorists acknowledge a role for formal systematic knowledge, they often foreground workplace contexts as central sites of occupational learning, echoing traditions that have long advocated considering forms of “knowing” in practice (and practical wisdom) as much as “knowledge” as key elements of expertise (Duguid 2005).

However, it is important to note that much research on learning at work, including much of the work discussed above, is often implicitly working with a view of practice that is “regulist” or “regularist” (Rouse 2007) suggesting that practices are defined by the rules or regularities by which they are characterized. This view of practice is often complemented by a focus on phenomena such as “shared embodied know how,” “shared practical understandings,” and “tacit knowledges and presuppositions” (Schatzki 2001, 11–12) that are said to underpin any given practice and provide its regularity, rules, and character. This view frequently extends to the claim that all forms of human activities that possess rules and some form of regularity can be considered practices, with “domestic tasks,” “parenting,” and the “practices privileged in educational institutions” (Billett 2004) not categorically different as all have routines and their own characteristic “sayings” and “doings” (Schatzki 2001). Such arguments often also suggest that practices often overlap and influence each other, but each has an “architecture” (Kemmis et al. 2014) that shapes the activities that are appropriate to the practice. To unpack the “architecture” or regularities of a practice is therefore vital to understand its character and the forms of knowledge and learning therein.

In such theories learning is conceptualized as the process of engaging with and becoming part of a practice – all “practitioners” learn in order to become more fully adept and to move from novice to expert (Lave and Wenger 1991) – and this can be as true of the most everyday practices as the more complex and specialized (Nicolini 2013). Learning becomes about socialization into the rules and regularities of the practice and identity formation, “the simultaneous development and performance of a practitioner identity” so that “coordinated activities” can be undertaken more competently in accordance with the rules of the practice (Gherardi and Perotta 2014, 142). Learning as participation is thus seen as a more appropriate metaphor than acquisition (Sfard 1998), with the community or “collective subject” rather than the individual foregrounded as the locus of learning (Gherardi and Perotta 2014, 144).

The focus on practices as sites of learning enables theories to emerge which attempt at general conceptualizations of workplace learning that bridge above the nuances and characteristics of specific vocational practices. In essence the notion of practice *participation* can be said to translate fruitfully across multiple practices – learning as participation can be seen to have some fundamental tenets. Learning in workplaces can

be understood through examining “affordances,” “dispositions,” and the “workplace curriculum” (Billett 2004, 2006), and therefore there needs to be a focus on “informal learning” and learning from others (Eraut 2004), coupled with a focus on practice induction (Gherardi and Perotta 2014). While some theorists develop frameworks that continue to see an important role for systematic knowledge, often identified as “propositional” or “declarative” and as “formal” and “explicit” (i.e., “codified academic knowledge” (Eraut 2004, 263)), other frameworks of vocational learning imply that there is nothing distinctive about systematic knowledge that might warrant its necessary inclusion in a process of occupational preparation. If cognitive learning at the individual level is displaced by a focus on ideas of legitimate participation, community, and distributed expertise (i.e., Gherardi and Perotta 2014; Markauskaite and Goodyear 2014), then knowledge and learning in formal settings cannot claim to be categorically different from learning processes in organizations or occupational groups. Thus systematically produced propositional knowledge can be drawn on selectively to meet the perceived requirement of the practice, including at the behest of the practitioner. It is drawn upon where relevant to task or problem in hand and then may be discarded when tasks are completed or problems solved.

Systematic knowledge developed in disciplines and by rigorous research practices thus is often seen as *just another* form of knowledge that will be judged alongside other forms of knowledge and understanding in terms of its efficacy or utility in the practice context. It may or may not have something to offer. This view of systematic knowledge can be seen as instrumental, perceiving this knowledge as useful only in terms of what it can do for a practitioner or organization in a specific scenario. An individual proposition or set of propositions may be selected, appropriated, and relocated outside of its original context of production without an ongoing connection with other propositions that provide it with its meaning and allow it to be fully understood (Bernstein 2000; Winch 2010; Hordern 2014). The result is that it may be difficult for a practitioner to make inferences from that proposition as its accompanying propositions have not been seen as worthy of selection because they have no obvious bearing on the context at hand (Winch 2010).

For example, building work is safer if builders are aware of the relationship between types of material and how these materials respond to different forces. If a material is selected specifically because of its ability to withstand a specific force (i.e., compression) but the builder is not conscious of the different natures of tensile forces and how these impact such materials, then a building may collapse (e.g., in an earthquake). Similarly, a plumber with a working understanding of chemistry of metals will be more likely to diagnose whether two metals in close proximity are a potential cause of corrosion and whether environmental conditions may contribute. If she possesses only partial knowledge of the relevant chemistry, there is a greater chance of a misdiagnosis of the problem. Thus propositional knowledge becomes fully meaningful only when understood together within other related propositions, as this allows meaningful inferences to be made from each proposition (Winch 2010) and a more rounded impression of the problem to emerge. The implication is that many vocational occupations require a systematic knowledge base that enables

practitioners to exercise well-founded judgments in the contexts in which they work, as will be discussed further below.

Additionally, as Rouse (2007) points out, if we follow the “regularities” or “regulist” conception of social practices which underpins much writing about workplace learning, there is “no good way” to identify how practice is “maintained across multiple iterations of the practice” (2007, 47), as there is nothing that sustains the practice regularities or rules other than those regularities or rules themselves. Essentially, we are missing an understanding of the basis for the persistence of habitual action, as will be discussed below. This omission may lead to assumptions about learning processes that do not adequately differentiate between the types of knowledge learnt or differentiate between the types of practice (or human action) within which that knowledge is constituted. If knowledge and learning in vocational practices is determined by what practitioners consider makes sense for the routines and regularities that currently characterize that practice, then there is also no necessary relationship with the changing nature of knowledge external to the practice. For example, new developments in scientific research that could potentially transform a work practice can be dismissed as irrelevant if not considered to relate to the existing practice dynamics.

---

## Differentiating Knowledge to Understand Vocational Education

While the ideas discussed above have considerably advanced understandings of learning at work and the variable contexts in which participation in a practice occurs, it can be argued that the role of systematic knowledge is unwisely downplayed or sometimes disregarded completely. The disciplinary knowledge produced in universities or research bodies has been criticized by some for its perceived irrelevance to practice, redundancy, excessive generalization, or inherent bias (i.e., Whitehead 1989; Schon 2001). If all knowledge is situated, the argument goes, how can a researcher in higher education claim a particular value or “power” for her or his knowledge? How can research communities claim a particular authority over knowledge and also therefore over the processes by which that knowledge can be acquired? The argument of some, in response to such questions, is to turn attention to the conditions in which knowledge is produced and made available to future vocational practitioners and to claim that “specialized” forms of knowledge are important for the vocational curriculum (Wheelahan 2010; Gamble 2016; Young and Muller 2014, 2016).

Rather than suggesting that vocational knowledge should emerge directly from vocational practice, Young and Muller (2014) draw on a sociohistorical analysis of the development of knowledge to show how knowledge used in occupations draws on higher education disciplines and that knowledge has increasingly been produced that takes account of the purpose of an occupation or field of practice (i.e., health, engineering). Some forms of knowledge (i.e., the pure disciplines such as physics and chemistry) develop specialized concepts, while other forms (i.e., applied disciplines such as engineering or architecture) develop knowledge that is specialized to a

contextual purpose (i.e., construction of a bridge or design of a building). Over time these two forms of knowledge have interconnected in an “irreversible twist” (Young and Muller 2014, 9) which has led to the applied disciplines drawing on the knowledge produced by, and influencing ongoing work within, the purer disciplines. As part of this, organizations and professional bodies involved in (for example) engineering and health, and their practitioners, have become more conversant with conceptual advances and used these to develop technologies and frameworks that have shaped the development of work. What makes this specialized knowledge reliable, and therefore useful in the ongoing development of technology and work practice, is its connection to certain disciplinary processes of evaluating truth claims which are maintained by academic and professional communities (Young and Muller 2014). Thus advances in engineering rely on the disciplinary processes in the physical sciences and the engineering community – the recontextualization of knowledge between the “pure” and “applied” disciplines – and the adaptation of knowledge to meet the purposes of the occupational practice (i.e., physics for engineers or technicians). This connection back to disciplinary sources, and ultimately to commitments to discovering truths about the world, enables new knowledge to be brought to bear on problems encountered in the occupational practice, but also means that the practice is not static as new knowledge can be fed into technological and process developments, resulting in new learning requirements for practitioners in the field.

Underpinning this argument is an important differentiation between specialized knowledge, as produced in disciplinary communities of a “pure” or “applied” nature, and everyday knowledge, which tends to be “local” and “context dependent” (Bernstein 1999), fluid, and unstructured. Whereas specialized knowledge is characterized by a disciplinary “sociality” that is in some way rule-bound and orientated toward the pursuit of truth and truthfulness, at least in its ideal conception (Young and Muller 2016), everyday knowledge is exhausted in the context of its application while remaining useful for the specific purpose to which it is put. In occupational contexts specialized knowledge might be knowledge relating to health and disease (for a nurse) or construction techniques or chemicals (for a builder or engineer), whereas nonspecialized everyday knowledge might be organizational procedures or “rules of thumb” developed by individual practitioners that may or may not have broader applicability. Indeed, the notion of individual practitioners developing and putting into practice their own solutions to problems may, in certain cases (i.e., in health and engineering), be highly problematic due to heightened levels of risk, whereas in some vocational areas (i.e., in craft or information technology) less problematic. Importantly, knowledge becomes specialized for the occupation when it meets the disciplined requirements of the occupational knowledge base – when it is tested for its validity and reliability and (in many occupations) its successful applicability in a variety of contexts. While everyday forms of knowledge are vital for undertaking many occupational tasks, they are not subject to the requirements of specialized knowledge and are often highly contextual to specific organizations or workplaces – and therefore there must be question marks around their inclusion in the vocational curriculum.

It is important to emphasize that specialized knowledge is not simply propositional (or “know-that” forms of knowledge). As Winch (2010) discusses, expertise is built not only on “know-that” but also on strongly related forms of “know-how” which are often less easy to identify. Individual propositions only make full sense when considered together with related propositions. A practitioner needs to know how to draw inferences from propositions based on an understanding of the relation between these propositions and others. Expertise in any domain is therefore reliant on inferential capabilities and understandings of the relations between propositions which are husbanded by disciplinary communities, including in applied disciplines. Strongly associated with the inferential dimension is knowledge of how to use procedures for judging new claims to knowledge. This procedural capability enables experts to assess whether a new proposition has bearing on the existing knowledge base and whether it meets standards of rigor appropriate to the discipline. Both the inferential and procedural capabilities can be seen as significant for vocational practitioners, who need to be able to understand how an aspect of vocational knowledge relevant to their practice relates to their knowledge and to be able to evaluate new ideas or techniques which may be introduced to them by a variety of sources.

However, none of this means that specialized knowledge can be used unproblematically in the vocational curriculum. A requirement to prepare practitioners for work in an occupation is distinctly different from a curriculum that prepares for further study – a vocational curriculum has to have some relation to the circumstances of the occupation and the work encountered (Muller 2009; Billett 2006) – and this may vary in terms of the extent of certainty and risk involved (Gamble 2016), but also in terms of the level of discretion and control that employees enjoy over their practice. Knowledge thus needs to be “selected, appropriated and transformed” (recontextualized) in accordance with the problems (Barnett 2006) and “supervening purpose” (Muller 2009, 213) of the occupation. However, those problems and that purpose are often subject to ongoing debates between various stakeholders (i.e., practitioners, professional associations, employers, education institutions, government) around definitions as to what aspects of work and task are “in scope” for the occupation, leading to different views as to what knowledge should form the basis of the curriculum. What Evans et al. (2010) call “content recontextualization” is therefore often a fraught process, with multiple actors engaged. Some may call for a curriculum based solely around current workplace practice, while others may see value in a more formal institutional period of preparation.

In professions as diverse as human resource management and chartered surveying, there have been debates around whether accreditation processes are responsive to employer and practice requirements (Cook and Chatterjee 2015; Gilmore and Williams 2007; Hordern 2014). While chartered surveying has decided to reinvent its connections with higher education institutions, HRM has opened up new work-based routes to qualification (Hordern 2014). Gamble (2012) notes how knowledge requirements brought about by technological change are increasing the need for formal educational involvement in intermediate-level apprenticeship programs in technical fields. However, even if forms of specialized knowledge are

valued, the process of recontextualization may result in individual propositions becoming more isolated from other propositions that provide greater meaning and from procedures that enable the evaluation of new claims to knowledge. The vocational curriculum cannot be excessively reliant on knowledge as produced by “pure” disciplines, as this is too remote from the concerns of practice. Therefore it seems a new knowledge base appropriate to the occupation must be worked through, transforming purer forms of knowledge so they relate to the practice context, so that there is a degree of coherence to the curriculum, and for most vocational occupations this will involve a degree of coherence both to the conceptual structure of a disciplinary body of knowledge and to the contexts in which practitioners work (Muller 2009; Barnett 2006).

The claims of Winch (2010) on propositional knowledge also suggest that vocational knowledge and expertise requires a form of curriculum that pays particular attention to sequencing, as new knowledge can only be properly understood in the light of knowledge previously acquired – propositions only make sense in the light of other propositions. Therefore curriculum designers need to pay special attention to how propositions are sequenced so that novice practitioners can make full sense of new ideas introduced to them. If the sequence is jumbled or confused, then practitioners will not gain from the process (Muller 2009; Gamble 2014). The structure of the knowledge base matters enormously for curriculum design in vocational fields and has implications for how the workplace aspects of vocational curricula are organized.

---

## From Differentiating Knowledge to Differentiating Practice

However, conceptual work that has asserted the importance of differentiating knowledge has not often extended this differentiation into the actuality of vocational practice. Young and Muller (2014) draw a distinction between the work of Schon (2001) on reflective practice and that of Bernstein (and also therefore their work). They discuss Schon’s “epistemology of practice,” which suggests that practitioners’ knowledge is comprised of a “store of experience” consisting of “certain types of situations and examples” (Young and Muller 2014, 12) which practitioners can draw upon analogically to handle real-world problems as they experience them. Using Bernstein they observe that the work of Schon neglects the use of disciplinary specialized knowledge that has bearing on practice and is limited in how it relates practice to knowledge production. Bernstein’s (2000) work is seen as offering the opportunity to develop a deeper understanding of the relationship between the production of knowledge (in pure and applied forms), occupational curricula, and “fields of practice” (Young and Muller 2014). Young and Muller (2014) point to the risk of collapsing distinctions between knowledge types and the practices associated with them that is inherent in Schon’s work, as Schon’s work posits a generic experienced-based model of reflection that transcends the specialized character of an occupational practice, as defined by its knowledge base. Effectively the disciplined nature of specialized knowledge is downgraded and its specialized character left unacknowledged – considered less significant

than that which is interpreted through experience. For Young and Muller (2014), this amounts to overlooking the distinctive propositional, inferential, and procedural aspects of expertise (following Winch 2010) and instead mistakenly elevates undifferentiated knowledge by acquaintance as the primary source of occupational knowledge (see also Hordern 2016).

However, the argument for specialized vocational knowledge implies that certain forms of (specialized) practice are concomitant with that knowledge. Specialized knowledge forms are products of particular forms of sociality or disciplinary community (Young and Muller 2016; Muller 2009). While the practices of academic and some professional communities are relatively bounded and specialized, undertaken by academics or professionals with defined identities and disciplinary guidelines around what is appropriate practice (Muller 2009), the practices and identities of saleswomen or a photocopy technicians are more fluid and flexible, influenced and shaped by other practices and encounters (i.e., see Orr 1996). Academic physicists and historians, along with doctors or engineers, are working extensively and perhaps exclusively with specialized forms of knowledge in their practice or at least interpreting events and claims in specialized terms that might appear opaque to the layman (Shalem 2014; Hordern 2016). In essence, highly specialized occupations and their practitioners are constantly in the business of seeing in sacred terms that which might be considered profane by others (Gamble 2014) and developing diagnostic frameworks in order to manage problems encountered in the occupation (Shalem 2014). On the other hand, in some occupations very little specialized knowledge is needed, although it could be argued that if more was used that might enhance the practice. Much vocational practice is however somewhere in between the highly specialized and the unskilled, characterized by an admixture of specialized and nonspecialized knowledge forms in order to complete tasks and activities (Muller 2009; Gamble 2016).

But how can these differences in occupational practice be understood? Rouse (2007) contrasts the view of practices as habitual or rules-based activities with a “normative” conception that suggests human activities are only practices if they can hold together purposefully due to something being “at stake” (Rouse 2007, 50) in the conduct of the practice. This view of practice suggests that a practice is held together by “interactions among its constitutive performances that express their mutual accountability” (Rouse 2007, 48). Participants engage in the practice through mutual interest – the pursuit of the issues at stake in the practice is meaningful to them – and therefore they stay involved. Hager’s (2011) refurbished account of MacIntyre’s (2007) conception of practices similarly highlights “purposiveness” and contributions to wider society (though a “balance of internal and external goods” (Hager 2011, 554) as important characteristics of certain types of practices (e.g., occupational practices). Actors and their actions are bonded together in the meaningful pursuit of some objective in such practices or because of a sense of duty or perceived obligation to the practice and the community of practitioners (Young and Muller 2014).

Such strongly purposive practices tend to have achieved a certain level of societal recognition and some autonomy in developing a license to practice, underpinned by forms of knowledge specialized to the practice purpose and its contexts (Young and Muller 2014). Indeed, this category may cover to a greater or lesser extent

professional groups and other skilled occupations, including many that would be considered established vocational occupations (i.e., building trades, emergency services, etc.). Furthermore, it also seems reasonable to suggest that those occupations that involve complex tasks over which practitioners have considerable discretion are likely to require more specialized knowledge in use than other occupations. Nevertheless, some occupations have limited direct use of such knowledge and a greater reliance on everyday forms of knowledge such as organizational routines, procedures, and locally developed ways of undertaking the work involved (Muller 2009; Fuller et al. 2007). In essence, in some occupations there is more clearly something “at stake” over which the practitioner has some control than in other occupations.

In this alternative normative definition of practice knowledge and learning processes become qualitatively different in different types of work. In other words, what it means to know and learn within a purposeful occupational practice where a practitioner has some discretion over their work activity is distinctly different from what it means to know and learn in “everyday” contexts. However, when we consider the learning processes for practitioners in actual workplace contexts, a further set of dimensions come into play. For example, the expansive or restrictive characteristics of learning environments (Fuller and Unwin 2004) have considerable bearing on the potential for specialized forms of knowledge to be encountered and expertise developed. Equally, the existence of affordances within workplaces that provide opportunities to encounter knowledge and recontextualize it for specific contexts is shaped by power dynamics in organizations and workplaces (Billett 2006; Hordern 2014). Specialized forms of knowledge may or may not be recognized and acknowledged through pedagogical processes in workplaces – with more experienced practitioners drawing novice practitioners’ attention to opportunities for the development of expertise. In some workplace environments, such opportunities to learn specialized knowledge may be (i) unavailable because of local workplace or organizational factors and/or (ii) considered unnecessary because of the assumptions of managers, occupations, or local supervisors (Eraut and Hirsh 2007). Other workplace environments may go to considerable lengths to structure workplace curricula so that new practitioners have opportunities to learn requisite forms of specialized knowledge in a structured manner, ensuring that workplace experiences relate to the knowledge encountered and offering time away from work for practitioners to organize and make sense of the learning they have undertaken. Thus the workplace curriculum, and associated workplace pedagogy, may differ not only by the occupation but also by the workplace.

---

## **Concluding Remarks: Implications for Workplace Learning**

So what are the implications of the above argument for how we think about workplace learning for vocational practice? Work can be seen to be strongly influenced by the extent to which the vocational practice makes use of forms of specialized knowledge, by the extent to which the differentiated nature of knowledge is acknowledged and recognized in that practice, and by the workplace curriculum and pedagogy that results. Without a recognition and acknowledgment of the

differentiated nature of knowledge, novice practitioners can be misled about the value of ideas, techniques, and practices introduced to them. The time-limited, ephemeral, or organizationally/occupationally specific nature of certain types of knowledge can be obscured without such recognition. Valuable forms of workplace learning can therefore thrive if we maintain a focus on the conditions in workplaces for valuing specialized forms of knowledge – and this needs to stem and be reinforced at an occupational practice level (i.e., through the institutional conditions that shape the purpose and character of the occupation).

Workplace learning in vocational practices that rely on forms of specialized knowledge is thus as much about acquisition as participation (Sfard 1998), and it is important to maintain a balance between the two. The notion that socialization and “induction” into a practice is a learning activity is important (as Gherardi and Perotta (2014) emphasize), but this should not neglect the importance of encounters with specialized knowledge and the acquisition of individual expertise. This learning inevitably takes place through participation, but participation needs to be understood as involving not just activities within workplaces and organizations but participation in the occupational sense – drawing on resources and expertise that are offered by the occupation and by experienced practitioners. This in turn suggests an important role for bodies and associations that represent practitioners and the standards of excellence considered important by the occupations in providing resources and support for practitioners in development and for connections between these bodies and educational institutions and academic communities involved in producing specialized knowledge and recontextualizing it for occupational education (Hordern 2017).

For full participation in an occupation, it is not however enough just to “learn effectively” in a given organizational or occupational context, in the sense of simply acquiring knowledge and becoming socialized into workplace practice. Participation in occupational practice also requires some sense of commitment to the quality of the practice, to its “internal goods” (MacIntyre 2007), to “supervening purpose” (Muller 2009), and to whatever is “at stake” (Rouse 2007). A degree of commitment to whatever is driving the practice suggests that learning is about voluntarily making a commitment to improve practice in the light of new claims to knowledge that will improve service to clients, customers, or the general public. It also entails a form of participation in the politics of the practice, to engage in internal debates and to feel a sense of responsibility for the vocation and for the quality of work undertaken. When such commitment is generated and sustained, opportunities to learn are not only made available but fully explored, to the benefit of individual practitioners, the occupation, and wider society.

**Abstract**

The field of research on “generalizing from qualitative research” (for convenience now referred to as GQR) is quite recent. It stems from an era which could be characterized as the “discourse of self-justification” when disclaimers about not generalizing from qualitative research were considered mandatory. Within this discourse of self-justification, there was always – small at first – some acceptance that generalization is possible and occurs. So from within the self-justification, there was also a strand that said “But maybe, just maybe we do? Or we can?”. Our point here is to review the recent field of research and then step back and look at “generalization” in general in its historical sense and follow how generalization, in any form, was always used – in fact it was/is mandatory for survival and became essential as a process in the statistical and scientific communities. To illustrate the processes of generalization in a contemporary applied vocational learning context, we provide two case studies – one from Australia and the other from Indonesia. To conclude, we will revisit GQR in the light of this vocational learning context in order to conceptualize GQR processes without the constraints of definitions based on narrowly proscribed paradigms which limit truth and reality to what can be measured or counted.

**Introduction: Why Bother?**

In 2007 we (the authors of this chapter) wrote a conference paper in which we justified qualitative generalization based on a series of case study examples from our work (Falk and Guenther 2007). That paper remains the first author’s most frequently downloaded and cited article. As we considered why this might be, 10 years on, we looked in the literature for anything new that might add to our work. We found very little (more on what we did find later) and so were tempted to conclude that indeed the debate was over and it was not worth pursuing this topic further. Moreover, literature such as Eisenhart (2009), Briesch et al. (2014), and Patton (2015) provided some different schemas for viewing the issue of generalizing from qualitative research, lending an air of respectability.

In the field of vocational training and adult learning more generally, the demands for “best practice” or “evidence-based practice” sometimes appear to imply that education and training can be delivered somewhat like a medical intervention. If only we can get the curriculum “right,” or the andragogy, or the assessment, then we will be able to improve outcomes. Yet attempts to show “what works” and generalize from one context to another are often confounded by either a lack of evidence or apparently poor methods. In their justification of the latter claim, some would point to a reliance on qualitative methods. However, the proponents of big data have not as

yet been able to explain how analysis of empirical data can improve educational outcomes in diverse contexts, such as remote Aboriginal and Torres Strait Islander communities of Australia. These issues are not confined to education and training, but for the purposes of this chapter, this is the context from which we will draw our examples, later on.

On closer inspection, most if not all of the later publications referred to earlier were based on an assumption of a “growth” or refinement of the ideas around generalization from qualitative research (GQR) as something that had emerged from the relatively recent establishment of qualitative research as a “valid” field of inquiry: this establishment itself embedded in it what we might call a “discourse of self-justification.” All qualitative methodological theses and research studies from around the 1980s onward included sections specifically referring to the incapacity to generalize from qualitative research compared with the predecessors of “valid” research typified in “hard sciences.” Lincoln and Guba’s (1985) statement that “The only generalization is: there is no generalization” is a clear example of a direct reaction to this discourse of self-justification in the historical context of the normalized expectations of qualitative research.

Before progressing, we offer a simple definition of generalizability. According to Vogt (2005), generalizability is “The extent to which you can come to conclusions about one thing (often, a \*population) based on information about another (often, a \*sample).” The simplicity of this definition disguises a contested understanding among research methodologies, which tend to split along binarized qualitative/quantitative lines. For example, Miller and Brewer (2003) define quantitative generalization as “a process of first establishing the empirical reliability of facts and then using these facts to assess the validity of theory” (p. 127) and then under the heading of qualitative generalization suggest: “Generalisation in qualitative research can be viewed as reversing this balance” (p. 127). From here, it is possible to open up a Pandora’s box of caveats, conditions, and contexts which frame and delimit the definitions. Dahler-Larson (2018 Kindle Location 30351) argues that “Issues of causality and generalization are important, but their meaning is not legislated by the philosophy of science. Instead, their meanings flow out of debate, argument, institutionalized rules, and power.”

The last five decades have seen emerging commentaries, if not debates, about how qualitative researchers might indeed generalize from their findings. As already observed, there was an overall “discourse of self-justification” which required the mandatory disclaimer as to generalizability, as we have seen above. One strand of commentary within the research pertaining to the discourse of self-justification was a growing observation that generalization was happening whether it “should” or not. Robert Stake (1980) recognized early that generalization occurred and externalized the phenomenon by attributing generalization to the actions of end users or observers. It is they who do it, not us, the researchers, who always warn against it.

In the overarching discourse of self-justification, 10 years before Lincoln and Guba (1985), Cronbach (1975) concluded that social phenomena were too context-specific to permit generalizability. He suggested the priority of qualitative research was to “appraise a practice or proposition. . . in context.” Denzin (1983) also rejected

generalizability as a goal. Others emphasized the context-specificity of qualitative research (Wainwright 1997), which in their view limited generalization to other similar situations (Creswell 1998). Hammersley (1990) argued that ethnographers are generally “not very effective in establishing the typicality of what they report. And in the absence of such information we must often suspend judgement about the generalisability of their claims.”

So these discourses of self-justification, emerging from the need for consolidation and justification of qualitative research, were paralleled by a commentary about the uses or functionality of qualitative research. That is, end users, readers, commissioners of research, and researchers themselves did to varying degrees generalize from qualitative research, as Stake noted. In other words, regardless of the debates, qualitative research has often been used either by researchers themselves or by end users to make generalized conclusions.

There followed a set of literature which recognized the commentary on generalizability as a phenomenon, analyzing and synthesizing it. Patton (2015), for example, summarizes 12 approaches to qualitative generalization depending on different inquiry perspectives. Eisenhart (2009) makes similar claims, identifying five main types of qualitative generalization: theoretical, probabilistic, nomological, grounded, and syntheses/meta-analysis. Lewis et al. (2013) argue for just three approaches: representational, inferential, and theoretical generalization. The first refers to inferences that can be made from the child to parent population samples, the second from the sample to another population, and the third where inferences can be taken from data toward theoretical propositions. On a more practical level, Larsson (2009) identifies five ways that qualitative research can be employed for generalization. The first two are used to make generalization redundant: (1) the ideographic study, where the intent is to focus on individual difference rather than common truths, and (2) studies that undermine established universal “truths,” where the focus is on creating doubt about pre-determined truth. The next three can be useful when generalization is called for: (3) enhancing generalization potential by maximizing variation, where sampling is used to deliberately increase the probability of variance, (4) generalization through context similarity such that the weight of evidence allows generalized judgments to be made, and (5) generalization through recognition of patterns.

With all these well-justified approaches, does that mean that the debates are all but over? Well, maybe. But before closing that door, we decided to implement a little evidenced-based revisionism and see what would happen to current thinking if we set the more recent work on GQR in a longer and broader historical and disciplinary context, though we have tried to be selective about this length and breadth for manageability reasons.

---

## Stepping Back

In the published history of philosophy and science, debates about generalizability are not new. However, academic debates around the topic differ from practical manifestations of generalizability. Some ageless examples are self-evident (and rather

trite). For example, if a child finds they get burnt on a hot object, they will soon generalize their instance/s of experience to a workable theory about touching a hot object and learn to avoid doing so in the future from quite a limited number of instances. Trauma theory as a discipline is based on the assumption of the strong and long-lasting generalizability of a small number of impacting events. Here the individual's capacity to generalize from even a single instance to all future activity is important to survival. To attempt and phrase such generalizability in quantitative terms ends up being silly: "This experiment will require N people to apply their hands to a red hot surface to determine what the probability is that they will burn their hands if they repeat the act in the future."

So the practice of generalizing is one important consideration. Theory is inextricably linked to practice in the sense that we quickly form a theory about future likelihood of the same outcomes from limited numbers. Theory further arises when we start meta-wondering via the established cognitive discourses of various disciplines about the process and conditions under which generalizability can be reasonably expected to occur when the instance is not so clear-cut as the hand and hot object example above. The disciplines of philosophy have a way of explaining generalizability, as do those of physics, statistics, geometry, and others. To emphasize the point made above, the act of generalizing has two components: the practice (hand on hot surface) and the theory derived from that practice (if I do that again, likely I'll get hurt again and it's not worth the risk). We will return to the role of theory and observation later.

As seen above, the making sense of particular instances of information by bundling them into more general ideas about their reliable application to potential but as-yet-unexperienced events is as old as humankind. The earliest of written records such as those of the Greek philosophers "...stressed the role of general concepts in knowledge" (Woleński 2004). And this leads us onto the next section, which overviews the writings about generalization before the emergence of the push for recognition of "modern" qualitative research following Taylor et al. (2016):

... early qualitative researchers, some of whom conducted their research in an era when their preferred approach was in disfavor. ... We also have learned from the epistemological and theoretical challenges to traditional (p. xi) ethnography and qualitative methodology raised by researchers since the 1970s. (xii)

So "modern" is from the 1970s roughly, while the publication of Denzin and Lincoln's (1994) *Handbook of Qualitative Research* marks a point in this modern history of qualitative research when this establishment occurred – in Taylor's terms, when the era of "disfavored" research methodology had largely passed.

But the elephant in the room remains: How is it that GQR emerged as an issue from this "modern" era of establishing qualitative research, and largely avoided pinning the issue into the earlier historical views of generalization that were extant at the time the "hard sciences" were consolidating and changing their methodologies around generalization? What are the implications of this historical sequence? And so to the next section.

## Broad Historical Context

Here we draw on the work of six key figures from history to point to the historical development of generalizing processes. We step back more than two millennia to the work of Aristotle and move forward in time to the work of Carnap in the last century.

### Aristotle

To understand the debates about generalizability from qualitative research requires an understanding of the history of the philosophy of science. For this purpose we could go back in time to Aristotle (384–322 BCE), who built his work on a “two-dimensional framework” (Psillos 2012) of observable phenomena and a priori knowledge or principles, which should be mutually supportive. These two dimensions allow for deductive logic and inductive reasoning, as part of scientific knowledge:

According to Aristotle, it behooves us to begin philosophizing by laying out the phenomena, the appearances, or, more fully, the things appearing to be the case, and then also collecting the endoxa, the credible opinions handed down regarding matters we find puzzling. (Shields 2016)

### Bacon

Nearly two millennia later, Bacon (1561–1626) disputed Aristotle’s method, arguing for the development of first principles from observation. Bacon, “in his view of science, found almost no place for mathematics” and claimed “that an essential part of interpreting nature by the new method of induction consists in devising a crucial experiment that judges between two competing hypotheses for the causes of an effect” (Psillos 2006).

### Newton

Newton (1642–1727), a scientist of his time who is perhaps most famous for his articulation of the laws of gravity, created four rules of reasoning. These rules developed in the early 1700s applied to drawing conclusions in “natural philosophy”:

Rule I: ‘We are to admit no more causes of natural things than such as are both true and sufficient to explain their appearances’.

Rule II: ‘Therefore to the same natural effects we must, as far as possible, assign the same causes’.

Rule III: ‘The qualities of bodies, which admit neither intensification nor remission of degrees, and which are found to belong to all bodies within the reach of our experiments, are to be esteemed the universal qualities of bodies whatsoever’.

Rule IV: ‘In experimental philosophy we are to look upon propositions inferred by general induction from phenomena as accurately or very nearly true, notwithstanding any

contrary hypotheses that may be imagined, till such time as other phenomena occur, by which they may either be made more accurate, or liable to exceptions' (Gower 1997)

The first two rules relate to deductive logic applied to assigning causes. In effect, he is saying we cannot assign a cause if there is no observable effect and vice versa. The third, which was constrained by objects with universal qualities, is a kind of inductive logic, but with very limited scope. You can induce to the universal if you know that all objects you are measuring have the same properties. Gravity is a good example of this. The fourth is more open, and argues for induction from the phenomenon to the hypothesis, as long as nothing observed contradicts the hypothesis. The latter rules caused some division among natural philosophers who felt that deductive logic alone could be used to make generalizations.

## Linnaeus

The work of Linnaeus (1707–1788) provides another example of observation being used to create a normative botanical classification system. Prior to Linnaeus the botanical classification system as we know it today did not exist. What he attempted to do was to create order from observations in diversity. Of significance to our discussion is that he used empirical qualitative evidence to generalize: Müller-Wille and Charmantier (2012) comment “That knowledge about the local use of a particular kind of plant or animal can be generalized to even its nearest ‘relatives,’ whether growing nearby or in distant countries, is not a simple matter of empirical fact” (p. 6). They go on to conclude: “Not all of the generalisations that Linnaeus put forward... would be verified—in fact, almost all his attempts to identify domestic substitutes or acclimatize exotics were doomed to fail” (p. 14). Importantly, Linnaeus’ ability to generalize was not dependent on having all the data required to draw a universal conclusion. However, what we could say is that as the number of his observations increased, the likelihood that his generalizations would hold true in other contexts would also increase.

## Darwin

Darwin (1809–1882) in 1833 embarked, as a natural scientist, in the *Beagle* for an expedition of 5 years, which went around the world and spent a long time in the coasts and islands of Oceania and South America. He recorded his observations and reflection in his research journals. After that trip he spent almost 20 years working on his theory of the evolution of the species, which he diffused in the book *On the Origin of the Species by Means of Natural Selection* (1859). The question about whether Darwin used deductive logic to generalize and so develop a theory of evolution or whether it was more inductive has been a point of contestation for some time (see, e.g., Caplan 1979). The reality is probably not an either (deductive) or (inductive) answer, but a creative combination of both that allows for generalization from inductive and deductive processes.

## Carnap

Skipping 200 years on from Newton and 100 on from Darwin, natural philosopher Rudolf Carnap (May 18, 1891–September 14, 1970) proposed that, consistent with Newton’s Rule IV, the greater the number of confirmations for the premises of an argument, the greater the probability generalization could be applied inductively. Carnap believed that, “just as logical implication is the key concept for deductive logic, so degree of confirmation is the key concept for inductive logic” (Gower 1997). Similarly probability associated with variability underpins the assumptions of generalizability theory which is used to assess the dependability of measurements associated with quantitative empirical studies (Briesch et al. 2014). The evolution of what was called the “scientific method” depends on the need to consider inductive processes carefully:

By ‘induction’ we are to understand a process which leads from particular facts to a general conclusion. The simplest kind of induction requires the particular facts to be positive instances of the general conclusion. (e.g., Gower, 1997 p. 52)

The point is that even the best quantitative studies suffer from limitations and that in both qualitative and quantitative studies, there is no such thing as certainty in generalizability. Comparing generalization from qualitative and quantitative research, Polit and Beck (2010) argue that the ideal of statistical generalization in science is nothing more than a “myth” (p. 1452) as is the notion of “random sampling” (p. 2453). Bringing these various historical and academic arguments together, we could feel some confidence in generalizing from qualitative research, with similar caveats which might be applied to quantitative research methods.

---

## Why GQR Is Possible

The argument for the approaches and processes or mechanisms of qualitative generalization are now well established. However, understanding why generalizability is possible is seldom unpacked beyond a mechanistic logic which in part is internally driven. For example, within a constructivist paradigm terms like “credibility, transferability, dependability, and confirmability replace the usual positivist criteria of internal and external validity, reliability, and objectivity” (Denzin and Lincoln 2018, Location 995). What we can conclude from this redefinition of terms is that generalizability in positivist or post-positivist paradigms (associated with quantitative methods) is not the same thing as generalizability in constructivist or interpretivist paradigms (associated with qualitative methods). Further, the difference in terminology should not imply that one form of generalization is better than another. Again, are we off the hook as it were? Is there further need to explore the topic?

A small clue as to why there might be a need to unpack the concept of generalizability emerges in Patton’s follow-up to principles of generalization mentioned above. He introduces the topic of “truth” (Patton 2015) deferring to Thomas

Schwandt's entry in the Dictionary of Qualitative Inquiry (Schwandt 2007) where ten definitions are briefly explained. Truth is of course the concern of philosophy, under the banner of epistemology. Truth theories cut across the methodological paradigms and help explain why and on what basis normative statements or generalizations can be made.

Knowledge (for our purposes of generalization), according to Lehrer (1990), has three conditions: it must be true; it must be accepted (or believed); and it must be completely justified. Research is defined internationally in terms of knowledge creation:

Research and experimental development (R&D) comprise creative and systematic work undertaken in order to increase the stock of knowledge—including knowledge of humankind, culture and society—and to devise new applications of available knowledge. (OECD 2015)

In the context of research, evidence enables justification, and consistent with the definition offered by Denzin and Lincoln above, the credibility of research makes it believable. But a question remains about what truth is. The answer to this helps us understand why and how we can apply qualitative or quantitative research to the task of normative generalization.

Truth theories fall into five main categories: (1) truth as correspondence, (2) truth as coherence, (3) truth as what works, (4) truth as consensus, and (5) truth as warranted beliefs (Bridges 2017). There are variations of these five categorizations (see, e.g., David 2004). However in simple terms, these theories suggest one of the following five positions:

1. A proposition is true only if it corresponds with an actual state of affairs or condition (Bridges 2017).
2. Propositional statements are true if they represent a coherent, consistent, and comprehensive set of propositions (Bridges 2017).
3. A proposition is true if and only if it works, allowing you to pursue your project/interest/purposes in practice (Bridges 2017).
4. A proposition is true if there is agreement universally or among relevant populations (Bridges 2017).
5. Propositions are true if they satisfy the relevant tests of truth for propositions of their kind; they are rationally warranted, reasonable, or defensible (Bridges 2017).

In the next chapter, Bridges goes on to draw connections between educational research paradigms and the theoretical positions listed above. For example, he links the pragmatist paradigm with “what works” theories of truth. While he does not make assertions about other truth theories, it is not too hard to see a link between correspondence and positivism/post positivism, coherence and constructivist paradigms, or consensus and participatory paradigms. Beyond the epistemological position of these theories, if we take account of ontologies and axiologies, the “paradigmatic controversies” (Lincoln et al. 2011) are little more than alignments

to truth theories. Hence we could then generalize from qualitative research, not on the basis of methodology but on the basis of epistemological, ontological, and axiological foundations of truth.

## **Merging of Qualitative and Quantitative Research**

It has always intrigued us that “hard science” contains a large amount of qualitative research. While scientists devise a hypothesis, then they often engage in something they call “proof of concept” which is a minor qualitative study conducted to establish the need or veracity of the hypothesis they dreamed up to start with. In other words, somehow or other qualitative methods are used to validate a quantitative concept but are not, in the cases we have been a party to, been given legitimacy as “qualitative research”: they have been justified only in terms of proving a quantitative/scientific concept/hypothesis. So that makes it acceptable. What would be more honest is if they actually said “we will do a qualitative study first to establish if our scientific one is really valid at the outset.” A hypothesis, after all, is simply a statement of a tentative conjecture about the likelihood of something being true or not, once tested. Such “proof of concept” of a hypothesis or research question is needed because in itself it provides more substantive “proof” that the hypothesis is worth exploring. Qualitative and quantitative research merges whatever the research is called. However, the goal of all research is to find something more of the truth of something. But what is ‘truth’, and how do we know when we ‘find’ it?

---

## **Illustrative Cases from Past Experience**

The following two case study illustrations based on our research in vocational education and adult learning provide a basis for reflection on the points raised above. They also provide a contextual springboard from which we can conceptually consider generalization from qualitative research.

## **Generalizing Across Contexts and Cultures: Training and Learning as the Interactive Reproduction of the Social Order**

In the discussion of generalization in this case study, we draw on Falk and Surata’s (2011) analysis of the vocational learning system in Indonesia, focusing on the province of Bali in particular. The interactive underpinnings and implications of different knowledge systems are made clear in the example of Balinese village life presented by Falk and Surata. Western notions of “industry” in terms of agriculture, tourism, and crafts are all subservient to and are consequences of the central role that the Balinese form of Hinduism plays in the cultural, vocational, and social life of the village. The social organization of the terraced rice paddies that derives from the religious culture then provides the community context for vocational knowledge.

Other examples include a builder whose skills have been acquired from an intense “apprenticeship” which involved no formal Technical and Vocational Education and Training (TVET) system training, but rather the interactive transmission of traditional knowledge mediated by religious ceremony. However, to this the builder adds new methods acquired from informal and largely Western sources.

Several strands of theory and research are drawn on and discussed in relation to the Balinese case studies of vocational learning in action. The case studies are of vocational learning as it occurs in the villages, local governments, and families. The TVET “system” is then compared with the ways most vocational learning is actually found to occur. Issues about generalizability arise regarding the underpinning theoretical issues about interactivity, as well as how these interactions are applied in different contexts. This in turn shapes the way findings and conclusions are made about vocational training and learning.

Social interactions underpin the nature of generalization discussed in this case. Lansing (2006) explains the role of interactive networks and the capacity of interactive networks to adjust flexibly and solve problems. Depending on the purpose and context, these networks could be vocational learning systems. Lansing’s research focuses on the Balinese rice irrigation system which relies on collective learning at the local level for successful farming outcomes. Lansing’s research is itself based on extensive longitudinal multidisciplinary research involving network theory, computer modeling, archaeological evidence, and mathematics. Lansing makes the generalization, supported by his and Falk and Surata’s research, that “...countless local interactions eventually produce a global optimum, with no need for centralized planning” (p. 195). The implications of the latter generalization have radical implications not only for any TVET “system” but for learning theory across cultures. The generalization suggests a strategy where policy and the local level vocational learning should work together for the mutual and sustainable benefits of each. In short, if local networks can not only “learn” and self-adapt to changing environmental conditions to produce the maximally beneficial outcome in terms of productivity and efficiency, it is crucial to ask the question as to what is the role of policy in building an effective TVET system?

One response to this question is that formal TVET policy systems should set up ways of interacting with the “informal” local learning networks (the local TVET systems) to see what each sector can learn from the other. The success over time of the informal systems as demonstrated in the research reported here therefore warrants scrutiny in order to see what can be done to assist learners in each sector, formal and informal, and find value and outcomes in the other.

In terms of generalizability, this is evident at several levels. First is the generalization about learning systems: “. . .countless local interactions eventually produce a global optimum. . .,” as Lansing puts it. The generalization is based on data which is “across cultures” in the sense that it is “not Western.” It is a generalization, however, which could apply in any culture. Moreover, it is not necessarily a generalization specifically about vocational learning, but it is applicable to vocational learning. The interactions referred to are not random. Rather they are purposeful in that they revolve around solving a specific problem or achieving a goal. In these

circumstances, the purposeful interactions form learning networks which in the cases discussed here produce relevant vocational learning outcomes at the local level.

The second issue for generalization emerging from this discussion regards its application to its intersection with formal policy, through the formal TVET system. In other words, what are the implications of the generalization about local learning systems for a formal social structure? After all, policy's main concern is with finding a single policy or strategy for problems that are generalizable to the largest number of people. If this is the case, then our discussion about local learning systems suggests that a single policy thought to be generalizable is likely to depend for its success on local processes and solutions: the interaction of these two vastly different systems provides practical food for thought in terms of the effectiveness of vocational learning (or indeed policy effectiveness in any field) in any society.

“Learning networks” – any group of purposeful interactivity – can achieve an ecological balance that at once achieves effective and productive outcomes while maintaining flexibility in problem solving. A generalization such as “learning networks” is a subset of “interactions” but with a particular purpose.

Earlier in this chapter, we quoted Bridges' (2017) elaboration of truth propositions/statements, which we revisit here:

A proposition is true only if it corresponds with an actual state of affairs or condition (Bridges 2017); Propositional statements are true if they represent a coherent, consistent and comprehensive set of propositions (Bridges 2017); A proposition is true if and only if it works allowing you to pursue your project/interest/purposes in practice (Bridges 2017); A proposition is true if there is agreement universally or among relevant populations (Bridges 2017); and propositions are true if they satisfy the relevant tests of truth for propositions of their kind; they are rationally warranted, reasonable or defensible. (Bridges 2017)

When the case of “local interactions” in Bali is considered, it is of interest that the local interactions which are the focus of the research apply in all five elaborations of Bridge's truth statements. Partly, this is because “interactions” are the fundamental means of building and maintaining human social structures of any kind in any place (e.g., Coleman 1988). However, local interactions here are examined in particular contexts all related to vocational learning. For example, one context is of the interactions involved in managing rice irrigation systems and another the interactions related to learning building skills. So the generalization in these cases not only involves the generalization of patterns of interactions but applies the concept of interactions to different contexts, which extends the scope of generalization beyond that of the original well-established notion of maintaining and building the social order. Moreover, patterns of interactions in specific contexts for specific purposes are then referred to as “training,” “vocational learning,” or “learning networks.”

In summary, in these Balinese cases, a large proportion of the interactions are built into the religious rituals and ceremonies. It is through these rituals and ceremonies that agricultural and other vocational learning practices are maintained and built through the interactive reproduction of the social order. Put more simply, in this case of “vocational learning,” generalization is seen to occur through instances of the interactive reproduction of the social order.

## A Case of Multiple Sites in Diverse Australian Contexts

In 2015, Australia's National Centre for Vocational Education Research commissioned a study to examine how remote training programs could be more successful. The rationale for the research was essentially the low completion rates of remote Aboriginal and Torres Strait Islander learners – about 10% of course starters complete their training in very remote parts of the country. The study used a five-site case study qualitative design and deliberately examined different training programs. A total of 69 people were interviewed, including employers, trainers, trainees, and nongovernment organizations. These programs were an aged care course, a health worker course, a ranger training program, an adult literacy campaign, and a mental health worker training course. These programs were about as diverse as we could find, but they were all considered successful by the training providers which delivered them (see Guenther et al. 2017 for full analysis and discussion).

One of the features of remote Aboriginal and Torres Strait Island communities is not so much their geographical isolation from large urban centers – remoteness is after all a construct of the urban metropolitan hegemony used to define and delimit them – rather, it is their connection with ancient cultural traditions and cosmologies. It is in these spaces that the generalizations usually applied to vocational learning in the urbanized metropolis fail spectacularly. For a start, the “truth” of human capital theory which argues that people invest in education and training for the purpose of gaining an economic benefit (Becker 2002) does not apply (evidenced by low completion rates). A second generalization often applied to vocational and adult learning is that it logically is a causal pathway into work. Data gathered for the justification of the project showed in these Aboriginal and Torres Strait Islander communities that it was often nonlocal people with relatively low qualification levels that filled labor market gaps (see McRae-Williams and Guenther 2014; Guenther and McRae-Williams 2014).

It turned out that only two of the five programs could demonstrate success with their course completion data. However, all programs shared common characteristics which pointed to different conceptions of success beyond completion. These included outcomes related to foundation skill development, improved personal confidence, and strengthened identity. Underpinning the revised definition of success was a common core of connection to locally accepted values (axiologies), ways of being (ontologies), knowledges (epistemologies), and understandings of belonging to their land or “country” (cosmologies).

While on the one hand the research dispelled previously accepted generalized truths (an important generalizing function of case study research as noted earlier), it went some way to confirming previous research which put forward theories of knowledge reproduction and application based on Aboriginal and Torres Strait Islander cosmologies, epistemologies, axiologies, and ontologies (McRae-Williams and Guenther 2012). As such it provides new empirical qualitative evidence, increasing the probability that the findings are indeed generalizable to a number of similar (in these cases, “remote” Aboriginal and Torres Strait Islander communities)

learning contexts. Methodologically the use of five similarly “remote” case study sites but with five diverse learning contexts is important for confirming the tenets of emerging theory. While we would not dare suggest that five cases are enough to be 100% certain of generalizable truths about the uptake and success of training, we are 100% sure that the old paradigms which purported generalizable truth are indeed false.

### So What Can We Conclude from These Case Studies?

Our case examples are consistent with a view of generalization, not as an end in itself, but as a process – one that requires constant revision, testing, and clarification – which leads to normative truth statements. As Cronbach (1975) states: “Generalizations decay.” That is, over time, or in a different context, those truths that once held true may no longer hold true. With the Australian remote training case, we would venture to suggest that in 20 years time, only some of the themes that were common to all sites would remain so in a similar study. The generalization process, which we have diagrammatized in Fig. 1, is therefore iterative, allowing for both contestation and confirmation. The qualitative data collected as “empirical evidence” may support the development of new theory or additions to existing theories. Similarly, as theories emerge, they can be tested with new data. With each

Fig. 1 The cycle of generalization from qualitative research

confirmation in the generalization process, the probability that the knowledge gained, can be applied more generally, should increase. Where contestation occurs (as happened with the remote training case), new processes of generalization occur, which in turn lead to normative truth statements – at least for a time.

