

Gould–Jacobs reaction

The Gould–Jacobs reaction is a sequence of the following reactions:

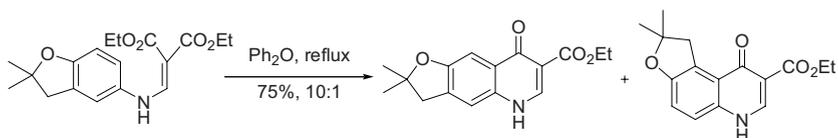

- Substitution of an aniline with either alkoxy methylenemalonic ester or acyl malonic ester providing the anilinomethylenemalonic ester;
- Cyclization of to the 4-hydroxy-3-carboalkoxyquinoline (4-hydroxyquinolines exist predominantly in 4-oxoform);
- Saponification to form acid;
- Decarboxylation to give the 4-hydroxyquinoline. Extension could lead to unsubstituted parent heterocycles with fused pyridine ring of Skraup type.

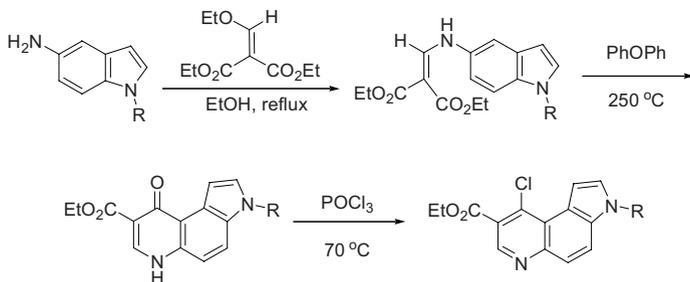

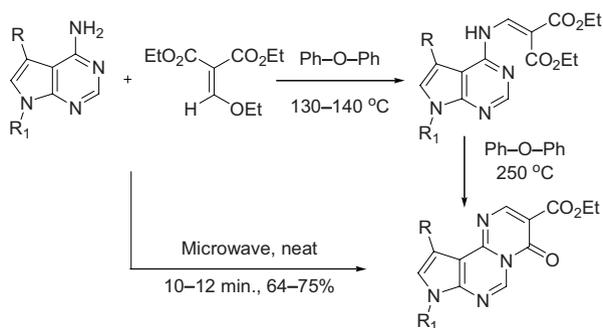

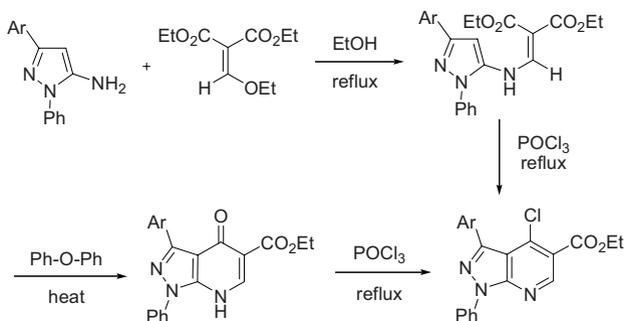

R = alkyl; R' = alkyl, aryl, or H; R'' = alkyl or H