For the researcher, the starting point for research may not be at the bottom of the spiral. It is quite possible that new research builds on existing normative truth statements, existing theories, and existing evidence. The Bali case of social interactions is a good example of this. The research described was ostensibly about vocational learning. However, as noted, the learning was embedded in a system of social interactions, rituals, and ceremonies that carry their own normative truth statements. The new knowledge that emerges from the vocational learning research does not displace these truth statements. Rather it adds a new cycle of generalization that further increases the probability that the truth will hold more generally to other cultural contexts.

---

## Conclusions

The foregoing discussion has several implications for generalizability in qualitative research, and we forward these knowing that the field of VET research has been proactive in fostering qualitative research and using its outcomes. Having established that a) the definitions of generalization, based on quantitative research paradigms, are inadequate and b) that generalization is a process in research not a product of research and c) that generalization is an iterative process, not a once and for all outcome, we can be confident that qualitative research can play a significant role in the production of epistemological truth. Our analysis of the history of generalization from research shows that it has in the past, despite the more recent arguments of self-justification which dominated the latter part of the last century.

Our first conclusion that emerges from the historical and contemporary examples we have drawn in is that generalization from qualitative research is possible. We no longer need to self-justify generalization on the basis that “we can because we do.” Throughout history we see evidence of the process – a cycle of generalization – of creating new knowledge iteratively, where truth statements are contested and confirmed drawing on evidence and theory. However, our understanding of generalization is not an excuse for poor methodology nor should we be looking for generalizable truth to emerge from every piece of qualitative research. Truths emerging about the particular are often just as useful as those that lead to the general. In the case of qualitative educational research though, design for generalizability will be crucial when normative claims or theories are required either to explain why educational policies, practices, and systems work the way they do (or not).

The historical aspect of our reconceptualization shows that the processes of generalization are common across qualitative and quantitative research. They both use theory and evidence to create normative statements of truth. They also both use refining processes to clarify, refine, or reject normative statements of truth.

Our reconceptualization of generalization also has implications for the use of qualitative research for informing policy, including in the vocational and adult

learning space. Our experience suggests that many policy advisors are reluctant to use qualitative research largely because of the self-deprecating limitations that qualitative researchers impose on their own work. What we can now say with confidence is that well-designed qualitative research can be just as useful for generalization as well-designed quantitative research. As we have shown with our case studies, the iterative nature of qualitative research lends itself well to theory development, and confirmation or rejection of normative truth statements – and the more this occurs, the greater the probability that those truth statements will hold generally, not just to the particular.

This leads us to another important conclusion about the design of qualitative research for generalization purposes. Researchers must first be able to position themselves within a frame of existing statements of normative truth. Then from a theoretical and data gathering perspective, they must ask research questions that will respond to the existing knowledge base in ways that will clarify, challenge, or confirm truth. In some cases, the new knowledge created may lead to a rejection of preexisting assumptions of truth (as was the case with the Australian example), and in others it may build upon and add to the existing truth statements (as was the case with the Balinese example). Regardless, having positioned themselves in this way, researchers will be able to confidently make new statements of normative truth, and with each iteration of the generalization cycle, they will be able to do so more confidently.

Finally, and perhaps more importantly for vocational training practitioners, the role that qualitative research plays in building normative truth about practice is fundamentally important. We would argue that no amount of “counting” will make a scrap of difference to the practices of teaching and learning in adult learning contexts. Practitioners will inevitably be keen to learn how to teach better. While quantitative evidence might show with some probability “what works” (see, e.g., Hattie 2009), it will struggle to show individual teachers how to make “what works” work for them. This is perhaps why there is so much good qualitative research that draws on theory to give practical and generalized guidance to teachers and learning organizations.

Having established generalizable principles or theories, qualitative researchers cannot rest on their laurels either. Contexts change, policy changes, technologies develop, public perceptions change, and culture changes. The emerging nature of normative truth claims can seem elusive for qualitative researchers in the field of adult learning. Researchers need to continually take account of the changing policy and adult learning practice environments in their research, thereby revising their truth claims and theories.

## Abstract

The notion of competence continues to be a major theme of vocational research. Notions of key competencies, in particular, continue to evolve in response to arguments about the new learning requirements of work and citizenship in the twenty-first century, including the rise of an interest in cross-cultural competencies. Yet there is still much controversy over the definition of the most important competencies and over their means of acquisition and assessment. There are questions, too, about how competence needs are identified and addressed in workplaces. Indeed, there are also powerful philosophical divisions among those who advocate competencies as a core aspect of learning systems. Debates about competence have thrown up a range of alternative and additional concepts. There are concerns that competence is best suited to describing a floor of minimally acceptable ability to perform, which is appropriate for assessing basic fitness to practice, particularly for those exiting initial vocational learning. However, where the emphasis is on innovation, artistry, or mastery, then it may be

that some further notion of excellence is required. However, such concepts often include stronger elements of tacit knowledge and more of a sense of subjective quality, making their measurement and assessment more challenging. There is little need to further define and discuss the issue of competence and competence development. However, the interface of *competence* and *excellence* needs further exploration. This chapter explores relevant research that has addressed the concept of competence and excellence and posits ways in which both can be achieved in vocational education and training.

## Competence Versus Excellence

Several authors have reviewed and discussed research regarding the possible conundrum of competence versus excellence. Evers and van der Heijden (2017) presented views of the divergent meanings of expertise regarding competence development. Hager (2017) identified a supposed limitation of competence standards, indicating that standards may discourage excellence by means of prescribing minimum standards in assessing competence. He further summarized current thinking by indicating competence-based assessment can, indeed, address a full range of expertise, from excellence to failure.

Mulder and Winterton (2017) purported that competence goes well beyond a minimum of performance. Competence does not necessarily prescribe a minimum; instead, competence depends on how high the standard is set, adding to Hager's (2017) viewpoint that there are gradations of competence assessment. But excellence does not mean "brilliance"; competence does infer additional opportunity to develop to a higher level.

Work at the US Military Academy at West Point was intended to move instruction to higher levels of trainee accomplishment by implementing four basic principles (Smith 2010). Programs and instructors must have high expectations for high levels of success, indicating that students should be expected to achieve excellence beyond skill attainment. Such an endeavor, the report continues, includes expanded opportunities for students to learn, focusing on significant outcomes and designing curricula based on proposed outcomes. Smith concluded that the outcome-based training programs should serve as a model at the university level or in any institution that requires students to excel in more than academics.

Vocational education and training standards in Lithuania, as discussed by Tütlys and Aarna (2017), include two factors: minimal performance requirements as well as the lack of attention to future needs in skill development. Further, they posited that the standards were lacking excellence indicators for the highest quality of performance.

Bowden (1997) drew upon earlier work by Gonczi, Hager, and Oliver in describing levels of competence-based education. Although his work concentrated on the state of affairs in Australia, there is probably ample evidence that the dilemma is not unique to the commonwealth. Bowden asserted that addressing issues in competence-based education must proceed from two points: that the quality of student learning is central to any argument and that the competency movement and the nature of higher education have developed over time. He further indicated the unfortunate situation regarding the disconnect between vocational competence excellence and the need to prescribe work performance that a competence-based approach is appropriate for technical training but not university education and that competence development is regulated to a certain group of students.

Bowden purported that while there are differences among countries and across time spans, the basic principles have remained: a focus on outcomes, greater workplace relevance, observable outcomes, assessments of competence and excellence, and skills recognition. Specifically, the focus on observable outcomes (competence) demands setting of goals, monitoring progress, and achievement recognition. In reviewing the four-level hierarchy of competence development, Bowden described the important trends: increasing the complexity of outcomes (competence), broader curriculum requirements, more complex assessment requirements, an increasing ambiguity between objective and outcome assessments, and an increasing need for professional judgment in assessment.

Mulder (2017a) purported from a synthesis of competence theory and research that competence mastery is not limited by standards, but that competence can be mastered at various levels including excellence and brilliance. Competence is key to effective performance. An important aspect of determining the competence that individuals need is not just for the present but also to address future challenges globally. Barrick (2017), in a review of competence-based education in the United States, also described the relationship between competence assessment and skill mastery. Further research related to vocational excellence (Nokelainen et al. 2017) also identifies self-regulation as a central concept in competence development. Goal orientation, for example, is stronger among employees who exhibit excellence. And finally, Harteis (2017) summarized characteristics of excellence in three terms: comprehensive knowledge, routine, and intuition.

When considering how effective competence-based degree programs can be implemented, Klein-Collins (2012) emphasized the need for strong leadership, rethinking staff and courses, establishing alternative degree pathways, and developing a system of reliable assessments. She concluded that assessment is vital for achieving excellence in quality and value of competence-based programs and that guidelines to assure high quality and rigor are essential.

In a model discussed by Soares (2012, June), the author described the progression of assessment in a learning model that culminates beyond the acquisition of competence; learners must be able to successfully demonstrate performance through assessment and achieving excellence. The model includes four levels of conceptual learning, beginning with traits and characteristics of the learner that serve as the foundation of their learning; they dictate the learning experiences that ensure the

acquisition and development of skills, abilities, and knowledge. Through integrated learning experiences, competence is attained, leading to the ability to demonstrate competence and assessment of performance. While some form of assessment is included at each level, the determination of overall excellence is provided through a summative assessment approach. The question remains, then, how vocational competence development can and should lead toward excellence.

## Competence-Based Vocational Education and Training

In a Canadian study, Bell and Mitchell (2000) investigated perceptions of students enrolled in a pre-apprenticeship program. In comparing student perceptions between those in a 36-week traditional cohort group and those in a 1-year competency-based group, the researchers reported differing experiences of the content. Students in the traditional group distinctly perceived a split between theory and practice, while the competency-based group did not. Further, students in the competency-based group were less adversely affected by described academic history and literacy difficulties. The researchers concluded that the competency-based approach to technical education provided advantages in terms of technical competence, learning, and theory/practice integration. As a sidelight, the researchers also discussed the competency-based approach advantages in social development and administrative issues such as scheduling, space allocation, and evaluating student progress.

Mulder presented a comprehensive summary of foundational research on competence-based vocational education and training. Mulder's work (2017b) stems from a thorough review of the comprehensive 2017 text, *Competence-based Vocational and Professional Education: Bridging the Worlds of Work and Education*, on competence-based vocational and professional education. The concept of competence-based education continues to spread, from industry to all levels of formal education. Mulder notes, however, that assessing student competence is getting more attention than supporting student learning. Certainly, assessment is needed, but the question arises whether and how competence-based frameworks for curricula lead to and promote authentic student learning. In some arenas, skills development and assessment have supplanted competence development, leading to teaching skills rather than developing competence.

In higher education, the issue of competence and excellence versus course and degree completion is gaining new attention. Oudshoorn-Fuller et al. (2016) synthesized a number of studies that addressed teaching approaches that should lead to increased student competence. They indicated that utilizing community-building activities, enhancing academic competence, and offering freedom to advanced students appear to be plausible while retaining structure and setting explicit learning objectives for the learners. The researchers also concluded that promoting the connection between the professional field and educators will result in curricular changes to further guide student development, improving the connection between education and practice, and allowing students to develop and enhance competence and behaviors that are essential in their chosen profession. In summary, excellence in

competence development hinges upon the expectations of the profession; educators by themselves may not advance excellence while encouraging competence development among their students.

Rein (2016) provided an overview of competence orientation and development in higher education. As with the Oudshoorn-Fuller et al. study, Rein focused on the juncture of theoretical, instrumental, and practical approaches on education competence and excellence. A main theme of the research centered on the potential interface of higher education and vocational education and training. He surmised that this interface would promote the connections between qualifications in competence excellence and transferring skills and learning outcomes in both academic and nonacademic settings. The driving force, as is apparent in most competence studies, is the increasing requirements of industry and the labor market, since few if any education programs are designed to nurture and develop academic and professional competence. A holistic approach is central to solving complex problems within and beyond academia. Excellence is more than excelling in academic pursuits. Current pedagogical and assessment approaches will need to address academic and professional excellence.

In a study of competence-based vocational education (CBVE) in Ethiopia, Solomon et al. (2016), the authors, concluded that CBVE is practiced in the training and vocational education system in that country but not performing well within that dimension. The system reportedly lacks a practice-oriented learning environment which is essential to competence development and therefore vocational excellence. The challenge is based on the lack of resources and an underdeveloped industrial base within the country. A strong correlation between education and training and graduate job performance was noted as well as a positive correlation between organizational and social conditions and performance. As these issues are addressed, excellence in job performance will emanate from excellence in competence-based programming.

---

## Vocational Excellence

Klotz et al. (2014) conducted a study that was aimed at promoting workforce excellence, concentrating on vocational identity in vocational educational training. They posited that vocational training includes more than factual knowledge and procedures, indicating that vocational identity is a key outcome of vocational education that is integral in how students learn and perform. In their work, the researchers developed a theoretical model to show that practical training, workplace integration, and free career choice lead to workplace and vocational identity which, in turn, lead to workplace effort and vocational competence. Practical training is enhanced through training that is school based as well as industry based; integration involves students as apprentices in actual workplace operations; and a vocation implies a “calling” to the occupation where the student has a choice in careers. The study involved students in vocational and apprenticeship programs in Germany providing perceptions of identity and effort. Generally, the key factors in the

theoretical model were related, indicating that indeed the program characteristics, identity factors, and performance worked in harmony. They concluded that vocational identity is a crucial factor for the development of excellence in the workforce.

The Commission for Adult Vocational Training and Learning (2012) in the United Kingdom can best be summarized by the statement that excellence starts with the teacher. However, they also concluded that there is not a single recommended pathway that results in having world-leading vocational education and training for adults. The researchers identify several characteristics of a positive further education system for excellence in vocational education. Among those characteristics were the following: national policies for teacher qualification, a culture of professionalism with professional organizations supporting excellence, strategic leadership, employer engagement and employer opportunities for teachers to improve, up-to-date resources, teachers serving as positive role models and as experts in their fields, and ambitious learners who are attracted to excellence teachers. An overall premise of the report is that vocational teaching must be an attractive career choice, leading to highly qualified teachers who promote excellence.

Researchers have examined competence- and competence-based education in a variety of settings. While a common understanding may not exist, the basic tenets as described by Suvedi and Ghimire (2018) indicate that vocational educators agree there is a profound need for clearer understandings of those tenets. They argued that excellence is performing at the maximum expected level; excellence provides the highest satisfaction to the individual learner. The authors identified a series of attributes that may be associated generally with excellence in education and particularly in vocational education and training, including such areas as a high level of skill development (both technical and “soft” skills), problem-solving and decision-making, transfer of learning, and persistence and perseverance. Those attributes naturally lead to a series of identified benefits associated with excellence in competence-based vocational education. Such concepts as technical skill (the fundamental purpose of vocational education and training) and non-technical skill development are coupled with more personal attributes such as communication, creativity, confidence, and time management and serve as benchmarks in determining the level of excellence attributed to competence development. Finally, they identify the role of educational institutions in ensuring that vocational education and training programs strive to achieve excellence in and for their students.

Given, then, that a set of attributes of vocational excellence can be defined and described, Relly and Keep (2018) examine approaches to achieving and recognizing vocational excellence. They draw heavily upon the WorldSkills Competition movement to illustrate how competitive events can be utilized in a variety of subject areas to encourage competence development and excellence and to reward participants and programs for their achievements. Several examples are presented, primarily in the United Kingdom. However, the premise is developed that the concepts involved in such competitions are applicable throughout the European area and probably worldwide.

Smeaton et al. (2002) also examined how UK Skills (a national subset of WorldSkills) promotes world-class standards in vocational skill development. They posited that UK Skills goes beyond competence development; the interest of the program is to encourage the pursuit of excellence. That is accomplished in several ways but primarily through competitions. To achieve that overall goal, a curriculum is required that promotes the mastery of skills as well as excellence in vocational learning. Five key attributes were identified: motivation and competitiveness among participants, the ability to organize work, an awareness of high standards, resilience and the ability to work under pressure, and social, communication, and teamwork skills.

---

## Vocational Competence and Excellence

More than 9.2 million of the 14.9 million secondary school students in the United States are enrolled in some level of career and technical education (CTE) courses (Israel et al. 2012). In a study designed to assess science achievement, the researchers examined science achievement scores of CTE students in science, technology, engineering, and math (STEM) programs as well as students in health CTE and students not enrolled in any CTE or STEM program. The researchers found some differences (slightly higher of slightly lower scores) among STEM (including agriculture and natural resources) students but generally higher science scores for all groups compared to the non-STEM/CTE students. Further, science scores tended to increase as students were enrolled in additional STEM or CTE courses. The conclusion, then, was that enrolling in STEM/CTE courses does not have a negative effect on science achievement. If a concern arises regarding the importance of excellence, it could be purported that enrolling in STEM/CTE courses enhances science excellence.

The Carl D. Perkins Career and Technical Education Act of 2006 in the United States provided for the appointment of an independent panel to advise the US Department of Education on the implementation of the National Assessment of Career and technical Education (NACTE) (Independent Advisory Panel 2014). The NACTE offered three major challenges to address and enact need improvements in career and college readiness in US schools. The third challenge was to “gather robust, actionable information about the implementation and outcomes of career and technical education.” Importantly, the report called for clearer definitions of outcomes and set standards for the validity and reliability of outcome measures. Monitoring the implementation of college and career readiness programs was inherent in that effort. Seemingly, this was an initial step in defining excellence in college and career readiness federally funded programs in the United States and effort that apparently was lacking in previous legislation.

Utilizing vocational (career and technical) education student organizations to help guide the teaching and assessment of student skill development is particular to the United States. While many countries, especially in Europe and East Asia, promote and support skills competitions for school students, none are connected to a broader

organization that is designed to develop students in ways beyond skill attainment. Zirkle and Jeffery (2018) trace the history of the development of vocational student organizations and provide various examples of how those organizations are intended to develop the “whole person” instead of simply training and skill development in a specific sector of the workforce. The authors encourage the profession to delve into additional inquiry aimed at determining the extent to which student participation and student success may be related.

Three approaches to competence proficiency scaling are identified and described by Tütlys et al. (2018): methodological approaches, contextual factors, and implications for vocational and professional education. Proficiency scaling is basic to competence assessment. Scaling must involve levels of competence that can be exhibited as well as specific criteria to determine where performance falls along the established scale. Behavioral, functional, and multidimensional approaches to assessing competence are explored. Further, the context within which the competence is developed is identified as a key consideration in determining appropriate scaling methods. Various examples are provided to show how the concepts can be applied to vocational education settings.

---

## Achieving Excellence

Establishing competence standards in vocational education and training appears to be a precursor to achieving excellence. Various methods and techniques are used worldwide to help students achieve vocational competence. An important factor related to skills development and competence is career readiness or enabling successful school-to-work transitions. Various researchers have investigated the role that skills competitions may play in skill development as well as career readiness, hopefully enhancing relevant work-life skills. Positive effects for students as well as instructors and trainers exist in certain arenas, such as WorldSkills. There appears to be a need to ascertain the extent to which vocational skills competitions, and the success of participants, enhance the image of vocational education and training.

As Nokelainen et al. (2018) and Tyson (2018) indicate, there is general agreement that excellence is worth striving for in vocational education and training. Given that stance, the next question involves the processes that are and/or could be utilized in education for excellence. Two paradigms emerge: the WorldSkills approach (discussed in other chapters) that emphasizes the attainment of a specific set of skills and the neo-Aristotelian approach with additional emphasis on virtues and dispositions relevant to the vocation. Tyson further concluded that the narrative approach is fairly well adopted in educational practice, but additional inquiry and writing is warranted on the reflective aspects of competence development and excellence. At best, additional research should address both approaches as well as the interface of the two approaches, as proposed in this chapter, ultimately leading toward greater self-awareness and understandings.

There are skills, and then there are skills needs. The discrepancy between the two (assuming the needs outpace the acquired skills) creates a skills mismatch (Na 2018). Literature through the years has used terms like employability and employability skills to discuss the need for and, at times, lack of essential work competence among potential and current employees. In essence, skills mismatches are a supply-and-demand phenomenon; business and industry create the demand for vocational and technical skill excellence, and the vocational education and training sector attempts to provide the supply to meet that demand. The discrepancy or mismatch of vocational skill development and competence creates a line of inquiry that is essential for achieving vocational education and training success. Na concluded that there remains ample opportunity for additional contributions to the debate surrounding the concept of skills development, its dynamic processes, and its consequences. Mismatches between skills development and skills needs of industry could also include a more holistic perspective as viewed through a multidimensional lens.

---

## Work Readiness and Global Competence

Technological development continues to advance at a quickening pace (DiBenedetto 2018). Organizations in Europe and the United States have addressed the issues surrounding the development of skills and competence to meet the needs of twenty-first-century business and industry. While technical skills will remain an important aspect of vocational training and development, other areas continue to grow in importance. These skills, often referred to as employability skills, encompass all the nontechnical attributes desired in the modern worker. Being ready for work requires competence in all areas, especially since the employability skills are key for worker adaptability as the job changes and new technical skills become essential. Much of that discussion is contained within what the World Economic Forum has labeled the fourth Industrial Revolution. DiBenedetto outlines a series of constructs intended to identify the knowledge, skills, and dispositions for career readiness in a global society. They include, among others, learning and life skills, career and social skills, knowledge competencies and experiences, and interdisciplinary topics.

Pylväs and Nokelainen (2018) highlight a dimension that is often assumed within vocational education and training yet infrequently discussed and studied. That is the ability of humans throughout the world to act and interact with others in a diverse, global, complex environment. Educating future world citizens as members of the workforce requires broad understandings of the global community and intercultural communication as a part of striving for vocational education excellence. Those dimensions must be within the context of education and work. Further, the authors conclude that global competence and excellence dimensions may have created contextual imbalances such as between higher education and vocational education and training or Western versus non-Western cultures. These imbalances must be addressed in future research.

## Conclusions

A variety of factors may contribute to excellence in vocational education and training in the broad spectrum of competence development. Generally, research clearly provides evidence of strong connections among those factors, with the understanding of concerns and potential issues that should lead to the next steps along the continuum of bringing clarity to future directions.

Competence-based approaches have been a mainstay of vocational education and training for many decades. One could argue that all of education is, or should be, competence-based. Foundational research in this arena has progressed from creating programs and courses that are based on competence development to massive undertakings in the assessment of learning, that is to say, in assessing the result of vocational education and training in addition to adequate planning and development at the start. From relatively simple, straightforward, short-term instructional activities, prevalent in military training, to courses, certification programs, and college degree programs, determining whether completers have gained competence beyond merely showing up for instructional activities is now the norm.

The logical extension, then, is to ascertain the degree or level of competence achieved in the vocational education and training venue. As noted periodically in the research summarized in this document, competence and excellence are often used interchangeably. But there is evidence to suggest a need for clarifying the degree of competence that learners achieve, going beyond a simple yes/no response to the question of whether the learner has achieved. Accountability measures, whether reviewing courses or complete programs, tend to measure success by “checking off” whether the standard has been met and, therefore, competence has been achieved. But this approach short changes the efforts of vocational educators and the professional training community in attempting to differentiate between those who have merely met the standard and those who have excelled.

Although competence evaluation was not a focus of this document, suffice it to say that progressing beyond simplistic measures of competence is paramount to the continued development of a well-trained workforce and provides opportunities for advancement in the job and career. Central to that movement is the ability to reward excellence beyond meeting the basic standard of achievement. In the broader education community, utilizing grading rubrics allows the assessor to indicate the level of competence in terms such as meets the standard, exceeds the standard, and displays excellence in exhibiting the standard. Truly more effort is needed in focusing on the identification of excellence if achieving excellence in competence development is the goal. Competence *and* excellence go hand-in-hand.

## Abstract

Several competence theories have been developed, and much competence research has been conducted during the last decades. Various competence solutions emerged at conceptual, strategic and operational level in the fields of corporate strategy, human resource management, education, training, and

---

e-mail: [martin.mulder@wur.nl](mailto:martin.mulder@wur.nl)

the development of personal effectiveness. Furthermore, the competence-based education philosophy has deeply entered the vocational education and training sector worldwide. Despite much criticism in certain countries, the competence-based vocational education and training (CBVET) philosophy has been attractive to many stakeholders in this field. This attractiveness can be easily explained, since CBVET addresses some perennial challenges in VET: the alignment with requirements of the labor market and entrepreneurship (including self-employment), the inclusion of applying knowledge and skills in practice, the hybridization of work and learning, the attention for the attitudinal dimension in professional identity, the focus on increased self-regulated learning, and the shift from final exams to portfolio development and formative and authentic assessment. Without the pretention of being exhaustive, this chapter, on the foundations of competence-based vocational education and training, gives a review of eight theoretical views on competence, which emphasize performance, self-determination, alignment, professional knowledge, shaping, effective instruction, capability, and human development. The chapter then reviews the current states of affairs regarding competence practices, characteristics of mature CBE systems, and discussions about definitions. The chapter is concluded with an outlook on competence for the future. Amongst all future-oriented competencies, learning competence remains most important. The development of all other competencies is depending on that.

## Introduction

In the 2017 movie “The Wizard of Lies,” directed by Barry Levinson (who also directed *Rain Man*), the story of the fraud made by Bernie Madoff, known as the largest Ponzi scheme ever, is told. Remember that the volume of the scam mounted to a dazzling sum of 65 billion US dollars, hitting thousands of people, including family and friends. The crime committed lasted for about 16 years, from the beginning of the 1990s until December 2008, when Madoff wanted to turn himself in, which however was actually done by his sons, after he had revealed his criminal acts to them. The movie shows Independent Financial Fraud Investigator and Analyst Harry Markopolos who said he had been warning the US Securities and Exchange Commission (SEC) already in May 2000, handing in evidence for the case. However, the SEC did not follow this up, so Madoff could continue his malpractices another 8 years. In the movie, Madoff (Robert De Niro) watches the television statement of Markopolos and alerts his wife Ruth (Michelle Pfeiffer) to it, who asks what this is about. Then Madoff explains the SEC was warned, but did not act against him, causing Ruth to conclude that the government agency was *incompetent*, which was confirmed by Madoff, claiming he was saying that for years already. Had the SEC followed up on the investigations of Markopolos, a lot of misery could have been ended significantly earlier.

However, was incompetence the real reason why the SEC did not intervene? There is some doubt about that; some state that corruption was the cause why Madoff could go on this long.

Whatever the truth, which will never be revealed, the point in case is that incompetence is often used as the major reason to blame people or institutions, justified or not, for why things are going, or will go, wrong. Look at other movies. Striking examples can be found in *Philadelphia* (1993) and *Skyfall* (2012). Government agencies, politicians, and administrators are frequently accused of being incompetent. But sadly, incompetence of people and institutions is not only featuring in motion pictures but also in real life. When “incompetence” is Googled (yielding over 35 million results in July 2018), lots of examples of bad performance are discussed of, for instance, medical doctors (“incompetent doctors” yielded over 6 million results), police officers (nearly 6 million results), and teachers (over 5 million results).

What is it that the concept of competence is so frequently used to underline the importance of being good in ones’ job and to perform well? The answer seems to be obvious: otherwise, too many people suffer from behavior of incompetent people and organizations. Think of the errors within the medical profession, the below-standard pedagogical and didactical performance of a number of teachers, and disputed behavior of certain law enforcers. Of course, this goes hand in hand with personal and professional integrity and attitude, work pressure, regulations, and assessment conditions. But incompetent behavior is generally regarded as being undesired.

Incompetence, however, is not only an issue of individual shortcomings. Competence can be constrained by cultural, organizational, and structural labor conditions. For instance, in non-meritocratic societies, in which education is not being regarded as a vehicle for individual vertical mobility, the intention to make sure that all graduates will be competent in their field may be regarded as useless. The reason for their employment and career success may be dependent on quite different personal factors such as belonging to a certain tribe or societal class. But also in societies which value professional competence, there should be opportunities to use this. A pressing problem in this respect is that in many countries not all graduates can find a job or create a livelihood by self-employment. This makes it hard for labor market-oriented education to be regarded as being successful. This problem is most prominent in societies with high youth unemployment rates. So what is important here is that inequity frames in the labor market can impede the use of acquired professional competence. When there are insufficient opportunities to find jobs, competent job performance of the unemployed, obviously, is not going to happen. See, for instance, the work of López Fogués (2014), who analyzed the state of youth unemployment in Spain and who contends that there is a lack of “guaranteed work” for students who graduate. Apart from the fact that it will be hard to “guarantee” employment for graduates, she is right in this analysis. She also states that vocational education and training, which is closely related to the labor market compared to other parts of the educational system, and especially competence- and skills-based education are not being effective. She argues that it is important to introduce “capabilities,” as possibilities for employment, which is seen as a matter of labor market policy. Actors in the labor market should enable graduates to get jobs; they should be given these capabilities as opportunities, in a sense as a basic right. This, however, is not an issue that can be solved by vocational education; the education system cannot create jobs. The critique that is often brought forward that competence or skills-based education is not effective, since it does not help graduates to find jobs, is therefore not just. Competence- or skills-based education, nor any education, can be solely blamed for labor market failure. It may be so that this type of education is not implemented well in Spain, or the region of Valencia, about which the story of López Fogués goes, but it seems that labor market imperfections are projected on certain vocational education and training practices. This chapter argues that the very purpose of the competence–approach in education is to adequately prepare students for being able to cope with the challenges of their future working, societal, and personal life. As a disclaimer, however, not all educational policies and practices which are being implemented under the label “competence-based” are really competence-based. A lot depends on how competence, competence-based education, and quality of competence-based education is conceptualized and implemented in practice.

This blurry use of competence theories and diversity in competence practices is the reason as to why there is so much confusion, dissatisfaction, and controversy about competence-based education. This is particularly disturbing because there are many countries across the globe which are implementing some form of competence-based education, not only within vocational education and training but also in elementary, secondary, and higher education. For the latter, see, for instance, the way in which Western Governors University implements competence-based

education (they call it competency-based education). In the July 31st (2017) issue of *Business*, Alana Semuels describes this innovation, although she also shares concerns and poses critical questions. Western Governors University, as she describes, is a not-for-profit school which was created by governors from 11 states in the USA in the mid-1990s. The goal of this institution was and is to better prepare students for the world of work, by using technology to enhance learning. However, it seems that assessment of student competencies is getting more attention than the support of learning, and the question is whether that complies with good competence-based education. Assessment is necessary, but it should be balanced with competence frameworks which are the foundation of the curriculum, the curricula themselves, and learning, as the core of the education process. It is because of the overrating of the importance of assessment of competencies in the UK, which resulted in the negative critiques of its competence movement and current embracement of a skills movement, if that would be any different. The objective of competence-based education after all is also to teach skills, of which many are cognitive and require in-depth knowledge, and to develop a professional identity, for which teaching educational objectives in the affective domain is essential.

This chapter, on the foundations of competence-based vocational education and training, tries to review theories on competence-based vocational education and competence practices which have emerged. It will first point at competence practices conducted by various associations and organizations, including institutions for vocational education and training. The chapter will then give an overview of characteristics of mature systems of competence-based education, which can be used to differentiate between more and less competence-based education systems. The chapter then gives a series of examples of competence frameworks for different professions. This will show the weight of the competence movement in defining the content and levels of professional performance. The chapter will then address the definition issues regarding the concept of competence. This part of the chapter is kept short, since much has been written already about the heterogeneity of definitions of the concept of competence. The chapter then finalizes with a call for attention to the importance of a reflection on future-oriented competence. This is particularly important in vocational education and training, which in many countries has the image of not being able to keep up with the developments in the world of work. An important pitfall of vocational education and training is that it is geared toward narrowly defined competencies which reflect the needs in present well-known jobs, whereas the nature of work is radically changing and profound transformations of societal, economic, industrial, and labor processes are taking place.

This chapter is largely based on a review of the literature collected in the edited volume *Competence-based Vocational and Professional Education. Bridging the Worlds of Work and Education* (Mulder 2017a). In this volume over 80 authors shared their insights in competence, competence theory, competence research and policy, practices, and educational systems issues regarding competence-based vocational education. The chapter also builds on the review of the literature on future-oriented competence frameworks (Mulder 2016). Finally, recent sources were used to complement this chapter.

## Competence Theories

In this section various theoretical approaches of competence will be presented. The section will point at the importance of the work of White and the research on achievement motivation which followed from that (Elliot et al. 2017). Next, the section will go into the relationship between competence and performance. Finally, it will give a brief overview of how competence entered the debate about the improvement of quality of teaching and education. But first an account will be given of the theoretical views on competence. Eight theoretical approaches will be reviewed, which ends with a short reflection about the relationship between the competence and human development and capabilities approach. The approaches are (1) performance theory, (2) self-determination theory, (3) alignment theory, (4) occupational domains theory, (5) shaping competence theory, (6) instructional theory, (7) capability theory, and (8) the human development and capabilities theory.

### Performance Theory: The AMO Model (Appelbaum et al.)

In line of the work of López Fogués (op. cit.), the first theoretical view on competence that will be summarized here is the one of Appelbaum et al. (2000). This theory, often referred to as the AMO model, defines competence, or ability in the terminology of that model, as a factor which predicts performance. The known formula of the model is  $P = A \times M \times O$  (P, performance; A, ability; M, motivation; O, opportunity). Therefore, if people who are in fact competent do not have the opportunity to show their competence because they are denied opportunity to perform the duties which require that competence (as described above), they may unjustly be assessed as being incompetent.

In the context of competence theory, the AMO formula may be adapted (Mulder 2017b) to

$$P(\text{erformance}) = C(\text{ompetence})_{ksa} \times O(\text{ppportunity})_{rpt} \times M(\text{otivation})_{ieo}$$

Competence in this formula consists of knowledge, skills, and attitudes, which need to be integrated in professional performance. Not only knowledge (k) and skills (s) are important, professional attitude (a) or identity is also important, which manifests itself clearly in sales, care, hospitality, and services sectors, but also holds for other professions. Opportunity includes available resources (r), positions (p) in which professionals are placed, and their task assignments (t). These can be rich in terms of opportunities or affordances, but also limited or even deprived. Motivation includes intrinsic (i) and extrinsic motivation (e), which are triggered by short- and long-term incentives, personal expectations and those of others, and personal and business objectives (o).

## Self-Determination Theory (Deci and Ryan)

The theory of self-determination, developed by Deci and Ryan (1985), is about the basic psychological needs of people, which are (1) competence, (2) relatedness, and (3) autonomy. Following the work of White (1959), who saw competence as a motive of human behavior, Deci and Ryan saw competence as the motive to master a sufficient level of performance. Relatedness is a need which is about interaction with others and a sense of belonging to a community. Autonomy is about the integrity of the self, being in control, and the feeling that one can make decisions and act according to one's own views.

Ryan and Deci (2000, p. 58) explicitly state (in their *Cognitive Evaluation Theory*) "... that interpersonal events and structures (e.g., rewards, communications, feedback) that conduce toward *feelings of competence* during action can enhance intrinsic motivation for that action because they allow satisfaction of the basic psychological need for competence." So, feelings of competence can increase intrinsic motivation, which is an important trigger for performance, as is explained in the description of the theory of Appelbaum et al. (op. cit.). But, Ryan and Deci (op. cit.) also emphasize "... that feelings of competence will *not* enhance intrinsic motivation unless they are accompanied by *a sense of autonomy*... Thus, people must not only experience perceived competence (or self-efficacy), they must also experience their behaviour to be self-determined if intrinsic motivation is to be maintained or enhanced." So, intrinsic motivation is enhanced by perceived competence of one self, also referred to self-efficacy, only if one's behavior is experienced as being self-determined.

## Alignment Theory (Biggs; Mulder)

Mulder (2017c) presents the alignment theory which is in his view the core idea behind competence-based and similar education approaches, such as outcomes-based education. The discontentment with the lack of alignment of education and the world of work was the starting point of many competence-based education practices. Notions about the alignment of education and work can be dated back to the middle of the nineteenth century, if not earlier, if the guilds which were created in the Middle Ages are included. During the last decades, the theory of strategic alignment (Biggs 1999) became quite popular in higher education. The essence of that theory is that intended learning outcomes, learning processes, and assessment of learning are balanced in such a way that they are well related. It is obvious that if learning outcomes are being modified, learning processes and assessment need to follow. But in education that did not always take place. New educational objectives were introduced, whereas often instruction, learning, and assessment stayed the same. According to Mulder (op. cit.), in vocational education and training, the strategic alignment theory of Biggs needs to be expanded. Intended learning outcomes need to be generated, and that happens within a certain context. This can be based on

competence frameworks in which stakeholders express their view on what students need to learn. These frameworks are much more general than sets of intended learning outcomes, which are specified for curricula, courses, and lessons. Educational institutes however should not blindly adopt these frameworks and try to implement them in their programs. Schools and colleges have their own views on education and training, and these philosophies should be used to filter these frameworks to establish education and training programs which are consistent with these views. Mulder positions the (extended) alignment theory in the so-called integrated occupationalistic approach of competence development. This means that competence frameworks express knowledge, skills, and attitudes which are conceived of as being essential for certain occupations (or occupational groups) and which are translated in learning programs. These learning programs are not necessarily behaviorist or reductionist, as some critics contend. For, goals, objectives, and outcomes of education and learning can be defined as open as one likes. Their nature depends to a large extent on the learning theory which is being used in the educational design process. In that sense competence frameworks are not deterministic. On the contrary, competence-based education can be holistic, flexible, and responsive. The competence frameworks merely serve as reference models for what the stakeholders of certain occupations and professions hold as being important. Mulder (op. cit.) points at various contexts and studies in which competence frameworks have been developed and used.

### **Domains of Occupational Competence (Billett)**

Billett (2017) points at the fact that expertise has been studied from the perspective of cognitive psychology but can also be seen from the socioculturalist perspective. From the latter perspective, work is seen as a cultural practice. Billett states that the socioculturalist perspective is helpful in understanding "...what comprises competent performance at work" (op. cit., p. 48). Billett consequently distinguishes three domains of knowledge which are conceived of as the foundations of competence or professional expertise: (1) canonical knowledge of the occupation, (2) particular situational knowledge, and (3) the personal domain of knowledge. The canonical domain of knowledge "...is the collection of concepts, procedures and dispositions that capture what societies want from that occupation and what are demanded and expected from those practising occupation" (op. cit., p. 48). Billett sees situated competence as "...that what is required for the practice or that occupation in a specific work of community setting" (op. cit., p. 48), referring to the importance to the situational meaning and assessment of competence. He also points at the relative importance of qualifications, which are of course important for labor market or job access, but which in his view cannot "...compensate for the inability to perform competently in specific situations and in tasks manifested in that situation" (op. cit., p. 49). Obviously, many contextual factors make a competent graduate not necessarily a competence job performer. The domain of the personal domain of knowledge, according to Billett, is constructed by people, and used "...within and across specific instances of their professional practice as they encounter and respond to it" (op. cit., p. 49).

## Shaping Competence Theory (Rauner)

As Howe and Gessler (2018) describe that Rauner introduced the idea that shaping competence (*Gestaltungskompetenz*) needed to be an important element of the theory of vocational education and training. This idea goes back to the work of Rauner et al. (1988), in which the concept of “social shaping” is introduced. This concept is used to “...describe the essential dynamic between the social purposes and technological possibilities which shape the development of technology in general” (op. cit., p. 47) and was applied to human-centered computer-integrated manufacturing (CIM). Within the discussion on professional competence as the goal of vocational education and training, Rauner thought that competent professional performance goes beyond a process-wise listing of occupational activities. Professional competence needs to go together with social and personal competence and the competence to shape work and society. This combination of competence domains needs to be understood against the background of the German version of the European Qualifications Framework (EQF), the DQR. Competence in the DQR does not stand next to the categories knowledge and skills, such as in the EQF, but it is an overarching category: it covers all intended learning outcomes, knowledge, skills, and attitudes. Essentially, the DQR is composed of two competence domains, (1) professional competence and (2) personal competence, which are both divided in two subdomains: 1.1 knowledge and 1.2 skills and 2.1 social competence and 2.2 autonomy. It is the autonomy category which represents the competence category in the EQF. The new vision of Rauner was to stress shaping as an essential element of professional competence. It is a competence domain that can be understood as comakership and co-construction. While self-responsibility and self-regulation for work became important values in the organization of work (as opposed to the Tayloristic organization of work, in which people are expected to perform part-tasks which were assigned to them), and employees were regarded more and more as co-workers, shaping one’s own work flow within the work environment that is provided, and even the innovation of work and its organization itself, became a key competence domain, referred to as shaping competence.

## Instructional Theory (De Corte et al.)

When it comes to educational design, competence is often conceptualized as related to curriculum development and less often to instructional design. However, Wesselink et al. (2017) have made an attempt to combine principles for competence-based vocational education with the design of competence-based instruction. But in most cases, competencies are seen as curricular inputs for the instructional design process or even as inputs for the curriculum development process itself, such as in the alignment theory mentioned above. An example of treating competencies as inputs for instructional design is from De Corte et al. and presented in their “CLIA model” (De Corte et al. 2004). The components of the model are competence, learning, intervention, and assessment. In the competence

component, De Corte et al. have defined five competence domains: (1) domain-specific knowledge, (2) heuristic methods, (3) metaknowledge, (4) self-regulatory skills, and (5) positive belief in the self. All these competence domains have been heavily studied by learning psychologists. The competencies defined are then related to learning, interventions, and assessment strategies, which is basically an example of alignment theory.

## Capability Theory (Cairns and Malloch)

In their review of the competence literature, Cairns and Malloch (2017) describe the critiques on the competency-based education and training philosophy. They state that that philosophy was strongly based on a behaviorist education philosophy. This competency-based education approach was recently reviewed by Barrick (2017). As this instrumental view on education has been criticized heavily already in the 1970s in the teacher education literature, alternative approaches of teaching and learning became more prominent, such as the humanistic-based teacher education (HBTE) approach and constructivist views on learning. While these developments were well underway, Cairns (1992) suggested to use the concept of “capability” to emphasize the holistic nature of education while retaining its purpose to prepare children and young adults for their role in society. Cairns based his view on literature which appeared in the UK (Stephenson 1992) and presented this as an “...alternative or complementary set of ideas and models to the competency-based education and training approach” (Cairns and Malloch 2017, p. 104). According to Cairns and Malloch, the capability movement started with a project on education for capability, which was described by Cairns and Stephenson (2009). It gained popularity in education, further education, vocational education and training, and higher education in the UK and Australia. Cairns and Malloch point at an elaborate list of applications on the capability approach in education (op. cit., pp 108–109).

Many of the publications on the integrative or holistic view on competence follow the broad view on capability. For instance, Stephenson sees it as important that (higher) education prepares capable people, who “...have confidence in their ability to take effective and appropriate action, explain what they are about, live and work effectively with others and continue to learn from their experiences as individuals and in association with others, in a diverse and changing society” (op cit., p. 1). Capability is “...a necessary part of specialist expertise, not separate from it. Capable people not only know about their specialisms; they also have the confidence to apply their knowledge and skills within varied and changing situations and to continue to develop their specialist knowledge and skills long after they have left formal education” (op cit., p. 2). Furthermore, capability is “...not just about skills and knowledge. Taking effective and appropriate action within unfamiliar and changing circumstances involves judgments, values, the self-confidence to take risks and a commitment to learn from the experience. Involving students in the decisions which directly affect what they learn and how they learn it develops a sense of ownership and a high level of motivation” (op cit., p. 2). This view on capability collides to a large extent with the views held by Biemans et al.

(2004, 2009) and relates to various principles of comprehensive competence-based vocational education (Wesselink 2010; Wesselink et al. 2015, 2017), which is also based on a broad view of occupational competence (Mulder 2014). Many of the competencies of the future are addressed near the end of this chapter (and elaborated in Mulder 2016). In the definition of competence in relatively recent publications, competence was even defined in terms of capabilities (Mulder 2014; Mulder and Winterton 2017).

## Human Development and Capabilities Theory (Nussbaum)

With discussing the human development and capabilities theory, this section goes back to the introduction, in which the work of López Fogués (2014) was mentioned, which is clearly the situation in this tradition. The competence and capability literature in education is quite different from the capabilities theory which is the foundation of the human development and capabilities approach. In their chapter Cairns and Malloch point of the work of Sen (1985, 2009) and Nussbaum (2011), who are using the plural “capabilities” in their work, but the theoretical foundations seem to be quite different. Nussbaum (2011) developed her human capabilities approach, which originates from a global politics perspective, with a strong emphasis on human rights, social justice, and opportunities to develop capabilities. There is a Human Development and Capability Association, with the subtitle “agency, well-being, and justice,” in which education is obviously included. But the capabilities distinguished by Nussbaum (op cit) are similar to basic human rights. These capabilities are (1) life; (2) bodily health; (3) bodily integrity; (4) senses, imagination, and thought; (5) emotions; (6) practical reason; (7) affiliation; (8) other species; (9) play; and (10) control over one’s environment. The capabilities approach is “...about the opportunities available to each person” (Nussbaum 2011, p. 18) and is related to social justice. Nussbaum describes these opportunities as “...created by a combination of personal abilities and the political, social, and economic environment” (op. cit., p. 18). Examples of the capabilities Nussbaum defined are the following:

1. *Life*. Being able to live to the end of a human life of normal length; not dying prematurely, or before one’s life is so reduced as to be not worth living.
2. *Bodily Health*. Being able to have good health, including reproductive health; being adequately nourished; having adequate shelter.
3. *Bodily Integrity*. Being able to move freely from place to place; having one’s bodily boundaries treated as sovereign, i.e. being able to be secure against assault, including sexual assault, child sexual abuse, and domestic violence; having opportunities for sexual satisfaction and for choice in matters of reproduction (op. cit., p. 33).

It will be clear that these capabilities transcend education and can be clearly seen as human rights. See, for example, Article 3 of the United Nations’ Universal Declaration of Human Rights (<http://www.un.org/en/universal-declaration-human-rights/>; accessed 24 July 2018). This article states: “Everyone has the right to life, liberty and security of person.” Article 13 is: “(1) Everyone has the right to freedom of movement and residence within the borders of each state. (2) Everyone has the right to leave any country, including his own, and to return to his country.” Article 25

(1) states: “Everyone has the right to a standard of living adequate for the health and well-being of himself and of his family, including food, clothing, housing and medical care and necessary social services, and the right to security in the event of unemployment, sickness, disability, widowhood, old age or other lack of livelihood in circumstances beyond his control.” And, finally, Article 5 is: “No one shall be subjected to torture or to cruel, inhuman or degrading treatment or punishment.” These are very close to the capabilities described by Nussbaum. While this is not to criticize the capabilities Nussbaum has defined, it is to show that these are fundamental to humanity; education, including vocational education and training, has to contribute to these capabilities. But education has its limits in this respect, as was mentioned above regarding the issue of unemployment. For generic global vocational and professional education, more focus is needed on professional competence (see Mulder 2016). Clearly, education can contribute to certain capabilities such as capabilities 4 on senses, imagination, and thought, which can be “...informed and cultivated by an adequate education, including, but by no means limited to, literacy and basic mathematical and scientific training” (op. cit., p. 33). Important questions here are how internal personal capabilities and external societal capabilities (as opportunities to exert human rights in a society with high standards of social justice) are related, and what education (as an external capability) can contribute to the personal capabilities of its students, and what (broad, holistic, and integral) competencies can be developed by – within the framework of this handbook – vocational education and training.

For a further detailed discussion of the analysis of the relationships and differences between these concepts, including the difference between internal and combined capabilities, see the review of the work of Nussbaum by Magni (2014). See for a further discussion of the capabilities approach in the context of European vocational education and training the work of Alessandrini (2017).

There is another view on capability, which features prominently in the literature; it is the capability of business and industry to realize technological innovation. This theme addresses knowledge transfer, business venturing, investment, etc. Technological capabilities are thus strongly related to product, business, and industry development, hence the many references to top publications in the field such as of Lall (1992), Tripsas and Gavetti (2000), Lee et al. (2001), Stuart and Podolny (1996), and Dosi et al. (2000). Since the views on technological capabilities do not focus on the design of vocational education, although the theme of technological capabilities is relevant for many vocational education programs, this chapter will not elaborate on this any further.

---

## Competence: The State of Affairs

After having reviewed a number of competence theories, without having had the pretention that this would be an exhaustive review, the state of affairs regarding competence practice will be discussed. There are three themes that will be elaborated here: competence in practice, characteristics of mature competence-based education practices, and a number of competence frameworks.

## Competence in Practice

So first of all, the state of affairs regarding competence in practice will be addressed. There is no worldwide survey about competence practices. Nevertheless, the edited volume mentioned before (Mulder 2017a) serves as a global inventory of national and regional approaches of competence-based education. But competence practices exist in various communities:

- Professional associations have developed competence frameworks to define their expectations of professional practice. Sometimes these frameworks come as standards for the profession or certification schemes. In many cases the frameworks serve as the foundation of vocational and professional education, professional licensure, and training for re-licensing.
- Governmental organizations have developed various competence frameworks as well. These are in most cases dedicated to public functions, such as tax inspectors or teachers' competencies. In some cases, these frameworks are established by law.
- Testing companies have developed a wide variety of competence measurement tools to test workers or students in all kinds of fields and at various levels. These tests can be purchased and used under licenses. The testing companies offer a wide range of services for testing individuals and groups, process test data, and report test results. They also provide comparative analyses and benchmarks at institutional, national, or international levels.
- Consultancy firms (some testing firms operate on a consultancy basis) have produced competence dictionaries, advisory services for competence assessment, and systems for competence development. The largest consultancy companies have their standard dictionary which can be adapted to individual corporations and implemented for employee, management, or executive assessment and development. These dictionaries typically consist of key competencies, underlying competencies, and sub-competencies, all defined, explained, and further detailed. Some of these dictionaries can be over 100 pages. In other cases, the consultancy companies create competence frameworks for a diverse group of clients, including companies that prefer not to work with standard dictionaries.
- Organizations, companies, and institutions have implemented competence management systems. In many cases these systems are based on the dictionaries mentioned above. In regular employee assessments (each half year or year), managers and employees, and sometimes co-workers and employees that report to the person who is being assessed (the assessee), review and rate the competence levels of the assessee, sometimes in a 360° assessment. The assessments can lay the foundation for further training and development, promotion, or other human resource management decisions. Some companies have experimented with competence-based remuneration, but that appeared not to be extremely successful.
- Educational institutions have graded their education programs according to national qualifications frameworks or have developed and implemented competence-oriented and competence-based curricula. The grading of studies in

publicly financed education within the European Union is obligatory. The levels of studies are defined by the European Qualifications Framework. Educational institutions are expected to mention the respective program level on the diploma. Education and training programs offered by privately funded institutions can also request for having their levels determined, although this is (still) voluntary. The grading of education programs is meant to make national and international levels of education more transparent. The degree in which principles of competence-based education are implemented in the educational institutions is also voluntary. This depends on the educational philosophy and expertise schools and colleges have in terms of realizing competence-based practices. The form of using competence practice in curriculum design that occurs most is that program teams use competence frameworks to defined learning outcomes. Others go an extra mile and are using competencies as foundations for learning tasks and authentic competence assessments as examinations.

Examples of national approaches and evaluations of experiences regarding competence-based vocational and professional education practices are given by Barrick on the USA (Barrick 2017), Cairns and Malloch (2017) and Hager (2017) on Australia, Stokes (2017) and Evans and Kersh (2017) on the UK, Weber and Achtenhagen (2017) and Gessler (2017) on Germany, Le Deist (2017) on France, Tütlys and Aarna (2017) on two Baltic States, Ronchetti (2017) on Italy, Fan (2017) on China, Panth and Caoli-Rodriguez (2017) on South Asia, Viet (2017) on Vietnam, and Van Halsema (2017) on Rwanda. Many of these national reviews show the diversity, complexity, and struggle to get competence models, education practices, and measurement schemes in place and some point at the dissatisfaction with using competence-based education as practiced, mentioning that there is the danger that assessment gets too much attention at the cost of learning time, or that competencies are trained and ticked off individually at the cost of the integration of the parts of professional competence, or that competence-based education frameworks are too rigid, whereas they should serve dynamic processes of agile adaptation to changing circumstances.

## **Characteristics of Mature Competence-Based Education Systems**

Many educational institutions have introduced so-called competence-based education programs on the waves of the competence movement, whereas at closer inspection, this often appeared to be lip service, marketing, or a way to reduce contact hours. This is why gradually the notion of immature and mature competence-based education systems developed. Mature competence-based education systems have various characteristics.

- *Competence frameworks.* These have been discussed already and often consist of key and basic of foundational competencies. Examples of these will be presented below.

- *Competence taxonomies.* These define skills, knowledge, and attitude levels and typically employ taxonomies of educational objectives. A specific issue of competence practices in vocational education concerns the various levels within the vocational education systems, sometimes referred to as the vocational education column. Suppose a competence domain like communication of entrepreneurship is part of the curriculum of junior secondary vocational education (for students of 12–16 years of age), but also of senior secondary vocational education (for students of 16–19 years of age) or of higher vocational (college) education (for students of 17–21 years of age). What does this competence domain at these different levels mean? Surely something different. The competence domains get more complex at higher levels because of the complexity of the vocational or professional practice. But how can achievement or mastery levels of communication or entrepreneurship competencies be compared? One way to do that is to link competence specifications to reference frameworks such as the European Qualifications Framework. Another possibility is to use laddering schemes such as the one developed by De Jong et al. (2017), which is the 4Cyourway framework for the measurement of competence growth, which can also be applied for curriculum development.
- *Competence recognition.* This is a system of recognition or the validation of prior learning. An important idea behind the competence-based education philosophy is, like in mastery learning, that once competencies are acquired no further education or training is needed. This especially holds for students or adults who are entering education programs and who already possess certain competencies which are being taught in the program. One would think that those who enroll in the program would get exemptions for these competencies and that the program time would be shortened. Due to the inflexibility of many educational institutions and programs, this however does not happen, unless students have a higher qualification than is strictly needed, so that they can perhaps skip the 1st year of the program they are starting. The inflexible structure of vocational education is particularly frustrating for workers who have many years of challenging work experience and who followed a number of in-company training programs and external courses, who take an assessment to accredit their prior learning, and who are then being informed that they would need to follow a complete education program to get the qualification of the level on which they already function for years. Bohlinger (2017) has given an international overview of systems of recognition of prior learning.
- *Competence acquisition.* This is the teaching and learning practice, in which the learners acquire the professional competence specified by the educational program. This learning in competence-based vocational and professional education should be as authentic as possible, and should not only include the acquisition of knowledge and skills, but should also contain an applied learning part. In many vocational and professional education programs, this authentic and applied learning takes place in field attachments, internships, or apprenticeships. They can vary by intensity, duration, and contractual agreement. In some apprenticeship schemes, students are being paid a student-worker salary, in others they get

compensated for costs, and in still other schemes they get no financial compensation whatsoever.

- *Competence assessment.* This is about the measurement of competence gain, but it can be used in different ways. Well-known is the difference between summative and formative assessment, for making pass-fail decisions at the end of the learning process and to provide support to the learner during the learning process, respectively. However, assessment can also be conceived of as an integrated part of the learning process. By continuous assessment of learning achievements during the learning process, students get direct feedback on their performance. This feedback can give them clear cues as to where they are in terms of their progress, which can help motivate them to proceed. This assessment as learning practice can also be used in adaptive learning systems and personalized instruction. Van der Vleuten et al. (2017) and Blömeke (2017) have given overviews of different competence assessment methods which provide support of learners.
- *Competence-based school-HRM.* If schools and colleges for vocational and professional education embark on a competence-based education journey, one of the things that should be considered is to transform the educational institution into a learning organization. It is surprising that institutions, whose primary objective is to make their target groups learn, do not act as learning organizations. Team learning in vocational education institutions is getting more and more popular (Bouwman et al. 2017a, b, c, 2018), but still, team-oriented human resource management and the implementation of practices of the learning organization are scant.

## Competence Frameworks

As said in the previous section, competence frameworks are a systemic element of mature competence-based vocational education practices. Many competence frameworks have been developed, by consultancy agencies, professional associations, and researchers. Various examples will be given below.

*The Great Eight Competency Framework.* This framework, developed by Bartram (2005) of Hay Group at that time, is the result of empirical research among thousands of managers and attempts to capture all human competence in eight broad competence clusters, just like the Big Five Personality Dimensions of Barrick and Mount (1991). Both the core competencies of Bartram and the personality dimension of Barrick and Mount are related to job performance, as it was the intention of these authors to be able to predict job performance by competence or personality tests, as these are essential methods in personnel selection. The eight core competencies identified by Bartram are (1) leading and deciding, (2) supporting and cooperating, (3) interacting and presenting, (4) analyzing and interpreting, (5) creating and conceptualizing, (6) organizing and executing, (7) adapting and coping, and (8) enterprising and performing. These are all further specified in a total set of hundreds of more detailed competencies. The research of Bartram showed that a relationship between the competencies and job performance can be established if job

success as the criterion is sufficiently differentiated. Mere managerial assessments of poor, average, good, and excellent job performance do not suffice. Job performance needs to be operationalized in detailed terms, and valid assessments of these are needed, as well as valid assessment of competence.

*The CanMEDS 2015 Physician Competency Framework (Canada).* This competence framework is developed by the Royal College of Physicians and Surgeons of Canada and is endorsed by 12 medical associations (Frank et al. 2015). It comprises roles, key concepts, key competencies, and enabling competencies for each role. The roles are medical expert, communicator, collaborator, leader, health advocate, scholar, and professional. Compared with the previous (Great Eight) competence framework, this framework is much more oriented toward the content of the tasks of the medical professional. Therefore, this framework can be referred to as a domain-specific, content-oriented framework, whereas the Great Eight competence framework can be seen as a generic, behavior-oriented framework. Both frameworks are appropriate and useful in their respective contexts.

*The Engineering Competency Model (USA).* This also is a recent competence framework, developed by the American Association of Engineering Societies (AAES) and the Department of Labor of the United States (USDOL). This model is created as a foundation for the development of the workers in the engineering sector. It comprises core competencies which enable the advancement of and success of individual workers in the engineering profession. This competence framework consists of tier 1–5 competence statements and on top of that management competencies and occupation-specific requirements. Tier 1 comprises personal effectiveness competencies, including interpersonal skills, integrity, professionalism, initiative, adaptability and flexibility, dependability and reliability, and lifelong learning. Tier 2 comprises academic competencies, including reading, writing, mathematics, science and technology, communication, critical and analytical thinking, and computer skills. Tier 3 comprises workplace competencies, which are teamwork, client/stakeholder focus, planning and organization, creative thinking, problem-solving, prevention and decision-making, working with tools and technology, scheduling and coordinating, checking, examining and recording, and business fundamentals. Tier 4 comprises industry-wide technical competencies, which are foundations of engineering, design, manufacturing and construction, operations and maintenance, professional ethics, business, legal and public policy, sustainability and social and environmental impact, engineering economics, quality control and quality assurance, and safety, health, security, and environment. Tier 5 comprises industry-sector functional areas which should be specified by industry-sector representatives. As said, on top of that management- and occupation-specific requirements are positioned. These are specific for management positions and occupations and not further operationalized in the framework. All competency components seem to direct to specific jobs and contexts. Further information about this framework can be found at <http://www.aes.org/model>.

*The Professional Capability Framework of Social Work (UK).* This framework is developed by the British Association of Social Workers and actually is part of various levels of professional practice along the career of the social worker, being

the entry level, readiness for direct practice, end of first placement, end of last placement, the ASYE (which is the assessed and supported year in employment, which takes 12 months and is a program which is led by employers; candidates are being supported and assessed based on the knowledge and skills statement for social workers in adult services – see for further information <http://www.skillsforcare.org.uk/Learning-development/The-ASYE-adults/The-Assessed-and-Supported-Year-in-Employment-Adults.aspx>), social worker, experienced social worker, advanced level, and strategic level. All capabilities (or competencies) at all career levels are specified within the following categories: (1) professionalism; (2) values and ethics; (3) diversity; (4) rights, justice, and economic well-being; (5) knowledge; (6) critical reflection and analysis; (7) intervention and skills; (8) contexts and organizations; and (9) professional leadership. All capabilities are defined and further specified. For further information about this framework, see <https://www.basw.co.uk/pcf/capabilities/>.

*More Research-Based Examples.* Many more examples can be given from research. See, for instance, the following studies, which all address competence frameworks which are based on empirical research or related competence issues. The frameworks are quite different in nature. Some are more generic, others more specific. Some compartmentalized knowledge, skills, and attitudes, others integrated these. Some are more behaviorally oriented, others more content-oriented.

- Agricultural extension competence (see Karbasioun et al. 2007)
- Argumentation competence (see Noroozi et al. 2017)
- Entrepreneurial education and learning (see Lans 2009; Karimi et al. 2016; Baggen et al. 2017)
- Innovation competence (see Du Chatenier et al. 2010)
- Oral presentation competence (see Van Ginkel et al. 2015)
- Purchasing (see Mulder et al. 2005)
- Training for practical competence (see Khaled et al. 2015)
- Regional learning (see Wesselink et al. 2015)
- Rural development services (Brinkman et al. 2007)
- Social responsibility competence (see Osagie et al. 2014)
- Teaching competence (see Kasule et al. 2015; Alake-Tuenter et al. 2012)

---

## Competence Definitions

In this chapter, an extensive section on the definition of competence was deliberately excluded. Much has been written about this already, and the conclusion very often is that there is little consensus about the concept and very wide diversity in the definitions. This is no surprise, given the many different competence theories and practices presented in this chapter. Also in research, there is much variation in which the concept of competence is defined, operationalized, and measured.

The definition of the concept of competence is discussed in detail in Mulder (2017a) and defined following earlier publications (e.g., Mulder 2014).

“Professional competence is seen as the generic, integrated and internalized capability to deliver sustainable effective (worthy) performance (including problem solving, realizing innovation, and creating transformation) in a certain professional domain, job, role, organizational context, and task situation” (Mulder 2014, p. 111). Competency is seen as “...an element and characteristic of competence” (op. cit., 2017, p. 14) or as “...a coherent cluster of knowledge, skills and attitudes which can be utilized in real performance contexts” (Mulder 2014, p. 111).

This chapter uses an inclusive view on competence and denies very narrow conceptualizations of competence by which students of vocational education must learn a long series of detailed tasks. But this stance is not uncontroversial. As stated above, the AMO model of Appelbaum et al. (2000) includes ability, which in the adapted formula was equated with competence. Some purists detest such elastic use of the concept of competence and make spasmodic attempts to stay away from the competence concept and narrowly stick to other – but related – concepts such as occupational knowledge, professional knowledge, capability, capacity, expertise, talent, and other concepts. However, these concepts have many commonalities. To show the elasticity of the concept of competence, the dimensions on which they differ can be mentioned (Mulder 2017b): centrality, contextuality, definability, developability, dynamic nature, knowledge inclusion, measurability, mastery level, performativity, and transferability. All definitions include variations on these dimensions and still claim they define the concept of competence.

Not much has been said about the stages of development of (professional) competence, although the work of De Jong et al. (2017) and the framework of professional capabilities of social workers are related to that issue. Nevertheless, it is an important issue, which also related to the taxonomies and mastery levels of competence. This chapter uses a broad view regarding competence. It is thought that competence can be acquired at various levels, from beginning to advanced or even world-class performance levels. Very often different words are being used for the competence levels. This is different from the theory of Dreyfus and Dreyfus (1986) who see competence as a phase on the continuum of being a novice, being competent, being proficient, being an expert, and possessing full mastery. This chapter contends that all positions of the continuum represent certain levels of competence or mastery and therefore sees competence as the overarching concept. Levels of competence can be categorized as (1) insufficient, (2) sufficient, (3) adequate, (4) good, (5) very good, (6) excellent, and (7) brilliant. Many corporate competence management systems have abbreviations of these levels of competence, whereby the tendency is to not include the category insufficient, as it would be perceived as being offensive. Typical categories are sufficient, good, very good, and excellent.

---

## Competence for the Future

More important than staying on the trodden path of competence definition discussions is the reflection on what would constitute competence which is needed for the future, not only for being able to function in tomorrow’s society and to cope with the

challenges ahead but also for shaping that society: competence that is needed to bring about change, create innovation, and realize transformation. To facilitate the discussion on this issue, a model was developed during 2016 in which various proposals for future-oriented competencies were made. These include the DeSeCo Model of Key Competencies (Rychen and Salganik 2003), the EU Recommendation on key competences (European Union 2006), the work on twenty-first century skills of the NCREL/Metiri Group (2003), the Essential Learning Outcomes as defined by the Association of American Universities and Colleges (AAUC 2015), the Seven Survival Skills for today's students (Wagner 2008), further work on the twenty-first century skills (P21 2015), and the critical competencies for future leadership (Vora 2015). Elements of the competence statements in these documents were semantically analyzed and grouped together in five categories which form the model of future-oriented competence (see Fig. 1).

There are five components in this model: (1) integrative learning competence, (2) disciplinary and interdisciplinary competence, (3) self-management and career competence, (4) personal-professional competence, and (5) social-professional competence.

*Integrative learning competence* is the heart of the model. This symbolizes the key role learning competence that plays in human existence. Without learning competence humans would not be able to solve the current complex questions and future challenges.

*Disciplinary and interdisciplinary competence* are the foundation, as the idea is that for effective performance and further learning disciplinary and interdisciplinary competence is a *conditio sine qua non*. In professional contexts *self-management and career competence* are needed to establish a livelihood and start a career, which can be based on getting and keeping a job or based on self-employment or

**Fig. 1** Model of future-oriented competence. (Source: Mulder 2016)

entrepreneurship. In many vocational education and training programs, the scope of programs and teachers is to prepare for the labor market, which translates to finding a job, and too often the road to self-employment and entrepreneurship is neglected, although as a result of various stimulation schemes and policy measures this is gradually changing.

The horizontal dimension is the dimension of professionalism and consists of the *personal and social competence* side of that.

The competence components are further described as follows. The specifications are a modification of those in Mulder (2016). Repositioned competence domains are printed italic.

1. *Integrative learning competence*. This is essential for all competence domains in the model. Next to other competencies, it consists of competence regarding *critical thinking*, development, knowledge creation, *higher order thinking*, *sound reasoning*, *inquiry and analysis*, synthesis, evaluation, and *lifelong learning*.
2. *Disciplinary and interdisciplinary competence*. This includes the whole array of competence domains which are related to certain professional fields and interdisciplinary working contexts, such as competence in finance, economics, business literacy, mathematics literacy, social sciences literacy, humanities literacy, languages literacy, arts literacy, digital (ICT) literacy, media and information literacy, reading, writing, numeracy, computational competence, science, technology, design and inquiry literacy, environmental literacy, and interdisciplinary problem-solving competence.
3. *Self-management and career competence*. This includes competence in autonomous action, self-regulation, life planning, personal project planning, responsibility, managing for results, prioritizing, productivity, accountability, argumentative reasoning, resilience and stamina, sense of initiative, innovation and entrepreneurialism, and calculated risk taking.
4. *Personal-professional competence*. This includes competencies such as *ambiguity and uncertainty handling*, adaptability, flexibility, agility, reflection and self-awareness, emotions handling, curiosity, imagination, creativity, intuition, mindfulness and integrity, big picture visioning, global competence, cultural awareness and expression, civic competence (balancing, defending/asserting rights, interest, limits, needs), anticipate and create change, complex problem-solving, managing complexity, health and physical competence, *sustainability*, and ethical reasoning and action competence.
5. *Social-professional competence*. This includes competence regarding civic knowledge and engagement, relating well to others, interpersonal contact, interactive communication, clarification of information to others, negotiating on meaning, multicultural literacy, *leadership*, *transformation*, productive teamwork, collaboration in networks, creating ecosystems for engagement, and managing and resolving conflicts.

As stated in Mulder (2016), the listing of competencies in the overview does not suggest an order of priority, nor does it serve as an exhaustive overview of

future-oriented competencies. Furthermore, more discussion and reflection are needed on future-oriented competence such as in the context of Industry 4.0, but more in general also in the context of transformation and transition.

---

## Conclusions

This chapter has reviewed various foundations of competence-based vocational education, addressing theories regarding performance, self-determination, alignment, knowledge domains of occupational competence, shaping competence, instruction, capability, and human development and capabilities. It then reviewed the state of affairs regarding competence practice and pointed at the way in which professional associations, governmental organizations, testing companies, consultancy firms, companies, and educational institutions are dealing with the competence movement. It listed the structural components of mature competence-based education systems, which included competence frameworks, competence taxonomies, competence recognition, competence acquisition, competence assessment, and competence-based human resource management. Next it gave examples of large and comprehensive competence frameworks for the management profession, medical profession, engineering profession, and social work profession. It then listed various examples of research-based competence frameworks. The chapter then shortly went into the issue of defining competence and was completed with drawing attention to the necessity of reflecting on and discussing the competence which is needed for the future. This is no easy exercise, but there have been various studies already which address this. These studies can be used to define future-oriented competencies for secondary and post-secondary levels of vocational and professional education and training. The changes in industry and transformations in society regarding smart technologies, big data, virtual mobility, and carbon-neutral production and consumption on the one hand, and geopolitical, climate change, food production, and water management challenges on the other hand, ask for immediate attention for this reflection, not only for the sake of setting the right course in vocational education and training, and thus focusing on the right things, but also for aligning learning and assessment practices in that direction. And although critics of the competence movement contend that competence-based education draws attention away from learning, it should not. In all education approaches, student learning and development should be at the core (World Bank 2018).

Returning to the introduction of this chapter, the public interest in incompetence is understandable. Incompetence goes with a lot of societal costs. Therefore, vocational education needs to prepare for professional competence (and where possible: professional excellence). It is up to educational designers, teaching professionals, and all those who are involved in quality education, to prepare students for a meaningful position in society in which the public can have trust.

## Abstract

“Excellence” and “vocational excellence” are buzzwords today, discussed in the literature with various connotations. Individuals want and try to perform their best, but not all succeed. How do some individuals succeed and become exemplary? What makes them the excellent performers? These questions always hound us. This review-based chapter sheds light on excellence and vocational excellence. Grounded on competence, self-regulation, and expertise theories, the chapter begins with defining the term “excellence.” The major portion of the chapter is spent on explaining attributes of vocational excellence. To name a few, individuals with vocational excellence are self-motivated people with high technical as well as soft skills. Ability to network with professionals, to solve problems, to communicate effectively with others, to work successfully as part of a team, and to remain calm and focused on the work are some of the attributes of vocational excellence. The chapter ends with presenting benefits of vocational excellence and ways that educational institutions can contribute to attainment of vocational excellence.

**Introduction**

The world is evolving fast. Challenges, risks, and problems are emerging that are making human life more difficult in some ways even as new technologies and innovations are being invented to make life easier in other ways. As human beings, we strive to examine challenges, risks, and problems that we come across, find ways to move forward and continue developing, and live prosperous and happy lives. To make this happen, we use our knowledge and skills and try to perform our best. But not all of us succeed. This leads us to these questions: What factors govern the best performance? Why are some people able to give their best while others cannot? These questions can be answered through the terms “excellence” and “vocational excellence,” which is the focus of this chapter.

Many examples in the literature discuss excellence and vocational excellence (Attwood 1984; Imel 1984; James 2016; Miller 1984; Levesque et al. 1995; Nokelainen et al. 2012; SKOPE 2016; Tyson 2015). Yet, they differ on the definitions and explanations of these terms. Some authors present excellence as being similar to competence; others argue that excellence is a step further and at a higher level than competence.

The literature presents differing perspectives on how and when the term “excellence” originated and gained wide recognition, while some (Lewis 2009; Tyson 2015) suggest that “excellence” came into the limelight with Greek philosopher Aristotle’s *Nicomachean Ethics* 1975, wherein he discusses that humans always strive to achieve good and, more importantly, the highest good. Knowledge, skills, and positive attitudes help them acquire pleasure, wealth, honor and virtues, and then happiness – the highest good. The happiest stage – when nothing is lacking – is the state of excellence. This is possible when intellectual virtue, discipline of the mind acquired through education and training, and moral virtue, discipline of action acquired through habituated moral action, are attained. Lewis (2009) noted that the inspiration of the concept of excellence came from Chinese culture. Zhuge Liang (181–234) led a war using excellent strategies and the finest weaponries, which made the Chinese army win the wars they fought under Zhuge’s leadership, therefore achieving the state of excellence. According to Lewis (2009), Zhuge was popular not only as a war hero but also for his moral character – treating people with respect. It is, therefore, argued that human excellence and good citizenship (social responsibility) go together and are integral to each other.

---

**What Is Vocational Excellence?**

Changing human lifestyles, advancing technologies, and public anticipation of innovative, advanced, and efficient services press service providers to offer services more efficiently and their employees to have increasingly higher levels of

competence. Interest and enthusiasm to learn about and attain excellence in their respective fields among beneficiaries, service providers, students, and faculty are ever high. Given that service seekers as well as service providers are demanding quality services that are simple and that provide immediate relief, as emphasized by vocational education, this section discusses what excellence is in relation to vocational jobs and delineates various attributes of vocational excellence.

An individual with vocational excellence (VE) gives the best services – as expected or beyond what service seekers expect. According to Smeaton, Hughes, and Graeme (2002), vocational excellence is performing at the maximum expected and/or anticipated level and giving the highest level of satisfaction to the individuals involved. This prompts us to these questions: What are the attributes of vocational excellence? How do we know one has vocational excellence? What makes one so special and outstanding that he/she is able to demonstrate his/her vocational excellence? How does one attain vocational excellence?

Drawing from various items in the literature (Attwood 1984; Miller 1984; Klotz et al. 2014; Nokelainen et al. 2012; Smeaton et al. 2002; Smith and Rahimi 2011) and reflecting on our experiences of working in academia and elsewhere, we present the following attributes of vocational excellence. Conceptually the chapter builds on three complementary lines of thought – competence (Mulder 2014), self-regulation (Zimmerman 2002), and expertise through practice and social engagement (Lave and Wenger 1991; Smith and Rahimi 2011). Competence is the stage of having acquired cognitive, psychomotor, and affective learning. It is assumed that individuals with VE have all the attributes that competent individuals have. Having knowledge about the tasks, having skills to transform that knowledge into action, and having motivation to apply those skills in real life situations make individuals competent. Individuals with higher levels of competency perform better and contribute to enhance their organizational performance. On a similar note, as posited by Zimmerman (2002), individuals with vocational excellence should also be mentally strong and be able to self-regulate themselves to perform and stand out as demanded by the context. Finally, they value participative practice and social engagement (Lave and Wenger 1991; Smith and Rahimi 2011; Wenger 1998). They believe that their services are not limited to their own benefits and satisfaction but have benefits for their communities. They anticipate learning much from their communities and their activities. They feel themselves to be integral parts of the community. Qualities that build these constructs or foundations are what VE individuals uphold.

**Technical skills:** Vocational education should prepare individuals with necessary technical skills. Also referred to as “hard skills,” technical skills are specific skills that an individual possesses that helps him/her perform certain tasks or jobs. Technical skills are prerequisite for any individuals in their pursuit to attain vocational excellence, but technical skills are not all that they need. Technical skill:

... implies understanding of, and proficiency in, a specific kind of activity, particularly one involving methods, processes, procedures, or techniques. Technical skill involves specialized knowledge, analytical ability within that specialty, and facility in the use of the tools and techniques of the specific discipline. (Katz 1974)

Technical skills could be in various fields and/or professions (e.g., medicine, agriculture, business, computer science, environmental science, etc.) and at different levels of competency as outlined in National Institutes of Health (n.d.): fundamental awareness, basic knowledge; novice, limited experience; intermediate, practical application; advanced, applied theory; and expert, recognized authority or specialist, depending on the training, education, and experiences the individuals have.

The literature (Teaching.org 2012) has outlined many attributes that define technical skills of people with vocational excellence. Individuals with vocational excellence are able to run the tools and have thorough understanding of how those tools work, what problems they might see in those, and how to resolve those problems, as well as safety measures to follow while running the tools, to name a few. Innovativeness and motivation to learn and develop new technologies are other important attributes of individuals with sound technical skills.

There is a general consensus among scholars that technical skills are acquired through education and experience. A prevalent misconception among some practitioners, mainly in developing countries, is that technical skill is everything that is required to attain vocational excellence. This is not true.

**Soft skills:** Vocational excellence requires excellence in both technical and soft skills. Smeaton et al. (2002) argue that vocational excellence depends not only on high technical skills but also on individuals' ability to articulate what they are doing and interpret or explain new things and difficulties to their clients and peers. Smeaton et al. (2002), Rampersad (2001), and Nokelainen et al. (2012) identified various attributes of vocational excellence that are summarized in the following paragraphs.

Identifying needs and problems facing communities or organizations, prioritizing them, and deciding when, what, and how to address them are essential attributes of vocational excellence. Vocational training institutions seek individuals to diagnose the problems and issues facing communities and proactively work to solve those issues.

Ability to work in a team is another attribute of individuals with vocational excellence. As and when needed, individuals should be able to bring in other workers and work as a team to attain the goal. The literature does not discuss much about how teamwork can be strengthened. We believe that involving members in planning and decision-making, communicating with and respecting others, and evaluating and reflecting on their work strengthen teamwork.

Individuals with vocational excellence are adaptive and flexible. They can quickly adapt to new situations as they arise. They act and proceed calmly when under pressure. They are apt at making adjustments to the work in progress and when work conditions and circumstances are changing.

Anderson et al. (2013) explain Bloom's learning hierarchy model and argue that individuals with vocational excellence are able to recall, comprehend, apply, analyze, synthesize, and evaluate information and knowledge. Vocational education helps individuals articulate and apply learning as they move from one workplace or working community to another. It is not only them learning and being knowledgeable and intelligent but also helping their clients learn and succeed in the

transfer of the skills and knowledge to solve problems. For effective transfer of learning to happen, individuals with vocational excellence should be good communicators.

Literature underscores the importance of communication in vocational excellence. Individuals with VE have to constantly communicate with their peers and others in their organization and in their communities. Thus, we strongly believe that communication skills are one of the most important attributes they should possess. They require interpersonal skills, listening, writing, and speaking skills.

Gainful employment is one of the key goals of vocational education. It is therefore important to know what employers are looking for in employees vis-à-vis what employees should possess to be exemplary workers that employers would appreciate. Presenting the results of a survey conducted among employers, Smeaton et al. (2002) argued that employees should possess excellent reasoning skills, have the ability to schedule work and diagnose work problems, have work-process management skills, and be able to visualize output and plan the work accordingly. In summary, employees should be farsighted individuals with potential to become managers at their respective institutions.

Individuals with vocational excellence accept the challenges and risks that come along their paths as learning opportunities. They are able to manage those challenges and risks as they keep their mission going and thus become stronger and more confident in their endeavors. On a similar note, they do not give up even in difficult situations. They keep working on their endeavors, thus demonstrating resiliency and ability to work under pressure. Getting back to finishing unfinished tasks is an important quality they possess.

Reaching out and networking with other professionals and professional organizations; sharing innovations, information, knowledge, and skills; and learning from such networks are inevitable parts of attaining vocational excellence.

Being resourceful is yet another attribute of VE. This is possible because they have a rich body of knowledge and skills. Having been able to network with a large number of other professionals and organizations, they have a vast store of information that they can utilize to make informed decisions. Additionally, because they are credible and trustworthy, they are able to pull resources from many sources and utilize them wherever and whenever resources are needed the most.

People with vocational excellence possess Total Quality Management (TQM) attributes. They are lifelong learners – i.e., learning continuously and striving toward excellence. Knowledge ages rapidly, and it needs to be updated by further learning (Rampersad 2001). Individuals with vocational excellence strive to learn, establish collaborative relationships with industries, and eagerly share successful experiences and skills with others. They develop skills as experts through networking with colleagues from other teams, observing other people perform at their best, keeping up-to-date with developments in their professions, and exploring new possibilities in their careers.

Individuals with vocational excellence strive to learn from their own actions and also from the people around them. They learn from their teachers, fellow workers, and experiences at their workplaces. Individuals also have the zeal to learn from

people in their communities as they work together. As Nokelainen et al. (2012) describe, in essence the attributes, attitudes, and values of individuals and their interactions with others and with their environments underpin the development of vocational excellence.

Vocational excellence is not only for learning to know and learning to do but also for learning to be. Individuals who embrace higher levels of learning and make learning their way of life realize that they are the experts and should be exemplary to the organizations or communities they belong to. They also possess occupational knowledge and skills, attain occupational advancement, and hold aspirations, attitudes and values, feelings of success, and citizenship.

Individuals with vocational excellence demonstrate social responsibility; they learn and work not only for themselves but also for others – for example, for their communities. Such individuals are highly respected in their societies.

They value time and strive to accomplish tasks on time. They understand that time is precious and limited. Striving to achieve in career, knowledge, skills, recognition, etc., is paramount to them. They are strongly dedicated to their professions. They are committed to pursue and finish the tasks they are assigned. They are proud of their own work and the work of others in their organizations.

They are self-initiators and are able to work and succeed on their own initiative. They are eager to compete when opportunity arises because they possess a competitive spirit. They are enthusiastic about their work, enthusiastic to learn new things, and enthusiastic to fix problems. With a well-thought-out plan, they are clear about what they are doing, what their objectives and goals are, and how to attain those objectives and goals. They follow the trajectories they have envisioned. They prepare and organize things well; therefore, they know the bits and pieces of the things they are involved in. People observing them and their actions and behaviors clearly understand their message: they are fully aware of what they are working for, what their clients or peers are expecting from them, and what they should do to promote excellence and achievement in others.

In all these actions, they evaluate their work and evaluate themselves – their mental preparedness and/or motivation to their work. They critically evaluate each of their actions and their works/projects and correct them as needed. They learn from their actions and experiences. For example, they accept the criticisms of other people, they carefully examine those criticisms, and they learn from them and improve their actions as needed.

Vocational excellence promotes professionalism. The Merriam-Webster (2018) dictionary defines professionalism as “the conduct, aims, or qualities that characterize or mark a profession or a professional person”; and it defines a profession as “a calling requiring specialized knowledge and often long and intensive academic preparation.” Individuals with VE highly value their professions, adhere to professional ethics, and contribute to strengthen their professions. They live up to the standards expected by their profession and become inspirations for their peers.

In summary, individuals with vocational excellence strive to attain mastery by learning things as deeply as possible, and they possess high levels of technical and social skills and continually reflect on their entrepreneurial abilities.

## Benefits of Vocational Excellence

Benefits of vocational excellence are many, technical, social, and economic, and of benefit to individuals, communities, and industries, locally and nationally (Mayhew et al. 2013a, b; Chankseliani and Mayhew 2015). Individuals with vocational excellence have gone through the learning hierarchical ladder – cognitive, psychomotor, and affective. This means that they are not only aware about or possess knowledge on their respective subjects, but they also have skills to apply that knowledge and are motivated to put those skills into action. They obviously have gone through higher levels of technical training and have attained a high level of technical ability that enables them to observe, assess their situations, diagnose problems, and make appropriate decisions to address those problems. Further, vocational excellence also bolsters individuals' creativity.

Additional benefits of VE as outlined by Mayhew et al. (2013a, b) and Chankseliani and Mayhew (2015) include motivation to strive for a higher standard in their endeavors or work, for which they diligently pursue refinement of existing techniques.

Communication and interpersonal skills are essential for people to achieve vocational excellence. Additionally, communities today are getting more diverse than ever; thus cross-cultural understanding is paramount. Individuals with vocational excellence possess these qualities – communication skills and ability to work with diverse teams – and so impart lasting impact on their organizations.

Performing their work with confidence and working independently with others' assistance are other benefits at the individual level. When individuals are at the height of their knowledge and skills, they can make judgments about what, how, why, when, and where to act, whom to seek help from, and to whom to provide support. They are able to lead the tasks that are in their hands because they are confident in their work and their ability to deal with others – their clients, their counterparts, and their organizations.

Doing the right things on time with the right approach is what successful individuals do. In the same vein, individuals with vocational excellence efficiently manage their time. As the above discussion alludes, the trajectory of achieving vocational excellence is complex and passes through cognitive, psychomotor, and affective phases. While one goes through these phases, he/she gets involved in many types of activities that serve as the platform for actors to plan, act, reflect, and synthesize their learning experiences. As a result, the activities in the succeeding cycle are more refined and advanced than those in the preceding ones. This is an example of improvement through practice.

It is worthy to note that individuals who are committed to experiential learning and who strive to attain excellence also pursue self-regulated learning. As noted by Wolters (2003), “. . . self-regulated learners are autonomous, reflective and efficient learners, and have the cognitive and metacognitive abilities as well as the motivational beliefs and attitudes needed to understand, monitor and direct their own learning” (p. 189). Wolters adds that self-regulated learners believe that efforts lead to success. Perseverance pays off.

Vocational excellence scholars are career-focused. They strategically examine and foresee job trends (Teaching.org 2012) and pursue studies in subjects that industries are looking for in their employees. Also, they can independently establish and maintain extensive networks with professionals, peers, and customers. They strive for career progression such as pay raises, promotion, and advancement to managerial positions. Because they have all the skills that are required to start new ventures and/or businesses, many of them can be self-employed if they want.

Businesses and industries strive to offer new, efficient, and quality services to their customers at affordable rates so that as many customers receive their services as possible. To make this happen, however, they need a sound plan, efficient machines, and skilled employees who can run those machineries. Industries and employers greatly benefit from employees with vocational excellence because these employees can offer new services or products, and they master new technologies for the companies that hire them. Eventually, vocational excellence does not only improve employee performance but provides employers higher return on investment together with positive publicity and increased prestige.

---

## **Educational Institutions' Roles to Attain Vocational Excellence**

Educational institutions such as colleges, universities, and vocational and technical schools play critical roles to impart to students theoretical as well as applied knowledge and skills and to motivate students to apply their skills in their respective professions. Tinto (1987) stressed that students come from varied socioeconomic backgrounds, and vocational and technical schools environments may be entirely new to them. Welcoming new students and guiding students to integrate themselves within the college culture through inception workshops, extracurricular and curricular activities, internships, informal student interactions, and faculty-student interactions are paramount.

It is essential to start orienting students about VE right from the very beginning so that they envision and plan high and they uphold high expectations and motivations. Schools should expose students to high standards and goals and motivate and prepare them to long for and strive to attain those standards and goals (Magisos et al. 1984; Nielsen 2010; Smeaton et al. 2002). Attaining excellence requires well-developed foundation skills in the subject areas he/she will pursue in his/her careers.

Competitiveness leading to excellence is a skill that requires preparation and practice. Opportunities to compete motivate students to work hard to improve their level of skills and thus achievement. So, schools are encouraged to hold competitions among students and inform participating students how they perform compared to the given standards.

Academic advising is an integral component of vocational education. According to Astin (1984), students' proficiencies, academic or otherwise, depend on availability of faculty advisors, mentors, student affairs professionals, and resources and how they facilitate students to get involved in college activities. Students should

have opportunities to interact with faculty members and other school staff members. Faculty and staff advising will greatly help students find not only the right courses that suit their interest and backgrounds but also the resources that are available within the schools and, ultimately, to create proper learning environments. Suvedi et al. (2015) underscore the need to strengthen advising services for college students. The academic advisors need to organize themselves and frequently interact with their advisees.

How teachers teach and behave with students greatly influences student learning. Teachers are therefore advised to be extremely skillful in communicating with students. A University of Colorado (1988) report provides teachers and advisors with these tips: choose the right communication methods, adhere to timelines, dress well, use the right words with appropriate level of emphasis, use humor, prepare before class, use innovative learning tools, give concrete and real-life examples to elaborate on points, involve classes in role play, encourage all students to participate in class, and seek students' feedback about facilitation.

Gopinathan and Lee (2018) describe the features of a good school that help attain excellence. These features include knowing the needs and interests of students, ensuring all students acquire fundamentals of literacy and numeracy, creating a positive learning environment, having caring and competent teachers, securing parental and community support, and providing opportunities to all students, regardless of family circumstances.

To serve students with high quality educational services, instructional staff members should be current with information, knowledge (expert), and skills. Their presentations should be appealing and motivating to students. Schools should be prepared to train advisors as needed. Instructors should also be motivated to teach their students, to understand their students' learning needs and employer demands, and to offer the best learning experience to their students that they can.

Curricula guide teaching and learning in schools and colleges. Schools should regularly evaluate their curricula, soliciting input from experts, past graduates, students, and employers, and update and redesign the courses as needed (Magisos et al. 1984; Nielsen 2010; Smeaton et al. 2002). The world is dynamic. Communities, industries, consumers, and producers, to name a few, all are changing, and their needs and demands are changing, too. Colleges and schools should be mindful of these changes and update and revise their educational programs so that their graduates are comfortable and productive in the changed contexts. Those schools and graduates who can anticipate the future and prepare themselves for the future will stand out and will attain excellence.

Much has been discussed about students, teachers, and advisors as they relate to vocational excellence. But, there has been limited discussion about roles of support staff, parents and family members, communities, and organizations to help students attain, use, and sustain vocational excellence. We believe that support staff are critical to students' learning and they should be proactive to cater to student needs and be accessible as needed.

Parents and family members make significant contributions to student learning. To build strong trust and rapport between student families and schools, it is highly

recommended that schools survey student families at the beginning of the enrollment and use survey input to plan for educational excellence, and, ultimately, students, their families, and schools together celebrate the excellence. Parents and family members should also render moral support to help students learn and grow intellectually and otherwise.

Communities should also offer necessary support – providing platforms to showcase talents, acknowledging talents and contributions, and marketing the talents, among others. It is the community where excellence is recognized, supported, and sustained.

---

## Conclusion

Discourse on vocational education and training has been going on for a long time. A body of literature exists on this topic, but literature on vocational excellence has been sparse and scattered. A document discussing attributes of vocational excellence has been long overdue, a gap which this chapter has tried to fill.

Individuals need to attain high levels of vocational excellence to meet changing societal needs. As outlined earlier, vocational excellence is grounded on three pillars: competence, self-regulation, and social engagement. And it requires individual, family, and community efforts; vocational excellence results from the synergistic effect of these entities. The discussions point out that individuals desiring to achieve vocational excellence should strive for high levels of motivation, competence, and resilience. These professionals are resourceful, and they are valuable capital or assets in themselves.

The discussion illustrates that educational institutions, families, and societies have great influence on how individuals attain and sustain vocational excellence. We emphasize that all these entities – i.e., families, communities, and educational institutions, in particular – have to be proactive and competent in themselves to assist students in acquiring vocational excellence. The educational intuitions and their staffs should understand the meaning and gravity of vocational excellence. Evaluating educational programs, including advising and revising curricula, using cutting-edge technologies, providing opportunities for hands-on learning, exposing students to problem-based learning, organizing competitions among students, and recognizing students for their achievement are among the ways that educational institutions can promote the development of vocational excellence.

That process begins with educational and vocational training institutions following a six-step procedure: selecting the students, developing and revising curricula and instruction methods, providing qualified teachers, providing a conducive learning environment, managing the programs well, and continually evaluating and updating programs.

Because technical skills are prerequisites to attain vocational excellence and individuals acquire technical skills through education and training, educational institutions need to tailor their training programs to the needs of and make them accessible to members of disadvantaged groups who otherwise might not be able to afford or access them.

Teachers play crucial roles in students' pursuit of educational excellence. To prepare teachers for teaching vocational excellence, institutions can bring teachers together with scientists and/or engineers from industry or government so that they can hear about cutting-edge research and development, ask questions, and network with other professionals.

Just as students should be evaluated for what and how they are learning, educational institutions need to continually evaluate their instructional programs, their professional development levels, teacher qualifications, and program management, among others (Maryland State Department of Education 2015).

We strongly feel that training to achieve vocational excellence should go beyond schools and colleges and reach people in all walks of life – employers, industries, consumers, politicians, to name a few. We believe that nonformal lifelong education would greatly contribute to making the world and the people living in it more prosperous and happy, as Aristotle envisioned.

## Abstract

Vocational excellence is not easy to define, not least because of differing country contexts, expectations, and norms. Yet, excellence in vocational education and training abounds. One such example is skills competitions. These provide both a benchmark for high performance and an objective way to assess vocational excellence, and where they are international, they also allow cross-country assessments against commonly agreed standards. International skills competitions, specifically WorldSkills Competitions, are the focus of this chapter with the aim of illuminating what vocational excellence is. Drawing on research on WorldSkills Competitions allows an opportunity to understand better the factors that contribute to the development of vocational skills to a high standard, while focusing on understanding the knowledge and skills development of the competitors, and the people involved in this development, allows us to begin to understand better how vocational excellence can be achieved and recognized.

**Introduction**

Economies around the world would not survive without vocational education and training (VET) systems. Yet, criticisms of the design and delivery of VET provision by some politicians and businesses are long standing (see Keep and Mayhew 1988, for a discussion of the UK). While there is clearly room for improvement in VET worldwide (OECD 2015), evidence also points to many positive aspects of VET (Maclean and Wilson 2009) and clear illustrations of vocational excellence. For example, Keep and James (2011, p. 56) highlight the fact that competition in the UK for apprenticeship training places with companies such as BT and Rolls Royce outstrips competition for undergraduate places at elite universities (e.g., Oxford and Cambridge) such is the reputation of these programs.

The other point to make at the outset is that national norms and conceptions of vocational learning for any given occupation at any given level can vary significantly in terms of curriculum and content from country to country. As research by Brockmann et al. (2011) demonstrates, the conceptual and philosophical underpinnings of what it requires by way of skill and knowledge to be able to practice in an occupation such as nurse or bricklayer are not uniform across Europe, and Anglo-Saxon models of occupations and vocational skill diverge quite significantly from those found on the continent.

As a result, what constitutes vocational excellence can vary across national boundaries, and hence international definitions of vocational excellence are not simple to arrive at. This chapter focuses on a practical example of an activity that both celebrates and actively supports the development of vocational excellence – skills competitions – to begin to understand better what it looks like and how it is developed. These competitions provide both a benchmark for high performance and an objective way to assess vocational excellence, and where they are international, they also allow international assessment against commonly agreed standards. They also allow an opportunity to understand better the factors that contribute to the development of vocational skills to a high standard. The next section provides the context of skills competitions, the pinnacle of excellence, followed by a discussion of current understanding of what vocational excellence encompasses.

---

**The Pinnacle of Excellence?**

Although some of the research on the role of competitions in education (for example, Verhoeff 1997) focuses on the potential for competitions to discourage a student's learning (Wang and Yang 2003), a great deal of other work has focused on how

competition can be used to good effect in specific subjects such as engineering in middle school classrooms (Sadler et al. 2000), engineering in universities (Sirianni et al. 2003), computing (Cormack et al. 2006), and music (Burnsed and Sochinski 1983). Yet relatively little has been written about competitions in VET (Berry-Lound et al. 2017) and even less attention has been directed to the end of understanding better how competitions can be used to raise standards in vocational excellence.

The Olympics are synonymous with sporting excellence. In much the same way, WorldSkills Competitions (WSCs) are now synonymous with vocational excellence (for more information on WSC, see [www.worldskills.org](http://www.worldskills.org)). The WSC is recognized by many as the pinnacle of excellence in VET (EduCluster Finland 2013). Competitors are tested and measured in their performance in work task simulations and practical tests and are awarded points by the judges. In each skills area, the competitor with the most points over 500 is awarded gold, second most points is awarded silver, and the third highest points receives a bronze medal, similar to the sporting Olympics. In addition, any other competitor in that skill who achieves a score of 500 or over in the competition assessment, and did not achieve gold, silver, or bronze, is awarded a Medallion of Excellence. The WSC is organized by WorldSkills International (WSI). WSI is a nonprofit association that promotes VET internationally in traditional trades and crafts as well as in multiskilled vocations, such as Manufacturing Team Challenge, and those utilizing newer technologies and innovative services. Currently, the competition brings together around 1000 contestants mostly aged 16–22 from 53 countries, who gather every 2 years to compete publicly and demonstrate excellence in 50 skill areas (it is important to note that not every country competes in every skill). The skill areas are grouped into six skills sectors:

1. Construction and building technology
2. Creative arts and fashion
3. Information and communication technology
4. Manufacturing and engineering technology
5. Social and personal services
6. Transportation and logistics

For a more detailed history of WSC see [http://www.worldskills.org/index.php?option=com\\_content&task=view&id=17&Itemid=453](http://www.worldskills.org/index.php?option=com_content&task=view&id=17&Itemid=453).

These competitions have been held biennially for 70 years. The first national competition of the International Vocational Training Organisation (IVTO) took place in Spain in 1947. In 1950, Portugal joined and in 1953, five other European countries – Germany, Great Britain, France, Morocco, and Switzerland – participated in the event. These competitions were formerly called Skill Olympics and mirrored the Olympic Games with the main purpose to:

create a youth festival in which competitors would recognise their role in helping to construct the future. Individual excellence is recognised in sports and the arts, and for this reason it was felt that achievements in vocational education and training were deserving of the same. (Wilson 2000, p. 201)

Each participating country has an organization which brings together the squad and team and provides for and organizes the inherent training required of team members by training manager experts (TMEs – a training manager expert is the expert in that particular skill who trains the young person) for that country to compete at the WSC. In the UK, for example, TeamUK is managed by WorldSkills UK, an organization which brings together skills and careers experiences from across the UK (WorldSkills UK 2014). In each of the four countries (England, Wales, Scotland, and Northern Ireland), WorldSkills UK organizes local, regional, and national skills competitions in partnership with industry and educational institutions.

---

## Vocational Excellence

Skills competitions provide a benchmark for high performance and an objective way through which to assess vocational excellence (James Relly 2016). Competitors, whether an individual or a team (for example, landscape design), complete “test projects” and are assessed according to criteria contained in the WSI “Technical Descriptions.” These descriptions define “the name of the skill, the competency specification and scope of work . . . the conduct and assessment criteria of the competition, and any skill-specific safety requirements” (WSI 2010, p. 34). Criteria include planning, technical accuracy, innovative thinking, and problem solving (WSI 2010). In addition, WSI have developed a set of international standards, the *WorldSkills Standards Specifications*, which “reflect the global occupations or work roles that are represented by the WorldSkills Competition” (WSI 2017). The specification of each skill has a framework. According to WSI (ibid.), the value of these frameworks is threefold:

- *As the reference points for the WorldSkills Competition, they establish the baseline from which to grow and reward authentic vocational performance.*
- *For WorldSkills members and more widely, they provide a benchmark for national and regional standards.*
- *As economies and markets become increasingly international, the specifications support young people and adults to survive and thrive in the modern world.*

Moreover, the specifications:

- *Cover the specialist, technical, and generic skills that comprise intermediate work roles across the world*
- *Set out what a capable practitioner must know, understand, and do*
- *Are prepared, with guidance, by technical and vocational WorldSkills experts*
- *Are consulted upon and updated biennially with industry and business worldwide*
- *Indicate the relative importance of each section of the standards, as advised by industry and business*

There is a specification for each skill represented at the WSC (see <https://www.worldskills.org/what/education-and-training/wsss/>) which is updated biennially after

consultation. Some evidence (Messenger et al. 2011) points to countries incorporating the standards into their apprenticeship programs as policy, and into the VET system more widely (Messenger et al. 2017); however, other countries seem to use the specifications purely for training their elite squad. Few countries have competitors, and VET systems, whereby their occupational training would place them at the level where they could compete on the world stage without extra training. James and Holmes (2013) provide the following illustration from the UK in their work on WSC and workplace learning environments.

### **Illustrative Example of the Development of Competitors for Team UK Development of Team UK**

Prior to trying out for TeamUK, some of the competitors are full-time college or university students, but many of them are, or have been, apprentices. So, while some of their skill development would have taken place within educational institutions, the vast majority of the training to the point of trying out for the UK squad would have occurred in the workplace. The WSC standards require demonstration of superior performance, which means participants undergo intensive training to ensure their skills, knowledge, and ability are raised to meet these standards of vocational excellence. Consequently, the competitors' skills and knowledge developed in their workplaces are built upon in the WorldSkills UK training.

However, due to the potentially different starting points for each squad member in terms of knowledge and skill, WorldSkills UK takes a number of factors into consideration to ensure the most suitable training profile for each potential Team UK member is developed. These factors are:

- The training matches each squad members' requirements at that precise point.
- The trainer has the understanding and skills to train to world standards with the appropriate briefing or has the ability to find suitable training.
- The environment enables, and requires, world standards to be practiced – training location is key.
- The training incorporates formative assessment and feedback to the squad member and training manager expert (TME).
- The training is varied and transparent in its settings, trainers, and material resources.

The final team competes against other countries, with the best performers receiving medals.

To understand better the pathways of the competitors towards competing at WSC, and their development of vocational excellence as part of this journey, the WorldSkills Foundation (WSF) funded a research project, *Modelling Vocational Excellence (MoVE)*, at the 2011 WSC. Prior to this project, there was little research

not only into skills competitions but also vocational excellence. What was available stemmed from Australia, Finland, and the UK (see *inter alia* Nokelainen and Ruohotie 2002, 2009; Nokelainen et al. 2008; Mayhew et al. 2009; James Relly 2016; Smith and Rahimi 2011).

The MoVE project, conducted by researchers from the University of Tampere (Finland), RMIT University (Melbourne, Australia), and the University of Oxford set out to investigate the cognitive, affective, and social dimensions of expertise, and the processes through which such expertise is most effectively acquired. To do so, two theoretical orientations were adopted (Nokelainen et al. 2012, pp. 5–6):

1. The first theoretical orientation draws on research into individual attributes and characteristics and the dimensions of intelligence, including Barry Zimmerman's research on self-regulation (Zimmerman 1998, 2000, 2006), Francois Gagné's research on development of talent (Gagné 2004, 2010), and Howard Gardner's research on multiple intelligence areas (Gardner 1983, 1999). Using these theoretical perspectives, the originator of the MoVE research, Professor Petri Nokelainen developed a theoretical model to explore the acquisition of vocational expertise. The model maps the development of vocational competence in terms of cognitive skills and affective abilities (expressed as Multiple Intelligences domains), work skills, influential individuals, and factors related to self-regulation (motivation, volition, and self-reflection). The major proposition derived from this aspect of the theoretical framework is that there is a relationship between key attributes and characteristics, and vocational performance. In the case of the WorldSkills International Competition, performance is measured by Competition results, and comparisons are drawn between the different perceptions of attributes and characteristics held by medal winners and other Competitors.
2. The second field of enquiry uses the work of Etienne Wenger, who pioneered the concept of communities of practice, and focuses on the settings in which vocational expertise is acquired. Wenger argues that learning involves participation in social settings and is a consequence of belonging to a group or community which has particular meaning in the lives of the learners (Lave and Wenger 1991; Wenger 1998). In other words, in addition to individual volition and cognitive development, learning involves interaction and communication. Wenger uses the concept of 'community of practice' to describe the social context of learning and identifies three dimensions of practice which characterize a 'community': mutual engagement; a joint enterprise; and a shared repertoire of routines, stories, and ways of doing things (Wenger 1998, pp. 73–85).

Wenger (following on from his work with Lave 1991) regards communities of practice as sites in which identity is formed and points out that learning is a process of identity formation. In this context, as well as leading to the acquisition of skill and knowledge, vocational learning is a process of professional identity formation. The specific communities in which vocational learning takes place thus influence the formation of identity, the values, and attitudes individuals adopt and the ways they

perform as professionals. Identity and practice are mirrors of each other. Being a particular type of professional – a bricklayer, a carer, a doctor, a mechanic – gives a certain focus (Wenger 1998, pp. 148, 152). The practices and values of particular professional communities are the framework for developing competence as a community member and as a professional. Via these communities, skills and knowledge developed through experience can be transferred between more experienced workers and newer entrants to the workplace.

---

## Stakeholders in Vocational Excellence

The MoVE research showed that developing the skills and knowledge in the competitors so they are able to compete on the world stage involves many stakeholders. In addition, their participation and involvement contributes to the capacity building of the wider VET system. Individuals develop vocational skill and knowledge in the workplace, school and/or college through the direct and indirect guidance of more experienced people (Billett 1999); they are part of a community of practice influencing each other and the systems or communities of which they are member(s). The attributes, attitudes, and values of individuals and their interactions with others and with their environments underpin the development of vocational excellence in these systems.

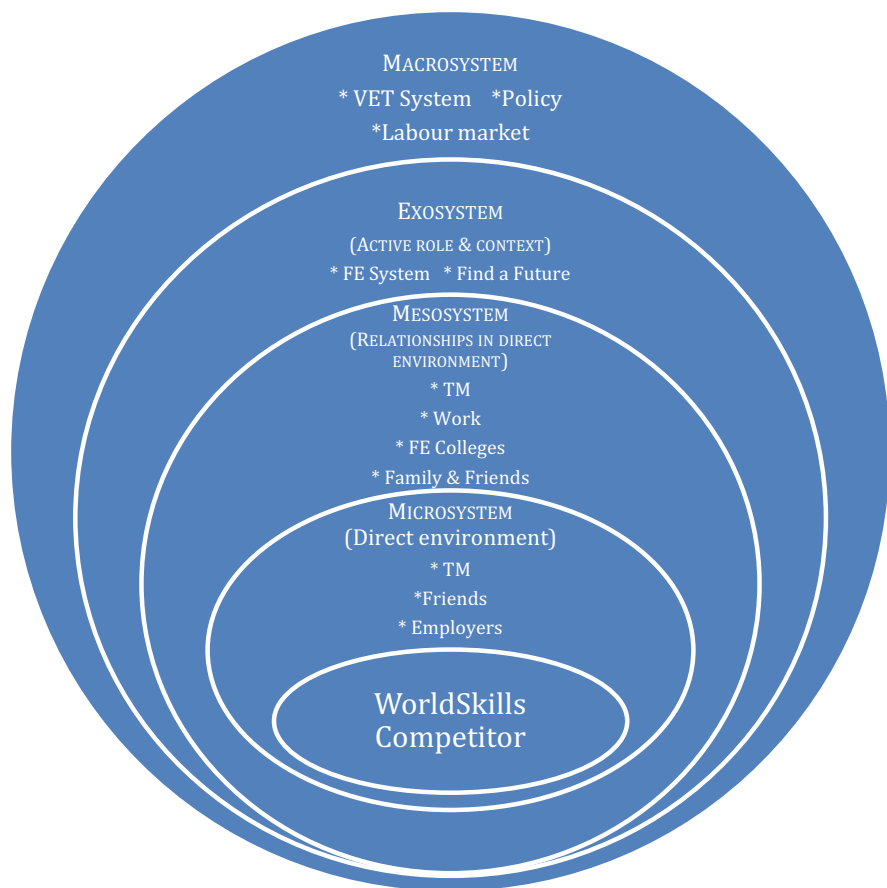

It is this premise that underlies the conceptual model (see Bronfenbrenner 1979) in the *Developing and Understanding Vocational Excellence* (DuVE) research conducted at the University of Oxford in conjunction with WorldSkills UK (James Rely 2016). The DuVE research consisted of six projects:

- Project 1: Modelling the characteristics of vocational excellence
- Project 2: Learning environments to develop vocational excellence
- Project 3: Benefits of developing vocational excellence
- Project 4: FE college participation in skills competitions: costs and benefits
- Project 5: WorldSkills contestants and entrepreneurship
- Project 6: Training managers: benefits and barriers to WorldSkills UK participation

The DuVE suite of projects (James Rely 2016) showed that WorldSkills competitors sit at the center of these communities (Nokelainen and Stasz 2016; Nokelainen et al. 2013a, b) and systems and are the main beneficiaries of participation in WSCs (Chankseliani et al. 2015a). However, they are supported by training managers (TMs) who assist competitors by strengthening and underpinning the learning and development of team UK members (Allen et al. 2015). They do this through their own professional knowledge and expertise and from drawing on the communities of which they are member(s) (Wilde et al. 2015). For example, fellow TMEs in the WorldSkills community share their knowledge. Thus, the knowledge and skills of TMEs working in a vocational education college can be reflected in the achievements of their colleges (identified in Project 4) and its curriculum development. The industry-employed TMEs bring their industry experience to the training

of the competitor. This real-world knowledge can help ensure that competitors, and college-based TMEs, are at the cutting edge of new technologies and processes (Project 6).

In addition, the young people who are selected to join Squad UK receive significant training in the lead up to team selection, and they return to their workplace or college with this skill and knowledge development, thereby diffusing knowledge and introducing their employers to new techniques and/or products (James and Holmes 2013). In that sense, the “reach” of the capacity building is wider than initially suspected – it extends beyond Team UK members as represented in Fig. 1. Employers in the research observed enhanced employee performance and enjoyed good publicity and higher prestige, with some companies even attracting more clients (Chankseliani et al. 2015a).

## Infrastructure and Support for Developing Vocational Excellence

The level of investment in the competitors for each of the country's teams is significant in terms of time and finances and involves infrastructure and support across a variety of systems. Achieving these results stems from the involvement of people from all levels, illustrated as above. What follows is based on research in the UK; similar research conducted in other countries is not evident.

While the research showed that some aspects of the infrastructure and support still needed development (James Relly 2016), there are many areas where the infrastructure and support around skills competitions is having an impact on the wider VET system in the UK. For instance, many vocational colleges have in-house competitions embedded in the curriculum, and some participate in local, regional, and national competitions, which can lead to WSC participation. The mechanisms through which this participation occurs have formed case studies (Doubleday 2016) from which others (colleges and employers) could learn. Some employers are building on the knowledge and skills of competitors to deliver in-house training (Chankseliani et al. 2015a).

Within these competitions, networks are developed and knowledge and skill shared. One such example is the Vocational Masterclasses (Find a Future 2015), which were led by people directly linked to Team UK. Participants in the classes were practitioners in the wider system. The program focused on developing new skills and techniques around competition activity and importing these into everyday teaching and learning practices akin to mainstream learning provision. Another is the use of the social networks for future employment. There were examples of competitors starting their own businesses and emulating the training they had received for their new employees (Chankseliani et al. 2015a). A key finding from the research for the development of vocational excellence within the wider VET system was that knowledge exchange between colleges regarding different ways of becoming involved in competitions acted as a means to support those educational institutions who are interested in becoming involved. In addition, facilitating knowledge exchange between colleges in order for them to learn how other colleges fund their participation in competitions is particularly valuable as this challenge is one all colleges face regardless of their relative levels of involvement.

---

## World Class Standards

The vocational route is often compared to higher education, the so-called “golden route,” in terms of whether parity of esteem is possible. WorldSkills Competitions show this comparison to be a red herring: young people competing on the world stage need no comparators and demonstrate their expertise in their chosen fields on an international stage.

The vocational arena and the route from which these competitors have developed their knowledge and skill provide a solid base from which to progress from their work role to competing at the highest levels of vocational excellence at WorldSkills

Competitions. There is much good practice evident. Those young people who came from positive, supportive work environments and were given a wide variety of tasks to complete during their training in the workplace were more likely to make the final team selection (James and Holmes 2013). In addition, in the UK, there was evidence that some learning providers were using world class standards, derived from the WSC, and deploying these via competition scenarios and spaces to replicate WSC-type learning (Allen et al. 2015; Wilde et al. 2015). This offered positive experiences for students across different levels, i.e., from initial entry level through to young people vying for a place on Team UK. To ensure vocational excellence is developed at each of the levels, it is important that curriculum development incorporates WSC standards.

Moreover, many benefits of participating in skills competitions, from local through to international, were identified in the DuVE research projects (see [www.vocationalexcellence.education.ox.ac.uk](http://www.vocationalexcellence.education.ox.ac.uk)), leading to the development of vocational excellence and world class standards. The majority of competitors reported enhanced confidence and the development of communication skills and time-management capabilities. Career development and progression opportunities, particularly those related to self-employment, networking, and professional reputation, were also identified as important benefits.

The main gain from supporting the WSC for employers and industry related to exposure to new techniques or products, teamwork-related benefits, enhanced employee performance, good publicity, and higher prestige, attracting more business clients and improvements in recruiting new talent, all of which help in the development of vocational excellence.

The benefits to vocational colleges revolved around continuing professional development (CPD) opportunities for teaching staff, enhancing the quality of teaching and learning, contributing to positive publicity and reputation, accessing new equipment, networking, and opening doors to other opportunities.

Importantly, skills competitions have the potential to contribute to improving the attractiveness of VET by raising awareness about vocational occupations and helping young people understand that the vocational route can lead to a rewarding career.

---

## Conclusion

WSI has a long history of promoting and staging competitions and European Commission policy encourages skills competitions as a way to enhance the image of vocational education (for example, Bruges Communiqué 2010) and strive for vocational excellence. However, there has been little research on WorldSkills Competitions and skills competitions in general as a means of achieving vocational excellence. The DuVE suite of projects and the MoVE project provides an actual research base to increase theoretical and practical understanding of vocational knowledge and skills development. It allows for an understanding of what does and does not work, and provides a platform for practical application of the research findings, for example, in terms of creating high-quality workplace learning provision

leading to vocational excellence (Chankseliani et al. 2016). The young people competing in WSC are high achieving. Understanding their knowledge and skills development, and the people involved in this development, through high-quality research allows provides a beginning to understanding better how vocational excellence can be achieved. These existing studies provide a research baseline for future research about vocational excellence.

## Abstract

This chapter presents an overview of extant literature on competence proficiency scaling. To structure the field, the chapter distinguishes between three aspects of competence proficiency scaling: (1) methodological approaches to competence proficiency scaling and the methodological and conceptual critique of this phenomenon; (2) the contextual factors of competence proficiency scaling, including organizational and societal factors; and (3) the implications of competence proficiency scaling to the vocational and professional education and didactics.

The chapter overviews a range of different approaches to competence proficiency scaling applied in the vocational education and training, higher education, and human resource management by synthesizing the perspectives to competence proficiency scaling from the different disciplines, such as education science, education sociology, work psychology, and human resource management and development. Particular attention is paid to the variety of the functions and application fields of competence proficiency scaling, such as assessment of competence acquired in the learning and work process, identification and hierarchical structuring of the requirements of performance in the occupational fields, and identification of the potential of competence development and progression in the occupational fields.

**Introduction**

Proficiency scaling is an inherent part of the processes of education, work organization and management, public administration, and other fields of social life, necessitating diagnosis, evaluation, measurement, and control of individuals' capacities and processes of learning and performance. The wide range of potential applications of proficiency scaling defines the complexity and heterogeneity of this phenomenon. Proficiency scaling is also an inherent element of competence-based approaches to education and training.

The relevance and importance of competence proficiency scaling is defined by the widespread implementation and development of competence-based approaches in different fields. It involves identifying, evaluating, and comparing levels of competence to ensure learning outcomes and curricula match required levels, planning and implementing learning and competence development processes, and guiding involved actors on the potential of competence development provided. Such a range of possible applications inevitably begs fundamental questions about the nature and content of competence proficiency scaling.

This chapter provides a systemic and holistic overview of competence proficiency scaling by (1) discussing the concept and methodological principles of this process; (2) outlining methodological and conceptual critiques; (3) considering contextual factors of competence proficiency scaling, including organizational and societal factors; and (4) discussing the implications of competence proficiency scaling for education and didactics.

The focus of this chapter is on scaling of vocational and professional competence, so issues of scaling of other types of competence, such as key competence or learning outcomes of general education, are not addressed.

## Conceptual and Methodological Principles

Proficiency scaling is a key feature of competence, defining and structuring core processes of competence design, development, and application. Proficiency scaling by itself is a highly complex process which refers to a range of factors, such as minimal requirements of performance defined by work characteristics and labor market needs, demands and requirements of work organization, gradients or steps of development of competence, or institutionally-developed, hierarchically structured pathways to acquire competence in education systems. Proficiency scaling measures demonstrated competence against defined levels according to specified criteria, usually originating from required work performance in the occupational field. The key object of competence proficiency scaling is an individual's performance. Competence proficiency scaling is a process for measuring and structuring the development of skilled performance, identifying stages of development by indicating acquired capacities of performer from one side and stages of more sophisticated capacities attained through stages of developing further skill from the other side (Dreyfus and Dreyfus 1980).

Different conceptual and methodological approaches to competence provide different goals and perspectives of competence proficiency scaling. A *behavioral approach to competence* focuses competence proficiency scaling on identifying factors of successful and effective performance (Le Deist and Winterton 2005). Here the main focus of competence proficiency scaling is on competence as a fundamental behavioral characteristic of the individual, which influences performance through relationships with work characteristics, functions, and organizational environment (Shavelson 2010). Such behavioral competence can be learned and reliably measured as well as aligned with the core competence of organization (Le Deist and Winterton 2005). However, the divergent practices of education, training, and human resource development employ different competence frameworks (personalized competence profiles, portfolios) to identify attained learning outcomes. Assessment often applies the logic of excellence measured against top performers using psychometric tests (Winterton 2009).

A *functional approach to competence* focuses competence proficiency scaling on occupational requirements expressed as occupational standards defined by stakeholder representatives (Le Deist and Winterton 2005). Assessment of competence and quality assurance is based on bureaucratic procedures, and the focus of assessment is on the ability to demonstrate performance to the standards required of employment. Assessment is mostly based on the logic of identifying a threshold of minimum performance or lowest common denominator (Winterton 2009).

From the perspective of a *multidimensional, holistic approach to competence*, the focus of competence proficiency scaling is on developing occupational and professional competence in different contexts (Le Deist and Winterton 2005). Comprehensive understanding of the structure and contents of competence includes knowledge, skills, and social competencies, in combination representing the capacity of an individual to act in the craft or occupation. This approach to competence

**Table 1** Methodological approaches to competence proficiency scaling

Conceptual and methodological approach to competence	Competence proficiency scaling		
	Focus	Important functions and processes	Dominant logics and approach
Behavioral approach	Competence as a fundamental behavioral characteristic of the individual, influencing performance through relationships with work characteristics, functions, and internal organizational environment	Competence development through learning and training, reliable measuring of competence by determining the factors of successful and effective performance, aligning individual competence with the core competence of organization	Logic of factors associated with excellence or above-average performance
Functional approach	Job requirements expressed as occupational standards	Elaboration of occupational standards by employers and social partners, assessment of competence against standards and by following bureaucratic procedures	Logic of threshold minimum acceptable performance or lowest common denominator
Multidimensional, holistic approach to competence	Developing occupational and professional competence in different contexts, considering individual and collective approaches	Applying holistic concept of contents of competence and stressing its universality and transversality in curriculum design, provision of education and training, and assessment	Progression logics and approach of highest common denominator

stresses the universality and transversality of competence, enabling the domination of a logic of progression and pursuit of the highest common denominator in competence proficiency scaling (Winterton 2009). The cumulative nature of knowledge and skills in the process of competence development also fosters growth of proficiency (Angelopulo 2000) (Table 1).

Development of competence levels and proficiency scaling occurs on different levels – individual, organization, and wider community – and is influenced by changes in the content and context of work performance at these levels (Mulder and Winterton 2017). Mulder and Winterton (2017) contrasted three methodological approaches: functional behaviorism, integrated occupationalism, and situated professionalism. These views provide rather different perspectives in conceptualizing the goal of competence proficiency scaling and defining its criteria as summarized in Table 2.

**Table 2** Methodological views of competence and their perspective on competence proficiency scaling

Views of competence (Mulder Winterton 2017)	The goals and functions of competence proficiency scaling	Definition of criteria for competence proficiency scaling
Functional behaviorism – curriculum is founded on behavioral analysis; education and training provides learning outcomes needed to deal with concrete and small tasks or functions	To identify minimal proficiency levels referring to the execution of specifically defined small tasks of activity	The main criteria are derived from concrete requirements of work tasks and corresponding typical behavioral reactions of performers in dealing with these tasks
Integrated occupationalism – knowledge, skills, and attitudes are addressed together in developing not only vocational/professional competence but also personal identity of the learners	To structure and evaluate integrated knowledge, skills, and attitudes in the performance of activity, as well as to provide the guidelines for personal and professional development (development of professional identity) in education	The main criteria are based on holistic learning tasks originating from core work processes that constitute the vocation or profession
Situated professionalism – the knowledge and competencies acquire meaning only in specific contexts or situations of work, which necessitates linking the content of teaching and learning with the work context	To provide the structure and references for acquisition and assessment of context- and situation-specific competencies typical of concrete professional activities	The main criteria are based on specific requirements of the content (e.g., specifications of work processes and tasks) and context of professional activity for the application of knowledge and skills in performance

Comparing methodological approaches to competence proficiency scaling reveals that different elements of competence have rather different weights in competence proficiency scales. Some competence proficiency scales are based on scaling cognitive and mental functions and applying knowledge in performance. A good example is the model of proficiency scaling suggested by Dreyfus and Dreyfus (1980). According to this model, development of a skillful performance is a result of successful transformation of four mental functions – recollection, recognition, decision, and awareness – by displaying them from a primitive to a more sophisticated form as summarized in Table 3.

This model of proficiency scaling is focused on the mental functions in defining the stage of development of the skillful performance, but it largely ignores many important contextual components of performance (e.g., social) as well as a wide range of specific contextual factors of work that directly influence this development. Spöttl and Musekamp (2017) note that the idea of a hierarchy of cognitive processes is increasingly being replaced by categorical structures. Levels of competence are giving way to empirically defined and proven work requirements, and hierarchical orders associated with didactic purposes are increasingly replaced by practical skills interwoven with generic knowledge (Spöttl and Musekamp 2017). Structuring of

**Table 3** Development of skillful performance (Dreyfus and Dreyfus 1980)

Skill level Mental function	Novice	Competent	Proficient	Expert	Master
Recollection	Non-situational	Situational <i>(achieved experience- based similarity recognition)</i>	Situational	Situational	Situational
Recognition	Decomposed	Decomposed	Holistic <i>(performer perceives similarity in terms of whole situations)</i>	Holistic	Holistic
Decision	Analytical	Analytical	Analytical	Intuitive <i>(unique decisions intuitively accompany situation recognition without a need of conscious calculation)</i>	Intuitive
Awareness	Monitoring	Monitoring	Monitoring	Monitoring	Absorbed <i>(the analytical mind is relieved from its monitoring role and permits performer to become completely absorbed in performance)</i>

competencies into levels defined in holistic way requires embedding these competences in work coherences, linking them to the respective domains and context of skilled work (Markowitsch et al. 2008). An example of such structuring is the steps of competence development from novice to expert based on articulation between occupational task areas and learning areas, as shown in Table 4.

Knowledge of itself presents a highly important element of competence proficiency scaling, especially when considered in terms of domains and context of application. Billett (2017) noted the importance of relationships between personal

**Table 4** Steps of competence development from novice to expert (Fischer 2014)

Learning areas		Occupational task areas	Modes of task execution
Complexity of applied knowledge	Logics of performance		
Systemic and deep occupational knowledge based on work experience	How to explain and treat objects of the occupation in a systemic way to solve situated occupational problems	Work tasks under unpredictable change	Indeterminate, experience-led execution of work tasks
Detailed and comprehensive functional knowledge	How things function and how to deal with the whole work process	Problem-based, specialized work tasks	Indeterminate, theory-based execution of tasks
Interrelated knowledge	Why and how things are specifically interrelated in the occupation	Systemic work tasks	Rule-based, systemic execution of work tasks
Guidance, orientation, and overview knowledge	How things are ordered and executed in the occupation	Simple occupational work tasks	Determinate and assisted execution of work tasks

capacities and qualities and domain-specific knowledge of occupation for manifesting competence, constituting expert performance, and discerning canonical, situational, and personal domains of occupational knowledge. Canonical occupational knowledge can be an important source of competence proficiency scaling since through particular procedures and values canonical knowledge shapes the ideals and goals of performance. Canonical knowledge can help define the core, stable, and objective criteria for competence proficiency scaling derived from work requirements. By contrast, the situational domain of occupational knowledge, by manifesting and expressing occupational expertise in terms of capacities enabling individuals to respond to domain-specific routine and non-routine problems within a situated domain, can be a source for precision and adjustment of criteria of competence proficiency scaling according to specific ways of executing work tasks. The personal domain of occupational knowledge addresses individualized attitudes and approaches to performance or individual styles of performance. Differentiation and hierarchization between different types of knowledge has been emphasized for vocational education and training curriculum design, particularly specialized, systematically revisable, emergent, and codified curriculum knowledge in formal education and tacit, uncodifiable, and nonspecialized knowledge acquired on the job (Young 2008; Young and Muller 2013).

One of the key methodological questions around competence proficiency scaling is the nature and universality of skill. To the extent that skill is a socially constructed phenomenon, the establishment of skill hierarchies and leveling also is a social phenomenon involving various stakeholders, which is one reason why this is such a contested terrain (Mulder 2017). Green (2013) notes there are no universal units of skill to facilitate objective comparison of the qualities of skills, so various proxies are

used, such as level of education for cognitive skills or prior work experience for job-specific skills. Qualitative diversity of work characteristics and individual discretion make it difficult to scale interpersonal skills (Green 2013). Scaling and measurement of skill involves methodological difficulties including, in the absence of direct measurement, the use of various proxies and limited scope for generalizing measurement because of high variance of skills and skilled performance, as well as dynamic evolution of work and associated skill needs (Green 2013; Handel 2017). Handel (2017) criticizes qualitative approaches to skills scaling based on analysis of attitudes, evaluations, and holistic judgments, which create doubts around interpretation of measurement scores, recommending explicit scaling survey instruments referring to specific facts, events, and behaviors with response options to discriminate between levels.

Professional expertise and experience are relevant in competence proficiency scaling, which is defined by knowledge, metacognitive knowledge, skills, social recognition, growth, and flexibility (Evers van der Heijden 2017). Level of expertise can also be defined by referring to the attained education level, work experience in the concrete field, and recognition of peers and colleagues (Kuhlmann Ardichvili 2015). According to Kuhlmann and Ardichvili (2015), experts can be distinguished from nonexperts by intelligence matched to the discipline, willingness to work hard, and fascination with the field of work, as well as desire to address complex and ambiguous situations. Professional expertise can be acquired through diverse vectors of development, such as acquisition of professional expertise in the hierarchical stages. Professional expertise is acquired and upgraded through experiential learning, practice, and coaching, with the influence of ergonomic, organizational, socio-economic, and institutional factors, including organizational support for learning (Evers van der Heijden 2017). Bereiter and Scardamalia (1993) suggest expertise is developed by continually addressing more complex problems, whose solutions enable progression from novice to advanced beginner and other stages of expertise. Mulder (2017) stresses differences and relationships between mastery and performativity, where the former defines the level to which competence is achieved, described by competence standards, while the second defines the degree of alignment of competence with performance characteristics.

Competence proficiency scaling is a complex process defined by a wide range of different factors, so requires holistic approaches. Holahan (2014) notices that the criteria for defining skillful performance and mastery in occupation are very diverse and can be attributed to the socioeconomic, cultural-historical, and individual-psychological stances of competence. Vonken (2017) suggests the multiplicity and complexity of competencies are caused by specifying competence through detailed description of performance and capabilities, when such capabilities are derived from performance. Ștefănică et al. (2017) also comment on the high heterogeneity of characteristics and criteria for competence proficiency scaling in technical occupations and corresponding curricula and relate this heterogeneity to the multiple origins of these criteria. An integrated, holistic approach to competence proficiency scaling based on the relationship between capabilities and task accomplishment entails multiple quantitative and qualitative dimensions (Hager 2017). Normative

assessment of skilled performance should be accompanied with assessment of qualitative characteristics like creativity, customer orientation, and attitude toward work, with reference to appropriate professional values.

When a vocational or professional competence is regarded as domain-specific and situated in the work process, measurement and proficiency scaling are defined by the requirements of concrete work processes for the application of knowledge and skills (Spöttl 2010). During vocational learning, when competence is being acquired, learners deal with different dimensions of work, learning tasks that are difficult to grasp, measure, and evaluate in terms of learning outcomes. The concept of core work processes that must be handled by competent individuals can help since these relate to systemically interrelated work tasks that are performed by applying professional vocational competence, or integrated knowledge, practical skills, and abilities (Spöttl 2010).

Another key methodological problem of competence proficiency scaling concerns differentiating between work requirements and cognitive dispositions typical for competent performance (Straka Macke 2010), which makes it difficult to test empirically theoretical knowledge underpinning competence. Competence levels needed to meet work requirements must be defined using restrictive mathematical scaling techniques and substantive qualitative analysis of work processes, comparing the performance of novice and expert (Straka Macke 2010). A good example of such modeling of competence proficiency scaling is a description of the competence levels developed in the KOMET project (Haasler 2010). This model distinguishes four levels of competence articulated by different regimes of application of knowledge and skills in work processes (starting with nominal competence and rising functional competence and conceptual and process competence to holistic formation competence).

---

## Methodological Critique of Competence Proficiency Scaling

The methodological critique of competence proficiency scaling addresses many issues, starting with the methodological backgrounds of scaling, applied concepts, and the logics of defining the criteria of scaling and ending with the application of competence proficiency scaling in different contexts of education, training, and work.

Competence proficiency scaling refers to outcome-based approaches to learning which is dominated by the logics of assessment, separation of learning processes and outcomes, and usage of standardized instruments for assessing performance and proficiency (e.g., occupational standards derived from functional analysis). In criticizing outcome-based approaches to learning, Young (2009) argues that (1) observation and distinguishing performance necessitates expertise and knowledge in specific work contexts, so cannot be done by “neutral” researchers expert in functional analysis; (2) in seeking to make inferences on performance and competence proficiency, it is necessary to understand the learning process that leads to competence acquisition; and (3) separation of learning processes from learning outcomes

leads to higher concentration of learning outcomes at lower levels, where work tasks involve less judgment and ambiguity. The main focus of this critique is on the application of “reductionist” scientific management approaches of industrial standardization to the field of competence and qualifications, which relies on the assumption that “human performance can be measured with the same lack of ambiguity as the diameter of a screw or the resistance of a length of wire” (Young 2009, p. 19).

Colins et al. (2014) similarly concluded that competence-based approaches are unsuitable for facilitating high-level proficiency in sports, medicine, and coaching professions, arguing that competence-based models cannot address professional practice requirements like judgment, flexibility, and decision making. Instead, they propose an expertise-based approach with differential weighing of factors according to their importance for performance. Unlike competence-based approaches, an expertise-based approach is not oriented to the minimal benchmark requirements and facilitates evaluating the complexity of performance, including complexity and variability of contexts that render standardization of performance requirements impossible (Colins et al. 2014).

Other researchers highlight weaknesses of methodological approaches used in defining and describing competence levels that derive from a misalignment of these approaches with educational goals. For example, psychometric and qualitative descriptions of competence levels have methodological weaknesses, such as the challenge of identifying clear and objective criteria of levels for competence of different types, as well as difficulties of empirical and practical operationalization of the categorization of competence into functional-professional, social, and methodical competence (Bremer Saniter 2010). Arguing that the goal of vocational education and training is to enable a high level of autonomy in the identification, definition, and execution of occupational tasks, Bremer and Saniter (2010) suggest all activities that facilitate competence development consist of empirically identifiable and occupation-specific sets and combinations of tasks that can serve as indicators of the competence level: naïve and unaware execution based on everyday experience, performative rule-based acting in dealing with tasks and work problems, competent execution based on the selecting or generation of rules, and professional execution referring to needs of users and society (Bremer and Saniter 2010).

Becker (2014) also claims that abstract dimensioning of competence into categories of functional, social, and personal competence, or reference to literacy as a basic component of every competence, leads to the elaboration of competence descriptors that are divorced from reality. Vocational competence is rooted in the complexities of occupational context, which experts in curriculum design often struggle to understand. Becker (2014) proposes introducing work requirements in competence descriptors because purely analytical descriptions of competence dimensions, their operationalization, and resulting taxonomies cannot ensure proper reflection of the occupational tasks in the way that work objectives-based and subject-centered competence descriptors can make all dimensions of work process clear and understandable for all involved in the vocational education and training process.

Grollmann (2008) argued that referencing competence to levels often entails several dimensions of level criteria in parallel (especially in competence and qualification frameworks), and anybody attributed with a certain proficiency level on one dimension must also possess the attributes of other dimensions for that particular level, what is not necessarily the case in real life, where competence development does not necessarily entail such alignment (Grollmann 2008).

---

## **Consideration of Organizational and Societal Factors in Competence Proficiency Scaling**

This section provides a brief overview of the effects of organizational and societal factors on competence proficiency scaling, including strategies of organizations, human resource management and development of occupations, as well as technological and organizational change.

Looking at competence proficiency scaling from the perspective of organizational and societal factors, the central focus is on work design and organization, which is shaped by strategies of enterprises, societal norms and state regulation, social agreements, and cultural attitudes. Organizational strategies for managing work and people represent an important source of competence proficiency scaling, since these shape skills demand in general, as well as structuring competence requirements and hence requirements of proficiency scaling. It is important at the outset to highlight differences between developing competence proficiency scaling in industry (demand side) and in the education system (supply side). Competence proficiency scaling in the education system (especially in school-based initial vocational education and training) involves specific pedagogical and institutional factors that are not directly influenced by competence demand in the sectors of economy. The level of competence developed in formal education also depends on the hierarchical position of related subsystems of education and associated qualifications. Different qualifications involve diverse methodologies of curriculum design, learning duration, educational pathways, and other aspects of educational provision. These differences, together with a mismatch between skills demanded in the economy and those supplied in education, contribute to differences in competence proficiency scales in the worlds of work and education.

Zarifian (2005), analyzing competence-based human resource management in organizations, identified two main pillars of application: (1) enterprise strategy, treating a competence-based approach as an essential factor for success; and (2) relationships between employees, prescribed and real work situations that employees encounter, and prospects for professional mobility. However, in everyday human resource management practices, important elements of competence demonstrated by employees remain unnoticed and unrewarded, while opportunity to master such elements is restrained. For Zarifian (2005), it is logical therefore that if enterprises genuinely seek to enable employee competence development, they should treat competence areas not as prescribed requirements but as fields of learning and development through executing occupational tasks.

Zarifian (2009) further argued that competence hierarchies reflect the prescriptive and normative side of work, originating from instrumental visions and approaches to work process. Referring to research on applying competence-based approaches in enterprises, Zarifian (2009) proposed a model of competence where competence proficiency scaling “operates” through three fundamental elements: freedom to act, responsibility, and the dynamics and unpredictability of the work context. Freedom of initiative to act, a basic precondition of competence, cannot be eliminated by hierarchy, but it can be constrained or facilitated according to how work is organized (Boxall and Winterton 2015). Scaling responsibility for acting is interdependent of scaling of autonomy in activity, and arbitrary decisions on limits of responsibility are made by managers and other stakeholders. The more deeply responsibility is internalized, the higher is the level of competence and professional conscience, since initiative taking implies stronger ethical responsibility. The most competent individuals are thus those who can assume responsibility spontaneously or culturally possess attitudes of caring for others. Accordingly, such competence is more likely to be developed and manifested where there is higher unpredictability of events and changes in work context (Zarifian 2009). From this perspective, competence means demonstrating effective performance in dealing with events and changes and showing creativity and initiative, so the potential for competence development is limitless and can never be completely attained. The aspirational nature of *entelechy* captures this conceptually (Winterton and Cafferkey 2017).

Coulet (2011) identified the normative nature of competence as used in human resource management, defined by reference to the culture of performance evaluation based on social judgment and identifying capability in executing work in constructive, coordinated, and hierarchical ways. Competence frameworks and other instruments of competence-based human resource management also involve dimensioning work content and task execution, where the level of competence is predefined by prescribed tasks and assessed by comparing actual with prescribed execution of tasks. Use of competence in human resource management practices inevitably involves reference to hierarchical aspects of activity, such as required levels of performance in terms of volume and scope of work tasks, autonomy, and other issues (Coulet 2011).

Clot (2014) disagrees with separating the social prescription of work and its actual execution, between task and activity and between work organization and individual performance promoted by some researchers in ergonomics and industrial psychology, arguing that between prescribed work organization and individual performance, work is reorganized by occupational groups. This process is affected by the social genre of work, or professional genre, which consists of shared obligations of employees that are not covered by prescribed work organization (Clot 2014). The genre of activity consists of shared norms of work performance, which constitute part of professional identity in the community of practice, adjusting prescribed requirements of work and thereby facilitating individual styles of work. The development of professional expertise involves continuous stylization of genres of activity, and this differentiation influences competence proficiency scaling in several ways. Firstly, norms that regulate competence proficiency scaling are affected by prescribed work norms originating

from managerial and ergonomic norms, human resource management practices in the enterprises, and so on. These norms of competence scaling also create specific conditions for developing the genre of work, when they are internalized by professional communities through collective patterns of competence development. The genre of activity also provides internal criteria for scaling of proficiency related to autonomy in, and complexity of, execution of work tasks. Here the genre has a power of approval of competence proficiency scaling inside the professional community. Personal styles of work performance help internalize norms of work induced by competence proficiency scaling in such fields as autonomy and responsibility. When norms of competence proficiency scaling comply with the personal style of work performance, they are more readily accepted; otherwise there is a conflict and refusal to accept imposed limitations. Therefore, overall acceptance and adoption of norms of competence proficiency scaling at work largely depend on the fit of these norms to individual styles of work performance and competence proficiency requirements established by the collective genre of work.

Technological changes also influence the development of competence proficiency scaling, and extant literature on the Fourth Industrial Revolution suggests significant implications for changes in demand for skills and qualifications. There is a widespread expectation of a polarization of labor market skills needs with the erosion of middle-level vocational qualifications through digitalization and automation of work (Kreinsen and Ittermann 2017; Lee and Pfeiffer 2017; Spöttl 2016). The development of hybridized high-skilled academic learning outcomes and VET competence is also anticipated with a growth in interdisciplinary knowledge and transversal competencies (Spöttl 2016), with increased emphasis on higher flexibility and individualization of VET provision, leading to additional qualifications (Hartmann et al. 2017).

---

## Competency Proficiency Scaling, Education, and Didactics

Debates on competence and assessment reveal different perspectives on education (Pellerey 2010). The introduction of competence in education represented a strengthening of the functionalist approach, viewing education as primarily directed to preparing individuals for the labor market. The European Commission strategies of employment and education are largely aligned with this perspective. Another direction is more oriented to fundamental needs of individuals and society, and this is more evident in strategic documents of UNESCO, for example, the Delors Report (1996), where education is seen to guarantee the right of every person to a dignified life contributing to social cohesion.

Among various ways of understanding competence (Di Fabio 2002; Le Deist and Winterton 2005) are those that consider the complexity of dimensions in the educational process and shift attention from abstract concepts of competence to competent individuals, who, in dealing with real-life problems, use knowledge acquired in their authentic personal style. According to such models, competence enters to the actor by transforming the “being able to do” into expressively

manifested “being able to be,” when instead of possessing competence one becomes, and is, competent (Damiano 2004).

From this perspective, competence is not an object that can be transferred from one person to another, but a deeply personal characteristic or attribute. Competence indicates the totality of personal qualities that are recognized and attributed to individuals when they demonstrate capacity to mobilize their own internal resources (factual and procedural knowledge, skills, motivation, etc.) and external resources (other actors, instruments, opportunity for the execution of activity) to address tasks and problems of professional activity and life in general. Therefore, competence cannot be reduced to the totality of capabilities expressed in terms of knowledge and skills, nor can it be related exclusively to contextual requirements of the socioeconomic context because it represents the fundamental ethical and moral nature of a person, as well as a disposition toward reality. A competent person is autonomous and responsible, knowing his or her own resources and personal vocation, facing proactively often unknown tasks (occupational and other). In this sense competence is not totally structured and predetermined, because it also applies to unpredicted or unpredictable situations.

There is an ethical dimension of exercising competence and assessing its level. In assuming that exercising competence in an activity involves the uniqueness and integrity of a person, it seems unavoidable to consider the moral consequences in terms of responsibility and not just ability to execute separated tasks. The Recommendation of the European Parliament and of the Council of 23 April 2008 on the establishment of the European Qualifications Framework for Lifelong Learning also defines competence by referring to autonomy and responsibility that are fundamentally ethical dimensions enabling the wholeness of a person.

While it has been argued that autonomy and responsibility are characteristics of the work situation (Winterton 2011) rather than individual attributes, clearly individuals need particular competencies to work in conditions of responsible autonomy. When considering the competent actor, instead of competence, assessment should be focused on the actor, which cannot be done simply with tests or other quantitative measures of assessment (Lichtner 2004), because it involves an irreducible subjective component.

Articulation between learning and engagement in professional activity is a key factor in competence proficiency scaling, which emerges and develops at the intersections of different dimensions of professional activity and learning (Pastré 2011). From this perspective, competence proficiency scaling is defined by (1) the state of separation or integration between learning and exercising professional activity, (2) the relationship between goals of learning and work, and (3) the ratio of theoretical know-how to practical skills. On this basis, Pastré (2011) distinguished four main proficiency levels: apprentices and students, novices in the profession, working professionals, and professionals participating in continuing vocational training (Table 5).

For higher-level competence, knowledge and skills are acquired in sequential order, where the epistemic model is being shaped before the operative model – knowledge is acquired before practical skills – while at lower levels acquisition of theoretical knowledge and practical skills can take place simultaneously (Pastré 2011). Articulation among the complexity of work, the level of conceptualization of activity by a performer, and their mobilized strategy of action is also important in

**Table 5** Competence proficiency levels in articulating the learning and professional activity (Pastré 2011)

Competence proficiency levels	The state of separation or integration between learning and exercising professional activity	The goals of learning and work	Ratio of theoretical know-how to practical skills
Students and apprentices ( <i>les élèves</i> ). Example: students and graduates of VET schools and higher education establishments	Have no real work experience (except for students in dual training). Need to acquire both basic and specialized theoretical professional knowledge and practical skills	To acquire competencies needed for starting independent performance at work	Predominantly basic theoretical knowledge and basic practical skills
Novices ( <i>les novices</i> ). Example: newly employed graduates of VET schools and higher education establishments	Starting work in a particular occupation, learning, and work is integrated and leads to the acquisition of competence through experiential learning and conceptualization of work practices	To widen and deepen professional competence by learning on the job and conceptualizing work practices with the help of acquired specialized know-how	Possession of basic theoretical professional know-how and basic practical skills, lack of specialized professional competence demanded by concrete work processes
Working professionals ( <i>les professionnels en place</i> )	Professional work and learning activities (predominantly experiential learning) are integrated and executed autonomously	To improve work performance and to adjust to the changing requirements of workplaces	Stable balance between theoretical knowledge and practical skills defined by the requirements of the performed activity
Professionals involved in competence development through continuing vocational training ( <i>les professionnels en formation de perfectionnement</i> )	Continuing professional training and learning processes are oriented to provision of competencies needed to improve and advance work performance/productivity and attain the goals of enterprises. Learning is integrated with individual and collective performance of work	To fill in existing competence gaps and to develop higher-level individual and collective competence needed to attain enterprise strategic goals	Dynamically changing balance of theoretical knowledge and practical skills depending on the content of developed/acquired competence

defining competence proficiency levels. For simple work tasks, individuals apply basic rules from their repertory, deploying trial and error. For more complex tasks, performance necessitates conceptualizing different work operations and technological processes, starting from pragmatic concepts and finally integrating pragmatic and theoretical concepts by considering conditions and context of activity, as well as applying complex, integrative strategies of action.

In light of the above, the scale of proficiency cannot be seen as the sole instrument for assessing competent individuals. A scale with proficiency levels can be used both as a measuring instrument and in a processual way by combining different perspectives of analysis to restore the complex holistic and integrated image of the competent actor (Tacconi 2015). Proficiency scaling can employ triangulation, which in revealing the complexity of reality requires combining different perspectives of observation to reconstruct the object of analysis in an articulated and complex way (Castoldi 2013). Once a rubric for assessment is defined that explicitly indicates meanings attributed to competence and specifies expected levels of mastery in relation to a particular person, group, or tasks, at least three perspectives are possible: (1) a subjective perspective, considering meanings attributed by the actor; (2) an intersubjective perspective, taking into account the system of expectations expressed by the social context; and (3) an objective perspective, referring to executed tasks. However, the use of rubrics is open to criticisms that are not very different from those leveled at competence proficiency scaling (Tenam-Zemach and Flynn 2015).

The subjective perspective leads to self-assessment processes where actors evaluate their experience with respect to the development of a certain level of competence (the competency proficiency scale can be used as a self-diagnostic assessment tool, like a reflective practitioner journal). The intersubjective perspective leads to third-party evaluation processes that involve evaluation of performance by others belonging to the professional community within which competent actions are manifested (the competency proficiency scale can be used as an observation tool along with other tools like field notes). The objective perspective leads to evaluation processes of products and other observable evidences; from observable performance, it is possible to deduce a certain level of mastery of a given competence (the most accredited instruments are so-called authentic tasks; here competency proficiency scaling as describing various levels of expected mastery can be used as an evaluation tool). As a result, the reliability of the evaluation is not based on assumed “objectivity” of the scale but on the possibility of using the scale to validate intersubjectively the judgment made.

---

## Conclusion

This chapter identified the complex and multifaceted nature of competence proficiency scaling by examining the phenomenon through the perspectives of underlying concepts and methodologies as well as perspectives of application in education, training, and development.

Competence proficiency scaling executes a wide range of functions, such as assessment of competence acquired in the learning and work process by referencing it to defined levels of required performance, identification and hierarchical structuring of requirements of performance in occupational fields by defining levels of performance and mastering of work processes, as well as defining the potential of competence development and progression in occupational fields.

Competence proficiency scaling is applied in a wide range of processes related to education, training, and human capital management. In education and training, competence proficiency scaling is important for structuring competence and learning outcomes in curriculum design, as well as in organizing training and didactics. Equally, competence proficiency scales are essential instruments in assessment of competence. In the field of human resource management and development, competence proficiency scaling is an essential measure in recruiting, planning, and executing training, as well as assessment of performance. From a macro-level perspective, competence proficiency scaling is used in measures and instruments designed for structuring qualifications and systems like national and sectoral qualifications, frameworks, and occupational standards (Spöttl 2014; Tütlys and Spöttl 2017).

Finally, it is pertinent to outline some important challenges in the field of competence proficiency scaling and to provide some ideas for an agenda of research in this field. Two areas of future challenges of competence proficiency scaling are suggested, related to technological and organizational change and the development of the global labor market.

The profound and accelerating dynamics of technological and organizational change at work have diverse and unpredictable implications for future competence needs, presenting a challenge for the applicability and sustainability of established competence proficiency scales. The Fourth Industrial Revolution is significantly changing the nature and structure of competence needs in all sectors and occupational fields. Such changes necessitate new solutions to revise the methodological approaches, institutional settings, and instruments of competence proficiency scaling to meet changing labor market needs. These developments invoke the need to design and develop more holistic approaches to competence proficiency scaling that include a wider range of ergonomic, technological, organizational, socioeconomic, psychological, and educational aspects of the provision, acquisition, and development of competence, to exploit the enabling potential of the Fourth Industrial Revolution and to reduce its threats (Schwab 2016). Data analytics and use of computer-assisted video monitoring have the potential dramatically to improve the quality of competence proficiency scaling, for example. The development of these new approaches will inevitably be accompanied by important changes in the conceptualization and understanding of competence and its potential.

Another major challenge in competence proficiency scaling is related to the development of the global labor market and globalized space of educational provision. Increased mobility of workers and learners, as well as global migration trends, increases the importance of international comparability and transferability of competence. How can competence proficiency scales contribute to international comparability of competence and qualifications? So far, competence proficiency scaling

has been strongly influenced by specific national or sectoral interests of the parties involved, leading to the fragmentation of competence proficiency scales and making it difficult to establish comparability and common, internationally relevant denominators in measuring competence. To what extent can “internationalization” of competence proficiency scaling help address problems of labor market integration of migrants in destination countries or the problems of “brain drain” in emerging market economies and developing countries?

## Abstract

Over the last decade, skills competitions in vocational education and training (VET) have increased in popularity and visibility. The most well-known global event is the biennial WorldSkills Competition (WSC), which is organized by WorldSkills International (WSI) and involves competitors from 77 member countries covering 50 skill areas (e.g., plumbing, hair dressing, robotics). Academic research on international vocational skills competitions provide an excellent opportunity to investigate the micro- and meso-level factors related to vocational excellence. This chapter focuses on the role of skills competitions in promoting vocational excellence, introducing relevant research, and discussing the seminal findings on individual vocational development and the attractiveness of VET.

## Keywords

Skills competitions · WorldSkills · Vocational excellence · Vocational talent development · Attractiveness of VET

## Introduction

Rapidly changing labor market requirements in nonacademic sectors have created worldwide challenges for both vocational education and training (VET) students and the workforce, preventing them from developing and maintaining the relevant skills. Research has shown a positive relation between participation in VET programs and smooth transitions from school to work (Caroleo et al. 2017). To better understand the mechanisms of different VET systems, research has focused on investigating the interplay between institutions and work life, with regards to curriculum (e.g., Biemans et al. 2009; Bohne et al. 2017), attractiveness (e.g., Chankseliani et al. 2016), and excellence (e.g., Acquah and Malpass 2017). Studying stakeholder values, objectives, and preferences also offers insights into the structures that enable or restrict the development of quality VET programs (van der Sluis et al. 2014). In a broader context, a globalized labor market allows skillful workers to gain employment abroad but, at the same time, calls for comparative studies of the VET systems in different countries with the aim to remove any barriers to such development (for a discussion of the European Qualifications Framework, see Brockmann et al. 2008).

In addition to studies concentrating on the structural, economic, and policy barriers to VET participation and completion, as well as the subsequent transition into the workforce, it is also important to understand the individual characteristics of each VET system. By identifying the factors hindering vocational talent development in the preliminary stages of VET, the future workforce has a better chance at fulfilling their potential. According to Tyson ([forthcoming](#)), two major research themes can be identified in the current research on vocational excellence: investigations of the individual characteristics related to the development of vocational competence (e.g., Nokelainen et al. 2013) and a focus on the neo-Aristotelian perspective of developing practical wisdom and virtues relevant to the vocation (e.g., for a discussion of “vocational identity,” see Klotz et al. 2014; for discussion of “Bildung and practical wisdom,” see Tyson 2015, 2017).

The interplay between these two themes is essential, as successful vocational performances require various competencies (i.e., unified sets of knowledge, skills, and views that one can employ in real contexts; see Mulder 2014) that can be mapped onto a holistic competence model (Le Deist and Winterton 2005). In this model, *cognitive competence* includes knowledge and understanding, *functional competence* includes practical know-how, and *social competence* includes behavior and attitudes. The fourth component of the model, *meta-competence*, supports the acquisition of cognitive, functional, and social competence (i.e., “learning how to learn”). Following Klotz et al. (2014) argumentation, all these competencies are required for successful vocational performances, as vocational identity and excellence are developed through voluntary and engaging (meta-competence), inclusive (social competence), and practical experiences in work processes (cognitive and functional competence).

Recent research indicates that one viable strategy for promoting VET is to increase its attractiveness through vocational skills competitions (Virolainen and Stenström 2014). It has also been suggested that skills competitions may have multiple benefits on the national, organizational, and individual levels (Wilson 2000). Acknowledgement of such competitions in higher education policies (e.g., EC 2010) indicates that they are no longer “the best kept secret” in the field of VET. Building an understanding of micro- and meso-level operations, such as the individual factors related to the development of vocational excellence in different learning environments, also contributes to the knowledge of macro-level issues (e.g., the “excellence” of VET).

Over the past decade, starting from the 2005 WorldSkills Competition (WSC) in Helsinki, there has been a massive increase in the popularity of international skills competitions, which is based on the rising popularity of national skills competitions. For example, in Finland, the vocational career path was “the second choice” for most young people from the seventies to the nineties (Tasala and Alhojärvi 2017); traditional vocations, such as cook or plumber, did not hold a high status compared to academic professions. The VET quality was also deemed low. In the early nineties, Finland’s Ministry of Education decided that various stakeholders, such as professional-sector representatives, social partners, relevant civil organizations, and education and training providers, should collaborate more closely to increase the quality and attractiveness of VET (Tasala and Alhojärvi 2017). To address these issues, the Ministry began supporting Skills Finland in organizing national “Taitaja” skills competitions for upper secondary students of vocational education. Over the following years, the concept was gradually developed and marketed to vocational education institutions. Its breakthrough is represented by the 2001 Taitaja skills competition in Lahti, in which over 20,000 spectators, primarily young people, observed 200 competitors compete for several days in 28 skill areas. Up to the time of this writing, approximately half a million young students from schools all over Finland have visited Taitaja skills competitions with their study counselors to gain a better understanding of the nature of different professions and to spectate the top performances of young, skillful workers in various trades (Skills Finland 2017).

As the second major theme of research on vocational excellence is discussed in detail elsewhere in this book, the present chapter focuses on the first theme (i.e., the processes related to individual development of vocational excellence), particularly the role of skills competitions in promoting vocational excellence. The essential questions of this research area include how VET teachers develop their expertise and update their professional knowledge (e.g., Andersson and Köpsén 2017; Kunst et al. 2017), as well as how both institution- and apprenticeship-based VET students gain competencies that are relevant to their careers (e.g., Behle 2017; Motta et al. 2017). It is also essential to investigate, from multiple perspectives, how in-service professionals in different fields retrospectively assess the value of VET for their skills and career development (e.g., Pylväs et al. 2015). The following sections introduce relevant research in the field and discuss the seminal findings related to individual vocational development and the attractiveness of VET.

## Competitions in Education

Stanne et al. (1999) suggested that competitions have a variety of purposes in different fields; social comparison theorists posit that the purpose of competition is to evaluate the level of competence, whereas behavioral-oriented cognitive evaluation theorists suggest that the purpose of competition is to win extrinsic rewards. According to social comparison theory, individuals are driven to improve their performances and minimize the differences between their and others' performances (Festinger 1954; Garcia et al. 2013). Garcia et al. (2013) pointed out the theory's proposal that individual and situational factors can increase competitiveness, especially by raising those related to social comparison. They noted that there are individual differences in competitiveness, presuming individuals compete on dimensions that are relevant or important to the self. Relational factors, such as similarity and closeness, are also important because individuals are inclined to compare themselves to those who are similar, whether in terms of performance or characteristics, and close relationships intensify this comparison. Situational factors, such as zero-sum competitions in which the winner takes it all, further increase competitiveness (Garcia et al. 2013).

Cognitive evaluation theory (CET) aims to explain the effects of extrinsic motivators (e.g., competition rewards) on intrinsic motivation (Gagné and Deci 2005). The theory assumes that social and environmental factors promoting feelings of autonomy and competence enhance intrinsic motivation, whereas rewards that are perceived as controlling an individual's behavior may undermine intrinsic motivation. The theory also proposes that individuals need social relatedness via secure and satisfying connections with others (Gagné and Deci 2005; Ryan and Deci 2000). Deci et al.'s (1999) meta-analytic review concluded that positive feedback enhances intrinsic motivation but, interestingly, concrete rewards tend to have a negative effect on intrinsic motivation. An intrinsically motivated person engages in action if it is interesting, pleasing, or challenging, not for external rewards or pressures (Ryan and Deci 2000). Furthermore, individuals can be intrinsically motivated to engage in some activities but not others (Deci et al. 1999). It has been assumed that the nature of the competition, the duration of preparation for the final event, and the age or maturity of the participants all affect how a competition elicits intrinsic and extrinsic motivation (Ozturk and Debelak 2008).

---

## Skills Competitions in VET

The history of international skills competitions dates to 1950, when the first Skills Olympics were organized between Portugal and Spain with the participation of 12 young, skilled workers from both countries (Wilson 2000). Originally, the purposes of the competition were to raise the status and standards of vocational careers and to reward individual excellence in various trades (WorldSkills International [WSI] 2010). Currently, the goals of the WorldSkills program have remained the same, but also stress how important vocational skills are in achieving economic growth and improving our world (Messenger et al. 2017).

The global, biennial WSC is organized by WSI, involving contestants from 77-member countries and regions and covering 50 skills (Messenger et al. 2017). Each country may enter one competitor per skill area. The upper age limit to compete is usually 22, except in the areas of Information Network Cabling, Manufacturing Team Challenge, Mechatronics, and Aircraft Maintenance, in which the competitors must not be older than 25. An international panel of judges assigns a score (0–600 points) to each competitor after four competition days. The best competitors in each skill area are awarded with gold, silver, and bronze medals. Competitors who score 500 points or more in their skill area are awarded with the Medallion for Excellence. The skill areas are grouped into six sectors: (1) Construction and Building Technology, (2) Creative Arts and Fashion, (3) Information and Communication Technology, (4) Manufacturing and Engineering Technology, (5) Social and Personal Services, and (6) Transportation and Logistics (WSI 2010). In 2008, a similar biennial skills competition, EuroSkills, was established in Europe. EuroSkills currently has 28 member countries, and the 2016 competition featured 500 competitors in 44 skill areas.

From a research perspective, the WSC provides an objective way to assess vocational excellence and represents an opportunity to better understand the factors contributing to the development of high-level vocational skills (Nokelainen et al. 2013). In Finland, only the winners in each skill area of the regional competitions are permitted to participate in the national skill competition, and only the gold and silver medalists in each skill area of the national skill competition are eligible to represent Finland in the WSC. The initial team selection is conducted through interviews with the team leaders, as well as both manual- and mental-skill trainers. Each competitor has a manual-skill trainer, usually a vocational instructor, who is an expert in the field. The Finnish WSC team has one or two mental-skill trainers who have degrees in education, religion, or psychology. Team members are monitored during the one-year training period, which differs significantly from Finland's traditional, institution-based VET model, as it is primarily based on workplace learning. The final composition of the team is announced about 3 months prior to the international competition, and each member is selected based on their performance during the training program.

---

## Research on Skills Competitions and Vocational Excellence

International academic competitions were thoroughly investigated during the last decade (e.g., Campbell and Walberg 2011; Nokelainen et al. 2007), but only recently has there been research on international vocational skills competitions (e.g., Chankseliani and Relly 2016; Nokelainen 2010; Nokelainen and Ruohotie 2009; Wilde and Relly 2015). Instead of focusing solely on the competitions, such research has emphasized the wider training experience that includes individualized programs in training organizations, such as vocational institutions, and workplaces (Pylväs and Nokelainen 2017). Both qualitative and quantitative data were collected on vocational excellence and WorldSkills competitors. Besides conducting surveys and interviewing

participants, data collection included a wider community of stakeholders, such as employers, family members, friends, college tutors, university lecturers, training managers (Chankseiani et al. 2016), and employers and colleagues in past workplaces (Pylväs and Nokelainen 2017). In addition, data from the WSC (e.g., the final competition scores) were used in the analyses (e.g., Nokelainen [forthcoming](#)).

## Modeling of Vocational Excellence (MoVE)

Academic research on the WSC started in a 2007 Finnish project titled “Modeling of Vocational Excellence” (MoVE). The study was conducted in the Research Centre for Vocational Education at the University of Tampere. MoVE was the first research project to address the individual attributes that characterize the development of vocational excellence through skills competitions (Messenger et al. 2017). Based on a similar approach to the development of expertise (Chi 2006), MoVE focused on investigating both the characteristics and developmental processes of individuals who were determined to have achieved vocational excellence (Nokelainen et al. 2008; Nokelainen and Ruohotie 2009; Nokelainen et al. 2009). By focusing on the quality of vocational performances in skill competitions, MoVE departed from mainstream vocational research, which has followed a deficit pathway in that it primarily concentrates on the structural, economic, and policy barriers to vocational participation and completion (Messenger et al. 2017).

The theoretical framework of MoVE was based on an adaptation of Gagné’s (2004) Differentiated Model of Giftedness and Talent (DMGT), which differentiates innate gifts from systematically developed talents. The DMGT comprises six components: (1) chance (i.e., genes), (2) gifts (i.e., intellectual, creative, socio-affective, sensory-motor, and other natural abilities), (3) intrapersonal characteristics (i.e., physicality, motivation, volition, self-management, personality), (4) environmental conditions (i.e., the milieu, important persons, provisions, events), (5) developmental processes (i.e., informal and formal learning and practicing), and (6) talents (i.e., systematically developed skills). Apart from the DMGT, the Developmental Model of Vocational Excellence (DMVE) used in several Finnish studies (Nokelainen 2010, [forthcoming](#); Pylväs et al. 2015) applied Multiple Intelligences theory (Gardner 1983, 1993) to operationalize “natural abilities” (i.e., chance and gifts), the sociocognitive theory of self-regulation to operationalize “intrinsic characteristics” (Zimmerman 2000, 2006), and the role of domain- and nondomain-specific factors to operationalize “extrinsic conditions” (Greenspan et al. 2004). The developmental components of vocational excellence (i.e., the individual’s initial interest in learning a vocational skill, perseverance during the learning process, and mastery of the skill) was operationalized through Bloom’s (1985) model of talent development and Ericsson’s (2006) concept of deliberate practice.

The first phase of the research (2007–2008) investigated the characteristics of Finnish WorldSkills competitors with the aim to predict vocational excellence. The results, which were extracted from interviews with the competitors, their personal trainers, their vocational representatives, and their parents ( $N = 30$ ), showed that

the most important characteristics related to vocational excellence are self-reflection, volition, cognitive skills, and social skills (Nokelainen and Ruohotie 2009; Nokelainen et al. 2009). Volition was considered the most important for all three stages of skill development (i.e., initial interest, perseverance, and mastery). The roles played by domain-specific stakeholders (e.g., vocational instructors and WSC trainers) were also important throughout all three stages, but having encouraging instructors was found to be especially vital in the early stages of skill development.

The second phase of the research (2009–2011), “Actualizing Vocational Excellence” (AVE), continued to work toward a comprehensive understanding of factors influencing the development of exceptional vocational talent. Both qualitative (structured theme interview) and quantitative (survey) instruments were developed for AVE to collect new data. The results, which included data from interviews with 26 past WSC medalists, were congruent with earlier findings, indicating that volition, self-reflection, and cognitive skills play an important role in all three stages of developing vocational talent (Nokelainen 2010, 2012). The results from surveys with 64 Finnish WSC training participants showed that the most successful competitors (i.e., the medalists) are characterized by their linguistic and interpersonal abilities, alongside a belief that effort was more important to their success than ability (Nokelainen 2010, 2012). Their goals for participating in the competition were also more performance-approach and less performance-avoidance than their less successful peers (see Midgley et al. 2000). A concluding remark in both the qualitative and quantitative studies was that supportive home and school atmospheres had positive effects on the development of vocational talent.

The third phase of the research (2012–2014), “Pathways to Vocational Excellence” (PaVE), included a long-term investigation of the effects of vocational skills competitions on career development via retrospective interviews of past Finnish WSC medalists who had entered the workforce. The results, which were extracted from 51 semistructured interviews with Finnish WSC medalists or diploma winners ( $N = 18$ ), their employers ( $N = 16$ ), and their colleagues ( $N = 17$ ), showed that, in addition to vocation-specific knowledge and skills, the development of vocational excellence requires problem-solving, creative, social, and self-regulatory skills (Pylväs and Nokelainen 2017). Further, the findings revealed that formal vocational education, combined with deliberate practice and training and based on expert mentoring, improves the long-term career development and vocational expertise of past WSC winners.

## MoVE International

In 2009, the WSC research entered the international arena with the addition of the University of Oxford, WorldSkills UK, RMIT University, and WorldSkills Australia (WSA), thereafter called the “MoVE International” research project (Messenger et al. 2017). In 2010, based on Finnish research instruments, researchers from RMIT University, WSA, and the Dusseldorf Skills Forum conducted a survey of 254 competitors and 122 judges and trainers participating in the WorldSkills

Australia National Competition (Smith and Rahimi 2011). In this study, both participant groups were asked about their WorldSkills journeys and how their experiences had influenced, and may influence, their careers. The results showed that most competitors enhanced their skills and enjoyed measuring their skills against other competitors and an accredited set of standards.

In 2011, 76 members of the WorldSkills UK London team completed an adapted version of the Finnish survey on the characteristics of vocational excellence (Nokelainen et al. 2013). The most notable pattern in the results indicated that motivational factors (an aspect of intrinsic characteristics) are most important for WSC medalists, who reported the lowest levels of competitiveness and had concerns about appearing incompetent to others.

The MoVE International research team administered a survey during WSC London 2011, yielding 413 valid responses from competitors of 38 countries (Nokelainen et al. 2012). The results showed that the medalists rated their bodily/kinesthetic (practical) and interpersonal (social) capabilities higher than did other competitors. They also reported higher self-ratings in ethical sensitivity, entrepreneurial abilities, mastery goal orientation, and self-regulation.

## Developing and Understanding Vocational Excellence (DuVE)

The UK “Developing and Understanding Vocational Excellence” (DuVE) project suite was established in 2012, intending to use evidence-based research to further develop and ground high-quality WSC skills and practices (James 2016). The project suite focused on (1) modeling the characteristics of vocational excellence, (2) the best learning environments for developing vocational excellence, (3) the benefits of developing vocational excellence, (4) further education college participation in skills competitions, (5) WSC contestants and entrepreneurship, and (6) the benefits and barriers to WSC UK participation.

In 2009, the UK Economic and Social Research Council’s (ESRC) Centre on Skills, Knowledge, and Organizational Performance (SKOPE) at the University of Oxford conducted a survey study on the workplaces of the 2009 and 2011 WorldSkills UK teams ( $N = 124$ ), investigating the role of the learning environment within the workplace in the formation of high-level vocational expertise (James and Holmes 2012). The results showed that “expansive workplaces” (Fuller and Unwin 2003) provided several key elements in the development of vocational excellence (e.g., acknowledgement as a worker and learner, mentoring, career progression, and time to work through tasks).

In 2014, Chankseliani and Relly interviewed 30 entrepreneurial and 10 non-entrepreneurial WorldSkills competitors to determine whether the competition experience contributed to enhancements in social, psychological, and human capital (Chankseliani and Relly 2016). The findings indicated that participation in the WSC supported entrepreneurship by providing opportunities for competitors to develop their social networks, psychological characteristics, and technical and business-interaction skills.

Wilde and Relly (2015) interviewed 36 UK training managers responsible for preparing young people to compete in the WSC. The results showed that the training managers' professional growth was supported by the opportunities to network with domestic and international colleagues, their enjoyment of the training process and competition, and the enhancement of their skills and knowledge. Although some negative aspects emerged (e.g., the intense time commitment), their main conclusion was that the benefits of the role outweighed the difficulties.

In a departure from previous studies, which focused on the individual aspects of developing vocational excellence, Chankseliani et al. (2016) interviewed 39 past WorldSkills competitors and 71 of their associates (e.g., employers, family members, friends, and training managers) to determine the role of skills competitions in improving the attractiveness of VET. Three potential factors emerged from the findings: (1) raising awareness of outstanding performances in various vocational occupations, (2) demonstrating the success and financial benefits of vocational careers, and (3) creating a positive image of young people who choose vocational careers.

---

## Conclusion

After considering all this evidence, can we conclude whether skills competitions promote vocational excellence? Large-scale international assessments (e.g., PISA, TIMSS) in compulsory schooling have proven the potential of both research and educational policy development in modeling and measuring competencies (Schleicher 2017; see also Carnoy et al. 2016 for more critical view). Although similar studies have been proposed in the context of VET (e.g., Achtenhagen and Winther 2014), their implications have not yet been actualized. Meanwhile, international vocational skills competitions provide an excellent opportunity for academic research to investigate the micro- and meso-level factors related to vocational talent development. The research indicates, quite unanimously, that WSCs and training have a positive effect on young peoples' vocational competencies and career success (Chankseliani and Relly 2016; Chankseliani et al. 2016; Pylväs and Nokelainen 2017; Smith and Rahimi 2011). The findings also demonstrate benefits for the experts and training managers who are involved in the process (Wilde and Relly 2015).

The WSC and its related training programs contain specific components that are not present in the VET curricula of many countries. International research on the WSC (e.g., Wilde and Relly 2015; Pylväs and Nokelainen 2017) shows that VET students need opportunities to strengthen their learning and self-regulatory skills within the sphere of vocational education, with the help of their instructors, and to recognize the potential advantages of collaborating with professional experts.

Perhaps most difficult to prove is the connection between skills competitions and an increased attractiveness of VET. The underlying premise of the WSC is that developing vocational excellence may raise the attractiveness and standards of the whole VET system. According to Wilde and Relly (2015, p. 95), "there is a significant tension between the concept of so-called elite skills competitions and

the concept of raising standards and skill levels across the board.” They mentioned several serious problems in the UK VET system, claiming that the winning of gold medals in the WSC should not be used to conceal these problems. Regardless, Chankseliani et al. (2016, p. 596) argued that “by establishing a positive societal image of young people, [skills] competitions may contribute to raising the attractiveness of VET to the degree that it becomes a respected, high-status learning pathway in its own right.”

## Abstract

This chapter reviews current research into educating for vocational excellence. It distinguishes between two conceptualizations of excellence, the world skills and the neo-Aristotelian, and pursues research connected to the latter. The neo-Aristotelian approach to excellence characterizes it as a combination of practical wisdom and virtues, sometimes with further additions. The review identifies three major trends in this research: one focusing on establishing conceptual frameworks for cultivating vocational excellence, one focusing on the development of virtues in practice, and the final one developing out of a narrative approach to practical wisdom and excellence. It identifies possibilities for more systematic combinations of these different approaches. The lack of more systematic research in the field is also discussed, especially regarding comparative and evaluative inquiries, the exception being, perhaps, the field of narrative medicine. The conclusion is that the research field is comparatively young, most work being post 2000, but that there has been significant growth since then. The review lays a foundation for both future inquiry and practice development to proceed with

## Introduction

It is generally agreed that excellence is something to strive for in vocational education and training (VET), although the term itself is sometimes used without further explanation. If one takes a closer look at the research and practice on vocational excellence, two approaches stand out. The first is often called modeling vocational excellence and is connected to world skills competitions (see ► [Chap. 33, “Vocational Student Organizations and Student Success”](#)). The other perspective is more connected to research and writing based on Aristotle and Alasdair MacIntyre (e.g., Kemmis and Smith 2008; Kristjánsson 2014; Tyson 2018). In this view excellence is about developing virtues and goods relevant to the vocation together with a capacity for wise deliberation (*phronesis* or practical wisdom). It is this broadly neo-Aristotelian perspective that will be considered in the following.

An important aspect of neo-Aristotelian views on excellence is the emphasis on virtues or dispositions, i.e., excellence is not something that can be educated for simply by studying rules, guidelines, and codes of conduct. Although, as the review below suggests, there is not a lot of research into how such education in the virtues of a vocation might actually be structured and practiced, one of the prominent scholars in the field, Kristjánsson, remarked on this recently (2014, p. 152):

[O]ne would expect library shelves to be stacked with books on ‘education for *phronesis*’. However, I have yet to find a single book, or even a single journal article, written by an Aristotelian moral educator, that gives pride of place to *phronesis* education. It is not as if the topic is simply passed over in silence; most sources on Aristotelian moral education do record Aristotle’s emphasis on *phronesis* (see, for example, Carr 1991; Curren 2000; Kristjánsson 2007; Sanderse 2012). However, the actual cultivation of *phronesis* is typically given short shrift – by repeating the same Aristotelian truisms – or absorbed into a more general discussion of virtue development.

This is not to say that no such education occurs within VET. On the contrary, it can be assumed that significant elements of it take place at work and in schools without being systematically articulated and published. It can also be assumed that individual workplaces and schools have constructed their own particular ways of educating for excellence irrespective of the terms used to describe that aspect of education (i.e., without using an explicitly neo-Aristotelian vocabulary). What seems largely absent then is a systematic documentation of such initiatives by the research community. Also absent is a recognition that leaving this aspect of VET to a tacit process of enculturation in a vocation places a good deal of trust in that process. There are masters who are not paragons of virtue who still teach apprentices. There

are institutional cultures that harbor sexism, racism, rampant greed, and other vices. Systematic research into ways in which education for vocational excellence has been enacted can thus contribute to making a largely local and tacit practice shared and articulated across contexts.

Finally, what is the context of vocational excellence as part of the wider discussion regarding competencies developed in this chapter? Day (2017), in his review of competence-based education and teacher professional development, mentions the alternative views developed by Amartya Sen and Martha Nussbaum centered on the concept of capability. Day writes (2017, p. 173):

A distinctive feature of Sen's 'human capability' approach is that it focuses upon, 'the *state* of the person, distinguishing it both from the *commodities* that help generate that state, and from the *utilities* generated by the state' (Sen 1993, p. 43). In terms of teachers and teaching . . . this is important for the ability to stimulate, motivate, engage and interact is key factor in influencing students' learning and achievement.

If a key purpose of school education is to enrich the lives of students (Flores-Crespo 2004, p. 45) by, for example, promoting critical reflection and active engagement in their own learning and, through these, the ability to exercise personal autonomy rather than passive compliance, then fostering 'capability' in teachers also, rather than 'functionalism' only [the more competence oriented approach] becomes important.

The focus on agency and flourishing in the capability approach suggests that it is more immediately related to an emphasis on education for vocational excellence than at least some of the views developed in the discourses on competence. It also aligns more with educational concepts such as *Bildung* (Tyson 2016a) where an emphasis is placed on the pedagogical potential inherent in a task or skill. This potential is such that beyond the immediate acquisition of a particular competence there are any number of possible connections to fields of knowledge, experiences, and related activities that the teacher can include in designing and enacting the curriculum. This, in turn, calls attention to a view on effectiveness and efficiency in education that is less about achieving exact outcomes as quick and cost-effectively as possible and more about considering these elements together with other more values-oriented matters. This is not a luxury or a superstructure that can be dispensed with at will, but rather a core element of vocational education aiming at the development of excellence.

Having considered this initial context, the main task of this chapter is to review relevant research in an attempt to provide a summary of the current stand regarding studies in how to educate for vocational excellence from a, broadly speaking, neo-Aristotelian perspective.

---

## Research Review

In the following review, emphasis has been on research from the field of vocational education and training. Research from the field of teacher education and school-based character education has not been included other than in passing, but it should be noted that a significant number of works exist in that field (cf., e.g., Biesta 2015;

Kreber 2002; Kristjánsson 2013a, b, 2014). One further issue that makes it difficult to draw up boundaries when reviewing research is the field of narrative medicine where the number of works published is comparatively large. This has therefore been discussed in what can only be called a preliminary way. Those works also rarely focus explicitly on education for vocational excellence but often discuss issues that have an extensive implicit overlap. They also highlight a related difficulty: many studies are contextualized as studies of excellence in vocational *practice* and not as work that can contribute to the *education* for vocational excellence. However, they may still be relevant as sources for understanding ways in which to structure educational measures. To explore this would necessitate a separate review. A similar difficulty is that there is an overlap between education for reflective practice and for practical wisdom (e.g., throughout Kinsella and Pitman 2012). This overlap has not been addressed here in more than a cursory way. It can be assumed then, that there is research in the field of Schön-related reflective practice that does not deal with wisdom but would still be relevant to consider. Finally, most studies in the field are concerned with education for practical wisdom and virtuous action (*praxis*), mainly because they are located in a research context concerned with ethics. This leaves the wider field of what constitutes excellence and how to educate for it comparatively unexplored (for an exception, see Tyson 2015, 2018).

Apart from articles, the main published works in the educational field (excluding narrative medicine) are *Phronesis as professional knowledge, practical wisdom in the professions*, by Kinsella and Pitman (2012); *Towards professional wisdom, practical deliberation in the people professions*, by Bondi et al. (2011); and *Enabling praxis, challenges for education* by Kemmis and Smith (2008). It should be noted that these collections only rarely speak directly to the more practical topic of how to educate for vocational excellence. Related publications, but even less concerned with issues of how and with what means, are Green (2011), Hager and Halliday (2009), Higgins (2010), and Sockett (2012). Finally, the field has been the focus of at least two dissertations: Swartwood (2013a) and Tyson (2017). Both dissertations are concerned with developing a conceptual framework for cultivating practical wisdom, the latter also using this framework as the basis for some empirical studies.

There are several trends in this research on education for vocational excellence that can be distinguished. The major trend is establishing a conceptual foundation for education toward vocational excellence. This rarely involves any empirical studies and thus tends to remain suggestions. A further trend focuses on educating for the goods and virtues aspect of excellence and is mostly concerned with ways in which workplace-based learning can be structured in order to promote such education. Finally, a third trend is more focused on the practical wisdom/phronesis aspect of excellence and is largely, but not exclusively, narratively oriented. These trends will be discussed in that order in the following.

However, the contention is also sometimes voiced that practical wisdom and the various virtues cannot be taught at all but only learned through experience (e.g., Kemmis 2012, p. 148f.). The objection by Kemmis is rooted in the argument that practical wisdom arises from the practice of the virtues rather than preceding it, thus undermining any pre-practice educational activity aiming at cultivating wisdom.

Kemmis writes (*ibid.*, p. 158): “those who have phronesis gain it through (successful and unsuccessful) experiences in which they have aimed to ‘do’ praxis . . . [i.e.] the good.” This argument, that practical wisdom arises from the learning that actions afford, is a version of Aristotle’s own dictum that only the old and experienced can have wisdom since the young are simply too inexperienced. To alleviate this, and to argue for the importance of case narratives of excellence, several works in the narrative field (e.g., Frank 2004; Tyson 2017) have suggested that such cases in which the experiences of others are recounted are at least in part an educational way of dealing with Kemmis’ argument. This is also a concession that Kemmis himself makes. Still, his argument remains a forceful reminder that any education for vocational excellence needs to involve practice (or what Kemmis calls praxis in the Aristotelian sense), i.e., (ethical) action, and cannot remain satisfied with various forms of critical reflection. It should also temper expectations as long as the present lack of empirical studies focusing on evaluating educational measures remains.

A further issue to bear in mind is that although the perspectives presented below are all more or less united in their neo-Aristotelian point of view, there is far from a consensus regarding how the various concepts borrowed from him are to be understood. This is especially the case with phronesis or practical wisdom where the differences can be quite large (cf. Ellett 2012; Kristjánsson 2005; Noel 1999a). This will be briefly considered below but cannot be fully explored in this chapter.

Finally, the importance of educating for vocational excellence in the sense of promoting the development of virtues and wisdom has been most extensively discussed with regard to the people professions, especially teaching and care (e.g., Bondi et al. 2011; Kinsella and Pitman 2012), and does not extend to cover VET as a whole. A major reason is the obvious relevance of practical wisdom in vocational fields concerned mainly with human interactions such as care and education. The empirical explorations of Tyson (2015, 2016a, 2018) bear this out to some degree. The narratives of excellence from practitioners in various craft-related works are less often overtly ethical in the way narratives from practitioners in healthcare or teaching tend to be. However, this underscores the remark made previously that the narrow focus on excellence as ethical education risks bypassing other aspects of excellence that have remained more tacit or marginal until now. It also suggests that the infrequent occurrence of such ethically charged narratives in other fields of VET than the people-oriented ones might well be the result of those fields underemphasizing the importance of ethical excellence. The potential of involving such perspectives more actively in VET that is not first and foremost about human interactions should not be overlooked.

---

## Conceptual Frameworks for an Education Aiming at Vocational Excellence

The most extensive work in this field appears to be Swartwood (2013a, b, who also discusses Annas 1995, 2011, the other major proponent of a similar perspective, extensively). His approach in developing a conceptual framework for what he calls

“cultivating practical wisdom” is “modeling wisdom on expert decision-making skill” (Swartwood 2013a, p. 7). In making the analogy between learning a complex skill expertly such as firefighting or military tactics and cultivating wisdom, Swartwood relies heavily on “Naturalized Decision-making” research (ibid, p. 12). The model he uses is “Recognition-Primed decision” which describes experts as making decisions based on “a combination of intuition and more conscious analysis of a situation” (ibid, p. 12). A central argument for the value of this model is that it provides suggestions for how to educate given that we already have significant research into the education and training of, e.g., expert firefighters. Swartwood lists the following six “strategies for developing wisdom” (ibid, p. 58):

Deliberate practice and feedback toward wisdom. This is in recognition of the fact that wisdom or expertise does not develop out of mere experience alone but requires some more systematic attention to practice and feedback from practice.

The seeking of wisdom-relevant experiences. In particular seeking experiences that offer a high degree of variance and challenges. Included in this is also a familiarity with the experiences of others. This strategy aligns with the argument of Tyson (2017) discussed below.

Trying new solutions and methods. This strategy is concerned with a continuous effort to expand one’s repertoire of solutions and methods in dealing with issues thereby preventing one from settling for solutions where the quality of outcomes is lower.

Practicing attentional control. This represents a further way in which to expand one’s situational awareness, namely, by more or less systematically trying to achieve perspectives that go beyond one’s immediate habits. In effect, developing a flexibility in one’s ability to attend to various elements or aspects of a situation.

Practicing critical reflection is focused on expanding one’s mental models of situationally relevant actions as well as selecting among them. Among Swartwood’s examples of how to achieve this are asking oneself what it would take to change one’s mind and keeping an eye out for discrepancies or contradictions in one’s beliefs.

Consulting the wise, i.e., seeking out good coaches for oneself to facilitate the development of wisdom.

Studies, reports, or evaluations discussing ways in which these strategies have been employed in educating for vocational excellence (as distinct from, e.g., military tactics or firefighting) have not been found, and this seems to be an area in need of further inquiry. One exception might be the work of Tyson (2017) to the degree that it overlaps with some of the strategies suggested.

Regarding the function of the strategies as a conceptual framework, Swartwood identifies one of the objections to the skill model as that in which the virtues are understood rather as dispositions than skills (for other critiques, see Hacker-Wright 2015; Kristjánsson 2014). The main difference is that a skill can be put to use in a situation or not on a rather voluntary basis, whereas a disposition indicates a motivation to act that would require some important reason for it not to result in actual action. One recent argument for virtues as dispositions is by Sockett (2012), and it is illustrative to compare his suggestions for how to cultivate and educate the virtues with that of Swartwood. A major difference is that Sockett spends a significant portion of his work enumerating and discussing the various virtues thereby achieving a much greater differentiation than Swartwood who is focused more

exclusively on practical wisdom. When it comes to educational measures, Sockett considers the matter more directly in connection with teacher education institutions and the issues they face with assessing something as contentious as a person's virtue. The result is a more in-depth consideration of reflective practice, especially in how to work with students' self-assessment, thus overlapping with the fifth of Swartwood's strategies. It is notable that there is no overlap with the other strategies that Swartwood enumerates, but it would require a separate inquiry in order to fully explore what Sockett and other "virtues as dispositions" scholars might have suggested as educational measures. It therefore remains unclear if there are practical and pedagogical consequences from regarding wisdom and virtues (i.e., major elements in excellence) as analogous to complex skills or as dispositions.

Another conceptual framework has been briefly worked out by Kinsella (2012) and focuses on the close relation between phronesis and reflective practice proceeding from the work of Schön (1983, 1987). In it she outlines a number of "criteria for phronetic judgment" (Kinsella 2012, p. 47ff.). These criteria are described not as being exhaustive or normative but rather as an explorative discussion to use as a guide for further research and practice. The first three are taken from Schön: pragmatic usefulness, persuasiveness, and aesthetic appeal. To these she suggests adding: ethical imperatives, dialogic intersubjectivity, and transformative potential. Schön's criteria focus in a general way on how practitioners judge situations in practice. Is the approach taken useful in relation to practice? Does it appear persuasive and does it have what can be termed aesthetic appeal? Kinsella's additions focus on the necessary ethical elements that need to be part of a phronetic judgment as well as the need for reflection to be more explicitly dialogical meaning that it cannot remain solely about one's own judgments but needs to include the experiences and judgments of others sharing one's practice context. The final criterion Kinsella adds is "attention to the transformative potential within the practice situation." Kinsella continues (ibid, p. 49):

Rather than looking solely for pragmatic fit within the traditions of practice, one might also consider the power of imagination and the transformative potential of a situation. Such a perspective embodies the idea of the practitioner as a transformative intellectual.

Similar to Swartwood's strategies, these criteria can be used as a basis for educational strategies and curriculum design, and they seem well positioned to be considered together with his strategies in order to elaborate on some of them. For example, the last, transformative criterion, has been the implicit focus in Tyson's (2016b) exploration of narratives of successful conflict resolution among students training to become after-school care teachers in Sweden. There a group of narratives are discussed as a way of enriching the pedagogical imagination of both teachers and practitioners and this in turn as a way of recognizing and expanding on the transformative potential of conflict situations in a particular practice.

Finally, in the field of sustainable tourism, there has also been some conceptual work done by Tribe (2002a) and Jamal (2004). Tribe's approach builds heavily on Schön's (1987) suggestions on how to educate reflective practitioners advocating for

the inclusion of an ethical tourism practicum in the curriculum for sustainable tourism. He writes (Tribe 2002a, p. 320):

The purpose here is to develop aspects of *phronesis* – disposition, experience, practical knowledge and an intuitive sense of the good for tourism. It is by reflection on good and bad actions that ethical tourism action is developed and the very openness of *phronesis* requires supervision and discussion so that bad practices are not accidentally acquired, repeated and reinforced.

He goes on to outline three activities that can support this: using case studies, role-play, and work placement. Jamal (2004) continues from the foundation laid by Tribe in discussing the importance of having clear principles regarding the *telos* or purposes of a practice (in his case sustainable tourism). Such principles need to be taught in order to provide aim and orientation to *phronesis* in practice. He also raises some issues that widen the scope of excellence (Jamal 2004, p. 539):

Further questions arise with respect to praxis: How much liberal education is needed to equip an ethical-tourism practitioner for ‘liberal action’ (Tribe 2002b)? How much race, ethnic and feminist studies for developing a critical sense of knowing, and awareness of aspects such as the ethics of care, and (eco)feminism? What breadth and depth of interdisciplinary perspectives?

Here the conceptual discussion on what is needed in an education for excellence is connected to wider issues of liberal education and related studies. Similar connections have been made by With (1994) in relation to the intersection of the vocational and the liberal and by Tyson (2016a, c) in relation to the educational concept of *Bildung* and the vocational, neither with an explicit view to excellence but both implicitly relevant to such education.

---

## The Education of the Virtues or Praxis

In this field, empirical research has concerned itself with ways in which the virtues of a practice can be promoted through education. It proceeds from the conclusion by Aristotle that a virtue such as honesty, bravery, or charity can only be strengthened through practice. One does not become more honest by being told about honesty or reading important stories on honest conduct. One becomes more honest by acting honestly. This does not detract from the value of hearing stories about honesty or discussing ethics, but such activities do more to enrich one’s practical wisdom in deliberating on *how* best to act honestly (thus they belong more to the narrative approach discussed below). The conceptual work referenced above returns to this issue repeatedly but far less has been done from an empirical educational perspective (Kristjánsson 2014). One exception is Brennan Kemmis (2008) who has suggested the practicum of VET teacher students (in a broader sense the workplace-based element in VET) as the place where the virtues can be promoted. She references Hamilton and Lempert’s (1996, see also Corsten and Lempert 1997 for a more

extended discussion) longitudinal study on the development of moral reasoning among apprentices where the following environmental factors were important to such development (Brennan Kemmis 2008, p. 205):

Involvement in manifest (instead of repressed or transferred) social problems and conflicts of interest

Free (instead of standardized, one-way, or manipulative) communication

Participation in cooperative decision making (instead of subordination, rivalry, or mere talk)

Abiding empathy, love, care, and recognition (instead of indifference, hatred, rejection, depreciation, or contempt)

Informed about the social impact of individual and collective behavior and action (instead of unfounded rules prescribing or proscribing certain actions)

Substantial involvement in contradictions between individual expectations, interpersonal rules, social norms, and cultural values that preclude one-sided solutions (instead of either enforced harmony or lack of common maxims)

Ascribing of responsibility for one's own life and (subsequently) for others according to one's growing capabilities instead of either distrustful strict control or uncontrolled laissez-faire)

This may well be a significant approach given that it is hardly possible to create educational situations where one has planned for the need to practice most virtues, e.g., the need to be honest (that would raise some important ethical questions in itself).

However, there is also the possibility of focusing more on how VET teachers promote excellence among their students/apprentices, including what they perceive to be excellence in their vocational practice. In the field of care, Myrick et al. (2010a, b) have recently discussed this based on the way nursing students are paired one-to-one with a nurse in a practice environment (see Sellman 2009 for some theoretical misgivings). This has also been part of the approach of Tyson (2015, 2016a, 2018) where the focus has been on having VET teachers and students tell narratives of educational actions aiming at promoting excellence. Such narratives, as argued in Schön's work on reflective practice (1987), can function as contributions to the pedagogical repertoire of VET teachers. The main contention is that such narratives can serve to expand the ways in which VET teachers can imagine future educational action given that personal experience in promoting excellence is, at best, still rather narrow and mostly tacit. This narrative approach will be discussed further below.

Vokey and Kerr (2011), based on Shulman (2007), argue for the establishment, in educational practices, of communities committed to the development of practical wisdom. How such communities are to arise and what they might be doing remains largely unsaid. Perhaps a concrete example is described by Swinton (2011) in his discussion of the wisdom cultivated in the L'Arche communities. These are an international organization of faith-based communities in support of people with intellectual disabilities. Swinton suggests (ibid, p. 166) that one way of working from the basis of the L'Arche practice without necessarily retaining the faith-based element of it would be to proceed from the concepts of hospitality and friendliness. In effect then, the kind of communities that Vokey and Kerr envision would primarily be formed around such common ideals and a committed pursuit to enact them.

A similar way of dealing with this could perhaps be that suggested by Tyson (2018) in connection with MacIntyre's (2011) ideas of practices and traditions (as well as more directly connected to Shulman and his case-based approach). In MacIntyre's view most vocations represent distinct practices with at least in part distinct goods and virtues (i.e., a distinct excellence) that one is initiated into as a practitioner. Tyson (2018), based on some initial empirical research, suggests that vocational practices are embedded in larger cultural practices, the various crafts, for example, in a larger one of craftwork or architecture, and the various caring professions in a larger one of healing or medicine. From this perspective, the emphasis becomes one of exploring the various cultural and vocational narratives informing a practice and making more explicit which ones embody the ideal goods and virtues of it. Becoming familiar with them would in turn constitute an important part of an education for excellence. Exploring such narratives from a research perspective, especially those that have remained largely oral and personal, would also contribute to an enrichment of the practices and their capacity to imagine concrete ways in which their goods and virtues have been experienced and taught.

---

## Narrative Approaches to Practical Wisdom

The general development of practical wisdom through exemplary narratives is something that has been argued for by several authors (e.g., Gallagher 2014; Gillespie 1996; Noel 1999a, b; Nussbaum 1990; Pendelbury 1995; Wall 2003; Worth 2008). However, these arguments are not vocational and thus tend to bypass the issue of vocationally relevant case narratives. Within the field of narrative medicine (Begley 2006; Carnevale 2007; Charon et al. 2017; Charon 2006; Frank 2004, 1995), a similar connection of central elements in care with practical wisdom and narratives has been made, and this seems to be the area where the most systematic work has been done in educational practice. This includes a master's degree program in narrative medicine taught at Columbia University which contains much of the language characteristic of discourse in vocational excellence without actually using the concept as such. Another narrative perspective has been developed recently by Tyson (2015, 2016a, 2018) with a more didactical or curriculum emphasis.

Tyson's approach can be considered as taking the suggestions made by Kinsella and Pitman in their concluding chapter and exploring their ramifications (2012, p. 169):

The power of story and narrative for conveying what phronesis [excellence] might look like suggests that they might be used to introduce phronesis into pre-induction, induction and continuing education stages of professional preparatory programs. The development of storied case studies that reveal examples could be instructive in terms of the cultivation of phronesis in the professions. In addition, if phronesis is best learned through experience, preceptors and educators in professional programs might be sensitized to phronesis (through education and research) and encouraged to begin to reflect, document and communicate

when phronesis occurs. Also worthy of attention is case study research that investigates and documents individual and collective experiences of phronesis in professional practice.

The research of Tyson (2015, 2016a, b, c, 2018) has been concerned with establishing a conceptual framework for using case narratives from vocational practice and vocational education centered on excellence as well as with the empirical collection of such cases. Such narratives, it is argued, can contribute to the development of novel curricula, educational tasks, and case-based training. An example could be to give apprentices or other learners the task of interviewing respected masters or other professionals asking for narratives of excellence in relation to their biographies. Furthermore, the narratives can also be used as a basis for enriching the practical wisdom of practitioners. Central to the approach is the focus on narratives that describe unusually wise, rich, successful, or paradigmatic cases taken from the biographical experiences of practitioners. This is meant to accelerate development and to surface what practitioners themselves consider the ideal goods and virtues of their practice. By documenting this it becomes easier to critique practice because it establishes a kind of baseline or ideal horizon from which to proceed both in comparison with variations across similar practices and in reflecting on the state of the ideals themselves.

The approach includes a number of cases collected to illustrate and drive the argument. These range from the full educational biography of a skilled craftsman, bookbinder, engraver, and gilder Wolfgang B., to brief case narratives from teachers, caregivers, craftspeople, and others engaged in various vocational practices. Part of the work collecting these cases was done in the context of courses in programs for VET teacher education. The teacher students, already trained in their respective vocations, were tasked with writing a case about unusual excellence from their own education or practice. This was framed as a way for them to begin articulating what excellence in their field of practice can be and how they can use this kind of narrative approach in their own work as teachers (mainly at the upper secondary level). It was also considered as a way of conducting education and research simultaneously. At this point the research overlaps largely with established practices on the use of cases and case narratives in higher education (e.g., McDrury and Alterio 2002; Mezirow and Associates 1990; Moon 2010) and as such links up with them to engage with the potential of using them in education for vocational excellence. It also links to the argument by Shulman (2004), developed already by 1987, that much of the practice wisdom of teachers remains undocumented since its codification would mean establishing a case literature similar to that of traditions such as medicine or law. Shulman was expecting this to become a central theme for the following decades but as far as can be determined only a few volumes have been published (Shulman and Colbert 1987, 1988; Shulman et al. 2002). This promising empirical approach thus remains largely untapped, perhaps because Shulman was not specifically interested in excellence but in a large array of matters that are covered by his concept of pedagogical content knowledge. Furthermore, the lack of specific interest in cases of unusual richness or wisdom probably diminished the value of them for practitioners.

Returning at last to narrative medicine and other more general approaches to educating for vocational excellence in care, this is the field where the most extensive practical work seems to have been done and published. Kristjánsson (2015) provides a useful up-to-date discussion in the field of medical ethics and phronesis arguing that although a wide-ranging discussion has emerged in academic writing on the subject, it is much less clear to what extent this has filtered down to professional ethics education (ibid, p. 317f.). Kaldjian (2010) discusses teaching practical wisdom in medicine with a focus on how it enriches clinical judgment. In the article, practical wisdom is subdivided into five core elements, and a case is presented where these elements are related to the process of forming a judgment by the physician. This represents an educational approach to teaching practical wisdom that has much in common with some of the more philosophical writing in which practical wisdom is conceived as a process of reflective deliberation (for a similar approach in the context of a business school, see Antonacopoulou 2010). Other approaches hold to a more perceptual understanding of practical wisdom where it is a capacity that can also, or only, function in the immediate moment (cf. Kristjánsson 2015).

In the field of narrative medicine, Carnevale (2007, p. 580) writes about the value of counter-stories when faced with the often irreconcilable dilemmas of medical practice. Although the discussion is brief, the suggestions hint at the possibility of creating a specific case literature centered on various narrative roles, such as inauthentic/authentic heroism, to allow systematic reflection on the dramatic narratives one often finds oneself part of. To the extent that phronesis is a narrative kind of knowledge, this could be a powerful way of structuring it. Aspects of this have also been developed extensively by Frank (1995, 2004) as he outlines a typology of narrative types that caretakers tell. In *Asking the Right Questions About Pain* (2004), Frank goes on to discuss exactly some of those deeper issues that are connected to understanding actual cases as connected to some of the elements in fictional ones in ways that can enrich our wisdom in dealing with the actual. Examples of further work are the aforementioned Charon et al. (2017) and Charon (2006) as well as Bolton (2006) and Haigh and Hardy (2011). Fundamental to the approach as a whole is the combination of reading illness narratives and other literature together with writing about one's own experiences in treating the ill. This writing is then directed toward deeper reflection on one's emotional reactions, empathy, thoughts, etc., in order to develop core aspects of excellence in care. Given the comparatively extensive nature of the field, it remains a truncated part of this review. It seems clear that the arguments presented in narrative medicine on the potentials in teaching phronesis and excellence through narratives are both important and promising also for other fields of VET.

---

## Conclusions

As a field of research, this is a fairly undeveloped area, whereas as a practice it has deep roots. The one exception in the VET field is perhaps medicine and care where research is more extensive. A common feature of many studies is the reliance on, or reference to, Schön's work on reflective practice (1983, 1987). This is hardly a

coincidence but rather points to the central role that reflection plays in the development and exercise of excellence, especially practical wisdom. However, from a meta-perspective it could be a valuable contribution of further explorations in how to educate for vocational excellence to undertake a more critical evaluation of what Schön's perspectives on reflection can contribute. Perhaps their popularity is such that they risk obscuring other perspectives simply by being the first at hand and by being fairly well established.

Of the approaches described, the narrative ones seem to be the most developed in educational practice, not least because they intersect with long established practices of using narratives and cases as parts of education. However, this leans heavily toward teacher and nursing/medicine education which both tend to be part of academic VET. It does not mean that there is no narrative work being done elsewhere, only that this does not seem to be the subject of much research and systematic writing. The issue warrants both further research and more systematic educational practice. The other approaches where the focus is more on workplace-based participation have developed some conceptualizations on ways in which excellence can be cultivated. However, in empirical research, especially of the comparative kind, evaluating such efforts is scant. Combinations, with concepts and perspectives from both narrative- and practice-based approaches seem rare (again with the possible exception of medicine/care), and the groundwork laid in this chapter can hopefully encourage a more systematic exploration of the potentials inherent in doing this.

To conclude then, there exist a good number of suggestions and described practices but little to no comparative or evaluative research. Empirical studies that are more descriptive exist but are rarely connected to other, potentially related, studies. There is also, or at least seems to be, a dearth of studies from a curriculum or didactics perspective. From a practice perspective, there is also little in the way of systematic work integrating different approaches to education for excellence. What the review does make clear is the recent growth of interest in the issue, as well as the plurality of ways that institutions, scholars, and practitioners have engaged with it. The foundation exists at this point then, for both inquiry and development to proceed with greater self-awareness and understanding of the potentials inherent in this aspect of vocational education and training.

## Abstract

Across the globe the term “twenty-first century skills” has become the focus of schools for preparation for work and the center of attention for industry leaders to maintain a competitive advantage in our ever-changing, technologically advanced world. Definitions of twenty-first century skills vary, but include lists of similar competencies and proficiencies commonly termed employability skills, soft skills, and hard skills. Career Ready Practices have been identified by the National Association of State Directors of Career and Technical Education Consortium/National Career Technical Education Foundation as skills required in 16 career and technical education career clusters that students should know and be able to do upon completion of a program of study. International perspectives of cross-cultural competencies and global awareness have been jointly recognized by the Organisation for Economic Co-operation and Development, a collaborative of 34-member countries which comprise 80% of world trade and investment. As we enter the fourth industrial revolution, to increase productivity and effectively address skills for the future, the international philosophy has become based not on “lifetime employment” but rather on “lifelong employability and lifelong

learning.” Many agree that communication skills are the number one competency required to be a successful wage earner. Several lists of twenty-first-century skills are reviewed and presented in summary format to assist the reader in understanding what currently exists in the literature base to better define work readiness in the twenty-first century.

## Introduction

Conventionally, school has served four purposes: academic development of intellectual skills and knowledge, vocational preparation for work, social preparation to be a citizen, and personal knowledge to develop as an individual (Goodlad 1984). The mission of vocational education continues to change as the needs of society have progressed beyond the local community and into the global economy throughout the twenty-first century. Today’s age of technological advancement and high-performance work systems requires wage earners to have the ability to solve problems, think critically, design innovative solutions, and bring about creativity in their work. Commonly referred to as the innovative age or the age of creativity, the twenty-first century has become a time for discovery and modernization (Trilling and Fadel 2009). The skills required by wage earners are primarily developed throughout their years in education. Work readiness can be determined by the individual, the school (secondary and post-secondary), and the employer (Casella 2017).

The global atmosphere of work in the twenty-first century has changed rapidly causing a surge of new skills necessary to conduct regular business. The major changes of the new millennium can be summarized by six major factors, including advances in technologies, globalization, need for a culturally diverse workforce, team-based organizational structures, speed of change, and flatter organizational structures (Casella 2017). Employers all around the globe are seeking experienced employees with “twenty-first-century skills” in order to remain competitive in the world economy. Most recently a new set of skills, twenty-first-century skills, has become a popular term for what was previously referred to as “soft skills” and/or “hard skills.” Soft skills typically include personal and interpersonal qualities, whereas hard skills refer to the technical knowledge and expertise one possesses (Robles 2012). Regardless of the terminology, as technology emerges during the fourth industrial revolution (Schwab 2017) and continues to advance in the twenty-first century, wage earners must be prepared with the proper employability skills to be productive and competitive citizens in the workplace (Stone and Lewis 2012). The question therein lies, “Are current graduates prepared and ready to work in the new innovative/creative age in which they live?” (Fabris 2015).

When nearly 400 employers in the United Kingdom were surveyed to respond to the question “Are new graduates ready?” the following responses were cited (CareerBuilder.co.uk 2015):

- Too much emphasis on book learning instead of real world learning – 53%
- I need workers with a blend of technical skills and soft skills – 42%
- Not enough emphasis on internships, work experience, and apprenticeships – 13%
- Entry-level roles within my organization are more complex today – 17%
- Technology is changing too quickly for academics to keep up – 12%
- Not enough students are graduating with the degrees my company needs – 12%

Only 23% of those UK employers surveyed “believe that academic institutions are adequately preparing students for vacant roles in their organisations. More than half (54%) said universities are preparing students for ‘some roles, but not all,’ and 19% do not believe they are preparing them adequately at all” (CareerBuilder.co.uk 2015).

---

## Defining Competence in Twenty-First-Century Skills

How is competence defined? What does it mean to be proficient? What is a skill? “The ability to do something well” is how the *Oxford Dictionary* defines a skill. Correspondingly, competence is referred to as “the ability to do something successfully or efficiently.” Originally the term “competence” dates back to ancient times and has been traced back to Greek, Latin, French, English, and Dutch sources (Mulder 2016). The term “competency” is used to identify standards of performance which serve as indicators in various professional roles to evaluate an individuals’ competence. See *Competence-based Vocational and Professional Education: Bridging the Worlds of Work and Education* (Mulder 2017) for an in-depth discussion about thoroughly defined perspectives of various competence frameworks. Proficiency is defined as “a high degree of skill or expertise.” A theory of performance is the foundation for the notion of competence (Boyatzis 2008). Richard Boyatzis, an organizational theorist, intertwines the meaning of competency with skill by describing competency as an “underlying characteristic of the person that leads to effective or superior performance” (Boyatzis 2008). The ability of an individual to possess a variety of essential “skills” has become a significant focal point during the twenty-first century as the global economy has become more technologically advanced and demanding.

Public education has been challenged with the responsibility to prepare students for work. The need for wage earners in skilled, technological careers related to science, technology, engineering, and math (STEM) has increased as the description of the American workforce has changed and evolved into the twenty-first century (Lynch 2000). In order to be prepared to address many of the global economic challenges of the twenty-first century, wage earners are required to have a combination of academic, employability, and technical skills (ACT 2010). For competency to be exhibited, the ability to transfer and apply the combination of skills learned in

school to an occupation has now been replaced with the former capability to recall information through rote memorization (Carnevale 2013). Minimally, advanced technical training or in most cases post-secondary education has become a critical requirement for wage earners to be qualified for many of the occupations that have industrialized in the twenty-first century (Lynch 2000).

Employability skills, more commonly referred to as “soft skills” prior to the twenty-first century, can be defined as the necessary skills a wage earner should possess to be successful in any type of career. Examples of employability skills can include responsibility, self-management, and integrity (Stone and Lewis 2012). Basic academic and thinking skills such as creative thinking and problem solving along with personal qualities (dependability and honesty) have been characterized as foundational skills essential for all occupations (SCANS 1991). Conversely, the skills requisite to a specific career are defined as “hard skills” or job-related technical skills (Stone and Lewis 2012). Employability skills, as such, refer to the skills required of an individual to be seemingly fit for work or in other words referred to as the fundamental skills needed to get a job (Mishra 2014). Research has indicated that in order for wage earners to be successful in a job, soft skills tend to be more relatively important than hard skills (Klaus 2010; John 2009). Business organization leaders report soft skills number one with regard to importance for entry-level success on the job (Wilhelm 2004). The top ten soft skills identified by 57 executives in 2012 were communication, courtesy, flexibility, integrity, interpersonal skills, positive attitude, professionalism, responsibility, teamwork, and work ethic (Robles 2012).

The inventory of employability skills was somewhat diminutive during the industrial age. Skills required for work included punctuality, following instructions, recognizing the authority of the supervisor, and working on monotonous tasks for long periods of time (Huitt 1999). Now the list of competencies or twenty-first-century skills has magnified and has been defined by a number of sources over the past decade. The ability to communicate and think like an expert in complex situations; teamwork and collaboration; grit; perseverance; global awareness; financial, economic, business, and entrepreneurial literacy; and civic, health, and environmental literacy have become prevalent competencies required of wage earners to be successful in a twenty-first-century career (Duckworth et al. 2007; Partnership for 21st Century Skills 2009; Stone and Lewis 2012). Additionally, the need for global/cultural awareness emerged and is defined as “the ability to understand global issues; learn from and work with people from diverse cultures; and understand the cultures of other nations, including the use of non-English languages” (Partnership for 21st Century Skills 2009, p. 2). Information and communication technology literacy (ICT) was also included in the Partnership for 21st Century Skills (2009) learning model and defined as “the ability to use technology to develop 21st century content knowledge and skills, in the context of learning core subjects. Students must be able to use technology to learn content and skills — so that they know how to learn, think critically, solve problems, use information, communicate, innovate and collaborate” (p. 5).

Competence in working on “real-world team projects” where skills such as experience from engagement in internships, teamwork, leadership, project management, cross disciplinary, community engagement, and international experiences

materialized as important skills required for the twenty-first-century workforce in a 2011 report focused on a comparative analysis of soft skills (Crawford et al. 2011). A common collection of standards, the Common Career Technical Core (CCTC), which focuses on developing career-ready individuals, has been adopted by many career and technical education (CTE) leaders in the United States. Competencies termed “Career Ready Practices” identified by the National Association of State Directors of Career and Technical Education Consortium/National Career Technical Education Foundation (2012, pp. 2–3) included a list of 12 skills required for each of the 16 CTE career clusters that identified what students should know and be able to do upon completion of a program of study. The 12 Career Ready Practices include the following:

1. Act as a responsible and contributing citizen and employee.
2. Apply appropriate academic and technical skills.
3. Attend to personal health and financial well-being.
4. Communicate clearly, effectively, and with reason.
5. Consider the environmental, social, and economic impact of decisions.
6. Demonstrate creativity and innovation.
7. Employ valid and reliable research strategies.
8. Utilize critical thinking to make sense of problems and persevere in solving them.
9. Model integrity, ethical leadership, and effective management.
10. Plan education and career path aligned to personal goals.
11. Use technology to enhance productivity.
12. Work productively in teams while using cultural/global competence.

Given that the main purposes of a CTE program are to provide career exploration and planning, to enhance academic achievement and motivation to learn more, to acquire generic work competencies and skills useful for employment, and to establish pathways for continuing education and lifelong learning (Lynch 2000), CTE programs are well suited to prepare students for work in the twenty-first century (Conley 2014; Conroy et al. 1998; Stone and Lewis 2012; Zinser 2003). CTE programs also offer important benefits to students by providing them with the opportunity to participate in career and technical student organizations (CTSOs). Examples of CTSOs include the National FFA Organization (FFA), SkillsUSA, Distributive Education Clubs of America (DECA), Future Business Leaders of America (FBLA), Family Career and Community Leaders of America (FCCLA), Technology Student Association (TSA), and Health Occupations Students of America (HOSA) (see ► Chap. 33, “Vocational Student Organizations and Student Success”). Work-based learning (WBL) has also been embedded into the curriculum of CTE programs and serves as an effective approach to develop career-ready individuals (Stone and Lewis 2012).

A comprehensive list of skill clusters was identified by Crawford et al. (2011). The skill clusters’ inventory consisted of communication skills, decision making/problem solving skills, self-management skills, teamwork skills, professional skills,

experiences, and leadership skills. Many of the skill clusters identified by Crawford et al. (2011) align with the 12 Career Ready Practices outlined by the National Association of State Directors of Career and Technical Education Consortium/National Career Technical Education Foundation (2012).

In 2016, DiBenedetto and Myers developed a Conceptual Model for the Study of Student Readiness in the twenty-first century that summarized the work of nine seminal studies conducted in the United States (ACT 2010; Crawford et al. 2011; Conley 2014; CTE Technical Assistance Center of New York 2013; NASDCTEc 2012; Partnership for 21st Century Skills 2009; SCANS 1991; Soland et al. 2013; Stone and Lewis 2012). Table 1 provides a detailed summary of the nine seminal studies.

Figure 1 presents the Conceptual Model for the Study of Student Readiness in the twenty-first century (DiBenedetto and Myers 2016). The purpose of the conceptual model for the study of student readiness was to provide a common list of twenty-first-century skills that were rooted by the development of nine constructs that were identified and organized by those nine seminal studies. The nine constructs include career skills, dispositions, experiences, incidental learning skills, interdisciplinary topics, knowledge skills, learning skills, life skills, and social skills (DiBenedetto and Myers 2016). Table 2 provides a list of the skills categorized into the nine constructs identified by DiBenedetto and Myers as the knowledge, skills, and dispositions required of US high school students to be career ready in the twenty-first century.

## International Perspectives of Cross-Cultural Competencies and Global Awareness

The Organisation for Economic Co-operation and Development (OECD) was established in 1961 with a mission dedicated to promoting and improving global development. The OECD originated through the shared vision of the United States, Canada, and 18 European countries. Currently, 34 countries from around the world work together to “build a stronger, cleaner, fairer world” (OECD 2011 p. 8). Collaboratively those 34 OECD member countries comprise 80% of world trade and investment focused on confronting the issues facing the world economy with a mutual obligation to sustainable growth, employment and trade, and the well-being of all citizens. The OECD country members and membership year include Australia (1971), Austria (1961), Belgium (1961), Canada (1961), Chile (2010), Czech Republic (1995), Denmark (1961), Estonia (2010), Finland (1969), France (1961), Germany (1961), Greece (1961), Hungary (1996), Iceland (1961), Ireland (1961), Israel (2010), Italy (1961), Japan (1964), Korea (1996), Luxembourg (1961), Mexico (1994), the Netherlands (1961), New Zealand (1973), Norway (1961), Poland (1996), Portugal (1961), Slovak Republic (2000), Slovenia (2010), Spain (1961), Sweden (1961), Switzerland (1961), Turkey (1961), the United Kingdom (1961), and the United States (1961) (OECD 2011).

Work of the OECD has recognized traditional industries that are now being challenged by technology integration to create new jobs to maximize career opportunities in areas where innovation and advancement has changed the existing platform of productive methods of work. Reports developed by OECD such as the Innovation Strategy (OECD 2010), Job Strategy (OECD 1996), and Skills Strategy have assisted policy makers in determining and assessing critical skills required of wage earners. To increase productivity and effectively address skills for the future, the philosophy has become based not on “lifetime employment” but rather on “lifelong employability and lifelong learning” (OECD 2011 p. 21). Overall the goal is to produce a better educated global population to increase success and establish a just, all-encompassing world. Global competition for capable and proficient wage earners is increasing, and skills are becoming progressively more valuable in all labor markets.

The OECD’s Programme for International Student Assessment (PISA) has become a comparative measure of assessment for member countries to evaluate performance in education. With regard to problem solving, an important twenty-first-century skill, a 2003 PISA report revealed only 20 percent of all students in OECD countries were able to analyze a situation, make decisions, and manage multiple conditions simultaneously, indicating the majority of students worldwide are not prepared for the current-day workplace of the twenty-first century. Data from the 2006 PISA report indicated a major decrease in student achievement from the 2003 data (Bybee 2009). In an assessment of 40 countries, US students ranked 35th in mathematics and 31st in science. US students’ lowest scores were reported as problem solving items in all tested disciplines (Darling-Hammond and McCloskey 2007). The 2006 PISA data supported the concern that US education has fallen behind the level of other countries (NCEE 1983).

The Great Eight Competency Framework, which is an example of the outcome of research conducted by David Bartram (2005) on human behavior, outlines sets of behaviors (competencies) that reflect employee effectiveness in twenty-first-century organizations. The Great Eight predominately relates to careers in management and includes (1) leading and deciding, (2) supporting and cooperating, (3) interacting and presenting, (4) analyzing and interpreting, (5) creating and conceptualizing, (6) adapting and coping, (7) organizing and executing, and (8) enterprising and performing (Bartram 2005). More recently and also specific to the needs of Europe, the Digital Skills and Jobs Coalition brings together collaborative efforts of companies, social partners, nonprofit organizations, and education providers with a mission to enhance digital skills. In 2016 the e-Competence Framework (e-CF), a common framework for information and communication technology (ICT), was published as the European standard reference for 40 competencies identified for the ICT workplace. Several stakeholders including ICT professionals, vocational education institutions, and market analysts, to name few, were brought together to create the e-CF.

What essential skills are employers from all over the world seeking from wage earners to be qualified to work in the ever-changing global environment? Are there differences in opinion among employers, countries, and universities, or is there a cohesive set of skills that wage earners can set goals to acquire? The summary which follows will provide some insight and perspective on many of the inquiries that arise about the list of skills in question.

Essential skills for a global work environment have been categorized by Sensenig (2009) as adaptability, communication, rapport building, conflict resolution, curiosity, and ambition. Similarly, Carnevale and Smith (2013) define competitive requirements of the twenty-first-century world economic system to include productive investment, quality, variety, customization and convenience, speed and continuous innovation, and social responsibility. Hence the skills required of wage earners must match the role of the economic system and include those identified by many others (Bardia 2010; Crawford et al. 2011; Dutta 2008; Sensenig 2009). Some argue that communication skill is the most important competency required to be successful in the global marketplace (Bardia 2010; Dutta 2008). A company's level of success can be directly related to their employees' ability to effectively communicate both internally and externally (Bardia 2010). Intercultural communication requires an ability to interact with a variety of culturally diverse individuals allowing for understanding and empathy with regard to the need to overcome cultural barriers that exist in a global environment. Spatial, temporal, and cultural differences exist among a group of employees, and culturally diverse teams must be able to collaborate in order to reach company goals (Dutta 2008). Cultural intelligence can be defined as a personal attribute that has been developed through experience with diverse groups that allows an individual to adapt to new cultural environments. Acquiring and exhibiting cultural intelligence has also been reported as an important twenty-first-century skill required to work in the global marketplace (Simpson 2016).

## Future Impacts on Society: The 4th Industrial Revolution

The term revolution is defined as “a sudden, radical or complete change; a fundamental change in the way of thinking about or visualizing something” (Merriam-Webster). Contemplating the future, it is important to learn from the past and recognize how revolutions have come about and impacted society. From 1760 to 1840 the first industrial revolution brought about change from human muscle energy to mechanical power. The second industrial revolution occurred throughout the late nineteenth and twentieth centuries and modernized business and industries’ means of mass production. Mainframes, personal computers, and the World Wide Web/Internet transformed the 1990s as the third industrial revolution emerged. We now begin to embark upon the fourth industrial revolution, one that builds upon the technological advancements of the third by creating a fusion of technology focused on digitalization and sensitive to ethical norms. The innovation of “smart machines” focused on digital, physical, and biological elements is causing a sweep of change and a reduction in roles for workers (Schwab 2017).

The World Economic Forum indicates that the fourth industrial revolution requires an identity change where the way everyone communicates, produces, and consumes will become digitalized and business models will be freshly defined to adapt to the continuous, rapidly paced changes that are and will continue to occur (Schwab 2017). The education system will need to adjust to the rapidly changing pace as well. Throughout the United Kingdom, the United States, and European Union, employer reports indicate universities are not sufficiently preparing graduates for the workforce. The skills frequently mentioned as needed but not possessed by college graduates are interpersonal/people, creative thinking, and problem solving (Career Builder.co.uk 2015).

A major concern of employers has been that the education system is focused too much on emphasizing book learning rather than real-world learning. Problem-based, experiential learning also commonly referred to as inquiry-based or “purpose learning” should be utilized as the pedagogy to alter curricula to foster graduates to pursue a problem or mission rather than simply select a major. According to the World Economic Forum, the ten most important skills needed to thrive in the fourth industrial revolution include cognitive flexibility, negotiation, service orientation, judgement and decision making, emotional intelligence, coordinating with others, people management, creativity, critical thinking, and complex problem solving. Interestingly the World Economic Forum identified a list of skills that closely mirrors the “Career Ready Practices” identified in 2012 by the National Association of State Directors of Career and Technical Education Consortium/National Career Technical Education Foundation. Interdisciplinary efforts that span across a variety of fields and move toward combining social and technical skills and knowledge will be required to prepare graduates to be equipped with a combination of technical and employability skills to succeed throughout future revolutions.

---

## Conclusion

Over time the list of “skills” required for a wage earner to be successful in the workforce has evolved to meet the changing demands of the twenty-first-century global economic system. Although the terminology has some variance (employability skills, soft skills, hard skills, competency, and proficiency), the actual abilities that a wage earner must possess to be successfully employed in the twenty-first century have advanced to include global/cultural awareness, intercultural communication, cultural intelligence, grit, perseverance, teamwork, social responsibility, and flexibility, to name a few. The thought of lifetime employment has transformed to lifelong employability and lifelong learning in order for wage earners to stay abreast of the changes and advancements required to maintain their jobs. People will no longer work in one role for one company for the majority of their careers. The characteristics of those of the millennial generation do not match those of their ancestors, and they will hold a variety of jobs throughout their lives (Lee et al. 2017).

Industries worldwide face similar challenges as the organizational leaders seek to find the most highly qualified graduates from around the globe. Competition to find and maintain wage earners who meet the skill requirements of the twenty-first century will continue to be reliant on the education system and how wage earners are prepared for work in a technologically advanced world. The majority of the future workforce currently entering school will eventually culminate with them working in entirely different and most likely new jobs that do not yet exist. As the momentum of the fourth industrial revolution continues to impact society, lifelong learning in an educational system willing to continuously change and adapt to the needs and skills necessary for success will be crucial worldwide.

## Abstract

Globalization and its driving forces have led to attempts by both scholars and practitioners to deepen our understanding of people’s abilities and strategies to act and interact with others in global, diverse, and complex environments. Education has aimed to keep pace with global socioeconomic changes in order to educate future citizens and members of the workforce. In addition to global competence, conceptualizations of intercultural (communication) competence are widely used not only in the context of education but also in the context of work and organizations. While consensus on the conceptualization of this issue is still lacking, several attempts have been made to deepen the understanding of both the theoretical trajectory and the ongoing state of conceptualization of intercultural competence over the past decades. Emerging approaches, however, have also created some contextual imbalances, for instance, between research on higher education and vocational education and training or Western versus non-Western perspectives. This chapter discusses some of the current debates on and approaches to intercultural competence in the context of education and work.

**Introduction**

Globalization and its driving forces have led to attempts by both scholars and practitioners to deepen our understanding of people's abilities and strategies to act and interact with others in global, diverse, and complex environments. The ability to productively collaborate across cultures, distances, and various contexts can be considered a critical resource for both social and economic development (Popov et al. 2017). From a societal standpoint, new forms of citizenship, including cultural rights for citizens from diverse racial, cultural, ethnic, and language groups, are expected to emerge in a global society (e.g., Banks 2008). From an economic perspective, the internationalization of business and migration has led to an increase in cross-cultural encounters and interest in intercultural communication - while practical problems have also boosted developments in the field (Van de Vijver and Leung 2009). Global companies are looking for innovative team players whose competencies are transferable to multiple locations and who think in terms of diversity, want to learn, and value freedom of choice (Trompenaars and Woolliams 2009). While earlier studies situated learners in specific settings that were focused on skills and knowledge acquisition (tightly defined and delineated for training), over the past two decades, the emphasis has rather been on the need for a multi-skilled and flexible workforce that is able to work anywhere and at any time on a range of tasks (Cairns and Malloch 2011). Thus, we have witnessed the development of the autonomous and reflective individuals who have a full set of skills to address the needs of their organization (Trompenaars and Woolliams 2009).

Education has aimed to keep pace with global socioeconomic changes in order to educate future citizens and members of the workforce. The OECD (2016) applies the multidimensional concept of *global competence* in terms of maximizing economic gains, care for the environment, social harmony, and establishing acceptable levels of security, health, and education. Global competence is defined as "the capacity to analyze global and intercultural issues critically and from multiple perspectives, to understand how differences affect perceptions, judgments, and ideas of self and others, and to engage in open, appropriate and effective interactions with others from different backgrounds on the basis of a shared respect for human dignity" (OECD 2016, p. 4). Broadly, global competence is included among the new abilities that members of the workforce need to operate successfully in a world of growing diversity and complexity (Popov et al. 2017). Graduates should not only be professionally competent but also experienced in working teams that can be virtual, multidisciplinary, and multicultural that implies the application of collaborative learning (Popov et al. 2014a, b, 2012). To make this complex learning goal tangible, it has been broken down into separate and measurable learning

objectives (OECD 2016; Deardorff 2006, 2009, 2015). Thus, the OECD Education 2030 Framework (2016) proposes deconstructing the macro domain of global competence into the following measurable “dimensions”: *skills* (analytical and critical thinking, ability to interact respectfully, appropriately, and effectively, empathy and flexibility), *knowledge and understanding* (knowledge and understanding of global issues, intercultural knowledge and understanding), *attitudes* (openness toward people from other cultures, respect for cultural otherness, global-mindedness, and responsibility), and *values* (valuing human dignity and cultural diversity).

This understanding of global competence illustrates the awareness of the broad demands on the students and workers of the twenty-first century. Furthermore, interculturalism also informs the mainstream discourse on education, and intercultural considerations influence educational policy-making on a large range of topics; Many states, particularly Europe, have seen the awakening of theoretical and educational interest in interculturalism due to political developments, for instance, the expansion of the European Union (Coulby 2006). Scholars are increasingly developing theoretical models for acquiring and evaluating *intercultural competencies*, looking for connections between interdisciplinary subjects, and researching the development of intercultural competencies in foreign relations, immigration, politics, education, commerce, and healthcare (Reid 2013). Indeed, the development of intercultural competence is emerging as a central focus as well as an outcome of many internationalization efforts (Deardorff and Jones 2012). This chapter discusses some of the current debates on and approaches to intercultural competence in the context of education and work.

---

## Variation of Cultures

According to Spitzberg and Chagnon (2009), terms such as *intercultural competence*, *intercultural sensitivity*, *intercultural effectiveness*, and *intercultural adaptation* can be traced back to the 1970s and 1980s when the need for interculturally competent government, educational, and business representatives was widely recognized due to social and economic developments in the aftermath of World War II. A need emerged for a widely accepted model for training and assessment of intercultural “readiness” (Spitzberg and Chagnon 2009). Since then, the literature has produced a large number of frameworks for, definitions of, and approaches to intercultural competence (Van de Vijver and Leung 2009). While consensus is still lacking, several attempts have been made to deepen our understanding of the theoretical trajectory and current state of conceptualization related to intercultural competence.

Many of the conceptualizations, theories, and models of intercultural competence examine *adjustment* (becoming well fit to an environment), *assimilation* (blending with or becoming similar to the host culture), and *adaptation* (microlevel adaptation, referring to interdependence and alteration of behavior in episodes of interaction, or macro-level adaptation, referring to making adjustments to the host

culture across episodes and contexts of interaction within that culture) (Spitzberg and Chagnon 2009). In any work of intercultural competence and cross-cultural communication and conflict, there is a need to acknowledge the variety in existing cultures and explore the underlying assumptions and existing biases about cultures and the ways in which one approaches the concept of intercultural competence (Deardorff and Jones 2012). Further, the ability to comprehend diversity and cultural differences in values, beliefs, and behaviors shared by groups (defined by, e.g., nationality, ethnicity, or any other grouping that generates identifiable patterns) of interacting people depends on understanding the culture itself (Bennett and Bennett 2004).

The commonly used constructivist approach to intercultural competence is based on Berger and Luckmann's (1966) definition of culture. While objective culture typically refers to institutional aspects of culture, such as economic and political systems, and to products of a culture (e.g., art, music), subjective culture refers to the experience of the social reality, "the worldview" of a society's people, formed and informed by a society's institutions (Bennett and Bennett 2004). Bennett and Bennett (2004) reminds that although knowledge of objective culture is important, subjective culture is the key to understanding the juncture between global and domestic diversity. An understanding of subjective culture may create a climate of respect for diversity – understanding and appreciation for different subjective cultures – thus providing access to the differing cultural experiences of others and enabling mutual adaptation (Bennett and Bennett 2004). Hofstede's (1980, 2011) well-known cultural dimensions theory defines culture as an aggregate of shared belief systems between different social groups, usually demarcated at a geographical or national level. He originally identified four dimensions of cultural variability: (1) power distance (small vs. large), related to the different solutions to the basic problem of human inequality; (2) uncertainty avoidance (weak vs. strong), related to the level of stress in a society in the face of an unknown future; (3) individualism versus collectivism, related to the integration of individuals into primary groups; and (4) masculinity versus femininity, related to the division of emotional roles between women and men. Three decades later, based on extensive analysis of data from the World Values Survey (Minkov 2007), Hofstede's model was augmented/complemented with two additional dimensions (Hofstede et al. 2010): (5) long-term versus short-term orientation, related to the choice of focus for people's efforts, with the future, the present, or the past, and (6) indulgence versus restraint, related to gratification versus control of basic human desires related to enjoying life (Hofstede 2011). According to Hofstede (2009, p. 85), a community, which can range from a few people (e.g., a married couple) to all the people in the world, constitutes a "moral circle," that is, "a group of which the members expect to live by a shared standard of moral rules," and understanding these moral circles is crucial to investigating intercultural competence. Even if the dimensions are considered meaningful only in combination, understanding cultural dimensions leads to a greater awareness of acceptable behaviors and thus adoption of such behaviors in moral circles (Hofstede 2009).

## Theoretical Constructs of Intercultural Competence

While consensus on the conceptualization of intercultural competence is still lacking and various theoretical frameworks have many differences, they also have many similarities. Overall, according to Spitzberg and Chagnon (2009, p. 5), all theoretical explanations of human activity attempt to cope with the complexities of *process*, which “broadly implies systemic aspects of ongoing or continuous change over time, functional interdependence, equifinality (different paths to the same outcome), and multifinality (one path to multiple outcomes)”. Chen (2017) elaborates that even if competence can be considered a state that does not change quickly in every moment and retains a certain degree of stability, it should not be considered a stable characteristic of a person either; most scholars orient to perceiving competence as an inherent but also changeably ability, which provides individuals with the potential to motivate themselves to learn and to move up the ladder of human development (Chen 2017; Fang 1980). Furthermore, intercultural competence is often discussed together with the multidisciplinary concept of *intercultural communication*, which draws heavily on psychology, anthropology, and sociology (Bennett and Bennett 2004). According to Bennett and Bennett (2004, p. 149), in the complex world of diversity, the concept of intercultural competence puts particularly useful emphasis on the development of intercultural communication: “intercultural competence is the ability to communicate effectively in cross-cultural situations and to relate appropriately in a variety of cultural contexts.” Based on linguistic traditions, Fantini (2009, p. 458) defines intercultural (communication) competence as “complex abilities that are required to perform *effectively* and *appropriately* when interacting with others who are linguistically and culturally different from oneself,” effectively reflecting the view of one’s own performance in the target language-culture, and appropriately reflecting how natives perceive such performance (Fantini 2009). Even if many other scholars also agree that competence is an ability to interact and discuss effectiveness versus appropriateness in the evaluation of communication, more and more researchers have recently advocated that ethics (e.g., mutual respect, sincerity, tolerance, and responsibility) should be included when conceptualizing intercultural competence (Chen 2017).

Hammer (2015) discusses the paradigmatic state of research and theory in relation to intercultural competence and distinguishes the mainstream *cognitive/affective/behavioral paradigm* (CAB) from the *alternative developmental paradigm*. The traditional and dominant CAB paradigm, which has been developed over the past 50 years, is essentially compositional and focuses on identifying personal characteristics and examining such personal variables as tolerance of ambiguity, open-mindedness, and behavioral flexibility. The developmental paradigm, which largely emerged after 1989, draws attention to the developmental progression individuals make in moving from less diverse intercultural understandings to a more complex way of understanding and responding to patterns of cultural difference between the self and the other (Hammer 2015).

Spitzberg and Chagnon (2009) conducted extensive meta-analyses of relatively well-defined and comprehensive models and theories of intercultural competence.

Based on the potential similarities between the models, the authors divide the studied models of intercultural communication competence into five types: compositional, co-orientational, developmental, adaptational, and causal process. *Compositional models* refer to the hypothesized components of competence (without specifying the relations between them) that are considered as productive or constitutive in competent interaction. *Co-orientational models* have a special focus on the particular criterion of communicative mutuality and shared meanings. *Developmental models* emphasize the time dimension of intercultural interaction by specifying stages of progression or maturity through which competence is hypothesized to evolve. *Adaptational models* acknowledge multiple interactants in the process and emphasize the interdependence of these interactants by modeling the process of mutual adjustment. *Causal process models* refer to fairly specific interrelationships among components and are the most easily formalized or translated from or into testable propositions. The models are typically presented in the form of a path model. Spitzberg and Chagnon (2009) note that the introduced types of models are not mutually exclusive. To illustrate some of the features that underlie these theoretical contributions, the following section briefly introduces three well-known theories of intercultural competence.

Deardorff's (2006, 2009) process model of intercultural competence is based on research conducted via the Delphi technique, an iterative process used to achieve consensus among a panel of experts, in this case, leading intercultural experts from the United States. The model focuses on *internal outcomes* and *external outcomes* of intercultural competence, based on the development of specific *attitudes* (particularly respect, openness, and curiosity), *knowledge* (particularly cultural knowledge, i.e., holistic, contextual understanding of a culture, including the historical, political, and social contexts), and *skills* (particularly critical thinking skills) inherent in intercultural competence. According to this grounded theory-based model, the development of intercultural competence is an ongoing process (Deardorff 2006, 2009). The overall external outcome of intercultural competence is defined as "effective and appropriate behaviour and communication in specific intercultural situations, which can be further detailed in terms of appropriate behaviour in specific contexts (appropriate behaviour being assessed by the other involved in the interaction)" (Deardorff 2009, p. 479).

Byram's (1997, 2009) model of intercultural communicative competence emerges from foreign language teaching. The components of the model are knowledge, skills, and attitudes, complemented by values. The foundation of intercultural competence is in the *attitudes* of the intercultural speaker and the mediator. Intercultural attitudes refer to curiosity, openness, and readiness to suspend beliefs about other cultures and about one's own culture. *Knowledge* refers to knowledge of social groups and their products and practices in one's own and in one's interlocutor's country and knowledge of general processes of societal and individual interaction. *Skills* refer to the ability to interpret a document or event from another culture, explain it, and relate it to documents or events from one's own culture. Moreover, it includes the ability to acquire new knowledge, attitudes, and skills under the constraints of real-time communication and interaction. *Values* refer to critical cultural awareness, an ability to evaluate critically and on the basis of explicit criteria, perspectives, practices, and products in one's own and other cultures and countries (Byram et al. 2001).

Bennett's (1993) constructivist developmental model of intercultural sensitivity (DMIS) was created as a framework to explain the observed and reported experiences of people in intercultural situations. It is based on longitudinal observation data focused on students participating in intercultural workshops, classes, exchanges, and graduate programs (Bennett and Bennett 2004; Bennett 1993). Instead of referring to the cognitive and behavioral skills used when dealing with cultural differences ("competence"), *sensitivity* is applied to understand one's ability to notice and experience cultural differences (Holm et al. 2011). The model relies on the assumption that "as one's experience of cultural difference becomes more sophisticated, one's competence in intercultural relations increases" (Bennett and Bennett 2004, p. 152). Thus, the model focuses on the development of cognitive structure instead of changes in attitudes and behaviors. The DMIS includes six stages that indicate a particular worldview configuration, and certain kinds of attitudes and behaviors are typically associated with each configuration (Bennett and Bennett 2004). The first three stages of the model, *denial*, *defense*, and *minimization*, are defined as "ethnocentric" stages that take place when the individual's own culture is experienced as central to reality. The emphasis is on ways of avoiding cultural difference, by raising defenses against it, or by minimizing its importance. The next three stages, *acceptance*, *adaptation*, and *integration*, are defined as "ethnorelative" stages that focus on the individual's ways of seeking cultural difference, either by accepting its importance, by adopting a perspective to take it into account, or by integrating the whole concept into a definition of identity. Several internationally validated scales to operationalize the stages of DMIS have been developed over the past two decades, for example, the Intercultural Development Inventory (IDI; see Hammer et al. 2003), the Intercultural Sensitivity Index (ISI; see Olson and Kroeger 2001), and the Intercultural Sensitivity Scale (ICSS; see Holm et al. 2011).

Chen and Starosta (1997) argue that intercultural competence and intercultural sensitivity (IS) are two different concepts and that the latter is a prerequisite of intercultural competence. DMIS provides the theoretical framework for understanding and assessing individuals' cognitive growth process when encountering cultural differences, whereas IS refers to "an individual's ability to develop positive emotion towards understanding and appreciating cultural differences" (Chen and Starosta 1997, p. 6). Their model of IS (1997, 2000) focuses on six elements that are essential to developing positive emotions that lead to understanding and appreciating cultural differences: self-esteem, self-monitoring, open-mindedness, empathy, interaction involvement, and non-judgement (or suspending judgement). The internationally validated Intercultural Sensitivity Scale (Chen and Starosta 2000) measures these elements with 24 items.

---

## Diversity and Working Life

During the second half of the twentieth century, the theoretical construct of *competence* was introduced in various domains and a competence-based approach to education gained much interest, in particular to better integrate education and work (Mulder and Winterton 2017; Le Deist and Winterton 2005). Much of the competence literature suggests that competence is comprised of knowledge, skills,

and attitudes, which closely interrelate with the conceptualizations of intercultural competence (Deardorff and Jones 2012). For instance, Spitzberg and Chagnon (2009) identify 264 components of well-defined and comprehensive models and theories of intercultural competence, noting 64 cognitive/personality traits, 77 affective/attitudinal dimensions, and 127 behavioral/skill factors (Hammer 2015). Recent research also suggests that self-regulation is needed to acquire competencies (Nokelainen et al. 2017), thus creating a link between self-regulative skills and development of intercultural competencies. Intercultural communication, on the other hand, interrelates with such terms as “interaction skills,” “communication,” and “soft skills” that are often used in work contexts to illustrate the aim of two or more people to build social connectivity or support the achievement of shared tasks in order to make their workplaces successful (Chydenius and Gaisch 2016).

Every day, people around the world must engage in unfamiliar cultural and linguistic practices in the workplace in order to solve problems, sell products or concepts, negotiate terms and prices, or simply to get the job done (Ladegaard and Jenks 2015). Moreover, workplace practices are often carried out in a second or third language and with people who not only have different cultural values and norms but also may have little knowledge of, or specific training to deal with, cultural, linguistic, and religious diversity (Ladegaard and Jenks 2015). Thus, the interest in diversity theorizing also extends to the context of organizations and workplaces. Chen and Du (2014), who have examined the concept of intercultural communication as an organizational process, state that the conceptualization of intercultural communication competence and related theories are often developed with an eye toward the clients, consumers, or business partners, that is, from the perspective of external parties and external stakeholders. The authors argue, however, that members of a given organization should rather be seen as tangible elements in the organizational process, as they also represent diverse cultural and ethnic backgrounds and thus are capable of expert intercultural communication on the part of the organization.

Further consideration should also be given to the power/status disparity between communicating parties (Chen and Du 2014). One critique, highlighted by Ladegaard and Jenks (2015), of existing paradigms and analytical frameworks in intercultural communication is that they do not sufficiently encompass the lives and experiences of people in multilingual, multicultural (global) workplaces, particularly in Asian and African settings. Martin and Nakayama (2015) also criticize the fact that existing research and training in intercultural competence is often seen through a Eurocentric lens. They also pay attention to its focus on individual characteristics, motivation, and skills. The authors propose rather a dialectical perspective on intercultural communication in the workplace that would emphasize larger societal issues, such as access to power, resources, and education that gives people more or less influence in the construction of reality (Martin and Nakayama 2015). Employees’ (unequal) access to power and resources thus becomes essential for our understanding of the dynamics of intercultural communication and competence in the workplace (Ladegaard and Jenks 2015; Martin and Nakayama 2015).

Kamp and Hagedorn-Rasmussen (2004) reflect diversity management in working life. Diversity management is a workplace management concept that emphasizes the

value of differences among people in organizations. It calls on managers to take advantage of a diverse workforce to create sustainable competitive advantages. This concept has been an important issue among scholars of organization studies in recent years. The discourses differ in their approach to human resources (e.g., human capital, cultural capital, learning and synergy, and social justice), and they are conducive to different conceptions of difference and otherness (Kamp and Hagedorn-Rasmussen 2004). Multiculturalism, a concept interrelated to intercultural competence, has also gained interest in the context of working life, particularly with regard to migration. Meer and Modood (2012, p. 192) note that while advocates of interculturalism wish to emphasize its positive qualities in terms of encouraging communication, recognizing dynamic identities, promoting unity, and challenging illiberality (qualities that feature, and are on occasion foundational to, multiculturalism as well), multiculturalism presently surpasses interculturalism “as a political orientation that is able to recognize that social life consists of individuals and groups, and that both need to be provided for in the formal and informal distribution of powers, as well as reflected in an ethical conception of citizenship, and not just an instrumental one.”

---

## Theoretical and Contextual Limitations

Certain contextual limitations must be considered when examining diversity and the current conceptualizations of intercultural competence. The relative underrepresentation of vocational and professional education institutes in the research literature is noticeable (Popov et al. 2017). Tran (2013) discusses the key principles of vocational education and training (VET) pedagogy and VET teaching and learning in response to internationalization, emphasizing the critical need for pedagogical practices in vocational education. More attention must be devoted to the development of the skills, knowledge, and attributes that enable both international and domestic students alike to adapt to different workplace contexts and changing work practices as well as to develop cross-border skills mobility. Compared to other educational sectors, VET providers must demonstrate compliance with the competency-based requirements of training packages, which makes the system more complex (Tran 2013). Teräs and Lasonen (2012) also note that VET should have a stronger focus on diversity and multicultural education, as it is one of the main reeducation channels through which immigrants can gain employment. Based on empirical findings, they suggest that VET teachers preparing immigrant students for working life should consider the wider cultural meaning of a vocation or profession, reflect on variations in intra- and intercultural practices, and discuss with students the stereotypes and attitudes they may encounter. In contrast, Coulby (2006) emphasizes the low priority given by intercultural education to higher education and argues that the discourse of intercultural education is overwhelmingly concerned with schooling, whereas most of the studies discussing issues related to global competence have been done in the context of higher education.

From a wider perspective, Spitzberg and Chagnon (2009) reflect the challenge of conceptualizing intercultural competence and the potential ethnocentricity of models; most of the models and related assessments of intercultural competence have been developed in Western or Anglo contexts. According to the authors, expanding and strengthening discussions and research in other parts of the world may open up new possibilities for rethinking the relevance of non-Western perspectives on intercultural competence and the cross-cultural generalizability of these models. For instance, Western concepts of competence are still largely viewed as individual, and many of the developed models define skills and knowledge as being possessed by an individual, despite the fact that they assume a partner (Spitzberg and Chagnon 2009). Spitzberg and Chagnon (2009, p. 44) note that one of the fundamental theoretical challenges in the future is the question of *where competence is located*. Moreover, Western curriculum and pedagogical tradition has been criticized for its tendency to construct international students as “the other” while actively denying and suppressing any emerging hybridity (Tran and Nyland 2013; Doherty and Singh 2005). Coulby (2006) conveys concern about some fundamental theoretical weaknesses of intercultural competence and researchers’ awareness of current developments in economics, political studies, or history that are needed to understand developments of complex phenomena. The authors argue that the discourse on normative concerns (e.g., human rights, gender equality, progressive pedagogy) has been widely accepted without embracing the phase of postmodernist analyses, increasing the risk that the known literature is perceived in too narrow a focus. In terms of understanding the economic and epistemological roots of prejudice, it is possible that other approaches, such as postcolonial discourse theory, might have much to offer in intercultural education (Coulby 2006).

---

## Conclusion

This chapter has introduced some current debates and developments dealing with the theoretical and conceptual foundations of intercultural competence. Various conceptualizations of intercultural competence are widely used in the context of education, as well as in the context of work and organizations. However, conceptual development of overlapping, complementary, and incompatible models is still ongoing, and we lack sufficient empirical work in which the proposed models are compared and tested (Van de Vijver and Leung 2009; Spitzberg and Chagnon 2009). Van de Vijver and Leung (2009) remind that as long as intercultural competence is not considered predictive of success in intercultural encounters, it is unlikely that intercultural competence will reach the level necessary for test measurements. The authors suggest that the next step is to test the presented frameworks and approaches to intercultural competence and engage in more fundamental study of this complex construct. The ability to assess intercultural competence depends on the clarity of both its definition and its conceptualization (Fantini 2009). Fantini (2009) reminds us that when selecting an instrument to assess intercultural competence, one must understand exactly what each instrument measures, ensure that its purpose is compatible with the goals and objectives being

addressed, and remember that a single instrument alone is usually inadequate for measuring all aspects of intercultural competence. Moreover, when analyzing studies dealing with research on intercultural competences, Reid (2013) notes several factors that strongly influence development of competences, such as age, profession, social and cultural background, motivation, and variation of environments. Finally, as discussed in the previous section, the conceptualizations of intercultural competence have also created some contextual imbalances, for instance, between research on higher education versus VET and Western versus non-Western perspectives. These imbalances must be considered in future research. The newest formats and strategies that incorporate, for example, portfolios, logs, observations, interviews, and performative tasks, may afford an opportunity to collect more valuable data on intercultural competence than has been done until now (Fantini 2009). Furthermore, future research in the field needs to deepen the ontological and epistemological understanding of various constructs used by different disciplines to enable researchers to better theoretically ground their approaches to intercultural and global understanding.

## Abstract

Authentic assessment of competence remains a central target of VET research; adequate measurement approaches clearly are rare though a prerequisite for accountable systems to authorize access to vocational activities, as well as for international qualification acknowledgment. The chapter outlines a conceptual framework of authentic assessment as well as respective evaluation methods. Though authentic assessment

is broadly discussed in scientific literature, coherent definitions and frameworks with respect to the assessment of vocational competence are scant. However, drawing on different streams of authenticity research, it can be suggested to operationalize “authentic competence assessment” by six major key characteristics:

1. Authentic modes of assessment
2. Relevant item sampling
3. Complexity of tasks
4. Staged embedding
5. Process orientation
6. Social interaction

The chapter substantiates these characteristics, places them in a logic assessment model, gives practical implementation examples (commercial domain), and finally introduces adequate evaluation methods by which this framework can be accounted for.

## Relevance and Research Purpose

Explicit or implicit measures of vocational competence are relevant to many facets of vocational education and training (VET) and thus constitute an ever-growing research field. They pertain to national educational factors, such as the relevant information and instruments for managing the quality of the vocational educational systems and developing adequate support programs. Increasingly, they also appear in national and international policy agendas (e.g., OECD 2016). That is, international comparisons and the acknowledgement of qualifications, as well as the encouragement of lifelong, informal learning, require adequate measurement concepts and innovative evaluation methods. To meet these multiple expectations, vocational assessments have to be meaningful in the sense that they capture real-life situations in a credible way. Though authentic assessment of competence thus is a central target of VET research, coherent definitions and frameworks with respect to the assessment of vocational competence are rare (for exemptions, see, e.g., Achtenhagen and Weber 2003; Gulikers et al. 2004), even though such frameworks are indeed a prerequisite for accountable systems to authorize access to vocational activities, as well as for international qualification acknowledgement.

The chapter draws on existing literature on authentic competence assessment in order to synthesize major criteria or key characteristics for an authentic representation of work-related abilities. In contrast to existing frameworks (e.g., Gulikers et al. 2004), these major criteria (1) explicitly target vocational education and (2) will be placed in a logic assessment model that connects the criteria to the assessment design process.

Moreover, (3) the logic assessment model provides adequate evaluation methods by which this framework can be accounted for in order to allow for a practical implementation and validation of authenticity characteristics in a design process.

---

## The Definition of Authentic Competence Assessment

According to Custer et al. (2000), appropriate measures of real-world learning include authentic assessments in which students apply skills and knowledge to solving authentic problems. But what are appropriate measures and what is meant by “authentic” problems? In order for an assessment to be effective, it should be harmonically embedded in curriculum and instruction (Pellegrino 2012). The principal argument for authentic curricula, instruction, and assessment is that transfer is more likely to occur, when real, instructional, and assessment settings are nearly identical and follow a constructivist and sociological approach on learning (Schell 2000, p. 16). In order for an assessment to be close to reality, authenticity does not exist per se but has to be modeled as a didactical job by the assessment designer, also called the “authenticity paradox” (Achtenhagen and Weber 2003, p. 190). Savery and Duffy (1995) argued that authentic assessment can be defined as the similarity between the cognitive demands of an assessment and the cognitive demands of the real-world situations on which the assessment is based. Accordingly, authentic assessment in the vocational domain refers to learners applying the same skills and knowledge to solve problems in an assessment as they would apply to real work problems. While this is certainly true, it can be argued that the concept of authentic assessment goes far beyond the validity of cognitive demands. For example, Gulikers et al. (2008) define authenticity more broadly as the resemblance to “students’ (future) professional practice” (p. 401). In this respect, authenticity refers to several dimensions of an assessment, also including aspects like, e.g., the fidelity of assessment conditions (Reeves and Okey 1996) or the context of tasks (Herrington and Herrington 1998).

For a definition of authentic assessment in vocational settings, it is moreover necessary to connect this broader approach to the definition of vocational competence. The concept of vocational competence describes “the capability to perform by using knowledge, skills, and attitudes that are integrated in the professional repertoire of the individual” (Mulder et al. 2006, p. 82). Against the backdrop of these two definitions (authenticity and competence), authentic competence assessment can be defined as the:

degree of fidelity of all relevant characteristics of an assessment design that have to be adhered to in order to align assessments with work reality and to allow vocational learners to apply their knowledge, skills, and attitudes effectively to solve real work-problems.

This definition is only to be seen as a general description, as it so far leaves open what the relevant characteristics of an assessment design consist of, which serve as prerequisites for vocational learners to apply their knowledge, skills, and attitudes

like they would in a real work situation. Therefore, the next paragraph will operationalize relevant characteristics of an authentic assessment design by drawing on existing authenticity research.

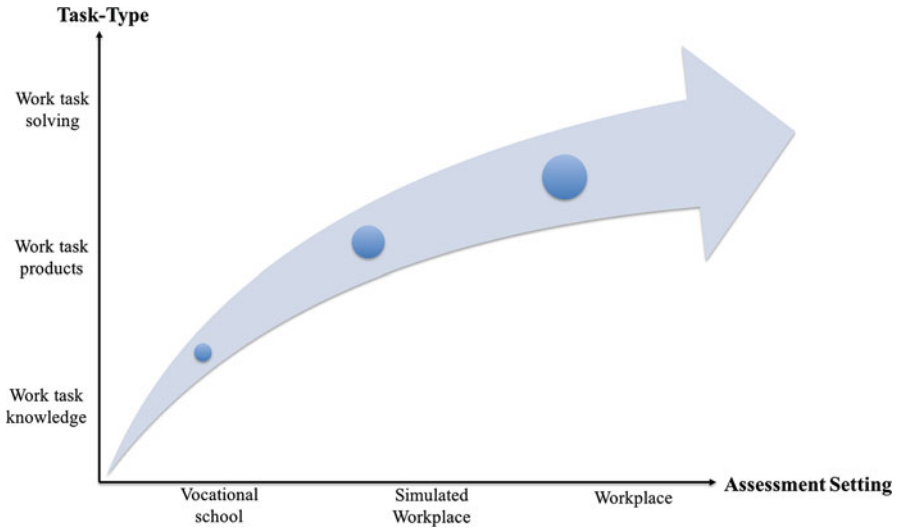

---

## **Relevant Design Characteristics for Authentic Competence Assessment**

It is noteworthy that the design characteristics for authentic competence assessment also include design principles of general learning assessment theory (e.g., construct validity, reliability, objectivity, instructional sensitivity), which are extensively discussed in assessment literature (for an overview, see, e.g., AERA/NCME 2014). The chapter will therefore not draw on general assessment standards but focus on aspects of vocational assessment that are additionally relevant in order to validly assess vocational competences. We justify these criteria as follows, substantiating them with literature in the field:

### **Authentic Modes of Assessment**

For example, Gulikers et al. (2004) stress the importance of a high fidelity of an assessment's test environment, which they refer to as the "physical context" (In the framework of Gulikers et al. (2004), this dimension also includes the representation of information and material, which is here subsumed in the logic assessment model within characteristic 4. "Staged Embedding.") (p. 74). This assessment characteristic describes how well the test environment reflects reality (Alessi 1988; Brown et al. 1989; Herrington and Oliver 2000) and for the case of vocational assessments how well the general assessment setting reflects the surrounding of the real workplace. Here two dimensions of the test environment that determine the authenticity of this aspect can be distinguished (see Fig. 1): First, the assessment can take place in different settings. It can be administered at a vocational school or another testing institution (e.g., as a paper-pencil test) or directly at the workplace and therefore at the natural surrounding where competence is demonstrated. As a compromise, it could also be administered as a computer simulation of a typical workplace. Second, the task types presented in the test environment can focus on either knowledge at the workplace (typically multiple-choice or short tasks), on work products (e.g., a chair for a carpenter or a business letter for an industrial apprentice), or on the solving of work tasks (observing the process of problem solving at the workplace, via log data in simulation or the solving approach in a paper-pencil task). Ideally, competence is captured most authentically in a natural surrounding (a workplace) by observing the process by which a product is created or a problem is solved. However, there may be good reasons in a VET system to choose other settings of assessment and task types. For example, high-stakes testing for the purpose of certification requires a certain degree of standardization and comparability between persons. Both properties can hardly be obtained in natural settings with very open task types.

**Fig. 1** Modes of vocational assessment

## Relevant Item Sampling

Different researchers emphasize that authentic tasks are at the core of any valid assessment and therefore should play a particularly crucial role for an evaluation of authenticity (Wiggins 1993; Newmann 1997; Achtenhagen and Weber 2003; Gulikers et al. 2004). The tasks chosen in a VET assessment are authentic if they resemble the activities required at the workplace. They should therefore be perceived by test takers as “representative, relevant and meaningful” in the sense that they resemble the criterion task carried out in professional practice (Gulikers et al. 2004, p. 71). Moreover, the distribution of relevant tasks over different fields of action of a vocational domain, i.e., the proportion of different contents, should reflect curricular relevance in terms of weighing (see Klotz and Winther 2017), meaning that activities that are given a large focus in the vocational curriculum and during vocational instruction should be presented proportionally within the assessment.

## Complexity of Tasks

Some authors argue that with respect to the complexity of tasks, there should be an emphasis on higher-level thinking and more complex learning (Custer et al. 2000, p. 13; Wiggins 1993). However, especially with respect to VET, not every task in an assessment has to be highly complex. The extent of complexity is authentic as long as it reflects the complexity of the relevant criterion task at the workplace (e.g., Gulikers et al. 2004). Such tasks can at times be relatively unchallenging and require a rather low level of cognitive and/or manual complexity. Moreover, they might be

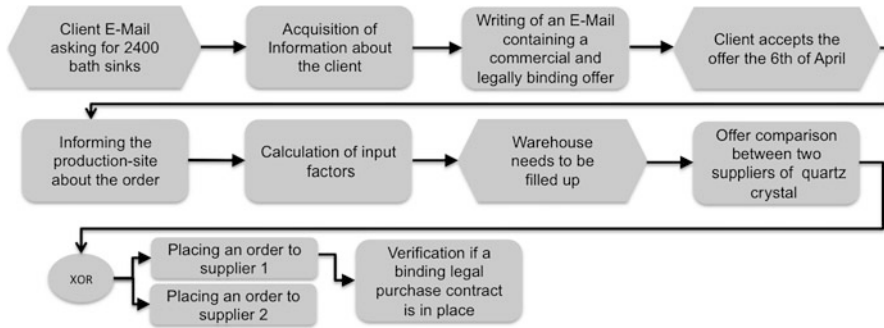

simple in the sense that the real vocational problem is well structured, with little solving steps and/or only one correct answer (Cronin 1993; Gulikers et al. 2004). Still those not complex activities should be considered authentic and not necessarily be excluded from an assessment. However, as recent commentary suggests (e.g., Schmidt 2000; Winther 2010), current test practices often fail to give students sufficient room or potential to apply their knowledge to solve complex problems in a working context. Therefore, an assessment should represent the complexity of a real work surrounding which usually contains a certain (domain-specific) amount of complex tasks.

### **Staged Embedding of Tasks in a Close-to-Reality Surrounding**

Test environments for vocational education are authentic if they model a realistic vocational setting in which all tasks are embedded (e.g., Shavelson and Semnara 1968). This could, e.g., for the commercial domain, consist in staging all tasks in a model company or for the medical domain in a model hospital. A close-to-reality surrounding facilitates the transfer of vocational competence in assessment situations – and vice versa. This characteristic deals with the staging of information and materials that are presented in the model environment. The quality of the presentation of material and the amount of detail presented as the context of all tasks determine the degree of authenticity. The additional material provided has to be used by learners to solve tasks in the assessment, as it otherwise just produces unnecessary cognitive load. Moreover, the number and kinds of information available to testees should equal the number and kinds of information at the workplace (Segers et al. 1999). In this respect, the surrounding also tends to be more authentic, if it contains relevant and irrelevant information (Herrington and Oliver 2000), as it is usually the case in a workplace situation, where learners have to filter, e.g., documents or websites for the necessary information to solve a problem.

### **Process Orientation**

Another characteristic of authenticity in vocational assessments can be found in the sequencing of the assessment tasks (e.g., Hacker 2003; Preiß 2005). Typically, events and resulting work tasks take place in a “natural order” at the workplace. The order of the tasks administered to the vocational testees should not be arbitrary but follow the logic of workplace processes. Accordingly, process orientation in vocational assessments can be defined as the modeling of a chronological sequencing of tasks according to the natural occurrence of vocational events. For example, for the commercial domain, tasks can be arranged according to the production chain or according to standardized processes in single departments, like human resource management or controlling. Here, learners also have to integrate preceding information on the operating work process. For example, with regard to our sample sequence of an operating process, given in Fig. 2, learners have to anticipate that the cheapest

**Fig. 2** Sample sequence of an operating process in the commercial domain

subcontractor for the acquisition department would not meet the goods and services department's production deadline, fostering a cross-department thinking. Also, the apprentices have to deduce information from foregoing client relation events. For example, if an offer had already expired at its acceptance date, no binding contract would be in place.

## Social Embedding

A (vocational) learner is most willing to demonstrate competence if attached emotionally (CGVN 1997). Against this backdrop, apart from staging tasks in a realistic model environment, they moreover should be staged in a social context. At most workplaces, social interaction takes place constantly as working and learning both take place in a community of practice (Lave and Wenger 1991) – though it is notable that not every single vocational activity requires social interaction. Therefore, if a real (work) task demands social interaction, the assessment should as well involve social interaction (Gulikers et al. 2004, p. 74). Social interaction can generally be defined as the process by which we act and react to those around us (Goffman 1959). There are different qualities of social embedding in a vocational assessment that can be interpreted as a taxonomy of authenticity with respect to social interaction. First, it is possible to put learners at the center of test events. The vocational testee is then not observing from a distal perspective but is an integral part of the storytelling. Second, it is feasible to let the learner be approached by the vocational test environment. The vocational learner then has to solve a task as a reaction to the social test environment in a game-like process. Third, it could be necessary for solving a task to let the learner actively approach others (e.g., writing an e-mail). Finally, it is technically possible in certain assessment modes to let the learner interact with the test environment and/or other testees. Again, also with respect to this characteristic, there may be good reasons to not fully adhere to the highest level of this taxonomy. This again depends on the purpose of the vocational assessment. For example, if the purpose of the assessment is vocational certification of an individual, the possibility of group collaboration on tasks is to be excluded. Again, depending on the purpose

**Table 1** Taxonomy of social embedding in (vocational) assessments

Taxonomy of social embedding in assessments	
Social Placement	Place the learner at the center of action “You have been employed with Ceraforma Keramik since the beginning of this year. Ms. Kenk, the team leader, and Mr. Friebel and Ms. Hoffmann, the new trainees, are your colleagues in the horizontal team. You are asked to help them by solving the following tasks”
Social Reaction	Let the learner solve tasks as a reaction to the social environment The industrial apprentice receives an e-mail by his superior Ms. Kenk, informing him about changing currency rates and asking him to adapt the price lists in the company’s pricing system
Social Action	Let the learner solve a task by actively approaching others The industrial apprentice receives a voicemail informing about a no sufficient quantity of quartz crystal on stock to execute an order. His task is to order 25 tons of new quartz by contacting various suppliers via e-mail
Social Interaction	Let the learner interact with the test environment and/or others The industrial apprentice receives a voicemail informing about a no sufficient quantity of quartz crystal on stock to execute an order. His task is to order 25 tons of new quartz by contacting various suppliers via e-mail. An intelligent test environment or other assessment participants respond to his request by asking for additional information in the order

of the assessment, it is possible to integrate social feedback on the solving of tasks on the last three stages of the taxonomic model. Table 1 gives an overview of the different qualities of social embedding in vocational assessments and substantiates these with examples for the commercial domain.

## The Logic Assessment Model

A conceptual framework for authentic competence assessment should not only list relevant characteristics but also refer to the assessment design process in order to give feasible guidance for practical implementation. This paragraph therefore substantiates the sequencing of the six relevant criteria identified by placing them in a logic assessment model that connects the authentic design criteria to the assessment design process.

The assessment design process starts with deciding for the mode of an assessment. Based on the assessment purpose, appropriate assessment settings and task types have to be considered and evaluated with respect to their cost-benefit ratio in terms of economic cost and testing time. According to the evidence-centered assessment design approach by Mislevy et al. (2003, p. 4), the starting point of any test and item design then consists in an initial substantive analysis of a domain. Here, experts in a field have to reduce vocational reality in a didactical assessment model of a given domain (Stachowiak 1980). Testimonials of relevance are ideally captured in activity-oriented vocational curricular or can be obtained via workplace observations in less formalized professional areas. The domain analysis should preferably focus on vocational activities, i.e., of working processes rather than on vocational contents, though of course vocational activities do require a

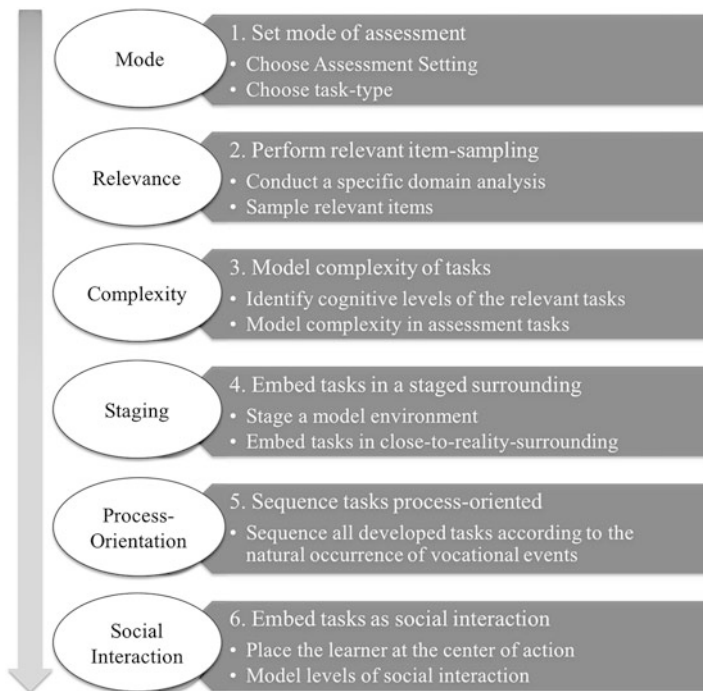

substantive body of content knowledge. Then, during item sampling, tasks have to be identified that are relevant for the workplace (Stachowiak 1980; Achtenhagen and Weber 2003). The sampling of the tasks moreover has not only to consist in relevant tasks but should ideally also reflect curricular weighing (see Klotz and Winther 2017) in order to not just pick and choose content areas unsystematically. Once meaningful items for an assessment have been identified, the complexity of these items (e.g., in terms of cognitive taxonomies, vocational specificity, or amount of information processing required) has to be identified and afterward translated in respective test tasks. The levels of complexity represented in the assessment should represent the complexity of real work surroundings and therefore ideally also roughly reflect the curricular and instructional weighing of complexity (see Klotz and Winther 2017). The modeled tasks then have to be embedded in a staged model environment in order to anchor vocational activities in a realistic workplace. This step of the assessment design process pays particular attention to a realistic anchoring of information. For this purpose, close-to-reality model environments and respective materials that are necessary for task solving are developed. After developing the test tasks, step 5 of the logic assessment model “process orientation” consists in sequencing the tasks. The sequence in which the tasks are administered to the vocational testees should reflect a possible occurrence of vocational events and activities at a workplace. The final phase of the vocational assessment design process consists in the modeling of social interaction in a vocational assessment. This step is placed at the end of the design process as it depends also on the model environment (e.g., company size, structure of employees, hierarchies, etc.) and as only social interaction is to be modeled for the purpose of assessment that directly accompanies vocational work processes (instead of, e.g., private chats) (Fig. 3).

---

## Evaluation

In order for this vocational assessment framework to be accounted for and to allow for a practical implementation and validation, evaluative methods are required. Hence, this paragraph deals with a summary of methods, which have been used in recent literature to establish and improve authenticity in vocational assessments.

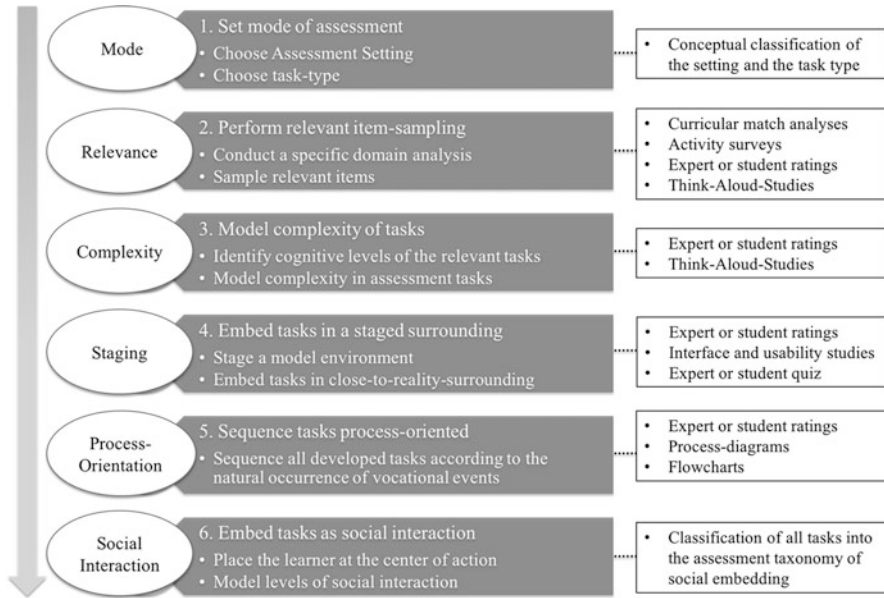

It is notable that authenticity in vocational assessments has to be evaluated by taking into consideration the respective purpose of the assessment for vocational education. Especially the distinction between the purpose of certification and admission to a (regulated) community of practice and rather formative purposes like the regulation of learning and teaching processes (e.g., self-assessment or feedback for vocational teachers and trainers) might justify reason to restrict certain aspects of authenticity. Moreover, when searching for methods for an evaluation of authenticity, close attention should be paid on the perspective of evaluation. For example, Gulikers et al. (2008) argue that authenticity is in the eye of the beholder and that different stakeholders of VET have different perceptions of authenticity. Particularly, they find that teachers rate most assessment characteristics as more authentic than learners do. Therefore, the perspective of the vocational learner should be included, where possible, in an evaluative framework for authentic vocational assessment.

**Fig. 3** The logic assessment model

With respect to the first authenticity characteristic “mode,” a conceptual classification of the assessment setting and the task typed administered given in Fig. 1 might describe the authenticity of the chosen assessment mode. With respect to the aspect of “relevance,” curricula match analyses, which compare the contents of the assessment with the contents in a VET curriculum in terms of their nature and their proportion, constitute a possible approach (for applications, see, e.g., Deutscher and Winther 2017). However, activity-based VET curricula are not available with respect to all vocations and all competences. Other options exist in qualitative interviews and quantitative ratings of relevance by either experts or vocational learners or in activity surveys administered at the workplace (for applications, see, e.g., Gulikers et al. 2004, 2008; Klotz et al. 2015) or in a think-aloud evaluation of task relevance perceived by learners (Kopriva 2001). “Complexity” could again be evaluated by expert or student ratings (for applications, see, e.g., Gulikers et al. 2004, 2008; Hartig and Jude 2007; Klotz et al. 2015). However, a deeper approach to evaluate complexity can be seen in qualitative think-aloud studies that determine the respective cognitive steps during task solving (Kopriva 2001). For an evaluation of the aspect of “staging,” again qualitative and quantitative ratings could determine the degree to which the modeled environment and the situational embedding are felicitous. The staged environment could also be evaluated by matching the staged learning environment against a set of criteria (rubric method) of the workplace to

**Fig. 4** Evaluative framing

determine the degree of convergence and additionally by user interface and usability analyses for computer-based assessments, e.g., in the form of think-aloud analyses (see, e.g., Sangmeister et al. 2018). A more experimental approach could be implemented by an expert or student quiz, in which “staged” and real company descriptions and materials are administered and have to be distinguished. “Process orientation” could again be evaluated by experts in a field or vocational learners, rating the closeness of the task sequencing in comparison to operating processes at a real work site. In some vocational fields, standard operating processes are also documented in process diagrams or flowcharts, which could also be used to validate the sequencing of assessment tasks. With respect to the final authenticity characteristic of “social interaction,” a conceptual classification of the social interaction modeled into the taxonomy of social embedding given in Fig. 1 might describe the authenticity of the chosen assessment mode. Figure 4 summarizes evaluative possibilities for all of the six authenticity characteristics and respective design steps.

## Conclusion and Discussion

The ambition of this chapter was to conceptually outline and operationalize authentic competence assessment in vocational contexts. For this purpose, the chapter drew on existing literature on authentic competence assessment in order to synthesize major criteria or key characteristics for an authentic representation of work-related abilities. In contrast to existing frameworks, these major criteria (1) explicitly target vocational

education, (2) are placed in a logic assessment model that connects the criteria to the assessment design process, and finally (3) provide adequate evaluation methods by which this framework can be accounted for and which allow for a practical implementation and validation of authenticity characteristics in the design process of vocational assessments.

With respect to a coherent definition, we argue that while “authentic” assessments in general education are intended to provide evidence about what students know and can do in a subject matter (Ruiz-Primo and Shavelson 1996, p. 569), it should be defined for vocational education as the *degree of fidelity of all relevant characteristics of an assessment design that have to be adhered to in order to align assessments with work reality and to allow vocational learners to apply their knowledge, skills, and attitudes effectively to solve real work problems.*

This definition can be filled by six characteristics discussed in authenticity literature that in this order also constitutes a logic model for the design process of authentic vocational assessments:

1. Modes of assessment
2. Relevant item sampling
3. Complexity of tasks
4. Staged embedding
5. Process orientation
6. Social interaction

However, it is notable that the logic model is not strictly linear. During the assessment development process, several developmental loops have to be performed in order to harmonize the different authenticity criteria and design steps. For example, after staging the tasks in a model environment and anchoring the vocational situations with realistic material, the items have to be adapted to the refined item context, e.g., by adapting their complexity.

With respect to evaluative methods, we argue, in line with, e.g., Gulikers et al. (2008), that for authentic assessments to reach their potential in positively stimulating learning and better preparing for the labor market, it is imperative that vocational learners perceive their assessments as authentic. Therefore, the perspective of the vocational learner should be included, where possible, in an evaluative framework for authentic vocational assessment. We suggest, among others, conceptual classifications, activity surveys, expert and student ratings, think-aloud studies, or worksite flowcharts as methods for establishing and evaluating authenticity in vocational assessments. It is notable, however, that (1) this is not an exhaustive list of all possible evaluative methods and that (2) authenticity in vocational assessments has to be evaluated by taking into consideration the respective purpose of the assessment for vocational education. Especially the distinction between the purpose of certification and admission to a (regulated) community of practice and rather formative purposes like the regulation of learning and teaching processes (e.g., self-assessment or feedback for vocational teachers and trainers) might justify reason to restrict certain aspects of authenticity.

Nonetheless, we proclaim that by establishing this definition and theoretical framework of authentic competence assessment, several practical steps can be undertaken to improve current VET assessment practices in terms of authenticity. Apart from this, only by co-delivery of adequate evaluation methods can such a framework take effect and be used as an accountability instrument.

## Introduction<sup>1</sup>

As vocational education and training (VET) systems and institutions expand, more energy is being invested in ensuring that sufficient learning has been achieved so that people are ready for work. VET plays a huge and growing role in the lives of billions of people across all nations. The competences people develop in VET are used to construct the world around us. It is essential to ensure that people develop desired knowledge and skills. Assuring the quality of learning is particularly important given the expansion of VET, the changing nature of work, and the global mobility of workers (UNESCO 2017). Yet many traditional and commonly used assessment approaches do not scale well, and there remains a pressing need for reform. This chapter distills insights from international investigations of student learning outcomes assessment and uses these to chart frontiers for innovation.

It seems common to hear in newspapers, reports, and conferences that “vocational education is changing rapidly.” Vocational education is becoming more central to socioeconomic prosperity, spurring intensification and proliferation of change (Coates 2017; UNESCO 2017). Online technologies and workplace learning have undoubtedly changed access to curriculum and the mechanics of instruction. Also, interesting institutional variants are emerging, giving rise to new forms of governance and commercial opportunity. At an aggregate level, change does indeed abound, and it would be easy to fill volumes synthesizing the marvelous transformations underway.

Yet as observation at almost any VET provider reveals, much of how teachers and institutions assess student learning has not changed for over a century. Within changing institutional settings, teachers are of course interacting with new computing technologies to provide diverse students with information and experiences intended to prepare graduates with capabilities for tomorrow's world of work. Given such change, it is surprising that much assessment in vocational education has not changed materially for a very long time and that economically and technically unsustainable practice is rife (Smith 2010; Halliday-Wynes and Misko 2013). There are an enormous number of innovative and high-quality developments, including those associated with technology advances. Still, every day around the world, students complete written assessment using pen and paper, sitting without

---

<sup>1</sup>The following text builds on Coates (2016) and Coates (2018).

talking in large halls at small desks in rows. It is possible this reflects the pinnacle of assessment, but given the lack of reflective advance over an extended period, this seems unlikely. Rather, given the enormous changes sweeping vocational education, and pressures and prospects surrounding assessment, it is more likely the “transformational moment” is yet to come.

There is substantial value in pushing progress along because the assessment of student learning outcomes is very important. Assessment provides essential assurance to a wide variety of stakeholders that people have attained various knowledge and skills and that they are ready for work or further training or study. More broadly, assessment signposts, often in a highly distilled way, the character of a VET provider and its educational programs. Much assessment is expensive, making it an important focus for analysis. Assessment shapes education and how people learn in powerful direct and indirect ways, influencing teaching and curriculum. Of course, assessment is highly relevant to individuals, often playing a major role in defining life chances and directions.

This chapter provides insight into the nature, relevance, research, and practice of assessment in vocational education. It is intended to be of wide use and furnish insights for policymakers, researchers, and practitioners alike. It takes stock of progress to date and sketches options for ongoing development of this fast-growing field. Assessment in VET takes many forms, including many different and critical forms of workplace assessment, behavioral examinations of skill, attitudinal or interpersonal assessments, and more traditional forms of cognitive assessment such as tests and examinations. This chapter focuses on the assessment of cognitive knowledge and skills, as opposed to behavior or broader affective kinds of competence. Other publications can be reviewed to obtain broader overviews of assessment in VET (e.g., European Commission 2012).

The chapter continues with a historical tour of the field, taking stock of progress over the last 30 years by examining signature initiatives. It sets out general principles for framing change, reviews likely facilitators and blockers, and, through these analyses, advances a strategy for guiding future development. The strategy articulates technical, practical, and substantive dimensions of assessment. Energy is invested in discussing each of these dimensions and creating a picture of what assessment will look like in a decade’s time. The chapter’s final section clarifies governance arrangements which would have capacity to spur the kind of progress required to propel the field.

---

## Development of the Field

Assessment has forever played an integral role in tertiary education, but the most relevant antecedents for analyzing contemporary development can be traced back over the past few decades. This section examines signature international initiatives. Clearly, taking critical stock of a field as large and diverse as tertiary education assessment is a useful, though challenging task – there are an enormous number of actors and initiatives, each at varying stages of maturity and diffusion. Rather than

conduct an exhaustive review, it is feasible to synthesize signature case studies which have sought to shift policy and practice.

One broad line of development has involved specifying qualification-level outcomes. Examples include the European Qualifications Framework (European Commission (EC) 2015), the United Kingdom's Qualifications and Credit Framework (Ofqual 2015), the Australian Qualifications Framework (2015), and in higher education the United States Degree Qualification Profile (Lumina Foundation 2015). As such titles convey, this work is developed and owned by systems, and such initiatives have served as important policy instruments for shifting beyond an anarchic plethora of qualifications, generating conversations about finding more coherence, and indeed articulating the general outcomes graduates should expect from a qualification (Chakroun 2010). These system-wide structures can suffer from unhelpful collisions with fruitfully divergent local practice, but their inherent constraint is that they go no further than articulating only very general graduate outcomes (Allais et al. 2009; Wheelahan 2009). They offer little beyond broad guidelines for improving the assessment of learning.

Going one step deeper, another line of work has sought to specify learning outcomes at the discipline level. In higher education, the tuning process (González and Wagenaar 2008) is a prominent example which has been initiated in many education systems and across many diverse disciplines. Broadly, tuning involves supporting collaboration among teachers with the aim of generating convergence and common understanding of generic and discipline-specific learning outcomes. Canada adapted this work in an innovative way, focusing the collaborations around sector-oriented discipline clusters rather than education fields (Lennon et al. 2014), while in Australia a more policy-based and compliance-focused approach was deployed (Australian Learning and Teaching Council (ALTC) 2010). Similar large-scale though much more compliance-focused work has been progressed in VET, for instance, via the development of training packages in Australia (e.g., Department of Education and Training 2017). Such collaborations travel several steps further than qualification frameworks by engaging and building capacity within disciplinary contexts. Like the qualification frameworks, however, the work usually stops short of advancing assessment resources or sharing data and tends to focus instead on advancing case studies or best practice guidelines.

A slightly deeper line of development involves shared rubrics that compare assessment tasks or student performance. Moderation in assessment can play out in many ways (Coates 2010) as indeed has been the case in recent vocational education initiatives. The moderation of resources has involved rudimentary forms of peer review through to slightly more extensive forms of exchange. Mechanisms have also been developed to help moderate student performance. In higher education, the United States, for instance, the Association of American Colleges and Universities (AAC&U) (Rhodes and Finley 2013) has developed VALUE rubrics for helping faculty assess various general skills. This has been progressed in most recent cross-institutional moderation work (AAC&U/State Higher Education Executive Officers (SHEEO) 2015). Several such schemes have been launched in Australia, including a Quality Verification System and a Learning and Teaching

Standards Project, both of which involve peer review and moderation across disciplines (Marshall et al. 2013). This work travels more widely than qualification- or discipline-level specifications, for it involves the collation and sharing of evidence on student performance, often in ways that engage teachers in useful assurance and development activities. Such moderation work is limited, however, in being applied in isolation from other assessment activities and materials.

Collaborative assessments build from the developments discussed so far to advance more coherent and expansive approaches to shared assessment. As with other developments addressed here, such work plays out in myriad ways. For instance, progress testing in the Netherlands (Schuwirth and van der Vleuten 2012) involves the formation of shared assessment materials and administration of these in a longitudinal sense. Other assessment collaborations have focused on the development of shared tasks and analytical or reporting activities – for instance, the Australian Medical Assessment Collaboration (AMAC) (Edwards et al. 2012) and the German initiative with the umbrella title Modeling and Measuring Competencies in Vocational education Modeling and Measuring Competencies in Higher education (KoKoHs) (Zlatkin-Troitschanskaia et al. 2014). In 2015, the Higher Education Funding Council for England (HEFCE) funded a suite of mostly collaborative projects to assess learning gains in higher education (HEFCE 2015), and the European Commission funded a large-scale collaboration titled Measuring and Comparing Achievements of Learning Outcomes in Higher Education in Europe (EC 2015). Such work is impressive as it tends to involve the most extensive forms of outcome specification, task production, assessment administration, analysis, and reporting and at the same time develop faculty capacity. Work plays out in different ways, however, shaped by pertinent industry, professional, and educational factors. This can mean, for instance, that extensive work is done that leads to little if any benchmarking or transparent disclosure.

Standardized assessment is easily the most extensive form of development and would appear to be growing in scope and scale. Licensing examinations are the most long-standing and pervasive forms of assessment, though their use is cultural and they tend to be far more common in the United States than Europe, for example. Other related kinds of national effort are evident in certain countries – for instance, in Brazil (Melguizo 2015), Colombia (Shavelson et al. 2016), and the United States (Shavelson 2007; Educational Testing Service (ETS) 2014). A series of international graduate outcomes tests have also been trailed in recent years, such as the OECD’s Assessment of Vocational education Learning Outcomes (AHELO) (Coates and Richardson 2012), the International Association for the Evaluation of Educational Achievement Teacher Education and Development Study (IEA TEDS) assessment of teachers (Braeken and Blömeke 2016), the HEIghten assessment (Liu et al. 2016), and a cross-national assessment of engineering competence (Loyalka 2015). The OECD’s Survey of Adult Skills (PIAAC) is the largest international initiative most relevant to VET (OECD 2017). Standardized assessments are also promulgated via commercial textbooks (Pearson 2014). As implied by the term “standardized” and by the external sponsorship of such work, such assessment often proceeds without engaging with teachers. Though such exogenous intervention may in the longer run inject the shock required for assessment

reform, it also tends to balkanize internal from external interests and has not yet been shown to have large impact on learning or teaching practice.

Of course, a variety of these practices are used by vocational education providers around the world, but it must be said, in varying and inconsistent ways. Traditional assessment practices are rife. Such practices are baked into education policy and procedures and more particularly into well-established workforces. More recently established institutions have the opportunity to leapfrog and setup more modern approaches to education design which better express contemporary assessment ideas and practices. It is surprising that VET providers are not playing a greater leading role in assessment reform given their involvement in such work over centuries. A review of the initiatives discussed above shows that most institutions are participating at the margins or in spasmodic ways, with many yet to embrace comprehensive assessment reform.

---

## **A Framework for Growth**

A two-dimensional framework is proposed as a mechanism for advancing principles for advancing the field of VET learning outcomes assessment. These dimensions are described, and the framework's value is teased out via a number of illustrative change areas. One dimension of this framework divides change into those aspects which are substantive in nature, which are technical in nature, and which are practical in nature. The other dimension is hierarchical and partitions consideration instead by the level or zone at which change might occur.

Substantive – policy, disciplinary, and conceptual – considerations are the most significant forces shaping learning outcomes assessment. Assessment is of little use unless it is relevant to students, to policymakers, to institutional leaders and managers, to teachers, or to the general public. Establishing such relevance is tricky, as it involves not just identifying but also then defining what counts, and of course stakeholder interests play a role in this. Power plays a key role, manifest through the formal or informal authority of individuals or institutions. The oligopolistic character of many established education systems has limited the extent to which change has been driven by research and technological development, though appetite for research-driven change appears to be increasing with the increasingly competitive nature of education markets.

It is imperative that assessment is cogent technically. This means that assessment resources and approaches should aim to be valid and measure and report what is intended. Assessment should be reliable, which means that assessment should provide consistent measurement of the target focus area. There are a host of methods for assessing and reporting these kinds of technical properties, which of course are the focus of active scientific debates. At a minimum, it might be expected that explicit consideration has been given to measurement considerations, but ideally a set of statistics should be provided as with professionally validated assessment instruments.

Substantive relevance and technical integrity are not sufficient to spur change in assessment. Practice is critical in that it must be feasible to collect, analyze, and report data. Though institutional budgets are getting tighter, many entrenched assessment methods have high fixed costs and limited economies of scale. It is vital that more viable options are explored. Really important changes in assessment might be costly or slow to deliver. They may waste students' time and hinder learning experiences and outcomes. Indeed, such practical constraints are often claimed as impediments to progress. Technology carries the potential to make a huge difference, as is evolving thinking about the nature of the evidence, hence processes required to assure student achievement.

The second dimension of the framework distinguishes the level at which change in assessment might unfold. The Organisation for Economic Co-operation and Development (OECD) (2015: 15) notes of this dimension that it “distinguishes between the actors in education systems: individual learners and teachers, instructional settings and learning environments, educational service providers, and the education system as a whole.” The level at which information is reported is not the same as the level at which information is collected. Data is often collected at a lower level then aggregated and often also combined with other data for reporting. Similarly, the interpretation level might be different again and will likely vary with the interests and concerns of stakeholders. For current purposes, it is proposed that assessment change is required for those involved in VET such as students and teachers and that change is required by broader communities, including the general public, business and industry, and people associated with planning education policy and strategy.

A series of ideas can be evoked from this two-dimensional framework. Substantively, it is important for assessment to be relevant or authentic to students and teachers. This often means that a diversity of assessment practice is required. At the same time, stakeholders more removed from everyday practice seek evidence which is more general in nature. Hence a substantive principle which might be derived is that future reform should ensure that assessment is locally relevant and externally generalizable. A technical principle is that reform should advance transparency regarding the validity and reliability of assessment. The most well-designed and validated assessments are meaningless unless they are feasible to implement. Hence a further principle for reform is that assessment must make efficient use of money and time. In terms of practice, emphasis might be placed on delivering feasible and efficient assessment to large student cohorts given tight resource constraints, whereas those more removed from the process may give more regard to the technical veracity of the evidence produced. Stereotypical remarks made by employer groups can suggest a lack of confidence in the everyday assessment by institutions of students' knowledge and skills.

Such principles could be nuanced differently or elaborated more exhaustively, but the above formulations are sufficient to tease out the main points at play. None of the three principles are particularly surprising or controversial, though they can provoke substantial complexity and be difficult to implement. Part of the trouble arises from the conundrums provoked by attempts to harmonize or jointly optimize the principles considered in unison. Further trouble flows from negotiating the dialectic

between internal and external interests. Broader considerations flow from complexities associated with generalizing the assessment of complex higher-order skills across national and cultural contexts. Resolving these issues offers a chance to unlock substantial progress in the assessment of learning outcomes. Hence the principles provide a useful normative rubric against which to evaluate current progress and change dynamics and to forecast insights and frontiers for reform.

---

## Facilitators and Blockers

Clearly, there are myriad reasons why assessment has not experienced its game-changing modernization moment. While such reasons are invariably entwined in specific contexts and initiatives, common themes can be isolated from review of several projects. These contextual challenges are considered with respect to the factors required to facilitate change. As with the preceding analysis, there is no claim that the list is exhaustive or the analysis universal. Thinking and practice in certain fields and institutions is more advanced than in others.

Obviously, people with vested interests in entrenched approaches are often significant obstacles to change. Today's vocational education leaders and teachers have often made significant institutional and individual investments in conventional assessment resources and practices. At the same time, these are the very professionals who are bearing the brunt of quality and productivity pressures. Reshaping their perspective on assessment would open myriad fresh opportunities. This is a challenging point to make, yet remains a task that cannot be ignored.

Likewise, it is likely the assessment of student learning doesn't change given its low priority to institutions. From many perspectives the current system seems "good enough," and besides pressure from accreditation or employers, there can appear to be little impetus to change. As these remarks portend, sparking change on this front likely requires an external commercial or regulatory intervention.

Relevant professional capability and capacity is required to change assessment practice, which in the field of vocational education is in short supply. Vocational education itself lacks dedicated assessment professionals, and there appear to be too few assessment specialists with relevant industry experience (Richardson and Coates 2014). The lack of a professional assessment community is an obvious impediment to change. Building a new profession of assessment experts or a community of faculty with interest in assessment requires investment by VET institutions and stakeholders, yet can ultimately be addressed through training and development.

VET teachers require professional training and development to improve competence in assessment, yet such training has really only evolved over the last few decades and as noted above is spasmodic. It would be helpful to cite figures on the incidence of such training among teachers, and while it affirms the point, it is regrettable that such figures do not exist. Most teachers learn their trade via what could be characterized as an informal apprenticeship, and while competence in assessment is no exception, this does not discount the need for creating more systematic forms of professional development. Improving assessment capability among teachers will do much to encourage diversification and excellence.

Often the most profound shocks are exogenous to any system. The rise of online technology and policies impelling increasing marketization of vocational education are two examples. By definition such shocks are highly significant to advancing education yet are profoundly difficult to forecast or induce. Ultimately, as in many industries, new technologies and business processes are required to adapt.

Inherent security and confidentiality constraints play an obvious role in constraining assessment reform. The greater the stakes, the greater the security and confidentiality implications. In a host of ways, such constraints hinder collaboration and drive-up costs yet contribute to the value and impact of assessment. Engineering new technologies and assessment processes seems to be the most effective means of addressing such constraints.

As assessment like other facets of VET becomes increasingly commercial in nature, various business considerations grow as greater obstacles to change. Non-trivial intellectual property considerations may be pertinent, for instance, by hindering the sharing and replication of materials. Working through such obstacles can be expensive and complex, yet in many instances is ultimately resolvable with appropriate negotiations and agreement.

Traditional VET structures can hamper progress, creating confusion about who should own change. Individual teachers focus on assessing particular subjects, departments focus on majors, and students and institutions on qualifications. Fragmentation of curriculum and cohorts can further hinder the formation of coherent assessment schemes. This can create an ownership or agency problem, rendering change problematic. Changing this dynamic typically involves developing and managing more collaborative training practices.

Teachers' belief in the success of current practice is likely to be a major change barrier. Indeed, current practice may well work locally yet be unsustainable in broader or different contexts. An assessment task may be perfectly aligned with a teacher's curriculum and teaching, for instance, yet fail to contribute to the qualification-level information required for external professional accreditation. Institutions have varying ways for leading change in education practice, which ultimately must resonate with prevailing policies and norms.

In reviewing challenges in changing VET assessment practice, it appears that change, in broad summary, hinges on further professional development, changed institutional management, ongoing technology and business process development, and external commercial or policy intervention. None of these facilitators are easy to plan or enact. Given the complexity and difficulty of the task to hand, there seems value in pushing on all fronts in synchrony, noting that even by passing through various tipping points, reform is likely to be haphazard and take time.

---

## **Glimpsing Future Assessment**

What do these change facilitators, the normative framework, and the earlier insights regarding signature initiatives convey in terms of prospects for development? This section deploys the framework to take brief stock of the emerging field before turning to focus on potential steps ahead. A picture is painted of prospects for future

development, building on earlier analyses of Coates (2014) and researchers from many different systems.

What evidence is there that the current initiatives are helping ensure that assessment is locally relevant and externally generalizable? Large-scale qualification frameworks do very little to achieve this, but the more practice-focused initiatives do appear to be driving progress in this direction. Programs that invite teachers to focus on organizing their practice around more generalizable principles – such as the tuning process and the VALUE rubrics – provide signposts for change. Simultaneously, the externally driven initiatives are themselves benefitting from technological advances in assessment (Bennett 2015) which give new insights into what assessment can look like and deliver. There would appear to be some way to go, however, in transcending the internal/external dialectic that appears to simultaneously spur and hinder progress. Also, there is much work to be done to bridge the reducing but still large gap between large-scale policy and technical development and everyday practice.

On the technical front, is progress regarding outcomes assessment advancing transparency regarding the validity and reliability of assessment? Several diversified and large-scale initiatives reveal the extent of work required to validate VET assessment. But with workforce capacity bottlenecking progress even with funded large-scale initiatives, it is unlikely that institutions will be positioned anytime soon to validate student assessment in ways that meet address psychometric standards and criteria. There is a high risk that students are assessed using insufficiently validated tasks which yield spurious information about performance and potential (Coates 2015). Inadequate information of this kind carries risk for graduates and also for institutions and countries. The need for development in this front is important.

Are contemporary advances helping to enhance the efficiency of assessment? Given that most large-scale initiatives tend to be relatively expensive (for instance, crude estimates of around \$10,000 per finished professionally produced multiple-choice item are not uncommon), such work is itself unlikely to be offering any intrinsic signals for how to make assessment more efficient. Through innovation, however, large-scale initiatives do carry potential to initiate new technologies and approaches and to model how new efficiencies may be achieved. The risk, of course, is that change is shaped more by factors which are exogenous to assessment. That is, given ambiguous budget constraints and unclear technical and substantive expectations, explicitly identifiable assessment costs become a real target for savings, particularly compared with more visible staffing resources and facilities. The consequence of such disinvestment is obvious – cheaper and lower-quality forms of assessment will be used that are less authentic and robust. Understanding the trade-offs linked with differential levels of direct and indirect resourcing are important, which hinges on the kind of productivity evaluations exemplified via the National Center for Academic Transformation (NCAT) Course Redesign initiatives (Twigg 2003). Broadly, it could be expected that in any decomposition of assessment costs, it is development and implementation as opposed to the planning, analysis, and reporting phases in which new techniques carry potential to spur new economies of scale.

What does this albeit brief stocktake imply about the most fruitful areas to target reform? Where should further energy be directed to optimize substantive, technical,

and practical matters and do as much as possible to address tensions associated with the internal/external dialectic? How can such energy most effectively navigate the change dynamics noted above? From the above analyses, recommendations can be made for focusing future development.

Seamless assessment tasks and processes must be prepared which can jointly serve the needs of internal and external stakeholders. This might involve production of resources which can be shared across boundaries perhaps via adaptation to different disciplinary or professional or cultural contexts, or it might involve embedding more generic materials within local assessments. Several of the initiatives reviewed above have progressed such options. They have identified ways for harmonizing the production and delivery of materials drawn from different sources, for integrating processes, and for using more professionally developed materials to seed change in local practice.

Further work should be invested in techniques that engineer validity into assessment development. Rather than defer to post hoc evaluation by assessment experts, the quality of assessment is most likely to be improved by intervening earlier in the development cycle to ensure materials exceed minimally sufficient technical standards in the first place. A specific example includes larger use of principled assessment design frameworks that help scale up assessment, so that assessment creation can be better aligned with standards, connected with learning sciences, more efficiently implemented for scaling up technologically, and with conceptual frameworks suited to tailoring to local needs within a broader framework (see: Mislevy et al. 2011; Luecht 2013). Any such development hinges obviously on a set of accepted standards and on an effective means for bringing such standards into play. Internationally standards do exist (e.g., American Educational Research Association (AERA), American Psychological Association (APA) and National Council for Measurement in Education (NCME) 2014; International Testing Commission (ITC) 2015), and VET institutions have a range of means for governing the incorporation of these into teaching practice. While mention of the word “standards” can provoke debates about standardization and regression to the mean (Coates 2010), there would appear to be value in progressing such work if it places a transparent floor around the quality of assessment.

Technology-assisted collaboration and delivery has an important role to play in improving practice. As Bennett (2015) conveys, by affording rethinking of task design and delivery, it also provides a frame for advancing the substantive and technical frontiers. Technology-assisted collaboration is important as this is a major means for making assessment more transparent and enhancing quality and productivity. Peer and stakeholder review of tasks helps to iron out glitches and improve authenticity. Professional capacity is developed through feedback. Technical standards could be embedded in design architectures. Sharing design and development also reduces redundancy and duplication and expensive fixed costs associated with resource production (Coates 2015). Also, with appropriate security solutions now available (Richardson and Coates 2014), it is feasible to shift from paper to online administration and reap derivative efficiencies in time and money. Of course, many platforms exist and are available from institutional or commercial

sources (e.g., Dillon et al. 2002; National Board of Medical Education (NBME) 2008; Cisco Networking Academy 2012). The key is to marry these with enterprise-level learning systems which have scaled to ubiquity over the last decade. Put simply, such technologies should distil insights from measurement science into systems that make good assessment easy for time-poor and non-expert teachers.

There is much to be considered regarding the propagation of powerful technologies into VET. As cautioned in 2005 in relation to the rapid expansion of enterprise-level learning management systems (Coates et al. 2005), such change should not be led by technozealots who see information systems as a panacea but rather by educational leaders who can shrewdly leverage technology for change. Among other matters, it is imperative to consider the influence of systems on teaching and learning, the uncertain effects on students' engagement, new dynamics in teaching, and the possible corporatization of knowledge. As Bennett (2015) contends, most value is to be had by exploiting the sophistication of "third generation" technology-based assessment. This involves not just transferring traditional paper-based batch processes to computer (first generation) or incremental improvement in quality and efficiency (second generation) but fundamental redesign which ensures that assessment serves both individual and institutional needs, is informed by cognitive principles, is a medium for enabling natural interaction with rich assessment tasks, and is technically enabled to support and enhance curriculum and teaching.

---

## Governance to Spur Progress<sup>2</sup>

The preceding sections set out a normative framework and used this to frame past and chart future assessment initiatives. What are the most effective ways of translating this work into practice? This chapter's final section articulates governance options for spurring the kind of progress required to propel the field. In particular, it advocates for more open forms of assessment, even in the most confidential and secure fields of assessment.

Analyzing how best to translate research into practice can be done in a variety of ways, and the most significant considerations go to governance. New ways of designing and managing VET, including assessment, will almost certainly require new forms of governing education activity, power, and performance (Shattock 2012). While assessment is experienced mostly as a practical matter, it touches many facets of VET leadership and management. Indeed, assessment goes right to the heart of important aspects of governance such as ownership, authority, and power. The risks of poorly designed or conducted governance, and the need to get governance right, show up in sectoral or organizational failures. The governance of assessment is both critical and problematic.

---

<sup>2</sup>The following text builds on: Canny and Coates (2014).

VET providers assess learning in myriad ways. Obviously, quite a lot of assessment is done by individual teachers working alone within single institutions. Alternatively, assessment can be done by groups of teachers within a single institution. In each of these cases, accreditation by a government or industry authority vests power in a provider's leaders, which devolves power to individual teachers. The situation in practice is far more complex than suggested by this straightforward chain of command, with teachers drawing on all kinds of more or less indirect and informal networks. In key respects, the quality and economics of this educational fabric is hard to beat, but at the same time its informal and elite nature falls short. Typically, there is loose institutional oversight, teachers flying solo, and deployment of non-validated materials using dated practical and technical approaches.

Alternatively, assessment can be enacted and governed by groups of teachers across institutions, almost invariably but not necessarily within the same discipline or field. Teachers collaborate in this way routinely in their own work – forming collaborations and networks to design, execute, and produce work. It is reasonably common for teachers across institutions to share teaching, perhaps to service particular knowledge needs, or to diversify teacher perspectives and student experiences. It remains far less common, however, for such collaborations to spill over into assessment. A few reasons for this have been sketched above – such as security, confidentiality, and privacy – and there are doubtless others that go to individual and institutional commercial and reputational factors. Operating between institutions also carries governance implications, inasmuch as the collaboration space lies strictly beyond the jurisdiction of any single institution's reach. These implications are addressed below via the proposed governance model.

Assessment may also be governed from outside institutions. This work may involve teachers working with third-party organizations or third-party organizations working alone. This work may take place at VET institutions, or it may be outsourced to collaborative education or other industry/government bodies empowered to perform specific functions for community benefit like licensing and credentialing. Such external governance is reasonably common with admissions or licensing examinations, but quite rare for in-course assessment even in highly regulated fields. The delegation of assessment in this way raises broader governance considerations about the cost and generalizability of the licensing organization and materials.

Figure 1 captures this spectrum of governance arrangements sketched above. These range from individual teachers working alone to teachers collaborating among themselves and with other agencies and to fully external arrangements. As with all models, this is an abstraction, but it is helpful in clarifying the main options at play.

These simplistic arrangements of course play out in an infinitely complex array of ways. Today's VET institutions are reforming in many areas, adopting a variety of approaches, and spawning a proliferation of organizational forms of work (Coates

**Fig. 1** Spectrum of assessment governance arrangements

2017). What seems sure in all of this complexity is that the business/educational model of (in general terms) “teachers working alone in isolation” is moving more toward “teachers playing a role in a broader team.” Where new forms of educational infrastructure are emerging, these are typically affiliated or owned by existing institutions. In essence, renovating/improving rather than replacing existing teaching arrangements seems to be the most common change underway. Shifting to more collaborative forms of assessment governance would do well to reflect such transition.

---

## Conclusion

The “sharing economy” is reshaping many facets of economic and social life, and VET is no exception. Rather than goods and services being created and used by individuals in isolation, teachers and learners are collaborating via advanced online systems to generate new ways of doing education. Teachers and institutions are collaborating on curriculum production, learners are collaborating on assignments, and open admissions, provision, and credit recognition are touching basic notions of the qualification. As signaled at the outset, the assessment component of education has been one of the most resistant areas to adapt to the changing environment. In many areas, assessment is closely tied via content and implementation to local educational settings. It has obvious security, confidentiality, and privacy aspects. As the tool for evaluating individual performance, it also helps measure the quality of programs and institutions, and through this carries reputational and commercial implications.

By taking stock of recent signature developments and painting a picture of future practice, this chapter has advanced a framework for thinking through the growth of the field and productive new approaches to assessing VET student learning outcomes. Technology almost certainly will play a role in changing practice, but it is essential that effective governance architectures are in place. This chapter has advocated reform by strengthening and augmenting rather than replacing traditional arrangements. Most particularly, the chapter has advocated for the value of moving to more collaborative kinds of governance. Even – and perhaps especially – the most high-stakes assessment needs to become more open to improvement.

## Abstract

Modelling and job-related assessment of vocational competences has been traditionally a major aspect for vocational education and training (VET) in order to adequately define and train necessary competences in the context of a dynamic, ever-changing occupational world, as the “ASCOT” research initiative has demonstrated. Similarly, one of the main objectives of higher education (HE) consists in preparing students for the demands of the labor market. This implies that not only discipline-specific competences and expert knowledge need to be acquired during studies but also more generic competences like communication skills. In order to be able to assess such generic learning outcomes of HE, performance-based test instruments are required.

Within this chapter, a conceptual framework as well as the method of such a performance-based test of students' communication skills will be presented. In vivo role plays are used in order to assess the relevant communication skills, respectively. Using Habermas' (1981) theory of communicative action, the conceptual elements corresponding with the two distinct types of communicative action, which are strategic and understanding-oriented communication, have been extracted. Furthermore, empirical results concerning the relation between discipline-specific competences of economics and observed performance of communication skills will be reported. The data were collected from a sample of nearly 500 students from ten different HE institutions within Germany.

The discussion will firstly address the application for assessment practice in HE as well as the potential limitations of the test; and secondly possible synergy effects between HE and VET assessment practices will be reflected.

## Introduction

In the last decades, a paradigm shift from educational attainment toward educational achievement and competence development has taken place in empirical educational research including all stages of education (Prenzel et al. 2007). This increasing interest in modelling and measuring competences has gone along with (re)defining (existing) competence concepts and developing innovative and theory-based test instruments. Especially in the fields of vocational education and training (VET) and higher education (HE), these new formats of assessment are more and more closely linked with future labor market requirements since coping with a rapidly changing, dynamic occupational world is a major challenge in the twenty-first century – as captured under the keyword “lifelong learning” within the “Lisbon Strategy” of the European Union (2000). These so-called performance-based tests which go beyond measuring “pure” cognitive skills are used for job-related training and the assessment of vocational competences containing more generic competences like communication skills. Their potential can be seen in the fact that these test formats are explicitly designed by including the later occupational context into the test setting itself. To handle these complex situations, not only specific (vocational) knowledge is needed but also the ability of interpretation, decision-making, and acting under certain circumstances.

To support research in such innovative competence assessment, the German Federal Ministry of Education and Research launched two big parallel research initiatives in these two educational fields: “technology-based assessment of skills and competences in VET (ASCOT)” (2011–2014) (e.g., Winther et al. 2016) and “modeling and measuring competences in HE (KoKoHs)” (2011–2019) (e.g., Zlatkin-Troitschanskaia and Pant 2016). Whereas the former focuses on general

vocational as well as specific skills in the commercial, health, and technical sector, the latter emphasizes generic academic skills as well as expert knowledge and discipline-specific competences in different fields of study like teaching profession or economics. Besides the development and empirical testing of new measurement instruments within the various domains, one major challenge can be highlighted in the systematic comparison between research activities in similar fields over both educational stages.

Hence, the aim of this chapter is twofold: On the one hand, the conceptual framework as well as the method and selected empirical results of such a performance-based test of students' communication skills is presented. On the other hand, the importance of transfer and exchange between HE and VET on a more general level is emphasized. Using the example of skills and competences acquired in economics in HE, the introduced test is intended to stay close to the equivalent in VET, the commercial sector. Hence, we sketch the idea of how progress and development in competence assessment in one educational field can be fruitfully adapted into the other.

Firstly, performance-based testing is introduced, and it is argued for using new formats of assessments with a special focus on recent changes in HE. Secondly, a theory-driven instrument for the performance-based test of communication skills will be presented. Furthermore, empirical results concerning the relation between discipline-specific competences and observed performance of communication skills will be reported. An overall concluding discussion will address two issues: (a) the application and relevance for assessment practice in HE as well as the potential limitations of the test and (b) possible synergy effects between HE and VET assessment practices.

---

## Reforms in HE and Performance-Based Tests

The changing demand of skills in the labor market strongly affects the role of HE institutions in fostering employability and in creating innovative knowledge-based societies (European Commission 2011). The Bologna Declaration (1999) with its focus on improving compatibility and comparability of HE qualifications and increasing global competitiveness of European HE, together with the "Lisbon Strategy" (European Union 2000) emphasizing a more powerful knowledge-based economy for growth and jobs, provided the needed impetus for HE reforms and increased the pace of transformation (Enders et al. 2011). The implications of these reforms can be observed at many levels. Students are no longer expected to master and acquire only discipline-specific knowledge and competences but also a broad set of generic competences that can be transferred to many different contexts; and the assessment of these competences calls for novel and innovative evaluation techniques by now (Westerheijden et al. 2007).

Even though there has been an increasing effort in analyzing HE competences and learning outcomes, this topic continues to be underrepresented in HE research overall (Zlatkin-Troitschanskaia et al. 2015), especially in comparison to VET where modelling and job-related assessment of vocational competences has been

traditionally a major aspect (Winther 2010). Since a huge educational expansion in HE has taken place (OECD 2017), the self-concept of HE institutions is in the process of changing into the direction of preparing and training students for the labor market (Wissenschaftsrat 2015). Although training and assessing competences in HE can be quite challenging and complex because of the underlying differences in the HE institutions, a wide range of courses and programs offered as well as the challenges associated with defining and measuring acquired competences (Blömeke et al. 2013).

Against the background of these reforms and changes in HE, the understanding of competences should be broadened, according to VET. Based on the concept of modelling competences rather as a continuum between cognitive- and affective-motivational “disposition” and real-life “performance” than a pure dichotomy (Blömeke et al. 2015), competence is not only focused on its discipline-specific aspects (e.g., factual knowledge) but also to those competences that enable HE graduates to successfully handle and manage new and complex situations. This implies that not only cognitive competences need to be acquired during studies but also such more generic competences that correspond to the successful coupling of individuals and specific situations and thus to students’ individual ability to actively adapt and perform well in their respective future jobs. Accordingly, Masten and Coatsworth (1998, p. 206, accentuation by authors) define competences as:

a pattern of *effective adaptation* to the environment . . . broadly defined in terms of reasonable success with major developmental tasks expected for a person of a given age and gender in the context of his or her culture, society, and time [. . .].

It is important to note here that this definition emphasizes good adaptation to different types of situations and not simply outstanding achievement. This implies that not only cognitive competences are needed but also the ability to adapt and perform well in a variety of situations. Consequently, it seems obvious that the goal of HE is not only to impart discipline-specific expert knowledge – in other words, to promote graduates’ cognitive competences – but also to foster these skills that enable graduates to become effective citizens who can contribute equally toward their personal, professional, and social lives (Chan et al. 2014).

---

## **Development of a Performance-Based Test Instrument to Assess Communication Skills**

The aim of the presented research project has been the development of a theoretically founded psychometrically sound test setting that can be efficiently employed in the HE context for the purpose of assessing students’ communication skills (Braun et al. 2018). Communication is a central and generic skill to handle complex situations. Furthermore, communicative skills are explicitly referred to as an important learning outcome of HE in national (Kultusministerkonferenz 2017) as well as in international qualification frameworks (OECD 2013). For example, communication skills

are mentioned as key learning outcomes in Dublin Descriptors (2004) and qualification frameworks for lifelong learning (AK DQR 2011). Recently, the German Rectors' Conference has emphasized communication and cooperation to be essential for German HE certificates (HRK 2017). Hence, communicative skills as a core and generic competence for HE graduates were selected to be focused on.

For the theoretical foundation, it is referred to Habermas' theory of communicative action (1981) in order to sketch distinct types of verbal interaction on the basis of the implied purpose of the interaction itself (Braun et al. 2018). In his comprehensive work, Habermas differentiates between two types of communicative action, namely, *strategic action* and *understanding-oriented action*. Strategic action is intentionally used to influence others in order to pursue specific, mostly hidden, goals. In contrast, understanding-oriented action is consent-driven and principally used in situations in which actors are oriented toward reaching a common agreement and seek to coordinate social actions by reasoned argumentation and cooperation. From a philosophy of science perspective, these two types function as theoretical ideals without the intention to evaluate one communication form as "better or worse" in a normative sense. Moreover, this differentiation helps to theoretically capture concrete definitions in the qualification frameworks. For economics, which are used as an empirical example throughout this contribution, communicative competence is described as "bargaining and negotiating" and in order to "to convince others" (Gehmlich 2007). This conceptual framework will be used to operationalize verbal interaction for the sake of its assessment. It clearly differentiates between two distinct "options" in professional conversation and thus accommodates a transition toward a workable definition of communication types and their specific characteristics.

In order to be able to assess and prove such competences as learning outcomes of HE, performance-based instruments and test settings are needed. It is argued that widespread forms to measure these kinds of competences, like self-reports in questionnaires, are fairly limited in assessing students' performance in real settings (Braun and Mishra 2016). In view of these limitations, role plays seem to be an appropriate method for capturing performance, especially when it comes to verbal interactions. They put students into specific scenarios where they have to take on different roles and responsibilities. This allows for observing students' abilities handling complex demands and applying skills and expert knowledge to solve problems in a direct interaction between two individuals. In the methodological literature, this method is described as follows (Beard et al. 1995, p. 133, accentuation by authors):

In a role-play exercise, participants are given a description of a scenario and their role in that scenario. They are then asked to *assume they are in that situation* and to respond to both the situation itself and to the actions of other role-players.

As "a set of behaviours which is considered appropriate to a particular role" (Van Ments 1999, p. 8) is activated, using role plays as an assessment method has the advantage of explicitly initiate performance within defined situations. Accordingly, using role plays is an adequate and socially accepted method to assess competences in the way it has been defined above.

**Table 1** Overview of role plays representing specific occupational situations

Type of communicative action	Role play number	Role play title
<b>Strategic communicative action</b>	1	Participation in professional development training
	2	Counselling with a personal aim
	3	Indirect criticism toward a colleague
	4	Coming too late to office (regular team meetings)
	5	Reduction of weekly working hours
<b>Understanding-oriented communicative action</b>	6	Explain poor performance and subsequent consequences
	7	Explaining a moderator's role
	8	Open occupational counselling
	9	Discussion of scheduled evaluation criteria
	10	Outlining questions/points of interest for a semi-structured interview

Combining the theoretical considerations with the direct assessment method of *in vivo* role plays, a series of different scenarios for the business company context was constructed. Situations displayed in these scenarios were based on qualitative data derived from a nationwide, representative survey of 10,000 HE graduates within Germany from various disciplines (Braun and Brachem 2017). They were asked to report typical interaction situations in their daily professional life. As a result, ten role play situations were constructed in total: five in which goal achievement is associated with strategic action and five in which goals are achievable through understanding-oriented action (Table 1). To ensure that these scenarios reflect the specific discipline-related context of work for the specific target group, an expert workshop was held.

Each of the instruction in the role plays corresponds with a standardized observation form. This instrument consists of various items which are derived from the theoretical framework described above. The procedure for the assessment of communicative performance works as follows: Each participant individually takes part in four out of ten randomly selected role plays where two are strategic and two are understanding-oriented. Instructions with contextualizing information and the goals to be achieved during the conversation are handed to participants immediately, prior to the conduct of the respective role play. During the test, three persons are present in the room: the test person itself, one trained interaction partner, and a trained observer in the silent present using the observation form and evaluating the test person's performance in the simulated communicative situation. Per design, the role plays, their ordering, and the interaction partners and observers are randomly assigned. After the role play session, an additional instrument is employed for a subsample of the participants: a discipline-specific test for general knowledge in economics as it was conducted in the German National Educational Panel Study (NEPS) (Lauterbach 2015). Students got a calculator to work on the cognitive test of expert knowledge.

The described performance-based test instrument was implemented in ten randomly selected universities and universities of applied sciences as you can study economics in both types of HE institutions in Germany. In total, 234 students participated in the role plays for economics.

Additionally, empirical results concerning the relation between discipline-specific competences and observed performance of communication skills are reported. As mentioned above, a central goal of tertiary education is to prepare and train students for the labor market. Therefore, graduates are supposed to gain discipline-specific, expert knowledge as well as competences that enable to handle and manage new and complex situations successfully. Consequently, the question about their relation arises: “How do communication skills and discipline-specific competences correlate with each other?” Therefore, the performance-based test for communication skills and the discipline-specific test for general knowledge in economics were simultaneously analyzed. The first one consists of two dimensions: the first scale refers to strategic communicative action and the second scale to the understanding-oriented communicative action. More details and the psychometrics of the developed performance-based test can be read in Braun et al. (in revision). The Pearson correlation was conducted via Software Stata using expected a posteriori values (Embretson and Reise 2013).

The correlation between strategic communication and general knowledge in economics is  $r = 0.32$ , and between understanding-oriented communication and general knowledge in economics, it is  $r = 0.31$ , respectively.

There are positive associations between the types of communication on the one hand and general knowledge in economics on the other hand. But both types of competences – those ones that are more related to performance aspects and those ones that are more related to cognitive aspects – covary only moderately and, thus, indicate mostly independent dimensions. Taking the traditional identity of HE institutions into account, mainly focusing on cognitive and discipline-specific competences, the meaning of reinforcing competences that enable to handle and manage new and complex situations successfully is revealed. As this is just one example from one field of study, it seems promising to systematically explore these relationships for a variety of subjects.

---

## Discussion and Future Prospects

In this contribution the idea and concept of a performance-based test instrument to assess students’ communication skills is presented, since acquiring these generic competences is regarded as a major goal of HE. Such a test goes beyond “pure” cognitive ability, captured by written tests, and also beyond self-reports of generic competences, a common way to collect this information in huge questionnaire studies. The presented empirical results show moderate associations between communicative performance in simulated vocational situations and knowledge in the field of economics. Thus it appears that there is a noteworthy independence of these two kinds of competences. Therefore, performance-based tests enable the inclusion

of the labor market perspective in terms of prospective professional requirements into HE. In contrast, the assessment and implementation of more generic aspects of competence, such as performance in complex situations, are more advanced in VET compared to HE (Baethge and Winther 2015).

The general idea of combining role plays with a corresponding observation form to assess communication skills in a standardized way can be easily transferred to other study programs in HE. Within the development of the performance-based test, the scenarios have been also parallelized for teaching professions. Thus, the 10 role plays were tailored in order to match the specific conditions of the respective fields in a credible manner resulting in an overall number of 20 role play scenarios: 10 role play scenarios set in the broad occupational field of economics (mostly including communication in the corporate organization setting) and 10 role play scenarios set in the occupational field of teaching (mostly communication situations in the school education setting). With the intention to be close and comparable to consumer services in VET, empirical findings for economics are presented here.

Even though the developed instrument is not yet implemented as an examination format in practice, there is high potential to do so. In the case of HE, the setting of the test strongly equals oral examination practices for field-specific knowledge as they are done in a wide range of fields of study: one person is tested by an examiner, and a second person is documenting the given answers without actively being involved in the conversation. So, human and time resources for the performance-based assessment are comparable to common practice in HE. Furthermore, with respect to promoting and training communication skills, the instrument can be used to systematically acquire these forms of general skills in HE. In the case of VET, such assessment practices can be relatively easily adopted especially in closely related fields like consumer services.

Nevertheless, there are some limitations of the described test setting. With respect to resources, it has to be mentioned that these forms of testing are relatively time-demanding as four different role plays last approximately one hour. Additionally, it is absolutely necessary to train the interaction partners as well as the “silent” observers beforehand. The latter must be absolutely familiar with the items and theoretical framework of the test instrument as well as with the rating scale to evaluate the shown performance adequately.

Finally, a first attempt was made to connect the two research initiatives “ASCOT” and “KoKoHs.” Besides the fact that these two are located in different fields in the German educational system, both face similar societal challenges in the future and use comparable concepts of competences and empirical methods. The discussed potential of transfer and adaption between both fields has been illustrated for the business and commercial sector. But, as there are many other projects in both research initiatives in similar fields, this is just the beginning. For example, research activities and findings in the health sector – for medical assistants and nurses in VET (e.g., Dietzen et al. 2012) and for medicine in HE (e.g., Harendza et al. 2016) – can be systematically compared with respect to competence definition, test design, and empirical findings. Even though focusing on different hierarchical levels going along with different tasks and responsibilities in the health sector, both groups have to interact and communicate with patients, so simulating the daily professional context either computer-based (Dietzen et al. 2015) or with trained confederates

seems to be an adequate assessment format to measure performance in social interactions. Especially in physicians' education at the transition from HE to work, such performance-based tests simulate later social-communicative tasks in hospitals.

Obviously, there is research potential for analyzing and using existing synergy effects between VET and HE in developing test instruments and changing prospective assessment practices. An amplifying discussion overcoming the borders of educational fields and research communities is regarded as very fruitful and promising, especially with respect to future challenges like digitization which affects education itself but also working life and the occupational context.

## Abstract

In the current vocational education and training (VET) research, many empirical studies focus primarily on the development of competence-based test instruments that aim to measure the cognitive dispositions of a domain-specific competence construct. While these studies mainly focus on the analysis of competence structures and levels, the valid measurement of competence development represents a research gap. Studies with this focus differ significantly in their theoretical-conceptual foundations and their methodological approaches. Moreover, different challenges arise in the methodological aspects of a valid change measurement. For this purpose, the first chapter reviews the research on the measurement of competence development in the

VET field. Given the increasing significance of sustainable development-related competencies in VET, an empirical analysis is performed on commercial trainees' development of declarative knowledge related to sustainability from a societal perspective and sustainability in business processes. The in-depth analyses are based on data sets from cross-sectional and longitudinal studies. The differences and similarities between these research designs are compared with regard to their analysis potential, analysis methods, and results.

## **Research on the Measurement of Competence Development in VET: Theoretical Assumptions and Methodological Designs**

The discourse on measuring competencies in vocational education and training has received increasing attention in recent years (see Beck et al. 2016; Seeber 2017; Klotz and Winther 2017; Holtsch et al. 2016; Winther et al. 2016). Nevertheless, the understanding of competence as a latent construct and its associated causality is not always clear (Klieme et al. 2008). Currently, individual cognitive and affective-motivational dispositions (Blömeke et al. 2015) serve to explain performance related to the requirements in a domain-specific context; these dispositions are understood to be the mental resource potentials of an individual. Due to the assumption that competencies refer to clusters of knowledge, abilities, beliefs, and emotional and motivational resources and considered as a result of previous learning processes (Weinert 1999), theoretical foundations of studies aiming to measure competence development have to take into account research on learning, teaching, learning environments, and processes as well as on specific characteristics of the domain. Moreover, psychometric research has to be considered.

In principle, competence development is a lifelong process (Blossfeld and Schneider 2011). Nevertheless, the research on competence development in VET is often restricted to observations in the life stage of a respective training program and goes seldom beyond. The theoretical frameworks in this context are often based on approaches to expertise research, particularly the five-stage skill acquisition model by Dreyfus and Dreyfus (1980), which describes the development from a novice to an expert or master level. However, corresponding (more deterministic) models of competence development, such as that of Dreyfus and Dreyfus (1980), are very general, and due to the abstract level differentiations and the lack of explicit explanation-relevant predictors, such models are limited to describing the development of professional competence in VET (Michaelis 2017, p. 45f.). In any case, it is still questionable whether competence development in terms of temporal development is to be understood as a continuous or discontinuous process (Fleischer et al. 2013). Because of the high degree of abstraction in Dreyfus and Dreyfus' (1980) model, competence development, which results from specific intervening learning arrangements, can be explained only to a limited extent by this theory. Even the offer-and-use models discussed in school effectivity research

(e.g., Helmke and Weinert 1997) are of limited use in VET because these models do not refer to the context of workplace learning and its prevailing norms (see Lempert 2009; Rausch 2011; Michaelis 2017, p. 45ff.; Sembill 2008).

Up to this day, the diagnosis of domain-specific competence in different educational areas has been predominantly based on curricular and therefore formal learning processes. For such research projects, and particularly for the previously noted intervention designs, the curriculum instruction assessment triad (Mislevy and Riconscente 2005; Mislevy and Haertel 2006) can be used as a theoretical framework (Winther 2010; Seeber 2017). This means that the development of an assessment should be convergent with the curricular requirements (intended curriculum) but also with the teaching process (implemented curriculum/intervention). Moreover, assessments in VET have to take into account different learning contexts: school-based theoretical learning and practical-oriented learning in companies or workplaces. It can be assumed that the two learning contexts help to develop different knowledge representations; both are necessary to cope with workplace requirements and to act as an expert in a respective domain. Subsequently, the assessment of the development of occupation-related competencies must refer to both learning contexts and their specific outcomes (see Winther 2010, p. 93ff.; Seeber 2017). Furthermore, assessments of the development of learning outcomes must not only consider different learning opportunities in vocational schools and training companies but also nonformal and informal learning opportunities outside of these education or training institutions. Nonformal and informal learning possibilities, e.g., extracurricular activities or learning possibilities in the private context, represent interesting and important explanatory factors. However, explanatory factors of competence development are not considered further in this chapter. This chapter is more concentrated on the methodological challenges due to the underestimation in research on the measurement of change.

Methodological differences can be attributed to general fundamental questions of the measurement of change. Studies with cross-sectional (survey of different samples at one occasion of measurement, e.g., different years of training), trend (survey of different, but comparable, samples at different occasions of measurement), as well as panel designs (longitudinal surveys in which a sample is repeatedly questioned at different occasions of measurement) are suitable for analyzing competence development. Independent of the research design, it must be ensured that the construct validity is the central condition. Consequently, the comparability of the outcome variable or a set of outcome variables across different samples (cross-sectional and trend) or at different occasions of measurement (trend and panel) is of central importance (von Davier et al. 2008). As a general rule, no change measurement methodology is free of measurement errors. Rost (2004) calls this the “validity problem of measuring change.” Each procedure has its own advantages and disadvantages, which have to be weighed against the objectives of a study. Table 1 presents major challenges associated with cross-sectional and longitudinal research designs.

In the past mean comparisons based on sum scores were common for the observation of competence development; however, this approach does not meet the expectation of a valid psychometric foundation. Recent research with validated psychometric procedures primarily focus on the German VET system with its specific characteristics of the so-called dual system. On the one hand, there are studies that analyze the development

**Table 1** Challenges of different methodical designs for measuring competence development

	Cross-sectional design/trend design	Longitudinal design
<b>Analytic potential</b>	Interindividual differences between subgroups (e.g., differentiated by years of training)	Interindividual differences between occasions of measurement and intraindividual development
<b>Sample requirements</b>	Comparable samples in difficult accessible test fields: In addition to the usual comparison of subgroups (especially by gender, level of education, migration background, socioeconomic status), VET faces the challenge of cyclical economic fluctuations that can lead to rapid compensation effects in the training market (Seeber et al. 2017). Therefore, regional aspects of the training market have to be compared across the subgroups	Constant sample over time or appropriate methods for use with incomplete data sets
<b>Test instruments</b>	Ensuring the measurement invariance/construct validity	Ensuring the measurement invariance/construct validity over time Risk of memory effects if subjects answer an item multiple times at all occasions of measurement within short intervals of time

of basic competencies in prevocational training programs (e.g., mathematics, linguistics, or natural sciences) (e.g., Weißeno et al. 2016; Behrend et al. 2017). On the other hand, there are studies that aim to measure the development of domain-specific competencies in selected occupations. Table 2 provides an overview of selected longitudinal studies measuring the change in domain-specific vocational competence during the course of training. These recent studies are methodologically acceptable, based on item response theory (IRT), a probabilistic approach where the models and underlying assumptions are verified in the process of scaling.

## Methodological Differences in the Use of Cross-Sectional and Longitudinal Study Designs for the Measurement of Competence Development

In scientific psychometrics, different approaches exist for measuring competence development. First, it should be noted that change can be observed and discussed on two levels: the group level and the individual level. The specific research interest and the study design determine which level should be addressed. For large-scale assessments on the effectiveness of VET as a whole or the effectiveness of selected training programs, a group-level observation may be sufficient; however, in most diagnostic processes, it is indispensable to obtain precise information on the individual change in competences. Both methodical designs can be analyzed

**Table 2** Selected studies of the “research field” diagnosis of competence development in VET

Domain reference	Authors	Sample/target group	Focus	Methodical approach
Commercial/ business	Rosendahl and Straka (2011a, b)	Bank clerks	Domain-specific competence	Longitudinal study: IRT and structural equation modeling
	Klotz (2015) and Klotz et al. (2015)	Industrial clerks	Domain-specific competence	Cross-sectional study: IRT
	Michaelis (2017)	Freight forwarding and logistics services clerks	Competencies toward sustainable operational management	Longitudinal study: IRT and structural equation modeling
Industrial-technical	Nickolaus et al. (2008, 2011)	Electronic technicians – specializing in energy and building technology Motor vehicle mechatronics technicians (only in the study of 2008)	Domain-specific competence	Longitudinal study: structural equation modeling
	Atik and Nickolaus (2016)	Plant mechanics	Domain-specific competence	Longitudinal study: IRT
	Abele (2014)	Motor vehicle mechatronics technicians Production mechanics Electronic technicians – specializing in automation technology Mechatronic fitters	Domain-specific competence	Longitudinal study: IRT and structural equation modeling

by using item response theory models (e.g., von Davier et al. 2011; Meiser 2007). Already the one-parameter logistic (1-PL) IRT model is suitable to analyze competence developments (see Rasch 1960; Fischer and Molenaar 2012). This chapter follows this approach. A crucial feature of this method is the representation of person skills and item difficulties on a scale based on the response behavior of a random sample.

To be able to evaluate competence-based test instruments with IRT models, an essential condition is the use of suitable linking designs (see von Davier et al. 2008). A common approach is to use anchor items. Studies with a cross-sectional design use identical subgroup-overlapping items, and longitudinal studies use identical occasion-overlapping items. These approaches are adopted in this chapter and are explained in more detail below.

## **An Approach to Analyzing Competence Development in Cross-Sectional Designs**

If anchor items exist between the considered subgroups, differential item functioning (DIF) analyses (as a method for testing measurement invariance) can be used to check subgroup differences both globally and at the item level. The basic assumption of DIF analyses is to calculate item parameters specifically for the considered subgroups within the Rasch analysis, such as trainees with different years of training. By comparing these subgroup-specific parameters, differences in the difficulty degree of a test instrument (global) or of items (local) can be derived for the subgroups. At the item level, the DIF parameter generally indicates the deviation from the average item difficulty in logit units. To calculate the item difficulty, the estimate average and the subgroup-specific estimate must be added. A positive item DIF parameter therefore means a higher item difficulty for the subgroup, whereas a negative item DIF parameter indicates a lower item difficulty (Wu et al. 2007).

To assess the DIF effect, the recommendations of the National Educational Panel Study (NEPS) will be considered. An absolute difference in the average item difficulty greater than 0.4 and less than 0.6 is a weak effect, a difference greater than 0.6 and less than 1.0 is a medium effect, and a difference greater than 1.0 is a strong effect (Pohl and Carstensen 2012). A DIF parameter is considered significant if it is at least twice as large as the associated standard error.

In accordance with expertise research (e.g., Dreyfus and Dreyfus 1980), it can be assumed that apprentices will find it easier to answer items as the number of years of training increases if the content of the items is implemented in curricula. Accordingly, for this case, lower DIF parameters are expected during the training program and can be interpreted as a positive development of competence. Klotz et al. (2015) used this approach in cross-sectional study for commercial trainees. Nevertheless, a high uncertainty remains with regard to the usability of these items as anchor items in longitudinal designs, because the link assumption assumes the item's measurement invariance over time.

## **An Approach to Analyzing Competence Development in Longitudinal Designs**

However, the 1-PL Rasch model faces a challenge in the analysis of longitudinal data with regard to the data structure. Due to the different occasions of measurement, the classical structure, which consists of items and cases, is extended by a time-specific third dimension. However, the three-dimensional structure can be resolved by a data restructuring with virtual test persons or virtual items. In this particular context, "virtual" means that the data of survey times  $n + 1$  are added to the data set of  $t_1$  as additional variables or test participants. However, the two procedures should be viewed not as alternatives but as complementary methods. Data restructuring via virtual persons enables analyses of temporal measurement invariance, which is referred to in the literature as item parameter drift. In principle, the data set is treated

with a cross-sectional design, and interindividual differences between the occasions of measurement can be calculated via DIF analyses, as described above.

The advantage of longitudinal designs, however, lies in the ability to analyze intraindividual competence development. For this purpose, the method of virtual items has been developed. This approach requires the specification of a multidimensional Rasch model. The items of each occasion of measurement form a separate dimension. Put simply, items of the first occasion of measurement form the first dimension, and items of the subsequent occasion of measurement  $n + 1$  form the  $n + 1$  first dimension. Corresponding models are based primarily on the methods of Andersen (1985) and Embretson (1991). The main difference between the two methods lies in the test booklet design. While in Anderson's design, identical items are used at all occasions of measurement (anchor items), Embretson's method allows occasion-specific items as well as anchor items. Embretson (1991) recommends using all items at each test time but distributing them to different test booklets so that a test participant answers each item only once. To implement a corresponding procedure, IT-based test assessments should be used.

Based on the assumption of construct validity, anchor items should still measure the same construct at later occasions of measurement in multidimensional models. For this purpose, it is important to keep the item parameters of the anchor items constant over time. This means that the anchor items receive the same item parameters for all occasions of measurement (parameter fixation). An essential aspect, however, is that competence development is based solely on anchor items. Additional occasion-specific items are used to improve the estimation quality of personal parameters. However, in this method, it is important to select for the item parameter fixation only anchor items whose stability over time is given. Therefore, the analysis of item parameter drift should be advanced. A significant item parameter drift of the anchor items can lead to inappropriate item fit values of the subsequent Rasch scaling. Whether an anchor item is finally usable can be checked via the subsequent Rasch scaling with item parameter fixations. The anchor items should have acceptable item fit values after scaling.

---

## **Exemplary Presentation of Challenges of the Measurement of Competence Development in VET**

### **Methodology**

The following example for the measurement of competence development in VET refers to the latent construct of sustainability competencies in business processes. The empirical analysis of competence development is focused on the specific competence construct "acting in the sense of sustainability in the context of operational management." "Competence in sustainability management are defined as a complex ability to act adequately in business contexts, in particular to be able to take into account the medium- and long-term economical, ecological and social – intra-company as well as external – consequences of (strategic and

operational – the authors) management decisions” (Seeber et al. 2016). Sustainability aspects are becoming increasingly important in sustainable development education (Barth and Rieckmann 2016) as well as in VET. However, curricular analyses show that in many German training programs, the implementation of sustainability aspects is insufficient (Brötz et al. 2014). For the purpose of this chapter, however, the complexity of this construct (Seeber and Michaelis 2014) is limited to the declarative knowledge (see Shavelson et al. 2005) or conceptual knowledge (see Anderson and Krathwohl 2001) regarding sustainability and sustainability in business administration. In terms of content, the declarative knowledge items asked about general principles of sustainability, i.e., theoretical and widespread normative concepts, facts and their significance, the impacts of currently discussed sustainability examples, and operational application possibilities in companies (Michaelis 2017).

The final test instrument consists of 40 items. In terms of item design, the test includes single- and multiple-choice items. The scoring is dichotomous. Accordingly, subjects earn one point if they answer the item correctly. A total of 698 apprentices in a 3-year freight forward and logistic clerk training program were tested in summer 2013. This training program provides a reasonable supply of training offerings in Germany (to ensure an adequate sample size); additionally, the issue of sustainability is becoming more and more part of the business models in the logistic sector (Handfield et al. 2013). Therefore, it could be assumed that the apprentices are familiar with topics of sustainability.

The survey was administered at the beginning of the school year. Trainees of all 3 training years were interviewed, so the data represented approximately 2 years of training. In the sense of a cross-sectional analysis, differences in competence levels between different training periods can be interpreted as competence development within the training. In addition, 185 of 326 apprentices in the first year of training were tested on two further occasions (summer 2014 and summer 2015). This sample was used for the longitudinal analysis. Table 3 shows the main characteristics of the tested sample.

**Table 3** Main characteristics of the tested sample

Methodological design	Year of training	Sample size	Age (mean/median)	Female	University entrance qualification	Number of declarative knowledge items
Cross-sectional	1	326	20.9/20 (28 missing)	116/35.6%	249/71.1% (3 missing)	20
	2	164	21.9/21 (3 missing)	61/37.4% (1 missing)	118/72.4% (1 missing)	23
	3	208	23.0/22 (2 missing)	82/39.6% (1 missing)	145/70.4% (2 missing)	23
Longitudinal	1–3	185	20.9/20 (4 missing)	71/38.4%	143/77.7% (1 missing)	20 per occasion of measurement

Note: The characteristics of the longitudinal analysis refer to the first year of training

The tests took place in four different vocational schools. Because the IT equipment in the vocational school was limited, it was not possible to use IT-based test software. Therefore, item rotations in the test booklets were not possible. For economic reasons, not all trainees received all items. Trainees in the cross-sectional sample answered 20–23 items. Trainees in the longitudinal sample received 20 items per occasion of measurement, with 10 items held constant as anchor items between the occasions of measurement.

To analyze the data, the 1-PL Rasch model by the ConQuest software program was used. This program offers different coefficients for analyzing reliability and construct validity, which are explained in the following:

- The estimate of item difficulty is given in logit units; in addition, the standard error is specified.
- The expected a posteriori/plausible value reliability (EAP/PV reliability) “is [the] explained variance according to the estimated model divided by total person variance” (Draney and Wilson 2008, p. 425).
- The weighted means square (wMNSQ) indicates how accurately an item fit the model. The expected value is 1.0. For multiple-choice tests, a wMNSQ between 0.8 and 1.2 is recommended (Bond and Fox 2007, p. 243).
- The T-value informs about the significance of the deviation from the perfect fit per item. Values between  $-2.0$  and  $2.0$  are recommended (Bond and Fox 2007, p. 43).
- For the discriminatory power of an item, ConQuest reported the item-total correlation. In this study, values of 0.2 are sought. In some cases, such as when an item represents meaningful conceptual content, lower values are acceptable.

## Results

### Cross-Sectional Scaling

For the cross-sectional analysis, three Rasch scaling procedures were performed. To check the construct validity of the test instrument, a general Rasch scaling over all items was carried out first. Overall, the reliability of this test instrument is still reasonable (EAP/PV reliability, 0.630). The item fit values (see Table 4, left columns) also have good item properties. Only three items (1.1, 1.6, and 1.9) are

**Table 4** Global DIF analysis for comparing the level of declarative knowledge regarding sustainability and sustainability in business administration between the years of training

Items	Year of training	Estimate	Error
1.1–1.12	1	−0.151	0.053
	2	0.081	0.062
	3	0.170	0.059
2.1–2.11	2	0.026	0.049
	3	−0.026	0.049

conspicuous, as their item-total correlation lies under 0.2. However, these values are still acceptable due to the content-related focus of the items.

In the second step, two DIF analyses were calculated for the items that were answered by trainees with different years of training. Accordingly, subgroup differences can only be calculated between the groups that received the same anchor items. Apprentices of all training years answered items 1.1–1.12, and apprentices from the second and third years of training additionally answered items 2.1–2.11. Table 4 displays the results on the global level, and Table 5 shows those on the item level in Table 5 (right columns). In contrast to the interpretation of the local DIF estimates, the lower the DIF parameter at the global level, the worse the individuals of the associated subgroup performed in comparison to the other subgroups (Wu et al. 2007). With regard to items 1.1–1.12, a decrease in test difficulty is observed with an increase in training courses. At first glance, this finding is in line with the expectation. With regard to items 2.1–2.11, there is only a marginal difference in sustainability-related knowledge between apprentices in the second and third years of training.

However, the global subgroup difference can be assumed only if the associated items show systematic discrimination between the subgroups. Accordingly, the level of item difficulty would have to decrease with increasing training process. In conclusion, negative DIF estimates are to be expected for higher years of training.

The DIF parameters show that the majority of item difficulties do not change significantly between the years of training. All DIF parameters (except item 1.10 toward the third year of training) are below the weak level of 0.4 in terms of the NEPS categorization described above. Only three items (1.1, 1.6, and 1.10) change significantly as the number of years of training increases. However, two items have an unexpected effect direction. Items 1.1 and 1.6 are significantly easier for trainees in the first years of training than for the other trainees. Certainly, the local item analyses only partially confirm the global findings. The global effect of the weaker performance of the first year of training is understandable with regard to the absolute number of stronger item parameters. Only 8 of the 12 items indicate a slightly higher item parameter value for the first year of training. While there were only marginal global differences for items 2.1–2.11 between the years of training, the DIF parameters show unsystematic drifts in the item parameters. The global result (a stable, declarative knowledge achievement) arises because of mutually decreasing item parameter differences between the subgroups.

### **Longitudinal Scaling**

In the first step, the data of each occasion of measurement were individually scaled to identify items containing measurement errors (see more differentiated information in Michaelis 2017). Of the original 40 items, 5 items had to be excluded because of the inappropriate fit of the values. One anchor item was below the adequate value, so the number of anchor items was reduced to nine. Second, the data set was structured such that the test participants of later occasions of measurement were treated as virtual persons. To analyze the item parameter drifts between the occasions of measurement, a DIF analysis was applied. The global-level results are shown in Table 6. Again, it can be observed that the test difficulty decreases over the course of training.

**Table 5** Cross-sectional scaling results

**Table 6** DIF analysis for comparing the development of item parameter drift on a global level (Michaelis 2017, p. 205)

Occasion of measurement	Estimate	Error
t1	-0.304	0.058
t2	0.127	0.058
t3	0.177	0.058

The anchor items of the declarative knowledge test have a globally significant subgroup difference and show a significant decrease in difficulty over the course of training. This decrease is most pronounced between occasion times t1 and t2. At the item level (Table 7), three of the nine anchor items show a significant item parameter drift. These are items A7, A8, and A10 at t1 and t3. At this time, these items should not be excluded but should be observed within the longitudinal scaling. As mentioned before, a significant item parameter drift is merely an indicator of potential measurement errors of item parameter fixation. Therefore, whether a potential impairment of the measurement model arises is examined below via a longitudinal scaling with item parameter fixation.

Third, the longitudinal scaling is performed by modeling each occasion of measurement as a separate dimension (virtual item structure) and using the item parameter fixation of anchor items. After the deviance (an indicator for assessing the quality of the Rasch model; see Wu et al. 2007) was compared, the best model fit was obtained when the anchor item parameters of the second occasion of measurement from the time-specific individual scaling were used as the item parameter fixation. In the following, only the results of the final scaling are discussed (for the final results of the scaling, see Michaelis 2017, p. 344f). In addition to the abovementioned exclusion of five items, nine additional items were excluded from the scaling due to insufficient item fit values during the longitudinal scaling. A few item parameter fixations were also removed as they resulted in inappropriate item fit values. This mainly concerns the items that were observed in

**Table 7** DIF analysis for the identification of items in the declarative knowledge test, which have an item parameter drift between the occasions of measurement. (Based on Michaelis 2017, S. 206)

Item	Estimate (average)	Error (average)	Estimate (t1)	Error (t1)	Estimate (t2)	Error (t2)	Estimate (t3)	Error (t3)

Note: Significant DIF parameters are grayed out

the item parameter drift analysis. The final scaling is reasonable to good scores in terms of item fit values and reliabilities (EAP/PV reliability, 0.689 (t1), 0.708 (t2), 0.733 (t3)). Only two items stand out with an item-total correlation under the recommendations of 0.2. For content-related reasons, however, these items are kept in the analysis.

The longitudinal survey design allows the calculation of the latent variances and correlations as an indicator of the stability of declarative knowledge about sustainability over time. The results, including those in Table 8, show a strong correlation between the occasions of measurement. Accordingly, interindividual differences in intraindividual development are less pronounced.

## Comparison of Scaling Results of Cross-Sectional and Longitudinal Research Design

Based on the previous results, the competence developments of both research designs are compared in Table 9. For this purpose, Warm's mean weighted likelihood estimates (WLE) as an estimator for a persons' ability (Warm 1989) were z-standardized per research design (mean value = 500, standard deviation = 100), and the effect sizes of the change (Cohen's/Hedge's d) were calculated. The effect sizes were calculated as the relative mean difference in the z-standardized WLE person ability scores between the higher and the lower occasions of measurement on the mean total standard deviation (Howell 2013). Hedge's d is similar to Cohen's d, but it calculates the effect size for subgroups of different sizes. The comparison shows that with a continuous training process, the performance on the declarative knowledge test regarding sustainability and sustainability in business administration

**Table 8** Latent covariances (top right) and correlations (bottom left) between the occasions of measurement of the declarative knowledge test (Michaelis 2017, p. 218)

Occasion of measurement	t1	t2	t3
t1		0.393	0.423
t2	0.702		0.412
t3	0.626	0.797	

**Table 9** Comparison of competence development between cross-sectional and longitudinal research designs

Subgroup	N	WLF (mean)	SD	Cohen's/Hedge's d to previous year of training
LS (t1)	185	466.497	107.233	
LS (t2)	185	511.292	86.246	0.460
LS (t3)	185	522.211	97.049	0.119
CS (first year)	306	488.057	109.456	
CS (second year)	164	513.507	93.548	0.244
CS (third year)	208	506.920	88.080	-0.073

Note: CS, cross-sectional study; LS, longitudinal study

increases. The greatest increase in knowledge is measured between the first and second years of the training program in both research designs; however, there is a stronger effect in the longitudinal study. One explanation may lie in the larger number of anchor items in the cross-sectional study design and the stronger unsystematic developments of their item parameters (see Table 4, left columns), which could lead to a reduced knowledge development in the cross-sectional design. The above-average improvement during the first year of the training program is congruent to curricular analyses that suggest the importance of developing competencies regarding sustainability in the freight forwarding and logistics clerk occupation (Michaelis 2017). Between the second and third years of training, the longitudinal study shows a weak but positive effect. In the cross-sectional data set, there is even a weak deterioration in performance between the second and third years of training.

In addition to the comparison of competence development using different research designs, it is possible to consider item parameter differences as well as the development of the items that were used in both study designs (cross-sectional and longitudinal) at all occasions of measurement. Five items fulfill this condition, for which a new DIF analysis is calculated. Therefore, the data of the second and third occasions of measurement of the longitudinal study were again structured as virtual persons and matched with the data of the cross-sectional study. Table 10 includes the results of the DIF analysis.

The DIF effects of the five-item twins from the different study designs show only slightly pronounced item parameter drifts between the individual occasions of measurement or years of training. Nevertheless, the comparison of the item

**Table 10** Comparison of item parameter development between cross-sectional and longitudinal research designs (DIF analysis)

Item twin	Design	Average		Year of training 1/t1		Year of training 2/t2		Year of training 3/t3	
		Estimate	Error	Estimate	Error	Estimate	Error	Estimate	Error
1.3	CS	1.657	0.067	-0.091	0.123	0.247	0.159	0.121	0.141
A2	LS			-0.053	0.147	-0.157	0.140	-0.067	0.143

A3	LS			0.032	0.132	0.136	0.134	-0.109	0.135
1.5	CS	-0.946	0.066	0.063	0.117	0.120	0.154	-0.079	0.142
A4	LS			0.089	0.143	-0.160	0.156	-0.033	0.149
1.8	CS	0.287	0.058	0.089	0.108	0.139	0.139	-0.122	0.126
A6	LS			0.028	0.131	0.064	0.132	-0.198	0.132
1.12	CS	-0.855	0.065	-0.082	0.117	-0.414	0.164	0.067	0.138
A7	LS			-0.096	0.144	0.116	0.147	0.408	0.139

Note: CS, cross-sectional study; LS, longitudinal study

parameters makes it clear that depending on the study design, different (but usually only slightly pronounced) item parameters and developments can be measured. The most noticeable difference between the study designs is the development of the item parameter of the five-item twin, which compares items 1.12 and A7. However, the absolute item parameter difference of only 0.341 logits between items 1.12 and A7 toward the third year of training is rated as a low effect.

## Discussion

As this chapter emphasized, the diagnosis of competence development in VET is a research gap. As clarified, the challenge of a valid change measurement is one of the main reasons for this research gap. Although there are comprehensive recommendations for measuring competence developments (e.g., von Davier et al. 2008, 2011), concrete measurement standards could not prevail in VET so far. Previous studies in VET differ mainly in their methodological design. The majority of VET studies aiming to measure competence development use longitudinal designs (e.g., Abele 2014; Atik and Nickolaus 2016; Rosendahl and Straka 2011a; Michaelis 2017; Nickolaus et al. 2008, 2011). In contrast, there are cross-sectional designs (Klotz 2015; Klotz et al. 2015), which are less common so far. However, both approaches have their own potential and advantages as well as aspects that promote measurement errors (see Table 1). The assets and drawbacks of the measurement approach have to be weighed against the objectives of a study. Hence, in the present analysis, psychometric issues of cross-sectional and longitudinal research designs were considered by the example of an instrument for measuring declarative knowledge regarding sustainability and sustainability in business administration. The analysis revealed the following findings:

- The greatest increase in declarative knowledge arises between the first and second years of the training program. However, the effect in the longitudinal research design is stronger than that in the cross-sectional research design.
- The comparison of the development of the items, which were all used in both survey designs for all occasions/training years, produced comparable results, with some individual occasion-specific deviations.

These differences can have a variety of methodological explanatory backgrounds. Therefore, causes are identified, and recommendations for the measurement of competence development in VET are briefly outlined in the following.

A substantial methodological difference is that the selection of anchor items in the two study designs differs. The cross-sectional research design includes 12 anchor items between all 3 subgroups and another 11 anchor items between the second and third years of training. The anchoring in the longitudinal study, however, is based on only five to seven items per measurement occasion. For both longitudinal and cross-sectional research designs, it is questionable whether the selection of anchor items represents a representative selection of items for measuring the declarative knowledge development regarding sustainability and sustainability in business administration. Using an IT-supported test procedure with the function of randomly distributing items on test booklets could improve the quality of the measurement for both research designs.

The sample can also be determined critically. In the longitudinal section, only persons who participated in all occasions of measurement were considered in the analysis. The representativeness of the sample can be limited by this (risk of selection effects). Here, however, imputation methods could be used to work with incomplete data sets. The cross-sectional sample is also problematic in terms of subgroup comparability. Particularly in the case of changing training market situations, the comparison of subgroups may be limited. In the case of changing critical comparison features, weighting methods would be recommended.

It is conspicuous for both research designs that unsystematic developments of the item parameters were measurable. To a certain degree, curricular analyses could explain item-specific difficulty-reducing developments (especially with regard to environmental aspects, which are anchored in the curriculum during the first year of training; Michaelis 2017). The finding that items become more difficult over the course of the training program must be attributed to memory barriers or oblivion processes. It could be assumed that corresponding concepts were acquired during previous educational processes (especially in general education) or perhaps informal learning processes (such as media contributions) but are less present during the training process. On the other hand, this result is compatible with critiques that training programs in Germany insufficiently support holistic sustainability aspects (Brötz et al. 2014). Despite partial curricular anchors, the promotion of sustainability-related competencies is more facilitated by the voluntary initiatives of training institutions. This makes it much more difficult to use cross-sectional study designs, as it is not possible to ensure comparability with regard to the content and quality of learning processes.

## Conclusion

The explanations in this chapter are concentrated on aspects on the psychometric challenges to measure development in domain-specific knowledge of future business administration clerks. Considering the previous aspects, it becomes clear that both methods can generate data that could contain measurement errors. However, the choice of the survey design also depends on the analysis objective. It is possible that the analysis of intraindividual developments is only possible via longitudinal research designs. Additionally, with regard to the analysis of explanatory contexts (e.g., relationships to affective-motivational dispositions), longitudinal studies are superior to cross-sectional studies. Complex structural relationship models can be computed if explanatory features have been tested with regard to the respective occasions of measurement.

A second challenge was mentioned in the introduction: the multiple influencing factors. Domain-specific competence development is not only a result of structured and intended learning processes in vocational schools and training companies but also of informal learning opportunities at workplaces and in private life, especially the discussed competence development in the domain of sustainable business processes. Competence measurement in VET is not an end in itself; rather the aim is to improve learning and training opportunities to support the individual competence development. Therefore, individual prerequisites at the beginning of training in particular knowledge, attitudes, motivation, prevocational experiences, social and cultural backgrounds, etc. and structured learning opportunities as well as nonformal and informal learning during the course of training have to be considered in research designs. A second aspect has to be taken into account in the future research on competence development: the measurement of noncognitive competence facets. Most studies avoid the integration of motivational and emotional competence facets, beliefs, and attitudes. The main reason for this specific research lack lies in the difficulty of their simultaneous measurement and in the lack of appropriate psychometric methods for such complex research designs. First research efforts can be observed by using the experience sampling method (see Rausch et al. 2016), albeit not yet in a longitudinal design.
